Revision Summary

Revision Number	Date	Comments
R000	2016-01-27	Initial issue.
R001	2016-06-01	- Documentation freeze date changed to January 15, 2016. Revised throughout, including affected documentation changes. - Sections 1.2 and 2.4. PSR2 validity period extended to the end of 2028, to align with the anticipated Power Reactor Operating Licence period. The period 2025-2028 is termed the "Licence Period Bounding case". Clarity provided that management of the activities and program changes associated with the transition to safe storage and safe storage periods will be addressed outside of the PSR process. - Section 2.2. "Define Review Tasks" added to Figure 1. "Ranking of Global Issues with identified actions" added to Figure 1. - Section 2.4. Clarified PSR1 / PSR2 interface and process for application of PSR1 findings to PSR2. - Section 2.5. Added that the scope of PSR2 is restricted to the facilities regulated under the Pickering NGS Power Reactor Operating Licence. - Section 2.6.1.2. Revised to clarify the process used to derive the PSR2 Review Tasks. - Section 3.2.1. Added footnote to clarify that Review Task compliance assessments are generally independent of PSR1 findings. Added "Plant Condition Assessments" as a source of information for Safety Factor compliance assessments. - Sections 3.2.1 and 3.2.3. Stated that effectiveness reviews would be documented for OPG programs used to demonstrate compliance with the PSR2 Assessment Basis. - Sections 3.2.2 and 3.2.3. Clarified description of review types, Compliances and Gaps. - Section 3.2.3. Noted that separate reports will be produced to document reviews of the Laws, Regulation, Codes and Standards in the PSR2 Assessment Basis, and also to document the derivation of the Safety Factor Review Tasks. Noted that Safety Factor reports will be submitted to CNSC staff for review. - Section 3.3.2. Added an element "Ranking of Global Issues with identified actions". - Section 3.3.3, Section on Prioritization. • Removed reference to ranking. • Clarified the origin and derivation of the information in Appendices E and F. • Added former Table E3. - Section 3.3.3. Added new section on ranking of Global Issues with identified actions. - Section 3.3.4. Noted that the Global Assessment Report will include a ranked list of those Global Issues with identified actions, with rationale for the ranking. - Section 4. Clarified wording relating to engagement of external contractors. Aligned PSR2 deliverable submission schedule with OPG-CNSC Protocol and added R1 of PSR2 Basis Document. - Added new Appendix A. PSR1 / PSR2 interface. - Previous Appendix B deleted (mapping of Safety Factor areas to CNSC Safety and Control Areas, comparison of PSR2 vs Darlington Safety Factor areas). Previous Appendix A (SSCs within scope of PSR2) moved to become new Appendix B. - Appendix C. Introduction revised to clarify the process used to derive the PSR2 Review Tasks. Review Tasks revised to ensure that IAEA SSG-25 and CNSC REGDOC-2.3.3 review elements are all addressed. Rewording of Objective for Safety Factors 2 and 4. - Appendix D, Section D.1.0. Section 2.10 reworded as an exclusion.

		- Appendix D, Section D.1.0. Section 3.2 inclusion rule clarified. - Appendix D, Section D.1.0. Section 3.3 added to clarify that informative / non-mandatory sections of documents in the PSR2 Assessment Basis are not included. - Appendix D, Table D1. Column identifying applicable Safety Factors deleted. - Appendix D, Table D1. Changes to listed documents, to modern versions, and to review types as a result of freeze date change and new information identified to date, as follows: • Added documents – CSA N288.7, CSA N290.8 • Modern version revised – CSA N286.7, CSA N290.14, CSA N291, NFPA 20, NFPA 24, CNSC REGDOC-2.3.2, ASME B31.1 • Review type revised – CSA N290.15, CNSC REGDOC-2.10.1 - Appendix E. • Revised Appendix E and Table E2 titles, for clarity. • Former Table E3 deleted (moved into Section 3.3.3). - Appendix F. Revised Appendix F title, for clarity.
R002	2016-06-29	- The term “Licence Period Bounding case” is no longer used to refer to the time period 2025-2028. Revised throughout the document. - Section 1.2. Clarified text concerning the planning basis, for PSR2 purposes, of operation of the Pickering NGS units. - Section 2.4. Clarified text concerning the PSR2 validity period. - Section 3.2.2. Definition of Incremental Review revised. - Section 3.2.3. Definition of Compliance and Gap, for Incremental Reviews, revised. - Sections 3.3.3 and 3.3.4. Added text to indicate that development of the Integrated Implementation Plan will be concurrent with Global Assessment phase activities. - Appendix D, Table D1. Review type for REGDOC 2.5.2 and REGDOC 2.2.2 changed from High Level to Incremental, at the request of CNSC staff.

1.0 INTRODUCTION

1.1 Purpose

This document is the Periodic Safety Review (PSR) Basis Document for the Pickering NGS Periodic Safety Review 2 (PSR2). It defines the scope and methodology of the conduct of PSR2. It addresses:

- The approach to conducting PSR2, including the proposed operating strategy of the facility,
- The PSR2 Assessment Basis, including applicable modern versions of Laws, Regulations, Codes and Standards,
- The methodology for conducting the elements of PSR2:
    - The Safety Factors to be reviewed and the strategy for the reviews,
    - The process for categorizing, prioritizing, tracking and resolving Gaps arising from the Safety Factor reviews,
    - Conduct of the Global Assessment,
    - The methodology for preparing the Integrated Implementation Plan,
- The major milestones, including the freeze date for document revisions,
- The project management and quality management processes to be followed in carrying out PSR2.

PSR2 is being performed in support of the evaluation of extended operation of the Pickering NGS units, beyond the year 2020, which is in accordance with the recent announcement by the government of the Province of Ontario. The CNSC has indicated [1] that OPG should perform a “subsequent PSR” should OPG decide to operate Pickering NGS units beyond 2020.

As noted, PSR2 is a subsequent PSR, an update building on the review basis of earlier OPG PSR work and other associated assessments (termed here “PSR1”). Specifically, PSR1 consists of:

- The Pickering B Integrated Safety Review (ISR), performed in support of refurbishment and continued operation (for another 30 years) of the Pickering 5-8 units [2],
- Pickering 1, 4 integrated safety assessments performed during the Pickering A Return to Service (PARTS) work (further described in Section 2.3 of this document), in support of approval to restart Units 1 and 4, and
- The Darlington ISR, performed in support of refurbishment and continued operation of the Darlington units [3] [4] (programmatic parts applicable to Pickering).

1.2 Operating Strategy of the Facility

Pickering NGS is located on the shore of Lake Ontario in the City of Pickering, in the Regional Municipality of Durham. The station has 6 operating nuclear reactors and 2 reactors (Units 2 and 3) that have been removed from operations and placed in the safe storage and surveillance state. Pickering NGS was built in two phases. Construction of Units 1 through 4 started in 1966, with Unit 1 becoming operational in 1971 and Unit 4 becoming operational in 1973. The construction of Units 5 through 8 started in 1974 and the units entered operations between 1983 and 1986.

Currently, the Pickering 5-8 units are approved to operate to 247,000 Effective Full Power Hours [5]. This operation limit is expected to be reached on some units in 2020. The current planning basis for Pickering NGS is an assumption of operation of Pickering NGS units until the end of 2024. To align with the anticipated expiry date of the next Power Reactor Operating Licence, for the purposes of PSR2 the period of operation of Pickering NGS units is extended until the end of 2028. Some Structures, Systems and Components (SSCs) will continue to be operated while the station is placed in the safe storage and surveillance state. OPG will make the final decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC by June 30, 2017 as required by the current Power Reactor Operating Licence.

1.3 Assurance of Safe Operation

The safety of Pickering NGS is regularly and thoroughly assessed through several processes that are part of the current licensing framework. The near-term safety of the plant is validated and assured by these processes. In addition, OPG applies routine comprehensive safety assessment and improvement programs that deal with specific safety issues, significant events and changes in standards and operating practices as they arise. These programs allow assessment of safety and plant operation to be improved on a continuous basis and they can be correlated to all of the Safety Factors reviewed in this PSR2. They include programs that ensure safe operations, effective configuration management, equipment reliability, life cycle management, aging management, periodic inspection and maintenance. Programs are also in place in the area of organization management and safety culture that focus on safety-related behaviours and accountability.

The ongoing programs and the previously completed safety assessments are extensive and include safety reviews conducted for Pickering NGS Units 1 and 4, and Units 5 - 8, assessments that are part of the licence renewal process, as well as other internal and external assessments and audits.

1.4 Statement of Current Licensing Basis

CNSC REGDOC-2.3.3, Periodic Safety Reviews [6], requires a statement of the current licensing basis of the facility. Licensing basis is defined in CNSC document INFO-0795, Licensing Basis Objective and Definition [7] as follows:

> *The Licensing Basis for a regulated facility or activity is a set of requirements and documents comprising:*
>
> *(i) the regulatory requirements set out in the applicable laws and regulations*

(ii) the conditions and safety and control measures described in the facility's or activity's licence and the documents directly referenced in that licence

(iii) the safety and control measures described in the licence application and the documents needed to support that licence application.

The following demonstrates how this definition of Licensing Basis is applied for Pickering NGS:

Item (i): The primary applicable Act and Regulations are the Nuclear Safety and Control Act and the Regulations made under this Act. Other Laws and Regulations applicable to the facility are listed on the CNSC website.

Item (ii): This item refers to licence conditions and documents directly referenced in the Power Reactor Operating Licence (PROL). The Pickering NGS PROL in effect at the time of the PSR2 documentation freeze date (defined in Section 2.4 of this report) was PROL 48.02/2018 [8]. The Canadian Standards Association (CSA) and CNSC documents directly referenced in the PROL are listed in the associated revision of the Licence Conditions Handbook (LCH), LCH-PNGS-R004 [9], in LCH Tables C.1 and C.2, respectively.

Item (iii): CNSC document INFO-0795 clarifies that documents needed to support the safety and control measures described in the licence application are those documents which demonstrate that (a) the applicant is qualified to carry out the licensed activities, and (b) appropriate provisions are in place to protect worker and public health and safety, to protect the environment, and to maintain national security and measures required to implement international obligations to which Canada has agreed.

Appendix D of the LCH [9] consists of a list of the key OPG documents that describe OPG's safety and control measures, taken from OPG's licence application for Pickering NGS. These are the OPG documents that require written notification to the CNSC of document revisions.

The OPG documents associated with Item (iii) above will be used to support the reviews in PSR2. Additional OPG documents will also be used, as required, to support the reviews.

2.0 PSR2 SCOPE

2.1 PSR2 Objectives

CNSC REGDOC-2.3.3 [6] identifies the objectives of a PSR as follows:

The objectives of a PSR are to determine:

1. *The extent to which the facility conforms to modern codes, standards and practices*
2. *The extent to which the licensing basis remains valid for the next licensing period*

3. *The adequacy and effectiveness of the programs and the structures, systems and components (SSCs) in place to ensure plant safety until the next PSR or, where appropriate, until the end of commercial operations.*
4. *The improvements to be implemented to resolve any gaps identified in the review and timelines for their implementation.*

Through the PSR2 work, OPG will confirm that the design, condition and operation of Pickering NGS supports continued safe operation for the period of PSR2, and will determine reasonable and practical enhancements that may be made.

2.2 Elements of PSR2

CNSC REGDOC-2.3.3 [6] provides regulatory expectations for the conduct and content of a PSR. This REGDOC incorporates requirements from the International Atomic Energy Agency's (IAEA) Safety Standards Series, Specific Safety Guide No. SSG-25, *Periodic Safety Review for Nuclear Power Plants* [10].

In accordance with REGDOC-2.3.3, the elements of PSR2 will consist of the following four phases:

1. Preparation of a PSR2 Basis Document (this document).
2. Conduct of Safety Factor reviews and identification of Compliances and Gaps.
3. Analysis of the Gaps and the potential safety enhancements for Pickering NGS in the Global Assessment process.
4. Preparation of a plan for the implementation of safety enhancements (Integrated Implementation Plan).

The elements of PSR2 are shown in a process flowchart in Figure 1. The steps associated with this process flowchart are further described in Section 3 of this document.

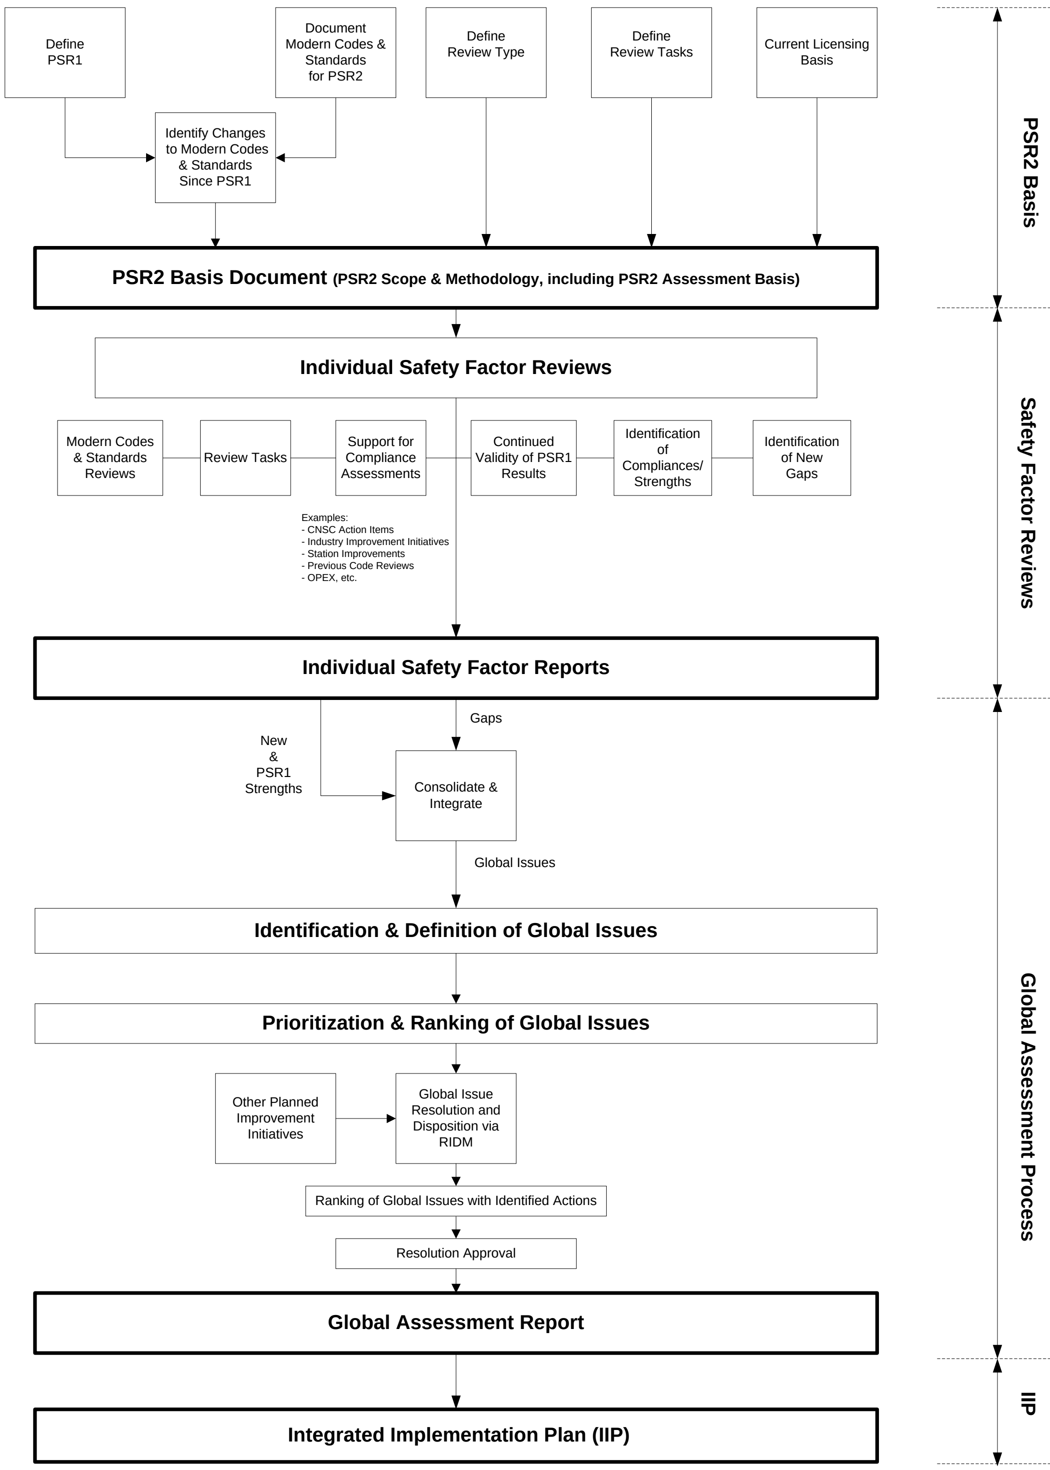

Figure 1 – Pickering NGS PSR2 Process Flowchart

2.3 Initial Pickering NGS PSR – PSR1 Description

PSR2 is a subsequent PSR, as defined in CNSC REGDOC-2.3.3 [6] and IAEA SSG-25 [10]. PSR2 is an update, building on the review basis of earlier OPG PSR work and other associated assessments (termed here “PSR1”). PSR1 consists of a combination of earlier reviews of OPG nuclear stations. These reviews are described below.

Pickering 5-8:

The Pickering B Integrated Safety Review (ISR), which included a comprehensive review of Codes and Standards, was completed in 2009, to support refurbishment and continued operation of the Pickering 5-8 units [2]. At that time, OPG was considering the option of refurbishment of the reactor components in each unit in order to continue to operate the Pickering 5 to 8 reactors for another 30 years. OPG later decided not to proceed with the refurbishment, for economic reasons, and decided to pursue instead the alternative of extended operations of all of the units to the end of 2020 without the replacement of the reactor components. In support of this approach, safety enhancements were identified (based on the results of the ISR) in the context of an operation timeframe extending to approximately 2025. These actions were documented in the Continued Operations Plan (COP), and progress has been reported to the CNSC on a regular basis. All of the COP actions, with one exception still in progress, have been completed [11].

Pickering 1,4:

Pickering 1,4 integrated safety assessments were performed during the Pickering A Return to Service (PARTS) work, in support of approval to restart Units 1 and 4 following the shutdown to enable implementation of an enhancement to the shutdown systems. (The reactor components in these units had previously been refurbished in the late 1980’s and early 1990’s. Units 2 and 3 had been placed in the state of safe storage with surveillance.) Based on the results of these safety assessments, Pickering Units 1 and 4 were restarted. These integrated safety assessments, termed Systematic Review of Safety, include the following key documentation:

- A review of Pickering A design against then-current codes and standards, including:
    - AECL report, 44RS-00531-ASD-001 R04, “Review of Pickering A Design Against Current Codes and Standards (C1-007-03-01-007)”, November 8, 2000 [12], which compared the Pickering A plant design with then current codes, standards and requirements to identify and recommend design changes to be considered by OPG;
    - AECB letter, C. B. Parsons to R. J. Strickert, “Pickering NGS-A Return to Service Project, Request for Approval of Code Effective Dates”, April 6, 2000, NA44-CORR-00531-00125 [13], and OPG report, NA44-REP-00584.1-10001 R00, “Pickering A ASME Codes Reconciliation”, August 2000 [14], which confirmed that the PARTS project conformed to code effective date requirements for various system design, equipment and materials. The impact of various code changes on the design basis was also assessed;

  - The Pickering A Basis for Return To Service, including AECL report 44RS-00531-AB-001 R01, "Methodology for Review of Pickering A Design Against Current Regulations and Standards (C1-007-03-01-002)", November 8, 2000 [15], which further outlined the approach followed for the review of Pickering A against selected codes, standards, and regulations.

- Other PARTS documentation, including OPG letter R.J. Strickert to J.S.C. Tong "Pickering A - Updated Basis for Return to Service Document" April 20, 2001, NA44-CORR-00531-00381 [16], in which 41 standards were reviewed to ascertain "direct and immediate effect on installed Design Features". This letter pertained primarily to design support analysis, quality assurance, and operations aspects.

Darlington:

The Darlington ISR was completed in 2011 [3], with a code refresh review [4] in December 2013. The Darlington ISR was performed in support of refurbishment and continued operation of the Darlington units. Extensive reviews (primarily clause-by-clause reviews) of Codes and Standards were completed. Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to the Pickering PSR2 for situations where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington.

2.4 PSR2 Strategy

The scope of the Pickering NGS PSR2 is to conduct a review of Pickering NGS that meets the elements of CNSC REGDOC-2.3.3 [6] and IAEA SSG-25 [10].

PSR2 is a subsequent PSR, building on the review basis of PSR1. CNSC REGDOC-2.3.3 and IAEA SSG-25 identify that subsequent PSRs should focus on changes in requirements, facility conditions, operating experience and new information, rather than repeating activities conducted in previous reviews. As such, PSR2 will be forward looking, focusing on changes to requirements since the last applicable assessment, confirmation that the condition of Pickering NGS supports the additional years of operation, and new operating experience since the last assessments. PSR2 will seek to identify incremental enhancements to safety above those that have already been implemented or that are already committed.

Appendix A depicts the interface between the elements of PSR1 and PSR2, and the process by which PSR1 findings are to be applied to PSR2. PSR2 will include consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document will be identified and the relevant text from that source document will be summarized in the context of PSR2.)

With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2. An effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted, using recent audit and self-assessment results.

Documentation Freeze Date

To establish a basis for conducting the review, and in order to reflect the interrelationships of OPG internal documents and external documents (e.g. Laws, Regulations, Codes, and Standards), a date of January 15, 2016 was chosen as the freeze date for PSR2. Where an external document was issued in January 2016 but the effective date is unknown, it will be considered to have been issued prior to the freeze date.

PSR2 Period of Validity

PSR2 is valid for the period up to the expiry of the next Power Reactor Operating Licence for Pickering NGS, which is anticipated to be the end of 2028.

The current planning basis for Pickering NGS is an assumption of operation of Pickering NGS units until the end of 2024. To align with the anticipated expiry date of the next Power Reactor Operating Licence, the planning basis for PSR2 extends the period of operation of Pickering NGS units until the end of 2028. Within this extended planning basis, individual units would only continue operating based on the ability to demonstrate assurance of continued safe operation for each unit through continued safe operation of critical systems and components.

PSR2 is focussed on operating units. When units are permanently shut down prior to 2028, some Structures, Systems and Components will continue to be operated while those units are placed in the safe storage and surveillance state (which will include defueling of the units), and Condition Assessments are in progress to address these requirements. During and approaching this transition period, some OPG program elements will change to align with new station conditions and new requirements. These program changes (and resulting activities) will be developed and approved following OPG's change management processes, and will include regulatory involvement prior to implementation (including CNSC notification or approval) as required. Description and management of the activities and program changes associated with the transition period (approaching and during) and safe storage period will be addressed outside of the PSR process.

2.5 Structures, Systems and Components within the Scope of the PSR2 Review

The scope of PSR2 is restricted to the facilities regulated under the Pickering NGS Power Reactor Operating Licence. The Structures, Systems and Components (SSC) within the scope of the PSR2 review will encompass the Pickering Safety Related Systems [17], with a focus on the Pickering Systems Important to Safety (SIS) [18] [19] and the Safe Operating Envelope (SOE) systems [20]. The SSCs within the scope of the PSR2 review are detailed in Appendix B.

Facilities regulated under other operating licences (Pickering Waste Management Facility) are not considered with the Pickering PSR2 scope.

2.6 PSR2 Assessment Basis

The PSR2 Assessment Basis consists of:

(1) Safety Factor Review Tasks derived from CNSC REGDOC-2.3.3 and IAEA SSG-25, taking into consideration the Review Tasks used in the Pickering B and Darlington Integrated Safety Reviews.

(2) A set of modern Laws, Regulations, Codes and Standards, determined to be applicable for PSR2 review.

These components of the PSR2 Assessment Basis are described further below.

2.6.1 Safety Factor Review Tasks

2.6.1.1 Safety Factors

Safety Factors cover all aspects important to the safety of an operating nuclear power plant. There are 15 Safety Factors used in the PSR2 review; 14 are identified in IAEA SSG-25, grouped into five subject areas, and one additional Safety Factor (Radiation Protection) is identified in CNSC REGDOC-2.3.3. These 15 Safety Factors are shown in Table 1.

Subject Area	Safety Factor	
The Plant	1	Plant Design
	2	Actual Condition of Structures, Systems and Components Important to Safety
	3	Equipment Qualification (environmental and seismic)
	4	Aging
Safety Analysis	5	Deterministic Safety Analysis
	6	Probabilistic Safety Assessment
	7	Hazard Analysis
Performance and Feedback from Operating Experience	8	Safety Performance
	9	Use of Experience from other Plants and Research Findings
Management	10	Organization, the Management System and Safety Culture
	11	Procedures
	12	Human Factors
	13	Emergency Planning
Environment	14	Radiological Impact on the Environment
Radiation Protection	15	Radiation Protection

Table 1 – Pickering NGS PSR2 Safety Factors

2.6.1.2 Safety Factor Review Tasks

The PSR2 Safety Factor Objectives and Review Tasks are shown in Appendix C. Review Tasks for Safety Factors 1 to 14 are an interpretation of requirements and guidance set out in IAEA SSG-25 [10]. The Review Tasks have been chosen to fulfil the requirements of IAEA SSG-25 while maximizing consistency with Review Tasks used in previous ISRs. CNSC REGDOC-2.3.3 encompasses all of the PSR Safety Factors recommended by the IAEA in SSG-25 and expands upon it by adding Safety Factor 15, Radiation Protection. As a result, PSR2 Review Tasks for Safety Factor 15 are derived from REGDOC-2.3.3 Appendix A.

In IAEA SSG-25, Safety Factors are described under headings of “Objectives”, “Scope and Tasks”, and “Methodology”. All of these headings contain information that is pertinent to the definition of Review Tasks, although the “Scope and Tasks” section is most directly related to Review Tasks. Review Tasks were generated to interpret the requirements in SSG-25 and also to retain alignment to the extent practicable with earlier Review Tasks from the Darlington and Pickering B ISRs [2] [3] [4]. (These previous ISRs were completed in accordance with CNSC RD-360, Life Extension of Nuclear Power Plants [21] and IAEA NS-G-2.10, Periodic Safety Reviews of Nuclear Power Plants [22], which have since been superseded.) By keeping the structure and grouping of similar SSG-25 Review Tasks as close as possible to previously used Review Tasks, the review effort can more effectively focus on safety significant differences including changes in requirements, plant conditions, operating experience and new information. This focus is consistent with the intent of a subsequent PSR as described in REGDOC-2.3.3.

Review Tasks were confirmed to address the requirements from the "Scope and Tasks" sections of SSG-25 and, if not, the Review Tasks were expanded or new Review Tasks were added. In cases where "Methodology" clauses from SSG-25 provide unique information, they were converted into Review Tasks or Review Tasks were expanded to incorporate the methodology statements. A final check was performed for each Safety Factor to confirm that Review Tasks align with the SSG-25 stated "Objectives" and, if not, the Review Tasks were expanded as required. Review Tasks for Safety Factor 15, Radiation Protection, were derived from Appendix A of REGDOC-2.3.3.

In SSG-25, some of the Safety Factor descriptions include discussion of reviews of codes and standards, and effectiveness reviews of programs that are used to demonstrate compliance with Review Tasks or codes and standards. In such cases, these discussions were not translated into PSR2 Review Tasks, since these reviews are completed separately for each Safety Factor, and thus having a stand-alone Review Task for this work would be redundant. See Section 3.2.1 for additional detail.

2.6.2 Modern Laws, Regulations, Codes and Standards Applicable to PSR2

The process to identify the modern Laws, Regulations, Codes and Standards that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate Laws, Regulations, Codes and Standards) and then filtering it to identify those that are most significant, and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Appendix D.

The result of the identification and selection process was a set of modern Laws, Regulations, Codes and Standards that became part of the PSR2 Assessment Basis. These documents are listed in Table D1 in Appendix D. This table also identifies the modern version / date of the Law, Regulation, Code or Standard, and the type of review that will be completed in PSR2. The type of review is explained in greater detail in Section 3.2.2.

For the purpose of the performance of PSR2, OPG has defined the freeze date for modern Laws, Regulations, Codes and Standards to be January 15, 2016 (refer to Section 2.4).

3.0 PSR2 METHODOLOGY

3.1 PSR2 Process Overview

Figure 1 shows the general process overview of PSR2. The PSR2 Basis Document (this report) defines the PSR2 Assessment Basis, scope and methodology. Safety Factor reviews are conducted in accordance with the PSR2 Assessment Basis, and identify Gaps and Compliances. The Compliances (and groups of Compliances) are taken into the Global Assessment for consideration as Strengths. The Gaps are consolidated into Global Issues in the Global Assessment process. The Global Issues are prioritized, assessed and ranked, and proposed resolutions (enhancements) undergo reviews and approvals. The Global Assessment outputs are documented in a Global Assessment Report. The Integrated Implementation Plan documents the proposed enhancements from the Global Assessment Report, and provides implementation timelines for the enhancements. Further details on all of these steps are provided in the sections that follow.

3.2 Safety Factor Reviews

3.2.1 Safety Factor Review Process

Safety Factor reviews will be conducted for the 15 Safety Factors included in PSR2. Each review will address the associated Review Tasks for the Safety Factor (Appendix C), and will conduct reviews against applicable modern Laws, Regulations, Codes and Standards from the PSR2 Assessment Basis (Appendix D). An effectiveness review of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted, using recent audit and self-assessment results. A Safety Factor report will be completed for each of the Safety Factors.

Safety Factor compliance assessments will incorporate information from:

- OPG programs and procedures listed in the LCH, and any other programs and procedures which support the compliance arguments;
- Plant Condition Assessments (for Safety Factor 2);
- Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by CNSC since the current operating licence was issued (safety significant issues, per the Pickering LCH) to determine if there are any impacts associated with Pickering operation past 2020. Fukushima actions will be included as appropriate as commitments or actions;
- Previously identified ISR gaps related to each Safety Factor and the status of OPG's improvement plans or other dispositions to address these;
- Assessments and reviews performed since the PSR1 documents were completed.

As a subsequent PSR, the PSR2 Safety Factor reviews will focus on changes in requirements (Laws, Regulations, Codes and Standards), updated plant conditions, operating experience and information from research, rather than repeating the activities of previous reviews. The methodology for performing the Safety Factor reviews is designed to take full advantage of the safety assessments and Law, Regulation, Code and Standard compliance work previously completed by OPG, and to focus effort on areas where incremental impacts may exist. This approach is in accordance with the guidance provided by the CNSC in REGDOC-2.3.3 that the effort required to undertake a subsequent PSR for a station will require considerably less effort, subject to confirmation that previous conclusions remain valid.

The approach for performing the PSR2 Safety Factor reviews will be in accordance with the following:

- Fully utilize existing Darlington ISR results to the extent that the programmatic aspects can be confirmed to be applicable to Pickering[1,2] ;
- Focus attention on findings from the 2009 Pickering B ISR and Pickering A Return to Service assessments that may no longer be applicable for operation beyond 2020, so that their impact can be assessed [3];
- Focus attention on requirements that are new or that have changed in relation to the requirements that were used as the basis for PSR1 ISRs, so that their impact on Pickering NGS can be assessed (e.g., new or revised Laws, Regulations, Codes and Standards, as well as incremental guidance contained in IAEA SSG-25).
- Apply information provided in Pickering PROL renewal applications. Documents specifically listed in the PROL have generally been in place for many years, and therefore have been subject to prior assessments as well as ongoing compliance verification activities by both OPG in the form of audits and self-assessments, and by the CNSC in the form of inspections and audits. This includes information on Pickering Units 1,4 performance that is useful in PSR Safety Factor reviews.
- Consider information related to OPG programs and processes for Pickering 5-8 in NK30-PLAN-00531-00001 “Pickering 5-8 Continued Operations Plan” [23], as well as OPG programs and processes common to both Pickering 1,4 and 5-8 in P-PLAN-09314-00001 “Pickering Sustainable Operations Plan” [24].

---

1 Areas where the Darlington ISR assessment cannot be judged to be applicable or sufficient to address Pickering will be identified. Account will be taken of any relevant feedback that the CNSC may have provided in relation to the Darlington ISR assessment for the Safety Factor.

2 In general, compliance assessments for PSR2 Review Tasks will be prepared independently of PSR1 findings. That is, compliance for each Review Task will be demonstrated via discussion of current OPG Governance, Programs, Policies, Procedures, Audits and Self-Assessments as required, and will only mention the findings of PSR1 if there are pertinent PSR1 gaps which need to be addressed within the context of PSR2.

3 Past integrated safety assessments of Pickering Units 1 and 4 will be reviewed. Any differences between Pickering Units 1,4 and 5-8, as well as any relevant feedback that the CNSC may have provided in relation to the Pickering B ISR assessment for each Safety Factor, will be taken into account. Previous Pickering B ISR Safety Factor Report content will be identified as being valid in relation to Pickering Units 1,4 where applicable.

3.2.2 Reviews of Modern Laws, Regulations, Codes and Standards

CNSC REGDOC-2.3.3 requires that the PSR Basis document identify:

- Which modern Laws, Regulations, Codes and Standards will be used in the Safety Factor reviews, including their effective dates, and the criteria for their selection – provided in Appendix D;
- The PSR documentation freeze date beyond which documentation changes and new information will not be considered – January 15, 2016; and
- The type of review to be performed (Clause-by-Clause, High Level, or alternative) – discussed in this section, below. PSR2 will include an alternative review type of "Incremental".

It is important that the methodology for PSR2 be focused on addressing aspects of the review that are likely to have material impact in terms of identifying enhancements that will be reasonable and practicable to implement during the remaining commercial life of Pickering NGS.

PSR2 will conduct reviews against a baseline of the PSR1 work. It is important to note, though, that OPG conducts regular reviews of new and revised Codes and Standards, so a large amount of information is already available to assist in the Safety Factor compliance reviews. In OPG letter W.M.Elliott to P.A Webster and M. Santini, "Design Codes and Standards Effective Dates for OPG Nuclear Fleet", April 30, 2012, N-CORR-00531-05661 [25], OPG stated:

> "...OPG commits to completing a code-over-code review (i.e., review of changes) of subsequent editions, addendum and/or updates of the Codes and Standards listed in [*Attachment 1 of the referenced document*]. Key emerging issues due to major changes in the codes will be addressed immediately, or as agreed with the CNSC on a case-by-case basis. Otherwise, OPG will confirm in a letter to the CNSC that these reviews have been completed and there are no significant technical issues..."

As a result, many of the updated codes and standards issued since PSR1 have already had gap assessments performed, to varying degrees of detail, which will be utilized and cited in the present Pickering PSR2.

As a subsequent PSR, PSR2 will focus on changes in requirements, plant conditions, operating experience and new information, rather than repeating the activities of previous reviews. Since PSR2 is an update of previous ISRs, it will incorporate reviews of Laws, Regulations, Codes and Standards that have occurred as new versions have been issued. Therefore, clause-by-clause reviews of the majority of applicable Laws, Regulations, Codes and Standards have already been completed and there is little value in repeating that process. If clause-by-clause reviews were to be undertaken in PSR2, a major portion of the review effort would be consumed by repackaging existing information that remains largely applicable and, therefore, is not contributing to the identification of new insights and enhancements. A more constructive approach is therefore planned that maximizes the value and usefulness of the work by focusing attention where it is most beneficial, i.e., on identifying new issues. The primary objective for this work, which is to identify safety significant enhancements that may be implemented during the limited remaining life of the station, will be achieved using this process and is expected to result in the same (safety significant) Global Issues being identified as would result from a clause-by-clause assessment.

Since this assessment is a subsequent PSR, the focus will be on identifying safety significant differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) versions than what was previously assessed;[4]
- Safety significant differences between Pickering and Darlington, if Darlington is the basis for the earlier assessment; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

In most cases Law, Regulation, Code or Standard reviews will be incremental in nature and performed by topic or subject matter for revised requirements. The rationale for this is that new or updated requirements that need to be included in PSR2 will be predominantly replacements for other Laws, Regulations, Codes or Standards that were previously assessed, and specify requirements that can be readily mapped to existing OPG programs to demonstrate compliance.

As noted earlier in this section, CNSC REGDOC-2.3.3 identifies three types of review that are appropriate for a PSR – Clause-by-Clause, High Level, and Alternative. For the reasons given above that align with the goals of a subsequent PSR, OPG plans to include an alternate review type called “Incremental”, as defined below. Thus, the following three review types will be applied for PSR2:

- Clause-by-Clause review: New Laws, Regulations, Codes and Standards referenced in Pickering PROL 48.02/2018 (listed in Appendix C of the Licence Conditions Handbook) will be subjected to a clause-by-clause type review. In a clause-by-clause review, conformance with individual clauses is demonstrated by supporting evidence stating whether the requirements stipulated in the requirement document are met;
- High Level review: New Laws, Regulations, Codes and Standards not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the Law, Regulation, Code or Standard is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and

[4] “New” refers to a Law, Regulation, Code or Standard that was not previously considered in the context of earlier assessments. “Revised” refers to an updated version of a Law, Regulation, Code or Standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a “revised”, not “new”, document (e.g., if a REGDOC replaces a CNSC G or RD document).

- Incremental review: For Laws, Regulations, Codes and Standards that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

Reports will be produced to document the reviews of Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis. These reports will provide more details of the three review types and how the reviews will be conducted.

Modern Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis will generally receive incremental reviews since PSR2 is an update of PSR1, so assessments and clause-by-clause or high level reviews for the majority of the Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis have already been completed. In addition, implementation plans exist for many of the codes and standards not addressed in PSR1 and therefore an incremental review will be applied to these documents. Table D1 identifies the review type to be applied to each of the Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis. Following further assessment of past work, the review type of a listed modern Law, Regulation, Code or Standard may be changed from Clause-by-Clause or High Level to Incremental.

3.2.3 Safety Factor Results and Reports

The Safety Factor reviews will identify Compliances and Gaps with respect to the review elements in the PSR2 Assessment Basis. These are further defined as:

- <u>Compliance</u>:
  - For Clause-by-Clause reviews of modern Laws, Regulations, Codes and Standards, Compliance indicates that the safety requirement is met.
  - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.
  - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
  - For reviews of Safety Factor Review Tasks, Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- <u>Gap</u>:
  - For Clause-by-Clause reviews of modern Laws, Regulations, Codes and Standards, a Gap indicates that the safety requirement is not met.
  - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.
  - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
  - For reviews of Safety Factor Review Tasks, a Gap indicates that the intent of the Review Task is not met.

Compliances that are equivalent to or surpass PSR2 Assessment Basis requirements or practices will be forwarded into the Global Assessment process for consideration as Strengths. Gaps will be evaluated by the Global Assessment methodology to identify Global Issues and, with justification, Acceptable Deviations.

The results of the Safety Factor reviews will be documented in Safety Factor reports, which will be submitted to CNSC staff for review. These reports will include:

- The scope of the review,
- Applicable elements of the PSR2 Assessment Basis (Review Tasks and applicable Laws, Regulations, Codes and Standards),
- Review methodology,
- Assessment of compliance with Review Tasks,
- Effectiveness review of OPG programs supporting compliance assessments,
- Review findings (Compliances and Gaps),
- Impacts on other Safety Factor reviews,
- Overall assessment of the Safety Factor.

Separate reports will be produced to document (a) the reviews of Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis, and (b) the derivation of the Safety Factor Review Tasks from IAEA SSG-25 and CNSC REGDOC-2.3.3. The Safety Factor reports will draw on the information in these reports.

3.3 Global Assessment

The objective of the Global Assessment is to provide an overall assessment of the safety of the plant, and to arrive at a judgement of the plant's suitability for continued operation on the basis of a balanced view of the results from the reviews of the separate Safety Factors [6] [10]. This judgement takes into account the safety enhancements identified in the Global Assessment (plant and process modifications), strengths and residual Global Issues / Acceptable Deviations (as defined in Section 3.3.3), impact of aggregate effects of the results, and consideration of existing planned safety enhancements and recent overall station safety performance.

3.3.1 Global Assessment Team

The Global Assessment will be conducted by an interdisciplinary team, with appropriate expertise in operations, design and safety at the plant, including appropriate participants from the Safety Factor reviews, and members who are independent from the Safety Factor review teams, consistent with the requirements in [10].

3.3.2 Global Assessment Process

The Global Assessment Process consists of the following elements:

1. Identification and consolidation of Strengths and Gaps from the Safety Factor Reports.
2. Identification of Global Issues.
3. Assessment of interfaces between the various Safety Factors, Aggregate Impact of Global Issues.
4. Prioritization of Global Issues.
5. Development of Resolutions / Dispositions of Global Issues (and Gaps).
6. Consideration of defence-in-depth and aggregate impact of residual Global Issues / Acceptable Deviations.
7. Ranking of Global Issues with identified actions.
8. Senior Management Scope Review Board approval of proposed modifications for the purposes of PSR2.
9. Assessment of overall acceptability of operation of the plant over the period considered in PSR2.
10. Preparation of the Global Assessment Report to summarize the assessments, and document the Global Assessment.

These elements are described further in Section 3.3.3.

3.3.3 Global Assessment Logistics

Details of the elements involved in executing the Global Assessment are provided below.

Identification and Consolidation of Strengths and Gaps from the Safety Factor Reports:

The Strengths and Gaps from the 15 individual Safety Factor Reports will be consolidated and grouped by topic area to support the Global Assessment. Recommendations from the Component Condition Assessments conducted in support of Safety Factor 2 will also be considered as part of this review.

Identification of Global Issues:

The consolidation of Gaps into Global Issues will provide a means to assemble Gaps of a common nature, facilitating the assessment of safety impact and identifying and assessing practical and effective resolutions. The Global Issues will be tabularized, tracking sources of the issues, to facilitate further review and assessment.

Assessment of the Interfaces Between the Various Safety Factors, Aggregate Impact of Global Issues:

With the assembly of Global Issues and Strengths, and considering the recommendations from the Component Condition Assessments, the aggregate impact of the Global Issues will be assessed. In this way, the interaction between issues will be identified. New Global Issues may be identified as part of this consolidation review. This will support the prioritization and ranking of Global Issues as described below.

Prioritization of Global Issues

PSR2 Global Issues will be prioritized with respect to their importance to Nuclear Safety, using the tables provided in Appendices E and F to determine the Safety Significance level associated with each Global Issue. This will support the resolution evaluation method and the outcome of the resolution process. This methodology is consistent with OPG prioritization processes [26] used in previous Integrated Safety Reviews and industry practice.

The Safety Significance level will consider deterministic (Appendix E) and probabilistic (Appendix F) safety analysis impact, as appropriate. The assignment of Safety Significance values for prioritization in Appendices E and F was derived based on OPG experience and takes into account the priority values from the OPG guidelines for evaluating and prioritizing Safety Report Issues, the COG Benefit-Cost Analysis processes, and the OPG Station Condition Record categorization process. Probability levels selected for delineation between categories are based on significance and engineering judgement, and are as used in previous Integrated Safety Reviews. These values account for overall safety impact and align, where appropriate, with requirements and limits in relevant safety standards.

Safety Significance will be derived primarily through the thresholds defined in Appendix E Table E1 and per the risk assessment criteria in Appendix F. Appendix E Table E2 thresholds will be used as an additional means to evaluate nuclear Safety Significance (where appropriate) and for the assessment of the significance of Global Issues without a direct nuclear safety impact. If a Global Issue is evaluated using multiple tables from Appendices E and F, the most safety significant result will be reported for the Global Issue for carrying forward.

The relationship between Safety Significance Level and Impact on Nuclear Safety is shown in the table below:

Safety Significance Level	Impact on Nuclear Safety
1	High
2	Medium
3	Low
4	Very Low

Development of Resolutions / Dispositions of Global Issues (and Gaps)

Resolution options will be developed and assessed using risk informed decision making techniques. The development of the resolution will utilize the following strategy:

- In assessing potential dispositions, defence-in-depth [27] elements will be considered.
- In developing the resolutions, consideration of overall safety significance will guide the resolution process.
- For Global Issue resolution – the process will be:
  - Evaluate the Global Issue to understand safety basis, and intent of requirement.
  - Consider possible options for resolution/mitigation. Consider safety significance and defence-in-depth elements.
  - Evaluate options with respect to effectiveness, cost, schedule, practicality. For potential plant modifications, this may require an evaluation of the safety impact, both deterministic and probabilistic. If it is not practicable to fully resolve a Global Issue, other mitigation options will be considered for enhancements.
  - Practicality of a proposed resolution will be evaluated in terms of cost, resources, schedule, and considered in relation to the overall safety impact.
  - Some proposed resolutions will be dependent on whether plant operation is assumed to continue into the 2025-2028 time period. These proposed resolutions will be distinguished as such.
  - Propose recommended resolution/mitigation.
  - Document the decision making process.
- Items of High or Medium Impact on Nuclear Safety (Safety Significance levels 1 and 2) will require more in-depth analysis to fully understand the issue and potential impact, and to develop the proposed recommended resolution/mitigation. This may require deterministic and/or probabilistic assessments to measure nuclear safety impact of modifications and more detailed evaluation of the cost/practicality of proposed resolutions. Insights from available site Probabilistic Safety Analyses may be used in evaluating the benefit/practicality of potential options. This will be done concurrent with the development of the Integrated Implementation Plan.
- Items of Very Low Impact on Nuclear Safety (Safety Significance level 4) will generally be deemed as Acceptable Deviations within the context of PSR2 (with the rationale provided), and while these items will not be tracked beyond the Global Assessment, they will be shared with the accountable organizations for consideration as potential enhancement initiatives for their future work program

planning purposes. This will allow the organizations to prioritize the initiatives as part of their integrated programs to ensure the focus is on the right overall priorities. A similar treatment will be applied for items of Low Impact on Nuclear Safety (Safety Significance level 3) for which a practicable solution is not readily evident.

- Proposed resolutions will be categorized as i) Programmatic (changes to procedures and programs), ii) Engineering (plant modifications), or iii) Analytical (e.g., safety analysis, hazard analysis), to facilitate binning of potential work. In some cases, the proposed resolutions will entail work from more than one of these categories.

- In some cases, the development of resolutions/dispositions to the Global Issues will be part of an OPG or industry initiative underway or planned. Or, the resolution and development of options may require more detailed analysis and assessment, extending beyond the timelines for submission of PSR2. In these instances, the status of the initiative and plans will be included in the disposition. The work will be included in the Global Assessment to facilitate continued tracking.

- The results of previous Global Assessments for OPG stations will be considered in the review.

- If in the assessment it is determined that a Global Issue / Gap has been closed, due to work done in the interim or for other reasons, the rationale will be documented and the Global Issue / Gap will be set to Resolved and Closed.

- At the recommendation of the senior management team, an alternate process / resolution may be utilized for a particular Global Issue / Gap.

Consideration of Defence-in-Depth and Aggregate Impact of Residual Global Issues / Acceptable Deviations:

An important element of the development of proposed recommendations will be to assess the overall defence-in-depth and aggregate impact of the residual Global Issues / Acceptable Deviations. After evaluating a range of resolutions for Global Issues, and determining a recommended resolution to be selected, the impact on defence-in-depth [27], considering both deterministic and probabilistic elements, will be evaluated to assess the aggregate impact on overall safety. It may be necessary to refine the proposed resolutions based on the results of this review. This overall assessment will be an important element in supporting the enhancement plans and the planned operational strategy over the period of PSR2.

Ranking of Global Issues with Identified Actions

All Global Issues whose resolution involves identified actions will be ranked from 1 through N, where N is the total number, in accordance with overall safety significance. This will be based on engineering judgement applied by the assigned Global Assessment team. The ranking process will consider factors such as the priority previously determined (Safety Significance Level), the contribution to defence-in-depth, the significance of the source (e.g., the type of document that generated the gap(s) leading to the Global Issue), and the degree of non-compliance with the PSR2 Assessment Basis. The ranking process will also account for the extent of impact on multiple safety factors or areas.

Senior Management Scope Review Board Approval of Proposed Modifications for the Purposes of PSR2:

The enhancements identified in the PSR2 Global Assessment Report, with their priority and safety basis, will be presented to the OPG Senior Management Scope Review Board for approval. This review will ensure alignment with the resolutions proposed, their basis and context, and will be the means to obtain concurrence that the proposed enhancements are practicable and effective. This will also allow the senior management team to consider potential realignment of overall priorities based on the insights from PSR2. Consistent with OPG Project Management processes, additional approval gates will be required as the resolution development continues towards full implementation.

Assessment of Overall Acceptability of Operation of the Plant Over the Period Considered in PSR2:

As a final step in the assessment process, the team will assess the overall acceptability of operation of the plant over the period considered in PSR2. This will entail a review of the results of the Safety Factor Reviews, a consideration of enhancements planned (both newly identified in PSR2 and from other station plans), and a consideration of plant performance and initiatives underway.

Preparation of the Global Assessment Report

Preparation of the Global Assessment Report will be conducted to summarize the assessments and document the Global Assessment, as detailed in Section 3.3.4 below.

3.3.4 Global Assessment Report

The results of the Global Assessment will be documented in a Global Assessment Report, presenting the results, assessing the overall defence-in-depth of the plant, and documenting the conclusions, corrective actions, and enhancements to be considered. The Global Assessment Report will include a ranked list of those Global Issues with identified actions, with rationale for the ranking. This will be done concurrent with the development of the Integrated Implementation Plan.

Residual Global Issues and Acceptable Deviations will be noted in the report, summarizing the assessed aggregate impact on safe operations. These items will be conveyed to the accountable organizations for their consideration as potential enhancement initiatives for their future work program planning purposes. These initiatives will be weighed against other important program and plant modifications as part of the base and project work within these organizations. These items will not be tracked further beyond the Global Assessment Report or carried forward into the Integrated Implementation Plan.

The Global Assessment Report will include a statement of OPG's assessment of the overall acceptability of operation of the plant [6]. Reviews and approval of the report will be conducted as required under the OPG Management System. The Global Assessment Report will be submitted to CNSC staff for review.

3.4 Integrated Implementation Plan

The proposed enhancements resulting from the Global Assessment will be documented in the Integrated Implementation Plan (IIP). The IIP will provide the proposed timeline for the implementation of the enhancements and it will also document and confirm the resulting enhancement.

The enhancements summarized in the IIP will be mapped to the CNSC Safety and Control Areas (per Appendix B of CNSC REGDOC-2.3.3 [6]) so as to facilitate the CNSC's review.

3.4.1 Integrated Implementation Plan Logistics

The IIP listing of enhancements will include those resulting from the Global Assessment Report, including both new modifications proposed as part of the resolution of Global Issues, and also considering the existing planned station process and physical modifications that were integral to the overall assessment of safety. The enhancements arising from resolutions dependent on an assumption of plant operation continuing into the 2025-2028 time period will be specifically identified as such.

A review will be conducted with program owners and appropriate managers to derive plans for implementation based on priority and resources. These plans will be developed with due consideration of the other important initiatives underway at Pickering NGS as part of the continued implementation of the "Passion for Excellence" vision.

The initiatives will be tabularized with owners assigned and planned implementation dates. Existing initiatives integral to the overall assessment of safety during the Global Assessment will also be included in this listing. The listing will include the priority and the basis for the priority. The implementation of the initiatives will be tracked and reported.

The IIP will be presented to OPG senior management to obtain support for the initiatives and plans. As the IIP will be based on initial conceptual consideration of the resolution plans (or range of plans), a change management process will be implemented to manage evolution of the resolution details and implementation schedules. Senior management approval for any proposed changes to resolution scope and/or completion timeframes will be required, and documented, consistent with OPG Project Management processes.

The Integrated Implementation Plan will be tracked and progress will be regularly reported throughout the implementation period.

3.4.2 Integrated Implementation Plan Report

The Integrated Implementation Plan Report will be structured to allow a reader to understand the implementation plan and the basis for the plan. The report will begin with a summary of work completed in the Safety Factor Reports and the Global Assessment Report.

The tabularized IIP will be included in the report to facilitate a full understanding of the related safety enhancement initiatives, their priority, and safety basis. These will include the new initiatives that came from the Safety Factor Reviews and the Global Assessment, and the existing initiatives that were integral to the overall assessment of safety.

To facilitate the CNSC review of the Integrated Implementation Plan, the plan will be presented in a manner aligned with the CNSC Safety and Control Areas [6].

The report will also summarize the implementation tracking and reporting process, and the change management process for the IIP. The processes will allow tracking of initiatives to completion or resolution in an auditable manner, consistent with OPG's Management System.

In closing, the report will again reiterate the overall assessment of safety. It will summarize the strengths and the enhancement plans with attention to defence-in-depth. It will affirm the safety of the plant, and it will state that the enhancements identified through the review, combined with the existing station programs and other enhancements planned, will reinforce the continued safe operation of the station through the period of PSR2.

The Integrated Implementation Plan Report will be submitted to CNSC staff for acceptance, per CNSC REGDOC-2.3.3 [6]. The IIP will be a component of OPG's PROL renewal application, should OPG make the decision to pursue extended operation of Pickering NGS beyond 2020.

4.0 PSR2 GOVERNANCE

<u>Quality Management</u>

PSR2 work will be conducted under OPG's quality management program (compliant with CSA N286-05). Where external contractors are engaged in performing portions of PSR2, they will either work under OPG's quality program, or under a quality program that has been accepted by OPG as meeting the quality requirements for the contracted work scope. It will be confirmed that these contractors have appropriate prior experience in order to conduct the OPG PSR2 work. This approach is consistent with OPG's management system.

Teams of reviewers composed of qualified and experienced experts in the subject matter of the reviews have been established. The results of the reviews will be evaluated by OPG to confirm that the reviewers had access to all of the information relevant to the performance of the review. OPG will accept the contracted deliverables for OPG use.

Project Management

OPG project management principles will be applied in performing PSR2.

The key target dates for completion, and submission to the CNSC, of PSR2 deliverables are:

Date	Item
January 2016	PSR2 Basis Document R0
June 2016	PSR2 Basis Document R1
June 2016	Safety Factor review reports 2 (R0), 3 & 4
September 2016	Remainder of the Safety Factor review reports (including R1 of the Safety Factor 2 report)
December 2016	Global Assessment Report
April 2017	Integrated Implementation Plan R0
August 2017	Integrated Implementation Plan R1

These dates are aligned with the agreed upon strategy and schedule in the OPG-CNSC Protocol for PSR2 conduct [32]. The completion / submission date for Revision 1 of the IIP is dependent on the timing of receipt and review of CNSC review comments on Revision 0 of the IIP.

Project Communications

Effective communications practices will be used throughout the performance of PSR2. Interfaces between the work of different external contractors and OPG staff will be managed to ensure consistency between related deliverables and accuracy of information.

Urgent issues will be communicated to the project manager promptly, including any emerging observations that suggest a non-compliance with the current PROL.

Communication with the CNSC will take place through Nuclear Regulatory Affairs and Stakeholder Relations, consistent with established OPG processes.

5.0 ACRONYMS

AECB	Atomic Energy Control Board
AECL	Atomic Energy of Canada Limited
CNSC	Canadian Nuclear Safety Commission

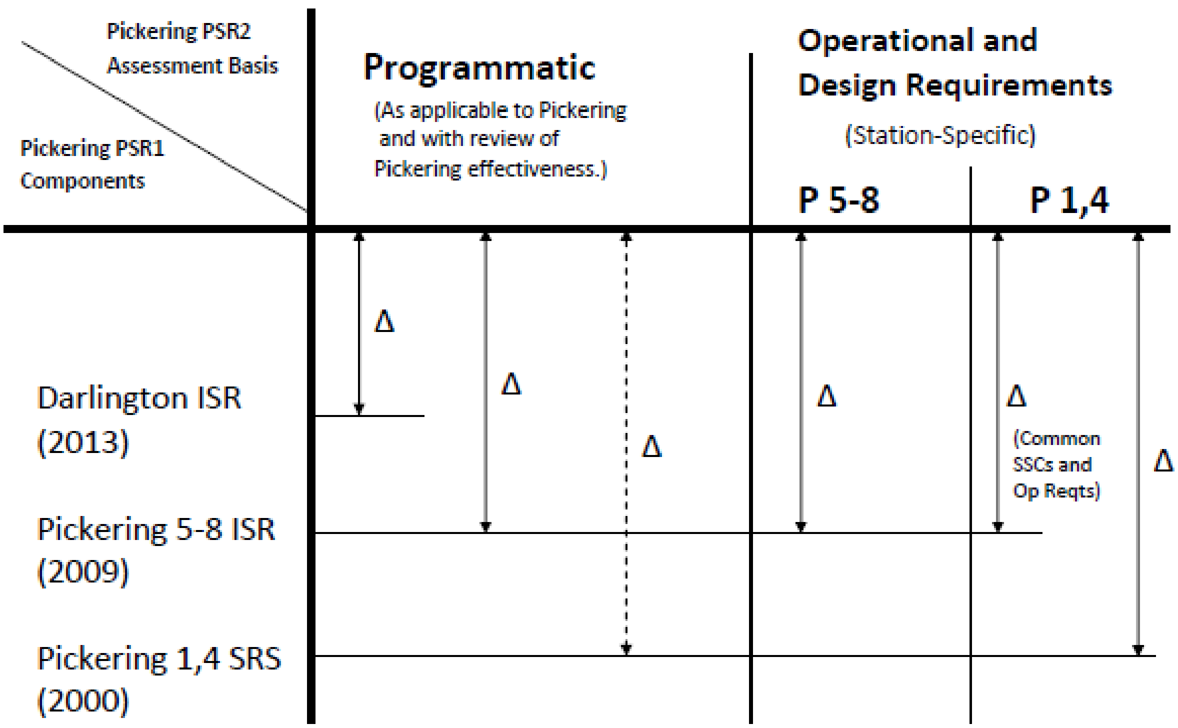
[32] Protocol, “OPG-CNSC Protocol for the Conduct of a Periodic Safety Review in Support of Pickering NGS Licence Renewal”, e-Doc 4927127, P-CORR-00531-04725, February 2016.

Appendix A: PSR1 / PSR2 Interface



The diagram is a schematic depiction of the primary interfaces between the elements of PSR1 and PSR2, and the process by which PSR1 findings are to be applied to PSR2. PSR2 is a subsequent PSR, and builds on the assessments of PSR1 to the extent that they are applicable. The focus is on changes between the PSR1 and PSR2 Assessment Bases and applicable results.

Programmatic aspects of the Pickering 5-8 and Darlington ISRs may be (or remain) applicable to Pickering NGS, and will be updated to reflect the latest OPG Governance where required (with a review of the effectiveness at Pickering for the related OPG Programs). Requirements related to station-specific aspects of the PSR2 Assessment Basis will draw on aspects of the Pickering 5-8 and Pickering 1,4 elements of PSR1. In addition, some station-specific gaps from the Darlington ISR will be applied to Pickering NGS if it is determined that they also apply to Pickering NGS.

Appendix B: Structures, Systems and Components within the Scope of PSR2

The scope of the Structures, Systems and Components (SSC) within the PSR2 review will encompass the Pickering Safety Related Systems [17] with a focus on Pickering Systems Important to Safety (SIS) [18], [19], and Safe Operating Envelope (SOE) Systems [20].

OPG defines Safety Related Systems as those systems, and the components and structures thereof, which, by virtue of failure to perform in accordance with the design intent, have the potential to impact on the radiological safety of the public or plant personnel from operation of the nuclear power plant [17]. Safety Related Systems are associated with the provision of safety related functions including regulation (and shutdown and start up) (control), and cooling of the reactor core (cool), and limiting the release of radioactive material and exposure of plant personnel and/or the public during normal operation and accident conditions (contain).

Systems Important to Safety are defined following OPG governance [28], considering the risk importance of systems and utilizing expert review panels to select these systems. The identification of SIS is consistent with the requirements of CNSC RD/GD-98 [29].

Safe Operating Envelope systems are identified per OPG governance [30], and include systems, and their associated critical components and structures, for which operational safety requirements are specified to conform with the Safety Report and hence, the Safety Analysis. OPG has prepared formal Operational Safety Requirements (OSR) documents in support of the SOE systems. The SOE systems and associated OSRs are listed in OPG governance [20] and are also listed in the Licence Conditions Handbook [9].

The Pickering NGS 1,4 SOE/SIS systems are listed in Table B1 below. The Pickering NGS 5-8 SOE/SIS systems are listed in Table B2 below.

Critical Structures (e.g., Reactor Buildings, Pressure Relief Duct, Vacuum Building) will be considered in the review.

Additional systems may be considered in the reviews conducted as part of PSR2 if required to demonstrate compliance with specific modern codes and standards.

B.1.0 TABLE B1 – PICKERING NGS 1,4 SOE / SIS SYSTEMS

#	Pickering NGS 1,4 Systems*	SOE**	SIS***
1.	Emergency Coolant Injection System	√	√ (Also includes associated recovery system (with Moderator Pumps and Moderator Room Active Drainage Sump Pumps))
2.	Shutdown System A	√	√
3.	Shutdown System E	√	√
4.	Negative Pressure Containment Systems	√	√
5.	Powerhouse Emergency Venting System	√	√
6.	Reactor Regulating System	√	
7.	Service Water Systems	√	√ (Limited to Emergency Low and High Pressure Service Water)
8.	Moderator System	√	
9.	Electrical Power System	√	√ (Limited to Standby Class III power and Class III 600V Interstation Transfer Bus, Emergency Transfer Scheme and Class III 600V Motor Control Centres 54130-MCC-18 and MCC-19)
10.	Emergency Boiler Water Supply	√	
11.	Heat Transport System++	√	√ (Limited to Heat Transport Pressure and Inventory Control System and Heat Transport D_2O Recovery System)
12.	Shutdown Cooling System	√	√
13.	Boiler Emergency Cooling System	√	√
14.	Feedwater System	√	√
15.	Main Steam Supply System	√	
16.	Fuel and Reactor Physics	√	
17.	Annulus Gas System	√	
18.	Fuel Handling System & Irradiated Fuel Bays	√	
19.	Critical Safety Parameter Monitoring Instrumentation	√	
20.	Shield Cooling System	√	
21.	Interstation Transfer Bus	√	
22.	Powerhouse Environmental Protection System	√	
23.	Critical Structures (e.g., Reactor Buildings, Pressure Relief Duct and Vacuum Building)		Included in Review – See +Note below

* Includes required critical components and structures.
**Specific USIs are provided in associated system OSRs listed in [20] and [17]. Also includes elements of specified support systems (e.g., Instrument Air) where required for credited design basis functions. (This is generally reflected in criticality coding.)
***Specific USIs and required functional elements are detailed in [18] and [17].
+Note: Critical Structures supporting SOE/SIS operation will also be included in the review.
++Fuel Channels and Feeders will also be included in this review.

B.2.0 TABLE B2 – PICKERING NGS 5-8 SOE / SIS SYSTEMS

#	Pickering 5-8 Systems*	SOE**	SIS***
1.	Emergency Coolant Injection System	√	√
2.	Shutdown System One	√	√
3.	Shutdown System Two	√	√
4.	Negative Pressure Containment Systems	√	√
5.	Powerhouse Emergency Venting System	√	√
6.	Reactor Regulating System	√	
7.	Service Water Systems	√	√ (Limited to Class III Service Water (Low and High Pressure))
8.	Moderator Systems	√	
9.	Group 1 Electrical Power System	√	√ (Limited to Standby Class III Power / Class II Power and also includes Class II UPS Room Ventilation)
10.	Emergency Water Supply System	√	√ (Limited to Emergency Water Supply to Boilers, Heat Transport, and Moderator)
11.	Heat Transport System++	√	
12.	Shutdown Cooling System	√	√
13.	Boiler Emergency Cooling System	√	
14.	Feedwater System	√	√ (Limited to Auxiliary Boiler Feedwater and Auxiliary Condensate Systems)
15.	Main Steam Supply System	√	
16.	Fuel and Reactor Physics	√	
17.	Emergency Power Supply	√	√
18.	Fuel Handling & Irradiated Fuel Bays	√	
19.	HPECI Power Supplies	√	
20.	Annulus Gas System	√	
21.	Critical Safety Parameter Monitoring Instrumentation	√	
22.	Shield Cooling System	√	
23.	Critical Structures (e.g. Reactor Buildings, Pressure Relief Duct and Vacuum Building)		Included in Review – See +Note below

* Includes required critical components and structures
**Specific USIs are provided in associated system OSRs listed in [20] and [17]. Also includes elements of specified support systems (e.g., Instrument Air) where required for credited design basis functions. (This is generally reflected in criticality coding.)
***Specific USIs and required functional elements are detailed in [19] and [17].
+Note: Critical Structures supporting SOE/SIS operation will also be included in the review.
++Fuel Channels and Feeders will also be included in this review.

Appendix C: Safety Factor Review Tasks

Objectives and Review Tasks for the 15 Safety Factor reviews are shown in the tables that follow.

Review Tasks for Safety Factors 1 to 14 are an interpretation of requirements and guidance set out in IAEA SSG-25 [10]. The Review Tasks have been chosen to fulfil the requirements of IAEA SSG-25 while maximizing consistency with Review Tasks used in previous ISRs. CNSC REGDOC-2.3.3 encompasses all of the PSR Safety Factors recommended by the IAEA in SSG-25 and expands upon it by adding Safety Factor 15, Radiation Protection. As a result, PSR2 Review Tasks for Safety Factor 15 are derived from REGDOC-2.3.3 Appendix A.

Additional detail regarding the derivation and application of Review Tasks is provided in Sections 2.6.1.2 and 3.2.1.

Safety Factor 1 – Plant Design	
Objective	The objective of the review of plant design is to determine the adequacy of the design of the nuclear power plant and its documentation by assessment against the current licensing basis and national and international standards, requirements and practices.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm that a detailed description of the plant design, documenting the Design Basis, supported by layout, systems and equipment drawings exists. (2) Assess the adequacy of design documentation. (3) Identify the SSCs important to safety (Appendix B of this document). (4) Review the application of defence in depth. This includes an examination of: - The degree of independence of the levels of defence in depth; - The adequacy of delivery of preventive and mitigatory safety functions; - Redundancy, separation and diversity of SSCs important to safety; - Defence in depth in the design of structures (for example: • The degree of independence of the levels of defence in depth; • The adequacy of delivery of preventive and mitigatory safety functions; • Redundancy, separation and diversity of SSCs important to safety; • Review of the integrity of fuel, cooling circuit and containment building). (5) Confirm that the human–machine interface is considered in the design of the control room and other workstations, that analysis of human information requirements and task workload is performed, and that there is linkage to the Probabilistic Safety Assessment, Deterministic Safety Analyses and Hazard Analysis. This review should include a discussion of how guidance such as U.S. NRC NUREG-0700 Revision 2, "Human-System Interface Design Review Guidelines" and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model" identified in CNSC REGDOC-2.5.2 are relevant to the design of Pickering U1,4 and U5-8. *Note: The above activity will be dealt with in the Plant Design Safety Factor (rather than Human Factors), as it is the only human factors activity that deals with plant design.* (6) Assess the adequacy of the arrangements for providing radiological protection. (7) Where the plant has undergone a significant number of modifications over its lifetime or in the period since PSR1, examine the cumulative effects of all modifications on the design. (8) Confirm that the plant SSCs are compliant with the design specifications and consistent with the design documentation.

Safety Factor 2 – Actual Condition of SSCs Important to Safety	
Objective	The objective of the review of this Safety Factor is to determine the actual condition of SSCs important to safety and so to consider whether they are capable and adequate to meet design requirements, throughout the period of PSR2. In addition, the review should verify that the condition of SSCs important to safety is properly documented, as well as reviewing the ongoing maintenance, surveillance and in-service inspection programmes, as applicable.
Review Tasks	The following Review Tasks are intended to support the Objectives above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* *Note: The SSCs within the scope of PSR2 (SSCs important to safety) are defined in Appendix B of this document.* (1) Assess and document present conditions of the SSCs important to safety and confirm appropriate measures to address any significant existing or anticipated aging degradation. Any major difference between operating units with respect to aging degradation mechanisms, present condition, or recommended actions shall also be presented. (2) Confirm resources and facilities (on and off site) are available for ongoing plant maintenance. (3) After determining the actual condition of the SSCs important to safety, each of these SSCs will be assessed against the current design basis to confirm that design basis assumptions have not been significantly challenged and will remain that way throughout the period of PSR2. (4) Review the condition and operation of spent fuel storage facilities and their effect on the spent fuel storage strategy for Pickering NGS. (5) Assess dependence on obsolescent equipment for which no direct substitute is available. (6) Assess dependence on essential services and/or supplies external to the plant.

Safety Factor 3 – Equipment Qualification (Environmental and Seismic)	
Objective	The objective of the review of equipment qualification is to determine whether plant equipment important to safety has been properly qualified (including for environmental conditions) and whether this qualification is being maintained through an adequate program of maintenance, inspection and testing that provides confidence in the delivery of safety functions throughout the period of PSR2.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm there exists a suite of Engineering programs or processes to ensure equipment qualification requirements are met and documented. (2) Confirm equipment qualification has been adequately established for all service conditions expected during normal operation, anticipated operational occurrences and accident conditions. These service conditions are subdivided into environmental conditions and operational conditions. Environmental conditions include ambient temperature, pressure, humidity/steam, radiation, water/chemical sprays, fluid submergence, fire and seismic vibration. Operational conditions include process related conditions such as vibration, load cycling, electrical loading parameters, electromagnetic interference, mechanical loads and process fluid conditions. (3) Perform an objective confirmation that the installed equipment is qualified to perform its Design Basis function for its operational life and that effective programs exist to monitor for timely maintenance or replacement, as required. (4) Confirm existence of a process for ensuring compliance with these programs and of documented previous qualification measures taken to ensure qualification throughout the equipment’s installed life (i.e. prescribed testing, calibration, maintenance, and parts replacement). (5) Confirm existence of a surveillance program and a feedback procedure to ensure aging degradation of qualified equipment remains insignificant. (6) Confirm existence of monitoring of actual environmental conditions and identification of ‘hot spots’ of high activity or temperature. (7) Confirm existence of an assessment that determines the effects of equipment failures on equipment qualification and appropriate corrective actions and/or safety improvements to maintain equipment qualification. (8) Confirm there is protection and adequate separation of qualified equipment from adverse environmental conditions. (9) Confirm physical condition and functionality capability of qualified equipment has been checked by walkdowns. (10) Confirm that changes to equipment classification have occurred, as required, as a result of major design modifications made since PSR1.

Safety Factor 4 – Aging	
Objective	The objective of the review of aging is to determine whether aging aspects affecting SSCs important to safety are being effectively managed and whether an effective aging management program is in place so that all required safety functions will be delivered throughout the period of PSR2.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm there is a documented method and criteria for identifying safety related SSCs covered by the Aging Management Program. (2) Ensure there is an effective Aging Management Program and dedicated organization with clearly defined roles and responsibilities with sufficient resources to continually assess aging effects in safety related SSCs. (3) Establish a list of SSCs covered by the aging management program and records that provide information in support of the management of aging. (4) Evaluate and document impact of potential aging degradation of safety related SSCs. (5) Confirm or develop understanding of dominant aging mechanisms of safety related SSCs. (6) Confirm existence of predictive maintenance program. (7) Ensure existence of programs for timely detection and mitigation of aging mechanisms and/or aging effects of any SSCs important to safety, including obsolescence of technology used in the plant or obsolescence of services or supplies external to the plant. (8) Establish acceptance criteria and required safety margin for safety related SSCs for the period of PSR2 through reliability and risk assessments. (9) Confirm adequacy of management of the effects of aging on those parts of the plant that will be required for safety when the reactor has ceased operation, for example the spent fuel storage facilities. (10) Confirm the models used to predict the evolution and advancement of aging degradation are properly supported in accordance with current accepted practices pertaining to aging degradation.

Safety Factor 5 – Deterministic Safety Analysis	
Objective	The objective of the review is to determine to what extent the existing deterministic safety analysis is complete and remains valid when the following aspects have been taken into account: • The actual plant design, including all modifications of SSCs since the last update of the safety analysis report or PSR1; • Current operating modes and fuel management; • The actual condition of SSCs important to safety and their predicted state at the end of the period covered by PSR2; • The use of modern, validated computer codes; • Current deterministic methods; • Current safety standards and knowledge (including research and development outcomes); • The existence and adequacy of safety margins.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm the existence of current deterministic safety analyses and the assumptions used to perform these analyses. (2) Evaluate the documentation and processes for defining, implementing, and maintaining the Safe Operating Envelope. (3) Perform assessment of OPG's Deterministic Safety Analysis to determine if the postulated events, event sequences and event combinations covered by the existing analysis are sufficient when compared against those for a modern nuclear power plant in accordance with the methodology in CNSC REGDOC-2.4.1, "Deterministic Safety Analysis". (4) Review adequacy of the documented guidelines for Deterministic Safety Analysis. (5) Evaluate the supporting analyses for design extension conditions to confirm that the arrangements aimed at preventing or mitigating severe core damage meet regulatory requirements. (6) Confirm that the impact of equipment failures and human errors, as well as the adequacy of engineering and administrative measures to prevent and mitigate accidents, have been analyzed and documented. (7) Confirm that the capabilities of the plant in its current state, and where relevant with account taken of planned safety improvements, have been demonstrated to be within regulatory requirements and expectations for both normal operation and accident conditions. In addition, confirm that plans are in place to ensure that forecast operational conditions of the plant will meet acceptance criteria for the design basis, including adequacy of safety margins, throughout the period of PSR2.

Safety Factor 6 - Probabilistic Safety Assessment (PSA)	
Objective	The objectives of the review of the PSA are to determine: • The extent to which the existing PSA study remains valid as a representative model of the plant; • Whether the results of the PSA show that the risks are sufficiently low and well balanced for all postulated initiating events and operational states; • Whether the scope (which should include all operational states and identified internal and external hazards), methodologies and extent (i.e. Level 1, 2 or 3) of the PSA are in accordance with current national and international standards and good practices; • Whether the existing scope and application of PSA are sufficient.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm existence of a PSA and the assumptions used, the fault schedule, the representations of operator actions and common cause events, the modelled plant configuration and consistency with other aspects of the safety case. (2) Confirm existence of processes to assess the impact of changes in plant design, operation, and plant specific failure data and update the PSA to reflect the current plant status as required. (3) Confirm there are guidelines to account for operator actions, common cause events, cross-link effects, redundancy, and diversity. (4) Confirm that the accident management programs for accident conditions (design basis accident conditions and design extension conditions) are consistent with PSA models and results. (5) Confirm that the results of the PSA show that risks are sufficiently low and well balanced for all postulated initiating events and operational states, and meet relevant probabilistic safety criteria. (6) Review the extent to which hazards are represented in the PSA to verify that omissions are based on site specific justifications and that these omissions do not weaken the overall risk assessment for the plant.

Safety Factor 7 – Hazard Analysis	
Objective	The objective of the review of hazard analysis is to determine the adequacy of protection of the plant against internal and external hazards, with account taken of the plant design, site characteristics, the actual condition of the SSCs important to safety and their predicted state at the end of the period covered by PSR2, and current analytical methods, safety standards and knowledge.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Perform an assessment of the existing Deterministic and Probabilistic analyses to confirm existence of hazard analyses for hazards listed below. The following hazards are to be included in the assessment: (i) Internal Hazards: - Fire, Pipe whip, Steam release, Toxic gas, Flooding, Missiles, Spray, Explosion. (ii) External Hazards: - Changes in site characteristics, High winds (Tornado), Seismic, Toxic gas, Flooding, Extreme temperatures, Aircraft crash, Explosions. (2) Confirm that the analyses and/or methods take into account the plant design and the condition of SSCs important to safety (both at present and predicted for the end of the period covered by PSR2). (3) For each relevant hazard, verify, by means of current analytical techniques and data, that the frequency of occurrence and/or the consequences of the hazard are sufficiently low so that either no specific protective measures are necessary, or the preventive and mitigatory measures in place are adequate.

Safety Factor 8 – Safety Performance	
Objective	The objective of the review of safety performance is to determine whether the plant's safety performance indicators and records of operating experience, including the evaluation of root causes of plant events, indicate any need for safety improvements.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm existence of a system for identifying, classifying and recording safety related incidents and operating experience including: • Safety related incidents, low level events and near misses; • Safety related operational data; • Maintenance, inspection and testing; • Replacements of SSCs important to safety owing to failure or obsolescence; • Modifications, either temporary or permanent, to SSCs important to safety; • Unavailability of safety systems; • Radiation doses (to workers, including contractors); • Off-site contamination and radiation levels; • Discharges of radioactive effluents; • Generation of radioactive waste; (2) Confirm that safety related incidents are investigated using root cause analysis and that lessons learned from investigation of these incidents are fed back into the conduct of Operations and Maintenance. (3) Confirm that the results of the root cause analysis are used to minimize the chances of the same incident reoccurring. (4) Confirm that information from trend analysis of safety related incidents is fed back into the conduct of Operations and/or Maintenance. (5) Confirm there is an adequate set of performance indicators that provides a systematic and comprehensive method to record, trend and analyze safety related data including the major system parameters, and maintenance and inspection records. Performance indicators may include: - Frequency of unplanned trips while the reactor is critical - Satisfactory performance of safety system tests within required limits - Special Safety System unavailability - Reliability of Systems Important to Safety - Collective annual radiation dose of plant staff - Amount of gaseous and liquid radioactive release relative to permitted limits - Heavy water escape and loss rates - Fuel reliability - Chemistry index - Volume of Low Level radioactive waste - Change control index - Maintenance backlog - Training - Environment Index - Non-radioactive effluents, including hazardous substances - Non-radioactive wastes - Spills.

	(6) Confirm that for cases where performance indicators show an unsatisfactory trend, corrective action is taken. (7) Review the adequacy of: - Records of the integrity of physical barriers for the containment of radioactive material. - Records of radiation doses to persons on the site. - Records of data from off-site radiation monitoring and records of the quantities of radioactive effluents. - Records of non-radioactive effluents, including hazardous substances. - Records of radioactive and non-radioactive waste. - Records of spills. - Records of other environmental impacts. (8) Consider the effects of any changes in operation at the plant on safety performance. In particular, confirm that current indicators and other safety performance methods continue to be relevant in the context of current and future operations, and confirm that only relevant data and records are used.

Safety Factor 9 – Use of Experience from Other NPPs and Research Findings	
Objective	The objective of the review of experience from other plants and research findings is to determine whether there is adequate feedback of relevant experience from other nuclear power plants and from the findings of research and whether this is used to introduce reasonable and practicable safety improvements at the plant or in the operating organization.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm existence and adequacy of a program for the sending and receiving of experience relevant to safety to and from other nuclear power plants and relevant nonnuclear plants. (“Other nuclear power plants” specifically include the IAEA, OECD/NEA, WANO, INPO as well as CANDU Owners Group and experience within OPG at Darlington.) (2) Confirm existence of a program for receiving of information on the findings of relevant research programs. (3) Confirm there is a process for assessing the significance of operating experience from other plants and incorporating the lessons learned into improving safety performance at the station. (4) Confirm that there is a process for assessing the significance of research findings and technology developments and for incorporating relevant improvements into the station's design and operation. (5) Review adequacy and effectiveness of the feedback arrangements and timely implementation of assessment findings. (Assess program audit results.) (6) List the major OPEX events and resulting plant changes that have resulted since PSR1 was completed.

Safety Factor 10 – Organization, Management System and Safety Culture	
Objective	The objective of the review of this safety factor is to determine whether the organization, management system and safety culture are adequate and effective for ensuring the safe operation of the plant.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Review organization and administrative procedures to ensure they play a significant role in defining safety culture and evaluate the adequacy of safety culture indicators. (2) Establish existence of a safety policy to ensure that safety takes precedence over production where a conflict between these two requirements exists. (3) Identify the method for setting performance targets and confirm that these targets are regularly and systematically reviewed. Confirm that appropriate actions are initiated if safety targets are not met. (4) Confirm that the published Nuclear organization clearly defines the roles and responsibilities of all individuals and work groups who are involved in activities that could influence the safe operation of the station. Ensure that this organization is understood and that adequate and effective procedures are in place to ensure the availability of these resources and control changes to this organization. (5) Establish that mechanisms for maintaining configuration control of the plant and its documentation are effective and up-to-date. (6) Confirm that there are formal arrangements for employing external technical, maintenance or other specialist staff, and confirm that the contracting procedures ensure that contract employees are qualified to do the work assigned to them. (7) Confirm that there is an approved Quality Assurance program and that regular Quality Assurance audits are conducted involving both internal and independent assessors. (8) Confirm that a program for self-assessment and continuous improvement has been adequately and effectively implemented including feedback of experience relating to organizational and management failures. (9) Confirm there is a system to ensure that comprehensive, easily retrievable, and auditable records exist of baseline design information, and operational and maintenance history. (10) Confirm there is an effective framework in place to support the management of regulatory affairs. (11) Confirm that the organization and management system include the processes and supporting information that explain how work is to be specified, prepared, reviewed, performed, recorded, assessed and improved. (12) Confirm there is control of purchasing of equipment and services where this affects plant safety. (13) Confirm there are comprehensive communication policies in place. (14) Confirm that a questioning attitude exists and conservative decision making is undertaken in the organization. (15) Verify that there is a process in place for prioritization of safety issues, with realistic objectives and timescales that ensures that these issues receive proper resources.

Safety Factor 11 – Procedures	
Objective	The objective of the review of procedures is to determine whether the operating organization's processes for managing, implementing and adhering to operating and working procedures and for maintaining compliance with operational limits and conditions and regulatory requirements are adequate and effective and ensure plant safety.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* *The review of this safety factor will focus on those procedures that have the highest safety significance.* (1) Determine if there is a process for the development, approval, and documenting of all safety related procedures. (2) Confirm there is a formal process for modifying procedures affecting safety, including adequate arrangements for tracking changes. (3) Confirm there is a program for assessing procedures and performance audits to determine if there is regular review and maintenance of these procedures. (4) Confirm that self-assessments are performed to ensure that the procedures are followed. (5) Establish that there is a means for assessing the adequacy of safety related procedures in comparison with industry good practices. (6) Confirm that there are operating procedures that apply comprehensively to normal, abnormal and emergency conditions (including anticipated operational occurrences, design basis accident conditions, post-accident conditions, and design extension conditions). (7) Confirm there is a means for assuring the clarity of procedures taking into account human factors. (8) Evaluate processes to update procedures to allow for changes in the assumptions made and/or the limits and conditions arising from the safety analysis, plant design and operating experience. (9) Verify that the analysis and justification of the accident management procedures are documented. (10) Verify that an appropriate process is in place for the categorization of procedures in accordance with their significance to safety. (11) Examine whether there is adequate involvement in the development of procedures by the staff who will use them. (12) Evaluate the distribution process for the control, copying and removal of obsolete versions of procedures, so that only the last approved edition is used. (13) Evaluate audits, self-assessments, safety performance and events to determine whether there is adequate understanding and acceptance of these procedures by managers and staff.

Safety Factor 12 – Human Factors	
Objective	The objective of the review of this safety factor is to evaluate the various human factors that may affect the safe operation of the nuclear power plant and to seek to identify improvements that are reasonable and practicable.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm that there are procedures to ensure that a minimum number of qualified staff, appropriate to the operating state of the plant, is available at all times. (2) Confirm that adequate staff training facilities, training staff and training programs exist. (3) Confirm that the method of selecting staff for new positions and for promotions involves systematic and validated staff selection methods and a method for succession planning. (4) Confirm that there are appropriate programs for initial, refresher, and upgrade training. For operating staff, this should include the use of simulators. (5) Establish that there is training in safety culture, including for management staff, that includes work supervision practices and internal communication practices and expectations. (6) Confirm there are fitness for duty guidelines relating to hours of work, health and substance abuse. (7) Confirm that the human–machine interface is considered in the design of the control room and other workstations, that analysis of human information requirements and task workload is performed, and that there is linkage to the Probabilistic Safety Assessment, Deterministic Safety Analyses, and Hazard Analysis. This review should include a discussion of how guidance such as U.S. NRC NUREG-0700 Revision 2, "Human-System Interface Design Review Guidelines" and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model" identified in CNSC REGDOC-2.5.2 are relevant to the design of Pickering U1,4 and U5-8. *Note: This Review Task will be dealt with in the Plant Design Safety Factor as it is the only human factors activity that deals with plant design.* (8) Confirm the style and clarity of procedures provides an appropriate level of detailed guidance for staff through a review of plant events identifying inadequate procedures as a contributing cause.

Safety Factor 13 – Emergency Planning	
Objective	The objective of the review of emergency planning is to determine: (a) whether the operating organization has in place adequate plans, staff, facilities and equipment for dealing with emergencies; and (b) whether the operating organization's arrangements have been adequately coordinated with the arrangements of local and national authorities and are regularly exercised.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm the full range of accidents and radiation emergencies have been identified and studied. (2) Confirm the appropriate response and mitigation strategies have been developed and have taken account of major changes at site and around the site (industrial, commercial, residential development). (3) Confirm that the station organization includes dedicated Emergency Response personnel on duty at the plant at all times, to handle accidents and emergencies. (4) Assess the adequacy of the training program for emergency response personnel including training, emergency exercises and qualification records. (5) Confirm there is a process for notification of staff that will be brought in to assist in the management of the response in the longer term. (6) Determine that there is a classification of accidents to guide the type of response. (7) Confirm there is a mechanism for notifying and informing relevant off-site organizations such as the police, fire departments, hospitals, ambulance services, regulatory bodies, local authorities, government, public welfare authorities and the news media. (8) Confirm the availability of sufficient communications equipment at the plant and at the off-site Emergency Centre to permit effective communications with Emergency Response Teams, both on and off site. (9) Assess adequacy of the emergency response procedures and training and exercises for all site staff. Confirm that integrated and partial emergency exercises have been conducted to check satisfactory function of the emergency organization and its equipment. (10) Confirm that the adequacy of on-site equipment and facilities for emergencies and offsite emergency facilities or locations, including walkdowns of relevant areas on and off the site. (11) Confirm development or existence of a program for Severe Accident Management.

Safety Factor 14 – Radiological Impact on the Environment	
Objective	The objective of the review of this safety factor is to determine whether the operating organization has an adequate and effective program for monitoring the radiological impact of the plant on the environment, which ensures that emissions are properly controlled and are as low as reasonably achievable.
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm there are procedures in place to ensure that permitted release limits of radiological substances are not exceeded and, if they are, that appropriate corrective action is taken to minimize the possibility of limits being exceeded in the future. (2) Confirm records of radiological effluent release are maintained in accordance with regulatory requirements. (3) Confirm that a program exists to define the requirements for alarm systems to respond to unplanned effluent releases from on-site facilities. (4) Confirm the environmental data recorded by the station is published and is available on request to the general public. (5) Review the environmental data recorded by the station and compare with the values measured before the plant was put into operation. (6) Confirm there is a process to address changes in the use of land external to the site with respect to the impact on public safety from facility releases. (7) Confirm that the monitoring program is appropriate and sufficiently comprehensive. In particular, confirm that the radiological impact of the plant on the environment is not significant compared with that due to other sources of radiation.

Safety Factor 15 – Radiation Protection	
Objective	The objective of this safety factor is to confirm that Radiation Protection has been adequately accounted for in the design and operation of the reactor facility, that Radiation Protection provisions (including design and equipment) provide adequate protection of persons from the harmful effects of radiation, and ensure that contamination and radiation exposures and doses to persons are monitored and controlled, and maintained as low as reasonably achievable (ALARA).
Review Tasks	The following Review Tasks are intended to support the Objective above: *Note: The Safety Factor Review Tasks and Process Sections of this report (Sections 2.6.1.2 and 3.2.1) provide information on the derivation and application of Review Tasks for PSR2.* (1) Confirm the adequacy of the reactor design features for Radiation Protection. (2) Confirm the adequacy of the Radiation Protection equipment and instrumentation for radiation monitoring. (3) Confirm that adequate provisions are in place to address Radiation Protection of the public and workers during nuclear emergencies. (4) Confirm that the Radiation Protection provisions have been improved as the result of external operating experience. (5) The review will demonstrate that the ALARA principle has been incorporated in any modifications of the reactor design and operational programs and arrangements.

Appendix D: Modern Laws, Regulations, Codes and Standards Applicable to PSR2

The process to identify the modern Laws, Regulations, Codes and Standards that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate Laws, Regulations, Codes and Standards) and then filtering it to identify those that are most significant, and that are applicable to the PSR2 scope. The identification and selection criteria are detailed below.

The result of the identification and selection process was a set of modern Laws, Regulations, Codes and Standards that becomes part of the PSR2 Assessment Basis. These documents are listed in Table D1. This table also identifies the modern version/date of the Law, Regulation, Code or Standard, and the type of review that will be done in PSR2. The type of review is explained in greater detail in Section 3.2.2 of this report.

For the purposes of the performance of PSR2, OPG has defined the freeze date for modern Laws, Regulations, Codes and Standards to be January 15, 2016. Where a document was issued in January 2016 but the effective date is unknown, it will be considered to have been issued prior to the freeze date.

D.1.0 PROCESS TO DETERMINE THE MODERN LAWS, REGULATIONS, CODES AND STANDARDS APPLICABLE TO PSR2

1. Identify potential candidate Laws, Regulations, Codes and Standards:

   1.1. List all Laws, Regulations, Codes and Standards that are identified in the Licence Conditions Handbook (LCH) and group the identified Laws, Regulations, Codes and Standards into those that are:

   - Directly referenced in the Power Reactor Operating Licence (PROL) (listed in LCH Appendix C).
   - Identified in the LCH as guidance or criteria (LCH Appendix E1).
   - Identified in the LCH as referenced in the LCH (LCH Appendix E2).
   - Referenced in the main body of the LCH but not listed in the LCH Appendices.

   1.2. Identify Laws, Regulations, Codes and Standards listed by the CNSC which have been published on or prior to the freeze date (CNSC Acts and Regulations webpage, Section 2.0 – Safety and Control Areas, http://www.nuclearsafety.gc.ca/eng/acts-and-regulations/regulatory-documents/index.cfm#R2).

   1.3. Confirm that the Laws, Regulations, Codes and Standards listed by the CNSC as noted in Step 1.2 are up-to-date by cross-referencing to the CNSC Regulatory Framework webpage (Category 2 – Safety and Control Areas, http://nuclearsafety.gc.ca/eng/acts-and-regulations/regulatory-framework/regulatory-framework-plan-table.cfm).

1.4. Identify Laws, Regulations, Codes and Standards from the Darlington Integrated Safety Review (ISR) basis (basis document OPG Procedure N-PROC-LE-0005 R03 [31] and Code Refresh report NK38-REP-03680-10207 R00 [4]). The Darlington ISR basis is considered to be an important listing of currently applicable Laws, Regulations, Codes and Standards as it resulted from recent and extensive discussion between OPG and the CNSC.

The foregoing represents a comprehensive list of all possible Laws, Regulations, Codes and Standards that could apply to the Pickering PSR2 Assessment Basis, but that are not yet filtered for significance or value.

2. Determine from this candidate list of Laws, Regulations, Codes and Standards those that should be excluded from the PSR2 Assessment Basis.

The following criteria were applied to remove Laws, Regulations, Codes and Standards from the candidate list:

2.1. If the Law, Regulation, Code or Standard is identified by more than one source, duplication in the foregoing list is removed.

2.2. If the Law, Regulation, Code or Standard is not in the Darlington ISR basis, not on the CNSC website listings as currently applicable, and not one of the PROL Laws, Regulations, Codes and Standards, then it is not part of the PSR2 Assessment Basis.

2.3. If the Law, Regulation, Code or Standard is not listed in the PROL and is in only one of the Darlington ISR basis or the CNSC website listings as currently applicable, then it was assessed for significance on a case-by-case basis and was excluded from the PSR2 Assessment Basis where it covered an area that is not significant to nuclear safety.

2.4. Laws, Regulations, Codes and Standards that are uniquely related to the CNSC Safety Control Areas for “Waste Management”, “Packaging and Transport”, “Security” and “Safeguards and Non-proliferation” are not part of the PSR2 Assessment Basis since they are not addressed in the Safety Factors (REGDOC-2.3.3). Requirements related to Construction, Decommissioning, “Ontario nuclear funds agreement”, and “public engagement and information” are not included in the PSR2 Assessment Basis.

2.5. Since the portions of the Pickering Nuclear site that are subject to PSR2 are federally regulated, the National Building Code of Canada and the National Fire Code of Canada are in the PSR2 Assessment Basis, and the Ontario Building Code and the Ontario Fire Code are not included in the PSR2 Assessment Basis.

2.6. Codes and Standards defined as guidelines are not part of the PSR2 Assessment Basis unless they are cited as mandatory within a PROL Code or Standard. (See Step 3.2 below.)

2.7. IAEA Codes and Standards are generally not part of the PSR2 Assessment Basis since they will have been used as references in the development of the Codes and Standards listed by the CNSC as being current. However if an IAEA Code or Standard is cited as mandatory within a PROL Code or Standard, it will be added to the PSR2 Assessment Basis. (See Step 3.2 below.)

2.8. US-NRC, and EPRI Codes and Standards are not part of the PSR2 Assessment Basis since they will have been used as references in the development of the Codes and Standards listed by the CNSC as being current.

2.9. CNSC Policy documents are excluded from the PSR2 Assessment Basis since they are for internal CNSC application.

2.10. Laws and Regulations are not considered to be part of the PSR2 Assessment Basis if they are not listed in the PROL (LCH Appendix C).

Following the exclusions in Steps 2.1 to 2.10, the remaining Laws, Regulations, Codes and Standards represent those that will form part of the PSR2 Assessment Basis, subject to the amendments noted below in Steps 3 and 4:

3. Additional considerations applied to the Laws, Regulations, Codes and Standards for use in the PSR Assessment Basis:

3.1. The version of the Law, Regulation, Code or Standard as of January 15, 2016 (the PSR documentation freeze date) is used for the PSR2 Assessment Basis. (Where a document was issued in January 2016 but the effective date is unknown, it will be considered to have been issued prior to the freeze date.) This includes where the Laws, Regulations, Codes and Standards that are on the CNSC website listings as currently applicable supersede those identified in the Darlington ISR basis. In those cases, Laws, Regulations, Codes and Standards from the CNSC website list are considered to be part of the PSR2 Assessment Basis. Where a document has a new number/type, but addresses the same topic from the same organization, the document will be treated as a revision within the PSR Assessment Basis (e.g., if a REGDOC replaces a CNSC G or RD document).

3.2. If a sub-tier Code or Standard is called up or cited as mandatory by a PROL Law, Regulation, Code or Standard (or a more recent version of a PROL Law, Regulation, Code or Standard as identified in Step 3.1), and either the sub-tier Code or Standard was not already assessed as part of PSR1 or the sub-tier Code or Standard has been updated since PSR1, then the applicable parts of the sub-tier Code or Standard are included in the PSR2 Assessment Basis if they are determined to be safety significant.

3.3. Informative / Non-mandatory sections or appendices of documents in the PSR2 Assessment Basis are not included.

4. An expert level review was performed of the Laws, Regulations, Codes and Standards removed from the initial potential candidate list generated in Step 1, to confirm that the safety significant Laws, Regulations, Codes and Standards are all included in the PSR2 Assessment Basis. The review also confirmed that the Laws, Regulations, Codes and Standards that were selected for the PSR2 Assessment Basis are consistent with the methodology approach to be taken for a subsequent PSR as defined in CNSC REGDOC-2.3.3.

D.2.0 TABLE D1 - LAWS, REGULATIONS, CODES AND STANDARDS APPLICABLE TO PSR2

#	Document Number	Document Title	Modern Version for PSR2	Type of Review

Appendix E: PSR2 Issue Prioritization – Deterministic Considerations

E.1.0 TABLE E1 – DEFENCE IN DEPTH

Safety Significance Level	Safety Significance Criteria						
	Impact on Protection Against Process Failures		**Impact on Protection Against Design Basis Accidents**		**Impact on Initiating Events / Challenges to Safety Systems & Personnel**		**Impact on Operational Performance & Safety Culture**
1	A barrier or safety function is seriously degraded by the issue.	**or**	Primary safety function is inadequate; one or more levels of protection are lost so that the primary safety function capability is disabled for certain design basis (DB) accident sequences.	**or**	The issue causes a new initiating event or an increase of the frequency of certain initiating events and challenges to safety systems and personnel, leading to a major impact on risk such that immediate corrective measures are necessary to reduce the risk.	**or**	The level of operational performance and safety culture is unacceptable.
2	A barrier or a safety function which protects against anticipated serious process failures is degraded by the issue.	**or**	Primary safety function is adequate; one or more levels of protection are significantly affected by the issue so that the primary safety function capability to protect the barrier(s) is questionable for certain DB accident sequences.	**or**	The issue causes a new initiating event or an increase of the frequency of certain initiating events and challenges to safety systems and personnel, leading to a significant impact on risk such that interim corrective measures are usually necessary in the short term.	**or**	The level of operational performance and safety culture is inadequate.
3	A (safety) function is affected by the issue but the effect does not impair the capability of safety provisions to terminate an anticipated serious process failure.	**or**	Safety function affected by the issue is robust; the issue does not affect the safety function capability for more than one level of protection so that the capability to protect the safety barrier(s) is not impaired for the majority of DB accident sequences.	**or**	The issue causes a new initiating event or an increase of the frequency of certain initiating events and challenges to safety systems and personnel leading to a small impact on risk such that interim corrective measures may be considered and implemented within a specified time schedule if shown to be reasonably practicable.	**or**	The level of operational performance and safety culture warrants improvements.
4	No (safety) function is affected by the issue.	**and**	The issue does not impair capability to protect the safety barriers for any DB accident sequences.	**and**	The issue does not cause new initiating events and has no impact on frequency of known initiating events.	**and**	The issue has no impact on the level of operational performance and safety culture.

E.2.0 TABLE E2 – SAFETY SIGNIFICANCE LEVELS (IN PARTICULAR FOR GLOBAL ISSUES WITHOUT A DIRECT NUCLEAR SAFETY IMPACT)

Safety Significance Level	Safety Significance Criteria		
1	Issue or condition causes a major reduction in margin of safety to public or to station personnel.	**and/ or**	Issue or condition has major impact on environment or production or other business deliverables.
2	Issue or condition causes some reduction in margin of safety to public or to station personnel.	**and/ or**	Issue or condition has some impact on environment or production or other business deliverables.
3	Issue or condition is not significant by itself but, has potential to be more significant or may be precursor to a more significant issue or condition.		
4	Issue or condition adverse to quality that may help identify areas that need more attention when it is later reviewed along with other issues / conditions as part of the PSR2 Global Assessment.	**and/ or**	Issue or condition is not significant by itself but may need more attention when it is later reviewed along with other issues / conditions as part of the PSR2 Global Assessment.

Appendix F: PSR2 Issue Prioritization – Probabilistic Considerations

F.1.0 TABLE F1 – REACTOR SAFETY – CORE DAMAGE FREQUENCY

Estimated reduction in core damage frequency resulting from resolution of issue or condition:	Safety Significance Level
> 10^{-5} / reactor-year	1
10^{-6} to 10^{-5} / reactor-year	2
10^{-7} to 10^{-6} / reactor-year	3
< 10^{-7} / reactor-year	4

F.2.0 TABLE F2 – REACTOR SAFETY – DEFENCE IN DEPTH

	Initiating Event Frequency			
Event / Sequence / Condition:	> 10^{-2}/y	> 10^{-3}/y	> 10^{-4}/y	> 10^{-5}/y
Could challenge effectiveness of a system or function whose failure could lead to breach of multiple safety barriers	1	1	2	3
Could challenge a derived acceptance criterion or effectiveness of a system whose failure could lead to breach of a safety barrier	1	2	3	4
Could lead to partial loss of safety margin on a primary parameter or reduction in reliability of a SIS system	2	3	4	4
Could lead to partial loss of safety on a secondary parameter or reduction in reliability of back-up systems	3	4	4	4

Note – Numbers 1 through 4 are Safety Significance levels.

F.3.0 TABLE F3 – PUBLIC RADIATION SAFETY

Event / Sequence with potential for ***change*** in public dose: Indiv. (Δ mSv) **or** Pop. (Δ Sv)	Initiating Event Frequency > 10^{-2}/y	> 10^{-3}/y	> 10^{-4}/y	> 10^{-5}/y
> 100 **or** > 1000	1	1	1	2 1 [if > 250 mSv indiv.]
> 10 **or** > 100	1	1	2	3
> 1 **or** > 0	1	2	3	4
> 0.1 **or** > 1	2	3	4	4

Note – Numbers 1 through 4 are Safety Significance levels.

F.4.0 TABLE F4 – PLANT OPERABILITY

Condition which may require or lead to:	Probability ~ 1	~0.1	~0.01	< 0.001
Extended period of plant shutdown or power de-rating	1	2	3	4
Outage to correct or change to Operating Policies and Principles (OP&P) limit leading to significant increase in complexity of plant operation	2	3	4	4
Change to OP&P limit without major impact on plant operation	3	4	4	4
Some loss of operating margin	4	4	4	4

Note – Numbers 1 through 4 are Safety Significance levels.

F.5.0 TABLE F5 – OCCUPATIONAL RADIATION SAFETY

Condition likely to cause actual or potential exposure:			Probability			
Indiv. (mSv)	**or**	**Incremental Collective (mSv/y)**	**~ 1**	**~0.1**	**~0.01**	**< 0.001**
> 20	**or**	> 1000	1	2	3	4
> 2	**or**	> 100	2	3	4	4
		> 10	3	4	4	4
		> 1	4	4	4	4

Note – Numbers 1 through 4 are Safety Significance levels.

F.6.0 TABLE F6 – EMERGENCY PREPAREDNESS

Condition which could result in:	Probability			
	~ 1	**~0.1**	**~0.01**	**< 0.001**
Spurious declaration of a General Emergency	1	2	3	4
Release sufficient to require emergency response (e.g. liquid emission)	2	3	4	4
Major change to Emergency Preparedness procedures	3	4	4	4
Significant change to Emergency Preparedness procedures	4	4	4	4

Note – Numbers 1 through 4 are Safety Significance levels.

F.7.0 TABLE F7 – ENVIRONMENT

Condition which could result in:	Probability			
	~ 1	~0.1	~0.01	< 0.001
Widespread contamination of soil / groundwater requiring remedial action	1	2	3	4
Contamination of lake water due to liquid release in excess of emission limits (chemical or radiological)	2	3	4	4
Localized contamination of soil / groundwater requiring remedial action	3	4	4	4
Failure or bypass of effluent monitoring	4	4	4	4

Note – Numbers 1 through 4 are Safety Significance levels.

F.8.0 TABLE F8 – LIKELIHOOD ASSESSMENT

Likelihood	Probability
Consequence or outcome expected to occur	~1.0
Consequence or outcome not expected to occur but possible	~0.1
Consequence or outcome highly unlikely	~0.01
Consequence or outcome not predicted by analysis but not impossible	< 0.001

R00	August 3, 2016	R. Jayasundera	Initial issue for OPG review and comment.
R01	March 3, 2017	R. Jayasundera, A. Johnstone, R. Ross	Updated report addressing OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 1, *Plant Design* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 1 were reviewed for the eight PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 1 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 1 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 1).

The results of the review of Safety Factor 1 are discussed in Section 5.0 of this report. The review has confirmed, by assessment against the current licensing basis and applicable standards, requirements and practices, that the design of Pickering NGS and its documentation is adequate. As discussed in Section 5.0, the review identified 36 gaps that will need to be addressed further as part of the PSR2 Global Assessment process.

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

[1] Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

[2] Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's Nuclear operations. As a result, where Pickering is confirmed to follow the same Nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Plant Design Safety Factor 1 is to: "determine the adequacy of the design of the nuclear power plant and its documentation by assessment against the current licensing basis and national and international standards, requirements and practices". REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 1 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 1 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 1 Review Tasks are:

1) Confirm that a detailed description of the plant design, documenting the Design Basis, supported by layout, systems and equipment drawings exists.

2) Assess the adequacy of design documentation.

3) Identify the Structures, Systems and Components (SSCs) important to safety (Appendix B of the PSR2 Basis Document).

4) Review the application of defence in depth. This includes an examination of:

   - The degree of independence of the levels of defence in depth;

   - The adequacy of delivery of preventive and mitigatory safety functions;

   - Redundancy, separation and diversity of SSCs important to safety;

   - Defence in depth in the design of structures (for example, review of integrity of fuel, cooling circuit and containment building[3]).

5) Confirm that the human–machine interface is considered in the design of the control room and other workstations, that analysis of human information requirements and task workload is performed, and that there is linkage to the Probabilistic Safety Assessment, Deterministic Safety Analyses and Hazard Analysis. This review should include a discussion of how guidance such as U.S. NRC NUREG-0700 Revision 2, "Human-System Interface Design Review Guidelines" and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model" identified in CNSC REGDOC-2.5.2 are relevant to the design of Pickering U1,4 and U5-8. (Note: In PSR1, a similar Review Task was addressed in the Human Factors Safety Factor. As it is the only human

---

[3] Note, an editorial error (duplicated text) was made in the Review Task 4 wording documented in the Pickering NGS PSR2 Basis document [1]. The Review Task 4 wording presented in this Safety Factor report has been modified to correct this issue. (Note: The Review Task wording continues to align with IAEA SSG-25 [3] guidance).

factors activity that deals with plant design it is being assessed as a PSR2 Plant Design Review Task.)

6) Assess the adequacy of the arrangements for providing radiological protection.

7) Where the plant has undergone a significant number of modifications over its lifetime or in the period since PSR1, examine the cumulative effects of all modifications on the design.

8) Confirm that the plant SSCs are compliant with the design specifications and consistent with the design documentation.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Plant Design Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 1 L/R/C/S reviews are high level or incremental in nature. The definitions of High Level Review and Incremental Review are as follows:

- High Level: New L/R/C/Ss not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6] [7], and [8]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Plant Design Safety Factor 1

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286.7	Quality Assurance Of Analytical, Scientific And Design Computer Programs	N286.7-16	1, 5, 6, 7, 10	Incremental	N286.7 addressed as part of Pickering B and Darlington ISRs.
2	CSA N285.0	General Requirements For Pressure-Retaining Systems and Components in CANDU Nuclear Power Plants	N285.0-12	1	Incremental	N285.0 addressed as part of Pickering B and Darlington ISRs and PARTS.
3	CSA N285.4	Periodic Inspection of CANDU Nuclear Power Plant Components	N285.4-14	1, 2, 4	Incremental	N285.4 addressed as part of Pickering B and Darlington ISRs.
4	CSA N285.5	Periodic Inspection of CANDU Nuclear Power Plant Containment Components	N285.5-13	1, 2, 3, 4	Incremental	N285.5 addressed as part of Pickering B and Darlington ISRs.
5	CSA N293	Fire Protection for Nuclear Power Plants	N293-12	1, 7, 13	Incremental	N293 addressed as part of Pickering B and Darlington ISRs and PARTS.
Additional L/R/C/Ss						
6	CSA N287.1	General Requirements for Concrete Containment Structures for Nuclear Power Plants	N287.1-14	1	Incremental	N287.1 addressed as part of Pickering B and Darlington ISRs and PARTS.
7	CSA N287.2	Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.2-08	1, 2, 3, 4	Incremental	N287.2 addressed as part of Pickering B and Darlington ISRs and PARTS.
8	CSA N287.3	Design Requirements for Concrete Containment Structures for Nuclear Power Plants	N287.3-14	1	Incremental	N287.3 addressed as part of Pickering B and Darlington ISRs and PARTS.
9	CSA N287.5	Examination and Testing Requirements for Concrete Containment Structures for Nuclear Power Plants	N287.5-11	1, 2	Incremental	N287.5 addressed as part of Darlington ISR.
10	CSA N289.1	General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants	N289.1-08	1, 3	Incremental	N289.1 addressed as part of Pickering B and Darlington ISRs.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
11	CSA N289.2	Ground Motion Determination for Seismic Qualification of Nuclear Power Plants	N289.2-10	1, 3	Incremental	N289.2 addressed as part of Pickering B and Darlington ISRs.
12	CSA N289.3	Design Procedures for Seismic Qualification of Nuclear Power Plants	N289.3-10	1, 3	Incremental	N289.3 addressed as part of Pickering B and Darlington ISRs.
13	CSA N289.4	Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components	N289.4-12	1, 3	Incremental	N289.4 addressed as part of Pickering B and Darlington ISRs.
14	CSA N289.5	Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities	N289.5-12	1, 3	Incremental	N289.5 addressed as part of Pickering B and Darlington ISRs.
15	CSA N290.0	General Requirements for Safety Systems of Nuclear Power Plants	N290.0-11	1	Incremental	N290.0 addressed as part of Darlington ISR.
16	CSA N290.1	Requirements for the Shutdown Systems of Nuclear Power Plants	N290.1-13	1	Incremental	N290.1 addressed as part of Pickering B and Darlington ISRs and PARTS.
17	CSA N290.2	Requirements for Emergency Core Cooling Systems of Nuclear Power Plants	N290.2-11	1	Incremental	N290.2 addressed as part of Darlington ISR. CNSC R-9 (precursor to N290.2) addressed as part of Pickering B and Darlington ISRs and PARTS.
18	CSA N290.3	Requirements for the Containment System of Nuclear Power Plants	N290.3-11	1	Incremental	N290.3 addressed as part of Darlington ISR. CNSC R-7 (precursor to N290.3) addressed as part of Pickering B and Darlington ISRs and PARTS.
19	CSA N290.4	Requirements for Reactor Control Systems of Nuclear Power Plants	N290.4-11	1	Incremental	N290.4 addressed as part of Pickering B and Darlington ISRs and PARTS.
20	CSA N290.5	Requirements for Electrical Power and Instrument Air Systems of CANDU Nuclear Power Plants	N290.5-06	1	Incremental	N290.5 addressed as part of Pickering B and Darlington ISRs and PARTS.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
21	CSA N290.6	Requirements for Monitoring and Display of Nuclear Power Plant Safety Functions in the Event of an Accident	N290.6-09	1	Incremental	N290.6 addressed as part of Pickering B and Darlington ISRs and PARTS.
22	CSA N290.11	Requirements for Reactor Heat Removal Capability During Outage of Nuclear Power Plants	N290.11-13	1	High Level	N290.11 not addressed as part of Pickering B or Darlington ISRs.
23	CSA N290.14	Qualification of Digital Hardware and Software for Use in Instrumentation and Control Applications for Nuclear Power Plants	N290.14-15	1	High Level	N290.14 not addressed as part of Pickering B or Darlington ISRs.
24	CSA N291	Requirements for Safety-related Structures for Nuclear Power Plants	N291-15	1, 2, 4	Incremental	N291 addressed as part of Darlington ISR.
25	CSA N285.6 Series-12	Material Standards for Reactor Components for CANDU Nuclear Power Plants	N285.6 Series-12	1	Incremental	N285.6 addressed as part of Pickering B and Darlington ISRs and PARTS.
26	ASME B31.1	Power Piping	B31.1-14	1	Incremental	B31.1 addressed as part of Darlington ISR and PARTS.
27	ASME BPVC	Boiler and Pressure Vessel Code	BPVC 2015	1	Incremental	BPVC addressed as part of Pickering B and Darlington ISRs and PARTS.
28	CSA B51	Boiler, Pressure Vessel, and Pressure Piping Code	B51-14	1	Incremental	B51 addressed as part of Pickering B and Darlington ISRs and PARTS.
29	CNSC G-278	Human Factors Verification and Validation Plans	2003	1, 12	Incremental	G-278 addressed as part of Pickering B and Darlington ISRs.
30	CNSC G-276	Human Factors Engineering Program Plans	2003	1, 12	Incremental	G-276 addressed as part of Pickering B and Darlington ISRs.
31	NFPA 20	Standard for the Installation of Stationary Pumps for Fire Protection	NFPA-20 (2016)	1	Incremental	NFPA 20 addressed as part of Darlington ISR.
32	NFPA 24	Standard for the Installation of Private Fire Service Mains and Their Appurtenances	NFPA-24 (2016)	1	Incremental	NFPA 24 addressed as part of Darlington ISR.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
33	CNSC REGDOC-2.5.2	Design of Reactor Facilities: Nuclear Power Plants	2014	1, 5, 6, 7	Incremental	RD-337 and NS-R-1 (precursors to REGDOC-2.5.2) addressed as part of Darlington ISR. NS-R-1 also addressed as part of Pickering B ISR.
34	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.
35	CSA N286.7.1	Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants	N286.7.1-09	1, 5, 6, 7, 10	N/A [4]	N286.7.1 not addressed as part of Pickering B or Darlington ISRs.
36	CSA N290.12	Human Factors in Design for Nuclear Power Plants	N290.12-14	1, 12	Incremental [5]	N290.12 not addressed as part of Pickering B or Darlington ISRs. OPG has completed a gap analysis against mandatory requirements of N290.12.
37	CNSC G-149	Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors	2000	1, 5, 6, 7	Incremental	G-149 addressed as part of Pickering B and Darlington ISRs.
38	CNSC R-77	Overpressure Protection Requirements for Primary Heat Transport Systems in CANDU Power Reactors Fitted with Two Shutdown Systems	1987	1	Incremental	R-77 addressed as part of Pickering B and Darlington ISRs and PARTS.

[4] The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [9]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

[5] Per CNSC's request in P-CORR-03680-0607223, "Pickering PSR2 – Change to Review Type for CSA N290.12" [10], the Review Type for CSA N290.12-14 was changed from High Level to Incremental.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
39	CSA N290.7	Cyber-Security for Nuclear Power Plants and Small Reactor Facilities	N290.7-14	1	High Level [6]	N290.7 not addressed as part of Pickering B or Darlington ISRs.
40	NBCC	National Building Code of Canada	NBCC 2010	1	Incremental	NBCC addressed as part of Pickering B and Darlington ISRs and PARTS.
41	NFCC	National Fire Code of Canada	NFCC 2010	1	Incremental	NFCC addressed as part of Pickering B and Darlington ISRs and PARTS.
42	CSA N290.8	Technical Specification Requirements for Nuclear Power Plant Components	N290.8-15	1	High Level	N290.8 not addressed as part of Pickering B or Darlington ISRs.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Programs (N-PROGs) reviewed for Safety Factor 1 are listed in Table 2 below.[7] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of each of the N-PROGs in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Programs Reviewed for Safety Factor 1

Document Number	Document Title
N-PROG-MP-0007 [11]	Conduct of Engineering
N-PROG-MP-0006 [12]	Software
N-PROG-MP-0005 [13]	Configuration Management
N-PROG-MP-0009 [14]	Design Management

6 As summarized in Section 4.2, a gap analysis for N290.7-14 has been completed by OPG and satisfies the intent of this PSR2 High Level Review. For reasons of security and confidentiality, the findings of this gap analysis will not be discussed in PSR2.

7 The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

2.4 Additional Reviews

The PSR2 Safety Factor 1 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 1):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 1 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 1 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [15] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 1 review which are relevant to other Safety Factors are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Plant Design Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 1 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[8]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

[8] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 1 L/R/C/S reviews identify Compliances and Gaps as defined below:[9]

- <u>Compliance</u>:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 1.)

[9] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 1.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records (SCRs) and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance. As a result, the broad review scope of program audits focuses on

identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [16]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 1):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 1 (as identified in the Darlington ISR Integrated Implementation Plan (IIP) [17] and Pickering Units 5-8 Continued Operations Plan [15]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[10]

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

---

[10] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Any PSR2 gaps identified as a result of the Safety Factor 1 review which are relevant to other Safety Factors are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 1 Review Tasks.

4.1.1 Review Task #1: Documentation of Plant Design

Confirm that a detailed description of the plant design, documenting the Design Basis, supported by layout, systems and equipment drawings exists.

The plant design basis is documented in an extensive set of documents and drawings defined in N-LIST-01300-10000, "Bounded Document Set" [18]. The Bounded Document Set lists the types of documents that are maintained when modifying the plant or when modifying other Bounded Document Set documents and provides for a consistent set of configuration managed documentation. For example, Appendix A of N-LIST-01300-10000 [18] (Bounded Document Set Listing) lists the set of documentation or data that:

- Represents the physical plant;
- Represents the design (design input or output);
- Ensures the physical plant is operated consistently within the design envelope (including training);
- Establishes acceptability or suitability of detailed design and physical entity; and
- Is controlled to ensure that the physical plant is consistent with the paper plant and its operation and maintenance.

The specific documents describing the plant design basis include:

- History Dockets;
- Design Manuals;
- Design Requirements (including software);
- Design Drawings;
- Software Release Notices;
- Flow Diagrams;

- Operational Flow Sheets (system drawings);
- Layout Drawings (Plant, Mechanical, Electrical);
- Equipment Drawings and Lists;
- Piping Design Specifications;
- Bills of Materials;
- System Classification Lists;
- Electrical Wiring Drawings;
- Technical Specifications
- Technical Basis Documents;
- Operational Safety Requirements; and
- Safety Report.

N-PROG-MP-0009, "Design Management" [14] provides the framework for the establishment, maintenance and compliance with the design basis for Pickering NGS. The Design Management program provides assurance that design and procedure changes are prepared, reviewed, approved, documented and implemented in accordance with approved procedures, applicable regulatory requirements, standards and industry practices (Note: Review Task #2 provides additional details on Design Management governance).

Conclusion:

The conclusion of this Review Task assessment is that a detailed description of the plant design, documenting the Design Basis, supported by layout, systems and equipment drawings exists. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Adequacy of Design Documentation

Assess the adequacy of design documentation.

<u>Configuration Management</u>

Configuration Management (CM) refers to the industry-accepted process to ensure design documentation is prepared and consistent with the plant design basis and matches the physical plant. The Pickering NGS CM Program has been established in accordance with the requirements of N-PROG-MP-0005, "Configuration Management" [13] and the objectives of this program are as follows:

- Assure the physical configuration matches the configuration documents for all states, including normal operation, upset, post-accident and emergency states;
- Ensure configuration information is accurate, consistent and readily accessible;
- Establish clear configuration control scope, responsibilities, authorities, and interfaces among organizations;
- Manage proposed changes effectively by:
    - Confirming physical configuration or configuration information changes conform to the design and licensing basis, by ensuring required regulatory and licensing reviews, approvals and safety evaluations are completed.
    - Reviewing impacts so that related configuration information is maintained consistent with the change.
    - Ensuring changes to the design and licensing basis receive appropriate verification and approvals before the change is made.
    - Ensuring change processes work in accordance and consistently with each other for design, procurement, construction, installation, commissioning, operation and maintenance, including surveillance, training and testing.
- Set requirements for:
    - Identification, control and management of configuration information;
    - Relationships among configuration items;
    - Change control;
    - Communication and training; and
    - Program review, performance monitoring and continuous improvement.

<u>Engineering Change Control and Design Management</u>

N-PROG-MP-0009, "Design Management" [14] specifies requirements for the following:

- Management of prescribed activities appropriate for execution and control of required design, design support and documentation for nuclear facilities;
- Processes for creating or modifying documentation required controlling the design basis and design outputs;

- Minimum set of documentation that identifies and describes the design basis, design output and design process; and
- Procurement Engineering processes ensuring implementation and maintenance of the physical nuclear facilities meet the design basis requirements.

An essential part of Design Management is the maintenance of accurate documentation. OPG-PROG-0001, "Information Management" [19], establishes a set of standards and procedures for the management of information throughout the plant's life-cycle, regardless of media. OPG-PROC-0179, "Nuclear Quality Assurance Records" [20] (an implementing procedure of OPG-PROG-0001 [19]) defines the process to ensure documents related to design are retained, stored, controlled and are traceable and retrievable. Also, Controlled Document changes are reviewed to ensure that the change does not impact the design basis or require a change to an SSC to maintain alignment between the documented and physical configuration. This review is required for engineering documents (normally those documents described in N-LIST-01300-10000, "Bounded Document Set" [18]). Document changes that do not affect the design basis (e.g., addition or revision of information for clarity), are processed in accordance with the governing processes applicable to the document type. Document changes in support of a modification process (i.e., changes to engineering documentation that reflect a change to the design basis or a physical change to SSCs) are listed in the Affected Document List of the specific Engineering Change in Asset Suite and processed in accordance with the procedure governing the specific document type. Hence, assurances are provided that any changes to controlled documents do not impact the design basis and maintain alignment with the physical configuration of the plant.

N-PROG-MP-0009 [14] requires that design changes be initiated, implemented and tracked in accordance with N-PROG-MP-0001, "Engineering Change Control" [21]. The primary objective of the Engineering Change Control (ECC) Program, is to ensure that all modifications to plant SSCs, including software and station engineered tooling, are planned, designed, installed, commissioned, decommissioned, placed into service or removed from service within the safe operating envelope, design basis and plant licensing conditions. It defines a systematic process and methodology for controlling design modifications for plant SSCs to meet the requirements of Canadian Standards Association (CSA) N285.0, "General Requirements for Pressure-Retaining Systems and Components in CANDU Nuclear Power Plants" and CSA N286, "Management System Requirements for Nuclear Power Plants". The interrelationship between ECC and Design Management is shown in Figure 1 (as documented in Figure 1 of N-PROG-MP-0009 [14]).

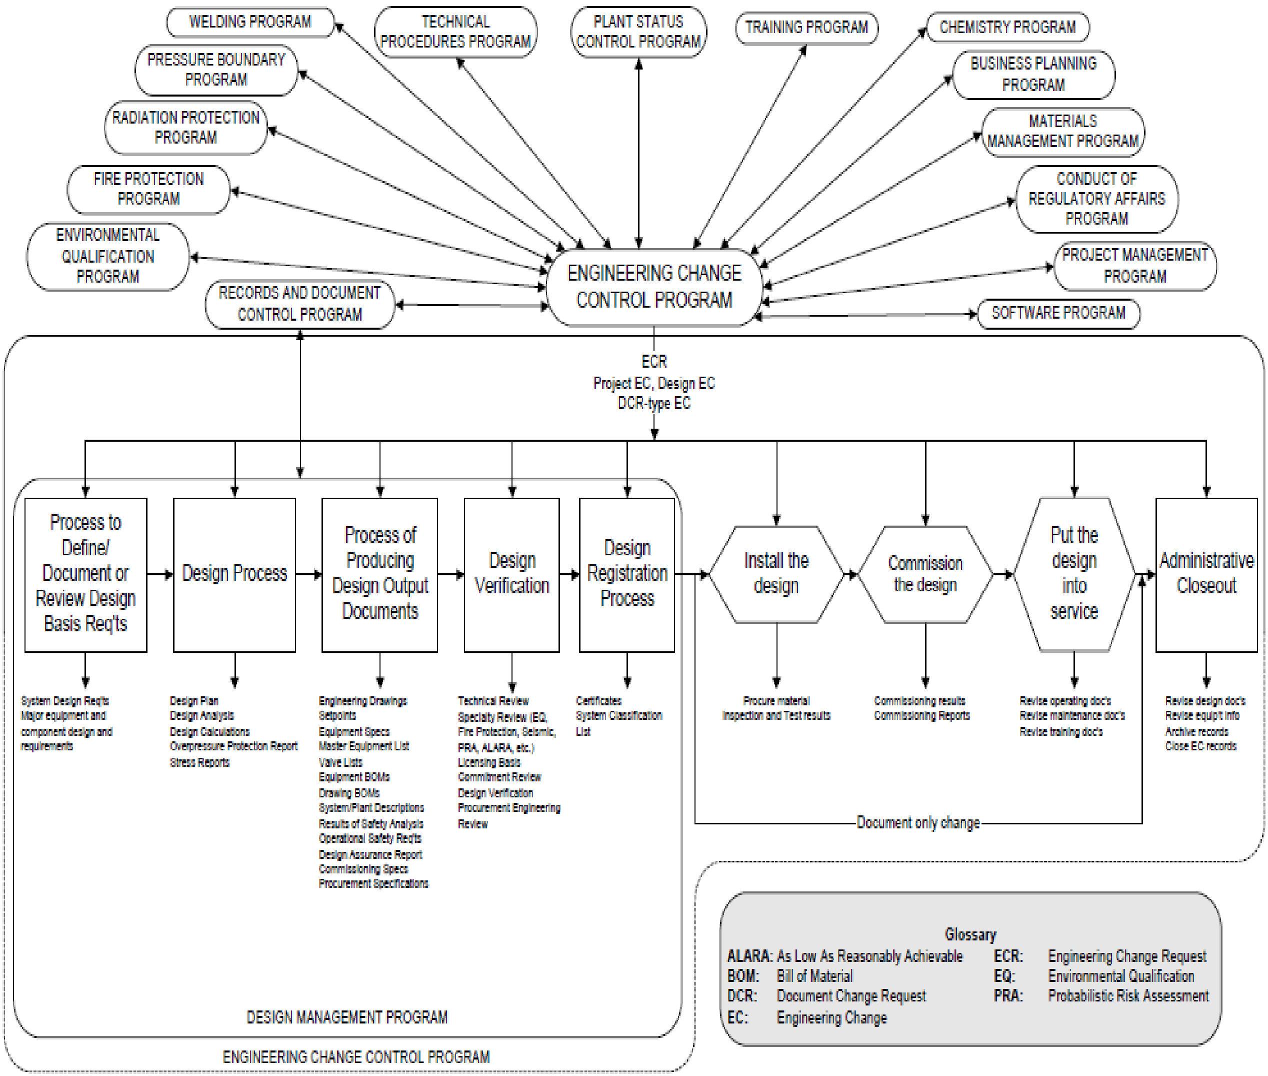

Figure 1: Engineering Change Control – Design Management Interrelationship

N-PROC-MP-0090, "Modification Process" [22] defines the process to be followed for all changes to the design basis, including modifications to, removal of, or abandonment of SSCs, software and engineered tooling designs (N-PROC-MP-0090 [22], and receives its authority from N-PROG-MP-0001, "Engineering Change Control" [21]). N-GUID-01130-10000, "Modifications for Beyond Design Basis Accidents" [23], provides guidance related to the design, modification, procurement, maintenance, testing and operation of SSCs for mitigating Beyond Design Basis Accidents (BDBAs). A primary input to the modification process is defined in N-PROC-MP-0083, "Constructability, Operability, Maintainability, and Safety (COMS)" [24] and N-FORM-10480, "COMS Checklist" [25]. N-PROC-MP-0083 [24] provides direction on:

- The identification of stakeholders from departments involved with or impacted by the modification;

- Determination of which stakeholders comprise the COMS team;
- Identification of user-centred issues and risks related to the COMS of a modification; and
- Addressing the issues and risks appropriately.

N-FORM-10480 [25] is a repository of questions to assist in determining that all appropriate issues have been identified during the design phase. The use of N-PROC-MP-0083 [24] and N-FORM-10480 [25] ensures that stakeholder and subject matter expert input is considered and that risks impacting the safety of the plant and personnel are adequately identified and addressed.

Conclusion:

The conclusion of this Review Task assessment is that design documentation is adequate. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: List of SSCs Important to Safety

Identify the SSCs important to safety (Appendix B of the PSR2 Basis Document).

The scope of SSCs within the PSR2 review encompasses the Pickering Safety Related Systems, with a focus on Pickering Systems Important to Safety (SIS) and Safe Operating Envelope (SOE) Systems. OPG defines Safety Related Systems as those systems, and the components and structures thereof, which, by virtue of failure to perform in accordance with the design intent, have the potential to impact on radiological safety of the public or plant personnel from the operation of the nuclear power plant (P-LIST-06937-00001 R00, "Pickering A and B List of Safety Related Systems" [26]).

SIS are defined per N-STD-RA-0033, "Reliability Monitoring and Reporting of Systems Important to Safety" [27] which considers the risk importance of systems and utilizes expert review panels to select these systems. The identification of SIS is consistent with the requirements of CNSC Regulatory Document RD/GD-98, "Reliability Programs for Nuclear Power Plants" [28].

SOE systems are identified per N-STD-MP-0016, "Safe Operating Envelope" [29] which identify systems and their associated critical components and structures, for which operational safety requirements are specified to conform with the Safety Report.

As detailed in the Appendix B of the PSR2 Basis Document [1] and derived from References [30], [31], the SSCs important to safety for Pickering Units 1,4 within the scope of PSR2 are as follows:

- Emergency Coolant Injection System (ECIS);

- Shutdown System A (SDSA);
- Shutdown System Enhancement (SDSE);
- Negative Pressure Containment System (NPCS);
- Powerhouse Emergency Venting System (PEVS);
- Reactor Regulating System (RRS);
- Service Water Systems;
- Moderator System;
- Electrical Power System;
- Emergency Boiler Water Supply;
- Heat Transport System (Pressure and Inventory Control and D_2O Recovery);
- Shutdown Cooling System;
- Boiler Emergency Cooling System;
- Feedwater System;
- Main Steam Supply System;
- Fuel and Reactor Physics;
- Annulus Gas System;
- Fuel Handling System and Irradiated Fuel Bays;
- Critical Safety Parameter Monitoring Instrumentation;
- Shield Cooling System;
- Interstation Transfer Bus;
- Powerhouse Environmental Protection System; and
- Critical Structures.

As detailed in the Appendix B of the PSR2 Basis Document [1] and derived from References [31], [32], the SSCs important to safety for Pickering Units 5-8 within the scope of PSR2 are as follows:

- ECIS;

- Shutdown System 1 (SDS1);
- Shutdown System 2 (SDS2);
- NPCS;
- PEVS;
- RRS;
- Service Water Systems;
- Moderator Systems;
- Group 1 Electrical Power System;
- Emergency Water Supply System;
- Heat Transport System;
- Shutdown Cooling System;
- Boiler Emergency Cooling System;
- Feedwater System;
- Main Steam Supply System;
- Fuel and Reactor Physics;
- Emergency Power Supply;
- Fuel Handling and Irradiated Fuel Bays;
- High Pressure Emergency Coolant Injection Power Supplies;
- Annulus Gas System;
- Critical Safety Parameter Monitoring Instrumentation;
- Shield Cooling System; and
- Critical Structures

Conclusion:

The conclusion of this Review Task assessment is that SSCs important to safety have been identified. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Design for Defence in Depth

> *Review the application of defence in depth. This includes an examination of:*
>
> - *The degree of independence of the levels of defence in depth;*
> - *The adequacy of delivery of preventive and mitigatory safety functions;*
> - *Redundancy, separation and diversity of SSCs important to safety;*
> - *Defence in depth in the design of structures (for example, review of the integrity of fuel, cooling circuit and containment building[11])*

<u>General</u>

As outlined in Part 2 of the Pickering 1,4 and 5-8 Safety Reports [33], [34], defence in depth is represented by a number of barriers between radioactive materials and the general public. The barriers (which include designed structures) in place to prevent radioactivity from escaping to the environment include:

1. The UO_2 fuel pellets, which bind the majority of radioactive fission products within a solid matrix;

2. The fuel sheath, which contains the fission products not retained in the fuel matrix;

3. The heat transport system boundary, which contains any leakage from the fuel sheath;

4. The containment structure, which contains any release from the heat transport system; and

5. The exclusion zone surrounding the facility, which provides for dilution of any release from containment.

The first three barriers prevent radioactive release accidents. So long as they are intact, very little radioactive material will escape into containment. Containment and the exclusion zone come into play to mitigate doses when all of the first three barriers are breached (e.g., following a loss of coolant accident with fuel failures). Based on protecting these barriers, the fundamental principles that guided the design of CANDU reactors in Canada can be categorized as:

---

[11] Note, an editorial error (duplicated text) was made in the Review Task 4 wording documented in the Pickering NGS PSR2 Basis document [1]. The Review Task 4 wording presented in this Safety Factor report has been modified to correct this issue. (Note: The Review Task wording continues to align with IAEA SSG-25 [3] guidance).

- Accident Prevention
  - Build high quality and reliability into systems to minimize the stresses on the first three barriers to prevent accidents from occurring; and
  - Anticipate component and system failures and build in defences to protect the first three barriers to prevent such failures from developing into an accident.
- Accident Mitigation
  - Anticipate a large range of accident faults, including very low probability failure of piping systems, and build in defences to mitigate the consequences of such accidents. These defences include the last two barriers to release.

Inherent to this approach is the requirement to postulate a range of process equipment failures that would impair one or more of the barriers, and then to establish that resultant releases of radioactive material will not result in radiation doses above allowable limits. To meet this requirement, a number of safety-related functions (as distinct from process functions associated with routine power production) are provided. These functions are performed principally by the special safety systems:

- The shutdown system (SDSA/SDSE for Pickering Units 1,4 and SDS1/SDS2 for Pickering Units 5-8);
- ECIS; and
- NPCS.

The special safety systems are independent of the process systems, such that a process system impairment will have minimal (if any) impact upon the effective functioning of a special safety system.

For Pickering Units 5-8, redundant equipment and circuits are separated to ensure the safety of the station following a common mode event (e.g., local fires). The station systems (both safety and process) have been divided into two groups (Group 1 and Group 2) and designed and located to provide maximum separation between these two groups. Each group is capable, independently of the other group, of safely shutting down the reactor, cooling the fuel, and providing the operator with indication of system conditions. Pickering Units 1,4 were not designed with Group 1 and Group 2 systems. However, systems have been either qualified or retrofitted to function as required for a given common mode event by ensuring effective separation and diversity. For example, the Inter-Station Transfer Bus and Emergency Boiler Water Supply systems have specifically been installed to mitigate high energy pipe failures in the powerhouse. Steam protected rooms and barriers have been installed to protect critical equipment and staff. For seismic events, systems including power (Class

I/II/III), water and control have been hardened to provide assurance that they will remain operational.

Alignment with the Five Levels of Defence in Depth

Five levels of defence in depth are defined in REGDOC-2.4.1, "Deterministic Safety Analysis" [35]. Based on the information provided above, alignment of Pickering NGS against these five levels can be summarized as follows:

- Level 1 – Prevent deviations from normal operation and prevent failures of SSCs.

  The first level of defence requires a high quality in the design and construction of the plant with barriers to prevent the occurrence of abnormal operating conditions. This is particularly important for the physical barriers surrounding the radioactive material in the fuel. Safe, conservative operation of the plant by qualified staff and a continued focus on preventive maintenance ensures reliable functionality of plant equipment under normal operation and therefore prevents process upsets and failures.

- Level 2 – Detect and intercept deviations from normal operation in order to prevent process upsets from escalating to accident conditions.

  The second level of defence is the provision of barriers to prevent process upsets from progressing to accidents. The Pickering NGS plant design possesses a number of strong features regarding Level 2 Defence in Depth. For example:

  - Automatic reactor control features detect and respond to abnormal conditions before these conditions progress to the point that the next level of barriers are required to act.

  - A large number of safety related and process system tests are completed routinely to detect problems regarding plant equipment.

  - A well-established framework of operating procedures is in place to respond to equipment malfunctions in a timely manner thereby ensuring that the plant stays within its well-defined safe operating envelope.

- Level 3 – Minimize the consequences of accidents.

The third level of defence consists of the barriers to minimize the consequences of accidents should they occur by providing inherent safety features, fail-safe design, additional equipment (including Emergency Mitigating Equipment (EME)), and mitigating procedures. The Pickering Units 1,4 and 5-8 Probabilistic Safety Assessments (PSA) [36], [37], [38], [39], demonstrate that the overall plant design has a Core Damage Frequency and Large Release Frequency within the specified safety limits, indicating robustness in the design, and reliable equipment that is capable of responding effectively to accident scenarios.

- Level 4 – Ensure that radioactive releases caused by severe accidents are kept as low as practicable.

  The fourth level of defence includes those barriers to control severe plant conditions. Significant progress in the Severe Accident Management Guidance program implementation has resulted in Pickering NGS strengthening its capability to respond to low probability Severe Accidents. Implementation of lessons learned from the Fukushima event, and installation of additional hydrogen mitigation equipment for BDBAs has added further capability to this defence in depth level. N-BDB-03600-00002, "OPG Emergency Mitigating Equipment for Beyond Design Basis Accidents: Technical Basis Document" [40], summarizes the analyses that have been done for each step of the Severe Accident progression, and the modifications undertaken by OPG to improve defence in depth.

- Level 5 – Mitigate the radiological consequences of potential releases of radioactive materials that may result from accident conditions.

  The fifth level of defence is associated with the management and mitigation of radiological off-site consequences should an accident occur. In the event of a nuclear plant accident, OPG is prepared with the necessary staff, equipment and procedures to support the Province in managing and mitigating off-site radiological consequences as required by the Provincial Nuclear Emergency Response Plan [41]. Also, the Consolidated Nuclear Emergency Plan (N-PROG-RA-0001 [42]) documents the concepts, roles and resources required by OPG Nuclear to implement and maintain its emergency response capability to protect the public, employees and the environment in the event of a nuclear emergency. It provides a framework for interaction with external authorities and defines OPG commitments under the Provincial Nuclear Emergency Response Plan. As a result of the events at Fukushima, OPG has conducted a review of its emergency response program in order to address lessons learned and identify further areas for enhancement. Note: Safety Factor 13 Report, Emergency Planning, provides details of Emergency Planning for Pickering NGS.

Conclusion:

The conclusion of this Review Task assessment is that defence in depth has been applied for the Pickering NGS design. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Design for Human-Machine Interfaces

> *Confirm that the human–machine interface is considered in the design of the control room and other workstations, that analysis of human information requirements and task workload is performed, and that there is linkage to the Probabilistic Safety Assessment, Deterministic Safety Analyses and Hazard Analysis. This review should include a discussion of how guidance such as U.S. NRC NUREG-0700 Revision 2, "Human-System Interface Design Review Guidelines" and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model" identified in CNSC REGDOC-2.5.2 are relevant to the design of Pickering U1,4 and U5-8. (Note: In PSR1, a similar Review Task was addressed in the Human Factors Safety Factor. As it is the only human factors activity that deals with plant design it is being assessed as a PSR2 Plant Design Review Task.)*

Human Factors Engineering (HFE) evaluates the role of humans in human-machine systems and how systems can be designed to work well with people, particularly in terms of safety and efficiency. Pickering NGS was originally designed to the standards of the day and designers relied on best design practices in addition to incorporation of operations and maintenance experience (e.g., for Pickering Units 1-4, experience was incorporated from Douglas Point and Nuclear Power Demonstration, while Pickering Units 5-8 incorporated experience from Pickering Units 1-4 and Bruce NGS A). Input obtained from OPG HFE subject matter experts is that Ontario Hydro design practice in this area recognized the need for focus on the operator interfaces in the control centre(s), and recognition of the integration of the control centre and the related human systems interfaces. Project records from the time Pickering 5-8 was being built show that HFE principles were being considered and applied in the design. Operation of the Pickering NGS design over the years has demonstrated that the plant layout and facilities provide a safe working environment. Operating experience and improvements have been incorporated into the processes and design to improve the human-machine interfaces in many areas (e.g., Control Room annunciation upgrades as a result of changes to computer hardware and operator interface [43]). Additionally, training and qualification processes (and certification processes for control room staff) for Operations positions ensure that the staff are competent to carry out functions assigned to them. The simulator is used extensively for initial training and qualification, as well as for refresher/requalification training. For example, per N-INS-08920-10002, "Simulator-Based Initial Certification Examinations for Shift Personnel" [44], Simulator Exercise Guides are used as part of training for certified staff.

Since 2000, HFE has been explicitly considered for all design changes at Pickering NGS, resulting in continuous improvements to the human-machine interfaces throughout the plant. In terms of design changes to the control room and other work stations, the following governance exists[12]:

Pickering Units 1,4

- 44RS-06700-HFP-004, "Human Factors Design Guideline: Maintenance, Inspection, and Testing [45]: This design guide addresses the human factors aspects of equipment and components that field personnel maintain, test or inspect.

- 44RS-66000-HFP-001, "Human Factors Minor Change Design Guideline: Pickering 'A' Main Control Room Unit Panels and Field Control Panels" [46]: This design guide provides Human Factors guidance for detailed design of human-system interface changes to panel-mounted operator instrumentation on main control room unit panels and field control panels.

- 44RS-66000-HFP-002, "Human Factors Minor Change Design Guideline: Pickering 'A' CRT-Based Displays" [47]: This design guide provides basic display guidelines to be used in making minor modifications to Cathode Ray Tube (CRT) based displays within the main control room at Pickering Units 1,4.

- NA44-MAN-60300-00001, "Annunciation Design Guide Pickering A, Units 1 and 4" [48]: This manual provides human-system interface design guidance to assist designers, human factor specialists and system engineers in implementing changes involving annunciation, which includes local field annunciation and main control room annunciation.

Pickering Units 5-8

- N-MAN-06700-10000, "Human Factors Design Guideline: Maintenance, Inspection and Testing [49]: This design guide addresses the human factors aspects of equipment and components that field personnel maintain, test or inspect (note, this document is a conversion of 44RS-06700-HFP-004 [45] to an OPG Nuclear Manual format and is applicable to both Pickering 1,4 and Pickering 5-8).

- NK30-MAN-06700-00001, "Human Factors Engineering Design Guideline for Main Control Room Unit Panels and Field Control Panels" [50]: This manual provides human factors guidance for detailed design of human-system interface changes to panel-mounted operator instrumentation on main control room unit panels and field control panels.

[12] In order to improve the human machine interface of the Pickering Units 1,4 Digital Control Computer (DCC) interface, the Pickering A Control Room Enhancement (PACE) was initiated. The PACE is part of the DCC system and forms an interface between control room operators and the DCCs.

- NK30-MAN-06700-00002, "Human Factors Engineering Design Guideline for CRT Displays" [51]: This manual provides basic display guidelines to be used in making minor modifications to CRT-based displays within the main control room.

- NK30-MAN-60300-00001, "Annunciation Design Guide Pickering B, Units 5-8" [52]: This manual provides human-system interface design guidance to assist designers, human factors specialists and system engineers in implementing changes involving annunciation which includes local field annunciation and main control room annunciation.

N-PROG-MP-0001, "Engineering Change Control" [21] applies to changes to SSCs which include the physical plant, software, and station engineered tooling, all of which can impact the human-machine interface. More specifically, N-PROC-MP-0090, "Modification Process" [22] (which receives its authority from N-PROG-MP-0001 [21]) provides the detailed steps and procedures required to meet all of the high-level requirements of the ECC program, which include the preparation of N-FORM-10959, "Design Scoping Checklist" [53]. Section 2.9 of N-FORM-10959 [53] contains a listing of high level HFE questions that are designed to identify whether the proposed modification has an HFE impact.

When required, Human Factors Engineering Program Plans (HFEPP) are prepared in accordance with N-MAN-06700-10002, "Guide for OPG Human Factors Engineering Process" [54], which describes OPG's HFE processes and approach to the conduct of HFE activities and OPG's expectations for performing HFE activities. Per Section 2.2.1 of N-MAN-06700-10002 [54], the HFEPP meets the requirements of the following CNSC guides:

- G-276, "Human Factors Engineering Program Plans" [55]; and

- G-278, "Human Factors Verification and Validation Plans" [56].

CNSC REGDOC-2.5.2, "Design of Reactor Facilities: Nuclear Power Plants" [57] refers to U.S. NRC NUREG-0711, "Human Factors Engineering Program Review Model" [58] in terms of guidance for the development of HFEPPs. Per Section 2.2.1 of N-MAN-06700-10002 [54], the HFEPP is expected to meet the intent of NUREG-0711 [58] (Section 2.4 Review Criteria). Also, Figure 2 of N-MAN-06700-10002 [54] identifies the NUREG-0711 [58] HFE Program Elements (i.e., Planning and Analysis, Design, Verification and Validation, Implementation and Operation). CNSC REGDOC-2.5.2 [57] also refers to U.S. NRC NUREG-0700, "Human-System Interface Design Review Guidelines" [59] for guidance relating to the design of human-system interfaces. As part of the Pickering B ISR, OPG agreed to complete a high level review against NUREG-0700 [59] if refurbishment was pursued [60]. This is not a gap for PSR2 since refurbishment is not being considered as part of Pickering NGS operation beyond 2020. As discussed earlier, Pickering NGS was originally designed to the standards and best design practices of the day. Many years of operation of Pickering NGS have demonstrated that the plant layout and facilities provide a safe working environment. Improvements based on operation and maintenance experience have been incorporated into processes and the design to improve the human-machine interface. In addition, training and qualification processes (and certification processes for control room staff) for Operations positions ensure that the staff are competent to carry out functions assigned to them.

In terms of analysis of human information requirements and task workload, Task Analysis is performed as part of the HFEPP for modifications with a significant HFE impact. Task Analysis identifies the specific tasks needed to accomplish human actions and the information, control and task support required to complete those tasks. The following two reports provide recent examples of modifications for which Task Analysis has been performed:

- NA44-REP-41170-00006, "Human Factors Engineering Summary Report – Pickering NGS Units 1,4 Turbine Governor System Upgrade" [61]; and
- NK30-REP-41220-10002, "Human Factors Engineering Summary Report – PB Main Generator Automatic Voltage Regulator (AVR) Replacement Project" [62].

The Human-Machine interface linkages to Deterministic Safety Analysis and Probabilistic Safety Assessment are demonstrated as follows:

- Tables 1-2 to 1-11 and Tables S.1-1 to S.1-10 in Part 3 of the Pickering 1,4 and 5-8 Safety Report respectively [63], [64], summarize all required operator action credits.
- The PSA includes human interaction events in the fault tree model for significant human interface related events which could lead to an accident. Examples of such human interaction events include [65]:
  - Failure to perform a required task;
  - Performing an incorrect operation; or
  - Failure to detect an alarmed component failure.

The Human-Machine interface linkage to Hazards analysis is established by the fact that hazards analysis contains consequential failures that are built into the PSA, which in turn captures human interaction events as discussed above.

In addition, the Minimum Shift Complement (MSC) is also linked to the plant design and safety analyses. The MSC is the minimum number of qualified workers required to be present at the plant at all times to respond to all credible events including for the most resource-intensive conditions, to ensure the safe operation and maintenance of the Plant. CNSC Regulatory Guide G-323, "Ensuring the Presence of Sufficient Qualified Staff at Class I Nuclear Facilities – Minimum Shift Complement" [66] describes the CNSC recommended approach for defining the MSC. OPG Instruction P-INS-09100-00003, "Pickering Minimum Shift Complement" [67] is in compliance with G-323 [66]. Analysis to determine the MSC requires consideration of the most resource-intensive initiating events and credible failures considered in the Safety Report and PSA. OPG Instruction N-INS-03490-10003, "Minimum Shift Complement Resources, Qualifications and Procedures Required for Responding to Resource Limiting Events" [68], requires that changes (e.g., design modifications, procedure changes) not be implemented without appropriate consideration and analysis of the MSC.

Conclusion:

The conclusion of this Review Task assessment is that the human-machine interface is considered in the design of the control room and other work stations, that analysis of human information requirements and task workload is performed and that there is a linkage to the PSA, Deterministic Safety Analysis and Hazard Analysis. Guidance such as U.S. NRC NUREG-0700 Revision 2, "Human –System Interface Design Review Guidelines" and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model", were considered in this assessment. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Design for Radiological Protection

Assess the adequacy of the arrangements for providing radiological protection.

N-PROG-RA-0013, "Radiation Protection" [69] implements a series of standards and procedures for the conduct of activities within the station, in order to achieve the following objectives:

1. Controlling occupational and public exposure:
    - Keeping individual doses below regulatory limits.
    - Avoiding unplanned exposures.
    - Keeping collective doses As Low As Reasonably Achievable (ALARA), social and economic factors taken into account.
2. Preventing the uncontrolled release of contamination or radioactive materials from the nuclear sites through the movement of people and materials.
3. Demonstrating the achievement of 1) and 2) through monitoring.

An important principle of the Radiation Protection program is the control of exposures. Guidelines for general dose rates were established during the design phase of Pickering NGS (for locations such as accessible areas or areas that are only accessible during shutdowns) that would be consistent with the occupancy requirements. Good engineering practice was followed during the initial design of the station such that the layout and operation of facility SSCs and processes are consistent with the established guidelines and contribute to maintaining occupational radiation exposures ALARA. For example, specific design features at Pickering NGS to control radiation dose include the use of radiological zones, the provision of area radiation monitoring equipment, and the use of shielding to control radiation exposures.

When making design changes, engineers maintain or improve upon designs that reduce occupational exposures throughout the lifecycle of the station. N-STD-RA-0018, "Controlling Exposure As Low As Reasonably Achievable" [70] describes elements of the managed system to keep occupational collective dose ALARA, social and economic factors taken into account. Per Section 1.6.2 of N-STD-RA-0018 [70], ALARA principles are to be applied to any changes to the facility design and Engineering must ensure proposed changes to radiological systems are reviewed by the facility Radiation Protection Department in accordance with N-PROG-MP-0001, "Engineering Change Control" [21] and N-PROC-MP-0083, "Constructability, Operability, Maintainability, and Safety (COMS)" [24]. This ensures that radiological safety requirements are identified and addressed as required.

In addition to engineering changes, Radiation Protection staff review changes to the use of space in radiological zones in accordance with N-PROC-RA-0054, "Control of Space Allocation for Transient Material and Extended Storage of Material within the Site" [71]. This procedure prescribes the administrative requirements regarding control of space allocation, transient materials, extended storage of material, and re-locatable structures.

Deposition of small irradiated particles on system pipework during system operation may result in radiological hot spots causing both local and general radiation fields to increase. The impact of these hot spots may be reduced by removing them or applying shielding. Hot spots are shielded in accordance with N-PROC-MA-0060, "Control of Temporary Shielding" [72]. This procedure outlines the processes and controls for requesting, evaluating, approving, installing and removing temporary shielding.

Certain areas of the station are subject to high radiation fields as a result of normal reactor operation, irradiated fuel transfer or equipment operation. Inadvertent entry to these areas is prevented through the use of locked access points. When work is required in these areas, workers use procedures and physical controls to ensure the access hazards are not present or, if present, are strictly controlled. Procedures for accessing areas impacted by station operations (including fuelling activities) for Pickering NGS are implemented via P-INS-09071-00002, "Access Control" [73]. This instruction defines radiation protection requirements that all individuals must follow when entering Access Control Areas. Note: provisions for radiation protection are further detailed in Safety Factor 15 Report, Radiation Protection.

Conclusion:

The conclusion of this Review Task assessment is that the arrangements for providing radiological protection are adequate. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Cumulative Effects of Design Modifications

> *Where the plant has undergone a significant number of modifications over its lifetime or in the period since PSR1, examine the cumulative effects of all modifications on the design.*

The cumulative effects of a design modification are addressed through the ECC Program (N-PROG-MP-0001 [21]) as each new design modification considers the cumulative effects of both the existing design (including previous design changes) and the planned design change. The ECC program ensures that each new design modification remains within the SOE, design basis and licensing basis and also improves or maintains operability, maintainability, radiological and conventional safety, regulatory compliance and production.

A listing of some of the major safety design modifications at Pickering NGS since PSR1 (as outlined in Part 2 of the Pickering A and B Safety Reports [33], [34] and the 2012 Power Reactor Operating Licence Renewal Application [74]) are provided below:

- Fukushima Project related modifications, including:
    - Installation of Passive Autocatalytic Recombiners on all units;
    - Addition of EME including portable diesel pumps and diesel generators;
    - Enhancements to water makeup/cooling capability for the Irradiated Fuel Bays; and
    - Additional flood barriers installed around the Pickering A Standby Generator Fuel Forwarding Pump house.
- Seismic Monitoring System Upgrades;
- ECI Strainer Capacity increase;
- Enhancements to improve Unit 1 and 4 ECI recovery availability;
- Airlock related Design Improvements;
- Fuel Handling Equipment Reliability Improvement;
- Improvements to Inter-Station Transfer Bus;
- Unit 1 and 4 installation of enhancement to the Shutdown Systems (i.e., SDSE and SDSA) as part of the PARTS; and
- Units 2 and 3 safe storage.

Examples of the cumulative effects of these plant design modifications are as follows:

- Equipment Qualification - the above mentioned design modifications have impacted equipment classification (i.e., Environmental/Seismic Qualification status). For example, the airlocks in Pickering Units 1,4 were upgraded to be Environmentally and Seismically Qualified; as part of Units 2 and 3 safe storage, the Unit 2 Class 1 batteries were replaced with new batteries in Seismically Qualified racks.

- Probabilistic Safety Assessment – The Pickering NGS 1,4 and 5-8 Level 1 At-Power Internal Events Risk Assessment [36], [37], have been updated to ensure that the PSA is consistent with the current station design and operation, which includes EME implementation. Likewise, the Level 2 PSA for Pickering NGS 1,4 and 5-8 [38], [39], have incorporated the risk benefits gained from the Fukushima enhancements (e.g., BDBA procedures/guides and EME).

- Deterministic Safety Analysis – To provide additional shutdown system trip parameter coverage for Pickering Units 1,4 (in particular for large loss of coolant accidents), additional trip parameters were added to the Shutdown System. These additional trip parameters (heat transport high/low pressure, neutron overpower, high neutron log rate and manual trip) are designated as SDSE and are independent from the original trip parameters (SDSA). The primary purpose of SDSE is to significantly reduce the probability of a failure to shut down following an initiating event (i.e., large loss of coolant accident (LOCA), fast loss of reactivity control).

Conclusion:

The conclusion of this Review Task assessment is that Pickering NGS has undergone significant modifications over its lifetime and the cumulative effects of all modifications on the design have been assessed. The intent of Review Task #7 is met and therefore Pickering NGS is compliant.

4.1.8 Review Task #8: Compliance with Design Specifications

Confirm that the plant SSCs are compliant with the design specifications and consistent with the design documentation.

The Pickering NGS CM Program (N-PROG-MP-0005 [13]) ensures design documentation is prepared and consistent with the plant design basis and matches the physical plant. Change control programs, policies, and procedures maintain the alignment. N-PROG-MP-0001, "Engineering Change Control" [21] ensures that all modifications to plant SSCs, including software and station engineered tooling, are planned, designed, procured, installed, commissioned, decommissioned, placed into service or removed from service within the safe operating envelope, design basis (including design specifications) and plant licensing conditions. For example, the ECC program ensures that approved modifications are:

- Evaluated based on the risk level, to determine the scope of work activities, stakeholders, resources, documentation updates required to reflect the modification and materials required to complete the modifications;
- Designed in accordance with relevant codes and standards;
- Installed in accordance with the approved design and installation requirements; and
- Commissioned and tested in accordance with acceptance criteria as specified in commissioning specifications.

The SOE is the set of limits and conditions within which the plant shall be operated to ensure conformance with the Safety Report and to ensure that the Safety Report conclusions remain valid. N-STD-MP-0016, "Safe Operating Envelope" [29] provides requirements for defining, implementing and maintaining the SOE. The specific objectives of the SOE are to establish the following:

- Thorough and current record of safety credits and operating limits in the form of Operational Safety Requirements and associated Instrument Uncertainty Calculation reports. Safe Operating Limits and Conditions of Operability (SOE Limits) are captured in station operating documentation, which provide plant operators with the information required to ensure safe operation of the plant in conformance with the requirements of the Safety Analysis.
- A compliance framework whereby plant operation within the requirements established as part of the SOE is verified on a regular basis and appropriate corrective actions are initiated upon discovery of plant operation outside of the SOE.
- Infrastructure by which the SOE is integrated with other relevant business processes and maintained current over the life of the station.

To ensure effective monitoring (e.g., ensuring SSC compliance with design requirements and specifications), maintenance and enhancement of system performance and reliability, N-PROC-MA-0024, "System Performance Monitoring" [75], provides a consistent and comprehensive process for System Engineers.

Pickering NGS has processes in place to ensure design documentation non-compliances are promptly identified and corrected. N-PROC-RA-0022, "Processing Station Condition Records" [76] provides a consistent reporting and evaluation process for identifying adverse conditions at OPG Nuclear. Upon identifying an adverse condition that directly impacts the ability of the station to operate safely, or one that represents an actual or potential operability concern, or one that represents a condition reportable under the operating licence, a Station Condition Record (SCR) is initiated to document the conditions. A corrective action plan is then developed to correct the adverse condition, as required. All actions are tracked to completion under the OPG Action Tracking system. N-PROG-RA-0003, "Corrective Action" [77] establishes the processes to ensure deficiencies, non-conformances, weaknesses, etc., identified in the SCR, are promptly corrected or dispositioned.

Conclusion:

The conclusion of this Review Task assessment is that plant SSCs are compliant with the design specifications and consistent with the design documentation. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for 42 L/R/C/Ss with content applicable to Safety Factor 1 are provided in References [6], [7] and [8]. Associated findings applicable to Safety Factor 1 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 1

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA N286.7-16, "Quality Assurance of Analytical, Scientific and Design Computer Programs"	There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.
CSA N285.0-12, "General Requirements for Pressure-Retaining Systems and Components in CANDU Nuclear Power Plants"	There are two PSR2 CSA N285.0-12 (including Updates No. 1 and No. 2) gaps which relate to Safety Factor 1: 1. Clause A.2.3.1 of CSA N285.0-06 identifies that for Shutdown Systems, pressure-retaining portions shall be classified as Class 1, except for three listed exceptions. It was identified during the Pickering B ISR that a limited number of Liquid Injection Shutdown System (LISS) components, which should have been Class 1, were purchased and installed as Class 3. In follow-up, OPG proposed four actions to address the deficiency. When refurbishment was not pursued, a code classification concession was accepted for continued operations. This code classification concession and the four actions identified in the Pickering B ISR gap resolution need to be reconsidered in the context of operation of Pickering NGS beyond 2020. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-1**). 2. The PARTS review against CSA-N285.0-95 identified two Acceptable Deviations relating to Clause 7.0 requiring confirmation that the allowable cycles for fatigue would not be exceeded. For Pickering Units 1,4 and Units 5-8 operation beyond 2020, further confirmation is required that the allowable cycles for fatigue will continue to bound current service limits for extended operation. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-2**).
CSA N285.4-14, "Periodic Inspection of CANDU Nuclear Power Plant Components"	For Safety Factor 1, there are no PSR2 gaps for CSA N285.4-14.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA N285.5-13, "Periodic Inspection of CANDU Nuclear Power Plant Containment Components"	For Safety Factor 1, there are no PSR2 gaps for CSA N285.5-13.
CSA N293-12, "Fire Protection for Nuclear Power Plants"	There are three PSR2 gaps for CSA N293-12 which relate to Safety Factor 1: 1. Clause 7.2.1.10.1 states: "A display and control centre shall be located in the MCR… capable of providing detailed information on the location and nature of the signal. In addition, the panel operator shall be able to control the fire alarm system without having to leave his or her station." Pickering 014 Display Annunciation Station 014-67140-WS2342 in the Emergency Operating Centre is capable of providing annunciation only, and there is no Display Annunciation Station in the Pickering 014 MCR (although there is limited annunciation). Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-3**). 2. Clause 7.2.1.13 of CSA N293-12 states: "Electrical conductors that are installed in service spaces containing other combustible materials and that are used in connection with fire alarm systems and emergency equipment, including fire alarm cables… shall be capable of performing their intended functions for not less than 1 hour after the start of a fire." Modifications to the Fire Protection System meet the requirements of CAN/ULC-S524 which mandates a 1 hour fire rating as described in Section 2.5 of NA44-DM-71400.2-00001 R001, Section A.2 of NA44-DM-71400-00002 R000 and Section 2 of NK30-DM-71400-00001 R006. This is achieved by the use of Edwards System Technology (EST) that connects the fire alarm control panels via a data communication link with dual redundant circuit wiring paths. However, existing Pyrotronics fire alarm control panels are not similarly connected and, hence, may be susceptible to loss of alarm signal due to spot burning of a cable. While measures such as lack of combustible material in service spaces, combustible transient material control practices, and inherent protection afforded by Pickering NGS cable routing practices used in the Fire Protection systems mitigate the lack of such a feature, it could not be confirmed based on existing documentation that all essential fire alarm cables are capable of performing their intended functions for not less than 1 hour after the start of a fire to meet the requirement of N293-12 sub-clause 7.2.1.13. As a result, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-4**). 3. Clause 7.3.2.2 (d) of CSA N293-12 states: "At a minimum, the fire protection water pumping system shall consist of at least one diesel-engine-driven fire pump and one electric-motor-driven fire pump set, with each pump set being capable of providing, the flow rate and pressure specified in Item (a)". This Clause is met at Pickering Units 1,4 with the provision of diesel-driven firewater pumps, backed up by supplies from the High Pressure Service Water (HPSW) system (as noted in the Pickering A Safety Report NA44-SR-01320-00001 R015, Section 11.5.1.1). It is not met at Pickering Units 5-8, where the Fire Protection System is comprised of the HPSW supplies from the four units only. As a result, Pickering Units 5-8 does not comply with Clause 7.3.2.2 (d) of CSA N293-12 and this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-5**).

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA N287.1-14, "General Requirements for Concrete Containment Structures for Nuclear Power Plants"	There are no PSR2 gaps for CSA N287.1-14. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA N287.1-14.
CSA N287.2-08, "Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N287.2-08. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with N287.2-08.
CSA N287.3-14, "Design Requirements for Concrete Containment Structures for Nuclear Power Plants"	There are no PSR2 gaps for CSA N287.3-14. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA N287.3-14.
CSA N287.5-11, "Examination and Testing Requirements for Concrete Containment Structures for Nuclear Power Plants"	There is one PSR2 CSA N287.5-11 gap which relates to Safety Factor 1: 1. The Concrete Containment Structures (CCSs) at Pickering A and B were built and tested to meet the 1965 and 1970 National Building Code of Canada requirements, respectively, prior to the initial issuance of CSA N287.5. No assessments exist which demonstrate that the requirements in effect during construction of Pickering NGS CCSs comply with the requirements of CSA N287.5. Ongoing confirmation that the Pickering NGS CCSs remain fit for service is demonstrated via periodic and in-service inspections conducted in accordance with the requirements of CSA N285.5 and N287.7, and the resultant inspection reports attest to the quality of the design. In addition, the ECC process ensures that any design changes made to the Pickering CCSs will comply with N287.5 going forward, as applicable. The original Pickering construction included requirements for tests and quality control procedures which generally meet the intent of N287.5. Furthermore, retroactive application of N287.5 to the as-built design of CCSs cannot be practically achieved without rebuilding them. Nevertheless, there is a PSR2 gap for Pickering NGS given that compliance with the specific requirements of N287.5 has not been demonstrated (**Pickering PSR2 Gap SF1-6**).
CSA N289.1-08, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N289.1-08. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with N289.1-08.
CSA N289.2-10, "Ground Motion Determination for Seismic Qualification of Nuclear Power Plants"	There are no PSR2 gaps for CSA N289.2-10. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with N289.2-10.
CSA N289.3-10, "Design Procedures for Seismic Qualification of Nuclear Power Plants"	For Safety Factor 1, there are no PSR2 gaps for CSA N289.3-10.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA N289.4-12, "Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components"	For Safety Factor 1, there are no PSR2 gaps for CSA N289.4-12.
CSA N289.5-12, "Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities"	For Safety Factor 1, there are no PSR2 gaps for CSA N289.5-12.
CSA N290.0-11, "General Requirements for Safety Systems of Nuclear Power Plants"	There are three PSR2 N290.0-11 gaps which relate to Safety Factor 1: 1. The Darlington ISR identified a gap against Clause 4.14.10 of N290.0-11 as a result of the lack of design standards related to HFE or HFE activities being formally documented when the control rooms were originally designed and constructed. Pickering NGS has many years of successful Special Safety System (SSS) operation and the absence of formal HFE in the original design is not expected to have any nuclear safety significance relating to SSSs. However, the Darlington gap is also applicable to Pickering NGS and is therefore identified as a PSR2 gap (**Pickering PSR2 Gap SF1-7**). 2. Clause 4.2 of N290.0-11 requires that Plant States be grouped into several categories, including Anticipated Operational Occurrences (AOOs). This is consistent with clauses of REGDOC-2.4.1 and REGDOC-2.5.2 related to identification and classification of initiating events. Since AOOs have not been identified and analyzed in the current Pickering Safety Reports, the requirements and credits attributed to the Special Safety Systems for AOOs, if any, cannot be readily ascertained. This issue has therefore been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-8**). It is being addressed as part of REGDOC-2.4.1 implementation. 3. Clause 4.13 of N290.0-11 identifies requirements to address dynamic piping effects. OPG is currently in the process of completing the High Energy Line Break Assessment (HELBA) for Pickering NGS. Preliminary results show that there would be no consequential damage caused by the rupture of high energy pipes inside containment to safety related equipment, beyond that already accounted for in the Safety Reports. The final HELBA reports for Pickering Units 5-8 have been completed, while Pickering Units 1,4 are expected to be completed in 2017. Since this work has not been completed for Pickering 1,4, this is identified as a PSR2 gap (**Pickering PSR2 Gap SF1-9**).
CSA N290.1-13, "Requirements for the Shutdown Systems of Nuclear Power Plants"	There is one PSR2 CSA N290.1-13 gap which relates to Safety Factor 1: 1. Clause 4.1.8.2 of CSA N290.1-13 is for a new plant and requires remote tripping and monitoring capability for both Shutdown Systems. Pickering Units 1,4 only have one Shutdown System with tripping capability from separate logic (SDSA and SDSE). Remote tripping capability is available for Pickering 5-8 SDS2 and Pickering 1,4 SDSE. However, Pickering Units 5-8 and 1,4 do not have remote tripping and monitoring capability for SDS1 or SDSA respectively.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
	Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-10**).
CSA N290.2-11, "Requirements for Emergency Core Cooling Systems of Nuclear Power Plants"	There are two PSR2 CSA N290.2-11 gaps which relate to Safety Factor 1: 1. Clause 5.2.1.2 of CSA N290.2-11 requires that ECIS design requirements be based on the assumption that the least effective of the Shutdown Systems has operated successfully. The Pickering Units 5-8 Safety Report analysis does address this requirement and the requirement is also contained in the Pickering Units 5-8 Design Requirements. However, this requirement cannot be met for Pickering Units 1,4 since there is only one Shutdown System (albeit with tripping capability from separate SDSA and SDSE logic). Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-11**). 2. Clause 5.14.11 of CSA N290.2-11 requires instrumentation to be available to monitor post-accident effectiveness and to determine the extent of plugging of ECIS debris interceptors (strainers). While relative health of a strainer can be inferred by a combination of ECIS recovery pump performance and reactor building water level, there is no direct correlation between these conditions and debris loading available. Therefore, this has been identified as a PSR2 gap (which is applicable to both Pickering Units 5-8 and 1,4) (**Pickering PSR2 Gap SF1-12**).
CSA N290.3-11, "Requirements for the Containment System of Nuclear Power Plants"	There is one PSR2 CSA N290.3-11 gap which relates to Safety Factor 1: 1. Per CSA N290.3-11, a Containment Energy Management System (EMS) and Radionuclide Management System (RMS) are required to protect containment and minimize radiological releases for BDBAs. The Pickering EMS and RMS use the Filtered Air Discharge System (FADS) and Reactor Building Air Cooling Units (ACUs). Enhancements to the AC power supplies to these systems and related loads are being provided by Phase 2 EME, which is not yet fully implemented. This PSR2 gap has been identified to track the implementation of Phase 2 EME such that it can be used to support the EMS and RMS (**Pickering PSR2 Gap SF1-13**).
CSA N290.4-11, "Requirements for Reactor Control Systems of Nuclear Power Plants"	There is one PSR2 CSA N290.4-11 gap which relates to Safety Factor 1: 1. Clause 4.2 and Clause 5.19 of CSA N290.4-11 require the capability of the RRS to be assessed to deal with AOOs, by preventing them from escalating into Design Basis Accidents (DBAs) that would require Shutdown System action. In general, the setback function (and stepback in Pickering Units 5-8) addresses this requirement; however, AOOs have not been identified and analyzed in the current Pickering Safety Reports. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-14**). It is being addressed as part of REGDOC-2.4.1 implementation. Note: There are also additional clauses which refer to requirements of RRS during AOOs (Clauses 5.6.2, 5.19, 5.16.1); however, for convenience, all issues related to AOO requirements for RRS in N290.4-11 are captured under this one PSR2 gap.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA N290.5-06 (R2011) including Update No. 1, "Requirements for Electrical Power and Instrument Air Systems of CANDU Nuclear Power Plants"	There is one PSR2 CSA N290.5-06 (R2011) including Update No. 1 gap which relates to Safety Factor 1: 1. A gap exists for the Pickering Units 1,4 and 5-8 Instrument Air and Electrical Systems on Clauses 7.1 and 7.4.2 of N290.5-06 (R2011) including Update No. 1 dealing with requirements for AOOs. These clauses introduce the requirement for components to be qualified to perform their required functions during normal operation and AOOs. Only the portion of this clause on AOOs is pertinent to nuclear safety. It is likely that AOOs, due to their nature, do not result in a challenge to the qualification of systems, including Instrument Air and Electrical systems. However, AOOs have not been identified and analyzed in the current Pickering Safety Reports. This issue has therefore been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-15**). It is being addressed as part of REGDOC-2.4.1 implementation.
CSA N290.6-09, "Requirements for Monitoring and Display of Nuclear Power Plant Safety Functions in the Event of an Accident"	There are no PSR2 gaps for CSA N290.6-09. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA N290.6-09.
CSA N290.11-13, "Requirements for Reactor Heat Removal Capability During Outage of Nuclear Power Plants"	There are three PSR2 CSA N290.11-13 gaps which relate to Safety Factor 1 (Plant Design): 1. The CSA N290.11-13 Clause 5.1.1 to 5.1.5 requirement for back-up heat sinks to mitigate the conditions following an AOO is not specified in governance/procedures. Loss of a division of power, a single component failure, etc., which are likely to be in the set of AOOs, are accounted for in the specification of heat sinks. However, AOOs have not been identified and analyzed in the current Pickering Safety Reports. This issue is therefore a PSR2 gap (**Pickering PSR2 Gap SF1-16**). It is being addressed as part of REGDOC-2.4.1 implementation. 2. Clause 5.6.1 of CSA N290.11-13 requires design reliability to be established for outage heat sinks. Although some emergency heat sinks (e.g., Emergency Boiler Water Supply and Emergency Water Supply) have design reliability requirements, design reliability requirements have not been established for all normal and back-up heat sinks used at Pickering. Reliability of all outage heat sinks (including those without explicit targets) is managed under the Risk & Reliability Program (both through unavailability models as well as through Probabilistic Safety Assessment), hence reactor safety impact is assessed and monitored. However, there is a PSR2 gap with respect to establishment of design reliability requirements for Pickering Units 1,4 and 5-8 outage heat sinks (**Pickering PSR2 Gap SF1-17**). 3. Clause 5.6.1 of CSA N290.11-13 requires that the designed reliability for process heat sinks be consistent with AOO frequency limits, such that an emergency heat sink does not need to be used for an AOO. AOOs have not been identified and analyzed in the current Pickering Safety Reports. This issue is therefore a PSR2 gap (**Pickering PSR2 Gap SF1-18**) and is being addressed as part of REGDOC-2.4.1 implementation.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA N290.14-15, "Qualification of Digital Hardware and Software for Use in Instrumentation and Control Applications for Nuclear Power Plants"	There is one PSR2 CSA N290.14-15 gap relating to Safety Factor 1 (Plant Design): 1. Correspondence with the CNSC identifies all of the software application qualifications for software Categories 1, 2 and 3 from January 1, 2007 to the time of the correspondence (June 2016). However, an evaluation of legacy Real-Time Process Computing applications with respect to the requirements of N290.14-15 for Categories 1, 2 and 3 software has not been performed. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-19**).
CSA N291-15, "Requirements for Safety-related Structures for Nuclear Power Plants"	There are three PSR2 CSA N291-15 gaps which relate to Safety Factor 1 (Plant Design): 1. Clause 6.5.2.2 of CSA N291-15 imposes new requirements for bolted connections in members that are part of the seismic load resisting system. Pickering NGS structures were not explicitly designed to meet these requirements and this is therefore identified as a PSR2 gap (**Pickering PSR2 Gap SF1-20**). 2. Clause 9 of CSA N291-15 contains new requirements related to aging management (including design provisions to account for aging) that are not in CSA N291-08 and that may have significance for operation of Pickering beyond 2020. Pickering structures were not explicitly designed to meet these requirements and this is therefore identified as a PSR2 gap (**Pickering PSR2 Gap SF1-21**). 3. Clauses 6.1.1(b) and 6.9.2.1.4 of CSA N291-15 state requirements for aspects of the design that are specifically based on the plant service life. Pickering structures were not explicitly designed or assessed in relation to the requirements of these clauses for operation beyond 2020. This is identified as a PSR2 gap (**Pickering PSR2 Gap SF1-22**). There is also one PSR2 gap for CSA N291 related to submission of Periodic Inspection Plans and Life Cycle Management Plans for a number of safety-significant civil structures to address fitness for service "to end of mission time" (which will need to be extended for Pickering operation beyond 2020). The gap is related to Safety Factor 4 (Aging). This issue is identified as a PSR2 gap in OPG Report P-REP-03680-00024 R000, "Pickering 5-8 Continued Operations Plan Review in Support of PNGS Periodic Safety Review 2 (PSR2)" [78]. Therefore, a duplicate gap has not been created under CSA N291-15.
CSA N285.6 Series-12, "Material Standards for Reactor Components for CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N285.6 Series-12. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA N285.6 Series-12.
ASME B31.1-14, "Power Piping"	There are no PSR2 gaps for ASME B31.1-14. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with ASME B31.1-14.
ASME BPVC (2015), "Boiler and Pressure Vessel Code"	There are no PSR2 gaps for ASME BPVC (2015). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with ASME BPVC (2015).

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CSA B51-14 (including Update No. 1), "Boiler, Pressure Vessel, and Pressure Piping Code"	There are no PSR2 gaps for CSA B51-14 (including Update No. 1). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA B51-14 (including Update No. 1).
CNSC G-278 (2003), "Human Factors Verification and Validation Plans"	There are no PSR2 gaps for CNSC G-278 (2003). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CNSC G-278 (2003).
CNSC G-276 (2003), "Human Factors Engineering Program Plans"	There are no PSR2 gaps for CNSC G-276 (2003). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CNSC G-276 (2003).
NFPA 20 (2016), "Standard for the Installation of Stationary Pumps for Fire Protection"	There are no PSR2 gaps for NFPA 20 (2016). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with NFPA 20 (2016).
NFPA 24 (2016), "Standard for the Installation of Private Fire Service Mains and Their Appurtenances"	There are two PSR2 gaps for NFPA 24 (2016) which relate to Safety Factor 1 (Plant Design): 1. For OPG Report NK30-REP-71400-10001 R001, "Fire Protection Code Compliance Review Pickering Nuclear Generating Station B", there is an outstanding issue (Deviation # 13301) which relates to NFPA 24 1970 Section 3601: "Yard post indicator valves at PNGS B are not secured in the open position as required by code" (and which applies to Pickering Units 1,4 as well as Units 5-8). Work to resolve this deviation is currently in progress with locks installed on the majority of the affected valves. Based on OPG List P-LIST-71400-00001 R000, there are a number of SSCs in the yard which directly support plant operation and which are defined as being "related to nuclear safety". As a result, fire water supply to these SSCs is a credited safety function. Deviation # 13301 is not yet complete. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-23**). 2. For Pickering Units 5-8 the baseline for NFPA 24 compliance is the 1970 version of the standard. Pickering Units 1,4 have not been previously assessed against NFPA 24. Although recent changes to the 2013 and 2016 versions of NFPA 24 will be addressed in any firewater system design changes going forward (as a result of Code-over-Code reviews performed for NFPA 24), compliance has not been formally documented for Pickering Units 1,4 or Units 5-8 against the most recent versions of NFPA 24. Furthermore, there have been a large number of significant changes to NFPA 24 since 1970, including the 2002 edition which "represented a complete revision of NFPA 24". Since Pickering NGS has not demonstrated compliance with the 2016 version of NFPA 24, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-24**). It is noted that OPG is proactively replacing portions of the firewater piping in accordance with NFPA 24, under the Pickering A Firewater Pipe Replacement Project 13-80069.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CNSC REGDOC-2.5.2 (2014), "Design of Reactor Facilities: Nuclear Power Plants"	There are eight PSR2 CNSC REGDOC-2.5.2 (2014) gaps which relate to Safety Factor 1 (Plant Design): 1. Containment Leak Tightness for Design Extension Conditions (DECs): Clauses 7.3 and 8.6.12 of REGDOC-2.5.2 require containment to provide a leak tight barrier following DECs with severe core damage for a period sufficient to implement off-site emergency measures. REGDOC-2.5.2 guidance suggests this period be at least 24 hours. Such a requirement does not exist in BDBA/Severe Accident (SA) mitigation, so this represents a PSR2 gap (**Pickering PSR2 Gap SF1-25**). 2. On-Demand Reliability of Safety Systems: Clause 7.6 of REGDOC-2.5.2 requires all SSCs important to safety to meet an on-demand failure rate of <10^{-3} yrs/yr. This requirement is not met for several systems including Pickering 1,4 ECI and is therefore identified as a PSR2 gap (**Pickering PSR2 Gap SF1-26**). 3. Sharing of Safety Systems and Turbine Hall: Clause 7.6.5 of REGDOC-2.5.2 has a new requirement that sharing of safety systems and the turbine generator building not be permitted. Pickering units share ECI and NPC, as well as the turbine hall; therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-27**). 4. Allowable Times for Crediting On-Site Operator Actions: Clauses 7.10 and 8.10.4 of REGDOC-2.5.2 establish new time limits for crediting operator actions, i.e., 30 minutes for MCR actions and 1 hour for field actions. Pickering NGS has not demonstrated that deterministic safety analysis consequences are acceptable if MCR and field action are not credited for these times respectively. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-28**). 5. Seismic Qualification and Design: Clause 7.13.1 of REGDOC-2.5.2 requires that Beyond Design Basis (BDB) Earthquake seismic margin be a factor of 1.67 beyond that required for the new plant Design Basis Earthquake (DBE). Fragility evaluations were completed for seismic mitigating SSCs, however, based on available information it could not be confirmed that the new plant BDB Earthquake margin of 1.67 would be achieved. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-29**). 6. Human Factors in Design: Clauses 7.21 and 8.10.1 of REGDOC-2.5.2 introduce new requirements for the systematic application of HFE principles to plant design. Many years of safe and reliable operating experience indicate that the design and processes for integration of human interactions with the plant were and remain robust. However, Pickering plant design predates the current requirements for incorporating HFE into the design and the existing plant has not been systematically demonstrated to meet the requirements for a new plant. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-30**). 7. Detection/Isolation of ECI Heat Exchanger Tube Leak: Clause 8.5 of REGDOC-2.5.2 requires ECI recovery heat exchanger tube leak detection capability. Pickering Units 5-8 ECI recovery heat exchangers do not have leak detection

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
	capability on the cooling water side. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-31**). 8. Safety Parameter Display System Qualification for DECs: Clause 8.10.1.1 of REGDOC-2.5.2 requires the MCR to contain a Safety Parameter Display System (SPDS) that presents sufficient information on safety-critical parameters for the diagnosis and mitigation of DBAs and DECs. The SPDSs are to be qualified for DEC and have parameters available in both the MCR and Secondary Control Areas (SCA), per Clause 8.10.2. Pickering SPDSs are not Review Level Condition (RLC) qualified or available in all locations. As part of the Fukushima follow-up, instrumentation to support critical parameters required to function for DECs has been evaluated for survivability. The instrument loops associated with these parameters have been identified for use in Critical Safety Parameter Monitoring (CSPM) and BDBA procedures. However, the indications from these loops are not in one central location and, in some cases, require field action (e.g., power) to obtain data. This does not fully satisfy the requirements to have these parameters available from a SPDS in the MCR and SCA. Therefore, this has been identified as a PSR2 gap relating to the new plant requirement to have SPDS that is DEC qualified and with parameters available in the MCR and SCA (**Pickering PSR2 Gap SF1-32**).
CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	There is one PSR2 CNSC REGDOC-2.3.2 (2015) gap which relates to Safety Factor 1 (Plant Design): 1. Full provision of Complementary Design Features for containment integrity as required by Clause 4.2.1 of REGDOC-2.3.2 will be addressed with the completion of Phase 2 Emergency Mitigating Equipment. This work is currently scheduled to be fully implemented by the end of 2017. Since this work is still in progress, it has been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-33**).
CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"	The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [9]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.
CSA N290.12-14, "Human Factors in Design for Nuclear Power Plants"	There are no PSR2 gaps for CSA N290.12-14. Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CSA N290.12-14.
CNSC G-149 (2000), "Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors"	There are no PSR2 gaps for CNSC G-149 (2000). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with G-149 (2000).

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 1
CNSC R-77 (1987), "Overpressure Protection Requirements for Primary Heat Transport Systems in CANDU Power Reactors Fitted with Two Shutdown Systems"	There are no PSR2 gaps for CNSC R-77 (1987). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with CNSC R-77 (1987).
CSA N290.7-14, "Cyber-Security for Nuclear Power Plants and Small Reactor Facilities"	The gap analysis, N-REP-69000-10003 R000, "Gap Analysis Between CSA N290.7-14 Cyber Security Requirements for Nuclear Power Plants and Small Reactor Facilities" [79] and implementation plan for N290.7-14 was accepted by the CNSC. For reasons of security and confidentiality, the findings of the gap analysis for N290.7-14 will not be discussed in PSR2.
NBCC (2010), "National Building Code of Canada"	There are no PSR2 gaps for NBCC (2010). Per the definition of Compliance for an Incremental Review, Pickering has a PSR2 Compliance associated with NBCC (2010).
NFCC (2010), "National Fire Code of Canada"	There is one PSR2 gap for NFCC (2010), related to piping for flammable or combustible liquids at building entrances. The gap is related to Safety Factor 1 (Plant Design). This issue is identified as a PSR2 gap in OPG Report P-REP-03680-00024 R000, "Pickering 5-8 Continued Operations Plan Review in Support of PNGS Periodic Safety Review 2" [78]. Therefore, a duplicate gap under NFCC (2010) has not been created.
CSA N290.8-15, "Technical Specification Requirements for Nuclear Power Plant Components"	There is one PSR2 CSA N290.8-15 gap which relates to Safety Factor 1 (Plant Design): 1. Clause 4.7 of CSA N290.8-15 mandates that the technical specification requires the supplier to identify and describe all digital items included in their equipment. In the event that the use of digital items is identified by OPG in advance of issuing a Request for Proposal (RFP) or Request for Quotation (RFQ), existing OPG procedures are adequate for ensuring that requirements related to digital items are documented in the technical specification. However, a requirement for a supplier to self-identify whether their product contains any digital items is not reflected in OPG governing documents. This has therefore been identified as a PSR2 gap (**Pickering PSR2 Gap SF1-34**).

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Programs reviewed for Safety Factor 1 are identified in Table 2, and details of the associated effectiveness reviews for each of the N-PROGs are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 1 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 1 to determine impacts associated with operation of the Pickering Units past 2020.

Review of the Darlington IIP [17] for gaps that may need to be reassessed in the context of Pickering PSR2 for operation past 2020, identified the following gap:

- **Gap SF1-35** – Darlington Gap IIP-OI 063 was identified based on the requirement to replace single wall fuel oil piping with double wall piping if degraded piping is found. AR# 28175307 was initiated which required revision of N-PROC-MA-0088, "Buried Piping Program Requirements" to use a graded approach for the replacement of single walled piping with double walled material in instances of leakage. AR# 28175307 currently has corrective actions in place and is expected to be completed by Q1 2020. This issue is also applicable to Pickering NGS and is therefore a gap for Pickering PSR2.

Review of the Pickering LCH [4] identified a concession in Section 6.2 that will need to be considered in the context of continued operation past 2020 for PSR2 Safety Factor 1. The concession is related to exemption from requiring a Canadian Registration Number (CRN) for certain fittings and components associated with fire protection systems. This is identified as a PSR2 gap (**Pickering PSR2 Gap SF1-36**).

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [15] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

The following PSR2 gaps identified in this Safety Factor 1 report are relevant to other Safety Factors:

- Gaps SF1-2, SF1-21 and SF1-22 are relevant to Safety Factor 4 (Aging);
- Gaps SF1-8, SF1-14, SF1-15, SF1-16, SF1-18 and SF1-28 are relevant to Safety Factor 5 (Deterministic Safety Analysis);
- Gaps SF1-17, SF1-18 and SF1-26 are relevant to Safety Factor 6 (Probabilistic Safety Assessment);
- Gap SF1-9 is relevant to Safety Factor 7 (Hazard Analysis);
- Gaps SF1-7 and SF1-30 are relevant to Safety Factor 12 (Human Factors); and
- Gaps SF1-13, SF1-25 and SF1-33 are relevant to Safety Factor 13 (Emergency Planning).

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 1 were reviewed for the eight PSR2 Review Tasks in Section 4.1 of this report and resulted in no Pickering PSR2 gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 1 were prepared per Sections 4.2 and 4.3, respectively, and resulted in PSR2 Gaps SF1-1 to SF1-34 below. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 1 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 1), which resulted in PSR2 Gaps SF1-35 and SF1-36.

The 36 PSR2 gaps that will need to be addressed as part of Pickering PSR2 are:

- **<u>Gap SF1-1</u>**: Clause A.2.3.1 of CSA N285.0-06 identifies that for Shutdown Systems, pressure-retaining portions shall be classified as Class 1, except for three listed exceptions. It was identified during the Pickering B Integrated Safety Review (ISR) that a limited number of Liquid Injection Shutdown System (LISS) components, which should have been Class 1, were purchased and installed as Class 3. In follow-up, OPG proposed four actions to address the deficiency. When refurbishment was not pursued, a code classification concession was accepted for continued operations. This code classification concession and the four actions identified in the Pickering B ISR gap resolution need to be reconsidered in the context of operation of Pickering NGS beyond 2020. Therefore, this has been identified as a PSR2 gap.

- **<u>Gap SF1-2</u>**: The Pickering A Return to Service review against CSA-N285.0-95 identified two Acceptable Deviations relating to Clause 7.0 requiring confirmation that the allowable cycles for fatigue would not be exceeded. For Pickering Units 1,4 and Units 5-8 operation beyond 2020, further confirmation is required that the allowable cycles for fatigue will continue to bound current service limits for extended operation. Therefore, this has been identified as a PSR2 gap.

- **<u>Gap SF1-3</u>**: Clause 7.2.1.10.1 of CSA N293-12 states: "A display and control centre shall be located in the MCR [Main Control Room]… capable of providing detailed information on the location and nature of the signal. In addition, the panel operator shall be able to control the fire alarm system without having to leave his or her station." Pickering 014 Display Annunciation Station 014-67140-WS2342 in the Emergency Operating Centre is capable of providing annunciation only, and there is no Display Annunciation Station in the Pickering 014 MCR (although there is limited annunciation). Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-4**: Clause 7.2.1.13 of CSA N293-12 states: "Electrical conductors that are installed in service spaces containing other combustible materials and that are used in connection with fire alarm systems and emergency equipment, including fire alarm cables… shall be capable of performing their intended functions for not less than 1 hour after the start of a fire." Modifications to the Fire Protection System meet the requirements of CAN/ULC-S524 which mandates a 1 hour fire rating as described in Section 2.5 of NA44-DM-71400.2-00001 R001, Section A.2 of NA44-DM-71400-00002 R000 and Section 2 of NK30-DM-71400-00001 R006. This is achieved by the use of Edwards System Technology (EST) that connects the fire alarm control panels via a data communication link with dual redundant circuit wiring paths. However, existing Pyrotronics fire alarm control panels are not similarly connected and, hence, may be susceptible to loss of alarm signal due to spot burning of a cable. While measures such as lack of combustible material in service spaces, combustible transient material control practices, and inherent protection afforded by Pickering NGS cable routing practices used in the Fire Protection systems mitigate the lack of such a feature, it could not be confirmed based on existing documentation that all essential fire alarm cables are capable of performing their intended functions for not less than 1 hour after the start of a fire to meet the requirement of N293-12 sub-clause 7.2.1.13. As a result, this has been identified as a PSR2 gap.

- **Gap SF1-5**: Clause 7.3.2.2 (d) of CSA N293-12 states: "At a minimum, the fire protection water pumping system shall consist of at least one diesel-engine-driven fire pump and one electric-motor-driven fire pump set, with each pump set being capable of providing, the flow rate and pressure specified in Item (a)". This Clause is met at Pickering Units 1,4 with the provision of diesel-driven firewater pumps, backed up by supplies from the High Pressure Service Water (HPSW) system (as noted in the Pickering A Safety Report NA44-SR-01320-00001 R015, Section 11.5.1.1). It is not met at Pickering Units 5-8, where the Fire Protection System is comprised of the HPSW supplies from the four units only. As a result, Pickering Units 5-8 does not comply with Clause 7.3.2.2 (d) of CSA N293-12 and this has been identified as a PSR2 gap.

- **Gap SF1-6**: The Concrete Containment Structures (CCSs) at Pickering A and B were built and tested to meet the 1965 and 1970 National Building Code of Canada requirements, respectively, prior to the initial issuance of CSA N287.5. No assessments exist which demonstrate that the requirements in effect during construction of Pickering NGS CCSs comply with the requirements of CSA N287.5. Ongoing confirmation that the Pickering NGS CCSs remain fit for service is demonstrated via periodic and in-service inspections conducted in accordance with the requirements of CSA N285.5 and N287.7, and the resultant inspection reports attest to the quality of the design. In addition, the Engineering Change Control (ECC) process ensures that any design changes made to the Pickering CCSs will comply with N287.5 going forward, as applicable.

The original Pickering construction included requirements for tests and quality control procedures which generally meet the intent of N287.5. Furthermore, retroactive application of N287.5 to the as-built design of CCSs cannot be practically achieved without rebuilding them. Nevertheless, there is a PSR2 gap for Pickering NGS given that compliance with the specific requirements of N287.5 has not been demonstrated.

- **Gap SF1-7**: The Darlington Integrated Safety Review (ISR) identified a gap against Clause 4.14.10 of N290.0-11 as a result of the lack of design standards related to Human Factors Engineering (HFE) or HFE activities being formally documented when the control rooms were originally designed and constructed. Pickering NGS has many years of successful Special Safety System (SSS) operation and the absence of formal HFE in the original design is not expected to have any nuclear safety significance relating to SSSs. However, the Darlington gap is also applicable to Pickering NGS and is therefore identified as a PSR2 gap.

- **Gap SF1-8**: Clause 4.2 of N290.0-11 requires that Plant States be grouped into several categories, including Anticipated Operational Occurrences (AOOs). This is consistent with clauses of REGDOC-2.4.1 and REGDOC-2.5.2 related to identification and classification of initiating events. Since AOOs have not been identified and analyzed in the current Pickering Safety Reports, the requirements and credits attributed to the Special Safety Systems for AOOs, if any, cannot be readily ascertained. This issue has therefore been identified as a PSR2 gap. It is being addressed as part of REGDOC-2.4.1 implementation.

- **Gap SF1-9**: Clause 4.13 of N290.0-11 identifies requirements to address dynamic piping effects. OPG is currently in the process of completing the High Energy Line Break Assessment (HELBA) for Pickering NGS. Preliminary results show that there would be no consequential damage caused by the rupture of high energy pipes inside containment to safety related equipment, beyond that already accounted for in the Safety Reports. The final HELBA reports for Pickering Units 5-8 have been completed, while Pickering Units 1,4 are expected to be completed in 2017. Since this work has not been completed for Pickering 1,4, this is identified as a PSR2 gap.

- **Gap SF1-10**: Clause 4.1.8.2 of CSA N290.1-13 is for a new plant and requires remote tripping and monitoring capability for both Shutdown Systems. Pickering Units 1,4 only have one Shutdown System with tripping capability from separate logic (SDSA and SDSE). Remote tripping capability is available for Pickering 5-8 SDS2 and Pickering 1,4 SDSE. However, Pickering Units 5-8 and 1,4 do not have remote tripping and monitoring capability for SDS1 or SDSA respectively. Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-11**: Clause 5.2.1.2 of CSA N290.2-11 requires that Emergency Coolant Injection System (ECIS) design requirements be based on the assumption that the least effective of the Shutdown Systems has operated successfully. The Pickering Units 5-8 Safety Report analysis does address this requirement and the requirement is also contained in the Pickering Units 5-8 Design Requirements. However, this requirement cannot be met for Pickering Units 1,4 since there is only one Shutdown System (albeit with tripping capability from separate SDSA and SDSE logic). Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-12**: Clause 5.14.11 of CSA N290.2-11 requires instrumentation to be available to monitor post-accident effectiveness and to determine the extent of plugging of Emergency Coolant Injection System (ECIS) debris interceptors (strainers). While relative health of a strainer can be inferred by a combination of ECIS recovery pump performance and reactor building water level, there is no direct correlation between these conditions and debris loading available. Therefore, this has been identified as a PSR2 gap (which is applicable to both Pickering Units 5-8 and 1,4).

- **Gap SF1-13**: Per CSA N290.3-11, a Containment Energy Management System (EMS) and Radionuclide Management System (RMS) are required to protect containment and minimize radiological releases for Beyond Design Basis Accidents (BDBAs). The Pickering EMS and RMS use the Filtered Air Discharge System (FADS) and Reactor Building Air Cooling Units (ACUs). Enhancements to the AC power supplies to these systems and related loads are being provided by Phase 2 Emergency Mitigating Equipment (EME), which is not yet fully implemented. This PSR2 gap has been identified to track the implementation of Phase 2 EME such that it can be used to support the EMS and RMS.

- **Gap SF1-14**: Clause 4.2 and Clause 5.19 of CSA N290.4-11 require the capability of the Reactor Regulating System (RRS) to be assessed to deal with Anticipated Operational Occurrences (AOOs), by preventing them from escalating into Design Basis Accidents (DBAs) that would require Shutdown System action. In general, the setback function (and stepback in Pickering Units 5-8) addresses this requirement; however, AOOs have not been identified and analyzed in the current Pickering Safety Reports. Therefore, this has been identified as a PSR2 gap. It is being addressed as part of REGDOC-2.4.1 implementation. Note: There are also additional clauses which refer to requirements of RRS during AOOs (Clauses 5.6.2, 5.19, 5.16.1); however, for convenience, all issues related to AOO requirements for RRS in N290.4-11 are captured under this one PSR2 gap.

- **Gap SF1-15**: A gap exists for the Pickering Units 1,4 and 5-8 Instrument Air and Electrical Systems on Clauses 7.1 and 7.4.2 of N290.5-06 (R2011) including Update No. 1 dealing with requirements for Anticipated Operational Occurrences (AOOs). These clauses introduce the requirement for components to be qualified to perform their required functions during normal operation and AOOs. Only the portion of this clause on AOOs is pertinent to nuclear safety. It is likely that AOOs, due to their nature, do not result in a challenge to the qualification of systems, including Instrument Air and Electrical systems. However, AOOs have not been identified and analyzed in the current Pickering

Safety Reports. This issue has therefore been identified as a PSR2 gap. It is being addressed as part of REGDOC-2.4.1 implementation.

- **<u>Gap SF1-16</u>**: The CSA N290.11-13 Clause 5.1.1 to 5.1.5 requirement for back-up heat sinks to mitigate the conditions following an Anticipated Operational Occurrence (AOO) is not specified in governance/procedures. Loss of a division of power, a single component failure, etc., which are likely to be in the set of AOOs, are accounted for in the specification of heat sinks. However, AOOs have not been identified and analyzed in the current Pickering Safety Reports. This issue is therefore a PSR2 gap. It is being addressed as part of REGDOC-2.4.1 implementation.

- **<u>Gap SF1-17</u>**: Clause 5.6.1 of CSA N290.11-13 requires design reliability to be established for outage heat sinks. Although some emergency heat sinks (e.g., Emergency Boiler Water Supply and Emergency Water Supply) have design reliability requirements, design reliability requirements have not been established for all normal and back-up heat sinks used at Pickering. Reliability of all outage heat sinks (including those without explicit targets) is managed under the Risk & Reliability Program (both through unavailability models as well as through Probabilistic Safety Assessment), hence reactor safety impact is assessed and monitored. However, there is a PSR2 gap with respect to establishment of design reliability requirements for Pickering Units 1,4 and 5-8 outage heat sinks.

- **<u>Gap SF1-18</u>**: Clause 5.6.1 of CSA N290.11-13 requires that the designed reliability for process heat sinks be consistent with Anticipated Operational Occurrence (AOO) frequency limits, such that an emergency heat sink does not need to be used for an AOO. AOOs have not been identified and analyzed in the current Pickering Safety Reports. This issue is therefore a PSR2 gap and is being addressed as part of REGDOC-2.4.1 implementation.

- **<u>Gap SF1-19</u>**: Correspondence with the CNSC identifies all of the software application qualifications for software Categories 1, 2 and 3 from January 1, 2007 to the time of the correspondence (June 2016). However, an evaluation of legacy Real-Time Process Computing applications with respect to the requirements of N290.14-15 for Categories 1, 2 and 3 software has not been performed. Therefore, this has been identified as a PSR2 gap.

- **<u>Gap SF1-20</u>**: Clause 6.5.2.2 of CSA N291-15 imposes new requirements for bolted connections in members that are part of the seismic load resisting system. Pickering NGS structures were not explicitly designed to meet these requirements and this is therefore identified as a PSR2 gap.

- **<u>Gap SF1-21</u>**: Clause 9 of CSA N291-15 contains new requirements related to aging management (including design provisions to account for aging) that are not in CSA N291-08 and that may have significance for operation of Pickering beyond 2020. Pickering structures were not explicitly designed to meet these requirements and this is therefore identified as a PSR2 gap.

- **Gap SF1-22**: Clauses 6.1.1(b) and 6.9.2.1.4 of CSA N291-15 state requirements for aspects of the design that are specifically based on the plant service life. Pickering structures were not explicitly designed or assessed in relation to the requirements of these clauses for operation beyond 2020. This is identified as a PSR2 gap.

- **Gap SF1-23**: For OPG Report NK30-REP-71400-10001 R001, "Fire Protection Code Compliance Review Pickering Nuclear Generating Station B", there is an outstanding issue (Deviation # 13301) which relates to NFPA 24 1970 Section 3601: "Yard post indicator valves at PNGS B are not secured in the open position as required by code" (and which applies to Pickering Units 1,4 as well as Units 5-8). Work to resolve this deviation is currently in progress with locks installed on the majority of the affected valves. Based on OPG List P-LIST-71400-00001 R000, there are a number of Structures, Systems and Components (SSCs) in the yard which directly support plant operation and which are defined as being "related to nuclear safety". As a result, fire water supply to these SSCs is a credited safety function. Deviation # 13301 is not yet complete. Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-24**: For Pickering Units 5-8 the baseline for NFPA 24 compliance is the 1970 version of the standard. Pickering Units 1,4 have not been previously assessed against NFPA 24. Although recent changes to the 2013 and 2016 versions of NFPA 24 will be addressed in any firewater system design changes going forward (as a result of Code-over-Code reviews performed for NFPA 24), compliance has not been formally documented for Pickering Units 1,4 or Units 5-8 against the most recent versions of NFPA 24. Furthermore, there have been a large number of significant changes to NFPA 24 since 1970, including the 2002 edition which "represented a complete revision of NFPA 24". Since Pickering NGS has not demonstrated compliance with the 2016 version of NFPA 24, this has been identified as a PSR2 gap. It is noted that OPG is proactively replacing portions of the firewater piping in accordance with NFPA 24, under the Pickering A Firewater Pipe Replacement Project 13-80069.

- **Gap SF1-25**: Containment Leak Tightness for Design Extension Conditions (DECs): Clauses 7.3 and 8.6.12 of REGDOC-2.5.2 require containment to provide a leak tight barrier following DECs with severe core damage for a period sufficient to implement off-site emergency measures. REGDOC-2.5.2 guidance suggests this period be at least 24 hours. Such a requirement does not exist in Beyond Design Basis Accident (BDBA)/Severe Accident (SA) mitigation, so this represents a PSR2 gap.

- **Gap SF1-26**: On-Demand Reliability of Safety Systems: Clause 7.6 of REGDOC-2.5.2 requires all Structures, Systems, and Components (SSCs) important to safety (SIS) to meet an on-demand failure rate of $<10^{-3}$ yrs/yr. This requirement is not met for several systems including Pickering 1,4 Emergency Coolant Injection (ECI) and is therefore identified as a PSR2 gap.

- **Gap SF1-27**: Sharing of Safety Systems and Turbine Hall: Clause 7.6.5 of REGDOC-2.5.2 has a new requirement that sharing of safety systems and the turbine generator building not be permitted. Pickering Units share Emergency Coolant Injection (ECI) and Negative Pressure Containment (NPC), as well as the turbine hall; therefore, this has been identified as a PSR2 gap.

- **Gap SF1-28**: Allowable Times for Crediting On-Site Operator Actions: Clauses 7.10 and 8.10.4 of REGDOC-2.5.2 establish new time limits for crediting operator actions, i.e., 30 minutes for Main Control Room (MCR) actions and 1 hour for field actions. Pickering NGS has not demonstrated that deterministic safety analysis consequences are acceptable if MCR and field action are not credited for these times respectively. Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-29**: Seismic Qualification and Design: Clause 7.13.1 of REGDOC-2.5.2 requires that Beyond Design Basis (BDB) Earthquake seismic margin be a factor of 1.67 beyond that required for the new plant Design Basis Earthquake (DBE). Fragility evaluations were completed for seismic mitigating Structures, Systems and Components (SSCs), however, based on available information it could not be confirmed that the new plant BDB Earthquake margin of 1.67 would be achieved. Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-30**: Human Factors in Design: Clauses 7.21 and 8.10.1 of REGDOC-2.5.2 introduce new requirements for the systematic application of Human Factors Engineering (HFE) principles to plant design. Many years of safe and reliable operating experience indicate that the design and processes for integration of human interactions with the plant were and remain robust. However, Pickering plant design predates the current requirements for incorporating HFE into the design and the existing plant has not been systematically demonstrated to meet the requirements for a new plant. Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-31**: Detection/Isolation of Emergency Coolant Injection (ECI) Heat Exchanger Tube Leak: Clause 8.5 of REGDOC-2.5.2 requires ECI recovery heat exchanger tube leak detection capability. Pickering Units 5-8 ECI recovery heat exchangers do not have leak detection capability on the cooling water side. Therefore, this has been identified as a PSR2 gap.

- **Gap SF1-32**: Safety Parameter Display System Qualification for Design Extension Conditions (DECs): Clause 8.10.1.1 of REGDOC-2.5.2 requires the Main Control Room (MCR) to contain a Safety Parameter Display System (SPDS) that presents sufficient information on safety-critical parameters for the diagnosis and mitigation of Design Basis Accidents (DBAs) and DECs. The SPDSs are to be qualified for DEC and have parameters available in both the MCR and Secondary Control Areas (SCA), per Clause 8.10.2. Pickering SPDSs are not Review Level Condition (RLC) qualified or available in all locations. As part of the Fukushima follow-up, instrumentation to support critical parameters required to function for DECs has been evaluated for survivability. The instrument loops associated with these parameters have been identified for use in Critical Safety Parameter Monitoring (CSPM) and Beyond Design Basis Accident (BDBA) procedures. However, the indications from these loops are not in one central location and, in some cases, require field action (e.g., power) to obtain data. This does not fully satisfy the requirements to have these parameters available from a SPDS in the MCR and SCA. Therefore, this has been identified as a PSR2 gap relating to the new plant requirement to have SPDS that is DEC qualified and with parameters available in the MCR and SCA.

- **Gap SF1-33**: Full provision of Complementary Design Features for containment integrity as required by Clause 4.2.1 of REGDOC-2.3.2 will be addressed with the completion of Phase 2 Emergency Mitigating Equipment. This work is currently scheduled to be fully implemented by the end of 2017. Since this work is still in progress, it has been identified as a PSR2 gap.

- **Gap SF1-34**: Clause 4.7 of CSA N290.8-15 mandates that the technical specification requires the supplier to identify and describe all digital items included in their equipment. In the event that the use of digital items is identified by OPG in advance of issuing a Request for Proposal (RFP) or Request for Quotation (RFQ), existing OPG procedures are adequate for ensuring that requirements related to digital items are documented in the technical specification. However, a requirement for a supplier to self-identify whether their product contains any digital items is not reflected in OPG governing documents. This has therefore been identified as a PSR2 gap.

- **Gap SF1-35**: Darlington Gap IIP-OI 063 was identified based on the requirement to replace single wall fuel oil piping with double wall piping if degraded piping is found. AR# 28175307 was initiated which required revision of N-PROC-MA-0088, "Buried Piping Program Requirements" to use a graded approach for the replacement of single walled piping with double walled material in instances of leakage. AR# 28175307 currently has corrective actions in place and is expected to be completed by Q1 2020. This issue is also applicable to Pickering NGS and is therefore a gap for Pickering PSR2.

- **Gap SF1-36**: Section 6.2 of the Pickering LCH [4] outlines a concession related to exemption from requiring a Canadian Registration Number (CRN) for certain fittings and components associated with fire protection systems. This concession will need to be considered in the context of Pickering PSR2 for operation past 2020 and is therefore a gap for Pickering PSR2.

The review has confirmed, by assessment against the current licensing basis and applicable standards, requirements and practices, that the design of Pickering NGS and its documentation is adequate.

Appendix A: Nomenclature

ACU	Air Cooling Unit
ALARA	As Low As Reasonably Achievable
AOO	Anticipated Operational Occurrence
AR	Action Request
ASME	American Society of Mechanical Engineers
AVR	Automatic Voltage Regulator
BDB	Beyond Design Basis
BDBA	Beyond Design Basis Accident
CANDU	CANada Deuterium Uranium
CCS	Concrete Containment Structure
CM	Configuration Management
CNSC	Canadian Nuclear Safety Commission
COMS	Constructability, Operability, Maintainability and Safety
COP	Continued Operations Plan
CRN	Canadian Registration Number
CRT	Cathode Ray Tube (display)
CSA	Canadian Standards Association
CSPM	Critical Safety Parameter Monitoring
DBA	Design Basis Accident
DBE	Design Basis Earthquake
DCC	Digital Control Computer
DEC	Design Extension Condition
ECC	Engineering Change Control
ECIS	Emergency Coolant Injection System
EME	Emergency Mitigating Equipment
EMS	Energy Management System
EST	Edwards System Technology
FADS	Filtered Air Discharge System
FAI	Fukushima Action Item
HELBA	High Energy Line Break Assessment
HFE	Human Factors Engineering

IAEA	International Atomic Energy Agency
IIP	Integrated Implementation Plan
ISR	Integrated Safety Review
L/R/C/S	Laws, Regulations, Codes and Standards
LCH	Licence Conditions Handbook
LISS	Liquid Injection Shutdown System
LOCA	Loss of Coolant Accident
MCR	Main Control Room
MSC	Minimum Shift Complement
NFPA	National Fire Protection Association
NGS	Nuclear Generating Station
NPCS	Negative Pressure Containment System
N-PROG	Nuclear Program
OPG	Ontario Power Generation
PACE	Pickering A Control Room Enhancement
PARTS	Pickering A Return to Service
PEVS	Powerhouse Emergency Venting System
PROL	Power Reactor Operating Licence
PSA	Probabilistic Safety Assessment
PSR	Periodic Safety Review
PSR1	Periodic Safety Review 1 (earlier OPG PSR work and other associated assessments)
PSR2	Periodic Safety Review 2 (subsequent PSR per REGDOC-2.3.3)
RFP	Request for Proposal
RFQ	Request for Quotation
RLC	Review Level Condition
RMS	Radionuclide Management System
RRS	Reactor Regulating System
SA	Severe Accident
SCA	Secondary Control Area
SCR	Station Condition Record
SDSA	Shutdown System A
SDSE	Shutdown System Enhancement
SDS1	Shutdown System 1

SDS2	Shutdown System 2
SIS	Systems Important to Safety
SOE	Safe Operating Envelope
SPDS	Safety Parameter Display System
SSC	Structures, Systems and Components
SSS	Special Safety System

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-MP-0007, "Conduct of Engineering"

The Conduct of Engineering Program provides a framework for performing engineering in a consistent manner across Ontario Power Generation (OPG) Nuclear, which includes programs, standards, procedures and instructions. The program establishes the following practices for engineering:

- Ensures plant configuration is maintained in accordance with the design and licensing bases, and operated within its Safe Operating Envelope (SOE).
- Ensures essential plant and nuclear waste management facility equipment performs safely and reliably.
- Complies with relevant legal, statutory, and regulatory requirements.
- Encourages continuous improvement in the conduct of engineering targeted at achieving safe, reliable, and competitive operation of nuclear power generating stations.

The Conduct of Engineering Program is applicable to all organizations performing engineering activities within Pickering. This includes contractors and design agencies performing engineering activities on behalf of OPG Nuclear unless these organizations are performing these activities in accordance with a Quality Program approved by OPG.

The Plant Design department completed a self-assessment in January 2015, P14-001378-SA [B.1.1], to examine various design quality events at Pickering NGS. The self-assessment concluded that performance improvement opportunities applicable to Pickering NGS existed in the areas of event free tools, vendor acceptance practices and staff technical development.

Two ARs were initiated (ARs 28173508 and 28170781) which required corrective actions to be implemented. These ARs have since been completed and the necessary corrective actions were completed to address the underlying issues.

The Operations and Maintenance Support department completed a self-assessment in March of 2013, NO13-000207-SA [B.1.2], in order to assess the health of N-PROG-MP-0007, "Conduct of Engineering" which is applicable for both Darlington and Pickering NGS. This involved a review of the Governance Framework, SCR database, Asset Suite, revision records and previous program assessment reports. No findings/SCRs were initiated as result of this self-assessment.

Nuclear Oversight conducted a performance based audit in October 2015, NO-2015-032 [B.1.3] for Pickering NGS, in order to assess whether the Margin Management requirements defined in OPG Nuclear governance have been met and effectively implemented to support safe and reliable operation (note, N-STD-MP-0020, "Margin Management" standard is a specific element within N-PROG-MP-0007, "Conduct of Engineering"). The audit concluded that performance improvement opportunities applicable to Pickering NGS existed in the areas of Margin Management process requirements (implementation and effectiveness), and fleet alignment in margin management practices.

Three SCRs were initiated to address the above findings (SCRs P-2015-23785, P-2015-23788 and N-2015-23789) which required corrective actions to be completed. The corrective actions from these SCRs have been completed to address the underlying issues. SCR P-2015-23785 has an open action to complete an effectiveness review by Q1 2017, to confirm the effectiveness of the completed actions.

B.2 N-PROG-MP-0006, "Software"

The Software program identifies processes and overall requirements for the classification of software. Software is classified in order to determine the set of applicable standards and procedures for its custom development, maintenance, acquisition, qualification, use and retirement. The Software program complies with Canadian Standards Association (CSA) N286, "Management System Requirements for Nuclear Facilities" and CSA N286.7, "Quality Assurance of Analytical, Scientific, and Design Computer Programs". The program applies to software classified as Real-Time Process Computing (RTPC) and Scientific, Engineering and Safety Analysis (SESA) Software or Software Engineering Tools in Ontario Power Generation (OPG).

Nuclear Oversight conducted an audit, NO-2010-007 [B.2.1], of the SESA software program in March 2010, to assess program compliance and overall program effectiveness for software quality assurance activities. The audit concluded that performance improvement opportunities applicable to Pickering NGS existed in the areas of Program Oversight, execution of SESA software process requirements and SESA software governance.

Five SCRs were initiated during this audit for Pickering NGS (SCRs P-2010-05827, P-2010-05829, P-2010-05832, P-2010-05834 and N-2010-01450) which required corrective actions to be implemented. These SCRs have since been completed and the necessary corrective actions were completed to address the underlying issues.

Nuclear Oversight conducted a performance based audit of the Software Program in June 2015, NO-2015-013 [B.2.2], applicable to both Pickering and Darlington NGSs. The objective of the audit was to determine whether the Software Program requirements for real-time process computing are effectively implemented. The audit determined that the performance of the managed system controls for the Software Program are effective. Improvement opportunities applicable to Pickering NGS were identified in the areas of procurement planning and quality assurance forms, software maintenance plans and software process requirements.

Three SCRs (SCRs N-2015-14731, N-2015-14733 and N-2015-14734) were initiated which required corrective actions to be implemented. The corrective actions from these SCRs have been completed to address the underlying issues.

Design Engineering completed a self-assessment in August of 2015, NO15-001375-SA [B.2.3], for Pickering and Darlington NGS. The purpose of the self-assessment was to perform an annual high level review of the SESA Software Program health. This included a review of previous self-assessments, audits, training statistics and SCRs. No findings/SCRs were initiated as result of this self-assessment.

B.3 N-PROG-MP-0005, “Configuration Management”

The Configuration Management (CM) program is an integrated management process which ensures that:

- Physical and functional characteristics, operation and maintenance conform with the design and licensing basis; and
- Operating, training, modification and maintenance processes are consistent with the design and licensing basis conditions.

The CM program applies to:

- Facility physical configuration, supporting hardware, and software, including: station structures, systems and components (SSCs), waste management facilities, training simulators, engineered tools, nuclear fuel and station process computers.
- Policies, programs and procedures which contain information that could impact the design and licensing basis, physical configuration or any configuration item or information.
- Staff that support operation and preservation of OPG assets (e.g., site staff, Nuclear Engineering, Nuclear Programs and Training, Performance Improvement, Nuclear Operations and contract service providers).

Nuclear Oversight conducted a performance based audit of the CM program in December 2015, NO-2015-033 [B.3.1], for Pickering and Darlington. The purpose of the audit was to determine whether the CM program requirements have been met and effectively implemented to support plant safety and reliability. Performance improvement opportunities were identified in the areas of CM Program governance and implementation.

Two SCRs were initiated (N-2015-29326 and N-2015-29328) which required corrective actions to be implemented. These SCRs have since been completed and the necessary corrective actions were completed to address the underlying issues.

Engineering Mechanics completed a self-assessment in October 2015, N015-000085-SA [B.3.2], in order to assess the health of the Design Management and Configuration Management governance framework, which is applicable for both Darlington and Pickering NGS. This involved a review of SCR databases, operating experience (OPEX) from industry, review of previous design/configuration management self-assessments and code changes versus governance changes. Minor clarifications/insights were proposed as a result of this self-assessment and an Action Request (AR) was generated (AR 28181695). All assignments from this AR have been completed, and the necessary corrective actions were completed to address the underlying issues.

B.4 N-PROG-MP-0009, "Design Management"

The Design Management Program specifies requirements for the following:

- Management of prescribed activities appropriate for execution and control of required design, design support, and documentation for nuclear facilities and organizations owned by Ontario Power Generation (OPG) Nuclear.
- Processes for creating or modifying documentation required for controlling the design basis and design outputs.
- The minimum set of documentation that identifies and describes the design basis, design output, and design process.
- Procurement Engineering processes ensuring implementation and maintenance of the physical nuclear facilities meet the design basis requirements.

The Design Management Program complies with both Canadian Standards Association (CSA) N286, "Management System Requirements for Nuclear Power Plants", as well as CSA N285.0, "General Requirements for Pressure-Retaining Systems and Components in CANDU Nuclear Power Plants" and N-MAN-01913.11-10000, "Pressure Boundary Program Manual", which specifies general requirements for design of pressure retaining systems, components, and their supports, and with complementary standard CSA B51.

Engineering Mechanics completed a self-assessment in October 2015, N015-000085-SA [B.4.1], in order to assess the health of the Design Management and Configuration Management governance framework, both of which are applicable to Darlington and Pickering NGS. This involved a review of SCR databases, operating experience (OPEX) from industry, review of previous Design/Configuration management self-assessments and code changes versus governance changes. The self-assessment concluded that the Design Management Program is in compliance with the applicable codes and licence conditions. AR# 28181695 was initiated to address minor clarifications/insights, which has since been completed.

Nuclear Oversight conducted a performance based audit of the design management program in June 2015, NO-2015-018 [B.4.2], in order to evaluate the level of compliance and effectiveness of the Design Control element of the Pressure Boundary Program Manual and assess the alignment between the Pressure Boundary Program Manual and design control governance. The audit determined that the Design Control elements of the Pressure Boundary Program Manual are effective and in compliance with all aspects of the QA program, and associated codes and standards. No findings were generated as a result of this audit.

Per P-REP-01914-00004, "Pickering Design Quality Assurance Program Review Years 2011-2014" [B.4.3], Pickering NGS carried out an assessment of the effectiveness of the quality management system as it pertains to Pickering Design Engineering, for the period of 2011 through 2014. The assessment also included a review of the effectiveness of corrective actions from the previous program review as well as other self-assessments, reviews and audits performed during the period. The assessment identified the following recommendations:

- Establish a Design Human Performance working group to continuously improve the effectiveness of the design, application and use of Event Free Tools (complete).

- Establish a process to systematically address knowledge transfer. A guide, along with a list of potential training courses for Design Engineers, to be used in conjunction with existing tools for employee development has been prepared and implemented. This information is used with design staff to assist in development planning (complete).

- Improve the clarity of action closure notes. Although this action is still open, the identified gap is administrative in nature and is not significant in the context of PSR2.

This revision history is applicable to Tetra Tech Report # 705-1680051200-REP-G0012-06.

Executive Summary

Introduction and Background

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards, as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 2 (SF2), Actual Condition of Structures, Systems, and Components (SSCs) Important to Safety, is presented in this report. It presents the results of the assessment of the Actual Condition of SSCs Important to Safety at Pickering NGS against Review Tasks as outlined in PSR2 Basis Document [1]. All results of reviews of Laws, Regulations, Codes and Standards and effectiveness reviews of OPG Programs applicable to SF2, are documented in the Safety Factor 4 Report [4].

Scope

There are six Review Tasks associated with the SF2 Review of Actual Condition of SSCs Important to Safety as summarized below (see Section 2.0 for detailed task descriptions):

1. Assess and document the actual condition of station SSCs Important to Safety.
2. Confirm facilities and resources are available for ongoing plant maintenance.
3. After completing the Condition Assessments (CAs), confirm that the design basis assumptions have not been significantly challenged and will remain that way throughout the PSR2 period.

4. Review the condition and operation of the Spent Fuel Storage Facilities.
5. Assess dependence on obsolete equipment for which no direct substitute is available.
6. Assess dependence on essential services and/or supplies external to the plant.

Although not considered a Review Task, the scope also includes a review of Emergency Mitigating Equipment (EME) required to mitigate the consequence of Beyond Design Basis Events (BDBEs).

This review considers continued commercial operation of Pickering Nuclear Generating Station up to 2028. The scope of the review does not address plant states after commercial operation is completed, e.g. final defueling.[1]

Findings and Conclusions

The assessments of the six Review Tasks and additional required reviews have been completed. As documented in this report, these assessments conclude that the majority of the plant SSCs are in good condition and support extended station operation to 2024. This conclusion is supported by the comprehensive and effective set of plant programs in place to ensure the condition of components meet design requirements with margin.

Recommendations for improvement have been made when required, many of which are in progress. For this life extension period, no major concerns have been identified and the SSCs Important to Safety continue to operate as per the design basis requirements. Recommendations to improve Aging Management practices have been made. Additional assessments need to be completed to fully assess life extension to 2028. This required work is documented in the SF2 gaps below.

The condition of Major Components, consisting of Fuel Channels, Feeders, Steam Generators, and Reactor Components and Structures is managed by rigorous Life Cycle Management Plans (LCMPs). There is high confidence that the major components will remain fit for service up to an extended station life to 2024, with limited potential mitigating actions required. However, additional analysis and assessment is required to demonstrate continued Fitness for Service for extended station life to 2028.

The Condition Assessments (CAs) discussed in this report support that for the balance of SSCs Important to Safety, including the Irradiated Fuel Bays, the majority of components (~93%), are rated as Satisfactory or better using the classification criteria described. For the Special Safety Systems there are only two components which are

[1] These post-shutdown phases, i.e. defueling, de-watering and transferring fuel from the IFBs to dry storage, are being considered as part of the Stabilization Activity Plan (SAP). Updated condition assessments are being prepared to cover these phases.

rated Poor. However, as discussed in this report, either their classification has been re-assessed as Satisfactory, or they don't have a safety function in the system. Updated CAs are being completed as part of OPG's ongoing aging management program. The need to complete these CAs is a SF2 gap.

Programs are in place to address required station maintenance and equipment obsolescence. The Irradiated Fuel Bays and supporting equipment are generally in good condition and are able to support the station's spent fuel storage strategy. Also, no vulnerabilities have been identified in obtaining external services and supplies.

The following eighteen gaps need to be addressed further as part of the PSR2 Global Assessment Report and Integrated Implementation Plan process:

- **Gap SF2-1:** Fitness for Service for Fuel Channels has not been demonstrated for station operation to 2028.
- **Gap SF2-2**: OPG does not have approval to operate beyond the current Licence limit of 247,000 Effective Full Power Hours (EFPH) for fuel channels.
- **Gap SF2-3**: The Fuel Channels LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-4**: Fitness for Service for Feeders has not been demonstrated for station operation to 2028.
- **Gap SF2-5**: The Feeders LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-6:** Fitness for Service for Steam Generators has not been demonstrated for station operation to 2028.
- **Gap SF2-7**: The Steam Generators LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-8:** Fitness for Service for Reactor Components and Structures has not been demonstrated for station operation to 2028.
- **Gap SF2-9:** The Reactor Components and Structures LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-10:** Environmental Factors have not been incorporated into the Service Limits Assessment for Class 1 piping.
- **Gap SF2-11:** Condition Assessments for civil structures are not complete for station operation to 2028.
- **Gap SF2-12:** Condition Assessments for in-scope piping systems are not complete for station operation to 2028.
- **Gap SF2-13:** The Cable Surveillance Program risk assessment and condition assessments currently use out of date criticality coding.
- **Gap SF2-14:** The Buried Piping Program risk assessment and condition assessments have not been updated for extended operation to 2028.
- **Gap SF2-15**: Updated Detailed Condition Assessments are not complete for Commodity Groups in the scope of PSR2 for station operation to 2028.
- **Gap SF2-16:** Action plans to correct the leakage in IFB-B are not complete.

- **Gap SF2-17:** The seismic capacity of the current spent fuel basket stacking arrangements in the Pickering IFBs needs to be documented.
- **Gap SF2-18**: The seismic capacity of the Pickering 058 IFB conveyer tunnel needs to be documented.

TABLE OF CONTENTS

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[2] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1 and 4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart these units. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR. These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as “PSR1”). The current PSR (referred to as “PSR2”) is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1, 4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against “Review Tasks” identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 and International Atomic Energy Agency (IAEA) SSG-25 [2];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards, as defined in Reference [1];

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 2 (SF2), Actual Condition of Structures, Systems, and Components (SSCs) Important to Safety, is presented in this SF2 report. It

---

2 Pickering Units 5-8 are currently approved to operate to 247,000 Effective Full Power Hours [25]. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028.

represents the results of the assessment of the Actual Condition of SSCs Important to Safety at Pickering NGS against Review Tasks as outlined in PSR2 Basis Document P-REP-03680-00001 R02 [1].

As outlined in IAEA SSG-25 [3], the objective of the review of Safety Performance Safety Factor 2 is to: “determine the actual condition of SSCs important to safety and so to consider whether they are capable and adequate to meet design requirements, throughout the period of PSR2. In addition, the review should verify that the condition of SSCs important to safety is properly documented, as well as reviewing the ongoing maintenance, surveillance and in-service inspection programmes, as applicable.” REGDOC-2.3.3 [2] requires that: “The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant.”

Per the Pickering PSR2 Basis Document [1], analysis of gaps and potential safety enhancements for Pickering NGS (including identification of improvements that are reasonable and practicable to implement) is addressed as part of the Global Assessment process. Preparation of a plan for the implementation of safety enhancements is addressed by the PSR2 Integrated Implementation Plan.

2.0 SCOPE OF REVIEW

The scope of the review was based on Review Tasks as documented in the PSR2 Basis Document P-REP-03680-00001 R02 [1]. Generally, the scope of the Safety Factor reports includes reviews against (i) Review Tasks, (ii) Modern Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis, and (iii) effectiveness reviews of OPG Programs applicable to the Safety Factor.

For Safety Factor 2:

- OPG governance, the PNGS design and the actual condition of the plant were assessed to determine the level of compliance with the requirements of each Review Task;
- All results of reviews of Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis applicable to SF2 are documented in the Safety Factor 4 Report [4]; and
- Effectiveness reviews of OPG Programs applicable to Safety Factor 2 are documented in the Safety Factor 4 Report[3] [4].

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

This review conservatively considers continued operation of Pickering Nuclear Generating Station to 2028. Consistent with the PSR2 Basis Document [5], a freeze-date of January 15, 2016 has been utilized to complete the assessment. All information inputs, e.g. system health reports, used in this assessment are aligned with this date.

It was recognized that, although the period of the PSR extends to 2028, the end of commercial operation is expected to occur prior to that. As such, the groups that are separately planning the life extension and the transition to Safe Storage are collaborating to ensure the plant condition assessment (i.e., aging management plans) adequately address the transition stages.

[3] As documented in Section 4.4, some component aging issues are contained in Safety Factor 4.

OPG's Aging Management program takes into consideration the long term aging management assessments and transition to decommissioning requirements. This is achieved by proactively identifying the plant's Systems, Structures and Components (SSCs) that will also be required to perform for years after the shutdown date. For example, items supporting the irradiated fuel bays will have to operate at least 10 years after shutdown, while some other SSCs may be needed even longer. As a result, the extended operations group has developed a System Transition Boundary Report [96], which documents the required lifespan of the various systems of the plant. This report includes input from the decommissioning/safe storage team, to ensure it reflects the post-shutdown aging management requirements, and they are being documented in the System End State Determination Reports.

2.1 REVIEW TASKS

The PSR2 Basis Document (P-REP-03680-00001 R02) [1] identifies that the Review Tasks for each Safety Factor Report are an interpretation of requirements and guidance set out in IAEA Safety Guide SSG-25 'Periodic Safety Review for Nuclear Power Plants' [3] and CNSC REGDOC-2.3.3 [2]. The Review Tasks were chosen to fulfil the requirements of IAEA SSG-25 [3], and also to retain alignment to the extent practicable with earlier Review Tasks from the Darlington and Pickering B ISRs [11] [12]. These previous ISRs were completed in accordance with CNSC RD-360, Life Extension of Nuclear Power Plants [13] and IAEA NS-G-2.10, Periodic Safety Reviews of Nuclear Power Plants [14], which have since been superseded. By keeping the structure and grouping of similar SSG-25 [3] Review Tasks as close as possible to previously used Review Tasks, the review effort can more effectively focus on safety significant differences including changes in requirements, plant conditions, operating experience and new information. This focus is consistent with the intent of a subsequent PSR as described in REGDOC-2.3.3 [2]. Details of the full alignment of IAEA SSG-25 [3] with the PSR2 Review Tasks are provided in the PSR2 Review Task Definition Report P-REP-03680-00003 [15].

The Objectives and Review Tasks for Safety Factor Report 2 (SF2) are defined in the PSR2 Basis Document R02 [1] as follows:

Objective: The objective of the review of this Safety Factor is to determine the actual condition of SSCs important to safety and to assess whether they are capable and adequate to meet design requirements, throughout the period of PSR2. In addition, the review should verify that the condition of SSCs important to safety is properly documented, as well as reviewing the ongoing maintenance, surveillance and in-service inspection programmes, as applicable.

Review Tasks:

1) Assess and document present conditions of the SSCs important to safety and confirm appropriate measures to address any significant existing or anticipated aging degradation are in place. Any major difference between operating units with respect to aging degradation mechanisms, present condition, or recommended actions shall also be presented.

2) Confirm resources and facilities (on and off site) are available for ongoing plant maintenance.

3) After determining the actual condition of SSCs important to safety, each of these SSCs will be assessed against the current design basis to confirm that design basis assumptions have not been significantly challenged and will remain that way throughout the period of PSR2.

4) Review the condition and operation of spent fuel storage facilities and their effect on the spent fuel storage strategy for Pickering NGS.

5) Assess dependence on obsolescent equipment for which no direct substitute is available.

6) Assess dependence on essential services and/or supplies external to the plant.

2.2 EMERGENCY MITIGATING EQUIPMENT REVIEWS

OPG has established Emergency Mitigating Equipment (EME) at its nuclear power stations to support the station response to Beyond Design Basis Accidents (BDBA). EME is not considered a Safety Related System at OPG, however, OPG has established EME procedures and practices commensurate with the role of the equipment in support of BDBA response. An assessment of the OPG procedures and practices in support of EME and the Pickering NGS EME equipment is included as part of the scope of SF2. This assessment, which was completed by OPG [70], addresses the technical basis, functional requirements, maintenance and testing applicable to EME. A summary of the report’s findings and conclusions is included within this report.

2.3 Additional Reviews

The PSR2 Safety Factor 2 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [25] for any impacts of Pickering NGS operation beyond 2020 on the following (related to Safety Factor 2):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The review of Pickering PSR1 gaps previously identified in the Pickering 5-8 Continued Operations Plan (COP) is provided in a separate PSR2 COP Review Report [88].

Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report, P-REP-03680-00022 R00, Fukushima Action Item Review in Support of PNGS Periodic Safety Review 2 (PSR2) [81].

Any PSR2 gaps identified as a result of the Safety Factor 2 review which are relevant to other Safety Factors are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

3.1 Review Task #1 – Actual Condition of SSCs

Review Task #1 is to assess and document the actual conditions of the SSCs important to safety and confirm appropriate measures are in place to address any significant existing or anticipated aging degradation. Any major differences between operating units with respect to aging degradation mechanisms, present condition, or recommended actions are also presented.

The two primary sources of information included in this review are Detailed Condition Assessments (DCAs) and Major Component Life Cycle Management Plans (LCMPs). The LCMPs are prepared and executed to assure the ongoing fitness for service of Fuel Channels, Steam Generators, Feeder Piping, and Reactor Components and Structures. Detailed Condition Assessments are prepared for the balance of Systems, Structures and Components (SSCs) deemed as being AM critical.

The Detailed Condition Assessments and Major Component Life Cycle Management Plans are not documented within this report, however they are Controlled Documents following OPG's well established and robust aging/asset management programs.

OPG's Integrated Aging Management (IAM) Program defines the method of condition assessment for plant SSCs. Documented detailed condition assessments are not required for all SSCs. As per Appendix A in N-PROG-MP-0008 [34], condition assessment is managed by either LCMPs, Condition Assessments (CAs), and/or by System and Component Surveillance. Not all plant SSCs require an assessment of condition to be documented in a DCA. Only those SSCs not-screened out via the aging management process (N-PROC-MP-0060 [7]) require a detailed condition assessment. The condition of screened-out SSCs is addressed by System Surveillance, N-PROC-MA-0024, "System Performance Monitoring" [93] and Component Surveillance, N-PROG-MA-0017, "Components and Equipment Surveillance" [87] and other programs. This is elaborated on further below in the section on the Treatment of SSCs not Requiring a Detailed CA.

An overview of OPG's IAM Program, N-PROG-MP-0008, "Integrated Aging Management" [34] and how it addresses the present condition of SSCs is provided in Appendix C. The Appendix also describes how the IAM program interfaces with and supports the Equipment Reliability Program, N-PROG-MA-0026, "Equipment Reliability" [80].

The following section describes how OPG's Aging Management governance has been applied for the completion of the condition assessments for PSR2.

Detailed Condition Assessments

The Condition Assessment process is defined within N-PROC-MP-0060, “Aging Management Process” [7] as well as P-GUID-01060-10000, “Condition Assessment Preparation Guide” [8]. The process is comprised of three primary steps: (i) Scoping (ii) Screening and (iii) Condition Assessment.

Scoping:

N-PROC-MP-0060 describes the detailed steps followed to derive the scope of OPG’s Aging Management Program. These steps define the boundary of System, Structures and Components (SSCs) that are considered within the program. Appendix C provides a full description of the process. The end result is a scope that includes the majority of station SSCs contained in the station’s Master Equipment List (MEL), encompassing most important station systems (both safety related and production important). Both critical and non-critical SSCs are included, with similar components combined into Commodity Groups (CGs). Component criticality is discussed further in the description of Screening. Both active and passive (e.g. structures, piping) components are included in the scope as required in governance.

From this broad AM scope for the Pickering station, the scope of PSR2 has been defined. In completion of SF2 Review Task #1, this scope is refined down to address SSCs Important to Safety. This is first done at the system level. The scope of the systems within the scope of PSR2 encompasses the Pickering Safety Related Systems, documented in P-LIST-06937-00001 [16] with a focus on Pickering Systems Important to Safety (SIS) (listed in OPG reports NA44-REP-03611-00004 [17] and NK30-REP-03611-00024 [18]), and Safe Operating Envelope (SOE) Systems (listed in N-INS-03602-10001 [19]).

OPG defines Safety Related Systems as those systems and the components and structures thereof, which by virtue of their failure to perform in accordance with the design intent, have the potential to impact on the radiological safety of the public or plant personnel (as defined in P-LIST-06937-00001 [16]). Safety Related Systems are associated with the provision of the following safety related functions: shutdown and regulating (Control), cooling of the reactor core (Cool), and limiting the release of radioactive material and exposure of plant personnel and/or the public during normal operation and accident conditions (Contain). Systems used for critical monitoring functions are also included.

Systems Important to Safety, a sub-set of the Safety Related Systems, are defined following OPG governance standard N-STD-RA-0033 [20], considering the risk importance of system and utilizing expert review panels to select these systems. The identification of SIS is consistent with the requirements of CNSC RD/GD-98 [21].

Safe Operating Envelope (SOE) systems, a sub-set of the Safety Related Systems, are identified per OPG standard N-STD-MP-0016 [22], and it consist of systems and their associated critical components and structures, for which operational safety requirements are specified to conform with the Pickering A and B Safety Reports [23] [24]. OPG has prepared formal Operational Safety Requirements (OSR) documents in support of SOE systems. The SOE systems and associated OSRs are listed in OPG instruction N-INS-03602-10001 [19] and are also listed in the Licence Condition Handbook [25].

The Pickering NGS Units 1,4 SOE/SIS systems included in the PSR2 assessment are listed in Appendix B.1 Table B.1-1 The Pickering NGS Units 5-8 SOE/SIS systems included in the PSR2 assessment are listed in Appendix B.1 Table B.1-2. Per Reference 7, Critical Structures (e.g. Reactor Buildings, Pressure Relief Duct and Vacuum Building) are also addressed in the review.

Within these PSR2 systems, system components having common attributes, e.g. type, criticality, are then arranged into Commodity Groups (CGs). The next step in the CA process is to screen these CGs to determine which are to be subject to detailed condition assessment.

Screening:

The objective of the aging management screening process is to review the large number of SSCs (greater than 500,000 for Pickering) in the scope of the program, and by employing a systematic process using defined criteria to determine which SSCs should be subject to detailed condition assessment. Per OPG Aging Management governance [7], to determine the condition of screened-out SSCs does not require an in-depth condition assessment, but rather, their condition is assessed and managed by other processes in the AM program, e.g. the Equipment Reliability program including system performance monitoring. The treatment of screened-out components (not requiring a Detailed CA) is discussed further below in the section on the “Treatment of SSCs not Requiring a Detailed CA”.

Critical components in the in-scope systems are included in the aging management scope for PSR2. Component Criticality is defined in N-PROC-MA-0077 R006, “Critical Equipment Identification and Categorization” [9]. Using this procedure, components are assigned criticality codes CC1, 2, 3 or 4. Criticality sub-codes are also assigned in the areas of Reactor Safety (RS), Production (P) and Cost, Conventional Safety and Environmental (CCSE). CC1 and 2 components are “critical” components and CC3 and 4 are “non-critical”.

CC1 and 2 components are included in the scope of aging management. For PSR2, CC3/RS3 components are also included. RS3 components are non-critical components having a lower level of importance in reactor safety function, i.e. (i) Components in an OSR system that are also in a non-SIS, whose failure results in a partial loss of redundancy impairment condition, or (ii) is associated with safety component testing. A partial loss of redundancy results when a safety system component is unavailable, however redundancy in the safety function is still present. Other non-critical components can also be added to the scope as requested by the system engineer. Critical structures are not always defined a criticality code and therefore they are included in the scope as per instructions in N-PROC-MP-0060 [7].

The next step of the screening process requires that a preliminary assessment be performed which collects pertinent information needed to conduct further screening. The information collected for each SSC is: (i) Aging Related Degradation Mechanisms (ARDMs), i.e. modes or processes resulting in degradation of the component, e.g. corrosion and (ii) Aging Management Practices (AMPs), i.e. the methods in place to detect and manage component aging.

The objective of the remaining steps in the process is to identify components which require a detailed Condition Assessment. These screening steps are described further in Appendix C. Before describing the condition assessment process used for screened-in components, a description is provided of the methods of managing aging used for screened-out components, i.e. those not requiring a Detailed CA.

Treatment of SSCs not Requiring a Detailed CA:

The condition of screened out components is managed on an ongoing basis via OPG's Equipment Reliability (ER) program and other supporting programs. OPG's ER program is aligned with best industry standards and is comprised of a set of processes whose objective is to ensure that the reliability of systems and components is managed on an ongoing basis, including ensuring that all nuclear safety requirements are met.

Example Supporting Equipment Reliability processes are:

(i) The Corrective Action Program, "Corrective Action", N-PROG-RA-003 [92], executed to identify adverse trends in performance or component failures and put corrective actions in place to prevent re-occurrence of the adverse condition;
(ii) System Performance Monitoring, "System Performance Monitoring", N-PROC-MA-0024 [93] which requires surveillance, tracking, reporting on overall health and preparation of System Health Action Plans to improve system health and component condition; and
(iii) The Component and Equipment Surveillance Program, N-PROG-MA-0017 [87], which addresses a number of different types of components, e.g. Power Operated Valves, Buried Piping, Cables, Heat Exchangers, etc. and;
(iv) The Preventative Maintenance Program, "Conduct of Maintenance", N-PROG-MA-0004 [94] which uses component operating history to optimize component performance and maintenance practices via PM feedback mechanisms and conducts the required maintenance on components. Work reports document the observed condition of equipment subjected to maintenance

Ongoing assessment, monitoring and the documenting information on the condition of station systems and components is conducted per the ER program.

With respect to the documentation of the condition of screened-out components, the objective of screening is not to assign a condition or classification for screened out components. As per N-PROC-MP-0060 [7], this is only required for components for which a detailed condition assessment is performed. However, during the preliminary assessment of component aging used in the screening process, the condition of AM-critical components is reviewed based on operating history, system health reports and other data sources. This information is documented in the System Screening Reports.

In addition, a number of comprehensive programs are in place which document component condition including: System and Component Health Reporting; The Maintenance Program which documents as-found condition of components; Predictive Maintenance, e.g. vibration monitoring; the Corrective Action Program, documenting adverse conditions on equipment in SCRs; Annual Reliability Reports; Design Assessments and many other station processes.

Detailed Condition Assessment:

Aging Management Critical components not screened out are subject to Detailed Condition Assessment (CA). These assessments involve:

a) Identifying and understanding component Age Related Degradation Mechanisms (ARDMs);
b) Collecting data to evaluate the degree of degradation experienced to date, e.g. SHR data, OPEX, SCRs, etc.;
c) Documenting Aging Management Practices (AMPs) in place to mitigate aging.
d) Assessing the adequacy of the AMPs;
e) Evaluating component condition by comparing experienced degradation against established limits; and
f) Establishing actions required to minimize and control Aging Related Degradation Mechanisms (ARDMs) and improving condition.

All of the information above is documented in a Detailed CA. An overall Condition Classification (Very Good, Good, Satisfactory, Poor, and Very Poor) is defined per the criteria in N-PROC-MP-0060 [7] (also provided in Appendix C), which accounts for:

a) The physical condition of the component at the time of assessment, and
b) The adequacy of the practices in place to manage component aging.

Condition Classification is assigned by selecting the limiting of these two criteria. For example if the physical condition of a component is “Good”, but the adequacy of practices is rated as “Satisfactory”, the component condition classification is rated as “Satisfactory”.

Per N-PROC-MP-0060 [7], recommendations for improvement are required for components with a “Poor” or “Very Poor” classification. These are captured as actions in the CAs. In many cases, recommendations are also made for “Satisfactory” or better rated components to maintain or improve this classification. However, these are not essential per governance. AM actions are captured in system health and component health reports. These actions are assessed on an on-going basis and are prioritized and tracked to completion via SHR action plans. OPG plans to implement a new Aging Management database to aid with the tracking and oversight of AM actions.

Review Task #1 also requires the following:

> *“Any major difference between operating units with respect to aging degradation mechanisms, present condition, or recommended actions shall also be presented.”*

Detailed CAs are prepared separately for Pickering Units 1, 4 and 5-8. These separate CAs also address equipment tags for all of the operating units and any differences between units in component condition, OPEX, practices or other factors and resulting recommendations are identified. Components in Units 2 and 3 are in scope if they play a role in supporting operating units, e.g. specific Unit 2 Class III 4.16 kV buses (there are a limited number of Unit 2 and 3 components in scope).

For this review, the contents of existing OPG approved Detailed CAs from screening were reconciled up to the PSR2 Basis Document R00 [5] freeze-date of August 31, 2015. Relevant plant information was reviewed (e.g. SCRs, Health Reporting, Work Orders (WOs), etc.) to establish the condition of each CG as of the freeze date. The Detailed CAs include recommendations (where needed) to reach Plant EOL (2020) and for an additional four years addressing continued operations to 2024.

The primary inputs to Detailed CAs are System and Component Health Reports from the OPG System, Plant, and Program IQ databases. System Health reports are designated by system, year and quarter. Work Orders, Preventative Maintenance Instructions and Station Condition Records were reviewed on as a required basis.

In addition to the above, the Detailed CAs are currently being updated to:

- Use an updated freeze date of January 15, 2016.
- Incorporate updated scoping and screening work. The scoping and screening is being updated to take into account work performed to review and revise component criticality and reflect the extended station operation to 2028
- Include full power operation of the Pickering Units to 2028.
- Address the different phases of permanent station shutdown, e.g. defueling. Although, this aspect of the CAs is not in the scope of PSR2.

This updated condition assessment work is being performed as part of OPG's ongoing IAM Program work, which routinely updates condition assessments as required and is not documented in this SF2 report. The preliminary results of these updated CAs is provided in Section 4.1.1.2.48.

Major Components

OPG maintains Life Cycle Management Plans (LCMPs) for major component groups as per OPG Major Components Program N-PROG-MA-0025, "Major Component" [26].

A review of the Major Components LCMPs (Fuel Channels, Feeder Piping, Steam Generators, and Reactor Components and Structures) Fitness for Service was completed by OPG [27]. OPG reviewed the overall Life Cycle Management Program, in-service inspection data, maintenance, engineering assessments, and research and development findings to determine the viability of these critical SSCs to remain fit for service to 2024. A summary of this review is included within this SF2 report. A review of the LCMPs to assess fitness for service to 2028 is not included in this revision of the report, but will be discussed in section 4.1.1.1.

Additionally, a Class 1 Piping Service Limit Assessment has been completed by OPG [28], the results of which are also summarized in this SF2 report.

3.2 Review Task #2 – Maintenance Facilities and Resources

Review Task #2 is to confirm resources and facilities (on and off site) are available for ongoing plant maintenance. Existing Plant Maintenance facilities used by Pickering NGS (onsite and offsite) were identified and described. Internal audits, self-assessments, and Station Condition Records (SCRs) were reviewed to confirm that the resources and facilities are available for ongoing plant maintenance. The review was based on criteria established within the IAEA Guide NS-G-2.6 'Maintenance, Surveillance and In-Service Inspection in Nuclear Power Plants' [40].

3.3 Review Task #3 – Design Basis Assumptions

Review Task #3 is linked to Review Task #1. As part of the process of determining the actual condition of SSCs important to safety, each of these SSCs is assessed against the current design basis to confirm that design basis assumptions have not been significantly challenged and will remain that way through the period of life extension.

3.4 Review Task #4 – Spent Fuel Storage Facilities

Review Task #4 is to review the condition and operation of spent fuel storage facilities and their effect on the spent fuel storage strategy for Pickering NGS. Inputs include a review of safety, inspection, and analysis reports, audits, self-assessments, and station condition records.

3.5 Review Task #5 – Dependence on Obsolescent Equipment

Review Task #5 is to assess dependence on obsolete equipment for which no direct substitute is available. The results of the condition assessments were reviewed to determine the degree to which station components are potentially obsolete. OPG's process for managing equipment obsolescence was also reviewed for its effectiveness in resolving obsolescence.

3.6 Review Task #6 – Dependence on External Essential Services/Supply

Review Task #6 is to assess dependence on essential services and/or supplies external to the plant. A review of system health and other reports and SCRs for SIS/SOE systems was performed to identify any vulnerabilities. In addition, the processes in place to sustain the required external essential services and supplies are described.

3.7 Additional Reviews

A review of the Pickering Licence Condition Handbook (LCH) [25] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (related to Safety Factor 2):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The review of Pickering PSR1 gaps previously identified in the Pickering 5-8 Continued Operations Plan (COP) is provided in a separate PSR2 COP review Report [88]

Fukushima Action Items (FAIs) were reviewed to identify any implications of extending operation beyond 2020. This review is presented in a separate PSR2 FAI Review Report. [81]

Any PSR2 gaps identified as a result of the Safety Factor 2 review which are relevant to other Safety Factor reports are discussed in Section 4.4 of this report.

4.0 REVIEW FINDINGS

4.1 REVIEW TASKS

4.1.1 *REVIEW TASK #1 - ACTUAL CONDITION OF SSCS*

4.1.1.1 *MANAGEMENT OF MAJOR COMPONENTS*

The OPG Major Components Program N-PROG-MA-0025 [26] classifies Fuel Channels, Feeders, Steam Generators, and Reactor Components and Structures as Major Components, and establishes requirements for an integrated set of processes and activities to justify Fitness for Service for these components and to develop long-term Life Cycle Management strategies that support the preservation of these assets. N-PROC-MA-0100 'Major Component Life Cycle Management Plan' [29], provides guidance for the preparation, review, and update of Life Cycle Management Plans (LCMPs) for each of these Major components Fuel Channels [30], Feeders [31], Steam Generators [32], Reactor Components & Structures [33], to facilitate compliance with the Major Components Program N-PROG-MA-0025 [26] and to meet the requirements of Integrated Aging Management (IAM) Program N-PROG-MP-0008 [34].

As described in P-CORR-01060-0632223 [27], major component aging is managed through a comprehensive program of in-service inspections, maintenance, engineering assessment and confirmatory research and development (R&D). These processes provide for the timely detection and mitigation of aging effects in SSCs that impact plant safety, reliability, and economics; thereby providing a decision making process to optimize asset management. The LCMPs addresses legal (Regulatory/Periodic Inspection Program) requirements, Fitness for Service (FFS) and asset preservation activities. The LCMPs are updated on a regular basis to include actions based on inspection results, industry operating experience, and research and development findings.

OPG conducted an assessment of Major Components and have documented the assessment findings and recommendations in P-CORR-01060-0632223 [27]. The key findings and conclusions of this assessment are summarized in the following subsections for each of the Major Components; Fuel Channels, Feeders, Steam Generators, and Reactor Components and Structures.

4.1.1.1.1 *FUEL CHANNELS*

OPG has completed and documented in the Fitness for Service Memorandum [27] a review of Fuel Channels and the results of the activities defined by the Fuel Channel LCMP [30]. This review included assessment of the LCMP principles and methodology, fuel channel inspections, fuel channel Fitness for Service (FFS) requirements, and fuel channel aging mechanisms. A summary of the review in the Fitness for Service Memorandum [27] is included below.

The assessment of fuel channel life cycle management principles and methodology included a listing of strategic goals of the fuel channel LCMP and the means by which those goals were achieved. The LCMP provides projections of the service life using the most up-to-date knowledge of the components condition and updates these projections as new information becomes available. The impact of other components and systems on the performance of fuel changes, and the impacts of fuel channel aging on other systems are also considered. No gaps in the principles and methodology were identified by OPG in their Fitness for Service Memorandum [27].

Fuel channel inspections and fuel channel Fitness for Service are governed by CSA standard N285.4 ‘Periodic Inspection of CANDU Nuclear Power Plant Components’ [35] and compliance to this standard is required by the Power Reactor Operating Licence (PROL). As per the Fitness for Service Memorandum [27], the LCMP for fuel channels includes inspection scope that exceeds the minimum CSA standard requirements of N285.4 [35] to demonstrate FFS. If a flaw is detected by in-service inspection that does not satisfy the acceptance criteria it is necessary to engage in the component disposition process to demonstrate FFS for the next operating interval.

Fuel channel aging mechanisms include pressure tube: axial elongation, sag, wall thinning, and diametral expansion; changes in spacer material properties and spacer mobility; hydrogen ingress and fracture toughness. Predictive models and tools have been developed in support of inspections, FFS, and aging assessments.

The inspection results and conclusions documented in the Fitness for Service Memorandum [27] confirm that “OPG has high confidence that the Pickering FCs will remain fit-for-service for extended operation to 2024. This confidence comes from years of operating experience, extensive research, current assessments and projections of channel condition”, which provides that their Life Cycle Management Strategy will allow timely intervention to predict and correct unacceptable deviations from design.

Additional analyses will need to be performed for the Fuel Channels for extended station operation to 2028. The degradations identified in Reference [27] will need to be projected based on calculated Effective Full Power Hours (EFPH) targets and strategies will need to be put in place for mitigating projected Fitness for Service issues, including increased inspections and replacement strategies. Since Fitness for Service for Fuel Channels has not been demonstrated for station operation to 2028, this results in a PSR2 gap (**Pickering PSR2 Gap SF2-1**).

In addition, OPG does not have CNSC approval to operate beyond the current Licence Condition Handbook [25] limit of 247,000 EFPH for fuel channels, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-2**).

Lastly, the Fuel Channel LCMP [31] has not been formally updated to address extended station operation to 2028, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-3**).

4.1.1.1.2 *FEEDERS*

OPG has completed and documented a review in the Fitness for Service Memorandum [27] of Feeders and the results of the activities defined by the Feeder LCMP [31]. This review included assessment of the general program, feeder inspections, and effectiveness of the in-service inspections. A summary of the assessment in the Fitness for Service Memorandum [27] is documented below.

The Feeder LCMP [31] specifies the required Periodic Inspection Program (PIP) and In-Service Inspections (ISI), and maintenance for Feeders. The Feeders LCMP [31] is revised on a regular basis to capture changes that may be required in response to issues identified by inspection, industry experience, and ongoing research activities.

The LCMP incorporates feeder PIP documents, which are Unit specific plans based on the requirements outlined in CSA standard N285.4 [35]. OPG inspects feeders and related components such as supports and instrument lines during planned outages in accordance with the LCMP to confirm that the feeders remain fit for service for the next operating cycle.

As per the Fitness for Service Memorandum [27], the LCMP [31] for feeders defines the periodic and in-service inspection (ISI), and provides a 7-year forward looking plan for all required activities during Pickering Unit planned outages. The PIP documents give specific details for each unit based on CSA Standard N285.4 requirements and represent the base inspection requirements. The ISI scope is based on active and plausible (susceptible) degradation mechanisms for feeder piping, support hardware and other components within the feeder cabinets. The LCMP [31] includes probability of degradation occurring and consequences of degradation (both FFS and economic considerations).

Each Pickering Unit has an inspection outage approximately every 2 years per the Fitness for Service Memorandum [27]. The thickness inspections for future scopes are focused on monitoring lead feeders and dispositioned feeders. Lead feeders are those that are approaching their minimum design-required thickness. Dispositioned feeders are those with specific analysis defining their service limits which were accepted by the CNSC. This population has been determined by previous campaigns where 100% of the feeder inspections were completed. The inspection scope increases as the dispositioned feeder population increases.

As per the Fitness for Service Memorandum [27], the latest inspection results demonstrate that the most recent measured wall thickness remained greater than the minimum allowable wall thickness and will be fit for service for the next operating cycle. As per the LCMP [31], these feeders will continue to be monitored. However, as per the Fitness for Service Memorandum [27], OPG believes there are a small number of feeders (14) that analysis may determine require replacement for reactor operation to 2024. OPG has experience replacing feeders in Pickering (Unit 8 in 2008) and has high confidence that with inspection, analysis, and targeted replacement activities the Pickering feeders will remain fit for service in each unit for extended operation to 2024.

Additional assessments will need to be performed for Feeders for station life extension to 2028. The degradations identified in Reference [27] will need to be projected based on calculated EFPH targets and strategies would need to be put in place for mitigating projected FFS issues, including increased inspections and replacement strategies. Since Fitness for Service for Feeders has not been demonstrated for station operation to 2028, this results in a PSR2 gap (**Pickering PSR2 Gap SF2-4**).

In addition, the Feeder LCMP [31] has not been formally updated to address extended station operation to 2028, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-5**).

4.1.1.1.3 *Steam Generators*

OPG has completed and documented a review in the Fitness for Service Memorandum [27] of Steam Generators (SG) and the results of the activities defined by the Steam Generator LCMP [32]. This review included assessment of the general program, inspections, and effectiveness of the in-service inspections. A summary of the assessment in the Fitness for Service Memorandum [27] is documented below.

The Steam Generator LCMP [32] specifies the required Periodic Inspection Program and In-Service Inspections, maintenance and modifications for Steam Generators.

The SG LCMP [32] is revised on an annual basis to capture changes that may be required in response to issues identified by inspection, industry experience and ongoing research activities. OPG inspects SG tubes and internals during Unit planned outages in accordance with the SG LCMP [32] to confirm that the SGs remain fit for service until the next planned inspection.

According to the Fitness for Service Memorandum [27], each Pickering Unit has a steam generator inspection approximately every 2 years. The SG LCMP [32] identifies the inspection scope, including Eddy current testing requirements to identify active and plausible tube degradation mechanisms and the extent of the condition in the SGs. Two sample sizes of 30%-50% and 10% are inspected using standard and specialized eddy current probes respectively. Tubes with previous indications are added to the minimum sample size, and the sample size may be further increased based on the particular degradation mechanisms that are active in the Unit. As per the Fitness for Service Memorandum [27], in the Unit 4 planned maintenance outage (P1641), inspection scope was expanded to additional steam generators in Unit 4 due to recent findings. Conditioning monitoring was not acceptable for Pickering Unit 4 during the 2016 outage. Therefore, a disposition period of one effective full power year was requested and accepted by the CNSC. Pickering Unit 4 has been shut down in January 2017 for additional inspections, and targeted ET + UT inspection was performed on 4 SGs to validate previously accepted disposition.

SG tube plugging and tube leakage also provide additional monitoring of SG structural health. No limits on steam generator tube plugging were established in the original design specification or code of construction but as per the Fitness for Service Memorandum [27] OPG has performed station specific assessments of the impact of tube plugging. Reviews of the current number of plugged tubes show that no steam generators in Pickering exceed the current assessment of allowable number of plugged tubes and that margin exists relative to these assessments to support operation to 2024 (per the Fitness for Service Memorandum [27]).

Also, there have been no SG tube leaks in the Pickering Units since mid-2001, although some existing SG tubes have warranted plugging over this period. This conclusion is based on analysis of main steam tritium levels, which in each units are stable and well below levels at which enhanced monitoring is performed to assess suspected steam generator tube leakage.

Based on these results of the SG LCMP [32], OPG has confidence that the Pickering SGs will remain fit-for-service in each of Units 1, 5, 6, 7, 8 for the approved operating interval for extended operation to 2024. Pickering Unit 4 SG inspections, as planned in P1741 outage, have been completed. The SG condition monitoring for P1741 was acceptable and degradations were conservatively bounded by the assessments given in the accepted 2016 disposition.

Additional assessments will need to be performed for Steam Generators for station life extension to 2028. The strategy listed above would need to be projected based on calculated EFPH targets, and solutions would need to be put in place for mitigating projected FFS issues including increased inspections. Since Fitness for Service for Steam Generators has not been demonstrated for station operation to 2028, this results in a PSR2 gap (**Pickering PSR2 Gap SF2-6**).

In addition, the Steam Generator LCMP [32] has not been formally updated to address extended station operation to 2028, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-7**).

4.1.1.1.4 *REACTOR COMPONENTS AND STRUCTURES*

OPG has completed and documented a review in the Fitness for Service Memorandum [27] of Reactor Components and Structures (RC&S) and the results of the activities defined by the RC&S LCMP [33]. The RC&S LCMP [33] prescribes the work program required to meet legal, Fitness for Service, or asset preservation requirements and embeds results with components dispositions as required to demonstrate Fitness for Service.

Maintenance activities in the RC&S LCMP [33] include CT/LISS gap inspection, Guide Tube gap inspection, and Calandria Tube inspections. According to the Fitness for Service Memorandum [27], OPG believes that for Pickering Units 5-8 there is the potential that the Calandria Tubes (CT) could come into contact with the Shutdown System #2 Liquid Injection Shutdown System (LISS) nozzles due to fuel channel sag. Pickering Units 1 and 4 do not have LISS nozzles.

The current assessments utilize baseline measurements of CT/LISS nozzle gaps in each unit. Additional measurements of CT/LISS nozzle gap will be used to refine the gap closure rate to more accurately predict CT/LISS nozzle contact time. As per the Fitness for Service Memorandum [27], these refinements are expected to show that CT/LISS nozzle contact will not occur prior to the extended operation to 2024 for any of the Pickering 5-8 units. It is expected that operation to end of life will be bridged by repeat inspections as specified in the LCMP [33] to assess gap closure rate and/or mitigation strategies previously employed in the CANDU industry. Additional mitigation measures are also available if required, up to and including single fuel channel replacement, to ensure Fitness for Service for CT/LISS nozzle contact concerns.

Additional assessments will need to be performed for Reactor Components and Structures for station life extension to 2028. The strategy listed above would need to be projected based on calculated EFPH targets, and solutions would need to be put in place for mitigating projected FFS issues including increased inspections and replacement strategies. Since Fitness for Service for Reactor Structures has not been demonstrated for station operation to 2028, this results in a PSR2 gap (**Pickering PSR2 Gap SF2-8**).

In addition, the Reactor Components and Structures LCMP [34] has not been formally updated to address extended station operation to 2028, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-9**).

4.1.1.1.5 *SERVICE LIMITS ASSESSMENT OF NUCLEAR CLASS 1 COMPONENTS*

OPG has completed a review of the service cycle usage of Nuclear Class 1 components to ensure adequate margin between analyzed cycles and completed cycles for continued operation to 2028 as per memorandum P-CORR-33000-00001 [28].

The methodology employed by OPG included review of the earlier Preliminary Service Limit Assessment [36], and subsequent assessment to incorporate:

a) The analyzed fatigue service limits of Pickering Class 1 systems and components.
b) The Units' operational transient histories.
c) The impact of Flow Accelerated Corrosion (FAC) on PHT piping Fatigue Service Limits.

OPG concluded that the analyzed design basis service limits can cover extended operation to 2028 with adequate safety margin. The number of recorded transient cycles prorated for extended operation would be less than 60% of the analyzed design basis service limit cycles of Pickering NGS 1,4 and 5-8 Units. It was also concluded that FAC induced wall loss is minimal with no impact on the PHT fatigue life calculations for operation up to 2028.

However, Environmental Factors have not been evaluated within the Service Limit Assessments for Class 1 piping, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-10**).

4.1.1.1.6 *ASSESSMENT FINDINGS FROM MAJOR COMPONENTS*

The Fitness for Service Assessment referenced above documents the current condition of the major components in the Pickering Units. There is high confidence that the major components will remain fit for service up to an extended station life to 2024, with limited potential mitigating actions required. Additional analysis and assessment is required to demonstrate continued Fitness for Service for extended station life to 2028 as per the PSR2 gaps below.

The following gaps were identified from this review:

- **Gap SF2-1:** Fitness for Service for Fuel Channels has not been demonstrated for station operation to 2028.
- **Gap SF2-2**: OPG does not have approval to operate beyond the current Licence limit of 247,000 EFPH for fuel channels.
- **Gap SF2-3**: The Fuel Channels LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-4**: Fitness for Service for Feeders has not been demonstrated for station operation to 2028.
- **Gap SF2-5**: The Feeders LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-6:** Fitness for Service for Steam Generators has not been demonstrated for station operation to 2028.
- **Gap SF2-7**: The Steam Generators LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-8:** Fitness for Service for Reactor Components and Structures has not been demonstrated for station operation to 2028.

- **Gap SF2-9:** The Reactor Components and Structures LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-10:** Environmental Factors have not been incorporated into the Service Limits Assessment for Class 1 piping.

4.1.1.2 CONDITION ASSESSMENTS FOR SSCS IMPORTANT TO SAFETY

This section provides results of the Condition Assessments for the balance of SSCs in two parts. In the first part System Summaries are presented. The System Summaries document the results of the Detailed CAs prepared prior to 2016. These results reflect a freeze date of August 31, 2015 and were performed in accordance to the methodology in Section 3.1. In the second part (Section 4.1.1.2.49), an overview is presented of the preliminary results of Detailed CAs currently being prepared to address an assessment for a station life of 2028, with a January 15, 2016 freeze date.

System Summaries:

The results of the DCAs are presented in this report as System Summaries. The System Summaries document the key DCA findings including component condition and any improvement actions required.

Prior to the PSR2 effort, the scope of Aging Management (AM) Systems were merged between Pickering 1,4 and 5-8. This resulted in 70 combined AM Systems, encompassing all Aging Management Program related systems in Pickering. 47 of these 70 AM Systems were identified as being in-scope for PSR2 (per the methodology described in section 3.1) and the DCA results for these systems are presented in this report. The 47 SF2 systems encompass all SOE/SIS systems as described in Section 3.1.

Screening reports encompassing all SOE/SIS systems were then prepared to identify those AM components that required a DCA to be prepared. These screening reports are issued as controlled documents. The results of the screening identified that 1202 unique Commodity Groups (CGs) required a DCA be prepared. The remaining CGs were screened-out based on the criteria in N-PROC-MP-0060 [7].

The System Summaries are documented in sections 4.1.1.2.1 to 4.1.1.2.47 for each of the 47 in-scope systems[4]. The following information is provided for each system:

- The relevant System Health Report(s).

[4] The results are also documented in Appendix B.2 in tabular form for each system and commodity group and discussed in section 4.1.1.2.48.

- Current Initiatives (not including periodic maintenance practices) credited within each Detailed CA for improvement and/or to sustain condition. This includes currently planned work, e.g. planned inspection work orders.
- Incremental Recommendations to support continued operation to 2020 (i.e. not currently planned).
- Incremental Recommendations to support extended operation to 2024.[5]

Where specific equipment tags/populations in a CG are referenced, recommendations apply to only that equipment. In cases where the recommendations do not identify specific equipment populations, the recommendations apply to the entire CG. CGs are not contained in these sections if no recommendations are required to improve their condition, indicating that their condition and aging management practices are acceptable. The entire list of CGs is addressed in Appendix B.2.

Selected Civil structures are included in the System Summaries and are in system numbers: 406, 425, 436, 441, 452, 455 and 466, and 0469. All structures that are part of Containment are included, e.g. the Reactor Buildings, Pressure Relief Duct. The remaining non-containment in-scope civil structures are in the process of being addressed as part of the current condition assessment updates. Since these condition assessments are not complete this results in a PSR2 gap (**Pickering PSR2 Gap SF2-11**).

The System Summaries include piping for many critical systems, e.g. the heat transport and moderator systems. The remaining in-scope system piping, e.g. ECIS, is in the process of being screened and CAs completed as required. Since these assessments are not complete this results in a PSR2 gap (**Pickering PSR2 Gap SF2-12**).

Pipe supports have been screened out from further assessment. There is a pipe support program N-GUID-04980-10002, "Guideline for Critical Pipe Support Inspection and Results Processing" [90] for critical systems and in addition pipe supports are included in system engineer surveillance practices. Selected critical hangers in Nuclear Class systems are also inspected via the Periodic Inspection Program (PIP) [82]. Continued execution of these programs would identify any pipe support deficiencies. Any deficiencies are then assessed for fitness for service and corrected via the work management process.

Lastly, compared to OPG Revision 0 of this report, recommendations have been removed for CGs now screened out based on the latest screening discussed in Section 4.1.1.2.49. These removed items correspond to the shaded out rows in the Appendix B-2 Tables which are discussed in section 4.1.1.2.48.

All of the recommendations documented in following sections will be assessed, dispositioned, prioritized and tracked via station work programs.

[5] Detailed CAs are being prepared to consider life extension to 2028. This is addressed in SF2 Gap 17. The preliminary results of these CAs is presented in section 4.1.1.2.49.

4.1.1.2.1 REVIEW OF ANNULUS GAS SYSTEM

System Number: 0400

System Health Report Name: Annulus Gas
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011268, Unit(s) 5,6,7,8: 34980 Annulus Gas System-Valves - NV-Non-Return CAT 1&2 - Replace 6/7/8-34980-NV102. This requires implementation of CAT ID 709329 (which is currently going through the design processes to address obsolescence issues with CAT ID 118136).

Incremental recommendations for Plant EOL (2020):

- CG 008001, Unit(s) 1,4: Analyzer, Cat 1/2 - Implement a new PM to perform periodic calibration and function checking.

Incremental recommendations for CO EOL (2024):

- CG 008010, Unit(s) 1,4: FAN, Cat 1/2 - Implement a new PM to periodically check the fan and motor bearings and add lubrication if necessary.

4.1.1.2.2 REVIEW OF BOILER BLOW-OFF SYSTEM

System Number: 0401

System Health Report Name: Main Steam and Blowdown
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Yellow	Green	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008060, Unit(s) 1,4: Valve Pneumatic / Pneumatic AC, Cat 1/2, large Boiler Blowdown Valves - Complete WOs 2731629, 2731630, 2284458, 2243671 to overhaul and/or replace valve internals and actuator.

Incremental recommendations for Plant EOL (2020):

- CG 011297, Unit(s) 5,6,7,8: 36410 Boiler Blow-off System – AOVs - Initiate one-time inspection of valve internals, and replace/repair if degraded. Procure additional spare valves to ensure corrective action can be expedited if required.

Incremental recommendations for CO EOL (2024):

- CG 008058, Unit(s) 1,4: Valve Pneumatic / Pneumatic AC, Cat 1/2 - Perform a one-time inspection of valve internals against ARDMs (elastomer embrittlement, material loss on bushing, spindle, seat, disc, bellows failure, valve body corrosion), weld inspections, and repair/replace valve internal parts if degraded.

- CG 011297, Unit(s) 5,6,7,8: 36410 Boiler Blow-off System – AOVs – Initiate new PMs for external inspections of valves every two years.

- CG 011298, Unit(s) 5,6,7,8: 36410 Boiler Blowoff System - Mechanical - Spare ball joint components to be procured to facilitate corrective actions if/when required.

4.1.1.2.3 *Review of Boiler Emergency Cooling System*

System Number: 0402

System Health Report Name: Main Steam and Blowdown
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Yellow	Green	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011477, Unit(s) 5,6,7,8: 36710 Boiler Emergency Cooling System – Valves – NV-Non-Return, Cat 1/2 - Perform internal inspection per WO 1618394. Also, resolve spare parts and obsolescence issues.

Incremental recommendations for Plant EOL (2020):

- CG 008081, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, BECS-02 - Perform one-time inspection of 4-36710-NV3, NV13, 1-36710-NV3, and NV13.

- CG 008086, Unit(s) 1,4: VALVE, PRESSURE REGULATING, Cat 1/2 - Complete a one-time calibration/set point check for 1/4-36710-PRV3006 to reach Plant EOL (2020).

Incremental recommendations for CO EOL (2024):

- CG 008086, Unit(s) 1,4: VALVE, PRESSURE REGULATING, Cat 1/2 - Complete a one-time calibration/set point check for 1/4-36710-PRV3006 to reach CO EOL (2024).

- CG 008089, Unit(s) 1,4: Solenoid / Solenoid Operated Val, Cat 1/2 - Perform one-time overhaul of Actuator and Solenoid Valve.

4.1.1.2.4 REVIEW OF THE BOILER FEED SYSTEM

System Number: 0403

System Health Report Name: Boiler Feed and Main Condensate System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Red	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008144, Unit(s) 1,4: Valve, Control, Cat 1/2 - Complete work orders, and resolution to the following issues:
    1. 4-43230-CV213 leaking WO#4703681
    2. Pressure controller failure 1-43230-CV206 WO#4762318
    3. Repacking of 1-43230-CV220 WO#4809923
    4. Check welds for cracks 1-43230-CV202 WO#3060177.

- CG 008146, Unit(s) 1,4: Valve, Manual / Hand Operated, Cat 1/2 - Complete outstanding CM/DM work orders to correct leaking valves.

- CG 011156, Unit(s) 5,6,7,8: 43230 Boiler Feed Pump Recirculation Control Valves:

1. Complete outstanding WOs to replace limit switches with a more robust model.
2. Complete outstanding AR 28175792 assignments to resolve issues regarding valve stem/plug separation.

- CG 011157, Unit(s) 5,6,7,8: 43230 Boiler Inlet Feedwater Isolation and Auxiliary BFP Discharge MOVs - Complete outstanding work requests, and resolve the issue of solenoid valve failures.
- CG 011185, Unit(s) 5,6,7,8: 43230 Main Boiler Feed Pump Discharge Motorized Valves – Complete work orders to overhaul actuators and repair leaks/packing issues.

Incremental recommendations for Plant EOL (2020):

- CG 008127, Unit(s) 4: Relay, Cat 1/2 - Implement recurring inspections to assess degradation of relay.
- CG 008148, Unit(s) 1,4: Valve, Motorized / Motor Operate, Cat 1/2 - Perform diagnostics including a review of current data to reach Plant EOL (2020).
- CG 008153, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, FW-02 - Perform a one-time internal inspection of at least one “Sample” valve to use as a reference of condition for the other valves.

Incremental recommendations for CO EOL (2024):

- CG 008100, Unit(s) 1,4: ELEMENT, Cat 1/2 - Perform one-time inspection, and if degraded replace.
- CG 008153, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, FW-02 – Initiate PM’s for non-intrusive testing of all valves in the CG every 104 weeks.

4.1.1.2.5 *Review of Boiler Steam and Water Systems*

System Number: 0404

System Health Report Name: Main Steam and Blowdown
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Yellow	Green	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008197, Unit(s) 1,4: VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2 - Complete outstanding WO 04849728 for 1-36110-MV5B, and WO 04845032 for 1-36110-MV6A.

- CG 008202, Unit(s) 1,4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2 –
    1. Complete WO 4850648 for 1-36110-MV38 overhaul and WO 4727738 for 1-36110-MV40 overhaul.
    2. Complete WO 4823379 for 1-36110-MV36 packing replacement and WO 4727739 for 1-36110-MV41 packing adjustment.
    3. Complete WO 04813836 (4-36110-MV38) and WO 04908520 (4-36110-MV40) for air leaks.
    4. Complete WO 02704201 (4-36110-MV38) and WO 02704199 (4-36110-MV39) to replace rubber hoses.

Incremental recommendations for Plant EOL (2020):

- CG 008164, Unit(s) 1,4: Controller, Hand, Cat1/2 - Implement new PM for inspection/overhaul and calibration to be scheduled every 104 weeks.

- CG 008197, Unit(s) 1,4: VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2 - Complete a one-time actuator overhaul and diagnostic testing for all MVs in this CG.

- CG 008199, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, MS-01 - Perform one-time inspections of valves 1/4-36110-NV7/NV8 to assess valve condition.

- CG 011221, Unit(s) 5,6,7,8: 63615 Boiler Steam and Water Systems-CONTROLLER -HAND-CAT 1&2 - Obtain a replacement for 5-63615-P1-HC1 and WX5 and perform calibration every 104 weeks.

- CG 011349, Unit(s) 5,6,7,8: 36110 Boiler Steam and Water Systems-Valves - NV-Non-Return -CAT1&2 - Inspect 7-36110-NV8 as part of a sampling strategy to determine required maintenance on 5/6/7/8-36110-NV7/NV8. Also, inspect 7-36110-NV63 to establish a baseline condition.

- CG 011350, Unit(s) 5,6,7,8: Boiler Steam and Water Systems-Valves - MOV-Standard-CAT1&2 –
    1. Inspect one Group 1 valve (MV1/MV2) to determine if future maintenance is needed and overhaul actuators.
    2. Replace Group 2 valves 5-36110-MV60, 6-36110-MV60 and 7-36110-MV62 with new Cat ID 609880.
    3. Procure spares for Group 1 valves and four valves along with Rotork actuator for Group 2 valves.

Incremental recommendations for CO EOL (2024):

- CG 008197, Unit(s) 1,4: VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2 –
    1. Implement new PMs for 1/4-36110-MV1, MV2, MV3A, MV4A, MV5A, and MV6A for actuator inspection, diagnostics and functional test on a 4 year frequency.
    2. Implement PMs for 1/4-36110-MV3B, MV4B, MV5B, and MV6B for actuator lubrication on a 3 year frequency.

4.1.1.2.6 *Review of Calandria Vault / Vault Structure Cooling / Shield Tank*

System Number: 0406

The Calandria Vault structure does not require a System Performance Monitoring Plan, and hence does not have a System Health Report.

The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Incremental recommendations for Plant EOL (2020):

- CG 011249, Unit(s) 5,6,7,8: Calandria Vault, Vault Structure Cooling, Shield Tank - Structural Concrete - Concrete Walls and Slabs - Conduct one-time visual inspection of accessible areas of Calandria Vault structural concrete for Unit(s) 5-8 to inspect for potential damage and perform any required mitigating/remedial actions.

- CG 011250, Unit(s) 5,6,7,8: 21300 Calandria Vault/Vault Structure Cooling/Shield Tank-Liners - Steel Liners - Conduct one-time inspection for Unit 8, and for Unit(s) 5 to 7 only if evidence of component failure or degradation is discovered. For Unit 8 the condition of epoxy patch as a temporary solution to repair a weld defect is unknown and it is recommended to initiate a permanent repair (i.e. welding).

- CG 011251, Unit(s) 5,6,7,8: 21300 Calandria Vault/Vault Structure Cooling/Shield Tank-Penetrations - Steel Sleeves Surrounding Concrete Vault Openings - Perform one-time visual inspection of accessible areas and local leakage testing to confirm components' suitability.

- CG 011252, Unit(s) 5,6,7,8: 21300 Calandria Vault/Vault Structure Cooling/Shield Tank - Embedded Parts and Supports - Conduct one-time visual inspection of accessible areas to confirm the suitability of the components.

- CG 011253, Unit(s) 5,6,7,8: 21300 Calandria Vault/Vault Structure Cooling/Shield Tank - Seals & Sealants –
    1. Complete one-time inspection of seals.
    2. Replace the elastomeric seals if required.
    3. Replace seals if they show advanced degradation.

Incremental recommendations for CO EOL (2024):

- CG 011253, Unit(s) 5,6,7,8: 21300 Calandria Vault/Vault Structure Cooling/Shield Tank - Seals & Sealants –
    1. Replace the elastomeric seals if required.
    2. Replace seals if they show advanced degradation.

4.1.1.2.7 *Review of Class 1 & 2 Electrical and battery room HVAC Systems*

System Number: 0408

System Health Report Name: Class I and II Electrical Equipment and Battery Rooms HVAC Systems
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 2	Unit 3	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	Green	Green	Green	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008265, Unit(s) 4: DAMPER, Cat 1/2 - Complete MDP actuator replacements via master Non-Identical Component Replacement (NICR) 104778.

Incremental recommendations for Plant EOL (2020):

- CG 008265, Unit(s) 4: DAMPER, Cat 1/2 - Revise PMs 92533, 98078, 98079 and 98080 to add tasks for lubrication and inspection every 1 year on 4-73230-MDP2030/2031/2032/2033 (4 components).

- CG 008279, Unit(s) 4: SWITCH, Cat 1/2 - Calibrations to be scheduled at a frequency adequate for each pressure switch.

Incremental recommendations for CO EOL (2024):

- No additional practices are recommended to reach CO EOL (2024).

4.1.1.2.8 *Review of Common Water Supply*

System Number: 0410

System Health Report Name: Screenhouse
Review Period for System Health Report: Q3-2015

Overall System Health Rating: White

Unit 012	Unit 034	Unit 056	Unit 078
Yellow	Yellow	Yellow	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here.
The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008326, Unit(s) 012,034: Screen, Cat 3/4 - Repair failed Bar Screens 012-71110-SC11 and 034-71110-SC12 (WO 3249081).

- CG 011247, Unit(s) 056,078: 71100, 71120 Common Water Supply - Screens and Conveyors - Overhaul the trash conveyors, 056, 078-71120 TC1 (WO 2809130 and WO 2795171).

- CG 011299, Unit(s) 056,078: 54130, 53300 Common Water Supply-Motor Control Centre (MCC) 600V - Complete structural inspection/maintenance activities on remaining CC2 MCCs (056-54130-MCC541, 078-54130-MCC741). Also, accelerate the implementation of all MCC cells replacement as per NK30-ESI-50000-00006.

Incremental recommendations for Plant EOL (2020):

- CG 011247, Unit(s) 056,078: 71100, 71120 Common Water Supply - Screens and Conveyors –
    1. Complete a one-time cleaning of the screens to remove debris and zebra mussels.
    2. Resolve spare parts issues.

Incremental recommendations for CO EOL (2024):

- CG 011247, Unit(s) 056,078: 71100, 71120 Common Water Supply - Screens and Conveyors –
    1. Complete one-time inspection of Screenhouse concrete structures and equipment supports.
    2. Initiate a new PM for zebra mussel cleaning for the bar screens.

- CG 011303, Unit(s) 056,078: 71100 Common Water Backwash Strainers - Purchase one additional strainer.

4.1.1.2.9 *REVIEW OF CONTAINMENT*

System Number: 0412

System Health Report Name: Airlocks
Review Period for System Health Report: Q4-2015

Overall System Health Rating: Green

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 018
Green	Green	Green	Green	Green	Green	Green

System Health Report Name: Filtered Air Discharge
Review Period for System Health Report: Q4-2015

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	Green	White	Green	Green	Green

System Health Report Name: Vacuum Building (NPC/ESW) System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 0	Unit 018
Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008418, Unit(s) 1,4: Igniter, Cat 1/2 - Complete proactive replacement of hydrogen igniters which failed recently in Units 1 and 4 (ref. EC 112707).

- CG 011182, Unit(s) 5,6,7,8: 73110 RB Cooling-Fuelling Machine Vault ACUs - Follow-up OEM and parallel company investigation of premature coil failures.

- CG 011242, Unit(s) 018: 34230 Filtered Air Discharge System (FADS) MOVs - Complete the actions listed below:
    1. Replace parts of 018-34220-MV12/MV13/M14 (Vacuum Pump Suction Isolation Valves) and 018-34220-MV201/MV203 per EC120350 (WOs 1887012/ 2886975/ 2887049/ 2887432/ 2887431).
    2. Replace 018-34230-MV119/MV122 (Vent to U1 Stack Isolation Valves) per EC108218 and EC108257.
    3. Replace 018-34230-MV124/MV125 (Stack Discharge Isolation Valves) per WR 1663427 and 1663428.
    4. Replace 018-34230-MV112 (F102 Discharge Isolation Valve) if required based on results from WO4939713.
    5. Complete investigation of MV112 failure, and initiate actions as required to address any AM related findings for the other affected valves.
    6. Procure spares/parts to support the above activities, as well as potential valve replacements resulting from inspection PMs.
- CG 011262, Unit(s) 018: 21100 Containment-ALARM-ALARM UNIT-CAT 1&2 - Procure a suitable replacement for the FADS pressure alarm Unit(s) per EC 129463.
- CG 011335, Unit(s) 5,6,7,8,018: 21103, 21130, 25230 Containment-Valves - NV-Non-Return -CAT1&2 - Complete the following work orders:
    1. WO 2096010 to remove and replace 018-25230-AL3-NV203.
    2. WO 619970 by installing new locking tabs on PRD AL3.

Incremental recommendations for Plant EOL (2020):

- CG 011181, Unit(s) 5,6,7,8: 73110 RB Cooling - Boiler Room ACUs - Confirm the integrity of the condensate drain lines (leak tight and not plugged) for all ACUs.

- CG 011182, Unit(s) 5,6,7,8: 73110 RB Cooling-Fuelling Machine Vault ACUs - Perform one-time replacement of coils which have not been replaced since 2009.

- CG 011277, Unit(s) 5,6,7,8: 73110 RB Cooling Dampers –
    1. Perform a one-time replacement of all dampers.
    2. Address obsolescence issues with CatID#151434.
    3. Perform a review to determine the availability of spares and stock for at least one complete overhaul of all dampers.
- CG 011340, Unit(s) 058,018: 34230, 71330 Containment-Valves - Manual-Criticality Category 1 (RS2) - Ensure that adequate spares are available to reach Plant EOL (2020).

- CG 011356, Unit(s) 018: 34200 - Containment - Manual Valves – FADS - Ensure that adequate spares are available to reach Plant EOL (2020).

Incremental recommendations for CO EOL (2024):

- CG 008430, Unit(s) 1,4,018: Regulator, Cat 1/2 - Perform one-time inspection, and if degraded repair/replace.

- CG 008436, Unit(s) 1,4,018: Switch, Cat 1/2 - Implement a new PM for the position switches of the FM shielding doors to reach CO EOL (2024).
- CG 008453, Unit(s) 1,4: VALVE, PRESSURE REGULATING, Cat 1/2 - Perform one-time inspection, and if degraded repair/replace.
- CG 011333, Unit(s) 5,6,7,8,018: 21000, 25000, 67000, 73000 Containment-Valves - SV-Solenoid Valves-CAT1&2 - Perform one-time inspection for all the Solenoid Valves that currently have no PMs (e.g. 5-21060-D3–SV1), replace/repair if needed.
- CG 011340, Unit(s) 058,018: 34230, 71330 Containment-Valves - Manual-Criticality Category 1 (RS2) - Ensure that adequate spares are available to reach CO EOL (2024).
- CG 011356, Unit(s) 018: 34200 - Containment - Manual Valves – FADS - Ensure that adequate spares are available to reach CO EOL (2024).

4.1.1.2.10 *REVIEW OF DEAERATOR AND STORAGE TANK*

System Number: 0417

System Health Report Name: Boiler Feed and Main Condensate System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Red	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008628, Unit(s) 1,4: Valve, Motorized / Motor Operate, Cat 1/2 - Complete WO 04793232 which requires actuator removal, a valve repack and stem/ drive nut replacement for 1-43210-MV17.
- CG 008629, Unit(s) 1,4: Valve, Check/Nonreturn/Back Fl - Complete WO 3005442 & 3005443 to inspect and overhaul U1 NV18 & NV19. Based on inspection results, overhaul U4 NVs.
- CG 011211, Unit(s) 5,6,7,8: 43120 Deaerator & Storage Tank - Complete modifications to the Unit(s) 5-8 Deaerator Storage Tanks (DST) supports to increase the seismic capacity beyond the Pickering B Review Level Earthquake (RLE) for applicable deaerators per Master EC124589.

Incremental recommendations for Plant EOL (2020):

- CG 008601, Unit(s) 1,4: Expansion Joint, Cat 1/2 –
    1. Perform a one-time proactive external inspection of 1/4-43210EJ4 & 4-43210-EJ3001.
    2. Resolve MEL/Bill of Materials (BOM) issues. 4-43210-EJ3001 & 4-43210-EJ4 are linked to incorrect CIDs, identify if CID 606527 (1-43210-EJ4) is appropriate.
- CG 008626, Unit(s) 1, 4: VALVE, MANUAL/HAND OPERATED, Cat 1/2 –
    1. Resolve outstanding MEL/BOM (Cat ID should be in approved status) issues on valves 1, 4-43210-V12, 1, 4-43210-V301 & 1, 4-43210-V69.
    2. Complete a one-time elastomer replacement and stem lubrication of all valves in this CG.
- CG 008628, Unit(s) 1,4: Valve, Motorized / Motor Operate, Cat 1/2 - Complete a one-time overhaul & diagnostics of all MV actuators as per instructions in INACTIVE PMs (e.g. 6969).
- CG 011211, Unit(s) 5,6,7,8: 43120 Deaerator & Storage Tank - Evaluate the cost/benefits of completing weld inspections (of the two welds on each side of the HX4 of the water box plate to the 43120-HX4 shell) on U2 or U3 and implement additional AM practices on U5-8 if necessary based on inspection results.

Incremental recommendations for CO EOL (2024):

- CG 008601, Unit(s) 1,4: Expansion Joint, Cat 1/2 - Conduct an assessment for additional AM practices for CC1/SPV EJ4 and EJ3001 based on expected life after one-time inspection.
- CG 008626, Unit(s) 1,4: VALVE, MANUAL/HAND OPERATED, Cat 1/2 - Review the need to initiate a PM for periodic stem lubrication for all valves in this CG, based on condition after one-time Plant EOL (2020) work.
- CG 008629, Unit(s) 1,4: Valve, Check/Nonreturn/Back Fl - Initiate a PM for in-service testing of 1/4-43210-NV18 & 1/4-43210-NV19 at frequency of 4 years.

4.1.1.2.11 *Review of Digital Control Computers*

The Digital Control Computers (DCCs) have been assessed by OPG under memorandum P-CORR-66400-0632085 [37], the following content is extracted from there.

System Number: 0418

P1, 4 Digital Control Computers:
The P1,4 DCC systems are expected to support the plant to end of Extended Operating Life (EOL 2024/8 + 3 years for DCC mission). The existing strategies for P1,4 DCC system operation to 2020 were adequate.

To maintain current operations, a number of projects are under way or were completed to deal with the obsolescence of the DCC equipment such as:

- Replacement of DCC power supplies;

- PACE computer refurbishment;
- Class II auto transfer panel PL170/171 replacements;
- DCC Digital Output card replacements;
- Display monitors and ANO desktop keyboards/monitors.

For operation during life extension, several recommendations are made in the Detailed CA (see Appendix B.2).

P5-8 Digital Control Computers:
The P5-8 DCC systems are expected to support the plant to end of Extended Operating Life (EOL 2024/2028 + 3 years for DCC mission).
The existing strategies for P5-8 DCC system operation to 2020 were adequate.

To maintain current operations, a number of projects are under way or were completed to address aging and obsolescence of the DCC hardware such as:
- DCC core memory boards;
- DCC power supplies and Ramtek display system.

For operation during life extension, it is recommended as indicated in the Detailed CA recommendations (see Appendix B.2) that selected DCC peripherals and associated power supplies be replaced due to obsolete computer technology.

4.1.1.2.12 *Review of Electrical Systems*

System Number: 0420

System Health Report Name: Class I
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 1	Unit 2	Unit 3	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008719, Unit(s) 1,3,4: Heat Tracing, Cat 1/2 –
    1. Ensure WOs 3014186, 2332936 are completed for replacement of 1-51200-HX1/2.
    2. Complete the proactive replacement of the System Service Transformer (SST) Heat Exchangers (1-52100-HX1, 4-52100-HX1, 1-52100-HX2 and 4-52100-HX2) and the GST Heat Exchangers (1-52200-HX2, 4-52200-HX2, 1-52200-HX1 and 4-52200-HX2 (example WOs are 04939705, 04939724).

- CG 008751, Unit(s) 1,2,3,4: Rectifier, Cat 1/2 – Complete WOs to replace capacitors and address other deficiencies.

- CG 011284, Unit(s) 018,0,056,078,058,068,5,6,7,8: 53000, 54000, 55000, 65000, 79000 Electrical Systems - Cables - 4.16 kV, 600V, 125V, 250V -
    1. Complete inspection of the MOT/SST/GST and S/Y underground cables per P-2015-03783.
    2. Complete inspection and/or replacement of SES 4kV cable between the P/H and HPECI building per WO# 1681231.

- CG 011287, Unit(s) 5,6,7,8: 57100 Electrical Systems - Control Cable - Complete inspection of the MOT/SST/GST and S/Y underground cables per P-2015-03783.

- CG 011331, Unit(s) 5,6,7,8,058,018,0: 54200 Class II Electrical Systems - UPS / Batteries - Replace 5-54230-UPSB under WO# 4917436.

- CG 011332, Unit(s) 5,6,7,8,056,078,058,018,0: Electrical Systems Relays-Control & Auxiliary - Procure spare CC1 & CC2 relays (under Relay Obsolescence Project 41042).

- CG 011476, Unit(s) 5,6,7,8,056,078,058,018,0: 50000 - Protective Relays-250 / 125 / 48 V D.C. - Replace protective relays on U5-8 MOT, SST & GST (under Project 13-40691) and address protective relay obsolescence issues (under I&C Obsolescence Project 41042).

Incremental recommendations for Plant EOL (2020):

- CG 008686, Unit(s) 1,2,4: Battery, Cat 1/2 –
  1. Replace CH 'J' cells of 1/ 4-54400-BY2.
  2. U1/U4 Class I battery banks 1/ 4-55100-BY1/BY2 to be replaced.

- CG 008698, Unit(s) 1,2,3,4,014: Contactor, Cat 1/2 - Proactive replacement of U1-4 CL II contactors to be completed.

- CG 008719, Unit(s) 1,3,4: Heat Tracing, Cat 1/2 – Procure spare heat exchangers.

- CG008753, Unit(s) 1,2,3,4: Regulator, Cat 1/2 - Replacement of regulators to be completed.
- CG 008754, Unit(s) 1,2,3,4,012,034,014,0: Relay (Protective), Cat 1/2 –
  1. Proactive replacement of ETS relays to be completed.
  2. Calibrate U2/U3 spares so they are available if needed.

- CG 011283, Unit(s) 5,6,7,8: 71310 Electrical Systems AOV's - Procure three MV844/845 and three CV826 for replacement, and actuator overhaul kits in case of valve failure.

- CG 011285, Unit(s) 5,6,7,8,058,018,0: 54100, 54200, 54300, 53300 Electrical System - Motor Control Centres - 600 V / 208 V - Replace all the CC1 and CC2 MCC cells in P058.

- CG 011331, Unit(s) 5,6,7,8,058,018,0: 54200 Class II Electrical Systems - UPS / Batteries -
  1. Replace Units 5,6,7 and 8 UPS-Cs.
  2. Replace DC and AC capacitors of 54230-UPSA and - UPSB at a frequency of 5 years.
  3. Procure one spare for UPSA/UPSB for future maintenance.
  4. Procure replacement for GUI for 5/6/7/8-54230-UPSA/UPSB.
  5. Replace the Class II batteries within the next 2-3 years.

- CG 011524, Unit(s) 5,6,7,8: 54240 Class II Main Transformer - T1/T2 – Procure a spare transformer.

Incremental recommendations for CO EOL (2024):

- CG 008694, Unit(s) 1,2,3,4,012,034,014,0: Circuit Breaker, Cat 1/2 – Perform a one-time overhaul of all the circuit breakers with no active PM.

- CG 008698, Unit(s) 1,2,3,4,014: Contactor, Cat 1/2 - Class IV MCC contactors to be maintained along with the recommendation for one-time maintenance for CL III/ IV MCCs to reach CO EOL (2024).

- CG 008731, Unit(s) 1,2,3,4,014,5,018,0: Motor Control Centre, Cat 1/2 - Perform one-time maintenance for CL III/ IV MCCs to reach CO EOL (2024).

- CG 008742, Unit(s) 1,2,3,4,0: Motor Starter, Cat 1/2 –
  1. Perform one-time inspection of Class II CC1 motor starter cells.
  2. Class III/IV MCC motor starters to be maintained along with the recommendation for one-time maintenance for CL III/ IV MCCs to reach CO EOL (2024).

- CG 008746, Unit(s) 1,2,3,4: Power Supply, Cat 1/2 - Perform proactive replacement of the 48VDC power supply (PS) modules for transfer contactors 1/4 - 54130-CN101/CN102-B2-PS1, and 4-55200-RF50B.

- CG 008751, Unit(s) 1,2,3,4: RECTIFIER, Cat 1/2 - Resolve obsolescence issues with 55200-RF20A/B/C/D/E/F/G/H/T.

- CG 008785, Unit(s) 1,2,3,4,014: Transformers, Cat 1/2 - Implement new PMs for transformers in the group not having a PM, similar to the PMs for the transformers that have PMs.

- CG 011286, Unit(s) 5,6,7,8,056,078,058: 53200,54120,54320,54600 Electrical Systems-Breakers-4.16 kV - Overhaul nine 4kV breakers not covered by PM program.

- CG 011289, Unit(s) 5,6,7,8,058,018,0: 53300, 54130, 54240, 562XX Electrical Systems - Dry-type Power Transformers; Regulating, 9kVA, 4.16kV/600V - Perform a one-time inspection of transformers used for lighting/receptacles (56210/56220-T10/T14) and if found degraded, repair/replace.

- CG 011325, Unit(s) 5,6,7,8: 65425 - 40V DC Distr.System Power Supplies - Perform one-time inspection, and if degraded replace.

4.1.1.2.13 *Review of Emergency Coolant Injection System*

System Number: 0421

System Health Report Name: Emergency Coolant Injection
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 056	Unit 058	Unit 078
Green	Green	Green	Green	Green	Green	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008835, Unit(s) 1,4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Complete Work Orders for a one-time replacement of all test SVs.

- CG 011324, Unit(s) 056,078,058: 33350 ECIS - Injection Pumps - Ensure examination of wearing rings at higher magnification is included in existing maintenance program (as recommended in NK30-33350-LOF dated 11-Jun-2010).

- CG 011529, Unit(s) 056,078: 33350 ECI Recovery Pump Motors-4kV - Procure one (1) spare motor for the ECI Recovery Pump Motor strategy documented in NK30-ESI-05600-0000.

- CG 011535, Unit(s) 5,6,7,8: 63330 - ECI - Controller - Hand - CAT 1&2 – Complete strategy to proactively replace hand controllers.

Incremental recommendations for Plant EOL (2020):

- CG 008817, Unit(s) 1,4,014: SWITCH, Cat 1/2 –
    1. Obtain spares for the valve limit switches of 1/4-33350-MV571.
    2. Replace the door switches of 1-63335-NS203 & NS204.
    3. Replace the temperature switch of 014-33350-HTR202-TS1.
- CG 011255, Unit(s) 5,6,7,8,056,078,058: 33350 Emergency Coolant Injection System - Copes-Vulcan AOVs - Complete the procurement of replacements for obsolete Copes-Vulcan ECI valves pneumatic positioners (Cat ID: 653079, 627875, and 606006).

- CG 011259, Unit(s) 5,6,7,8,056,078,058: 33350, 63335 Emergency Coolant Injection System - Check Valves - Perform one-time inspection and overhaul NV3 as necessary, and complete the replacement of 058-33350-NV3020.

- CG 011355, Unit(s) 5,6,7,8,058: 63335 Emergency Coolant Injection System-Hoke & Valcor AOVs - Investigate a more robust replacement to mitigate passing Hoke valves.

Incremental recommendations for CO EOL (2024):

- CG 008817, Unit(s) 1,4,014: SWITCH, Cat 1/2 - Implement new PMs for the position switch of ECI recovery injection isolation valves (33350-V476/V477) and Moderator Room door limit switches (63335- S201/NS203/NS204).

- CG 008835, Unit(s) 1,4,014: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 – Perform one-time replacement of all SVs to ensure all components in this CG reach CO EOL (2024).

4.1.1.2.14 REVIEW OF EMERGENCY POWER SUPPLY

System Number: 0422

System Health Report Name: Emergency Power Distribution System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 5	Unit 6	Unit 7	Unit 8	Unit 058
Green	Green	Green	Green	Green

System Health Report Name: Emergency Power Generators
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 058
White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011376, Unit(s) 058: 54800 - Emergency Power Supply-Lube and fuel oil Pumps - Complete WO 3199660 / 3199647 for Proactive replacement of EPG1/2-P5.

Incremental recommendations for Plant EOL (2020):

- CG 011368, Unit(s) 5,6,7,8: 54300 - Emergency Power Supply-Rectifiers-48 Volt D.C - Replace major components (e.g., control cards, blocking diodes and SCRs) to support continued operation to Plant EOL (2020).

- CG 011376, Unit(s) 058: 54800 - Emergency Power Supply-Lube and fuel oil Pumps - Add inspection of P1, P2, and P5 to PM 18249.

- CG 011378, Unit(s) 058: 54800 - Emergency Power Supply - Emergency Power Turbine-driven Generator - Perform inspection and overhaul of EPG1 and EPG2 generators. Also, replace the exhaust stacks for EPG1. Note that all remaining equipment tags are subject to inspection and overhaul.

Incremental recommendations for CO EOL (2024):

- CG 011376, Unit(s) 058: 54800 - Emergency Power Supply-Lube and fuel oil Pumps - Procure 3 spare pumps to have one spare for each type of the pumps (058-54800-EPG1/G2-P1, 058-54800-EPG1/G2-P2, 058-54800-EPG1/G2-P5).

4.1.1.2.15 REVIEW OF EMERGENCY WATER SUPPLY (EWS) SYSTEM

System Number: 0423

System Health Report Name: Emergency Water Supply
Review Period for System Health Report: Q3-2015
Overall System Health Rating: Green

Unit 5	Unit 6	Unit 7	Unit 8	Unit 056	Unit 058	Unit 078
Green	Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008880, Unit(s) 1,4: Valve, Motorized / Motor Operate, Cat 1/2 - Complete repair of 1-71330-MV501.

- CG 011177, Unit(s) 056,078: 71380 EWS Recovery Pump Motors - Procure spare motor as approved in MR #2858124.

- CG 011445, Unit(s) 058: 71380 - Emergency Water Supply (EWS) System - Travelling Screens –
    1. Resolve issues to enable overhaul of screens (WO 1665303 - SC1, WO 1665305 - SC2).
    2. Obtain critical spare parts for traveling screens to be used if required, this will ensure the screens can be replaced quickly if failure occurs prior to end of life.

Incremental recommendations for Plant EOL (2020):

- CG 008836, Unit(s) 1,4: Actuator, Cat 1/2 - Implement a diagnostics program for actuator testing.

- CG 008845, Unit(s) 3,4,0: Expansion Joint, Cat 1/2 - Perform baseline inspection and initiate new PM for routine inspection of Expansion Joints.

- CG 008865, Unit(s) 1,4,0: Strainer, Cat 1/2 - Initiate a PM to complete regular inspection and cleaning of Unit 0 Strainers. Note: All of the remaining equipment tags are subject to cleaning and inspection.

- CG 008878, Unit(s) 018,0: Valve, Manual / Hand Operated, Cat 1/2 - Initiate a PM to inspect condition of valves 018-71330-V2007 and V2008.

- CG 008880, Unit(s) 1,4: Valve, Motorized / Motor Operate, Cat 1/2 - Implement diagnostic testing.

- CG 011440, Unit(s) 5,6,7,8,056,078,058: 71380 Emergency Water Supply (EWS) System - Valves - Manual - Criticality Category 1 (RS2) –
    1. Procure spare parts for maintenance and overhaul. Removed valves to be overhauled and used for future replacements.
    2. Resolve obsolescence issues.
    3. Initiate a one-time replacement of the shear pins on 056-71380-V3 and 078-71380-V3 to prevent reoccurrence of shear pin failure.
- CG 011441, Unit(s) 5,6,7,8,056,078,058: 71380 Emergency Water Supply (EWS) System-Valves - Manual-Criticality Categories 1 (P1, P2) And 2 (RS3) - Address obsolescence issues and source replacement valves.

- CG 011442, Unit(s) 5,6,7,8,058: 71380 Emergency Water Supply (EWS) System-Valves - MOV-Standard-CAT1&2 - Resolve spare parts and obsolescence issues.

- CG 011471, Unit(s) 058: 54320 Emergency Water Supply (EWS) System-Stand Alone Motor Starters-4.16 kV - Perform a one-time refurbishment of motor starters.

Incremental recommendations for CO EOL (2024):

- CG 008850, Unit(s) 0: Heater (Generic), Cat 1/2 - Complete a one-time sample inspection of an HX to ensure condition for CO EOL (2024).

- CG 011177, Unit(s) 056,078: 71380 EWS Recovery Pump Motors - Procure spare bearings.

- CG 011443, Unit(s) 5,6,7,8,056,078,058: 71380 Emergency Water Supply (EWS) System-Non Return Valves -CAT1&2 - Initiate PMs for NVs in accordance with check valve strategy manual P-MAN-04946 00001 that have no PM practices.

- CG 011470, Unit(s) 5,6,7,8: 67138 Emergency Water Supply (EWS) System-Power Transformers - 600V to 120/208V - Implement a one-time transformer inspection program, repair/replace if required.

4.1.1.2.16 *Review of EWS Intake Structure*

System Number: 0425

System Health Report Name: Emergency Water Supply
Review Period for System Health Report: Q3-2015
Overall System Health Rating: Green

Unit 5	Unit 6	Unit 7	Unit 8	Unit 056	Unit 058	Unit 078
Green	Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Incremental recommendations for Plant EOL (2020):

- No additional practices are recommended to reach Plant EOL (2020).

Incremental recommendations for CO EOL (2024):

- CG 011463, Unit(s) 058: 23910 - 23910 - EWS Intake Structure-Structural Concrete - Concrete Walls and Slabs of Water Passages - Perform a one-time inspection of the concrete walls and slabs of water passages for EWS intake structure.

4.1.1.2.17 *REVIEW OF FEEDWATER AND CONDENSATE SYSTEM*

System Number: 0426

System Health Report Name: Boiler Feed and Main Condensate System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Red	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 008901, Unit(s) 1,4: Controller (LEVEL), Cat 1/2 - Complete WO's 1709429 to 1709433 to replace controllers.

Incremental recommendations for Plant EOL (2020):

- CG 008907, Unit(s) 1,4: Expansion Joint, Cat 1/2 –
    1. Perform one-time inspection of 1-43110-EJ5/6/8/10, and pending inspection findings repair/replace as required.

2. Consider acquisition of spares to address potential replacement depending on inspection result.

- CG 008956, Unit(s) 1,4: Valve, Manual / Hand Operated, Cat 1/2 - Perform one-time inspection for valves 1/4-45310-V22 (inspection to include valve internals), and if degraded repair/replace.

- CG 011414, Unit(s) 5,6,7,8: 43210 / 43110 Feedwater And Condensate System-Piping-Expansion Joints - Procure one spare for each unique CAT ID with priority based on component criticality (i.e. CC1 and CC2).

Incremental recommendations for CO EOL (2024):

- CG 008935, Unit(s) 1,4: Relay, Cat 1/2 - Procure sufficient spares.

- CG 008938, Unit 1,4: Switch, Cat 1/2 - Perform one-time inspection/calibration checks on equipment in this CG not covered under existing PM program.

- CG 011414, Unit(s) 5,6,7,8: 43210 / 43110 Feedwater And Condensate System-Piping-Expansion Joints - Implement a one-time inspection with priority based on component criticality (i.e. CC1 and CC2).

4.1.1.2.18 *Review of Fuel Transfer System*

System Number: 0428

System Health Report Name: Fuel Transfer System
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Yellow	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009056, Unit(s) 012,034: Conveyor Unloader –
  1. Complete the implementation of EC 94748 to modify the IFB-A unloader gate cylinder linkage for 034 Conveyor Unloader.
  2. Complete the following work orders: WO’s 3249406 and 3249409 for proactive replacement of the unloader pulley bearings. WO 1832501 to install “basket in position” switch for 034 irradiated fuel receiving bay.

- CG 009057, Unit(s) 1,4,012,034: Cylinder Cat 1/2 - Complete WOs: 4805164 for replacement of parker fitting/tubing on 4-35200-NLR-M1E and 2456198 to inspect/rebuild/replace conveyor stop cylinder.

- CG 009069, Unit(s) 1,4,012,034: Hose, Cat 1/2 - Complete WO#3148365, 3149052, 3149053, 3149054, 3149055 and 3017012 to replace hoses.

- CG 009080, Unit(s) 1,4: Mechanism Cat 1/2 –
    1. Complete EC (DCR) # 124483 for drawing changes to enable timely ram overhauls.
    2. Complete ECR# 19333 to perform the TM U/L Ram position indication change.
    3. Complete FH reliability plan work orders not yet done; WOs 2811775 (P1551), 2811812(P1671), 2814749(P1671), 2811816(P1681), 2806566 (P1681), 2808315 (P1681), 2808335 (P1681), 2814794 (P1681).

- CG 011505, Unit(s) 5,6,7,8: 63524 DC Motor Controllers and Torque Controllers - Procure spares to facilitate prompt replacement if required.

Incremental recommendations for Plant EOL (2020):

- CG 009057, Unit(s) 1,4,012,034: Cylinder Cat 1/2 - Initiate proactive replacement of cylinders on (7 components) 012/034-35200-NGS-M1, 012-35200-NIS/NMS-M1, 4-35200-NVR-M3E, 1/4-35200-NVR-M3W.

- CG 009069, Unit(s) 1,4,012,034: Hose, Cat 1/2 - Complete a one-time inspection of hoses which have not been replaced in the last 2 years.

Incremental recommendations for CO EOL (2024):

- CG 009056, Unit(s) 012,034: Conveyor Unloader - Complete one-time replacement of unloader bearings based on condition of bearings replaced on WO’s 3249406 and 3249409.
- CG 009057, Unit(s) 1,4,012,034: Cylinder Cat 1/2 - Complete a one-time replacement of (19 components) 012/034-35200-NGS/NIS/NMS/NRS/NSS/NTS/NUS/NWS-M1, 4-35200-NVR-M3E, 1/4-35200-NVR-M3W.

- CG 009069, Unit(s) 1,4,012,034: Hose, Cat 1/2 –
    1. Complete a one-time replacement of the D2O flex hoses and all other hoses in the CG.
    2. Complete a one-time hose inspection 2 years after replacement.

- CG 011505, Unit(s) 5,6,7,8: 63524 DC Motor Controllers and Torque Controllers - Perform one-time inspection, and if degraded, repair/replace.

4.1.1.2.19 Review of Fuelling Machine Ancillaries

System Number: 0430

System Health Report Name: Fuelling Machines
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	Yellow	White	White	White	White

System Health Report Name: Fuelling Machine Auxiliaries
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	White	Green	White	White

System Health Report Name: Fuel Transfer System
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Yellow	Yellow	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

There are no incremental recommendations per the Detailed CAs.

4.1.1.2.20 Review of Fuelling Machine Auxiliary Systems

System Number: 0431

System Health Report Name: Fuelling Machine Auxiliaries
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	White	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009244, Unit(s) 1,4: Motor, Tank, Cat 1/2 - Complete proactive replacement of PM3 under WO #3007230 (Unit 1) and #3007229 (Unit 4).
- CG 009254, Unit(s) 1,4: Pump, Cat 1/2 - Ensure existing WO's (1458455, 2811100) for overhaul/replacement are completed. Ensure spare pump parts and spare pump assembly procured and ready for replacement.

Incremental recommendations for Plant EOL (2020):

- CG 009244, Unit(s) 1,4: Motor, Tank, Cat 1/2 - Procure new assembly (CID 674769).
- CG 009263, Unit(s) 1,4: Switch, Pressure, Cat 1/2 - Complete a one-time proactive replacement of pressure switches (Unit 1 -WR 854456 & 854463 for PS1 & PS2 respectively) by December 2017.
- CG 011503, Unit(s) 5,6,7,8: 35390, 63530, 63536 D2O Valves - Ensure spare parts for equipment in this CG are procured as part of FH 100 parts initiative to support run to failure maintenance strategy.
- CG 011519, Unit(s) 5,6,7,8: 63530, 63535 FM Oil Hydraulic System Valves – Implement PMs for all tags without PMs in the CG.

Incremental recommendations for CO EOL (2024):

- CG 009263, Unit(s) 1,4: Switch, Pressure, Cat 1/2 - Add a task in existing PMs for control maintenance to calibrate PS's during pump overhaul.

4.1.1.2.21 *Review of Fuelling Machine Carriages and Bridges*

System Number: 0432

System Health Report Name: Fuelling Machine Bridges and Rams
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	**Unit 4**	**Unit 5**	**Unit 6**	**Unit 7**	**Unit 8**
White	White	Yellow	Yellow	Yellow	Yellow

System Health Report Name: Fuelling Machines
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	Yellow	White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- No current initiatives required to be completed for Plant EOL (2020).

Incremental recommendations for Plant EOL (2020):

- CG 009287, Unit(s) 1,4: Bridge, Cat 1/2 - Ensure a set of spare ball nuts are available.

Incremental recommendations for CO EOL (2024):

- No additional practices are recommended to reach CO EOL (2024).

4.1.1.2.22 *Review of Fuelling Machine Head System*

System Number: 0433

System Health Report Name: Fuelling Machines
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	Yellow	White	White	White	White

System Health Report Name: Fuelling Machine Bridges and Rams
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	Yellow	Yellow	Yellow	Yellow

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009293, Unit(s) 1,4: Magazine, Cat 1/2 - Complete replacement of FM Magazine Ferguson drive bearings and FM Magazine rear shaft bearings per outstanding Work Orders (WO # #2453453, 2453452, 2416636, 2416634).

- CG 011509, Unit(s) 5,6,7,8: 35310, 35313 FM Magazine DR Gearbox & FM Magazine Assembly –
    1. Complete WO 04826430 for 7-35313-MAGAZINE W, to repair / replace a large Graylok seal leak.
    2. Complete WO 02625577 for 7-35313-MAGAZINE W magazine seal replacement.
- CG 011511, Unit(s) 5,6,7,8: 35314, 35317 FM Main Ram Assembly and Ram Adaptor - Complete AR#28153602-06 for new RAM ball screw seals.

Incremental recommendations for Plant EOL (2020):

- CG 009293, Unit(s) 1,4: Magazine, Cat 1/2 - Initiate proactive one-time replacement of the Ferguson drive assemblies at the end of expected design life of Ferguson drive assemblies.

- CG 011509, Unit(s) 5,6,7,8: 35310, 35313 FM Magazine DR Gearbox & FM Magazine Assembly – Resolve obsolescence and issues.

- CG 011511, Unit(s) 5,6,7,8: 35314, 35317 FM Main Ram Assembly and Ram Adaptor - Resolve obsolescence/spares issues.

- CG 011512, Unit(s) 5,6,7,8: 35319 FM Cradle Assembly - Resolve spare parts issues.

Incremental recommendations for CO EOL (2024):

- CG 011509, Unit(s) 5,6,7,8: 35310, 35313 FM Magazine DR Gearbox & FM Magazine Assembly – Revise existing analysis (Reports 30-35310-SR-001 Rev. 01, 30-35310-ASD-001 Rev. 0) to demonstrate adequacy to CO EOL (2024).

4.1.1.2.23 *Review of HPECI Storage Tank*

System Number: 0436

System Health Report Name: Emergency Coolant Injection
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 056	Unit 058	Unit 078
Green	Green	Green	Green	Green	Green	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. Detailed CAs have evaluated the work recommended for maintaining current life or extended operating life. Refer to Appendix B.2 for more information.

There are no incremental recommendations per the Detailed CAs.

4.1.1.2.24 REVIEW OF HPECI SUPPLY AND RECIRCULATION

System Number: 0437

System Health Report Name: Emergency Coolant Injection
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 056	Unit 058	Unit 078
Green	Green	Green	Green	Green	Green	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011207, Unit(s) 058: 71260 HPECI Supply & Recirculation-Valves - NV-Non-Return - CAT1&2 - Repair 058-71310-NV2140.

Incremental recommendations for Plant EOL (2020):

- CG 011207, Unit(s) 058: 71260 HPECI Supply & Recirculation-Valves - NV-Non-Return - CAT1&2 - Perform one-time internal inspection of 058-71260-NV11.

Incremental recommendations for CO EOL (2024):

- No additional practices are recommended to reach CO EOL (2024).

4.1.1.2.25 REVIEW OF INSTRUMENT AIR (B)

System Number: 0439

System Health Report Name: Instrument Air
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 014	Unit 058
White	Green	White	Yellow	White	Yellow	Green	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here.
The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009446, Unit(s) 034: Element, Cat 1/2 - Complete replacement of 034-67513-ME2142 as per WO#1975449.

- CG 011227, Unit(s) 5,6,7,8,056,078,058,018: 75120 Instrument Air Check Valves - Excluding Airlocks - Complete work orders 02906169, 02906171, 02964221, 02908772, 02964232, 02964234, and 02723248, to inspect and replace specified check valves.

- CG 11202, Unit(s) 5,6,7,8: 75120 Instrument Air Manual Valves Inside Containment - Complete current diaphragm valve replacement campaign.

Incremental recommendations for Plant EOL (2020):

- CG 009443, Unit(s) 018: Disc, Cat 1/2- Complete a one-time replacement of the rupture disc.

- CG 009455, Unit(s) 018: Hose, Cat 1/2 – Perform a one-time inspection of the hoses to reach Plant EOL (2020).

- CG 009460, Unit(s) 034: Motor, Cat 1/2 - Implement a new PM to perform inspection and oil change for 034-75130-DRM2047/DRM2048/DRM2049 every year.

- CG 009467, Unit(s) 1,4: Regulator, Cat 1/2- Perform a one-time overhaul of these pressure regulating valves.

- CG 009475, Unit(s) 1,4: Station, Cat 1/2- Implement a TOV replacement program.

- CG 009477, Unit(s) 1,4: Strainer, Cat 1/2 - Update maintenance procedures to inspect the strainers when SRV maintenance is being performed.

- CG 009488, Unit(s) 1,012: Valve, Control, Cat 1/2 - Implement a one-time inspection and/or overhaul program for these control valves.

- CG 009490, Unit(s) 1,034: Valve, Isolation, Cat 1/2 - Implement one-time inspections/replacements of these isolation valves.

- CG 011198, Unit(s) 5,6,7,8,058: 75120 Instrument Air System Dryers - Obtain sufficient spares for Instrument Air CV’s.

- CG 011226, Unit(s) 058: 75120 Instrument Air Pressure Regulating Valves - Resolve obsolescence by procuring an adequate replacement PRV.

Incremental recommendations for CO EOL (2024):

- CG 009446, Unit(s) 034: Element, Cat 1/2 - Implement new PM for routine calibrations.

- CG 009451, Unit(s) 4,018: Gauge, Cat 1/2 - Implement new PM for routine calibrations.

- CG 009460, Unit(s) 034: Motor, Cat 1/2 - Resolve spares issues for 034-75130-CPM2044/ CPM2045/ CPM2046.

- CG 009469, Unit(s) 012,034: Relay, Cat 1/2 –
    1. Implement new PM for routine calibrations/tests.
    2. Resolve obsolescence and spares issues.

- CG 009482, Unit(s) 1,4,018: Tank, Cat 1/2 - Implement new PMs for internal/external inspection of 018-67513-TK2000, 1-75130-TK2001, 4-75130-TK2001, and 1-75130-TK2002.

- CG 011226, Unit(s) 058: 75120 Instrument Air Pressure Regulating Valves - Complete a one-time replacement of all PRVs.

4.1.1.2.26 *Review of Irradiated Fuel Bay Auxiliaries*

System Number: 0440

System Health Report Name: IFB-A, IFB-B, AIFB and Interbay Transfer Systems
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 0	Unit 014	Unit 058
White	White	Yellow

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

There are no incremental recommendations per the Detailed CAs.

4.1.1.2.27 REVIEW OF IRRADIATED FUEL BAYS

System Number: 0441

System Health Report Name: IFB-A, IFB-B, AIFB and Interbay Transfer Systems
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 0	Unit 014	Unit 058
White	White	Yellow

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011318, Unit(s) 058: 21500 – IFB- (Irradiated Fuel Bay) - Complete repairs to liner cracks under Project 13-40703.

There are no incremental recommendations per the Detailed CAs

4.1.1.2.28 REVIEW OF THE LIQUID ZONE SYSTEM

System Number: 0444

System Health Report Name: Liquid Zone Control
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Green	White	Green	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011129, Unit(s) 5,6,7,8: 34810 Liquid Zone Control Compressor Motors - Complete CR2012-01045 to re-instate PM for motor replacement every 4Yr.

- CG 011131, Unit(s) 5,6,7,8: 34810 Liquid Zone Control H2O Supply Valves - Continue replacing positioners with smart positioners as per ECR 15052.

- CG 011374, Unit(s) 5,6,7,8: 34810 Liquid Zone System-Helium Bubbler & Balance Header Pressure And Storage Tank Level Control Valves - Complete outstanding work orders to proactively replace the Bubbler Header Control Valves and the Back-up Balance Header Control Valves.

- CG 011453, Unit(s) 5,6,7,8: 34810- Liquid Zone System- Non-Return Valves - CAT 2 - Continue to execute recommended actions from previous CA NK30-REP-34810-00012 R002 i.e. procure spares for NV225, one-time internal inspection of one of 5-8-34810-NV225 (see AR 1646265, WO 4814904), and inspect one of NV16, NV55, NV58 from U7 due to these valves being in service the longest.

Incremental recommendations for Plant EOL (2020):

- CG 009613, Unit(s) 1,4: Compressor, Cat 1/2 - Address compressor seal flow conditions through MV31/33. This is a known cause for compressor degradation.

- CG 011129, Unit(s) 5,6,7,8: 34810 Liquid Zone Control Compressor Motors - Implement proactive replacement of compressor motors to address concerns regarding premature winding failures (ref. SCR P-2012-16220).

- CG 011131, Unit(s) 5,6,7,8: 34810 Liquid Zone Control H2O Supply Valves - Address vendor quality issues for Unit(s) 1&4 valves leaking through the O-rings.

- CG 011132, Unit(s) 5,6,7,8: 34810 Liquid Zone Control Return Header Isolating Valves - Follow-up on BOM for MVs and ensure spare parts procured.

- CG 011453, Unit(s) 5,6,7,8: 34810- Liquid Zone System- Non-Return Valves - CAT 2 - Complete one-time inspection of 7-34810-NV37.

- CG 011465, Unit(s) 5,6,7,8: 34810 - Liquid Zone System-Tanks - Implement periodic tank inspections.

Incremental recommendations for CO EOL (2024):

- CG 011131, Unit(s) 5,6,7,8: 34810 Liquid Zone Control H2O Supply Valves - Perform a one-time overhaul of the U6 actuators to reach CO EOL (2024).

- CG 011132, Unit(s) 5,6,7,8: 34810 Liquid Zone Control Return Header Isolating Valves - Re-initiate PMs for diagnostics every 4 years e.g. PM 97834-01.

- CG 011374, Unit(s) 5,6,7,8: 34810 Liquid Zone System-Helium Bubbler & Balance Header Pressure And Storage Tank Level Control Valves - Implement one-time internal inspections of valves.

- CG 011465, Unit(s) 5,6,7,8: 34810 - Liquid Zone System-Tanks - Depending on inspected condition, establish procurement route to purchase a new tank.

4.1.1.2.29 REVIEW OF THE MODERATOR SYSTEM

System Number: 0445

System Health Report Name: Moderator and Auxiliaries
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 058
White	White	White	Green	White	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009671, Unit(s) 1,4: Actuator, Cat 1/2 –
    1. Complete work orders to perform one-time valve and actuator replacement/overhaul: WO 04976469, 04976480, 04976489, 4967469, 04974812, and 1677304.
    2. Complete outstanding work order 03175399 “4-32110-CV27 Replace Calandria Outlet Actuator / Valve”.
- CG 009677, Unit(s) 1,4: Alarm, Cat 1/2 - Complete proactive replacement per WOs 1549266, 1549267, 1549251, and 1549269.

- CG 009680, Unit(s) 1,4: Arrestor, Flame/Fire, Cat 1/2 - Complete WO#3005445 to complete a visual inspection of 1-32310-FA2 to determine the integrity of the flame arrestor. The inspection should include a review of internal screen material to reach Plant EOL (2020).

- CG 009691, Unit(s) 1,4: Controller, HC1/PIC1/TIC1 - Complete proactive replacement of 1/4-63210-L8-HC1 and 1/4-63230-P2-PIC1 per WOs 2073755, 2073756, 3003138, and 3001713.

- CG 009699, Unit(s) 1,4: Disc, Rupture, Cat 1/2 - Complete the outstanding WOs to replace 1-32310-Y6 and 4-32310-Y8/Y9.

- CG 009743, Unit(s) 1,4: Station, Current Output, Cat 1/2 - Complete outstanding WO# 3004764 to replace 1-3231-CV104-HC1.

- CG 009788, Unit(s) 1,4: Transmitters (LT), Cat 1 - Complete one-time replacement for 1/4-63210-L8-LT2 and 1-63210-L1-LT1/LT2 (per WO#02073776 and WO#02073779).

- CG 009792, Unit(s) 1,4: Transmitter (Temp), Cat 1/2 - Complete life cycle replacement for 1/4-63210-T11-TT1 per WO#02953863/4.

- CG 009801, Unit(s) 1,4: EXPANSION JOINT, Cat 1/2 - Complete the inspection's scheduled in WO#03005464 and WO#3003872 for Unit(s) 1 and 4 EJ3.

- CG 009831, Unit(s) 1,4: VALVE, CONTROL, Cat 1/2, Calandria inlet/outlet, DT outlet:
    1. Perform a one-time replacement/overhaul of Calandria outlet valves (1/4-32110-CV2/4/26/27) before EOL per WOs 4976443, 4976469, 4976480, 4976489, 4967469, 4974812, 4974813, 3175399.
    2. Obtain required spare parts for the Calandria outlet valves 1/4-32110-CV2/4/26/27.

- CG 009835, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2 - Complete WOs 03180892, 02791486, 02791484, 02791483 for overhaul and internal inspections.

- CG 011100, Unit(s) 5,6,7,8: 32110 Moderator Head Tank –
    1. Complete outstanding work order WO#3056287 (internal inspection of moisture separator 5-32310-TK1).
    2. Complete work order WO#3005445 to inspect Pickering A flame arrestor 1-32310-FA2. Based on findings, determine if inspection of Pickering B flame arrestors is warranted, and establish work orders for inspection/replacement.

- CG 011109, Unit(s) 5,6,7,8: 32110 Moderator to EWS Tie Non-Return Valves - Complete WO 1580499 to replace 5-32110-NV37.

Incremental recommendations for Plant EOL (2020):

- CG 009671, Unit(s) 1,4: Actuator, Cat 1/2 –
    1. Ensure that there are adequate spare parts for the moderator outlet valve actuators.
    2. Review EQA N-EQA-04944-00036 for the CV actuators and complete a one-time replacement of components which have not been replaced for 30 years.
    3. Review EQA NA44-EQA-04944-00009 for MV9 and complete a one-time replacement of components which have not been replaced for 40 years.

- CG 009691, Unit(s) 1,4: Controller, HC1/PIC1/TIC1 - Resolve obsolescence and spares issues.

- CG 009699, Unit(s) 1,4: Disc, Rupture, Cat 1/2 - Perform a one-time replacement of 1/4-32310-Y7 rupture discs. Note that all the remaining components are subject to replacement.

- CG 009708, Unit(s) 1,4: Element, Cat 2– Resolve obsolescence and spares issues.

- CG 009710, Unit(s) 1,4: Element (FE), Cat 1– Resolve obsolescence and spares issues.

- CG 009717, Unit(s) 1,4: Ion Exchanger (Column), Cat 1/2 - Perform a one-time inspection of Ion exchange columns to determine their condition (pressure boundary and strainer integrity).

- CG 009730, Unit(s) 1,4: Recombination Unit, Cat 1/2 - Implement a one-time replacement of the catalyst and perform an internal and external inspection.

- CG 009756, Unit(s) 1,4: Valve, Control, Cat 1/2, Small Moderator Level CV - Obtain spares either by purchasing or from harvesting Unit 2/3.

- CG 009815, Unit(s) 1,4: Pump, Cat 1/2 - Complete a one-time inspection of one pump internals to assess degradation.

- CG 009818, Unit(s) 1,4: Regulator, Cat 1/2 for Calandria inlet/outlet - Replace all PRV's that have not been replaced since 2015.

- CG 011100, Unit(s) 5,6,7,8: 32110 Moderator Head Tank–
    1. Address spare parts supply issues with 32210-FR1/FR2.
    2. Complete a one-time inspection of selected components from all component groups.

- CG 011101, Unit(s) 5,6,7,8: 32110 Moderator Heat Exchangers - Complete shell side and LPSW inlet/ outlet nozzles inspections. These inspections should be added to the current PM instructions.

- CG 011108, Unit(s) 5,6,7,8: 32110 Moderator Pump Motors-4.16kV - Resolve obsolescence and spares issues.

- CG 011112, Unit(s) 5,6,7,8: 32710 Moderator Liquid Poison Addition Pumps - Purchase one spare pump and perform BOM verification of subcomponent CIDs to ensure spare parts are available.

- CG 011165, Unit(s) 5,6,7,8: 63210 Moderator Wide Range Level Transmitters – Rosemount 1152DP5N - Complete proactive replacement.

- CG 011172, Unit(s) 5,6,7,8: 71310 Moderator HX Temperature Control Valves - Purchase spares for valves: 5/8-32210-MV39/MV40, 5/8-32310-CV1/CV2, & 5/8-32710-MV7/MV8.

- CG 011359, Unit(s) 5,6,7,8: 32310 Moderator Cover Gas Compressors - Complete replacement of compressors under Master EC# 129405 prior to 2018.

- CG 011360, Unit(s) 5,6,7,8: 32110 Moderator System-Valves - HX Manual Isolators - Perform a one-time test/inspection of 5/6/7/8-32110-V20 to reach Plant EOL (2020).

- CG 011363, Unit(s) 5,6,7,8: 32000 Moderator System-Valves - Manual Isolators - Perform a one-time inspection of the CC2 components in this CG and repair / replace as required to reach Plant EOL (2020) (excluding V15 & V21, which have associated PMs in place to replace diaphragm).

Incremental recommendations for CO EOL (2024):

- CG 009677, Unit(s) 1,4: Alarm, Cat 1/2 - Perform a one-time calibrations.

- CG 009680, Unit(s) 1,4: Arrestor, Flame/Fire, Cat 1/2 - Perform a one-time inspection of 1-32310-FA2 to determine the integrity of the flame arrestor if necessary based on inspection results of WO#3005445 to reach CO EOL (2024).

- CG 009699, Unit(s) 1,4: Disc, Rupture, Cat 1/2 - Perform a one-time replacement of 1/4-32310-Y7 rupture discs. Note that all the remaining components are subject to replacement.

- CG 009701, Unit(s) 1,4: Element (temp), Cat 2 - Perform a one-time calibrations on the temperature loops associated with 1-63230-T3/T4-TE1.

- CG 009707, Unit(s) 1,4: Element, Cat 1/2 - Perform one-time calibration on the temperature loops associated with 4-63230-T3/T4-TE1. Note that all the remaining components are subject to calibration.

- CG 009708, Unit(s) 1,4: Element, Cat 1/2 - Perform calibrations at a frequency consistent with the approved IQ Review Maintenance Template.

- CG 009710, Unit(s) 1,4: Element (FE), Cat 1 - Inspect and clean the flow elements and verify their operation every 6 years.

- CG 009717, Unit(s) 1,4: Ion Exchanger (Column), Cat 1/2 - Perform a one-time inspection of Ion exchange column (vessel) to address effects of aging if necessary based on results of the last inspection.

- CG 009730, Unit(s) 1,4: Recombination Unit, Cat 1/2 - Perform a one-time inspection to verify the internal and external condition of the recombination unit if necessary based on the results of the last inspection.

- CG 009738, Unit(s) 1,4: Recorder, Cat 1/2 –
    1. Calibrate the moderator purification conductivity CRs as part of the loop calibration.

2. Perform one-time replacement of the capacitors in all CRs.

- CG 009743, Unit(s) 1,4: Station, Current Output, Cat 1/2 –
  1. Perform calibrations at a frequency consistent with the approved IQ Review Maintenance Template.
  2. Complete replacement of 4-32310-CV104-HC1.

- CG 009770, Unit(s) 1,4: Valve, Pneumatic/ Pneumatic Ac, Cat 1/2, Dump Tank MVs - Implement a one-time seat replacement.

- CG 009783, Unit(s) 1,4: Solenoid/Solenoid Operated Val, Cat 1/2, Dump MVs - Refurbish the SVs as part of the MV PMs.

- CG 009784, Unit(s) 1,4: Solenoid/Solenoid Operated Val, Cat 1/2, Valcor V70900-98-07 - Implement new PMs for the solenoid valves of 32210-MV15 and 32510-MV43.

- CG 009787, Unit(s) 1,4: Transmitters (FT), Cat 1/2 - Complete one-time proactive replacement.

- CG 009801, Unit(s) 1,4: EXPANSION JOINT, Cat 1/2 - Perform a one-time inspection of all expansion joints based on inspection results from WO# 03005464 and WO# 3003872.

- CG 009805, Unit(s) 1,4: Heater (Generic), Cat 1/2 - Perform periodic heater inspection with a contingency task to replace as required.

- CG 009815, Unit(s) 1,4: PUMP, Cat 1/2 - Perform further pump inspections/overhauls as required based on previous sample inspection.

- CG 009818, Unit(s) 1,4: Regulator, Cat 1/2 for Calandria inlet/outlet - Replace all PRV's that have not been replaced by 2019.

- CG 009834, Unit(s) 1,4: Valve, Motorized/Motor Operate, Cat 1/2 - Revise EQ assessment NA44-EQA-04940-00020 to allow extending the life of the existing valves seats to reach CO EOL (2024), or perform replacement.
- CG 011100, Unit(s) 5,6,7,8: 32110 Moderator Head Tank - Perform a one-time inspection of selected components from each of the component groups if required based on results from previous inspections.

- CG 011109, Unit(s) 5,6,7,8: 32110 Moderator to EWS Tie Non-Return Valves - Initiate WOs to inspect 50% of this valve group.

- CG 011357, Unit(s) 5,6,7,8: 32310 Moderator Cover Gas Check Valves –
  1. Initiate a sampling strategy to inspect one valve per valve group and replace based on inspection results.
  2. Procure spare NV's.

- CG 011360, Unit(s) 5,6,7,8: 32110 Moderator System-Valves - HX Manual Isolators - Perform a one-time test/inspection of 5/6/7/8-32110-V20 to reach CO EOL (2024), if required based on previous inspection/test.

- CG 011362, Unit(s) 5,6,7,8: 32110 Moderator System-Valves – Pump Suction Manual Isolators - Initiate a new PM to stroke test CC1/CC2 valves every 104 weeks (or at minimum during unit outages).

- CG 011363, Unit(s) 5,6,7,8: 32000 Moderator System-Valves - Manual Isolators - Perform a one-time inspection/replacement for the CC2 valves in this CG to reach CO EOL (2024) (excluding V15 & V21, which have associated PMs in place to replace diaphragm).

- CG 011365, Unit(s) 5,6,7,8: 32310 - Moderator Cover Gas Heater - 120 Volt - Periodically conduct heater inspection with a contingency task to replace as required.

4.1.1.2.30 *Review of the Powerhouse Emergency Venting System*

System Number: 0447

System Health Report Name: Powerhouse Emergency Venting
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 2	Unit 3	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 014
Green	Green	Green	Green	Green	Green	White	White	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Incremental recommendations for Plant EOL (2020):

- CG 011166, Unit(s) 5,6,7,8: 67324 Powerhouse Emergency Venting Panels - Replace rusted latching plates on all panels.

- CG 011424, Unit(s) 058: 67322 - Powerhouse Emergency Venting System-SIGNAL CONDITIONER-CAT 1&2 - Resolve obsolescence and spares issues.

Incremental recommendations for CO EOL (2024):

- No additional practices are recommended to reach CO EOL (2024).

4.1.1.2.31 REVIEW OF THE PRIMARY HEAT TRANSPORT SYSTEM

System Number: 0449

System Health Report Name: Primary Heat Transport and Aux
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	White	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009924, Unit(s) 1,4: Heat Exchanger (Collection), Cat 1/2 - Complete WO 1418348 &1645320 to replace HXs.

- CG 009984, Unit(s) 1,2,4: Transmitter , Cat 1/2/3 - Complete life cycle replacements and procure spares.

- CG 009991, Unit(s) 1,4: Valve, Manual/Hand Operated, Cat 1/2 - Perform scheduled replacements of elastomeric gaskets/packing and/or valves with materials vulnerable to aging (e.g. diaphragm valves).

- CG 009998, Unit(s) 1,4: Valve, Check/Nonreturn/Back Fl, Cat 1/2, Swing HTS-05, 11 - Inspect/repair/replace 4-33310-NV14.

- CG 011117, Unit(s) 5,6,7,8: 33320 Heat Transport Bleed Condensers - Inspection of Unit 7 tube bundle is scheduled under WO 4819201 during P1671. Further inspections for P058 side tube bundles to be scheduled based on the outcome of this inspection.

- CG 011243, Unit(s) 5,6,7,8: 33120 HT Pump Discharge & Boiler Inlet/Outlet Isolation Valves - Complete planned work orders for gasket/packing replacement and actuator overhaul.

- CG 011258, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System - Check Valves - Swing Type - Inspect valve internals of selected check valves:

  - 5-33340-NV312 (WO# 2719342) Inspect NV,
  - 8-33340-NV312 (WO# 2878274) Inspect NV,
  - 5-33710-NV8 (WO# 2722790) to inspect and overhaul NV.

- CG 011270, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System-Valves - MOV-Standard-CAT1&2 - Complete WOs for actuator overhauls.

- CG 011352, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System - Check Valves - Ball & Piston Type - Complete planned Work Orders to inspect valve internals of selected check valves (i.e. 5-33330-NV216, 8-33330-NV216, 7-33310-NV2 and 8-33310-NV2).

Incremental recommendations for Plant EOL (2020):

- CG 009921, Unit(s) 1,4: Heat Exchanger(Bleed Cooler), Cat 1/2 - Perform one-time inspection of heat exchangers, and if degraded repair / replace.

- CG 009923, Unit(s) 1,4: Heat Exchanger (Gland), Cat 1/2 –
  1. Remove an HX from U2 or U3, inspect to confirm good condition, then use it to replace an HX from Unit 4. The HX from U4 to be used to determine the current condition of the active gland cooler heat exchangers.
  2. Based on findings, create WOs for replacement of HXs.
  3. Purchase spare HXs as needed based on findings.

- CG 009945, Unit(s) 1,4: MOTOR (PRESS PUMP), Cat 2- Include vibration monitoring in Super Route PM, to reach Plant EOL (2020).

- CG 009946, Unit(s) 1,4: Motor (Recovery), Cat 2 - Complete proactive replacement of motors.

- CG 009947, Unit(s) 1,4: Motor (Transfer), Cat 1 - Implement new PM to perform electrical testing every 2 years and vibration analysis to be performed every year.

- CG 009959, Unit(s) 1,4: Pump, Cat 1/2 - Perform a one-time inspection of pump internals (impeller, casing, shaft etc.). Inspect one primary heat transport circulation pump, pressurizing pump and D2O transfer pump. Based on inspection results create supplemental WOs to inspect/overhaul other pumps within this CG.

- CG 009976, Unit(s) 1,4: Tank (33810), Cat 1/2 - Perform a one-time inspection, and if degraded repair/replace (for all tanks).

- CG 009978, Unit(s) 1,4: Tank (BUIA 33610), Cat 1/2 - Perform a one-time inspection, and if degraded repair/replace (for all tanks).

- CG 009991, Unit(s) 1,4: Valve, Manual/Hand Operated, Cat 1/2 –
  1. Resolve obsolescence issues with 1/4-33320-V110/V119, 1/4-33540-V21/V2.
  2. Update SPMP to include all manual valves in CG.

- CG 009993, Unit(s) 1,4: Valve, Motorized/Motor Operate, Cat 1/2 –
  1. Proactively refurbish a contingency of actuators for fast swapping with malfunctioning actuators during outages (for Boiler Isolating Valves and Pump Discharge Valves.
  2. Perform one-time inspection, and if degraded repair/replace.
  3. Replace worn out stem nuts (for all valves).

- CG 009999, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Swing HTS-06 - Perform a one-time inspection of valve internals and if degraded, repair/replace valve.

- CG 010001, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Ball & Piston, HTS-01, 01A - Perform one-time inspection, and if degraded repair/replace valves.

- CG 010003, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Ball & Piston, HTS-14- Perform one-time inspection, and if degraded repair/replace valves.

- CG 010005, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Swing HTS-02 - Perform a one-time inspection of a valve from this CG. Based on the findings generate WOs for inspection/overhaul/replacement.

- CG 010007, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Ball&Piston, HTS-23 - Perform a one-time sample inspection of 1-33610-NV3001. Determine if further inspections are required from the results of inspection.

- CG 010008, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Ball&Piston, HTS-18 - Perform one-time inspection for one representative valve in each unit. From inspection results, determine if any further inspections and/or replacements are required.

- CG 010009, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, Ball&Piston, HTS-16 - Inspect 1/4-33120-NV49, 1/4-33120-NV54, 1/4-33120-NV58 & 1/4-33120-NV64 and determine if further inspections or replacements are required based on inspection results.

- CG 010020, Unit(s) 1,4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Obtain sufficient spares for 1/4-33310-MV5-SV1, 1/4-33330-MV217-SV1 & 1/4-34960-MV3008-SV1.

- CG 011116, Unit(s) 5,6,7,8: 33320 Bleed Condenser Inlet Isolating Valve –
  1. Add a task to the current PM actuator overhaul to replace the limit switch.
  2. Create separate PMs for 5-8-33320-MV103 stroke tests.

- CG 011117, Unit(s) 5,6,7,8: 33320 Heat Transport Bleed Condensers - Procure spares as required to support inspection/tube bundle replacement.

- CG 011244, Unit(s) 5,6,7,8: 33710 HT D2O Inter-Unit Transfer Pump - Acquire one spare pump to enable replacement in the event of component failure.

- CG 011258, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System - Check Valves - Swing Type - Resolve obsolescence issues and obtain necessary spare parts.

- CG 011270, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System-Valves - MOV-Standard-CAT1&2 - Resolve valve obsolescence issues.

- CG 011274, Unit(s) 5,6,7,8: 33120 Primary Heat Transport Pumps –
  1. Complete a one-time proactive replacement of the HTS pump seals.
  2. Spares/Parts to be procured to support repair/replacement of the seals. (In addition, safe storage of 3 assembled seal cartridges is recommended).
  3. Spares/Parts to be procured to support overhaul of the pump.

- CG 011292, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System - Manual Valves - D2O Inside Containment –
  1. One-time replacement/repair of manual valves with known negative OPEX.
  2. Establish a performance monitoring program to trend of failure rates of Boiler Drain Valves to determine if a future maintenance strategy is required.
  3. Resolve outstanding spare parts issues.

- 011352, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System - Check Valves - Ball & Piston Type - Obsolescence issues to be resolved. Procure replacement valves and spare parts to support valve inspection and potential replacement/overhaul activities.

Incremental recommendations for CO EOL (2024):

- CG 009903, Unit(s) 1,3,4: ELEMENT (TEMP.), Cat 1/2/3 - Initiate new PMs for Boiler Outlet, Pump Motor & Pump Gland Circuit TEs to perform calibrations at a frequency adequate for each temperature loop.

- CG 009924, Unit(s) 1,3,4: Heat Exchanger (Collection), Cat 1/2 - Based on the condition of the replaced HXs, implement PMs to inspect/clean HX at frequency of 4 years, if required.

- CG 009970, Unit(s) 1,4: Strainer, Cat 1/2 - Complete a one-time strainer removal, inspection and replace or clean as necessary. Based on condition of strainers, supplemental WOs to be generated.

- CG 009984, Unit(s) 1,2,4: Transmitter, Cat 1/2/3: Perform one-time replacement of all transmitters without replacement PM.

- CG 009986, Unit(s) 1,4: VALVE, CONTROL, Cat 1/2, 657/667 w/ A or DBQ - Perform a one-time internal inspection of a representative control valve sample from each functional group. Raise supplemental WO's for overhaul or replacement as a result of internal inspection findings.

- CG 009993, Unit(s) 1,4: VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2 - Perform recurring inspection/lubrication at a frequency of 2 years for all valves/actuators.

- CG 010020, Unit(s) 1,4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 –
    1. Perform one-time replacement of associated SV's for 1/4-33910-MV2002 & 1/4-34960-MV3008.
    2. Perform one-time replacement of associated SVs for 1/4-33610-CV1-SV1/2, 1/4-33610-CV2-SV1/2, 1/4-33610-CV3-SV1/2, and 1/4-33610-CV4-SV1/2.

- CG 011119, Unit(s) 5,6,7,8: 33340 Heat Transport Pump Gland Seal Coolers - Perform sample inspections (similar to U2 planned inspections) to ensure condition is acceptable to reach CO EOL (2024). Based on inspection results, as well as U2 inspection results, determine any further AM activities to reach CO EOL (2024).

- CG 011214, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System-TRANSMITTER-ANALYTICAL-CAT 1&2 - Resolve obsolescence and spares issues for transmitters.
- CG 011352, Unit(s) 5,6,7,8: 33000 Primary Heat Transport System - Check Valves - Ball & Piston Type - Perform additional inspections if currently scheduled inspections show degraded condition to ensure condition is maintained to CO EOL (2024).

- CG 011276, Unit(s) 5,6,7,8: 33810 Primary Heat Transport System-Vessels-PV's, Tanks, Drums, etc.-CAT1&2 - Complete a one-time inspection, and if degraded repair/replace (for all tanks).

- CG 011291, Unit(s) 5,6,7,8: 33810 PHT Leakage Collection - Heat Exchanger -
    1. Perform a one-time inspection and if degraded, repair/replace.
    2. Proactively procure replacement heat exchangers for all units.

4.1.1.2.32 *Review of Reactor Building*

System Number: 0452

System Health Report Name: Negative Pressure Containment and H2 Ignition
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	Green	White	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

There are no incremental recommendations per Detailed CAs.

4.1.1.2.33 *Review of Reactor Regulating System*

System Number: 0453

System Health Report Name: Reactor Regulating
Review Period for System Health Report: Q3-2015
Overall System Health Rating: Green

Unit 1	**Unit 4**	**Unit 5**	**Unit 6**	**Unit 7**	**Unit 8**
Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010147, Unit(s) 1,4: POWER SUPPLY, Cat 1/2 - Complete replacement of AC Transfer Panels 4-63715-R1A/R1C-PS1 (ref. EC#30104, WO's 1377367 & 1377370), ensure spares are available for 1/4-63715-R1A/B/C-PS1.

- CG 011455, Unit(s) 5,6,7,8: 63171/63177 - Reactor Regulating System-SIGNAL CONDITIONER-CAT 1&2 - Complete replacement program for AA & CA ESPM modules.

Incremental recommendations for Plant EOL (2020):

- No additional practices are recommended to reach Plant EOL (2020).

Incremental recommendations for CO EOL (2024):

- CG 010135, Unit(s) 1.4: DETECTOR, Cat 1/2 - Replace all detectors that were last replaced before 2004.

- CG 010141, Unit(s) 1,4: ION CHAMBER, Cat 1/2 - Replace all detectors that were last replaced before 2004.

- CG 010147, Unit(s) 1,4: POWER SUPPLY, Cat 1/2 - Complete the rest of the lifecycle replacements of power supplies to reach CO EOL (2024).

4.1.1.2.34 *Review of Recirc Cooling Water (RCW)*

System Number: 0454

System Health Report Name: Recirculating Cooling Water
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010158, Unit(s) 1,4: ELEMENT, Cat 1/2 - Perform a one-time inspection of 1/4-67132-T501-TE1 and if degraded replace.

- CG 010163, Unit(s) 1,4: HEAT EXCHANGER, Cat 1/2 - Maintain established PM frequency (cessation of repetitive PM deferral history), and complete outstanding WO#2164403 to obtain a spare floating end cap from Unit 2 and WO#03088812 to replace cover gasket.

- CG 010189, Unit(s) 1,4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2 - Complete NICRs to replace Unit 4 MV531/MV560.

- CG 011174, Unit(s) 5,6,7,8: 71320 RCW Heat Exchangers - Maintain established PM frequency (to address deferred PMs). Monitor wall losses and leakages, and raise Work Orders as necessary to address aging management issues.

- CG 011402, Unit(s) 5,6,7,8: 71320 Recirc Cooling Water (RCW)-Expansion Joints:
    1. Investigate an alternate style/type/material of expansion joint that can withstand the piping misalignment, or a way of aligning the piping to prevent the expansion joint from leaking. Once a solution is found, complete replacement of discharge expansion joints EJ544/EJ545/EJ546 under Master NICR 124073.
    2. Complete open WOs to replace both suction and discharge expansion joints and initiate WOs to replace the remaining suction side expansion joints, if necessary, based on the results of visual inspection during pump maintenance.
    3. Complete outstanding corrective WOs to address leakage problems.

- CG 011403, Unit(s) 5,6,7,8: 71320 Recirc Cooling Water (RCW)-Strainers - Complete removal of the filter element from 6-71320-STR501.

Incremental recommendations for Plant EOL (2020):

- CG 011174, Unit(s) 5,6,7,8: 71320 RCW Heat Exchangers –
    1. Procure sufficient spare parts to support potential gasket replacements, as needed.
    2. Proactively establish procurement requirements for new HX, tube bundle and channel cover to reduce procurement time, should a replacement be required.

Incremental recommendations for CO EOL (2024):

- CG 010158, Unit(s) 1,4: ELEMENT, Cat 1/2 - Implement a PM program to test and inspect these TEs.

4.1.1.2.35 *Review of Relief Ducts*

System Number: 0455

System Health Report Name: Negative Pressure Containment and H2 Ignition
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	Green	White	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. Detailed CAs have evaluated the work recommended for maintaining current life or extended operating life. Refer to Appendix B.2 for more information. There are no incremental recommendations per the Detailed CAs.

4.1.1.2.36 *REVIEW OF SERVICE WATER SYSTEMS*

System Number: 0456

System Health Report Name: Low Pressure Service Water
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 0	Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 058
Green	Yellow	Yellow	Green	White	White	White	Green

System Health Report Name: High Pressure Service Water
Review Period for System Health Report: Q3-2015
Overall System Health Rating: Green

Unit 0	Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8	Unit 058
Green	White	Yellow	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010212, Unit(s) 1,2,3,4: CONTROL, Cat 1/2 - Implement late/deferred Predefine WO# 2432900 to overhaul/diagnose 4-71310-CV825.

- CG 010241, Unit(s) 1,4: MOTOR, Cat 1/2, CLIV Pumps - Execute PMs that have not been performed in the last 4 years (e.g. PM #126075).

- CG 010251, Unit(s) 1,4: PUMP, Cat 1, LPSW Pumps -
    1. Complete outstanding weld repair of pump top case and suction bell (WO# 2933902).
    2. Significant negative OPEX (SCR's) suggests that deferred PM activities have resulted in the downgrade of the condition. The PM activities need to be completed as per their approved frequency to reach Plant EOL (2020).

- CG 010252, Unit(s) 1,4: PUMP, Cat 2, HPSW Pumps - Complete the following WOs: WO 2850568 to overhaul pump 1-71340-P3, WO 1667952 to overhaul pump 4-71340-P3, WO 2826402 to replace 1-71340-P4, WO 02854187 to perform daily IR & vibration monitoring 4-71340-P4.

- CG 010290, Unit(s) 2,0: VALVE, CONTROL, Cat 1/2, Diaphragm Actuator, Rising Stem Cooling CVs, Fisher –

1. Complete WO for replacement of 2-71310-CV697 and 2-71310-CV698 (WO# 2480901, 2480903).
2. Complete WO 04861286 for one-time actuator overhaul of 0-71310-CV810.

- CG 010303, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, LPSW-05, 05A – Implement a one-time inspection/overhaul/repair/replacement of 1-71310-NV20.

- CG 010311, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2, HPSW-08, 09 - Complete outstanding work orders WO 2786118, WO 2968105, WO 2967008 and WO 2967009 to inspect/repair the respective valves.

- CG 010315, Unit(s) 1,2,3,4,0: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, Piston, Butterfly Keystone MVs - Complete a one-time overhaul/refurbishment of valve, actuator and instruments for valves 1,4-71310-MV186, MV187.

- CG 010317, Unit(s) 1: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, Piston, Butterfly Jamesbury MV- Complete outstanding WO to refurbish valve 1-71310-MV176 and instruments (WO# 02254655).

- CG 010318, Unit(s) 1,4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, Piston, Centerline Butterfly MV –
    1. Complete replacement of valve assembly 1-71310-MV502 (ref. NICR 105583; WO# 2878189).
    2. Overhaul valve and actuator of 1-71310-MV505 (WO 939721).
    3. Replace valve assembly of 71340-MV660 (WO #02417971).

- CG 010320, Unit(s) 4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, Piston, Butterfly Keystone MVs Associated UPP Supply MV and High Pressure pump discharge MV - Complete WOs for valve replacement (1561412, 1561410).

- CG 011170, Unit(s) 5,6,7,8: 71310 Emergency LPSW Pumps – PM deferral will result in further degradation of the pumps. PM's need to be completed at their scheduled frequency to reach Plant EOL (2020).

- CG 011175, Unit(s) 5,6,7,8: 71340 HPSW Pumps - PM deferral will result in further degradation of the pumps. PM's need to be completed at their scheduled frequency to reach Plant EOL (2020).

- CG 011371, Unit(s) 5,6,7,8: 71340 Emergency CLIII HPSW Pump Motors-4kV - Accelerate motor refurbishment program that was started in 2009, to support continued operation.

- CG 011383, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems-Valves – Manual Diaphragm – Cat 1&2 - Complete Work Orders; 2928072, 3108125, 2928086, 2928089, 2928091, 2928092 and 2940512.

- CG 011387, Unit(s) 056,078,058: 71310 Service Water Systems-Valves – MOV – Butterfly – CAT1&2 – Complete inspections of 056-71310-MV402/ MV403 and 078-71310-MV404/405.

- CG 011388, Unit(s) 5,6,7,8,056,078: 71310 / 71340 Service Water Systems-Valves - AOV-Standard-CAT1&2 - Complete outstanding WOs: WO for 8-71310-CV585 replacement (WO 4907606), WO for 5-71310-CV583 monitoring temp changes (WO 4907649), WO for 5-71310-CV585 replacement (WO 2508842), WO for 7-71310-CV585 troubleshooting (WO 3067647). Generate WR for 6-71310-CV585 replacement (no WO).

- CG 011391, Unit(s) 5,6,7,8,056,078: 71310 / 71340 Service Water Systems-Non Return Valves - CAT1&2 –
    1. Complete a one-time practice per the check valve strategy manual P-MAN-04946-00001 for all equipment tags that are not covered by an active PM to reach Plant EOL (2020).
    2. Complete all Work Orders and Change Requests in the Action List of the CA.
    3. Complete WO’s: 2853616, 04781418 02736496, 02733802, 02626810, 03060255, 01703138, 02626810, 02736588 and 2735252.

- CG 011399, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems-Valves - Manual Butterfly - Criticality 1 & 2 - Complete WO 02945929, WO 02945931, WO 02657191.

Incremental recommendations for Plant EOL (2020):

- CG 010217, Unit(s) 1,4: EXPANSION JOINT, Cat 1/2, Moderator - Perform a one-time replacement of all expansion joints.

- CG 010219, Unit(s) 1,4: EXPANSION JOINT, Cat 1/2 - Complete a one-time inspection of the EJs in this CG to reach Plant EOL (2020).

- CG 010235, Unit(s) 1,4: LUBRICATOR, Cat 1/2 - Complete a one-time inspection of the lubricators to reach Plant EOL (2020).

- CG 010252, Unit(s) 1,4: PUMP, Cat 2, HPSW Pumps - Complete a one-time task for pump monitoring, inspection and lubrication to reach Plant EOL (2020).

- CG 010262, Unit(s) 1,4: STRAINER, Cat 1/2 -
    1. Complete a one-time internal inspection of 1-71310-STR3310, 1-71310-STR3311, and 1-71310-STR3312 to reach Plan EOL (2020).

2. Increase the frequency of existing PM (e.g. 10938) execution from every 3 years to every 2 years. If performance does not improve, increase the frequency further.

- CG 010290, Unit(s) 2,0: VALVE, CONTROL Cat 1/2,Diaphragm Actuator, Rising Stem Cooling CV's Fisher – Complete a one-time diagnostic/calibration of 0-71310-CV813.

- CG 010300, Unit(s) 1,3,4,0: VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2-
    1. Complete a one-time diagnostic testing of 0-71310-MV401 and 3-71310-MV2012.
    2. Complete a one-time inspection and lubrication of 1/4-71310-MV2070, 1/4-71340-MV2191, MV2332, 0-71310-MV459, MV401 and 3-71310-MV2012 to reach Plant EOL (2020).

- CG 011383, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems-Valves – Manual Diaphragm – Cat 1&2 – Replace valves as they reach their 10 year life expectancy.

- CG 011388, Unit(s) 5,6,7,8,056,078: 71310 / 71340 Service Water Systems-Valves - AOV-Standard-CAT1&2 – Complete a sample inspection of one CV, based on results repair/replace as necessary and implement further PM activities for remaining CV's.

- CG 011394, Unit(s) 5,6,7,8,056,078: 71310 Service Water Systems-Valves - Cast Iron Manual Butterfly - CAT1&2 - Replace 5, 7, 8-71310-V370. Replace or refurbish six other valves in this CG based on OPEX.

- CG 011399, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems-Valves - Manual Butterfly - Criticality 1 & 2 - Perform a one-time replacement of valves as they approach their 10 year service life.

- CG 011400, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems - Valves - Manual Gate & Globe - Cat 1 & 2 –
    1. Perform a one-time replacement of valves as they approach their 10 year service life.
    2. Procure spare CAT ID 123565.

Incremental recommendations for CO EOL (2024):

- CG 010219, Unit(s) 1,4: EXPANSION JOINT, Cat 1/2 - Complete a one-time inspection of the EJs in this CG to reach CO EOL (2024), depending on outcome of last inspection.

- CG 010235, Unit(s) 1,4: LUBRICATOR, Cat 1/2- Complete a one-time inspection of the lubricators to reach CO EOL (2024), depending on previous inspection condition.

- CG 010240, Unit(s) 4: MOTOR, Cat 1/2, MOVs - Change PM frequency for associated MV diagnostic testing from every 8 years to every 4 years, to reach CO EOL (2024).

- CG 010252, Unit(s) 1,4: PUMP, Cat 2, HPSW Pumps - Complete a one-time task for pump monitoring, inspection and lubrication to reach CO EOL (2024), depending on condition from last completion.

- CG 010256, Unit(s) 1,4: RELAY, Cat 1/2 - Validate status of spare relays to ensure between 5 &10% spares are available to reach CO EOL (2024).

- CG 010262, Unit(s) 1,4: STRAINER, Cat 1/2- Complete a further one-time internal inspection of 1-71310-STR3310, 1-71310-STR3311, and 1-71310-STR3312 to reach CO EOL (2024).

- CG 010269, Unit(s) 1,4: SWITCH, Cat 1/2, Flow Switch - Initiate PM to calibrate and function check CC2 items 67131-FS195, FS196 & FS197 (ref. PM 117096).

- CG 010290, Unit(s) 2,0: VALVE, CONTROL, Cat 1/2, Diaphragm Actuator, Rising Stem Cooling CVs, Fisher –
    1. Complete a one-time overhaul of 0-71310-CV813.
    2. Complete a one-time diagnostics/calibration 2 years after CV813 overhaul.

- CG 010300, Unit(s) 1,3,4,0: VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2 - Complete a further one-time inspection and lubrication of 1/4-71310-MV2070, 1/4-71340-MV2191, MV2332, 0-71310-MV459, MV401 and 3-71310-MV2012 to reach CO EOL (2024).

- CG 010320, Unit(s) 4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, Piston, Butterfly Keystone MVs Associated UPP Supply MV and High Pressure pump discharge MV - Complete a one-time actuator overhaul for 4-71340-MV28/29.

- CG 010329, Unit(s) 4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2, Associated UPP Supply MV and High Pressure pump discharge MV- Implement PM to overhaul/replace SVs during MV overhaul PM which is currently set at 208 week interval.

- CG 010337, Unit(s) 1,4: TRANSFORMER, Cat 1/2- Perform a one-time inspection of transformers and if degraded repair/replace to ensure equipment reaches CO EOL (2024).

- CG 011170, Unit(s) 5,6,7,8: 71310 Emergency LPSW Pumps - Complete a one-time detailed inspection of the concrete supporting pads.

- CG 011370, Unit(s) 5,6,7,8: 71310 Emergency LPSW Pump Motors-4kV - Refurbish all ELPSW pump motors before 2020 to restore condition of all ELPSW motors to reach CO EOL (2024).

- CG 011383, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems-Valves – Manual Diaphragm – Cat 1&2 - Replace the valves that have not been replaced for 10 years.

- CG 011387, Unit(s) 056,078,058: 71310 Service Water Systems-Valves – MOV – Butterfly – CAT1&2 - Complete a one-time actuator inspection for 056-71310-MV402/403 and 078-71310-MV404/405 similar to PM#18360.

- CG 011399, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems-Valves - Manual Butterfly - Criticality 1 & 2 - Perform a one-time replacement of valves that have not been replaced for 10 years.

- CG 011400, Unit(s) 5,6,7,8: 71310, 71340 Service Water Systems - Valves - Manual Gate & Globe - Cat 1 & 2- Perform a one-time replacement of valves that have not been replaced for 10 years.

4.1.1.2.37 *Review of Shield Cooling System*

System Number: 0458

System Health Report Name: End Shield Cooling
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010363, Unit(s) 1,4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2 - Ensure 1-34310-MV1/MV5 limit switches are replaced per EC 67465 and EC 67464.

- CG 010373, Unit(s) 1,4: ALARM, Cat 1/2 - Complete WO 2796608 to correct deficiencies with 1-63431-L1-L8060IA1 and L4-LIA1.

- CG 011126, Unit(s) 5,6,7,8: 34110 End Shield Cooling Heat Exchangers -
  1. Complete outstanding WOs 02868142, 02868136, 02868103 to replace rear channels.
  2. Complete WOs 02320095, 02839923 for inspection and cleaning activities.

- CG 011479, Unit(s) 5,6,7,8: 34110 End Shield Cooling System-Non Return Valves -CAT1&2 - Complete WOs 02719289, 02733800, 02737230, 02734283, 02525539, 02734357 to overhaul/replace NVs.

Incremental recommendations for Plant EOL (2020):

- CG 010353, Unit(s) 1,4: EXPANSION JOINT - Add a task to routine RB operator rounds to perform a visual inspection of the expansion joints. Look for signs of mechanical/thermal degradation of the joints, as well as material deterioration resulting in cracking and failure of the pressure boundary.

- CG 010357, Unit(s) 1,4: RELAY, Cat 1/2 –
  1. Implement a PM to periodically replace the relays.
  2. Implement a PM to perform periodic inspection and testing.
  3. Populate model information and Cat ID in Asset Suite for 1/4-34310-MV5-R61.
  4. Contact vendor to confirm spare part availability for 1/4-34310-MV5-R61 following identification of the model(s).

- CG 011479, Unit(s) 5,6,7,8: 34110 End Shield Cooling System-Non Return Valves -CAT1&2 - Resolve spare parts issue associated with Cat ID 118501.

Incremental recommendations for CO EOL (2024):

- CG 010356, Unit(s) 1,4: VALVE, CONTROL, Cat 1/2-
  1. Re-activate PMs to calibrate the actuator & components every 728 days.
  2. Complete a one-time actuator overhaul / replace sub-components for all control valves.

- CG 010372, Unit(s) 4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2 - Implement PMs for NV replacements.

- CG 010373, Unit(s) 1,4: ALARM, Cat 1/2 - Perform proactive replacement of Alarm Unit(s).

- CG 011479, Unit(s) 5,6,7,8: 34110 End Shield Cooling System-Non Return Valves -CAT1&2 - Perform one-time NIT for valve groups consistent with P-MAN-04946-00001.

4.1.1.2.38 REVIEW OF SHUTDOWN COOLING SYSTEM

System Number: 0459

System Health Report Name: Primary Heat Transport and Aux
Review Period for System Health Report: Q4-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	White	Green	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010380, Unit(s) 1,4: HEAT EXCHANGER, Cat 1/2 - Complete the implementation of EC's 107659 and 108155 to install new leak off valves for the isolators on 1, 4-33410-HX-1, 2, 3, 4.

Incremental recommendations for Plant EOL (2020):

- CG 010380, Unit(s) 1,4: HEAT EXCHANGER, Cat 1/2 –
    1. Perform a one-time inspection of 1, 4-33410-HX1, 2, 3, 4 to include inspection of tubes for cleanliness and eddy current inspection.
    2. Complete internal and external inspections of the shell for Microbiologically Induced Corrosion (MIC) on 1, 4-33410-HX1, 2, 3 and 4 every outage.
    3. Initiate a one-time inspection and tube cleaning of 1, 4-33410-HX5, 6, 7, 8.

- CG 011294, Unit(s) 5,6,7,8: 33410 Shutdown Cooling System - AOV's - Perform one-time overhauls of the outstanding depressurization and warm-up valve actuators.

Incremental recommendations for CO EOL (2024):

- CG 011347, Unit(s) 5,6,7,8: 33410 Shutdown Cooling System - Solenoid Valves - Perform one-time proactive replacement.

- CG 010380, Unit(s) 1,4: HEAT EXCHANGER, Cat 1/2 –
    1. Initiate new PMs for tube cleaning and internal inspections of 1, 4-33410-HX5, 6, 7, 8 every 4 years.
    2. Complete shell replacements on 1-33410-HX1, 2.

- CG 010385, Unit(s) 1,4: MOTOR, Cat 1/2 - Reinstate Baker Analysis and Megger Check for pump motors (e.g. PM #6709-1/3).

4.1.1.2.39 Review of Shutdown System (SDS1)

System Number: 0460

System Health Report Name: Shutdown System 1 (SDS1)
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 5	Unit 6	Unit 7	Unit 8
White	White	White	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Incremental recommendations for Plant EOL (2020):

- CG 011434, Unit(s) 5,6,7,8: 31730 Shutdown System 1 (SDS1) - Major Equipment - Shut-off Unit(s) - Replace SA Rod Ready Reed Switch assemblies on the SA Mechanisms in Unit(s) 5, 6, 7 and 8.

- CG 011468, Unit(s) 5,6,7,8: 63721 Shutdown System 1 (SDS1)-Independent PCB-S/R Perform proactive replacements on Unit 7 & 8.

Incremental recommendations for CO EOL (2024):

- No additional practices are recommended to reach CO EOL (2024).

4.1.1.2.40 Review of Shutdown System (SDS2)

System Number: 0461

System Health Report Name: LISS Shutdown System 2
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 5	Unit 6	Unit 7	Unit 8
Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 011256, Unit(s) 5,6,7,8: 63730 SDS2 Check Valves - Complete all active work orders to replace and/or inspect valve internals.

Incremental recommendations for Plant EOL (2020):

- CG 011128, Unit(s) 5,6,7,8: 34710 LISS Poison Addition & Sampling Pumps - Acquire a spare pump for 34710-P1.

Incremental recommendations for CO EOL (2024):

- CG 011256, Unit(s) 5,6,7,8: 63730 SDS2 Check Valves - Complete one-time replacement of 6-34710-NV217 and 8-34710-NV15.

- CG 011281, Unit(s) 5,6,7,8: 31760 Shutdown System 2 (SDS2)-Piping-Piping Components-CAT1&2- Complete mechanical design evaluation of the LISS Piping for continued operation and implementation of any findings.

- CG 011282, Unit(s) 5,6,7,8: 34710 Liquid Injection Shutdown System (LISS) Tanks:
    1. Perform internal inspections of one of the LISS Tanks in each of the Units (5/6/7/8-34710-TK1, TK2, TK3, TK4, TK5, and TK6).
    2. Perform an internal inspection of the mixing tanks in each of the units (5/6/7/8-34710-TK11).
    3. Perform an internal inspection of the Helium Supply Tank (5/6/7/8-34710-TK10) in each of the units.

4.1.1.2.41 Review of Shutdown System A (SDSA)

System Number: 0462

System Health Report Name: Shutdown System (SDSA)
Review Period for System Health Report: Q3-2015
Overall System Health Rating: Green

Unit 1	Unit 4
Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010429, Unit(s) 1,4: MOTOR, Cat 1/2 - Proactive replacement to be completed: Backlogged Work Orders to replace all Unit 1, 4 aged Shut Off Rod (SOR) motor to be completed.

- CG 010445, Unit(s) 1,4: SWITCH, Cat 1/2 - Replace all hand switches/pushbuttons when performing SDS tests.

- CG 010451, Unit(s) 1,4: TRANSMITTER, Cat 1/2 - Implement outstanding WOs for the pro-active replacement of Boiler Room High Pressure (BRHP) Pressure Transmitters.

Incremental recommendations for Plant EOL (2020):

- CG 010412, Unit(s) 4: CAPACITOR, Cat 1/2 - Implement comprehensive capacitor monitoring (thermography) PMs.

- CG 010420, Unit(s) 1,4: DETECTOR, Cat 1/2 - Inspect all detectors, if needed repair/replace.

- CG 010425, Unit(s) 1,4: INDICATOR, Cat 1/2 - Complete one-time replacement of meters and position indicators.

- CG 010434, Unit(s) 1,4: POWER SUPPLY, Cat 1/2- Implement a PM for proactive life cycle replacement.

- CG 010456, Unit(s) 1,4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2- Replace all valves with USI 63101 and USI 63744 that have not been replaced since 2012.

Incremental recommendations for CO EOL (2024):

- CG 010407, Unit(s) 1,4: AMPLIFIER, Cat 1/2 - Initiate EQ PM to replace the amplifiers, as the amplifiers will be reaching their qualified life.
- CG 010409, Unit(s) 1,4: ANALYZER Cat 1/2 – Perform one-time replacement.

- CG 010412, Unit(s) 4: CAPACITOR, Cat 1/2- Implement proactive replacement PMs.

- CG 010420, Unit(s) 1,4: DETECTOR, Cat 1/2 - Replace all ICFD.

- CG 010456, Unit(s) 1,4: VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2 - Perform one-time replacements of all valves which have not been replaced since 2016.

- CG 010458, Unit(s) 1,4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Implement one-time replacement.

- CG 010462, Unit(s) 1,4: POWER SUPPLY, Cat 1/2 –
    1. Procure sufficient spares.
    2. Perform one proactive replacement.
    3. Initiate PM to Monitor AC Ripple and DC Output Voltage before start-up.

4.1.1.2.42 *Review of Shutdown System E (SDSE)*

System Number: 0463

System Health Report Name: Shutdown Sys Enhanced (SDSE)
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 1	Unit 4
Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010468, Unit(s) 1,4: AMPLIFIER, Cat 1/2, Fission Chamber - Complete installation of modified amplifiers per Design ECs 102583 and 102590.

- CG 010496, Unit(s) 1,4: POWER SUPPLY, Cat 1/2 - Proactive replacements to be completed for the power supplies (e.g. WO# 3003011).

- CG 010500, Unit(s) 1,4: RELAY, Cat 1/2 - Replace the relays 1-63731-R93G/R94G/R96G per WO# 3261833.

Incremental recommendations for Plant EOL (2020):

- CG 010468, Unit(s) 1,4: AMPLIFIER, Cat 1/2, Fission Chamber - Resolve spare part issues.

- CG 010469, Unit(s) 1,4: ARRESTOR (Dump Arrest Unit), Cat 1/2- Procure sufficient spares.

- CG 010478, Unit(s) 1,4: DETECTOR, Cat 1/2 - Inspect all detectors, if needed repair/replace.

- CG 010479, Unit(s) 1,4: DETECTOR, Fission Chamber, SPV –
    1. Perform Fission Chamber detector Plateau Checks every 2 years.
    2. Based on the results of the Plateau Checks, replace the detectors if required.
- CG 010499, Unit(s) 1,4: Regulator, Cat 1/2 – Initiate a one-time replacement of all valves in this commodity group.

Incremental recommendations for CO EOL (2024):

- CG 010469, Unit(s) 1,4: ARRESTOR (Dump Arrest Unit), Cat 1/2 - Implement new PMs for calibration.

- CG 010478, Unit(s) 1,4: DETECTOR, Cat 1/2 –
    1. Perform prompt fraction checks as required prior to CO EOL (2024).
    2. Replace all ICFD.

- CG 010496, Unit(s) 1,4: POWER SUPPLY, Cat 1/2 - Implement a new PM for monitoring AC ripple and output voltage.
- CG 010518, Unit(s) 1,4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Implement new PMs for the solenoid valves for use in SDSE HTS High/Low Pressure Trips.

4.1.1.2.43 *Review of Site Electrical System*

System Number: 0464

System Health Report Name: Class IV / Class IV Transfer
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 0	Unit 1	Unit 2	Unit 3	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
Green	Green	Green	Green	Green	Green	Green	Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. Detailed CAs have evaluated the work recommended for maintaining current life or extended operating life. Refer to Appendix B.2 for more information.

There are no incremental recommendations per the Detailed CAs.

4.1.1.2.44 *Review of Standby Generators*

System Number: 0465

System Health Report Name: Standby Generators
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 0	Unit 012	Unit 034	Unit 056	Unit 058	Unit 078
Green	Yellow	Yellow	White	Green	White

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010564, Unit(s) 012,034: ACTUATOR, Cat 1/2 –
    1. Complete implementation of Master EC 114279 and WO's 02620689, 02620691 for governor valve replacement.
    2. Complete WO 04802166 to ensure that the louver failure was not a result of actuator failure.

- CG 010572, Unit(s) 012,034: CIRCUIT BREAKER, Cat 1/2 - EC#118495 and WOs# 4857973, 3272375, 44675553, 44675558, 44675563, 44675567, 44675571 to be completed.

- CG 010594, Unit(s) 012,034: FAN, Cat 1/2 - Ensure spare parts/spare fans are available to facilitate repair/replacement/corrective action if fans fail regular function test.

- CG 010603, Unit(s) 012,034: GENERATOR, Cat 1/2 - Complete WOs 4701963, 2834659, 3141105 to restore condition.

- CG 010608, Unit(s) 012,034: HEAT EXCHANGER, Cat 1/2 - Ensure adequate spares are available to facilitate replacement if required.

- CG 010664, Unit(s) 012,034: SWITCH, Cat 1/2 - Complete EC (e.g. 29774) that removes CO2 fire protection system from SGs.

- CG 010693, Unit(s) 012,034: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Complete NICR 125627 for 034 SG3 to replace SV3007.

- CG 011260, Unit(s) 056,078: 54600 Standby Generators - Lube Oil Cooler Dampers/Generator air cooling Dampers –
    1. Perform one-time replacement of Generator air cooling system Dampers (056/078-54600-SG1/2/3-MDP1/2) and spare parts through NICRs.

2. Perform one-time replacement of lube oil cooler dampers and spare parts through NICRs.
3. Perform one-time replacement of actuator motor for the PT lube oil cooler.
4. Procurement engineering to BOM and CAT ID components of new dampers (replaced via NICRs from above recommendations).

- CG 011305, Unit(s) 056,078: 54600 Standby Generators-Standby Generator - Complete WO's for one-time inspections of power turbines (i.e. WO's 02696119, 02696120, 02696121, 02696116, 02696117 and 02696118).

Incremental recommendations for Plant EOL (2020):

- CG 010564, Unit(s) 012,034: ACTUATOR, Cat 1/2 – Complete a one-time inspection of governor actuator.

- CG 010572, Unit(s) 012,034: CIRCUIT BREAKER, Cat 1/2 –
  1. Implement PMs on the CBs that are not subject to already under a PM.
  2. Resolve obsolescence issues on applicable breakers.

- CG 010594, Unit(s) 012,034: FAN, Cat 1/2 - Perform a one-time lubrication of fan/motor bearings, and inspection of fan for wear and proper alignment to reach Plant EOL (2020).

- CG 010602, Unit(s) 012,034: GEARBOX, Cat 1/2 - Complete cost/benefit for obtaining one spare.

- CG 010603, Unit(s) 012,034: GENERATOR, Cat 1/2 - Perform major generator inspection (electrical and mechanical testing) on 012-SGs and 034-SGs.

- CG 010608, Unit(s) 012,034: HEAT EXCHANGER, Cat 1/2 - Complete a one-time cleaning, internal inspection, NDE inspection and leak testing.

- CG 010678, Unit(s) 012,034: VALVE, CONTROL, Cat 1/2 - Perform a one-time inspection of all valves (including valve internals) that are not covered under PM's for periodic replacement (i.e. only CV3029 is regularly replaced). If inspection indicates aging degradation, then repair or replace to reach Plant EOL (2020).

- CG 010680, Unit(s) 012: VALVE, CONTROL, Cat 1/2 - Perform a one-time inspection of valve internals, and repair / replace if degraded to reach Plant EOL (2020).

- CG 010688, Unit(s) 012, 034: VALVE, PRESSURE REGULATING, Cat 1/2 – Complete a one-time inspection, and repair/replace if degraded.

- CG 010645, Unit(s) 012,034,0: PUMP, Cat 1/2 –
  1. Ensure PdM for thermography is conducted routinely (at 12 week frequency) for fuel forwarding pumps only (i.e. 012/0-54660-P101/102/201/202/301/302).
  2. Complete a one-time alignment inspection on all pumps except fuel forwarding pumps (i.e. 012/034-54660-P101/102/201/202/301/302).

- CG 011305, Unit(s) 056,078: 54600 Standby Generators-Standby Generator - Complete a one-time inspection of generator on 056 bank, similar to inspection performed on 078 bank (078-SG2, WO 2146890). Results of inspection to determine if corrective actions or further inspections on other SGs are required.

Incremental recommendations for CO EOL (2024):

- CG 010594, Unit(s) 012,034: FAN, Cat 1/2 - Perform a further one-time lubrication of fan/motor bearings, and inspection of fan for wear and proper alignment to reach CO EOL (2024).

- CG 010608, Unit(s) 012,034: HEAT EXCHANGER, Cat 1/2 – Complete a further one-time cleaning, internal inspection, NDE inspection and leak testing.

- CG 010645, Unit(s) 012,034,0: PUMP, Cat 1/2:
  1. Ensure PdM for thermography is conducted routinely (at 12 week frequency for fuel forwarding pumps only (i.e. 012/034-54660-P101/102/201/202/301/302).
  2. Complete a one-time alignment inspection on all pumps except fuel forwarding pumps (i.e. 012/034-54660-P101/102/201/202/301/302).

- CG 010664, Unit(s) 012,034: SWITCH, Cat 1/2 - Complete proactive replacement of 056/078-54600 SG louvres 11/12 and the actuator motor.

- CG 010670, Unit(s) 012,034: TRANSMITTER, Cat 1/2 - Perform one-time inspection/maintenance checks of all transformers in this CG, and if degraded repair/replace to ensure components reach CO EOL (2024).

- CG 010678, Unit(s) 012,034: VALVE, CONTROL, Cat 1/2 - Perform a further one-time inspection for all valves (including valve internals) that are not covered under PM's for periodic replacement (i.e. only CV3029 is regularly replaced). If inspection indicates aging degradation, then repair or replace to reach CO EOL (2024).

- CG 010680, Unit(s) 012: VALVE, CONTROL, Cat 1/2 - Perform a further one-time inspection of valve internals, and repair/replace if degraded to reach CO EOL (2024).

4.1.1.2.45 REVIEW OF STRUCTURES

System Number: 0466

System Health Report Name: Screenhouse
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 012	Unit 034	Unit 056	Unit 078
Yellow	Yellow	Yellow	White

System Health Report Name: Negative Pressure Containment and H2 Ignition
Review Period for System Health Report: Q3-2015
Overall System Health Rating: White

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	Green	White	Green	Green

System Health Report Name: Vacuum Building (NPC/ESW) System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 0	Unit 018
Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information. Note, the Calandria Vault structure does not require a System Performance Monitoring Plan, and hence does not have a System Health Report. The CGs in this system were all screened out.

4.1.1.2.46 REVIEW OF VB / EMERGENCY WATER TANK AND SPRAY SYSTEM

System Number: 0469

System Health Report Name: Vacuum Building (NPC/ESW) System
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Green

Unit 0	Unit 018
Green	Green

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 010748, Unit(s) 0: PUMP, Cat 1 –
  Complete the following:
    1. Complete WOs 2810540 & 2956861 to do a post-mortem inspection of 0-34220-P3 (Sent to OEM, Waiting for Report).
    2. Implement the applicable ACE recommendations written for SCR P-2014-30189, and implement the recommended changes resulting from the OEM inspection.
    3. Complete WOs 2898045 and 2898043 to inspect the strainer/ separator on 0-34220-P1 and 0-34220-P3 respectively.
    4. Complete WO 02956864 to overhaul 0-34220-P1.
    5. Complete WO 04930103. 0-34220-P3 could not shutdown at target pressure. Repair / replace as necessary.
    6. Complete WO 02953941 to rebuild the spare main volume pump and return to stores.
    7. Complete WO 04808854 to investigate an oily mist observed at the pump inboard bearing.
    8. Complete WO 02956863 0-34220-P2. Investigate and fix oil loss issue with P2.
    9. Complete WO 04773326 and install In-pro Seals on P3.
    10. Progress ECR 18400 to install permanent vibration transducers in pump bearing cartridges for improved transmission of high frequency signal.
    11. Complete EC 88952 and install proper oil sampling ports on the pumps.
    12. Complete EC 74633 to change the seal water distribution to each of the main volume vacuum pumps.
    13. Complete EC 83997 to modify the breathers on the main volume vacuum pumps (0-34220-P1, P2, P3) to prevent pump oil leakage.
    14. Complete EC 107060 for 0-34220-P1 and 0-34220-P2 to update the OEM flow diagram to as built conditions.
    15. Complete EC 108025 for P2 0-71620-NICR Demin. Water piping change to support 0-34220-P2 Seal water float valve replacement.

- CG 010753, Unit(s) 018, 0: Relay (U0, 018), Cat 1/2 - Complete a proactive replacement of relays in the system that are experiencing higher failure rates.

- CG 010781, Unit(s) 1,4,018,0: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Execute PMs that have not been performed in the last 10 years (e.g. PM #88954).

Incremental recommendations for Plant EOL (2020):

- CG 010745, Unit(s) 0: MOTOR, Cat 1/2 - Replace Main Vacuum Pump Motors.

- CG 010748, Unit(s) 0: PUMP, Cat 1 – Implement PdM activities to perform vibration testing, infrared readings and oil analysis.

Incremental recommendations for CO EOL (2024):

- CG 010748, Unit(s) 0: PUMP, Cat 1 – Review OEM inspection / recommendation from WOs 2810540, 2956861 and SCR P-2014-30189, and apply to assure condition of components to CO EOL (2024).

4.1.1.2.47 REVIEW OF FUELLING MACHINE

System Number: 0472

System Health Report Name: Fuelling Machines
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	Yellow	White	White	White	White

System Health Report Name: Fuelling Machine Rams and Bridges
Review Period for System Health Report: Q4-2015
Overall System Health Rating: Yellow

Unit 1	Unit 4	Unit 5	Unit 6	Unit 7	Unit 8
White	White	Yellow	Yellow	Yellow	Yellow

On-going Station activities geared at maintaining and/or improving the System Health Rating are included in the System Health Report and are not repeated here. The incremental work identified in the Detailed CAs as being recommended for maintaining current life or extended operating life is listed below. Refer to Appendix B.2 for more information.

Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

- CG 009129, Unit(s) 1,4: Catenary Assembly, Cat 1/2 - Correct configuration management errors in current PMs.

- CG 009134, Unit(s) 1,4: Control, Cat 1/2 - Complete one-time replacement per WOs 2636180, 2636179, 2731627, and 2636257.

- CG 009138, Unit(s) 1,4: Cylinder, Cat 1/2 - Complete one-time replacements of 1/4-63535-NZM-A1E & W and 1/4-63535-NZM-A2E & W via WO#3163574, 3163568, 3163587 and 3163654 (scheduled for 2019) to reach Plant EOL (2020).

- CG 009143, Unit(s) 1,4: Fueling Machine, Cat 1/2 - Resolve outstanding spare parts issues for Fuelling Machines, sufficient spares should be on hand to complete outstanding WOs for replacement and support maintenance.

- CG 009155, Unit(s) 1,4: Meter, Cat 1/2 - Complete one-time replacement of the x-drive train (WO # 2416645, 4940414, 4940416, 2676831) to restore condition to reach Plant EOL (2020).

- CG 009161, Unit(s) 1,4: Motor, Hydraulic, Cat 1 - Complete a one-time replacement of the x-drive motors, including WOs 4940414, 4940416, 2416645 and 2676831.

- CG 009195, Unit(s) 1,4: Valve, Control, Cat 1/2 –
  1. Complete one-time replacements of Latch Ram and Z-Drive valves not completed via WO 2260381, 2260387, 2260389, 2392149, and 2392150.
  2. Complete ECs #106679 to 106686 to replace the 90-degree rotation control valves.

- CG 009197, Unit(s) 1,4: Valve, Mag Pressure Control, Crit 1- Complete WOs 04803924, 4948548 and 4832604 for 1/4-63536-PMA-CV1E/W, REPLACE/OVERHAUL VALVE.

- CG 009200, Unit(s) 1,4: Valve, Hydraulic, Cat 1/2 - Complete WOs for snout valve replacement (QLD-MVs): WO 3006097 (U1E) ACTIVE WO 2917819 (U1W) ACTIVE WO 4822459 (U4E) ACTIVE WO 4731348 (U4W) ACTIVE.

- CG 009206, Unit(s) 1,4: VALVE, CHECK/NONRETURN/BACK FL, Cat 1/2 - Complete WOs: 2106863, 1972285, 2362488, 2362478 to replace Magazine return check valves (FMA-NV2).

- CG 009208, Unit(s) 1,4: Valve, Pneumatic/ Pneumatic Ac, Cat 1/2 - Replace 1/4-63536-QLD-MV3E/MV3W via NICR 131568 and associated WOs (e.g. WOs 2451453, 2451451) and monitor performance to determine replacement frequency based on vendor's expected design life and operating duty.

- CG 009215, Unit(s) 1,4: SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 - Complete currently in-progress NICR (e.g. EC #116372) to address availability of spare parts.

Incremental recommendations for Plant EOL (2020):

- CG 009134, Unit(s) 1,4: Control, Cat 1/2 - Resolve obsolescence and spare part issues.

- CG 009161, Unit(s) 1,4: Motor, Hydraulic, Cat 1 - Complete a one-time replacement of Magazine motors (NMA) upon resolution of vendor quality issue with subject bent axis motors.

- CG 009176, Unit(s) 1,4: Regulator, Cat 1/2 - Complete a one-time replacement of all PRVs in this CG to reach Plant EOL (2020).

- CG 009195, Unit(s) 1,4: Valve, Control, Cat 1/2 –
  1. Perform a one-time replacement of the Latch Ram Speed valves (SLA).
  2. Complete a one-time replacement of the Z-Drive speed valves (SZM).

3. Complete a one-time replacement of the Y-Correction Speed valves (SYC).
4. Complete a one-time replacement of the FM 90 degree rotation valves (SRO).

- CG 009197, Unit(s) 1,4: Valve, Mag Pressure Control, Crit 1- Complete one-time replacement for all valves (except 1/4-63536-PMA-CV1E/W) to reach Plant EOL (2020).

- CG 009209, Unit(s) 1,4: Valve, Pressure Regulating, Cat 1/2 - Complete a one-time replacement of 1/4-63535-PHS-PRV4E/W, 1/4-63536-PSE-PRVE/W and 1/4-63535-PZM-PRVE/W and monitor performance to determine replacement frequency based on vendor's expected design life and operating duty.

- CG 009211, Unit(s) 1,2,4: Valve, Pressure Relief, Cat 1/2 - Complete a one-time replacement of 1/4-63536-PCR-RV2/3/E/W to reach Plant EOL (2020).

- CG 009213, Unit(s) 1,4: Valve, Speed Control, Cat 1/2 - Complete a one-time replacement of all valves in this CG to reach Plant EOL (2020).

Incremental recommendations for CO EOL (2024):

- CG 009118, Unit(s) 1,4: Actuator, Cat 1/2 - Reactivate PMs (#121195-01,12297-01, 121198-01, and 121199-01) to replace the catenary isolation valve and FM D2O valves every 5 years to each CO EOL (2024).

- CG 009136, Unit(s) 1,4: Converter, Cat 1/2 - Perform calibrations at a frequency consistent with approved IQ Review Maintenance Template.

- CG 009138, Unit(s) 1,4: Cylinder, Cat 1/2 - Complete one-time replacements of 1/4-63535-NZM-A1E & W and 1/4-63535-NZM-A2E & W to reach CO EOL (2024).

- CG 009143, Unit(s) 1,4: Fueling Machine, Cat 1/2 - Update recent fatigue analysis for Fuelling Machine Pressure Boundary (i.e. NA44-CALC-35310-00002 R001), to account for life extension to CO EOL (2024).

- CG 009161, Unit(s) 1,4: Motor, Hydraulic, Cat 1 - Complete a one-time replacement of the X-Drive Motors (NXM). Complete a one-time replacement of the Magazine motors (NMA).

- CG 009176, Unit(s) 1,4: Regulator, Cat 1/2 - Complete a one-time replacement of all PRVs in this CG to reach CO EOL (2024).

- CG 009195, Unit(s) 1,4: Valve, Control, Cat 1/2-
    1. Complete a one-time replacement of the Z-Drive speed valves (SZM).
    2. Complete a one-time replacement of the Y-Correction Speed valves (SYC).
    3. Complete a one-time replacement of the FM 90 valves (SRO).

- CG 009197, Unit(s) 1,4: Valve, Mag Pressure Control, Crit 1- Complete a one-time replacement of all valves to reach CO EOL (2024).

- CG 009211, Unit(s) 1,2,4: Valve, Pressure Relief, Cat 1/2 - Complete a one-time replacement of 1/4-63536-PCR-RV2/3/E/W to reach CO EOL (2024).

- CG 009213, Unit(s) 1,4: Valve, Speed Control, Cat 1/2 - Complete a one-time replacement of all valves in this CG to reach CO EOL (2024).

- CG 009215, Unit(s) 1,4: Solenoid/Solenoid Operated Val, Cat 1/2 - Reactivate PMs to replace NMA-SV1, NSC-SV, NYC-SV2 and NZM-SV1 every 5 years to reach CO EOL (2024).

4.1.1.2.48 *Assessment Findings from System Summaries*

Detailed Condition Assessments have been completed for 1202 commodity groups, encompassing all SSCs in Systems Important to Safety and Safe Operating Envelope systems. Detailed recommendations were provided in the previous sections for each of the 47 PSR2 systems. The System Summaries are provided in Appendix B-2 in tabular form and document the CG classifications and related improvement initiatives. Appendix B-2 contains a number of CG entries that are in shaded rows. These shaded rows represent CGs that have now been screened-out as not requiring a DCA based on the 2016 updated screening work[6]. This was done to focus on the CGs that are relevant to PSR2 moving forward. As a result of the updated screening, 546 of the original 1202 CGs remain in SF2 scope compared to Revision 0 of this report (shown in non-shaded rows).

As required in Review Task #1, the condition of SSCs Important to Safety is documented in the System Summaries per OPG's Aging Management Program. For those components not requiring a Detailed CA, their condition is documented via a significant number of robust and comprehensive programs including: System and Component Health Reporting; the Maintenance Program which documents as-found condition of components; Predictive Maintenance, e.g. vibration monitoring; the Corrective Action Program which documents adverse conditions on equipment in SCRs; Annual Reliability Reports; Design Assessments and many other station products/processes. These processes provide confidence that station components are maintained such that their condition is acceptable, or improvement actions are put in place. Further information on this was provided in section 3.1.

As shown in Table B.2, a large number of CGs are classified as "Good" or "Very Good" (58%). Thirty-five percent are assigned a "Satisfactory" classification. Only 6% are assigned a classification of "Poor" and 0.4% are "Very Poor. For the Units 1, 4 and Units

[6] These updated screening reports are approved OPG Controlled Documents.

5-8 Special Safety Systems, there are only two CGs rated “Poor” that have a primary safety function.[7]

Another assessment observation is a large fraction of the CGs rated less than “Satisfactory” are not associated with components in a SOE/SIS having nuclear safety functions, e.g. main boiler feed pump recirculation valves and the boiler steam isolation valves. Another contributing factor for classifications being less than “Satisfactory” is there are a number of cases where the current condition of the CG is “Good”, but future recommendations are required to address obsolescence and/or spare parts procurement.

633 recommendations were identified within the CAs, largely focused on incremental actions to improve condition and/or aging management practices. Approximately thirty percent of the recommendations are current station initiatives (i.e. already identified, planned and in some cases completed after the freeze date, or are in progress). The majority of the recommendations are already in place for CGs classified as “Satisfactory” or lower.

A breakdown on the predominant recommendation types is as follows:

- 32% recommend a one-time replacement (e.g. instrumentation)
- 26% recommend a one-time inspection (e.g. tanks)
- 9% are to procure spare parts

Approximately half of the recommendations pertain to activities that are only required to be executed once before the end of extended station life to 2024. This was identified as an observation in OPG Revision 0 of this report. In many cases, these one-time actions are to perform an infrequent Pre-defined Maintenance (PM) activity, e.g. calibration that was managed by a PM, but given the previously planned station life to 2020, was suspended or cancelled. Other examples falling into this category are life cycle replacements, recommended to maintain component reliability to extended station life. These recommendations will also apply for extended life to 2028.

Other one-time recommendations are associated with performing a one-time inspection on a component for ARDMs that require long periods of time to become apparent, e.g. inspection of motorized butterfly valve or pump internal degradation. This was also identified as an observation in OPG Revision 0 of this report. Valve program activities are primarily associated with actuator capability and set-up and therefore degradation of some

[7] Of the two CGs rated as Poor for the Special Safety Systems, the ECI system has one CG for a hand controller used for testing purposes only and therefore does not have a primary safety function, i.e. does not have a role in the successful actuation of the SSS. There is one CG rated Poor for the Pickering B SDS1. The CG contains switches used for shutoff rod position indication only, i.e. they are not active components required to initiate shutdown the reactor (there are also redundant indications for this function). Also for information, in the updated CAs these components have been classified as Satisfactory. This is based on the good performance, but there is an obsolescence issue that needs to be addressed.

valve internal components, e.g. seats, bodies is not necessarily identified. In general, it is not expected that these one-time inspections will result in unacceptable condition of the component being observed. Other periodic activities, e.g. safety related system tests are in place for critical safety components to confirm safety requirements are met. These one-time inspections are proactive to identify potential degradation prior to component failure.

A number of recommendations pertain to passive components, e.g. piping, cabling, structures, tanks and expansion joints. Some passive components are addressed in OPG Component Programs, N-PROG-MA-0017, “Component and Equipment Surveillance” [87] and other activities. Example programs are:

- Periodic Inspection Program (PIP) for structures, piping and supports in place to fulfill the requirements of CSA Standards and to address emerging OPEX [82];
- Pressure Vessel Certification Program for tanks and other pressure vessels [83];
- Buried Piping Program for Underground Piping [39];
- Cable Surveillance Program, N-PROC-MA-0099 [38];
- Pipe Support Program [90].

Some CGs are screened out based on these effective aging management programs being in place. For components not having a program in place, condition assessments are performed as required for SSCs in the Aging Management program. An example recommendation from these passive component condition assessments are inspection of back-up air tanks for safety related components. The CA process is the vehicle for assessing the condition of this group of passive components and therefore their presence is not unexpected and does not represent a PSR2 gap. Recommendations for internal inspections will be addressed by current station work programs.

However, there are two issues with risk assessments for the Cable and Buried Piping Programs. For the Cable Surveillance Program, the current risk assessments are based on component criticality coding that has not been updated to the latest available. In addition, the condition assessments need to be prepared to reflect this new coding. Since these assessments are not yet complete this results in a PSR2 gap (**Pickering PSR2 Gap SF2-13**).

The Buried Piping Program Risk Assessment identifies activities required to be performed in the program. This risk assessment and buried piping condition assessments have not been updated for extended operation to 2028, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-14**).

Another observation made in OPG Revision 0 of the report was that many CGs had recommendations to change PMs. A PM is a work management type of activity for completing pre-defined recurring maintenance tasks. Approximately 10% of the recommendations re-instate or create a new PM. These modifications to PMs are one of the types of recommendations that will be assessed, prioritized and tracked in System Health Reports.

A number of improvement initiatives were identified during the completion of the CAs which will or have improved component condition and equipment reliability for life extension, including the:

- Fuel Handling Improvement Initiatives
- DCC Improvements
- Obsolescence Management (see section 4.1.5 for further information)
- Critical Spares Initiative

In addition, OPG has an ongoing “Equipment Reliability Cornerstone”, which is a mechanism used to drive specific initiatives and station behaviors to improve equipment reliability. ER Initiatives from 2016 included:

- Fuel Handling Reliability
- Chemistry Performance Improvement
- Vendor Parts Quality
- Work Management Initiatives to reduce backlogs and increase work completion rates, e.g. backlog blitzes.

All of these initiatives play an important role in maintaining and improving the condition of critical plant equipment. The following additional information is provided for the Fuel Handling Reliability Initiatives as a sample of the work being completed via initiatives.

Fuel Handling Reliability Initiatives

The focus of the Fuel Handling (FH) Reliability Initiative for 2016 was to:

- Identify Critical Spare Parts which support fueling reliability and operational readiness
- Increase the quantity of these critical spares on hand
- Improve the quality of FH project work plans in order for needed projects to be executed safely, per schedule and with the required quality

To support these initiatives a comprehensive review of FH criticality was performed and changes made where required. FH Top 100 Parts Weekly Meetings were put in place to drive improvements in parts availability. Staffing changes were made in Supply Chain and Engineering to put in place higher priority support. Also, governance changes were made to support critical activities.

By mid-2016 the percent of available critical inventory increased to 86%. Also, a FH Equipment Reliability Index (ERI) is in place to track the critical indicators in a number of areas which measure availability and reliability of FH systems. This indicator has improved from 53 in July 2015 to 66 in January 2016.

Work is being completed to update the CAs and preliminary results are discussed in the next section. This work will result in changes to the recommendations contained in the System Summaries and Appendix B-2 Tables.

The following gaps were identified resulting from the System Summaries:

- **Gap SF2-11:** Condition Assessments for civil structures are not complete for station operation to 2028.
- **Gap SF2-12:** Condition Assessments for in-scope piping systems are not complete for station operation to 2028.
- **Gap SF2-13:** The Cable Surveillance Program risk assessment and condition assessments currently use out of date criticality coding.
- **Gap SF2-14:** The Buried Piping Program risk assessment and condition assessments have not been updated for extended operation to 2028.

4.1.1.2.49 *Results of the Updated CAs For Operation to 2028*

In addition to the results from the System Summaries described above, updated Detailed CAs are currently being completed as part of the ongoing Aging Management Program to:

- Use an updated freeze date of January 15, 2016;
- Reflect updated scoping and screening work;
- Include full power operation of the Pickering Units to 2028;
- Address the different phases following station shutdown, e.g. defueling. (This phase of operation is outside the scope of PSR2).

A preliminary overview of the results of these updated CAs follows.

Updated Scoping:

No changes have been made to the scope of systems addressed in the aging management scope for PSR2. The scope still encompasses all Systems Important to Safety and Safe Operating Envelope systems.

Updated Screening:

Updated screening is in process of being completed as part of the current CA revisions for all of the PSR2 systems. The previous screening results that were the basis for CGs in OPG Revision 0 of this report were prepared in 2010/2012. Updated screening was primarily required to address extended operation to 2028 and changes made to criticality coding. As described in the previous section, of the original 1202 CGs in the SF2 report OPG Revision 0, 656 were screened out with the primary basis being:

- Component criticality of the CG has been re-classified to non-critical, i.e. to CC3/4 (and non-RS1/2/3).
- A re-assessment of aging management practices for certain groups of components, e.g. handswitches, push-buttons and other simple devices, have resulted in them being classified as adequate.

A Detailed CA is no longer required for these CGs and their condition is managed via other programs as described in Section 3.1. To maintain traceability from OPG Revision 0 of the SF2 report, these CGs have not been removed from the Appendix B.2 Tables, but have been shaded to show they are no longer applicable to SF2.

Also, based on this updated screening, additional DCAs were determined to be required for SF2 (not included in Appendix B.2), resulting in a total of 716 CGs[8] requiring a Detailed CA be prepared. The primary reasons for the additional number of CAs are:

- Additional components with a reactor safety ranking of RS3 were not screened out.
- Aging management practices were re-assessed, and those that were presently deemed adequate and screened out, now require a DCA to address life extension beyond 2020, e.g. practices with long duration PMs were retired since they would not be required again before 2020.
- One-time internal inspections were conservatively deemed required for life extension for susceptible pumps/valves. A subsequent condition assessment will determine the need for these inspections based on recorded history.

Updated CA Results:

To date, the preliminary results of the Detailed CAs are largely consistent with the System Summaries reported on in Section 4.1.1.2.48 which considered operation to 2024. No states of degradation have been observed that compromise the current design basis or design basis assumptions for operation to 2028.

In general, the condition of the assessed components is not expected to be significantly different from the conclusions of the System Summaries. This is expected since the difference in the freeze dates used in the assessments (changed from August 2015 to January 2016), has not resulted in significant changes to the operating history used in the assessment.

[8] This represents a delta of 170 DCAs from what is in this report, i.e. (716-546 per section 4.1.1.2.48).

Preliminary results from the updated CAs have identified a larger number of recommendations to improve component classifications. For the updated CAs a more in-depth assessment has been made in the areas of obsolescence and spare parts requirements. Approximately half of the updated recommendations made fall into these two categories. Consistent with the criteria in N-PROC-MP-0060 [7], if aging management practices are not effective in only one area, e.g. in obsolescence, the classification rating can be no greater than “Satisfactory”. Therefore, given the findings in the obsolescence and spare parts areas, the classification of the affected CGs can be no greater than “Satisfactory”. The potential impact of this finding is discussed further in Section 4.1.5 in Review Task #5 on Obsolescence.

The majority of the recommendations shown in the System Summaries in sections 4.1.1.2.1 through 4.1.1.2.47 and Appendix B.2 Tables, are still applicable and those required for life extension to 2024 are also required for life extension to 2028. The types of recommendations are the same in the updated CAs, the predominant ones being for:

- Resolving obsolescence
- Procuring spare parts
- One-time inspections
- One-time calibrations
- Component replacements

As described above these results are still preliminary. The set of recommendations will still be assessed and prioritized as per normal practice associated with Aging Management assessments. These recommendations will be managed under OPG’s Equipment Reliability and System and Component Surveillance programs, with required actions being tracked to completion in the System Health Reports.

No new PSR2 gaps have been identified based on the preliminary work completed to date. However, updated Detailed Condition Assessments are not complete for Commodity Groups in the scope of PSR2 for station operation to 2028, resulting in a PSR2 gap (**Pickering PSR2 Gap SF2-15**).

4.1.1.2.50 *Summary Of Review Task #1 Findings – Condition Assessments*

Detailed Condition Assessments have been performed and documented as per the requirements of OPG’s Aging Management Program. The majority of SSCs Important to Safety have been found to have a condition of Satisfactory or better. Recommendations for improvement have been documented where required to improve component condition. These recommendations will be tracked in System and Component Health Reports per normal station practices. As described above, the condition of all SSCs Important to Safety is documented by a comprehensive set of programs. The following gaps have been identified in completion of this Review Task:

- **Gap SF2-11:** Condition Assessments for civil structures are not complete for station operation to 2028.
- **Gap SF2-12:** Condition Assessments for in-scope piping systems are not complete for station operation to 2028.
- **Gap SF2-13:** The Cable Surveillance Program risk assessment and condition assessments currently use out of date criticality coding.
- **Gap SF2-14:** The Buried Piping Program risk assessment and condition assessments have not been updated for extended operation to 2028.
- **Gap SF2-15**: Updated Detailed Condition Assessments are not complete for Commodity Groups in the scope of PSR2 for station operation to 2028.

4.1.2 *Review Task #2 - Maintenance Facilities and Resources*

The purpose of Review Task #2 is to confirm resources and facilities (on and off-site) availability for ongoing plant maintenance. This assessment was performed against the IAEA guidelines ‘Maintenance, Surveillance and In-service Inspection in Nuclear Power Plants’ issued as NS-G-2.6 [40]. These guidelines were selected as they are in general prescriptive and therefore allow a more direct comparison with existing PNGS maintenance facilities than the CNSC Regulatory Standard S-210 ‘Maintenance Programs for Nuclear Power Plants’ [41], which has a similar intent of the IAEA guideline with respect to maintenance facilities and resources.

Additionally, they are referenced in CNSC Regulatory Standard S-210 [41] with regards to maintenance program requirements that Nuclear Power Plant (NPP) licensees must implement.

NS-G-2.6 [40], against which the earlier PSR1 review was also performed, has not changed following the issue of PSR1 NK30-REP-03680-00002 [42]. As such, the following assessment provides an update to the maintenance facilities information in PSR1 NK30-REP-03680-00002 [42]. Additionally, a review was performed on the acceptability of resource allocation to Maintenance for safe operation. The latter follows from page 18 of the PSR2 Basis Document R02 [1] which requires “focus attention on requirements that are new or that have changed in relation to the requirements that were used as the basis for PSR1 ISRs, so that their impact on Pickering NGS can be assessed”.

4.1.2.1 *Maintenance Facilities Description and Operation*

The support facilities available to Pickering NGS were described in PSR1 NK30-REP-03680-00002 [42] and assessed against the recommendations of Sections 8.6 through 8.20 of IAEA Safety Guide NS-G-2.6 [40], Maintenance, Surveillance and In-service Inspection in Nuclear Power Plants.

The IAEA recommendations focus on the following areas for maintenance facilities:

1. Workshop Facilities (IAEA NS-G-2.6 [40] Sections 8.6 to 8.8).
2. Facilities for Maintenance on Radioactive Items (IAEA NS-G-2.6 [40] Sections 8.9 to 8.11).
3. Decontamination Facilities (IAEA NS-G-2.6 [40] Sections 8.12 to 8.14).
4. Other Facilities, Tools and Equipment (IAEA NS-G-2.6 [40] Sections 8.15 to 8.20).

4.1.2.1.1 WORKSHOP FACILITIES

As a summary, IAEA NS-G-2.6 [40] Sections 8.6 to 8.8 makes the following recommendations for workshop facilities:

- Facilities should include a workshop for mechanical, electrical and instrumentation equipment.
- Facilities should be equipped with facilities for processing and storage of records and procedures.
- Facilities should be equipped with necessary work areas for assembly and disassembly.
- Facilities should be equipped with tools and testing equipment needed for maintenance.

Pickering NGS workshop facilities consist of number of function-specific workshops that together meet the intent of recommendations listed above. These facilities consist of Facilities inside the Operating Island and Facilities outside the Operating Island, and are described separately below.

4.1.2.1.1.1 FACILITIES INSIDE THE OPERATING ISLAND

The workshop facilities inside the operating island at Pickering NGS consist of the following:

- The mechanical maintenance shop is located in the service wing extension. The major maintenance activities performed in the shop are repairing mechanical equipment, prefabrication of pipe and supports and pressure boundary repairs. A fitting and overhaul area with suitable work benches for disassembly, repair and reassembly of components is also available.
- The machine shop is located in the service wing on elevation 254'. Machine tools such as lathes, milling machines, pedestal drills, grinders and presses are available. Space for sheet metal and plate fabrication and handling of heavy equipment and materials is also available.
- The control maintenance shops are located on the second floor of the service wing, the service wing extension, and the East Annex. Test benches with appropriate power supplies and pneumatic and hydraulic supplies and test equipment are provided. Calibration and testing facilities for instruments, relays

and portable calibration equipment are provided. Both electrical and instrumentation and control maintenance activities are carried out in the shops.

- The valve testing shop is located on elevation 254' in the service wing. Test facilities are available for maintenance and testing of pneumatic and motorized valve actuators and relief valves. The relief valve testing program for both nuclear and non-nuclear relief valves is under the Relief Valve Certificate of Authorization issued to PNGS by the Technical Standards and Safety Authority (TSSA).
- Test facilities are also available for maintenance and testing of pneumatic and motorized valve actuators and relief valves.
- The welding shop is located in the service wing on elevation 254'. Welding and brazing of pressure boundary materials is carried out in the shop.
- The fuelling machine shop is located on elevation 254’ in the service wing. The repair of fuelling machines, overhaul of contaminated equipment, and decontamination of large parts is carried out in the shop.
- The control maintenance electronic shop is located on elevation 274' in the service wing. Calibration and repair of electronic hardware is carried out in the shop.
- There are two tool cribs located on elevation 254' and 274' in the service wing. All necessary tooling for carrying out activities in the field are stored in the tool cribs.
- A calibration laboratory calibrates measurement and test equipment used at Pickering to site standards that are periodically calibrated to national standards. The climate of the laboratory is controlled. On occasion during the summer, the environment cannot be controlled within specifications. At those times, calibration of measurement and test equipment is prohibited.
- Two annex buildings were constructed for the Large Scale Fuel Channel Replacement Program (LSFCRP). The west annex is beside the west end of the Pickering A reactor auxiliary and turbine auxiliary bays. The east annex is beside the east end of the Pickering B reactor auxiliary and turbine auxiliary bays. Both annex buildings are connected to the powerhouse, and are accessible from the reactor auxiliary bays via truck and personnel doors on the 254’ and 274’ elevations. Transfer of tooling from one annex to the other is along the 254’ elevation reactor auxiliary bay corridor. The two annexes contain:

    - West Annex: Space and facilities are provided for the decontamination and repair of LSFCRP equipment and tooling at the 254’ elevation. A maintenance welding and fabrication shop is located on the 274’ elevation. Also on the upper elevation are offices for station personnel.
    - East Annex: Storage facilities for decontaminated LSFCRP tooling are provided at the 254’ and 274’ elevations. The 254’ elevation at the south end also has a steel-framed and skinned enclosure. This is a controlled environment for pressure tube sampling, or manual decontamination of large flasks and shielding cabinets which cannot be accommodated in the west annex.

Workshop facilities also include provisions for the processing and storage of both paper-based and electronic records.

As recently re-approved by the TSSA on April 15, 2014, the Pickering site holds a Certificate of Authorization (C of A) for carrying out the following work. The C of A has a three year term, next due on April 15, 2017, which covers:

- Fabrication of welded and non-welded Category A, B, D and H type fittings in accordance with CSA Standard B51, Boiler & Pressure Vessel and Pressure Piping Code.
- Repair and alterations of boiler and pressure vessel fittings and piping in accordance with CSA Standard B51, Boiler & Pressure Vessel and Pressure Piping Code.
- Fabrication of process piping in accordance with CSA Standard B51, Boiler & Pressure Vessel and Pressure Piping code and ASME 31.3 Process Piping.
- Fabrication of Class 1, 2 & 3 welded and non-welded Category A, B, D & H type fittings in accordance with CSA N285.0, General Requirements for Pressure Retaining Systems and Components in CANDU Nuclear Power Plants.
- Construction of Class 1, 2, 3 & 4 Piping Systems and Class 1, 2, 3 Shop Assembly, as a Material Organization supplying ferrous and non-ferrous material with material supply from the Central Warehouse.
- Fabrication of Class 1, 2, 3 & 4 welded and non-welded supports with or without design responsibility in accordance with CSA N285.0 General Requirements for Pressure Retaining Systems and Components in CANDU Nuclear Power Plants.

Based on the description above, the Pickering NGS workshop facilities inside the operating island are properly equipped, are capable of maintaining the required equipment, and can address contaminated equipment as needed; which satisfies the recommendations of paragraphs 8.6, 8.7, 8.8, and 8.9 of IAEA Safety Guide NS-G-2.6 [40].

4.1.2.1.1.2 Facilities Outside the Operating Island

The major workshop facilities outside the operating island at Pickering NGS are as follows:

- The east site shops are located just east of Pickering NGS Unit 8. The east site shops include: a pipe fabrication shop, a paint shop, a carpentry shop, a machine shop, a sandblasting shop, and a vehicle maintenance shop. The facility holds a Certificate of Authorization for carrying out pressure boundary work on Class 1, 2, 3 and 6 systems. The facility is primarily used for carrying out modifications for Pickering NGS.

- The Inspection & Maintenance Services (IMS) Division has facilities at the Pickering Training and Mock-up Building (TMB). IMS supports Pickering NGS with steam generator, feeder and fuel channel inspections and CSA N285.4 and CSA N285.5 periodic inspections. IMS carries out specialized inspections for cracks in pipes. IMS also develops specialized inspection tooling.
- Babcock & Wilcox (B&W) has facilities in Cambridge, Ontario. B&W supports Pickering NGS with water lancing of steam generators and development of specialized tooling.
- SNC-Lavalin (previously Atomic Energy of Canada Limited (AECL)) has facilities in Sheridan Park, and CNL (previously AECL) in Chalk River. These facilities support OPG including Pickering NGS with analysis of pressure tube scrape samples, development of specialized tooling and fuel handling support.
- Kinectrics has facilities at the Kipling Research Facility. Kinectrics supports OPG including Pickering NGS with analysis of failed components such as steam generator tubes and with CSA N287.7 inspections.
- Siemens supports Pickering NGS with chemical cleaning of steam generators and turbine-generator maintenance.
- Multiple approved vendors support Pickering NGS in various maintenance activities such as rewinding of electrical motors.

Based on the description above, the major workshop facilities outside the operating island provide the required support and required qualifications to adequately support PNGS maintenance and therefore satisfy the recommendations of sections 8.15 and 8.16 of IAEA Safety Guide NS-G-2.6 [40]. These facilities also assist in meeting the requirements of sections 8.6, 8.7, 8.8, and 8.9 of the Safety Guide.

4.1.2.1.2 *Facilities for Maintenance on Radioactive Items*

As a summary, IAEA Guide NS-G-2.6 [40] Sections 8.9 to 8.11 makes the following recommendations for Facilities for maintenance on radioactive items:

- Maintenance of contaminated plant items.
- Temporary arrangements for work on radioactive plant items.
- Specific considerations such as access control and change rooms, ventilation filters, radiation monitoring and radiation protection facilities, shielding and decontamination facilities.

Workshop facilities are physically located in Zone 2 (in the service wing). This allows plant items to be maintained within permitted levels of fixed contamination (after decontamination). The Tool Cribs also allow segregated storage of tools with permitted levels of fixed contamination. All radioactive work is controlled via station Radiological Processes and Procedures (RP&Ps).

Temporary arrangements for work on radioactive plant items are also addressed in station RP&Ps. As an example, items or areas may be tented to allow contamination control.

Specific considerations include PNGS facilities layout and procedures for access control, change rooms, ventilation discharge filters, radiation monitoring and radiation protection equipment, shielding and decontamination facilities to control spread of contamination and prevent worker exposure. Details are addressed through station RP&Ps and satisfy the recommendations described in IAEA Guide Section 8.11.

Based on the description above, the maintenance facilities for radioactive items satisfy the requirement to contain and minimize radioactive contaminations within acceptable limits control and worker exposure, therefore meeting the recommendations of sections 8.9, 8.10 and 8.11 of IAEA Safety Guide NS-G-2.6 [40].

4.1.2.1.3 *Decontamination Facilities*

As a summary, IAEA Guide NS-G-2.6 [40] Sections 8.12 to 8.14 makes the following recommendations for Decontamination Facilities:

- Facilities to remove radioactive contamination from plant items, tools and equipment prior to their maintenance or any other disposition.
- Adequate worker facilities such as change rooms during maintenance work during peak use.

The decontamination shops are located in the service wing and in the West Annex. On elevation 254' on the north side of the corridor of the service wing, there is an area for decontaminating small parts. On the south side of the corridor, there is an area for decontaminating large parts. On elevation 274' in the service wing there is an area for the decontamination of plastic and rubber goods. The facilities are equipped with access control and changing rooms, ventilation with discharge filters, handling, storage and disposal of liquid and solid radioactive waste, decontamination tanks and equipment capable of decontaminating the largest plant items. Equipment is also provided for local decontamination at worksites.

Change rooms for male employees are located on the 254' and 274' elevations of the service wing. Change rooms for female employees are located on the 274' elevation of the service wing. Change rooms for contractors are located outside the powerhouse near Unit 4 and the 254’ and 274’ change rooms are also available for contractor use. The change rooms have sufficient capacity for peak use during outages.

Based on the above, the decontamination shops at Pickering NGS and the worker facilities such as change rooms adequately support the requirement for safe handling and decontamination of radioactive materials and therefore satisfy the recommendations of sections 8.12, 8.1 3 and 8.14 of IAEA Safety Guide NS-G-2.6 [40]. It should be noted, however, that reactor defueling may present additional challenges such as in equipment utilization rate and OPG may need to evaluate the adequacy of existing decontamination facilities to address post operation demands. However, this is not considered a gap as defuelling is outside the scope of the PSR2 per the PSR2 Basis Document R02 [1].

4.1.2.1.4 OTHER FACILITIES, TOOLS, AND EQUIPMENT

OPG has a Tool Control System (TCS) to control and track tools used for maintenance across OPGN [101]. It also provides a general history of the tools available in the system. In this system, the inspection scheduling and labels for tools requiring periodic inspection can be identified [100]. This will ensure that certain tools, such as gamma metres, are calibrated and inspected to minimize factors that can cause delays and inaccurate findings during maintenance.

In addition, IAEA NS-G-2.6 [40] Sections 8.15 to 8.20 are considered below.

4.1.2.1.4.1 MOCK-UPS

Mock-ups have been used for rehearsing work that is to be carried out in high radiation areas. In addition, mock-ups are used in the development and improvement of tools, equipment and training of personnel. Examples where mock-ups have been used include:

- Development of the Universal Delivery Machine (UDM) for remote inspection of fuel channels. A mock-up was built to develop the tool prior to implementing the tool in the field.
- Development of the Feeder Cutting Tool for carrying out remote cutting of feeder pipe. A mock-up facility was built for tool development and training of personnel.
- Pressure Tube Replacement.
- Cobalt Adjuster Rod Rehearsal Facility and Dynamic Learning Activity mock-ups.

4.1.2.1.4.2 SPECIAL EQUIPMENT

To reduce exposure special equipment is utilized. Some examples of the special equipment used at Pickering NGS are:

- Remote handling manipulators for steam generator tube inspections.
- UDM for pressure tube inspections.
- Remote viewing equipment such as fiberscopes for steam generator secondary side inspections.
- Communication equipment for use inside the reactor building.
- HVAC mobile tent/glove box with dedicated venting.
- Robotic maintenance for high dose work where possible.
- Thermography.

- Remote video recording is used at Pickering NGS to establish baseline and degradation data. Subsequent inspections use video recording and photographs.
- Cobalt Adjuster Element Processing System (CAEPs)

4.1.2.1.4.3 MAJOR LIFTING AND TRANSPORT FACILITIES

Adequate fixed and mobile lifting and transport facilities are provided at Pickering NGS. Examples of the major lifting and transport facilities are as follows:

- The boiler room cranes (31.7 Mg) support lifting in the reactor building. Monorails are provided for moving equipment to the main crane.
- In the reactor auxiliary bay there are hatches for the transfer of reactor building equipment from elevation 274' to grade via a 27.2 Mg monorail.
- The irradiated fuel can be loaded into a shipping flask by the fuel-handling gantry and the flask can be lifted from the bay by a 113 Mg hoist.
- The turbine hall is equipped with two cranes each with a capacity of 130 Mg. The cranes can be operated in tandem for lifting heavy items such as low-pressure turbine spindles.

4.1.2.1.4.4 SUMMARY OF OTHER FACILITIES, TOOLS, AND EQUIPMENT

The review did not identify any shortcomings with regard to the recommendations of paragraphs 8.6 through 8.20 of IAEA Safety Guide NS-G-2.6, Maintenance, Surveillance and In-service Inspection in Nuclear Power Plants [40].

Note: Station SSCs that identify any system or equipment findings which might result from gaps in the maintenance facilities or resource allocation are outside the scope of this assessment, however the findings from the CAs are within Review Task #1 in Section 4.1.1.2 where applicable.

4.1.2.2 MAINTENANCE RESOURCES

PNGS conducts numerous internal audits and self-assessments in all areas including maintenance. Internal processes at OPG require that recommendations from internal audits and self-assessments generate SCRs, when gaps in performance are identified. A review was performed of the PNGS SCR database for the period 2011-2015 for performance gaps in maintenance facilities or maintenance resource allocation. The SCR review did not identify any significant findings.

This assessment also reviewed the findings of industry audits of OPG. The results of this review did not identify any significant findings related to maintenance facilities or maintenance resource allocation. The audits did identify a maintenance backlog finding, but these are not necessarily attributable to maintenance resources.

In 2003, the CNSC raised Action Item 2003-8-01 to track the Pickering B maintenance backlogs. In 2009, CNSC staff acknowledged [43] that the corrective maintenance backlogs at Pickering B had met its target. In 2012, "CNSC staff agreed that the Deficient (previously called Elective) Maintenance backlog at Pickering B is now consistent with the industry benchmark target and that the Corrective Maintenance backlog at Pickering B is also now consistent with other OPG facilities. Hence, Action Item 2003-8-01 is hereby closed." CNSC also indicated they expected OPG to continue to monitor backlogs to ensure continuous improvement (per CNSC correspondence [44]). All backlogs are tracked and documented in the OPG Self-Assessment database as per the requirements in Section 1.1 of N-PROC-MA-0008 [45]. Gaps are documented and tracked via SCRs.

On-Line maintenance work scheduling is performed as per the requirements in OPG procedure N-PROC-MA-0022 [46]. It is intended to ensure "maintenance work is organized, well-coordinated station collaboration by which fully planned work, system and component tests, Corrective Maintenance (CM), Deficient Maintenance (DM), Preventive maintenance (PM), Other Maintenance (OM) and Projects are systematically identified, scoped, scheduled, executed, monitored and reported". Key parameters such as the corrective maintenance backlog target by Unit are also updated weekly and tracked against the Target backlog. The results are available to all OPG personnel to review on the intranet.

It should be noted that there are station systems with "Yellow" or "Red" categorized maintenance backlogs. However, these are not attributable to facilities deficiencies or lack of maintenance resources.

Maintenance performance is assessed on a quarterly basis that use the methodology described in INPO-05-005: Guidelines for Performance Improvement at Nuclear Power Stations [47], and newly revised N-INS-01966.1-10000 R05, "Trending Analysis Instruction and Performance Improvement Reporting" [48]. Any findings, which includes gaps in the adequacy of maintenance facilities and/or maintenance resources allocation that could impact Station safety performance is monitored and tracked to completion. The data from the most recent assessment are documented in report P-REP-01966-0575908 [49].

A quarterly report is provided to the CNSC on safety performance indicators including indicators such as maintenance backlogs (see above), Forced Loss Rate performance metrics pursuant to the Regulatory Document REGDOC-3.1.1 Reporting Requirements for Nuclear Power Plants [98], Section 3.1, 25 Safety Performance Indicators.
Any impacts from facilities or resource gaps would be reflected in the performance indicators. The data from the most recent assessment are documented in correspondence P-CORR-00531-04625 [50].

The Pickering NGS Licence Renewal Application also documented improvements in Equipment Reliability, reflecting acceptability of many factors including maintenance resource allocation. “The industry recognized indicator for Forced Loss Rate (FLR) has improved by approximately 40%.” as documented in reference [51]. The FLR data from 2011 onwards is provided in letters between OPG and the CNSC in References [50], [52], [53] and [54]. The FLR for the six Pickering Units was 2.9% and 4.1% in 2016 [95], which demonstrates significant improvement in station performance (a 66% reduction since 2011). Refer to Appendix D: Forced Loss Rate (FLR) Data for visual representation of the FLR trend for the past six years.

Training and development of staff at OPG, including Maintenance staff, follow the requirements in N-PROG-TR-0005, R016 ‘Training’ [55]. This Training Program provides the structure, processes, and tools for defining, developing, implementing, documenting, assessing, and improving the training required to ensure Nuclear staff have the appropriate knowledge, skill, and attitudes for safe and efficient plant operation. The Program applies to trained performance areas, which includes maintenance, as identified in N-LIST-08920-10001, ‘Trained Performance Areas’ [56]. The Performance Areas in this List identify Training and Qualification Descriptions (TQDs), the organization responsible for the performance area training, and those TQDs which are part of the Major Trained Performance Areas. For example, TQDs to qualify Mechanical Maintenance, Electrical and Control Maintenance, Civil Maintenance and non-BTU Contractor personnel to work independently are defined in N-TQD-301-00001, Rev 018A ‘Nuclear Maintenance Training And Qualification Description’ [57]. OPG audits and self-assessments (programmatically driven) provide mechanisms for assurance that OPG remains in compliance with its training and development requirements.

The minimum maintenance group complement for PNGS is identified in OPG Instruction P-INS-09100-00003 [58]. A review of the PNGS SCR databases for the period 2011-2015 did not identify any SCRs where the minimum maintenance group complement was not met.

Also, N-PROG-AS-0005, ‘Nuclear Business Planning Program’ [86] is in place to ensure OPG’s performance, including in one of its four cornerstones on Equipment Reliability, meets objectives and is aligned with best industry performance. The objective of the business planning process is to ensure all station resources, material, etc., including maintenance resources, are in place to achieve the station’s reliability objectives.

4.1.2.3 *Maintenance Facilities and Resources Assessment Summary*

No gaps with respect to maintenance facilities and resources against the guidance from IAEA NS-G-2.6 [40] were identified that could challenge continued operations for PNGS to 2028. Therefore Review Task #2 is assessed as compliant for PSR2.

4.1.3 Review Task #3 - Design Basis Assumptions

This Review Task is to assess the SSCs against the current design basis to confirm that design basis assumptions have not been significantly challenged and will remain that way through the period of PSR2. This Review Task is an integral part in the completion of Review Task #1 (see Section 4.1.1).

In the context of this SF2 Report Design Basis Assumptions are the set of requirements identified in the Safety Report, OSR documents and other relevant Design Basis Documentation. These requirements are used to assess the SSCs in the condition assessments and therefore the CA process demonstrates Design Basis Assumptions are met or required actions are recommended to maintain this.

Technical Operability Evaluations (TOEs) are prepared to document cases when the operability of a safety related component is in question. TOEs are addressed in the CA process as one of the inputs where they exist, since they are documented in the Health Reports and Station Condition Record database.

The CAs have identified where recommendations are required to improve or maintain condition, or to improve aging management practices. However, none of these recommendations are required to ensure Design Basis Assumptions are currently met. They all represent improvement actions. Therefore, Review Task #3 is assessed as compliant for PSR2.

4.1.4 Review Task #4 - Spent Fuel Storage Facilities

This Review Task is to review the condition and operation of spent fuel storage facilities and their effect on the spent fuel storage strategy for Pickering NGS.

Facility and System Descriptions in the following subsections have been extracted from relevant Safety Reports [23] [24] and Design Manuals [60], [61].

4.1.4.1 Storage Facilities Description and Operation

Pickering reactors are fuelled on-power. Each reactor is serviced by two remotely controlled fuelling machines, one at each reactor face, which, operating at opposite ends of the same fuel channel, match Primary Heat Transfer system pressure, open the channel and insert fresh fuel or remove irradiated fuel, without interrupting reactor operation.

The Pickering Nuclear Generating Station (PNGS) contains three Irradiated Fuel Bays (IFBs): the IFB-A, IFB-B, and the Auxiliary Irradiated Fuel Bay (AIFB). The IFB-A and AIFB support P014 Units and the IFB-B supports P058 Unit’s requirements. Each bay has a cooling and purification system to remove used fuel decay heat, contain radioactive by-products, and shield the public and personnel from harmful radioactive by-products. Fuel is stored and cooled for a minimum of ten (10) years in the IFBs prior to being moved to a Dry Storage Container (DSC) and sent to the Pickering Waste Management Facility (PWMF) for storage.

The irradiated fuel storage bays are located in the Reactor Auxiliary Bay (RAB) at the ground floor level between reactor buildings 2 and 3 for P014 Units, and between reactor buildings 6 and 7 for P058 Units. The AIFB is located southwest of Unit 4 RAB and connected via a corridor to the IFB-A.

In Units 1 and 4 irradiated fuel is transferred by an elevator and conveyor to the IFB-A where it remains for a minimum of four years before transfer to the AIFB. The discharge of fuel into the transfer system, the transfer of fuel to the receiving bay, and its placement into storage baskets may be done remotely. The removal of filled baskets to the storage area and their placement into stacking frames is done manually with powered tools operated from the bay gantry.

After a minimum four year cooling period, the fuel baskets can be removed from the stacking frames and loaded under water into the on-site flask for transfer to the AIFB. The on-site flask is sized to hold eight baskets of fuel (a total of 256 fuel bundles) and provides a total containment barrier for the fuel during the transfer. In the AIFB, fuel is transferred to modules that are stored in seismically qualified stacking frames in the storage area. The empty baskets are returned, in the on-site flask, to the primary storage bay. The modules hold 96 fuel bundles and provide a higher storage density than baskets. They have also been qualified as transportation devices for possible future shipments to off-site long-term storage depots.

In P5-8, two receiving bays serve a single storage bay. Baskets are used in the receiving bays to accept fuel, as at P1,4, but the fuel is then transferred to modules holding 48 pairs of bundles for stacking in the main storage bay. Similar to P1,4 modules provide better storage density than baskets, and are qualified transportation devices for shipment to long-term storage depots. Space is also allocated in the storage bay for loading irradiated fuel into shipping flasks.

The discharge of fuel into the transfer system, the transfer of fuel to the receiving bay, and the placement of fuel into storage baskets may be done remotely and automatically. The removal of fuel baskets is done manually with powered tools.

The irradiated fuel transfer and storage facilities are sized for the handling and accumulation of irradiated fuel at the average fuelling rate of the reactors.

4.1.4.2 COOLING AND PURIFICATION DESCRIPTION AND OPERATION

The system consists of a cooling circuit and a purification circuit, which return water to a common header at the north end of the storage bay.

Three parallel pumps draw water from dual intakes at one end of the bay and feed it through three parallel heat exchangers. Permanent skimmers are the intakes for the purification system and maintain the water surfaces free of foreign matter. Since emergency shutdown of the purification system is acceptable, a single pump is used ahead of the ion exchange columns and filters. There is also a separate, portable underwater vacuum cleaner. The two receiving bays, the main storage bay, and its south extension may each be emptied for inspection or repair.

The irradiated fuel bay cooling and purification system is designed (Section 10.1.4.1 of Pickering A Safety Report [23], Section 10.2.4.4 of Pickering B Safety Report [24], and Design Manual [60]) to meet the following:

1. Maintain the temperature of the storage bay water between 28ºC - 32°C (82ºF - 90°F); based on an accumulation of irradiated fuel over 5.5 years operation at a 90% capacity factor.
2. Maintain optical clarity of the water to permit observation of irradiated fuel handling operations.
3. Remove suspended and dissolved radionuclides to allow access to the work areas.
4. Ensure a minimum water level is maintained in the bays for shielding during all phases of fuel handling and storage.
5. Provide a cooling water supply to the irradiated fuel elevators and conveyors.

For the IFB-A, the system piping, valves and equipment which contact the storage bay water are made of stainless steel or other corrosion resistant material. All components conform to Section VIII of the ASME Boiler and Pressure Vessel Code, 1964 edition.

For IFB-B, the piping, valves, and equipment of this system are made of stainless steel or other corrosion resistant material. All components conform to Section III Subsection ND (Class 3) of the ASME Boiler and Pressure Vessel Code.

The AIFB cooling and purification system is designed to meet the following (per the Design Manual [61]:

1. Maintain the temperature of the storage bay water at less than 29 ºC (84ºF); from a full bay load of irradiated fuel that has been previously cooled at least 4 years.
2. Maintain optical clarity of the water to permit observation of irradiated fuel handling operations.
3. Remove suspended and dissolved radionuclides to allow access to the work areas.
4. Ensure a minimum water level is maintained in the bays for shielding during all phases of fuel handling and storage.

The AIFB cooling and purification system is designed to ASME Section III, Subsection ND (currently classified as Class 6), except for piping and fittings between CV1 and the Irradiated Fuel Bay Structure designed to ANSI B31.1 and the shell side of the heat exchangers designed to ASME Section VIII, Division 1.

4.1.4.3 FACILITIES CONDITION

The bays structures (IFB and AIFB), cooling systems and purification are the SSCs that contribute to Fuel Storage functionality. The Irradiated Fuel Systems provide the following critical functions:

1. Remove the heat transferred to the bay water by irradiated fuel bundles.
2. Reduce the radioactivity level and turbidity of the bay water by removing suspended and dissolved solids; maintain clarity of the bay water to permit observation of irradiated fuel handling operations.
3. Provide shielding of the irradiated fuel to reduce radiation fields around the bays to acceptable levels.
4. Ensure that contaminants do not escape to the environment.
5. Supply water to the Elevator Sprays.

The overall health rating of the Irradiated Fuel Bay - A, Irradiated Fuel Bay – B and Auxiliary Irradiated Fuel Bay and Interbay Transfer System as of Q4 2015 is WHITE. One of the major reasons for the downgrade from GREEN, and common across all bays and systems, is the Corrective Maintenance backlog (discussed below) related to cooling and purification systems, and addressing the spares for pumping systems in IFB-B and AIFB.

There is one recommendation in the System Summaries for IFB and Auxiliary systems operation until 2024 (refer to Section 4.1.1.2.27). It is to correct the problem with IFB-B leakage and is discussed below. In addition, updated DCAs will be completed for IFB and Auxiliary systems as part of the current DCA update. Completion of these DCAs is addressed by gap SF2-15 identified earlier covering all of the DCA updates.

A CNSC Type II inspection (P-CORR-00531-04477) [62] of the IFBs resulted in two action notices. One action (PRPD-2015-010-AN1) requires OPG to develop and implement a corrective action plan to correct equipment deficiencies in the IFB-A, IFB-B and AIFB. This action is a result of multiple Work Requests (WRs) located in the field that have not been addressed for a prolonged period of time. The second CNSC action (PRPD-2015-010-AN2) was related to lighting deficiencies in IFB-A which have since been addressed.

The issue related to maintenance backlogs (CNSC Action - PRPD-2015-010-AN1) is being tracked by OPG. OPG has already submitted a detailed action plan for addressing this issue (P-CORR-00531-04624 [64]. This work is being managed through the station work program and as per the latest available update [97], one third of the work has been completed. A review of the remaining work has shown that it primarily consists of maintenance on non-critical components (outside the scope of SF2) and other work that is relatively minor in nature. This is consistent with none of the work being addressed within the Condition Assessments for these systems. Given these factors, existing station work management processes and Management Actions updating progress with the CNSC, will effectively track this work to completion and a PSR2 gap addressing the issue is not required.

Another issue with the fuel storage facilities is the chronic leakage from IFB-B to the collection sumps that has been increasing since 2007. This issue was raised in CNSC Action – 2014-4-5386. Equipment improvements and revised procedures are in place to maintain the water levels in the collection sumps below groundwater level so that any leakage is inward and not outward. Monitoring for tritium in groundwater at the IFB is conducted regularly to confirm the adequacy of the current fixes. OPG has taken initiatives to make repair of the IFB a high priority and has committed to the CNSC (P-CORR-00531-04624) [63] of its intention to mitigate leaks from the P058 IFB, and its collection sumps, to minimize the leak rate and to reduce the potential for environmental risk. Since these action plans are not complete, this results in a PSR2 gap **(Pickering PSR2 SF2-16)**.

In addition, per SCRs P-2013-05015, P-2015-11143 and Action Request AR 28182003, the seismic capacity of the current spent fuel basket stacking arrangements in the Pickering IFBs has not been adequately documented, resulting in a PSR2 gap **(Pickering PSR2 SF2-17)**.

These same SCRs and Action Request identify the seismic capacity of the Pickering 058 IFB fuel conveyor has not been adequately documented, resulting in a PSR2 gap **(Pickering PSR2 SF2-18)**.

4.1.4.4 Spent Fuel Storage Strategy

Assessments (P-REP-34400-00001) [65] have been performed and have confirmed that both structural loading and heat removal capacity are sufficient to accommodate the full design storage capacity. Therefore, heat removal and structural loading are not limiting factors for the long term storage facilities.

The irradiated fuel bays are designed to have a storage capacity for all the irradiated fuel accumulating over approximately 12 station-years. Since the fuel is stored and cooled for about ten (10) years in the bays prior to being moved to a DSC and sent to PWMF, there is sufficient bay space available provided movement to dry storage is performed in a timely manner.

However, recent field walkdowns have identified unusable space in each of the bays. Unusable bay space is defined as basket/module spaces in each bay that are inaccessible, damaged, filled with non-fuel material, filled with scrap fuel and/or non-fuel matter, and any space that cannot be occupied by used intact irradiated fuel. According to an assessment performed following the walkdowns (P-REP-34400-00002) [66], the number of bundles that cannot be optimally stored represent the amount of fuel stored in approximately one reactor in each of IFB-B and AIFB, and approximately three reactors for the IFB-A.

As per the Bay Storage Assessment at End of Life (P-REP-34400-00003) [67], given the unavailable space in the bays, and DSC and ITB transfer rates, there are challenges to meeting the Bay Storage requirements for EOL core defueling. However, this is a production issue and can be effectively managed as part of the station work programs.

4.1.4.5 SPENT FUEL HANDLING

Pickering Auxiliary Irradiated Fuel Bay (AIFB) and Irradiated Fuel Bay Pickering B (IFB-B) each employ a module handling mechanism (Supertool) attached to existing gantry to securely latch, lift, transport and deposit Irradiated Fuel baskets/modules.

The existing AIFB module handling device has reached its end of life and the IFB-B module requires a major overhaul to fix issues encountered on a regular basis. It is more cost effective to replace the entire mechanism rather than conducting a major replacement of its existing potentially obsolete parts/components.

The modification per Master EC 122773 will provide two new module handling devices (Supertool) which will ensure ergonomic concerns raised are eliminated for AIFB & IFB-B. The replacements for the AIFB and IFB-B are designed to be ergonomically superior with a longer operational life (300,000 fuel cycles) to support defueling and regular operation of the units. These new modules are planned to be installed by 2018 or earlier. Given this is being tracked by an existing modification EC, this will be tracked by system health reporting and therefore is not a PSR2 gap.

Spent fuel older than 4 years is transferred from IFB-A to AIFB (as described above). The lifting equipment in IFB-A to support this activity was replaced in 2011 and there are no issues with this transfer operation. The fuel transport is performed by a purpose-built transport truck called the ‘King-Kong”. There are age related maintenance issues associated with this equipment. The equipment meets its current functional requirements, but outstanding maintenance issues will be addressed via a planned refurbishment program under EC 126141. Since the equipment continues to meet its functional requirements, completion of this work is not considered a PSR2 gap.

4.1.4.6 SPENT FUEL STORAGE FACILITIES ASSESSMENT SUMMARY

A review of the condition and operation of spent fuel storage facilities and their effect on the spent fuel storage strategy has been completed. The condition of the storage facilities is generally good. One recommendation was identified in the Detailed CAs on IFB-B leakage and there is a committed action plan addressing the issue. Updates to the Detailed CAs for spent fuel storage facilities for operation to 2028 is addressed by gap SF2-15. The assessment has confirmed that all of the IFBs are designed to accommodate the de-fueling rates from all of the reactors with margin.

The following gaps were identified from this Review:

- **Gap SF2-16:** Action plans to correct the leakage in IFB-B are not complete.
- **Gap SF2-17:** The seismic capacity of the current spent fuel basket stacking arrangements in the Pickering IFBs needs to be documented.
- **Gap SF2-18**: The seismic capacity of the Pickering 058 IFB conveyer tunnel needs to be documented.

4.1.5 *Review Task #5 - Dependence on Obsolescent Equipment*

During the preparation of condition assessments a review is performed to address the availability of any parts for critical components required for replacement or periodic maintenance. Having the necessary supply of parts is essential to maintain the condition of critical components. Unavailability of parts may be due to them becoming obsolete. Equipment obsolescence is an issue that becomes more apparent during the latter phases of nuclear power plant operation. This section describes the OPG processes in place to address obsolescence and the results from the condition assessments pertaining to obsolescence.

As identified in the system reviews, Pickering relies on some equipment that is no longer available for purchase from original equipment manufacturers to the existing technical and quality requirements. To improve upon the processes in place to deal with these situations, in 2015 OPG set up a section within the Design Division and issued N-STD-MA-0024, "Obsolescence Management" [91] to, "*define and implement a sustaining program to manage the proactive and reactive obsolescence issues associated with critical equipment and components. The program activities interface with equipment reliability and life-cycle management strategies designed to sustain continued safe and reliable plant operation*."

The Nuclear Utility Obsolescence Group[9] was used to ensure the standard aligns with industry best practice. It includes the following key elements:

1. Identification of obsolescence.
2. Prioritization of obsolescence issues.
3. Determining a solution.

[9] The Nuclear Utility Obsolescence Group is a North American organization formed to support the nuclear industry to identify obsolete items and potential replacements to reduce station risk and vulnerabilities associated with Equipment Reliability.

4. Implementation of obsolescence solutions according to prioritization.

The standard documents how OPG uses industry tools to proactively assess the material management system to see what catalogue items are no longer available. OPG staff prioritize obsolescence issues to support critical spares, emergent on-line work and outage schedule demands. Standard industry software is also used to gain access to previously solved obsolescence issues. The OPG staff may use these solutions to determine the resolution path to be taken and develop the appropriate change paper to address obsolescence proactively. N-STD-MA-0024 [91] provides all the details of how this process is performed and overseen.

Obsolescence issues associated with safety related SSCs at Pickering NGS may also be identified through N-PROG-MP-0008, “Integrated Aging Management” [34] and N-PROG-MA-0026, “Equipment Reliability” [80] programs. The Integrated Aging Management program requires obsolescence of a component to be identified in condition assessments prior to it having a significant station impact. In particular, N-PROC-MP-0060, “Aging Management Process” [7] requires obsolescence to be considered as an aging related degradation mechanism, when conducting a condition assessment of an SSC. In determining whether obsolescence is an issue of concern, consideration is given to the quantity of spares available and their predicted usage. Once an equipment obsolescence issue has been identified, actions to resolve the issue are identified in the condition assessments and tracked in system health report action plans.

In addition, the Equipment Reliability program requires critical spares be identified for safety related SSCs and the status of these spares monitored for any issues including obsolescence. N-INS-00680-10000 “Identification of Critical Spares” [88] outlines the process of identifying critical spares together with roles and accountabilities. System Engineers are responsible for identifying critical spares and summarizing their status in system health reports by identifying issues with the procurement of these parts. Once a component or part has been identified as critical, the responsible System Engineer is required to provide the information to Nuclear Supply Chain. Nuclear Supply Chain flags the component CAT ID in Asset Suite as a critical spare and then develops an appropriate stocking strategy which takes into consideration any other instances where the specific CAT ID is used.

System Engineers periodically review obsolescence and inventory levels of critical spares as part of system health monitoring. Critical spares not in stock are identified in system action plans for prioritization. In addition, Nuclear Supply Chain also reports on the health of Critical Spares through Supply Chain Performance Reporting.

Through all of these processes, OPG manages obsolescence tied to safety related SSCs at Pickering NGS. The program is sustained in the five year business plan, and fully staffed, so no further improvement actions are required.

The System Summaries contain 25 recommendations to address equipment parts that are presently assessed as being obsolete. That represents 4% of the recommendations in the condition assessments. Some of these items are already recognized and are being addressed in System Health Report action plans (which address the most critical parts). The majority of the obsolete items are in components having a Satisfactory or better condition and none are in Special Safety Systems. Therefore, these obsolescence issues do not introduce a nuclear safety risk. Recommendations to address obsolescence will be tracked in System Health Reports along with the other CA recommendations.

Based upon the above, OPG has effective processes in place aligned with industry standards. Obsolete equipment is identified in condition assessments and are tracked in OPG processes and system health reports. Therefore, Review Task #5 is assessed as compliant for PSR2.

4.1.6 *Review Task #6 – Dependence on External Essential Services/Supply*

To complete this task on the dependence on external essential services and supplies, the following information sources were reviewed:

- System Health Reports
- Station Condition Records (SCRs)
- Applicable OPG Governance
- Potential Issues affecting the Global Nuclear Industry

System Health Reports:

A review of SHRs was conducted to identify any issues in this area. No relevant problems were observed identifying potential risks associated with the supply of external services or supplies. In addition, available Chemistry Reports and Self-Assessments were reviewed and again no vulnerabilities were identified.

Review of Station Condition Records:

A review of SCRs was also conducted and no significant vulnerabilities were identified within the scope of this Review Task.

Only one SCR was found using the search criteria “Possible Supplier Interruption” noted below in the governance review. Station Condition Record P-2014-03700 was issued to document that a supplier of calibration services was unwilling to be subject to an OPG audit. The issue was resolved by using another available supplier and therefore this issue does not introduce a vulnerability to the supply of external services or supplies.

Governance Reviews:

Obsolescence of services and supplies for any reason (business discontinuation/interruption, failure of a qualification audit, low volume interactions) is addressed by OPG-PROC-0058 “Procurement Activities” [84], Section 1.19.5, which states:

“Any potential disruptions to the supply of items and/or services that may adversely impact OPG shall be addressed in a consistent and expedient manner.
(a) For nuclear and/or OPG wide suppliers:
(1) When OPG becomes aware of a potential supplier interruption a Station Condition Record (SCR) titled “Possible Supplier Interruption: [vendor name]” shall be initiated.”

Specific actions to address a supplier interruption of any type is then addressed by N-PROC-MM-0010 “Establishing and Maintaining Ontario Power Generation Approved Suppliers List” [85]. Among other things, this governance mandates an Approved Supplier List Oversight Committee meeting (ASLOC), which reviews impacts on internal stakeholders and initiates corrective actions as may be required. This governance ensures the risk posed by potential discontinuation of any external supplies or services is effectively mitigated.

Potential Vulnerabilities Affecting the Nuclear Industry:

Various information sources (Industry and Regulatory web-sites and periodicals)[10] were reviewed to identify any vulnerabilities affecting the nuclear industry or other related industries. No significant issues were identified. The sole potential issue identified was the supply of Lithium. Lithium hydroxide is used for protection against corrosion. There has been a significant increase in the demand for lithium for energy storage technologies. However, this is not considered to be a risk given potential other materials that can be used for corrosion protection and there is sufficient supply beyond 2028.

In addition to the reviews performed in the above areas, there are a number of established engineering service providers serving OPG that are capable of providing continued specialized engineering tasks.

Lastly, many of the same external services and supplies required for Pickering are also required for the Darlington station. Darlington is being refurbished to operate far beyond the proposed Pickering life extension date of 2028. OPG’s processes will provide assurance of supply of external services and supplies for the extended life of Darlington and Pickering stations.

[10] NRC, Nuclear Energy Institute, Power Engineering and other web-sites were searched for shortages/vulnerabilities in the power industry.

Given the above, there are no existing vulnerabilities associated with this Review Task and OPG processes are in place to mitigate future risks. Therefore, Review Task #6 is assessed as compliant for PSR2.

4.2 Emergency Mitigation Equipment Review

REGDOC 2.10.1 'Nuclear Emergency Preparedness and Response' [68] includes requirements to identify essential emergency response equipment and how its operation and effectiveness are assured during an emergency. These regulations are generic to all classes of accidents. Subsequent to the failure of the Fukushima Daiichi Nuclear Power Plant to maintain critical safety functions following a BDBA, the CNSC established a "Task Force" to manage the CNSC Fukushima review. Based on recommendations from the "Task Force", Fukushima Action Items (FAI) were raised pertaining to Emergency Mitigating Equipment (EME), which is the term adopted by Canadian Nuclear Power Plants to define the equipment that provides additional lines of defense against BDBA. All FAIs assigned to OPG for EME are now closed (per final status report N-REP-03600-10003 [69]).

As part of the Fukushima response, OPG has established EME at its nuclear power stations to support station response to BDBA. As per OPG EME memorandum [70], Nuclear Safety has programmatic accountability for EME, the Emergency Response Team is responsible for EME maintenance and testing, and Station Performance Engineering provides engineering support for the equipment.

Although EME is not considered a Safety Related System, OPG has established EME procedures and practices commensurate with the role of the equipment in support of BDBA response.

The technical basis pertaining to EME is documented in N-BDB-03600-00002 'OPG Emergency Mitigating Equipment for Beyond Design Basis Accidents – Technical Basis Document' [71]. This document summarizes the analyses that have been done for each step of event progression, and modifications undertaken by OPG to improve the depth and capability to arrest BDBA progression.

The analysis documented in the Technical Basis document has established technical requirements that have led OPG to ensure that portable diesel powered pumps and generators, and required support equipment, are in service and available to be deployed following an event to limit accident progression and mitigate the impact of a BDBA.

A detailed listing of the EME is provided in N-BDB-03600-00001 'Emergency Mitigating Equipment Inventory' [72]. As documented in the OPG memorandum [70], EME from other Canadian utilities is also available for use under the establish Mutual Aid Agreement with details provided in N-CORR-0542905, 'Beyond Design Basis Event Response –

Emergency Mitigating Equipment (EME) – Equipment Available from other Canadian Nuclear Facilities' [73].

EME has also been established within the OPG governance framework as per the following documents.

N-STD-MP-0019 'Beyond Design Basis Accident Management' defines the reactor safety program governing Beyond Design Basis Accident Management [74]. The overall approach for management of BDBAs includes measures to prevent BDBAs from progressing to Severe Accidents (SAs) as well as measures to mitigate the consequences should a BDBA progress to a SA. This document includes both Emergency Mitigating Equipment Guidelines (EMEG) and Severe Accident Management Guidelines (SAMG) where the intent of EMEG is to prevent a BDBA sequence from progressing to a SA. Defined within the Beyond Design Basis Accident Management Standard [74] are BDB Functional Safety Requirements, BDB Challenge Evaluation Process, and Roles and Accountabilities. Also included in the implementation requirements of the BDBA Standard [74] is a requirement for EME testing to support sustainable operation, sufficient to demonstrate that the required functional performance for BDBAs is achieved.

As per the BDBA Accident Management Standard [74], BDB Functional Safety Requirements have been identified and documented for each station. NA44-GUID-03600-00001 'Pickering 1-4 Beyond Design Basis Functional Safety Requirements' [75], and NK30-GUID-03600-00001 [76] 'Pickering 5-8 Beyond Design Basis Function Safety Requirements' include BDBA credited equipment requirements (similar to safety limits) and degradation conditions (similar to impairments). These documents summarize functional requirements for SSCs credited to manage and/or mitigate BDBAs, or to prevent progression to SAs and include specific functional safety requirements for EME.

Testing and maintenance of EME is addressed in N-INS-03600-10002 'Beyond Design Basis Emergency Mitigating Equipment Testing and Maintenance Process' [77]. This document establishes instructions for testing and maintenance of EME and associated connection points to station systems credited to support BDBA mitigation, which is aligned with INPO governance AP-913 [10]. This instruction document ensures fleet wide consistency and rigour of the process of testing, maintenance, monitoring, and reporting in support of BDBA management. This document also identifies all portable EME as Equipment Important to Emergency Response (EITER) as per N-PROC-RA-0133 [78]. Management of EITER includes maintenance, testing, and response requirements to unavailability of equipment.

As per the EME memorandum [70] and OPG Instruction N-INS-03600-10002 [77], as part of the testing and maintenance pre-defined Preventative maintenance and equipment checks are performed and major EME equipment availability is reported in the daily Pickering Alignment Meeting and in the Chief Nuclear Officer report. Also as per the

Memorandum [70], Emergency Preparedness drills and exercises are conducted using the equipment to confirm integrated response capability.

A review of testing and maintenance practices is documented in N-CORR-01130-0495435, 'Review of Testing and Maintenance Practices for Emergency Mitigation Equipment at Darlington and Pickering' [79] indicating that the overall performance has been good, EME is being well maintained, there has been few equipment problems, and that there is confidence that any issues are being identified and corrected in a timely manner.

According to the EME memorandum [70], OPG is also planning to add additional EME to further enhance response capability, and as part of the OPG change control processes the new equipment will have appropriate maintenance and testing requirements and procedures in place.

As per the discussion above, the Fukushima action items associated with EME have been completed (per Status Report N-REP-03600-10003 [69]) and have led to having EME management incorporated into station governance, the establishment of EME requirements, and the implementation of EME including ongoing maintenance and testing.

As no issues are identified in the review of EME at OPG, EME is assessed as compliant for PSR2.

4.3 Additional Reviews

As discussed in Section 3.7, the SF2 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering Licence Conditions Handbook LCH [25], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The only item in the LCH related to SF2 is contained in section 16.3 of the LCH [25], which documents a hold point for not exceeding 247,000 EFPHs on any unit without prior CNSC approval. This has already been identified as PSR2 gap. This assessment did not find any additional PSR2 gaps for Safety Factor 2.

OPG has also conducted a review of the Pickering 5-8 Continued Operations Plan in support of PSR2 [88]. Fitness for service aspects from that review (e.g., items related to life cycle management plans and condition assessments) parallel the assessment conducted in this Safety Factor 2 Report. Implications were identified if closed COP actions needed to be re-assessed given the potential to operate Pickering to 2028 rather than 2020, which had been factored into the closure criteria for some COP actions. PSR2 implications were also identified if they were applicable to Pickering Units 1,4. Where there were implications for extended operation, a PSR2 gap has been identified in the COP report. These gaps will be considered in the Global Assessment Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify any implications of extending operation beyond 2020. This review is presented in a separate PSR2 FAI Review Report [81]. There are no SF2 gaps associated with this review.

4.4 SF2 Gaps that Impact Other Safety Factors

Safety Factor Report 4, "Pickering NGS PSR2, Safety Factor 4 Report – Aging" [4] reviews the aging of spent fuel facilities, as does Section 4.1.4 in this report. This reference contains a gap to complete the condition assessments for these facilities. This gap is addressed by gap SF2-15 in this report. In addition, some of the gaps raised in this report on spent fuel storage facilities, i.e. SF2-16 and SF2-17 are discussed in Reference [4].

No other SF2 gaps have been identified that are related to other PSR2 Safety Factors. A number of gaps in SF2 relate to work ongoing related to aging management (updating LCMPs, fitness for service of components, completion of condition assessments, etc.). These do not directly impact other Safety Factors, but the completion of this work supports the continued safe operation of the plant and to maintain operation within the credited design basis.

5.0 RESULTS AND CONCLUSIONS

5.1 RESULTS

5.1.1 MAJOR COMPONENTS

Major components (Fuel Channels, Feeders, Steam Generators, and Reactor Components and Structures) are managed through a comprehensive program of in-service inspections, maintenance, engineering assessment and confirmatory research and development documented in life cycle management plans. There is high confidence that the major components will remain fit for service up to an extended station life to 2024, with limited potential mitigating actions required. Additional analysis and assessment is required to demonstrate continued Fitness for Service for extended station life to 2028. The review identified the following gaps:

- **Gap SF2-1:** Fitness for Service for Fuel Channels has not been demonstrated for station operation to 2028.
- **Gap SF2-2**: OPG does not have approval to operate beyond the current Licence limit of 247,000 Effective Full Power Hours (EFPH) for fuel channels.
- **Gap SF2-3**: The Fuel Channels LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-4**: Fitness for Service for Feeders has not been demonstrated for station operation to 2028.
- **Gap SF2-5**: The Feeders LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-6:** Fitness for Service for Steam Generators has not been demonstrated for station operation to 2028.
- **Gap SF2-7**: The Steam Generators LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-8:** Fitness for Service for Reactor Components and Structures has not been demonstrated for station operation to 2028.
- **Gap SF2-9:** The Reactor Components and Structures LCMP has not been formally updated to address extended station operation to 2028.
- **Gap SF2-10:** Environmental Factors have not been incorporated into the Service Limits Assessment for Class 1 piping.

5.1.2 CA Summary Tables

Detailed condition assessments have been performed for 1202 Commodity Groups (CGs), including all SSCs in Systems Important to Safety and Safe Operating Envelope systems. No states of degradation were observed that compromise the current design basis or design basis assumptions. 58% of the CGs are classified as “Good” or “Very Good”. 35% are assigned a “Satisfactory” classification. Only 6% are assigned a classification of “Poor” and 0.4% are “Very Poor.

For the Special Safety Systems for both P1,4 and P5-8, there are no CGs credited in the Safety Factor 2 Report which are rated Poor or Very Poor. For the Units 1,4 and Units 5-8 Special Safety Systems, there are only two CGs rated “Poor” that have a primary safety function. However, as described above these have minimal safety impact.

Approximately 500 recommendations were identified within the CAs, largely focused on incremental actions to improve condition and/or aging management practices. Approximately thirty percent of the recommendations are current station initiatives (i.e. already identified and planned). The majority of the recommendations are in place for CGs rated Satisfactory or lower. The following gaps were identified during completion of the condition assessments:

- **Gap SF2-11:** Condition Assessments for civil structures are not complete for station operation to 2028.
- **Gap SF2-12:** Condition Assessments for in-scope piping systems are not complete for station operation to 2028.
- **Gap SF2-13:** The Cable Surveillance Program risk assessment and condition assessments currently use out of date criticality coding.
- **Gap SF2-14:** The Buried Piping Program risk assessment and condition assessments have not been updated for extended operation to 2028.

Work is currently in progress to complete updated CAs to address extension of station life to 2028. This outstanding condition assessment work introduces the following PSR2 gap:

- **Gap SF2-15**: Updated Detailed Condition Assessments are not complete for Commodity Groups in the scope of PSR2 for station operation to 2028.

5.1.3 Maintenance Facilities and Resources

The review of Maintenance Facilities and Resources did not identify any issues when reviewed against the relevant sections of IAEA Safety Guide NG-G-2.6 ‘Maintenance, Surveillance and In-Service Inspection in Nuclear Power Plants’ [40]. This review included assessment of SCRs and the findings of industry audits, and did not identify any issues of significance. Also, maintenance resources are assigned via station business planning to ensure that equipment reliability goals are achieved.

5.1.4 CONDITION AND OPERATION OF SPENT FUEL STORAGE FACILITIES

An assessment of the condition and operation of the Irradiated Fuel Bays (IFB-A, IFB-B), and the Auxiliary Irradiated Fuel Bay (AIFB), including their cooling and purification systems, was completed. Overall, the condition of the facilities is good. Three gaps have been identified as outlined below:

- **Gap SF2-16:** Action plans to correct the leakage in IFB-B are not complete.
- **Gap SF2-17:** The seismic capacity of the current spent fuel basket stacking arrangements in the Pickering IFBs needs to be documented.
- **Gap SF2-18**: The seismic capacity of the Pickering 058 IFB conveyer tunnel needs to be documented.

5.1.5 EMERGENCY MITIGATING EQUIPMENT

The EME program within OPG has been reviewed including its governance and programs, technical basis and maintenance practices. No issues were identified in the review of the EME program at Pickering.

5.2 OVERALL ASSESSMENT OF THE SAFETY FACTOR

An assessment of the six SF2 Review Tasks has been completed and the objectives of each have been satisfied as documented in this report.

As part of this review, a comprehensive assessment of the Systems, Structures and Components (SSCs) Important to Safety at Pickering NGS has found they are generally in good condition. This conclusion is supported by the presence of comprehensive and effective programs in place to ensure the condition of components meet design requirements with margin.

This assessment has not identified any major concerns that the SSCs will continue to operate as per the design basis requirements during life extension. As part of SF2, eighteen PSR2 gaps have been identified that will need to be addressed further as part of the PSR2 Global Assessment Report as detailed in the PSR2 Basis Document [1].

WO	Work Order

APPENDIX B. SOE/SIS SYSTEMS INCLUDED IN SF2

Appendix B.1

The systems included in this review are focused on the Pickering NSG 1, 4 SOE/SIS systems as per Table B.1-1 and Pickering NGS 5-8 SOE/SIS systems as per Table B.1-2 in this Appendix. In preparation of the DCAs, system numbers are assigned to the in-scope systems. These system numbers are shown in Tables 1 and 2 for each SOE/SIS system. Note: Some SOE/SIS systems cover more than one system/sub-systems, therefore multiple system numbers can be assigned to a single SOE/SIS system.

APPENDIX B.1 SIS/SOE SYSTEMS

Table B.1-1: Pickering NGS 1, 4 SOE/SIS Systems

#	Pickering NGS 1,4 Systems	SOE[1]	SIS[2]
1.	Emergency Coolant Injection System System Numbers: 0421, 0436, 0437	√	√ (Also includes associated recovery system (with Moderator Pumps and Moderator Room Active Drainage Sump Pumps))
2.	Shutdown System A System Number: 0462	√	√
3.	Shutdown System E System Number: 0463	√	√
4.	Negative Pressure Containment Systems System Numbers: 0412, 0423, 0452, 0455, 0466, 0469	√	√
5.	Powerhouse Emergency Venting System System Number: 0447	√	√
6.	Reactor Regulating System System Numbers: 0444, 0453	√	
7.	Service Water Systems System Numbers: 0410, 0454, 0456	√	√ (Limited to Emergency Low and High Pressure Service Water)
8.	Moderator System System Number: 0445	√	
9.	Electrical Power System System Numbers: 0408, 0420, 0464	√	√ (Limited to Standby Class III power and Class III 600V Interstation Transfer Bus, Emergency Transfer Scheme and Class III 600V Motor Control Centres 54130-MCC-18 and MCC-19)
10.	Emergency Boiler Water Supply System Numbers: 0423, 0456	√	
11.	Heat Transport System System Number: 0449	√	√
12.	Shutdown Cooling System System Number: 0459	√	
13.	Boiler Emergency Cooling System System Number: 0402	√	
14.	Feedwater System System Numbers: 0401, 0403, 0417, 0426	√	
15.	Main Steam Supply System System Number: 0404	√	
16.	Fuel and Reactor Physics System Number: N/A[3]	√	
17.	Annulus Gas System System Number: 0400	√	

#	Pickering NGS 1,4 Systems	SOE[1]	SIS[2]
18.	Critical Safety Parameter Monitoring Instrumentation System Numbers: 404, 421, 437, 458, 462, 463	√	
19.	Fuel Handling System & Irradiated Fuel Bays System Numbers: 0428, 0430, 0431, 0432, 0433, 0440, 0441, 0472	√	
20.	Shield Cooling System System Number: 0458	√	
21.	Interstation Transfer Bus System Number: 0420	√	
22.	Powerhouse Environmental Protection System System Number: 0448[4]	√	
23.	Critical Structures (e.g., Reactor Buildings, Pressure Relief Duct and Vacuum Building) [5] System Numbers: 0406, 0425, 0436, 0441, 0452, 0455, 0466, 0469		

1. Specific USIs are provided in associated system OSRs listed in References [16] and [19]. Also, it includes elements of specified support systems (e.g. Instrument Air) where it is required for credited design basis functions (This is generally reflected in the criticality coding).
2. Specific USIs and required functional elements are detailed in [16] and [17].
3. There are no specific equipment credits in the Fuel & Reactor Physics (F&RP) OSR. Any implicitly credited instrumentation for measurement purposes are included in other systems, e.g. SDSA. Therefore there is no system number or Appendix B-2 Table entries for F&RP.
4. System 448 is not in Tables in Appendix B-2 since all components were screened out and CAs were not required.
5. Critical Structures supporting SOE/SIS operation are included in the review.

Table B.1-2: Pickering NGS 5-8 SOE/SIS Systems

#	Pickering NGS 5-8 Systems	SOE[1]	SIS[2]
1.	Emergency Coolant Injection System System Numbers: 0421, 0436, 0437	√	√
2.	Shutdown System One System Number: 0460	√	√
3.	Shutdown System Two System Number: 461	√	√
4.	Negative Pressure Containment Systems System Numbers: 0412, 0423, 0452, 0455, 0466, 0469	√	√
5.	Powerhouse Emergency Venting System System Number: 0447	√	√
6.	Reactor Regulating System System Numbers: 0444, 0453	√	
7.	Service Water Systems System Numbers: 0410, 0454, 0456	√	√ (Limited to Class III Service Water (Low and High Pressure))
8.	Moderator System System Number: 0445	√	
9.	Group 1 Electrical Power System System Numbers: 0408, 0420, 0464, 0465	√	√ (Limited to Standby Class III power / Class II Power and also includes Class II UPS Room Ventilation)
10.	Emergency Water Supply System System Number: 0423, 0425	√	√ (Limited to Emergency Water Supply to Boilers, Heat Transport, and Moderator)
11.	Heat Transport System System Number: 0449	√	
12.	Shutdown Cooling System System Number: 0459	√	√
13.	Boiler Emergency Cooling System System Number: 0402	√	
14.	Feedwater System System Numbers: 0401, 0403, 0417, 0426	√	√ (Limited to Auxiliary Boiler Feedwater and Auxiliary Condensate Systems)
15.	Main Steam Supply System System Number: 0404	√	
16.	Fuel and Reactor Physics System Number: N/A[3]	√	
17.	Emergency Power Supply System Number: 0422	√	√
18.	Fuel Handling System & Irradiated Fuel Bays System Numbers: 0428, 0430, 0431, 0432, 0433, 0440, 0441, 0472	√	

#	Pickering NGS 5-8 Systems	SOE[1]	SIS[2]
19.	HPECI Power Supplies System Numbers: 403, 404, 417, 420, 453, 464	√	
20.	Annulus Gas System System Number: 0400	√	
21.	Critical Safety Parameter Monitoring Instrumentation System Numbers: 404, 421, 423, 445, 449, 451, 453, 460, 461	√	
22.	Shield Cooling System System Number: 0458	√	
23.	Critical Structures (e.g., Reactor Buildings, Pressure Relief Duct and Vacuum Building)[4] System Numbers: 0406, 0425, 0436, 0441, 0452, 0455, 0466, 0469		

1. Specific USIs are provided in associated system OSRs listed in [16] and [19]. Also includes elements of specified support systems (e.g., Instrument Air) where required for credited design basis functions (This is generally reflected in the criticality coding).
2. Specific USIs and required functional elements are detailed in [16] and [17].
3. There are no specific hardware credits in the Fuel & Reactor Physics (F&RP) OSR. Any implicitly credited instrumentation for measurement purposes are included in other systems, e.g. SDS1. Therefore there is no system number or table entries for F&RP.
4. Note: Critical Structures supporting SOE/SIS operation are included in the review.

Appendix B.2

The Tables in Appendix B.2 contain the key findings from the System Summaries documented in section 4.1.1.2. The Tables are shown on a system basis listing the system number and name, e.g. System 0400 Annulus Gas. For each of the systems, the DCA results are shown for each Commodity Group (CG) which are reactor safety or production critical. The following columns are provided:

Column	Description
CG	Commodity Group Number
Units	Applicable Units
USI#	All USIs/sub-USIs covered in the CG
CA Description	Component Type
Function	Description of Reactor Safety or Production Role
Classification	Aging Management Classification (more information provided below)
Potential Aging Related Degradation Mechanisms (ARDMs)	ARDMs applicable to the component
Current Practices	Summary of Aging Management practices currently in place (more information provided below)
Incremental Work Recommended for Current and Extended Operating Life	Aging Management Recommendations (more information provided below)

Aging Management Classification

An overall Condition Classification (Very Good, Good, Satisfactory, Poor, or Very Poor) is established in N-PROC-MP-0060 [7], which accounts for:

a) The physical condition of the component at time of assessment, and
b) The adequacy of the practices in place to manage component aging.

Condition Classification is assigned by selecting the lesser of these two criteria. For example if the physical condition of a component is “Good”, but the adequacy of practices is “Satisfactory”, the component condition classification is “Satisfactory”. Aging Management recommendations are required for CGs having a Poor or Very poor classification. The criteria used for assigning classification is provided in Table C.2.

Of note, the condition classification of “Satisfactory” can be a result of:

- The component still meets all it functional design requirements, but operating margins are significantly eroded. This can be attributed to evidence of significant aging degradation, or,

- The *aging management* practices are ineffective in only one area and should be reviewed and/or changed.

Given these definitions of Satisfactory, improvement recommendations would nominally be expected. Of the approximately 350 CGs with this classification, the majority have a number of associated recommendations. Only about 90 CGs (~25%) currently do not contain recommendations. This is acceptable for the following reasons:

- The physical condition is rated as “Good”, however, only one practice is ineffective and therefore classification is “Satisfactory”. In some cases practices may not be practical or justified to improve practices for a component in a physically “Good” condition.
- The physical condition is rated as “Satisfactory”. The classification for “Good” is indicative of a component having only a slight reduction in operating margins. There is a significant difference between these two condition definitions, i.e. a “slight reduction” vs. “significantly eroded”. Usually, the classification will be assessed conservatively, resulting in Satisfactory being selected.
- The criticality of the component is low, i.e. CC3 or CC4.
- Per OPG governance, recommendations are only required for “Poor” and “Very Poor” classifications.

Current Practices

This column lists the aging management practices in place for the components across the CG. It includes high level activities. These practices were extracted from the updated DCAs. Additional details, e.g. PM #s, etc. are documented in the DCAs. In some cases the practice on the parent component is listed, e.g. limit switches are addressed during the diagnostics test performed on a valve.

There can also be cases where a practice is listed for a CG, e.g. calibration, yet there is a recommendation to perform calibrations on a specific component(s) in that CG. This is acceptable, as in this case, calibration is performed on the majority of components in the CG, but it is not performed in the components that are listed in the recommendations. There are standard practices that are in place generically which are not listed as they are applicable to all relevant CGs. These include: Operator Rounds, System Walkdowns, and Trending of Safety System Component Failure Rates in accordance with REGDOC-3.1.1 [98]. Operator Rounds and System Engineer surveillance are listed for components where these are the primary practices.

Incremental Work Recommended for Current (2020) and Extended Operating Life (2024)

This column identifies recommendations resulting from the Condition Assessments for each CG. Although recommendations are only required for Poor or Very poor classifications, recommendations can also be made for Satisfactory or better classifications to maintain that rating or to make improvements.

Three different types of recommendations can be made:

a) Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices.

   These are recommendations to complete currently planned work for plant end of life in 2020. For example, complete currently planned inspection work orders (WOs). They are termed “incremental” as they are not currently complete, and are not in the set of periodic aging management practices.

b) Incremental recommendations for Plant EOL (2020).

   These are recommendations to complete work that is not currently planned (i.e. incremental) for current plant end of life in 2020.

c) Incremental recommendations for CO EOL (2024)

   These are recommendations to complete work that is necessary for life extension. For the System Summaries a life extension date of 2024 was considered. The DCAs currently in progress address life extension to 2028.

Information for selected CGs has been shaded in this revised version of the report. These shaded rows represent cases where the information is no longer applicable, as the latest scoping and screening has determined that these CGs can be screened out and no longer require a Detailed CA to be produced. The condition of these components and recommendations made are no longer relevant to this SF2 assessment and have not been updated. They are included to illustrate which CGs have been removed compared to OPG Revision 0 of this report.

As an example, for the Annulus Gas System, system 0400, Commodity Group 11475, on CO2 monitors has been shaded, i.e. screened out. The justification for this is the criticality code was changed from cat 1/2 to cat 3/4 and therefore a Detailed CA is no longer required. This change in criticality code occurred as a result of the criticality code review project performed by OPG. The recommendation provided in the Table to complete EC 111431 is also removed in section 4.1.1.2.1. However, this action is still in the SHR and will be tracked, prioritized and executed via the work management system.

Also, the content of the tables has not been updated to reflect the DCA work currently in progress. The tables reflect a snapshot of the CA results representative of a freeze date of Aug 31, 2015. The results of the updated CAs with a freeze date of January 15, 2016 and addressing extended operation to 2028 is a PSR2 gap. The CA recommendations from these updated CAs will be captured in system health reports, and prioritized and tracked to completion via the System Health process. OPG plans to implement a new Aging Management (AM) database to aid with the tracking and oversight of AM actions.

System 0400 Annulus Gas

CG:	Units	USI #	CA Description	Function	Classification	Potential Aging Related Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008000	1,4	34980 63498	ALARM, Cat 1/2	CO2 concentration in strategic areas surrounding the Annulus Gas System is monitored continuously for each unit. Level instrumentation is provided for drains tank, alarms in MCR.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008001	1,4	34980 63498	ANALYZER, Cat 1/2	Oxygen is added to the AGS to maintain 02 concentration between 0.5% and 5% by volume at all times. Oxygen analyzer continuously monitors concentration on-line during normal operation.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging	Surveillance	Incremental recommendations for Plant EOL (2020): Implement a new PM to perform periodic calibration and function checking. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008003	1,4	34980 34980	COIL, Cat 1/2	The finned cooling coil is used with two cooling fans and a separator for condensing and collecting sufficient liquid to alarm moisture beetles.	Good	Corrosion / General Corrosion	Surveillance	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008004	1,4	34980 34980	COMPRESSOR, Cat 1/2	There are stainless steel, bellows type compressors which provide air flow for recirculation. Each compressor has a nominal flow rating of 170 NLlmin (6 Ncfm).	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Lubricant Degradation Corrosion / Oxidation		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete EC 119541 to replace the applicable compressors with CID 670078. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI #	CA Description	Function	Classification	Potential Aging Related Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008007	1,4	34980 34980	DISC, Cat 3/4	The overpressure protection for the compressors is provided by rupture discs 3498-RD1, RD2 and RD3. The rupture discs have been set to burst at a maximum differential pressure of 227.5 kPa(d).	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008008	1,4	34980 63498	ELEMENT, Cat 1/2	Moisture element (beetle) measures dewpoint of CO2 in order to detect pressure tube, calandria tube leaks or leakage from the End Shield Cooling.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008010	1,4	34980 34980	FAN, Cat 1/2	The cooling fans are used with a finned cooling coil and a separator for condensing and collecting sufficient liquid to alarm moisture beetles.	Satisfactory	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Functional Test Logic Test Lubrication Predictive Maintenance - Thermography Predictive Maintenance - Vibration Monitoring	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement a new PM to periodically check the fan and motor bearings and add lubrication if necessary.
008013	1,4	34980 63498	FUSE, Cat 1/2	40VDC supply fuse for Moisture Collection Tank level instrumentation loop.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008014	1,4	34980 63498	GAUGE, Cat 1/2	Collection Tank level gauge.	Good	Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008018	1,4	34980 63498	INDICATOR, Cat 1/2	Flow meter to monitor purge flow	Good	Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008019	1,4	34980 63498	INDICATOR, Cat 3/4	1-63498-F4-FI515 is a flowmeter for measuring beetle blast flow, currently not in use and valved out. 1-	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI #	CA Description	Function	Classification	Potential Aging Related Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				63498-F5-FI527 is a flow meter used for monitoring gas flow during cold finger sampling, normally valved out. PI instruments are system local pressure gauges.		Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		
008021	1	34980 63498	MONITOR, Cat 1/2	Fixed CO2 monitors & detectors	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008022	4	34980 63498	MONITOR, Cat 3/4	Fixed CO2 monitors & detectors	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008023	1,4	34980 34980	MOTOR, Cat 1/2	Compressor motor & motor cooling fan.	Satisfactory	Environmental degradation, General corrosion, Mechanical fatigue, Thermal fatigue / 81		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008026	1,4	34980 63498	PROCESSOR, Cat 1/2	Collection Tank rate calculation microprocessor.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008027	1,4	34980 63498	RECORDER, Cat 3/4	Chart recorders for AG system	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008028	1,4	34980 34980	RELAY, Cat 1/2	Relay in cooling fan motor start logic.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI #	CA Description	Function	Classification	Potential Aging Related Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008029	1,4	34980 34980	RESISTOR, Cat 1/2	Resistor in cooling fan start logic.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008038	1,4	34980 63498	TRANSMITTE R, Cat 1/2	Collection tank level transmitter	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011263	5,6,7,8	34980 63498	63498 Annulus Gas System-Oxygen Analyzer	Analyser provides local oxygen concentration indication.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Perform probe and digital display replacement for O2 Analyser per EC 122171. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011265	5,6,7,8	34980 63498	63498 Annulus Gas System-Moisture Hygrometer Transmitter	Transmits measurements of CO2 dewpoint to MCR, detects pressure tube or calandria tube leaks or leakage from the End Shield Cooling.	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Electronic Aging Radiation Induced Degradation / Radiation Embrittlement		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0401 Boiler Blow-Off System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008058	1,4	36400 36410	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2	This CA includes the local boiler blowdown isolating valves. They are normally closed, and opened intermittently to assist in chemical control in the boilers.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue	Surveillance SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Perform a one-time inspection of valve internals against ARDMs (elastomer embrittlement, material loss on bushing, spindle, seat, disc, bellows failure, valve body corrosion), weld inspections, and repair/replace valve internal parts if degraded.
008060	1,4	36400 36410	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, large boiler blowdown valves	This CA includes the main boiler blow-off isolating valves. These valves are operated intermittently, and operate in conjunction with local boiler blow-off isolating valves to maintain reasonable solids accumulation levels and assist in chemical control in the boiler.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue	Overhaul/Refurbishment SRST - Functional Test Valve Diagnostics	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete WOs 2731629, 2731630, 2284458, 2243671 to overhaul and/or replace valve internals and actuator. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008061	1,4	36400 36410	SOLENOID/SOLENOID OPERATED VAL, Cat 1/2	The Blow off system has individual boiler blow off valves 36410-MV2 through MV24. The pneumatic valves are operated by solenoid valves, 36410-MV2-SV1 through MV24-SV1.	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Electronic Aging Radiation Induced Degradation / Radiation Depletion of Material Properties Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		
008063	1,4	36400 36410	SOLENOID/SOLENOID OPERATED VAL, Cat 1/2 for large boiler blowdown valves	The Blow-off system has two large pneumatic valves, 3641-MV37 and 3641-MV38, mounted on header lines for the two groups of boilers. The pneumatic valves are operated by two solenoid valves, 3641-MV37-SV1 and 3641-MV38-SV1.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Depletion of Material Properties Mechanical and Thermal Degradation / Thermal Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011278	5,6,7,8	36400 36410	36410 Boiler Blow-off System NVs	These check valves protect against a backflow of water/steam from the intermittent blowdown and steam when the steam reject valves 36110-MV36 and MV 42 operate	Satisfactory	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear		<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Complete a one-time replacement of all check valves in this CG.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		
011297	5,6,7,8	36400 36410	36410 Boiler Blow-off System - AOVs	This CA includes individual blowdown isolating valves and main blowdown isolating valves. The main isolating valves are normally open and provide a common isolation point for the blowdown system from the east or west bank of boilers. They are operated in a coordinated sequence with the individual boiler blowdown valves (normally closed) allowing an operator to select a boiler for blowdown, to provide chemical control and sludge removal from the boiler water.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Thermal Aging Fatigue / Mechanical Fatigue	Component Replacement Inspection - Visual SRST - Functional Test	<u>Incremental recommendations for Plant EOL (2020):</u> Initiate one-time inspection of valve internals, and replace/repair if degraded. Procure additional spare valves to ensure corrective action can be expedited if required. <u>Incremental recommendations for CO EOL (2024):</u> Initiate new PMs for external inspections of valves every two years.
011298	056, 078	36400	36410 Boiler Blowoff System- Mechanical	This CA includes the pipe, tube, fittings, flanges, ball joints, pipe supports, snubbers and anchors that form the boiler blowdown system flow path from the boilers to the screen house intake channel.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / General Corrosion Fatigue / Thermal Fatigue Fatigue / Mechanical Fatigue	Inspection - Pipe Wall Thinning Program	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendation for CO EOL (2024):</u> Spare ball joint components to be procured to facilitate corrective actions if/when required.

						Mechanical and Thermal Degradation / Electronic Aging		
008070	1,4	36710 63670	SWITCH, Cat 1/2	Pressure alarms for the Boiler Emergency Cooling system.	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008071	1,4	36710 36710	SWITCH, Cat 1/2	Limit switches on MVs indicating Valve position for the Boiler Emergency Cooling Valves.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Fatigue / Mechanical Fatigue Radiation Induced Degradation / Radiation Depletion of Material Properties	Overhaul/Refurbishment Valve Diagnostics	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008073	1,4	36710 36710	TANK, Cat 1/2	36710-TK1 and TK2 are water storage tanks to provide injection water. 36710-TK3, TK4, TK5 are pressurized air tanks to provide pressure – assistance for water injection.	Good	Corrosion / General Corrosion Corrosion / Pitting Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008074	1,4	36710 63670	TRANSMITTER, Cat 1/2	Pressure Transmitter converts pneumatic input signal to output current required for providing alarms.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging Radiation Induced Degradation / Radiation Depletion of Material Properties		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008081	1,4	36710 36710	VALVE, CHECK/NONRETURN/BACKFL, Cat 1/2, BECS-02	BECS injection non-return valves to prevent reverse flow from boilers to the BECS water tanks.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms – Wear	Inspection - Internal Inspection - Non - Intrusive	<u>Incremental recommendations for Plant EOL (2020):</u> Perform one-time inspection of 4-36710-NV3, NV13, 1-36710-NV3, and NV13. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
008082	1,4	36710 36710	VALVE, CHECK/NONRETURN/BACK	BECS air non-return valves, prevent backflow of air from the high pressure instrument air station.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
			FL, Cat 1/2, BECS-01			Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		
008083	1,4	36710 36710	VALVE, CHECK/NONRETURN/BACKFL, Cat 1/2, BECS-04, 05	BECS air supply line non-return valves.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008084	1,4	36710 36710	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2	MV2 and MV14 are normally closed isolators which permit discharge of BECS tanks TK1 & TK2 to boilers.	Very Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008085	1,4	36710 36710	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2, Worcestor Rack & Pinion, Ball Valve	MV15 is a motor operated valve which permits the BECS tanks to be pressurized via instrument air.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear	SRST - Stroke Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008086	1,4	36710 36710	VALVE, PRESSURE REGULATING, Cat 1/2	PRV1 regulates instrument air pressure to controls of end device MV15. PRV3006 regulates instrument air pressure to BECS tanks.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Creep and Stress Relaxation	Calibration SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Complete a one-time calibration/set point check for 1/4-36710-PRV3006 to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete a one-time calibration/set point check for 1/4-36710-PRV3006 to reach CO EOL (2024).
008087	1	36710 36710	VALVE, PRESSURE REGULATING, Cat 1/2, related to POV program valve	The PRVs serve to regulate instrument air pressure to the air controls of their end devices MV2 and MV14.	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Creep and Stress Relaxation	Overhaul/Refurbishment SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

011477	5,6,7,8	36710 36710	36710 Boiler Emergency Cooling System-Valves - NV-Non-Return - CAT1&2	5/6/7/8-36710-NV3, NV34 NV3 and NV34 are swing check valves located in the injection lines. They prevent hot, high pressure water from entering the BECS tanks in event that injection valve CV2 or CV35 open spuriously. 5/6/7/8-36710-NV4 NV4 is a piston type check valve in the BECS drain/overflow line. 5/6/7/8-36710-NV22 NV22 is a piston type check valve in the instrument air supply line to prevent backflow from the BECS to the Instrument Air System. 5/6/7/8-36710-NV26, NV27 Instrument air supply non return valve to boiler Emergency Cooling tanks 1 & 2.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Obsolescence / Immediate Obsolescence Concern	Component Replacement Inspection - Non - Intrusive SRST - Functional Test	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Perform internal inspection per WO 1618394. Also, resolve spare parts and obsolescence issues. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011484	5,6,7,8	36710	36710 Boiler Emergency Cooling System-Piping - Cat1&2	The system is designed as a safety support system to provide water injection into the boilers upon loss of feedwater.	Good	Corrosion / General Corrosion Corrosion / Microbiological Influenced Corrosion	Inspection - Pipe Wall Thinning Program SRST - Leak Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

System 0403 Boiler Feed System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008091	1,4	43230 64323	ALARM, Cat 1/2	Components in this CA control Auxiliary Boiler Feed pump #5 (ABFP#5) operation and provide alarms and trips for very high boiler levels. AS212 to AS215 control ABFP#5 operation. L51A-LIA1 provide very high boiler level alarm and L51A-LA1 sends trip signals to turbine governor valves.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008093	1,4	43230 43230	BOOSTER, Cat 1/2	AF1's (boosters) provide a high volume air signal to improve response of associated control valves (CV). CVs control flow to boilers to maintain boiler level at set point.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008096	1,4	43230 64323	CONTROL, Cat 1/2	PC206 controls Auxiliary Boiler Feed Pump #5 outlet pressure. LIC1's control boiler level control valves position to maintain boiler level (Boiler Level Control).	Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008098	1,4	43230 64323	CONVERTER, Cat 1/2	The convertors compute rational signals from Steam Flow, Feedwater flow and Boiler level to derive an output signal that can be used to accurately control boiler level.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008100	1,4	43230 64323	ELEMENT, Cat 1/2	The flow elements produce differential pressure changes that are related to changes in flow rate.	Good	Corrosion / Flow induced wear of the leading edge	Calibration	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Perform one-time inspection, and if degraded replace.
008102	1,4	43230 43230	FILTER, Cat 1/2	These air filters are used to clean air for the reliable operation of CVs.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008106	1,4	43230 43230	HEAT TRACING, Cat 3/4	HX3001/3003/3005: Removes heat from circulated lubrication oil for Boiler Feed Pump (BFP) 6/7/8. HX3002/3004/3006: Removes heat from circulated lubrication oil for Boiler Feed Pump Motor (BFPM) 6/7/8.	Good	Corrosion / Fouling (accumulation of deposits) Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008107	1,4	43230 43230	HEATER (GENERIC), Cat 1/2	Pump motor heater is used to heat motor windings and reduce moisture buildup when pump is off line.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008109	1,4	43230 43230 64323	INDICATOR-CAT 1/2	Indicate Feedwater flow or valve position.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008114	1,4	43230 43230	MOTOR, Cat 1/2	Pump motor provides motive power to drive Auxiliary Boiler Feed pump #5.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring,	Overhaul/Refurbishment Predictive Maintenance - Vibration Monitoring	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

011195	5,6,7,8	43230	43230 Boiler Feed Boiler Quadrant Inlet Non-Return Valves	In case of a boiler feed line rupture outside of the reactor building, these non-return valves function to maintain boiler inventory.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011196	5,6,7,8	43230	43230 Boiler Feed MBFP Oil Pump Suction Non-Return Valves	These non-return valves ensure the suction line to shaft driven oil pump remains filled with oil when the boiler feed pump is not in service	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011197	5,6,7,8	43230 64323	64323 Pressure Controller PC206	Control Auxiliary Boiler Feed Pump (ABFP) outlet pressure.	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011201	5,6,7,8	43230	43230 Boiler Feed Pump Concrete Pads	The primary function of these concrete pads are to support the Main Boiler Feed pumps and Auxiliary Boiler feed pump along with their associated motors.	Good	Mechanical and Thermal Degradation / Cracking Due to Cyclic Loading Mechanical and Thermal Degradation / Cracking Due to Vibration		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete initiated WO's for visual inspection of all Main and Auxiliary Boiler Feed Pump Concrete foundations. Carry out mitigating/remedial measures required for the component to reach Plant EOL (2020). <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> A routine condition monitoring of the boiler feed pump/motor concrete pads (above 254' level) including the sole plate, grout and anchor bolts needs to be performed

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								each time the pump/motor is removed for maintenance.
011238	5,6,7,8	43230	43230 Boiler Feed System-Cable - 4.16 kV, 600V, 125V, 250V - Power Cables	Cables feed power from source to load.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011538	5,6,7,8	43230 43230	43230 Main Boiler Feed Pump Motors-4kV	Main Boiler Feed Pump (MBFP) motors drive boiler feed pumps	Satisfactory	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Microbiological Influenced Corrosion Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete the refurbishment of all the MBFP motors. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

System 0404 Boiler Steam and Water Systems

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008159	1,4	36000 63615	ALARM, PRESSURE , Cat 1/2	Annunciations of Boiler Emergency Cooling abnormal conditions (Boiler secondary side pressure / 36710 MV2 fail open)	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008161	1,4	36000 63615	AMPLIFIER, SERVO FOR SPEEDER GEAR , Cat 1/2	63615-P1-AF1 controls turbine speed when Unit synchronized.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008162	1,4	36000 36110	BOOSTER, Cat 1/2	The volume boosters are used to increase the stroking speed of the valve.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008164	1,4	36000 63615	CONTROLLER , HAND, Cat 1/2	Manual control of steam reject valves (SRV)	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Implement new PM for inspection/overhaul to be scheduled every 104 weeks. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008165	1,4	36000 63615	CONTROLLER , SPEED, Cat 1/2	Control Turbine Speed when unit synchronized.	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008168	1,4	36000 36110	EXPANSION JOINT, Cat 1/2	The expansion joints accommodate for thermal expansion within the Boiler Steam and Water System.	Good	Fatigue / Thermal Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008170	1,4	36000 36110	FILTER, Cat 1/2	Provide clean instrument air to Steam Reject Valves (SRV) and control components.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008172	1,4	36000 36110	GAUGE, Cat 1/2	The component pressure gauge used for the Service Air to MVXX-AX1 (Transducer I/P Converter).	Good	Corrosion / General Corrosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Incremental recommendations for Plant EOL (2020): Perform a one-time replacement of the pressure gauges. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008174	1,4	36000 63615	INDICATOR, PRESSURE, Cat 1/2	Provide indication of steam pressure at Line 3611L6 west	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008179	1,4	36000 36110	POSITIONER, Cat 1/2	NC's (valve positioners) accurately position SRV travel based on controlled signal.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008180	1,4	36000 63611	POWER SUPPLY, Cat 1/2	Provide loop power for boiler steam flow measurement loop (1-63611-F1-FT1 and 1-63611-F1-FM1)	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008181	1,4	36000 63611	PROCESSOR, Cat 1/2	1-63611-F1-FM1 provide a square root steam flow signal for boiler level control.	Very Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008183	1,4	36000 36110	REGULATOR, Cat 1/2	The design intent of PRV1 is to provide a constant control pressure to Transducer I/P Converter AX1. The design intent of PRV2 is to provide a constant control pressure to signal booster B4. The design intent of PRV3 is to provide a control pressure to the pilot valve actuator, to keep the pilot valve closed.	Very Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008185	1,4	36000 36110	SWITCH, Cat 1/2	Limit switches, NS's, provide indication of SRV position.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008188	1,4	36000 36110	TRANSMITTER, Cat 1/2	AX's convert electrical signals from electronic controllers to pneumatic signals for SRV control instrumentation.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		<u>Incremental recommendations for Plant EOL (2020):</u> Replace AXs with high temperature model. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
008190	1,4	36000 63615	TRANSMITTER, PRESSURE, Cat 1/2	Measure and transmit channelized boiler steam pressure.	Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008191	1,4	36000 63611	TRANSMITTER, FLOW Cat 1/2	Flow transmitters measure and transmit steam flow rate for boiler control and indication	Good	Mechanical and Thermal Degradation / Electronic Aging		<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Proactively replace transmitters.
008193	1,4	36000 36110	VALVE, AIR RELEASE, Cat 1/2	The quick release valve provides capacity for the quick exhausting of actuators to reduce cycling times.	Very Good	Mechanical and Thermal Degradation - Deterioration of Material / 62		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue		
008194	1,4	36000 36110	VALVE, CONTROL, Cat 1/2	The valve is a three way switching valve used to assist in the proper operation of the Stream Reject Valve.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008197	1,4	36000 36110	VALVE, MOTORIZED/ MOTOR OPERATE, Cat 1/2	These motorized valves are used to control/stop flow between the main steam header and the steam inlets	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue	Inspection - Internal Inspection - Visual	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete outstanding WO 04849728 for 1-36110-MV5B, and WO 04845032 for 1-36110-MV6A <u>Incremental recommendations for Plant EOL (2020):</u> Complete a one-time actuator overhaul and diagnostic testing for all MVs in this CG. <u>Incremental recommendations for CO EOL (2024):</u> 1. Implement new PMs for 1/4-36110-MV1, MV2, MV3A, MV4A, MV5A, and MV6A for actuator inspection, diagnostics and functional test on a 4 year frequency. 2. Implement PMs for 1/4-36110-MV3B, MV4B, MV5B, and MV6B for actuator lubrication on a 3 year frequency.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008199	1,4	36000 36110	VALVE, CHECK/NONRETURN/BACKFL, Cat 1/2, MS-01	These are non-return valves in the main steam supply lines to the deaerator.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / General Corrosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Surveillance	Incremental recommendations for Plant EOL (2020): Perform one-time inspections of valves 1/4-36110-NV7/NV8 to assess valve condition. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008201	1,4	36000 36110	VALVE, CHECK/NONRETURN/BACKFL, Cat 1/2, MS-02	These components are non-return valves in the steam supply bypass lines to the deaerator.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008202	1,4	36000 36110	VALVE, PNEUMATIC/PNEUMATIC AC, Cat 1/2	These are pneumatically operated valves that provide isolation for main stream supply to screenhouse equipment and steam release to atmosphere.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Flow Assisted Corrosion (Erosion-Corrosion)	Calibration Inspection - Visual Overhaul/Refurbishment SRST - Functional Test SRST - Stroke Test Valve Diagnostics	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: 1. Complete WO 4850648 for 1-36110-MV38 overhaul and WO 4727738 for 1-36110-MV40 overhaul. 2. Complete WO 4823379 for 1-36110-MV36 packing replacement and WO 4727739 for 1-36110-MV41 packing adjustment. 3. Complete WO 04813836 (4-36110-MV38) and WO 04908520 (4-36110-MV40) for air leaks. 4. Complete WO 02704201 (4-36110-MV38) and WO 02704199 (4-36110-MV39) to replace rubber hoses. Incremental recommendations for Plant EOL (2020):

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008203	1,4	36000 36110	VALVE, PRESSURE REGULATING, Cat 1/2	PRVs provide regulated instrument air pressure to SRV and its control devices.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008204	1,4	36000 36140	VALVE, PRESSURE RELIEF, Cat 1/2	These RVs provide over pressure protection to the Boiler Steam and Water Systems	Very Good	Fatigue / Mechanical Fatigue Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008205	1,4	36000 36110	SOLENOID/SOLENOID OPERATED VAL, Cat 1/2	SV's provide a signal path for operation of SRVs during normal operation and testing.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008206	1,4	36000 36110	SOLENOID/SOLENOID OPERATED VAL, Cat 1/2	SV1 is used to ensure SRV pilot valve is locked open when main SRV valve plug lifts off its seat.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		
008207	1,4	36000 63615	RELAY, Cat 1/2	Detects turbine runback due to reactor trip and illuminates "Turbine Runback Interlock" lamp at SDSE MCR panel.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008208	4	36000 63610	Fuse	63615-FU1 provides protection for turbine speed control electronic circuits.	Satisfactory	Fatigue / Thermal Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008209	4	36000 63615	BREAKER, CIRCUIT	63615-EF1-CB1, when closed, applies power to speeder gear motor.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		<u>Incremental recommendations for Plant EOL (2020):</u> Add inspection of CB1 in PM for speeder gear. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
008210	1,4	36000 63615	SPEEDER GEAR SERVOMOTO R	Accurately adjust governor valve position to regulate turbine speed.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Component Replacement Inspection - Internal	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008213	4	36000 63615	CONTACTOR	Relay 4-63615-P1-CN1 is energised when operated via 63615-P1-HS4 to apply power to Speeder Gear Amplifier and Motor.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Visual Predictive Maintenance - Thermography	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008214	1,4	36000 63615	SWITCH, HAND FOR REACTOR	HS5 is used in Turbine Run-Up and Control Logic circuits.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

			SETBACK CANCEL					
008215	4	36000 63615	SWITCH, PRESSURE	P1-PS1 supplies DC power to turbine speed controller	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Develop new PM to check DC voltage output ripple and to replace power supply at periodic intervals. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008216	4	36000 63615	TRANSFORMER, ISOLATION	Transformer P1-T1 isolates field 120 Vac from amplifier circuits to reduce noise in the Amplifier.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Incremental recommendations for Plant EOL (2020): Add calibration of 4-63615-P1-PM1 to PM 89235. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011133	5,6,7,8	36000 36110	36110 Large Boiler Steam Reject Valves	The Large Steam Reject Valves (5/6/7/8-36110-MV37/MV38/MV39/MV40/MV41/MV43/MV44/MV45/MV46/MV47) are used to provide crash cooling of the Heat Transport System following a LOCA.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Corrosion / General Corrosion	Overhaul/Refurbishment SRST - Stroke Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011221	5,6,7,8	36000 63615	63615 Boiler Steam and Water Systems-CONTROLLER-HAND-CAT 1&2	5-63615-P1-WX5 provides DC power to HC5. HC5 is used to manually control operation of SRV's during testing or loss of auto control.	Good	Thermal Aging / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear	SRST - Functional Test SRST - Stroke Test	Incremental recommendations for Plant EOL (2020): Obtain a replacement for 5-63615-P1-HC1 and WX5 and perform calibration every 104 weeks. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Fatigue / Environmentally-Assisted Fatigue Mechanical and Thermal Degradation / Electronic Aging		
011222	5,6,7,8	36000	36110, 45220, 63611 Boiler Steam and Water Systems - Cables 4.16 kV, 600V, 125V, 250V, 120V	Cables transmit electrical power from power source to load.	Good	Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Radiation Embrittlement Fatigue / Mechanical Fatigue	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011223	5,6,7,8	36000 36110	36110 Boiler Stop and Bypass Valves (MOVs)	5/6/7/8-36110- MV3A, MV4A, MV5A & MV6A are the main Boiler Stop Valves are used to isolate the turbine from main steam when the turbine is not operating. 5/6/7/8-36110-MV3B/MV4B/MV5B/MV6B are bypass valves to balance the pressure between the main steam piping and the turbine steam chest when opening the main stop valves	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Lubricant Degradation	Inspection - Internal Inspection - Visual Lubrication	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011224	5,6,7,8	36000 36110	36110 Boiler Steam and Water Systems- Valves - NV- Non-Return - CAT1&2	The check valve is required to prevent reverse flow of instrument air to the instrument air station and not leak externally in the event of a loss of instrument air.	Satisfactory	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Flow Assisted Corrosion (Erosion-Corrosion)	Overhaul/Refurbishment Inspection - Visual Inspection - Internal SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		
011225	5,6,7,8	36000 36110	36110 Boiler Steam and Water Systems-Piping-Expansion Joints-CAT3&4	The expansion joints accommodate for thermal expansion of the boiler steam lines.	Good	Fatigue / Mechanical Fatigue Corrosion / Flow Assisted Corrosion (Erosion-Corrosion)		<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Perform a one-time inspection of one EJ to confirm the CG will reach CO EOL (2024).
011349	5,6,7,8	36000 36110	36110 Boiler Steam and Water Systems-Valves - NV-Non-Return - CAT1&2	The check valves protect against a back flow of water into the main steam headers under conditions where the deaerator becomes flooded.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> Inspect 7-36110-NV8 as part of a sampling strategy to determine required maintenance on 5/6/7/8-36110-NV7/NV8. Also, inspect 7-36110-NV63 to establish a baseline condition. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011350	5,6,7,8	36000 36110	Boiler Steam and Water Systems-Valves - MOV-Standard-CAT1&2	The motorized valves provide isolation of main stream supply to the condensate system deaerator.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Obsolescence / Immediate	Lubrication Inspection - Visual Inspection - Internal SRST - Stroke Test	<u>Incremental recommendations for Plant EOL (2020):</u> 1. Inspect one Group 1 valve (MV1/MV2) to determine if future maintenance is needed and overhaul actuators. 2. Replace Group 2 valves 5-36110-MV60, 6-36110-MV60 and 7-36110-MV62 with new Cat ID 609880. 3. Procure spares for Group 1 valves and four valves along with Rotork actuator for Group 2 valves. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

System 0406 Calandria Vault, Vault Structure Cooling Shield Tank

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011249	5,6,7,8	31200	Calandria Vault, Vault Structure Cooling, Shield Tank - Structural Concrete - Concrete Walls and Slabs	The main purpose of the vault structure is to provide shielding against the radiation from an operating unit and to provide structural support to Calandria in its operating and non-operating modes. The Calandria Vault and its demineralized light water provides operational and shutdown shielding for the immediate surrounding areas. The water also provides cooling for the Calandria assembly and the vault concrete.	Good	Corrosion / Corrosion of Embedded Steel Radiation Induced Degradation / Radiation Embrittlement Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Leaching Calcium Hydroxide	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> Conduct one-time visual inspection of accessible areas of Calandria Vault structural concrete for Unit(s) 5-8 to inspect for potential damage and perform any required mitigating/remedial actions. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011250	5,6,7,8	31200	21300 Calandria Vault/Vault Structure Cooling/Shield Tank-Liners - Steel Liners	Steel liner is a crucial part of the calandria shielding system and provides a leak-tight seal for containment of the vault demineralised light water.	Good	Corrosion / General Corrosion	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> Conduct one-time inspection for Unit 8, and for Units 5 to 7 only if evidence of component failure or degradation is discovered. For Unit 8 the condition of epoxy patch as a temporary solution to repair a weld defect is unknown and it is recommended to initiate a permanent repair (i.e. welding). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011251	5,6,7,8	31200	21300 Calandria Vault/Vault	With the exception of the large diameter opening in each end shield wall and the	Good	Corrosion / General Corrosion	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
			Structure Cooling/Shield Tank-Penetrations - Steel Sleeves Surrounding Concrete Vault Openings	rectangular opening in the roof slab, the only other openings and penetrations in the vault wall are to provide for moderator and other systems piping. These penetrations and their associated embedded parts for piping and other systems are designed to contain the shield water within the confines of the Calandria Vault.		Radiation Induced Degradation / Radiation Embrittlement		Perform one-time visual inspection of accessible areas and local leakage testing to confirm components' suitability. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011252	5,6,7,8	31200	21300 Calandria Vault/Vault Structure Cooling/Shield Tank - Embedded Parts and Supports	Reactivity Mechanism Deck Supports and Connections: The Reactivity Mechanism Deck is part of the reactor vault assembly. It closes the top of the Calandria Vault, thus providing a boundary between the vault and the boiler room atmospheres. The deck is supported by the Calandria Vault and it seals the vault atmosphere by seal plates welded to both the lower plate and the vault liner. End Shield Manhole: A manhole is located at the top of each End Shield, passing through both the support shell and the End Shield shell. It was used to provide access during fabrication and ball filing and was permanently sealed by welded cover plates.	Good	Corrosion / Corrosion of Embedded Steel Radiation Induced Degradation / Radiation Embrittlement	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> Conduct one-time visual inspection of accessible areas to confirm the suitability of the components. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011253	5,6,7,8	31200	21300 Calandria Vault/Vault Structure Cooling/Shield Tank - Seals & Sealants	Atmospheric SS Seals & Rubber Seals: The Atmospheric seals together with the silicone rubber seals at elevation 317'-6" (extending to elevation 324'-0"), separate the east and west F/M room atmospheres. The Elastomer Silicone rubber seals at elevation 274'-0" prevent liquid spills into the 25mm (1inch) and 76mm (3inch) gaps around the Calandria Vault. Integrity of the barrier/seal has a direct effect on environment inside the Calandria Vault. Inconel 600 Manhole Seal: The Inconel 600 Manhole expansion joint seal is necessary to allow free movement of the seal plate due to a temperature differential. Shear Key Joints: The Horizontal keys (elev. 312'-0") and vertical keys (elev. 312'-0") in north and south cross-walls are provided to resist forces due to earthquake and unbalanced header failure pressure on the east or west face of the vault.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> 1. Complete one-time inspection of seals. 2. Replace the elastomeric seals if required. 3. Replace seals if they show advanced degradation. <u>Incremental recommendations for CO EOL (2024):</u> 1. Replace the elastomeric seals if required. 2. Replace seals if they show advanced degradation.

System 0408 Class 1 & 2 Electrical and Battery Room HVAC

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008260	4	73230 73230	AIR CONDITIONIN G UNIT, Cat 1/2	ACUs maintain the temperature in the Class I Electrical Equipment Rooms including Battery & Rectifier / Inverter Room.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Fatigue / Mechanical Fatigue		No additional practices are recommended to reach CO EOL (2024).
008265	4	73230 73230	DAMPER, Cat 1/2	These components are electric actuated dampers used for control and isolation of ACU flow of outside air and fan discharge.	Satisfactory	Fatigue / Mechanical Fatigue Corrosion / General Corrosion	Inspection - Visual Functional Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete MDP actuator replacements via master NICR 104778. <u>Incremental recommendations for Plant EOL (2020):</u> Revise PMs 92533, 98078, 98079 and 98080 to add tasks for lubrication and inspection every 1 year on 4-73230-MDP2030/2031/2032/2033 (4 components). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
008270	4	73230 73230	FAN, Cat 1/2	This CG consist of supply fans for ACUs, 4-73230-ACU2008/2009/2010/2011	Good	Corrosion / General Corrosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008279	4	73230 67323	SWITCH, Cat 1/2	Generates a contact input signal when the monitored	Satisfactory	Corrosion / General Corrosion	Calibration	<u>Incremental recommendations for Plant EOL (2020):</u>

TETRA TECH

						Obsolescence Concern		

System 0410 - Common Water Supply

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
08313	012, 034	71100 67111	GAUGE, Cat 1/2	These gauges are used throughout the Common Water Supply System to provide differential pressure, pressure and flow instrumentation (e.g. differential pressure across the travelling screens; discharge pressure and flow indication for pump operation etc.)	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete work order WO 04723427 to replace 034-67112-PG2006 as well as WO 01719247 to replace 034-67111-PG2009. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Initiate a new PM for periodic calibration or replacement of the gauges.
008317	012, 034	71100	MOTOR, Cat 1/2	Motors are used to drive associated pumps	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008322	012, 034	71100 71110 71120	PUMP, Cat 3/4	The pumps serve in two different applications, they are used to pump water to clean / wash the screen and the other application is to act as a sump-pump in the trash bin.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						/ Wear Mechanisms - Wear Fatigue / Mechanical Fatigue Corrosion / General Corrosion		
008323	034	71100	RELAY, Cat 1/2	This relay is part of the control logic for the automatic operation of the bar screen rake (034-71110-SCM7).	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete EC127600 to replace Screen Motor relays. Incremental recommendations for CO EOL (2024): Schedule inspection of the Screen Motor relays 2 years from completion of EC, if needed repair/replace.
008325	012, 034	71100	SCREEN, Cat 1/2	The screens filter out particulate in the Screenhouse. The traveling screens remove debris from intake water. The trash sump bar screens filter water from the trash sump.	Satisfactory	Corrosion / General Corrosion Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Fouling (accumulation of deposits)		Incremental recommendations for Plant EOL (2020): Complete one-time cleaning of screens to remove debris and zebra mussels. Incremental recommendations for CO EOL (2024): 1. Complete one-time inspection and overhaul of the screens. 2. Complete one-time inspection of Screenhouse concrete structures and equipment supports. 3. Re-initiate PMs for zebra mussel cleaning every 104 weeks.
008326	012, 034	71100 71110 71120	SCREEN, Cat 3/4	Bar screens remove debris from intake water.	Satisfactory	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / General Corrosion Corrosion / Fouling (accumulation of deposits)	Lubrication Clean and Inspect	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Repair failed Bar Screens 012-71110-SC11 and 034-71110-SC12 (WO 3249081). Incremental recommendations for Plant EOL (2020):

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008327	012, 034	71100 71110	STRAINER, Cat 3/4	These strainers are used to strain screen backwash water.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Fouling (accumulation of deposits)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008328	012, 034	71100 67111	SWITCH, Cat 1/2	These pressure switches sense differential pressure across strainers/ bar screens to operate strainer/ bar screen logic and alarm abnormal conditions.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008335	012, 034	71100	VALVE, MANUAL/HAND OPERATED, Cat 1/2	These manually operated valves function in isolation applications of the common water system.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion		Incremental recommendations for Plant EOL (2020): Obtain adequate spare replacements to reach Plant EOL (2020). Incremental recommendations for Plant EOL (2024): Obtain adequate spare replacements to reach CO EOL (2024).

TETRA TECH

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008339	012	71100	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2	This is a pneumatic valve used for draining a strainer (012-71110-STR1).	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Initiate a new PM for AM practices to ensure condition for CO EOL (2024).
008341	012	71100	SOLENOID/SOLENOID OPERATED VAL, Cat 1/2	SV operates strainer 012-71110-STR1 backwash drain valve on high strainer differential pressure.	Good	Mechanical and Thermal Degradation (Deterioration of material - wiring, seals, gaskets, O-rings etc.) / 101		Continue current practice. No additional practices are recommended to reach CO EOL (2024)
011247	056, 078	71100 71110 71120	71100, 71120 Common Water Supply - Screens and Conveyors	The function of the bar screens in the sediment suction system is to protect the pumps from debris. The bar screens remove trash from the intake water. The trash conveyors are installed indoors at the back of the bar screens for the continuous removal of the trash mostly in the form of weeds, fish and debris which are brought up by the cleaning rake. The conveyors discharge the trash into the trash bins. The travelling screens remove trash following the bar screens. The trash removal screens remove trash from water from the travelling screens.	Satisfactory	Corrosion / Fouling (accumulation of deposits) Fatigue / Environmentally-Assisted Fatigue Corrosion / General Corrosion Corrosion / Microbiological Influenced Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Lubrication Clean and Inspect	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Overhaul the trash conveyors, 056, 078-71120 TC1 (WO 2809130 and WO 2795171). Incremental recommendations for Plant EOL (2020): 1. Complete a one-time cleaning of the screens to remove debris and zebra mussels. 2. Resolve spare parts issues. Incremental recommendations for CO EOL (2024): 1. Complete one-time inspection of screenhouse concrete structures and equipment supports. 2. Initiate a new PM for zebra mussel cleaning for the bar screens.
011299	056, 078	71100 53300 54130	54130, 53300 Common Water Supply-Motor	MCCs supply 600Vac power and provide protection and switching for motor operated loads and	Satisfactory	Mechanical and Thermal Degradation / Self-Loosening	Component Replacement Inspection - Visual	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
			Control Centre (MCC) 600V	components in the Screenhouse.		General Corrosion / General Corrosion Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Internal Predictive Maintenance - Electrical Testing Predictive Maintenance - Thermography	Complete structural inspection/maintenance activities on remaining CC2 MCCs (056-54130-MCC541, 078-54130-MCC741). Also, accelerate the implementation of all MCC cells replacement as per NK30-ESI-50000-00006. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011300	058,056,078	71100	67127, 71110, 71120, 71270 Common Water Supply - Cables - 4.16 kV, 600V, 125V, 250V	The cables are used to supply power (e.g. 5 kV, 600 V) and for control purposes (e.g. 600V, 300V)	Good	Fatigue / Thermal Fatigue Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Radiation Embrittlement	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011301	056, 078	71100 71110	71110 Bar Screen, Travelling Screen, Screenwash and Backwash Strainer Motors	The motors are used to operate various equipment such as pumps, strainers, and bar screens.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Thermal Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011302	056, 078	71100 67111 71110	67111, 71110 Common Water Supply-Valves - AOV-Standard-CAT1&2	Screen wash valves are used to supply screen wash water to their respective travelling screens to remove debris. The SV's provide instrument air to their respective MV's. (Example: 056-67111-SV310 for 71110-MV16)	Satisfactory	General Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Review PM frequency to determine if valve replacement should be more frequent, after completion of 078-71110-MV16 investigation under WO 04735450.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						/ Wear Mechanisms - Wear		
011303	056, 078	71100 71110	71100 Common Water Backwash Strainers	The strainers provide filtered water to clean debris from the travelling screens.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Microbiological Influenced Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms – Erosion		Incremental recommendations for Plant EOL (2020): Update the Bill of Materials to include a Cat ID for the strainer motor and spare parts. Incremental recommendations for CO EOL (2024): Purchase one additional strainer.
011304	058, 078	71100	Common Water Supply-Mechanical	The carbon steel piping provides a flow path for wash water from the three screen wash pumps to the six travelling screens to remove debris from the screens in order to maintain adequate circulating water flow through the screens.	Good	General Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Corrosion / Microbiological Influenced Corrosion Fatigue / Mechanical Fatigue	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011531	056, 078	71100 71120	71120 Screenhouse Trash Removal Pump Motors, Bar Screen & Conveyor Motors	These motors operate Trash Removal pumps, Bar Screens and conveyors in the Screenhouse.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current Practices. No additional practices are recommended to reach CO EOL (2024).

TETRA TECH

Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Visual SRST - Functional Test	<u>Incremental recommendations for Plant EOL (2020):</u> Ensure that adequate spares are available to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				058-71330-V20 is an isolation valve on the ESW supply common for Units 5 - 8. 058-71330-V21, V22, V23, V32, V33, V34, V35 are isolation valves in the emergency water supply/return header.		Corrosion / General Corrosion		Ensure that adequate spares are available to reach CO EOL (2024).
011341	058	34200 71330	71330 Emergency Storage Water Piping - Containment Expansion Joints	These expansion joints allow for movement due to vibration and thermal expansion / contraction in the Emergency Storage Water piping supply and return lines.	Good	Corrosion / Stress Corrosion Cracking - Austenitic Stainless Steels Fatigue / Mechanical Fatigue Corrosion / Pitting Corrosion Fatigue / Environmentally-Assisted Fatigue Corrosion / General Corrosion		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete a baseline inspection, and depending on inspected condition implement a PM to complete recurring inspections at an appropriate frequency to determine internal and external condition.
011356	018	34200 34230	34200 - Containment - Manual Valves - FADS	These manually operated valves serve various isolation purposes. V3000 is a normally closed purge valve/ test valve. Other valves allow measurement of system pressure, isolation of pressure instruments and draining of collected system condensation. The valve V24 (Position Assured and Normally Closed) is provided for pressurization of the interspace between MV101 and MV102, so that a pressure test for leak tightness of these valves can be carried out periodically.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Visual SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Ensure that adequate spares are available to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Ensure that adequate spares are available to reach CO EOL (2024).

System 0417 - Deaerator & Storage Tank

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008601	1,4	43122 43210	EXPANSION JOINT, Cat 1/2	The expansion joints 1, 4-43210-EJ4 are installed on inlet pipe, upstream of auxiliary condensate extraction pumps. The function of expansion joint is to absorb movement, relieve system strain due to thermal change, load stress and compensate for misalignment.	Satisfactory	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Corrosion / Flow induced wear of the leading edge Corrosion / General Corrosion	Inspection - Visual	<u>Incremental recommendations for Plant EOL (2020):</u> 1. Perform a one-time proactive external inspection of 1/4-43210EJ4 & 4-43210-EJ3001. 2. Resolve MEL/BOM issues. 4-43210-EJ3001 & 4-43210- EJ4 are linked to incorrect CIDs, identify if CID 606527 (1-43210-EJ4) is appropriate. <u>Incremental recommendations for CO EOL (2024):</u> Conduct an assessment for additional AM practices for CC1/SPV EJ4 and EJ3001 based on expected life after one-time inspection.
008602	1,4	43122 43210	EXPANSION JOINT, Cat 3/4	The function of expansion joint is to absorb movement, relieve system strain due to thermal change, load stress and compensate for misalignment in the condensate pump suction piping.	Satisfactory	Fatigue / Mechanical Fatigue Corrosion / General Corrosion Corrosion / Stress Corrosion Cracking - Carbon and low alloy steels		<u>Incremental recommendations for Plant EOL (2020):</u> Perform a one-time proactive replacement. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
008603	1,4	43122 43122	HEAT TRACING, Cat 1/2	HX4 is the condensate deaerator which receives condensate from the low pressure heaters, vents non-condensable gases and provides condensate to the deaerator storage tank.	Good	Corrosion / General Corrosion Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Stress Corrosion Cracking - Carbon and low alloy steels Mechanical and Thermal Degradation / Thermal Aging Fatigue / Thermal Fatigue	Inspection - Internal Predictive Maintenance - Thermography	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		
008608	1,4	43122 43210	MOTOR, Cat 1/2	The Auxiliary Condensate Extraction Pump discharges directly to the Deaerator via a CV255. The purpose of this pump is to provide a supply of condensate to the Deaerator during Reactor cooldown periods.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Lubrication Predictive Maintenance - Electrical Testing Predictive Maintenance - Thermography Predictive Maintenance - Vibration Monitoring SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008609	1,4	43122 43210	MOTOR, Cat 3/4	Three 50% capacity Main Condensate Extraction Pumps (43210-PI, P2, P3) take condensate from three Condenser shell hotwells and discharge it to the Deaerator. The pump's discharge is also used as a supply of condensate to the BFP glands and LP cylinder exhaust cooling system.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Implement and maintain a bearing lubrication and inspection program. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008611	1,4	43122 43210	POSITIONER, Cat 1/2	The water level in the Deaerator Storage Tank is controlled by level controllers which modulate the three flow CVs, CV252, CV253 and CV254, to maintain the water level within an operating band. The auxiliary systems use the wide range Deaerator storage tank level measurement (64321-	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				LT252) and modulates CV255.				
008613	1,4	43122 43210	PUMP, Cat 1/2	Auxiliary condensate extraction pumps transfer demineralized water from the condensers to the deaerator during abnormal conditions.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Visual Predictive Maintenance - Vibration Monitoring Predictive Maintenance - Thermography SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008614	1,4	43122 43210	PUMP, Cat 3/4	The transfer of demineralized water from the condensers to the deaerator via the drain coolers is achieved by the use of three main condensate extraction pumps (CEPs) 1-43210-P1, 4-43210-P1, 1-43210-P2, 4-43210-P2, 1-43210-P3, 4-43210-P3 (two duty, one standby) during normal operation.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Re-activate PM activities for pumps.
008615	1,4	43122 43210	REGULATOR, Cat 1/2	PRV1 is a pressure regulator for instrument air supply to CV255 for auxiliary condensate pump discharge to the deaerator.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008616	4	43122 43210	RELAY, Cat 1/2	The 43210-PM4-83-R1 relays ensure an alternate 48VDC power supply is available to the control logic	Good	Corrosion / General Corrosion Corrosion / Oxidation		Incremental recommendations for Plant EOL (2020): Schedule periodic testing of 1-43210-PM4-83-R1.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				circuit for the Auxiliary Extraction Pumps for the Condensate System.		Mechanical and Thermal Degradation / Electronic Aging		Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008618	1,4	43122 43210	STRAINER, Cat 1/2	These strainers pre-filter fluid before it enters the auxiliary pumps in the condensate system. They prevent debris from entering the pumps which could lead to possible damage to the pumps and downstream items.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Fouling (accumulation of deposits)		Continue current practices. No additional practices are recommended to reach EOL (2024).
008621	1,4	43122 43122	TANK, Cat 1/2	The deaerator storage tank serves as the head tank, ensuring sufficient NPSH for the Boiler Feed Pumps. The storage tank also acts as a reservoir to provide storage volumes to accommodate transient conditions.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Mechanical Fatigue	Inspection - Internal Inspection - Visual	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008623	1,4	43122 43210	VALVE, CONTROL, Cat 1/2	Flow control valves CV254, CV255 and CV260 regulate the flow to the deaerator storage tank.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion	Overhaul/Refurbishment SRST - Functional Test Valve Diagnostics	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008624	1,4	43122 43210	VALVE, CONTROL, Cat 3/4	The water level in the deaerator storage tank is controlled by level controllers which modulate the three flow CVs, CV252,	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

TETRA TECH

				CV253 and CV254, to maintain the water level within an operating band. For normal full load operation any two CVs can be selected from the control room. In the event of a malfunction of one valve, the third (standby) valve will take over automatically.		/ Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		
008626	1,4	43122 43210	VALVE, MANUAL/HAND OPERATED, Cat 1/2	Manual/ Hand operated valves 1-43210-V12, 4-43210-V12, 1-43210-V301, 4-43210-V301, 1-43210-V32, 4-43210-V32, 1-43210-V4, 4-43210-V4, 1-43210-V69, 4-43210-V69 are used for isolation of piping components for maintenance purposes.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Obsolescence / Immediate Obsolescence Concern	Surveillance	Incremental recommendations for Plant EOL (2020): 1. Resolve outstanding MEL/BOM (Cat ID should be in approved status) issues on valves 1, 4-43210-V12, 1, 4-43210-V301 & 1, 4-43210-V69. 2. Complete a one-time elastomer replacement and stem lubrication of all valves in this CG. Incremental recommendations for CO EOL (2024): Review the need to initiate a PM for periodic stem lubrication for all valves in this CG, based on condition after one-time Plant EOL (2020) work.
008628	1,4	43122 43210	VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2	The MV's in this CG are the condensate isolating motorized valves. When closed they isolate their respective LP Heater Banks in the condensate system.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation	Lubrication Inspection - Internal SRST - Stroke Test	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete WO 04793232 which requires actuator removal, a valve repack and stem/ drive nut replacement for 1-43210-MV17. Incremental recommendations for Plant EOL (2020):

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						/ Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		Complete a one-time overhaul & diagnostics of all MV actuators as per instructions in INACTIVE PMs (e.g. 6969). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
008629	1,4	43122 43210	VALVE, CHECK/NONRETURN/BACKFL	Non-return valves 1-43210-NV18, 4-43210-NV18, 1-43210-NV19, 4-43210-NV19 prevent feedwater flow reversal to drain coolers and 1-43210-NV8, 4-43210-NV8 prevent reverse flow to auxiliary condensate pump.	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Fatigue / Mechanical Fatigue Corrosion / General Corrosion	Inspection - Internal SRST - Functional Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete WO 3005442 & 3005443 to inspect and overhaul U1 NV18 & NV19. Based on inspection results, overhaul U4 NVs. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Initiate a PM for in-service testing of 1/4-43210-NV18 & 1/4-43210-NV19 at frequency of 4 years.
008631	1,4	43122 43210	VALVE, PRESSURE REGULATING, Cat 1/2	The PRV's in this CG regulate instrument air pressure to their respective parent valve assemblies (1/4 43210-CV260).	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011211	5,6,7,8	43122 43120	43120 Deaerator & Storage Tank	The Deaerator consists of a heat exchanger 43120-HX4 and a storage tank 43120-	Good	Fatigue / Mechanical Fatigue	Inspection - Internal	<u>Current initiatives that need to be completed for Plant EOL (2020) that are</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				TK1. The DA liberates most of the non-condensable gases from the condensate. The deaerator storage tank serves as the head tank, ensuring sufficient NPSH for the Boiler Feed Pumps and the storage tank also acts as a reservoir to provide storage volumes to accommodate transient conditions.		General Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Corrosion / Flow Assisted Corrosion (Erosion-Corrosion)	Inspection - Non - Intrusive	incremental to current periodic maintenance practices: Complete modifications to the Units 5-8 Deaerator Storage Tanks (DST) supports to increase the seismic capacity beyond the Pickering B Review Level Earthquake (RLE) for applicable deaerators per Master EC124589. Incremental recommendations for Plant EOL (2020): Evaluate the cost/benefits of completing weld inspections (of the two welds on each side of the HX4 of the water box plate to the 43120-HX4 shell) on U2 or U3 and implement additional AM practices on U5-8 if necessary based on inspection results. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0418 – Digital Control Computers[11]

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008634	1,4	66400	CIRCUIT BREAKER, Cat 1/2	Circuit breaker panels (PL175/176) supplying power for DCC system.	Good	Thermal aging, mechanical wear, and corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation.	Predictive Maintenance - Thermography	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008638	1,4	66400	DCC MONITOR, Cat 3/4	Provides ANO visual interface to DCC system.	Satisfactory	Thermal aging, mechanical wear, and corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation and particularly obsolescence issues due to the fast changing nature of computer technology	Inspection - Visual	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete obsolete monitors replacements. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental Work Required for CO EOL 2024</u> Replace Monitors.
008639	1,4	66400	DIGITAL CONTROL COMPUTER, Cat 1/2	The DCCs provide, via software, many functions for the safe operation of the plant. The main functions of the DCC are: - Reactor Regulating system (RRS) - Boiler Pressure Controller (BPC) Other control functions are: - Zone Thermal Power (ZTP) - Fuel Handling Most functions are duplicated on both channel	Satisfactory	Thermal aging, mechanical wear, and corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation and particularly obsolescence issues due to the fast changing nature of computer technology.	Inspection - Visual Overhaul/Refurbishment Predictive Maintenance - Thermography	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete maintenance console PC power supplies and hard drives replacement. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental Work Required for CO EOL 2024</u> • Replace Maintenance Console. • Replace FH Typer. • DCC Cable Replacement

[11] OPG has assessed the Digital Controls Computers under P-CORR-66400-0632085 [37], this table has been extracted from P-CORR-66400-0632085 [37].

008667	1,4	66400	TRANSFORMER, Cat 1/2	The isolating transformers (T1, T2) supply power to the DCC system.	Good	Thermal aging, mechanical wear, and corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation.	Calibrations Predictive Maintenance - Thermography	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011228	5,6,7,8	66400	66400 Digital Control Computers (DCCs)-COMPUTER-UNIT DCC CONTROL COMPUTER-CAT 1&2	The DCCs provide, via the software, many functions for the safe operation of the plant. The main functions of the DCC are: - Reactor Regulating System (RRS) - Boiler Pressure Controller (BPC) Other control functions are: - Zone Thermal Power (ZTP) - Moderator Temperature Control (MTC) - Fuel Handling (DCCY only)	Satisfactory	Thermal aging, mechanical wear, corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation.	Inspection - Visual Overhaul/Refurbishment Predictive Maintenance - Electrical Testing	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete: • Differential Amplifier replacement. • Replace wire-wrapped IOBIC with CID 643793. • Qualification testing of spare CPUs from Wolsong. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental Work Required for CO EOL 2024 Complete DCC cable replacement.
011229	5,6,7,8	66400	66400 Digital Control Computers (DCCs)-COMPUTER-PERIPHERALS-CAT 1&2	The peripherals in combination with the Varian V72 computers (CG011228) provide all essential computer operations crucial to the control of the reactor. This also includes the operator interfaces (e.g. keyboards, displays).	Satisfactory	Thermal aging, mechanical wear, corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation	Inspection - Visual Overhaul/Refurbishment Predictive Maintenance - Electrical Testing	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete: • Replace Megaram with BMSU and BTC. • PIPC computers replacement. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental Work Required for CO EOL 2024 Complete: • Unit Printer replacement.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								• PTE replacement. • Fuel Handling PC replacement.
011230	5,6,7,8	66400	66400 Digital Control Computers (DCCs)-COMPUTER-PERIPHERALS -CAT 3&4	Cat 3 & 4 Peripherals provide mainly the interfaces between field inputs/outputs and the Varian V72 computers (CG011228) and other devices essential to the computer operations.	Good	Thermal aging, mechanical wear, corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation.	Inspection - Visual Overhaul/Refurbishment	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011231	5,6,7,8	66400	66400 Digital Control Computers (DCCs)-POWER SUPPLY - CAT 1&2	The power supplies Cat 1 & 2 in CG 011228 are mainly the power supplies for the Varian V72 computers and for the I/O expansion chassis # 1 and #2. These power supplies are integral parts of the Varian V72 computers.	Good	Thermal aging, mechanical wear, corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation	Inspection - Visual Overhaul/Refurbishment Predictive Maintenance - Electrical Testing	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental Work Required for CO EOL 2024 Refurbish or replace CPU and I/O Expansion chassis power supplies.
011232	5,6,7,8	66400	66400 Digital Control Computers (DCCs)-POWER SUPPLY - CAT 3&4	Cat 3 & 4 power supplies in CG 011228, as listed in Passport, are mainly power supplies for the process I/Os chassis. There are also 500+ power supplies in the 9 DCCs that are not registered in Passport.	Good	Thermal aging, mechanical wear, corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation	Inspection - Visual Overhaul/Refurbishment Predictive Maintenance - Electrical Testing	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental Work Required for CO EOL 2024 Replace CAE/Lambda power supplies.
011233	5,6,7,8	66400	66400 Digital Control Computers (DCCs)-Scanners - CAT 1&2	Contact scanners are used in the DCC to scan relay contacts, limit switches, or other similar types of contacts, and to provide contact alarm annunciation and sequence of events.	Satisfactory	Thermal aging, mechanical wear, corrosion in electronics/connectors, thermo-mechanical fatigues of solder joints, electric contact degradation	Inspection - Visual Overhaul/Refurbishment	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental Work Required for CO EOL 2024 Complete: • Replace or refurbish scanner power supplies, • Replace Unit scanner CS1 and CS2 wire-wrapped cards on Unit 8 only.

System 0420 - Electrical Systems

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008686	1,2,4	54400 55100	BATTERY, Cat 1/2	As part of the Class I power supply system, the batteries provide the most reliable source of electrical power for a variety of essential loads and safety related systems at the station.	Good	Fatigue / Mechanical Fatigue Corrosion / General Corrosion Mechanical and Thermal Degradation / Thermal Aging	Inspection - Visual Predictive Maintenance - Electrical Testing	Incremental recommendations for Plant EOL (2020): 1. Replace CH 'J' cells of 1/ 4-54400-BY2. 2. U1/U4 Class I battery banks 1/ 4-55100-BY1/BY2 to be replaced. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008689	1,2,3,4,012,034,014,0	51100 51150 51300 53200 53300 54120 54130 54230 54400 55100 55200	BUS, Cat 1/2	To transfer electrical power throughout the station to the various loads.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Corrosion / General Corrosion	Inspection - Visual Predictive Maintenance - Thermography SRST - Logic Test SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008692	1	54230	CAPACITOR, Cat 1/2	a) enable quick energy transfer into IGBT circuit b) smooth out DC-bus voltage variation c) prevent ripple from interfering back to DC power source	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008694	1,2,3,4,012,034,014,0	51200 53200 53300 53400 53500 54120 54130 54150 54230 54400 54500 55100 55200 65440	CIRCUIT BREAKER, Cat 1/2	Circuit breakers are for power transmission and for isolating/clearing faults.	Good	Corrosion / Pitting Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Thermal Aging	Inspection - Internal Inspection - Visual Overhaul/Refurbishment Predictive Maintenance - Thermography SRST - Functional Test SRST - Logic Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Perform a one-time overhaul of all the circuit breakers with no active PM.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008696	1,2,4	54400 55100	CHARGER, Cat 1/2	Rectifier charges Class II TPS battery bank.	Very Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008698	1,2,3,4 ,014	51200 53200 53300 54120 54130 54140 54230 54400 55100	CONTACTOR, Cat 1/2	An electrically controlled switch used in power circuits for motors, transfer schemes etc.	Good	Corrosion / Pitting Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Thermal Aging	Inspection - Visual Predictive Maintenance - Thermography SRST - Functional Test SRST - Logic Test	<u>Incremental recommendations for Plant EOL (2020):</u> Proactive replacement of U1-4 CL II contactors to be completed. <u>Incremental recommendations for CO EOL (2024):</u> Class IV MCC contactors to be maintained along with the recommendation for one-time maintenance for CL III/ IV MCCs to reach CO EOL (2024).
008719	1,3,4	51200 52100 52200	HEAT TRACING, Cat 1/2	Heat exchanger provides cooling for transformer insulating oil, via LPSW.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Clean and Inspect	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Ensure WOs 3014186, 2332936 are completed for replacement of 1-51200-HX1/2. 2. Complete the proactive replacement of the SST Heat Exchangers (1-52100-HX1, 4-52100-HX1, 1-52100-HX2 and 4-52100-HX2) and the GST Heat Exchangers (1-52200-HX2, 4-52200-HX2, 1-52200-HX1 and 4-52200-HX2 (example WOs are 04939705, 04939724). <u>Incremental recommendations for Plant EOL (2020):</u> Procure spare heat exchangers. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008727	1,4	54230 54400	INVERTER, Cat 1/2	Supply total unit Class II control power.	Very Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging		<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> 1. Re-active the PMs to check and calibrate TPS inverter/battery for 1/4-54400-IN1 every two years. 2. Re-active the 1-65440-PDM-ROUTE “C116” Infrared Thermography for 1-54400-IN2 every year consistent with IQ Review Maintenance Strategy Template. 3. Re-active the 4-65440-PDM-ROUTE “C416” Infrared Thermography for 4-54400-IN2 every year consistent with IQ Review Maintenance Strategy Template.
008731	1,2,3,4 ,014,5, 018,0	53300 54130 54230	MOTOR CONTROL CENTRE, Cat 1/2	These MCCs supply critical loads for safe unit operation.	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Thermal Fatigue Corrosion / Pitting Corrosion	Inspection - Internal Predictive Maintenance - Thermography	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Perform one-time maintenance for CL III/ IV MCCs to reach CO EOL (2024).
008736	4	51200	MONITOR, Cat 1/2	To detect incipient faults in the MOT by monitoring dissolved combustible gases in the oil and send out warning.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008738	1,4	67097	MONITOR, Cat 1/2, MONITORING UNITS	Monitoring unit, part of liquid effluent sampling system	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008741	1,4	51200	TRANSFORM R PUMP MOTOR , Cat 1/2	To circulate the oil through the coolers that cools the MOT.	Good	Fatigue / Thermal Fatigue		<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Fatigue / Mechanical Fatigue Corrosion / General Corrosion		Incremental recommendations for CO EOL (2024): Procure MOT pump motor spares.
008742	1,2,3,4 ,0	53300 54130 54140 54230	MOTOR STARTER, Cat 1/2	Device used to start/stop a motor. Starter includes circuit breaker/contactor, control circuit & protective relays.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Inspection - Internal Predictive Maintenance - Thermography	Incremental recommendations for CO EOL (2024): 1. Perform one-time inspection of Class II CC1 motor starter cells. 2. Class III/IV MCC motor starters to be maintained along with the recommendation for one-time maintenance for CL III/ IV MCCs to reach CO EOL (2024).
008746	1,2,3,4	54130 54230 55200 65450	POWER SUPPLY, Cat 1/2	To provide regulated DC output voltage to meet system requirements.	Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Component Replacement	Incremental recommendations for Plant EOL (2020): No additional recommendations required to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Perform proactive replacement of the 48VDC power supply (PS) modules for transfer contactors 1/4 -54130-CN101/CN102-B2-PS1, and 4-55200-RF50B.
008748	1,4	51200	PUMP, Cat 1/2	Circulates transformer insulating oil to heat exchanger for cooling.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Procure spare MOT pumps. (Note: MOT pump and motor are built as one unit). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008751	1,2,3,4	55100 55200	RECTIFIER, Cat 1/2	55100-RF1 supply units 250 V DC Class I power from the 600 volt, 60 Hz, Class III System. The 55200-RFs, 600 V AC / 48 V DC power rectifiers, supply the units 48 V DC Class II control power	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging	Calibration Component Diagnostics Component Replacement Inspection - Internal	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete WOs to replace capacitors and address other deficiencies. Incremental recommendations for CO EOL (2024): Resolve obsolescence issues with 55200-RF20A/B/C/D/E/F/G/H/T.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008753	1,2,3,4	54400	REGULATOR, Cat 1/2	To provide regulated power supply, 208/120VAC +/- 1%, to Class II regulated bus.	Poor	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Thermal Aging	Clean and Inspect	Incremental recommendations for Plant EOL (2020): Replacement of regulators to be completed. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008754	1,2,3,4 ,012,0 34,014 ,0	51200 52100 52200 53200 53300 54120 54130 54140 54230 54400 54500 55100 65010 65400 65414	RELAY (PROTECTIVE), Cat 1/2	A protective relay is a device designed to trip a circuit breaker when a fault is detected.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging Corrosion / General Corrosion	Calibration Overhaul/Refurbishment SRST - Functional Test SRST - Logic Test	Incremental recommendations for Plant EOL (2020): 1. Proactive replacement of ETS relays to be completed. 2. Calibrate U2/U3 spares so they are available if needed Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008757	1	51200 52100 52200	RELAY, Gas Protection, Cat 1	Detect gas in the transformer and send out alarm at low gas quantity or trip the transformer when pressure surge is detected.	Good	Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008762	1,4,01 2,014	67090	STATION, Cat 1/2	Monitoring unit for Liquid Effluent sampling station.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008769	1,4	51100	SWITCH (GENERATOR N - GND), Cat 1/2	Connect/disconnect generator and Neutral Ground Transformer	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms – Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008778	1,3	54400	UNINTERRUP TABLE POWER SUPPLY, Cat 1/2	TPS UPS system provides an emergency 120 Vac power required by safety-related systems.	Very Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008785	1,2,3,4,014	51100 51200 52100 52200 53200 54130 54140 54230 54400 55100	TRANSFORMERS, Cat 1/2	Transformers reduce higher supply voltages to voltage levels acceptable to common station loads. (E.g. 54130-T21 reduce 4.16KV voltage to feed critical Class III 600 Vac MCC loads.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Thermal Aging Corrosion / Galvanic Corrosion	Calibration Component Diagnostics Inspection - Internal Inspection - Non - Intrusive Inspection - Visual Predictive Maintenance - Vibration Monitoring SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement new PMs for transformers in the group not having a PM, similar to the PMs for the transformers that have PMs.
011159	5,6,7,8	51150	51150 Isolated Phase Bus Coolers	Two 100% duty air coolers remove heat generated by the isolated phase bus.	Satisfactory	Corrosion / Pitting Corrosion		Continue current practices. No additional practices are recommended to reach CO OEL (2024).
011160	5,6,7,8	51220	51220 Main Output Transformer Oil Circulation Pumps	The MOT oil circulation pumps are used to circulate oil through heat exchanger for cooling purposes.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Replace Unit 5, 7, and 8 MOT circulating oil/pump assemblies (Unit 6 components replaced in 2008). Incremental recommendations for EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011161	5,6,7,8,1,2,3,4,058	52100 52200	52100 52200 Transformer Hydrogen Monitor for SST, GST, and 058-51320-T3	The Calisto 2 Monitor provides protection by identifying onset of incipient faults in a transformer by detecting the presence of H2 or CO in transformer insulating oil.	Good	Corrosion / General Corrosion Radiation Induced Degradation / UV exposure Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practice. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011162	5,6,7,8	54240	54240 Class II Bus Transfer Contactors	To transfer power to transfer buses to ensure power supply to critical loads.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011283	5,6,7,8	71310	71310 Electrical Systems AOV's	These valves control (modulating or on/off) LPSW to main output transformer oil coolers.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Erosion	Component Replacement Overhaul/Refurbishment	<u>Incremental recommendations for Plant EOL (2020):</u> Procure three MV844/845 and three CV826 for replacement, and actuator overhaul kits in case of valve failure. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011284	018,0, 056,07 8,058, 068,5, 6,7,8	53000 54000 55000 65000 79000	53000, 54000, 55000, 65000, 79000 Electrical Systems - Cables - 4.16 kV, 600V, 125V, 250V	The cables used for Pickering GS B can be sub-divided into five (5) basic categories. There are 5 kV power cables, 600 V power cables, 600 V control cables, 300 V control cables and special definite purpose cables. The (major) equipment associated with the cables listed are: Class III / Class IV 4.16kV and 600V Switchgear, Class II / III / IV Motor Control Centers, 600V Distribution Panels and Class III / IV 4.16kV/600V Distribution Transformers.	Good	Mechanical and Thermal Degradation / Radiation Embrittlement Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Condition Monitoring Program	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Complete inspection of the MOT/SST/GST and S/Y underground cables per P-2015-03783. 2. Complete inspection and/or replacement of SES 4kV cable between the P/H and HPECI Building per WO #1681231. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								No additional recommendations required to reach CO EOL (2024).
011285	5,6,7,8,058,018,0	53300 54130 54140 54240 54330	54100, 54200, 54300, 53300 Electrical System - Motor Control Centres - 600 V / 208 V	The main function of the motor control centres located throughout the station are to provide 600V / 208V power distribution to process system motors, heaters, distribution panels, for loads rated less than 150 amperes. The centres provide a means of interfacing with process relay logic in order to control the multiple process schemes as well as a centralized location for the termination of the related control and power cables associated with these systems. The MCC's also provide an isolation point for work protection when maintenance is required to be done by Control Maintenance Staff.	Satisfactory	Wear Mechanisms - Wear / Wear Mechanisms - Wear Mechanical Fatigue / Mechanical Fatigue Thermal Fatigue / Thermal Fatigue	Inspection - Visual	<u>Incremental recommendations for Plant EOL (2020):</u> Replace all the CC1 and CC2 MCC cells in P058. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011286	5,6,7,8,056,078,058	53200 54120 54320 54600	53200,54120,54320,54600 Electrical Systems-Breakers-4.16 kV	Circuit breaker is a switch that interrupts electrical power to its load. Breaker utilises spring powered stored energy to instantly interrupt all 3 phases of power supply when required.	Good	Corrosion / Pitting Corrosion Mechanical and Thermal Degradation / Wear Mechanisms – Wear Mechanical and Thermal Degradation / Thermal Aging.	Overhaul/Refurbishment SRST - Functional Test	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Overhaul nine 4kV breakers not covered by PM program.
011287	5,6,7,8	57100	57100 Electrical Systems-Control Cable	The cables addressed are considered to be all unitized and common system control cables for the complete station currently listed in the Online Wiring database. These cables are routed throughout the plant on dedicated cable trays. The cables are terminated in	Good	Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Radiation Embrittlement Fatigue / Mechanical Fatigue	Inspection - Condition Monitoring Program	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete inspection of the MOT/SST/GST and S/Y underground cables per P-2015-03783. <u>Incremental recommendations for Plant EOL (2020):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				multi-terminal distribution frames (DF's) and control panels and provide a means to interconnect the various components of process systems. Items interfaced are logic relays, control power supplies, limit switches, annunciation and status indication, instrumentation loops and panel-to-panel multi-connections etc. System identification is not "system specific" for a particular control cable as a multi-conductor cable may contain individual conductors that serve more than one related system index.		Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional recommendations required to reach CO EOL (2024).
011288	5,6,7,8	54250	54250 Electrical Systems-Rectifiers-48 Volt D.C	54230-RFs rectifiers supply units 48 V DC Class II control power from 120/208 V AC Class II power. D.C. outputs of every two main rectifiers are connected in parallel for each distribution panel. This ensures that if one sources or one rectifier should fail, the dc supply will continue to operate without interruption.	Good	Mechanical and Thermal Degradation / Thermal Aging Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Electronic Aging		<u>Incremental recommendations for Plant EOL (2020):</u> Obtain a pair of spare rectifiers and control cards. <u>Incremental recommendations for CO EOL (2024):</u> No additional recommendations required to reach CO EOL (2024).

				emergency lighting & protective relaying.				
011534	058	54300 55400	55400 - 125V EPS Rectifiers	The 125 VDC system provides power for EPS generator breaker control, emergency lighting and protective relaying.	Satisfactory	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Thermal Aging		Incremental recommendations for Plant EOL (2020): Complete a proactive replacement of the rectifiers. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

TETRA TECH

System 0423 - Emergency Water Supply (EWS) System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008836	1,4	71380 71330	ACTUATOR, Cat 1/2	These actuators operate the Emergency Storage Tank make-up valves which are used to fill the storage tank from the high pressure service water system.	Poor	Corrosion / General Corrosion Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Internal Lubrication	Incremental recommendations for Plant EOL (2020): Implement a diagnostics program for actuator testing. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008838	018	71380 67133	ALARM, Cat 1/2	Alarm units provide flow indication and alarm capability on low flow.	Very Good	Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008840	018	71380	ALARM, Cat 1/2	Alarm units provide water level & temperature loop indication, initiates alarms and in some cases have control functions.	Very Good	Mechanical and Thermal Degradation / Electronic Aging		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Ensure spare transmitters (Cat ID 626506 & 525880) are available.
008843	018	71380 67133	ELEMENT, Cat 1/2	The temperature element is used to detect temperature.	Good	Fatigue / Thermal Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008845	3,4,0	71380 71330	EXPANSION JOINT, Cat 1/2	The expansion joints absorb the heat-induced expansion, contraction and vibration in the service water system emergency storage piping.	Good	Corrosion / General Corrosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Surveillance	Incremental recommendations for Plant EOL (2020): Perform baseline inspection and initiate new PM for routine inspection of Expansion Joints. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008850	0	71380 71330	HEATER (GENERIC), Cat 1/2	The heat exchangers prevent water from freezing inside the dousing header and the emergency storage water tank. Heat tracing provides heating / prevention of freezing in the supply pipes to the VB.	Very Good	Corrosion / General Corrosion Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Clean and Inspect SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete a one-time sample inspection of an HX to ensure condition for CO EOL (2024).
008856	0	71380 71330	MOTOR, Cat 1/2	40HP, 575VAC drive motor for Emergency Water Storage pump.	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement PMs (similar to those that are retired 129068 & 129069) for electrical testing of motors (0-71330-PM501 and 0-71330-PM502). Replace if required.
008860	0	71380 71330	PUMP, Cat 1/2	The pumps supply make-up water to the storage tank, recirculate the contents of the storage tank and remove	Good	Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				water accumulation from the vacuum building floor.		Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		
008862	018,0	71380 67133 71330	REGULATOR, Cat 1/2	The PRV's control the Instrument Air supply to actuators on control valves and Instruments in the EWS tank level measurement loops.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Creep and Stress Relaxation		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008865	1,4,0	71380 71330	STRAINER, Cat 1/2	The strainers remove particles and reduce levels of contamination to maintain the quality of the service water emergency water storage system process fluid.	Good	Corrosion / General Corrosion Corrosion / Fouling (accumulation of deposits)	Clean and Inspect	Incremental recommendations for Plant EOL (2020): Initiate a PM to complete regular inspection and cleaning of Unit 0 Strainers. Note: All of the remaining equipment tags are subject to cleaning and inspection. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008867	018,0	71380 67133 71330	SWITCH, Cat 1/2	Temperature switches (TS1's/TS2's) operate Emergency Storage System (ESS) service water piping trace heaters. Pressure switches (L502P–PS1 & L502Q-PS1) senses air receiver pressure for ESS level bubbler air supply PRVs to generate a low air receiver pressure alarm on Units 5, 6, 7 & 8.	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration Inspection - Visual SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008873	018	71380 67133	TRANSMITTER, Cat 1/2	RTD elements measure temperature of water in Emergency Water Supply (EWS) system & transmitter output is fed to an alarm/indicator on Vacuum Building panel. Differential pressure transmitter measures water level in EWS Storage Tank.	Good	Mechanical and Thermal Degradation / Electronic Aging		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): 1. Perform one-time replacement for all transmitters. 2. Ensure spare transmitters are available.
008878	018,0	71380 67133 71330	VALVE, MANUAL/HAND OPERATED, Cat 1/2	Valves function as isolation valves in the EWS. They provide isolation for maintenance purposes, Vacuum building isolation from EWS, instrument isolation etc.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Surveillance	Incremental recommendations for Plant EOL (2020): Initiate a PM to inspect condition of valves 018-71330-V2007 and V2008. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
008880	1,4	71380 71330	VALVE, MOTORIZED/MOTOR OPERATE, Cat 1/2	Normally closed valves fill the storage tank from the high pressure service water system. During extreme emergency conditions these valves can be opened in the unit to be supplied and the unit supplying, this provides a means of supplying high pressure service water from/to any of the other units.	Poor	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Creep and Stress Relaxation	Inspection - Internal SRST - Stroke Test Valve Diagnostics	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete repair of 1-71330-MV501. Incremental recommendations for Plant EOL (2020): Implement diagnostic testing. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

011515	5,6,7,8	35300 63538	35380 FM Ram Force Calibration Assembly	The F/M calibration assembly is used to verify various forces on various components by the Fuelling Machine rams, remotely with a read out in the control room.	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011518	058	35300 35630	35630, 63563 Basket to Module Fuel Transfer Assembly (Module Loader)	The Basket to Module Fuel Transfer Assembly, also referred to as "Module Loader assembly", is used to transfer the irradiated fuel bundles from an irradiated fuel basket into a tube of an irradiated fuel storage Module. The modules are used for storing the irradiated fuel bundles in the Irradiated Fuel Bay (IFB).	Satisfactory	Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): 1. Prepare a specification for filter 058-35630-FR9. 2. Initiate a review of design discrepancies. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0431 - Fuelling Machine Auxiliary Systems

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009244	1,4	35300 35390	MOTOR, Cat 1/2	Pump motor provides motive power to drive the pump required to pump out D2O from the FM storage tank to the purification system.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Thermal Aging	Coupling Alignment Inspection - Visual	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete proactive replacement of PM3 under WO #3007230 (Unit 1) and #3007229 (Unit 4). Incremental recommendations for Plant EOL (2020): Procure new assembly (CID 674769). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009249	1,4	35300 35390	POSITIONER, Cat 1/2	Valve positioners (NC1) accurately position valve stem based on an applied signal.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009254	1,4	35300 35390	PUMP, Cat 1/2	These pumps deliver heavy water from Fuel Machine (FM) storage tank 35390-TK5 to Heat Transport System. FM face seals D2O is collected into this tank. Based on tank level and FM demands, the pump is activated manually or automatically.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue	Coupling Alignment Lubrication	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Ensure existing WO's (1458455, 2811100) for overhaul/replacement are completed. Ensure spare pump parts and spare pump assembly procured and ready for replacement. Incremental recommendations for Plant EOL (2020):

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / High Vibrations		No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
009256	1,4	35300 35390	Regulator, Cat 1/2	These PRV's regulate instrument air pressure for their respective CV valves.	Good	Mechanical and Thermal Degradation / Creep and Stress Relaxation Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Component Diagnostics Inspection - Visual	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009263	1,4	35300 35390	SWITCH, PRESSURE, Cat 1/2	Pressure switches are an integral part of pump (P1/P2) and alarm at low pump lubrication oil pressure.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation /	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> Complete a one-time proactive replacement of pressure switches (Unit 1 -WR 854456 & 854463 for PS1 & PS2 respectively) by December 2017. <u>Incremental recommendations for CO EOL (2024):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Wear Mechanisms - Wear Corrosion / General Corrosion		Add a task in existing PMs for control maintenance to calibrate PS's during pump overhaul.
009268	1,4	35300 35390	TRANSMITTER, Cat 1/2	These devices (AX's) convert an electrical control signal to a pneumatic signal that is used to operate associated control valves	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009271	1,4	35300 35390	VALVE, CONTROL, Cat 1/2	The high pressure supply pumps 35390-P1 and P2 maintain flow via a bypass line (these pumps are constant volume flow). These valves 35390-CV907 and CV944 are the bypass pressure control valves.	Good	Corrosion / General Corrosion Corrosion / Fouling (accumulation of deposits) Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Fatigue / Mechanical Fatigue	Overhaul/Refurbishment Valve Diagnostics	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009279	1,4	35300 35390	VALVE, PRESSURE RELIEF, Cat 1/2	Fueling machine D2O supply system RVs provide overpressure protection. 35390-RV906 – Relief for pump P2 35390-RV914 – Relief for P1 35390-RV960 – Ajax pumps suction RV	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Mechanical Fatigue Corrosion / Stress Corrosion Cracking - Carbon and low alloy steels Corrosion / General Corrosion		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete existing PMs that have a history of PM deferrals. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009281	014,0	35300 35610 35630 35670 35680	VALVE, AIFB PRESSURE RELIEF, Cat 1/2	014-35610-FLSK2000-RV1 and 014-35610-FLSK2001-RV1 are relief valves for the irradiated fuel transfer flask. 014-35680-RV2001 is the relief valve for AIFB flask nitrogen purge. 0-35630-RV4 is the pressure relief valve for the h20 module loader in the IFB basket to module fuel transfer system.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Creep and Stress Relaxation		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete EC 114894 to remove RV65 and RV5. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011501	5,6,7,8,058	35300	35390 FM D2O Supply System Piping	This CA covers piping, fittings, and piping supports for the FM D2O supply system. A brief description of the flow path is described below:	Satisfactory	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear	Inspection - Pipe Wall Thinning Program Inspection - Visual	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				Low pressure supply: D2O supply from PHT system is pressurized by Ajax pumps. High pressure supply: discharge from Ajax pumps is filtered, and delivered to either or both FM valve stations. FM magazine return: D2O is received from either or both FM magazines via the FM valve stations, and sent back to Ajax pump suction FM seals return: heavy water received from FM seals (via FM valve stations) is transferred to PHT system, and sent back to Ajax pump suction		Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Wear		
011502	5,6,7,8	35300 35390	35390 F/M D2O Supply System Heat Exchangers	5/6/7/8-35390-HX5 cools the flow to about 38°C (100°F) or less on the "bypass" (i.e. recirculation) line for D2O supply pumps 35390-P1/P2. The cooling water is taken from the Recirculated Cooling Water System. 6/7/8-35390-HX7 reduces the Fuelling Machine return D2O temperature from approximately 93°C (200°F) to less than 38°C (100°F). This flow then passes to either the suction of the PHT pressurizing pumps (33310-P1/P2), or to the suction of the D2O supply pumps (35390-P1/P2), NOTE: On Unit 5, 5-35390-HX7 has been removed.	Satisfactory	Corrosion / Microbiological Influenced Corrosion Corrosion / Crevice Corrosion Corrosion / Pitting Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Modify PM activity associated with 5/6/7/8-35390-HX5, to confirm integrity of shell side, as well as tube side (e.g. open valves supplying RCW to the shell side and confirm no leakage). 2. Complete W/O 2723295 - Remove and inspect one HX5 so that confidence is maintained that tubing integrity can meet end of life. <u>Incremental recommendations for Plant EOL (2020):</u> Complete a one-time confirmation of tube integrity for 6/7/8-35390-HX7. <u>Incremental recommendations for CO EOL (2024):</u> Implement a new PM for periodic confirmation of tube integrity for 6/7/8-35390-HX7, or implement a modification to remove these heat exchangers and replace with a spool piece (similar to what was done for 5-35390-HX7).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011503	5,6,7,8	35300 35390 63530 63536	35390, 63530, 63536 D2O Valves	High pressure supply from FM D2O supply pumps (35390-P1/P2) is maintained by controlling bypass flow of the pumps through pressure control valves 35390-CV944 and CV907. Control valve 63536-CV1 is used to control magazine pressure. Control valve 63536-CV2 automatically regulates the differential pressure between the ram supply line and the magazine at set point levels as required. Solenoid valves 63530-P1-SV1 directs and controls flow of air supply which controls the pressure of the fuelling machine magazine. Solenoid valves 63530-N1/2/3/19-SV1/2 are used to control the direction of the D2O flow which operates various components on the FM assembly. 63530-N19-SV1 controls advance or retraction of C-Ram 63530-N3-SV1 controls the separator stop which prevents any undesired movement of the fuel along the reactor tube. 63530-N2-SV1 controls the separator retractor which “pushes” one or a pair of fuel bundles into the fuelling machine magazine.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Calibration Overhaul/Refurbishment Valve Diagnostics	<u>Incremental recommendations for Plant EOL (2020):</u> Ensure spare parts for equipment in this CG are procured as part of FH 100 parts initiative to support run to failure maintenance strategy. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

TETRA TECH

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				63530-N1-SV1 and SV2 both control the separator feeler which senses the gap between the fuel bundles during fuelling operations.				
011516	5,6,7,8	35300 35390	35390 FM D2O Supply System Strainers	Strainers 3539-STR2 and STR3 are installed at inlets of FM D2O supply pumps 35390-P1 and P2, and serve to protect the pumps from large debris/particles (these strainers removed under MEC 102220 and replaced with spool piece, due to strainer leaks causing D2O supply pump unavailability, replacement strainers are in process of being procured) Strainers 3539-STR4 strains the flow from the FM return line before it is sent back to PHT.	Poor	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Fatigue due to Vibration Corrosion / Fouling (accumulation of deposits)		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Pursue replacement strainers per FH 100 parts initiative. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Assess cost-benefit of proactively replacing strainers given failure trends.
011517	5,6,7,8	35300 35390	35390, 54130 FM D2O Supply Pump & Motor Assembly (Ajax Pumps) and Circuit Breakers	The F/M D2O Supply Pumps supply high pressure D2O for Fuelling Machine on-reactor operation. Only one pump is required to supply the high pressure D2O to both Fuelling Machines. During unit planned outages, both pumps are required to support the UDM operations for the SLAR campaigns.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Complete replacement of the pump leakage seals under Master NICR 131008. 2. Complete proactive replacement of pump motors (PM1 & PM2) under the following work orders (2705259, 2705262, 2705264, 2705266, 2705979 & 2706024) by 2018. <u>Incremental recommendations for Plant EOL (2020):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				In the event of failure of both PHT pressurizing pumps, an alternative delivery path for supply of low pressure D2O is ensured from the outlet of the F/M supply pumps. Pump motors (PM1 & PM2) provide motive power to drive the respective attached pumps		Degradation / Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Fatigue / High Vibrations		No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement a vibration monitoring, IR and oil sampling program for these pumps.
011519	5,6,7,8	35300 63530 63535	63530, 63535 FM Oil Hydraulic System Valves	The principal function of the oil hydraulic control systems is to actuate the various drives of the Fuelling Machine including the head, the supporting bridge and the carriage movements during the fuelling process.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Embrittlement Fatigue / Mechanical Fatigue	Component Replacement	Incremental recommendations for Plant EOL (2020): Implement PMs for all tags without PMs in the CG. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0432 – Fuelling Machine Carriages and Bridges

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009284	1,4	35300 35330	ASSEMBLY, Cat 1/2	The Y drive provides vertical positioning for the fuelling Machine Carriage.	Good	Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Lubricant Contamination		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete all outstanding work associated with the FM Bridges Reliability Improvement Project. Incremental recommendations for Plant EOL (2020): Ensure set of spare ball nuts, ball screws, and y-drive gearboxes are available. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009285	1,4	35300 35330	BEARING, Cat 1/2	The thrust bearings are located at the top of the y-drive ball screw assemblies and facilitate the y-directional movement of the bridge.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Lubricant Degradation Fatigue / Mechanical Fatigue		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete outstanding WO's 2456235 and 2456224 to replace 1-35330-THRUST BRG E and 1-35330-THRUST BRG W respectively. Incremental recommendations for Plant EOL (2020): Implement routine inspection of ball-screws and ball-nuts. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2020).
009287	1,4	35300 35330	BRIDGE, Cat 1/2	The Bridge supports the fuelling machine carriage to bring it to its desired position for loading and unloading fuel in the reactor channels and to pick up new fuel and discharge spent fuel.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal	Surveillance	Incremental recommendations for Plant EOL (2020): Ensure a set of spare ball nuts are available. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2020).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Degradation / Lubricant Degradation		
009288	1,2,3,4	35300 35320	CARRIAGE, Cat 1/2	The FM carriage function is to A) support the fueling machine and move it to a desired position; B) support the electrical and control conductors, and oil hydraulic and D2O hoses.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Lubricant Degradation		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Resolve obsolescence issues relating to 1/4-35320-CARRAIGE - Fine Y Bevel Gearbox CID 553949. (Added to the FH Top 100 Parts list). <u>Incremental recommendations for Plant EOL (2020):</u> Ensure a set of spare ball nuts are available. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
009289	1,4	35300 35320	DRIVE(GENERIC), Cat 1/2	The Z drive supports fueling machine actions by driving the fueling machine head to the desired position in the Z direction (horizontal and perpendicular to the X direction).	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Lubricant Degradation		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011513	5,6,7,8	35300 35320 35321 35323	35320 FM Carriage, Trolley, Upper Gimbal and X Drive Assembly	The FM carriage function is to A) support the fueling machine and move it to a desired position; B) support the electrical and control conductors, and oil hydraulic and D2O hoses.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue		<u>Incremental recommendations for Plant EOL (2020):</u> Obtain sufficient spare part inventory necessary to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Lubricant Contamination		
011514	5,6,7,8	35300 35333	35333 FM Bridge Vertical Drive	The FM bridge drive mechanism enables the Fuelling Machine to access all the fuel channels for fuelling the reactor.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Obsolescence / Immediate Obsolescence Concern		Incremental recommendations for Plant EOL (2020): 1. Implement routine inspection of ball-screws and ball-nuts. 2. Obtain sufficient spare part inventory. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0433 - Fuelling Machine Head

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009292	1,4	35300 35316	GUIDE, Cat 1/2	The Guide Sleeve (GS) is inserted into the snout passage via Guide Sleeve Insertion Tool (GSIT) in order to facilitate the delivery of fuel bundles.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion		Incremental recommendations for Plant EOL (2020): Procure new assemblies (GS and GSIT) and resolve spare part issues. Incremental recommendations for CO EOL (2024): No additional practice are recommended to reach CO EOL (2024).
009293	1,4	35300 35313	MAGAZINE, Cat 1/2	The magazine assembly provides suitably shaped tubes for the storage of a variety of plugs, tools and fuel bundles.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Depletion of Material Properties	Calibration Inspection - Internal Overhaul/Refurbishment Supply Monitoring	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete replacement of FM Magazine Ferguson drive bearings and FM Magazine rear shaft bearings per outstanding Work Orders (WO # #2453453, 2453452, 2416636, 2416634). Incremental recommendations for Plant EOL (2020): Initiate proactive one-time replacement of the Ferguson drive assemblies at the end of expected design life of Ferguson drive assemblies. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009295	1,2,3,4,014	35300 35314	RAM, Cat 1/2	The Ram assembly performs the function of opening and closing the fuel channels, and pushing the fuel bundles into the fuel channel.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring,		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Seals, Gaskets, O-rings etc.) Corrosion / Fouling (accumulation of deposits)		
009296	1,4	35300 35312	SEPARATOR, Cat 1/2	The separators assembly senses the position of gaps between fuel bundles, ram adaptor, or shield plug. It also prevents axial movement of the fuel column, and pushes fuel bundles through the last one half inch into the magazine tube.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009297	1,4	35300 35311	SNOUT, Cat 1/2	The snout assembly provides a means for accurately aligning the head with an end fitting. It also forms a leak-proof seal between the heavy water in the head housing and the reactor PHT system.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Radiation Induced Degradation / Radiation Embrittlement		<u>Incremental recommendations for Plant EOL (2020):</u> Increase current PM frequency for Hydrodyne seal and O-ring replacement which is currently set at once every 4 years to address OPEX of recurring seal failures. <u>Incremental recommendations for CO EOL (2024):</u> Revise NA44-CALC-35310-00001 “Fatigue Analysis of PA FM Pressure Boundary Components” analysis to extend CO EOL from 2020 to 2024.
011504	5,6,7,8	35300 63530 63534	63530, 63534 Printed Circuit Boards (PCBs) and Connectors	These Printed Circuit Boards provide a variety of logic functionality for the operation of the Fuelling Machines (e.g. help control Ram acceleration).	Satisfactory	Mechanical and Thermal Degradation / Creep and Stress Relaxation Mechanical and Thermal		Continue current Practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Degradation / Thermal Aging Corrosion / General Corrosion		
011506	5,6,7,8	35300 63534	63534 Low Voltage DC Power Supplies	Provides a highly stable power supply required for operation of Fuelling Machines.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging		Continue current Practices. No additional practices are recommended to reach CO EOL (2024).
011508	5,6,7,8	35300 35310 35311 35315 35316	35310 FM Head Assembly	35310-FM HD ASSY E/W – Major component of fuel handling system, two operational heads for each reactor unit, one at each end of reactor (east & west). The fuelling machine heads are designed to fuel the reactor while it is at full power, or any level of power, including shutdown. 35316-GS TOOL EAST/WEST – Guide Sleeve Insertion Tool, used to move guide sleeve between the magazine and fuelling machine snout by the fuelling machine ram assembly using this tool. 35316-GS-E/W – Provides a smooth bore for the passage of fuel bundles and shield plugs between the magazine and the fuel channel. 35311-SNOUT E/W –The snout assembly forms an extension of the pressure boundary between the magazine housing and the channel end fitting, and contains the mechanisms	Satisfactory	Fatigue / Mechanical Fatigue Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Creep and Stress Relaxation		<u>Incremental recommendations for Plant EOL (2020):</u> Resolve spare / obsolescence issues. <u>Incremental recommendations for CO EOL (2024):</u> Revise existing analysis (Reports 30-35310-SR-001 Rev/ 01, 30-35310-ASD-001 Rev. 0) to demonstrate adequacy to CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				for clamping, locking and sealing the head to the end fitting. Snout assembly senses position of the end fitting and provides a positive clamp. 35315-SNOUT PLUG E/W – Function is to seal the fuelling machine head snout, while the head is in the “park” or “off-reactor” condition, to allow the head to be filled with D2O and pressurized.				
011509	5,6,7,8	35300 35310 35313	35310, 35313 FM Magazine DR Gearbox & FM Magazine Assembly	The Magazine assembly components and functions are: The Magazine Rotor is a twelve-chamber magazine rotor assembly to store a variety of plugs, tools and fuel bundles. Magazine D2O Flows provides cooling of the magazine housing and irradiated fuel bundles Magazine Shaft Seal maintains the pressure boundary of the magazine assembly. Magazine Drive System permits accurate alignment of the magazine sites with the snout bore.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Calibration Inspection - Internal Inspection - Visual Overhaul/Refurbishment	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Complete WO 04826430 for 7-35313-MAGAZINE W, to repair / replace a large Graylok seal leak. 2. Complete WO 02625577 for 7-35313-MAGAZINE W magazine seal replacement. <u>Incremental recommendations for Plant EOL (2020):</u> Resolve obsolescence and issues. <u>Incremental recommendations for CO EOL (2024):</u> Revise existing analysis (Reports 30-35310-SR-001 Rev. 01, 30-35310-ASD-001 Rev. 0) to demonstrate adequacy to CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Obsolescence / Immediate Obsolescence Concern		
011510	5,6,7,8	35300 35312	35312 Fuelling Machine Separator	The separators assembly senses the position of gaps between fuel bundles, ram adaptor, or shield plug. It also prevents axial movement of the fuel column, and pushes fuel bundles through the last one half inch into the magazine tube.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Resolve spare part issues. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011511	5,6,7,8	35300 35314 35317	35314, 35317 FM Main Ram Assembly and Ram Adaptor	The ram assembly performs opening and closing of the coolant channels, and pushes the fuel bundles into the reactor. The ram adaptor centralizes the 'C' ram and prevents sagging while operating inside the fuel channel.	Poor	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear	Component Monitoring Overhaul/Refurbishment	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete AR#28153602-06 for new RAM ball screw seals. Incremental recommendations for Plant EOL (2020): Resolve obsolescence/spares issues. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

						Mechanisms - Erosion Obsolescence / Immediate Obsolescence Concern		
011512	5,6,7,8	35300 35319	35319 FM Cradle Assembly	The cradle and gimbal support allows the FM head to pivot in both horizontal and vertical directions while engaging an end fitting.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue	Surveillance	Incremental recommendations for Plant EOL (2020): Resolve spare parts issues. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0436 - HPECI Storage Tank

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011206	058	57439	33350 HPECI Storage Tank	The HPECI Storage Tank maintains water inventory required for high pressure injection following a loss of coolant accident.	Satisfactory	Corrosion / Environmental Degradation Corrosion / General Corrosion	Inspection - Visual	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011216	058	57439	33350 HPECI Storage Tank - Foundations, Steel	The steel H-piles support the storage tank foundation concrete.	Good	Corrosion / General Corrosion Fatigue / Environmentally-Assisted Fatigue	Sampling Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011217	058	57439	33350 HPECI Storage Tank - Foundations, Concrete	The reinforced concrete base supports the HPECI storage tank.	Good	Corrosion / Chemical Attack Corrosion of Embedded Steel / Corrosion of Embedded Steel Mechanical and Thermal Degradation / Cracking due to Expansion/Creep Fatigue / Environmentally-Assisted Fatigue	Sampling Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

System 0437 - HPECI Supply & Recirculation

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009377	1,4	71260 63335	ALARM, Cat 1/2	The indicating alarm units provide HT pressure indication and alarm annunciation during ECIS HT pressure tests (channels E and F), which are mounted on the panel 66100-PL7C of the control room.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings, etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009379	1,4	71260 63335	TRANSMITTER, Cat 1/2	The pressure transmitter is to monitor boiler room ECIS piping pressure continuously by an indicator, 63335-P38-PIA, located on the CR panel 7C.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings, etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011169	058	71260 71260	71260 HPECI Storage Tank Fill & Recirculation Heat Exchanger	Maintains HPECI storage tank water temperature below the maximum temperature limit during hot summer months. Uses LPSW to cool recirculation system demineralized water.	Good	Corrosion / Pitting Corrosion	Surveillance	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011207	058	71260 71260 71310	71260 HPECI Supply & Recirculation-Valves - NV-Non-Return - CAT1&2	Check valves prevent reverse flow in the HPECI storage tank supply & recirculation circuit. Failure of these check valves could result in: -no temperature control of the storage tank. -reverse flow through non-operating centrifugal recirculation pumps 058-71260-P1 & P2. -unavailability to make up water to the storage tank -heat exchanger 058-71260-HX2000 over pressurization	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion	Surveillance	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Repair 058-71310-NV2140. <u>Incremental recommendations for Plant EOL (2020):</u> Perform one-time internal inspection of 058-71260-NV11. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

TETRA TECH

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011208	058	71260 71260	71260 HPECI Supply & Recirculation-Piping - Expansion Joints	The primary function of these two expansion joints is to accommodate the thermal expansion/contraction between the HPECI tank and the embedded piping that runs underground to the ECI auxiliary services building.	Satisfactory	Corrosion / General Corrosion Fatigue / Mechanical Fatigue		Incremental recommendations for Plant EOL (2020): Procure spare expansion joints. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011209	058	71260 71260	71260 HPECI Supply & Recirculation Pumps	The two 100 percent duty pumps are provided to fill the HPECI Storage Tank with filtered service water and subsequently recirculate it on a continuous basis.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Abrasion, Erosion and Cavitation / Abrasion, Erosion and Cavitation		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Procure spares to facilitate prompt replacement if required. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011218	058	71260	71260, 71310 HPECI Supply & Recirculation-Cable - 4.16 kV, 600V, 125V, 250V - Power Cables	These cables are 1000 volt rated and are supplying 600V power to the two (2) ECIS Storage Tank Heaters (rated 100 kW each.) and the two (2) closed loop circulation pumps.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Radiation Embrittlement	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011522	058	71260	71260 HPECI Supply & Recirculation-Piping - Cat1&2	The 4" and 6" carbon steel piping recirculate demineralised water which is part of the temperature control loop for the ECIS storage tank. The 2" stainless steel piping provides demineralised water from the plant to the storage tank building to	Satisfactory	Corrosion / General Corrosion	Inspection - Buried Piping Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				provide filling and make-up water to the storage tank.				

System 0439 - Instrument Air

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009436	034	75120 75130	COMPRESSOR, Cat 1/2	The function of the compressor is to produce high pressure instrument air.	Good	Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		<u>Incremental recommendations for Plant EOL (2020):</u> Install physical barriers (directly above compressors) to prevent FME material from entering compressor intakes. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
009443	018	75120 67513	DISC, Cat 1/2	This rupture disc is for overpressure protection for tank 018-67513-TK2000	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Visual SRST - Functional Test	<u>Incremental recommendations for Plant EOL (2020):</u> Complete a one-time replacement of the rupture disc. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
009444	034	75120 75130	DRYER, Cat 1/2	The function of this component is to dry the air for the high pressure compressors (CP2044/CP2045/CP2046).	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete execution of approved ECs to replace the gearbox and motor of the air dryers. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009446	034	75120 67513	ELEMENT, Cat 1/2	Generate and transmit signals representing instrument air dew points, which correspond to moisture levels.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Electronic Aging	Calibration	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete replacement of 034-67513-ME2142 as per WO#1975449. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement new PM for routine calibrations.
009449	1,4,03 4	75120 75130	FILTER, Cat 1/2	These components filter instrument air prior to final use.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Incremental recommendations for Plant EOL (2020): Initiate new PMs (annual filter replacement) for: 4-75130-FR3030/FR3031/FR3033/FR3034/FR3035/FR3037 and 1-75130/FR3070/FR3071/FR3072/FR3073/FR3074/FR3075. The quantities of spare parts should be reviewed and potentially increased to ensure the quantities are adequate to meet the requirements of the new PMs. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009451	4,018	75120 67510	GAUGE, Cat 1/2	4-67510-PG2001/PG2002 provide local indications of the instrument air pressures at the central air cylinders stations. 018-67513-PG2012 provides local indication of the pressure of the instrument air supplied	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement new PM for routine calibrations.

				to 018-34220-MV49/MV2005.		Corrosion / General Corrosion		
009455	018	75120 67513	HOSE, Cat 1/2	These Flex Hoses are used to provide instrument air to the Vacuum Header Pressure CVs in the PRD Weather Enclosure.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Surveillance	Incremental recommendations for Plant EOL (2020): Perform a one-time inspection of the hoses to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009460	034	75120 75130	MOTOR, Cat 1/2	Drive compressors and dryers for the Instrument Air System.	Poor	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Lubricant Degradation Obsolescence / Immediate Obsolescence Concern	Lubrication Predictive Maintenance - Electrical Testing Predictive Maintenance - Thermography Predictive Maintenance - Vibration Monitoring	Incremental recommendations for Plant EOL (2020): Implement a new PM to perform inspection and oil change for 034-75130-DRM2047/DRM2048/DRM2049 every year. Incremental recommendations for CO EOL (2024): Resolve spares issues for 034-75130-CPM2044/ CPM2045/ CPM2046.
009463	018	75120	PANEL, Cat 1/2	Mount instruments and associated isolation valves and tubing for the instrument air supply to 018-34220-MV49 and -MV2005 of the Negative Pressure Containment System.	Satisfactory	Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009466	1,4,01 2,034	75120 75120 75130	RECEIVER, Cat 1/2	These receivers are used with the HP and LP instrument air compressors to provide a supply of instrument air.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024)
009467	1,4	75120 75130	REGULATOR, Cat 1/2	The pressure regulating valve provides specific pressure to an instrument air vessel (i.e. TK512, TK513).	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue	Calibration Overhaul/Refurbishment	Incremental recommendations for Plant EOL (2020): Perform a one-time overhaul of these pressure regulating valves. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009469	012,03 4	75120 75130	RELAY, Cat 1/2	Implements part of the control logic for the Instrument Air compressors.	Poor	Mechanical and Thermal Degradation / Thermal Aging Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Obsolescence / Immediate Obsolescence Concern	Predictive Maintenance - Thermography SRST - Logic Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): 1. Implement new PM for routine calibrations/tests. 2. Resolve obsolescence and spares issues.
009475	1,4	75120 75130	STATION, Cat 1/2	The stations are used for connections to and distribution of station instrument air.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Inspection - Visual	Incremental recommendations for Plant EOL (2020): Implement a TOV replacement program. Incremental recommendations for CO EOL (2024):

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		No additional practices are recommended to reach CO EOL (2024).
009477	1,4	75120 75130	STRAINER, Cat 1/2	These strainers are used to filter air used for the operation of actuators used for steam release valves.	Satisfactory	Corrosion / Pitting Corrosion	SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Update maintenance procedures to inspect the strainers when SRV maintenance is being performed. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009482	1,4,01 8	75120 67513 75130	TANK, Cat 1/2	These tanks are used for backup instrument air supply.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion	Inspection - Radiography SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement new PMs for internal/external inspection of 018-67513-TK2000, 1-75130-TK2001, 4-75130-TK2001, and 1-75130-TK2002.
009485	034	75120 75130	TRAP, Cat 1/2	These traps are used with the air receiver filer to contain particulates.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Overhaul/Refurbishment	Continue current practices. No additional practices are recommended to reach CO EOL (2024)
009488	1,012	75120 75130	VALVE, CONTROL, Cat 1/2	The function of the control valve 1-75120-CV3033 is to tie-in LP instrument air to pneumatic devices on the vacuum building emergency water storage system, function of 012-75130-CV3044 is tie-in of HP and LP instrument air.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue	Functional Test	Incremental recommendations for Plant EOL (2020): Implement a one-time inspection and/or overhaul program for these control valves. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009490	1,034	75120 75120 75130	VALVE, ISOLATION, Cat 1/2	The function of these valves are to isolate instrument air for station 2094/2095 or for commissioning and testing purposes.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Surveillance	Incremental recommendations for Plant EOL (2020): Implement one-time inspections/replacements of these isolation valves. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009499	1,4,01 2,034, 018	75120 67513 75100 75120 75130	VALVE, PRESSURE RELIEF, Cat 1/2	These RVs provide over pressure protection to the Instrument Air system.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009505	1,4	75120 75100	CYLINDER, Cat 1/2	These cylinders are used to supply back up instrument air.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion	SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011198	5,6,7,8 ,058	75120 67512 75120	75120 Instrument Air System Dryers	Dryer function is to dry instrument air to an outlet dewpoint of -40C. Changeover valve function is to enable switch-over between dryer chambers. Solenoid valve function is to control dryer purge/changeover functions.	Good	Corrosion / General Corrosion Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Obsolescence / Immediate Obsolescence Concern	Calibration Functional Test Inspection - Visual	Incremental recommendations for Plant EOL (2020): Obtain sufficient spares for Instrument Air CV's. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011199	5,6,7,8	75120 75120	75120 Instrument Air Check Valves - Airlocks	Prevents backflow of instrument air supply.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion		Complete WO 2871081 to replace 7-75120-NV1505. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011200	5,6,7,8	75120 75120	75120 Instrument Air Compressors	Instrument Air Compressors provide clean, dry air at pressure (~800 kPa) to plant Instrumentation and Control pneumatic equipment.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / Fouling (accumulation of deposits) Fatigue / Fatigue due to Vibration Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Obsolescence / Immediate Obsolescence Concern Mechanical and Thermal Degradation / Lubricant Contamination		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Obtain replacement items and procure sufficient quantities for CIDs 221426,186292, 184473, 553410, to ensure timely repairs. 2. Complete compressor replacement program (e.g. WO 4937597). <u>Incremental recommendations for Plant EOL (2020):</u> 1. Review and reinstate the following PMs (sample PM 12564): • Calibrate Panel pressure gauge PG1601 (yearly) • Perform Vibration Analysis (quarterly). • Collect Compressor Performance Data (weekly). • PM 112966 Oil samples every 13 weeks 2. Perform a one-time maintenance service (reference sample retired PM 12564) for the following: • Calibrate Panel temp. Gauge at 10,000 hrs • Grease Compressor Motor Bearings at 10,000 Hour Service • PM Electrical Testing (Off-Line) (sample PM 117067) <u>Incremental recommendations for CO EOL (2024):</u> Review and reinstate the following PMs (sample PM 12564):

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								• Calibrate Panel temp. Gauge at 10,000 hrs (every 2 years) • PM Electrical Testing (Off-Line) every 2 years (sample PM 117067 Perform a one-time maintenance service (reference sample retired PM 12564) for the following: • Grease Compressor Motor Bearings at 10,000 Hour Incremental Service
011202	5,6,7,8	75120 75120	75120 Instrument Air Manual Valves Inside Containment	These Isolation valves are used to meet instrument air (IA) requirements inside each Reactor Building (RB).	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Radiation Induced Degradation / Radiation Embrittlement	Component Replacement SRST - Functional Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete current diaphragm valve replacement campaign. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011220	018	75120	75120 Instrument Air - Cables 4.16 kV, 600V, 125V, 250V	Provide power to the motors, heaters and dryers of Instrument Air System.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011226	058	75120 75120	75120 Instrument Air Pressure Regulating Valves	Provide pressure regulation for various air cylinders providing back-up air supplies.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Obsolescence / Immediate Obsolescence Concern	Surveillance	<u>Incremental recommendations for Plant EOL (2020):</u> Resolve obsolescence by procuring an adequate replacement PRV. <u>Incremental recommendations for CO EOL (2024):</u> Complete a one-time replacement of all PRVs.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life

Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Component Replacement Inspection - Non - Intrusive SRST - Functional Test	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete work orders 02906169, 02906171, 02964221, 02908772, 02964232, 02964234, and 02723248, to inspect and replace specified check valves. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0440 - Irradiated Fuel Bay Auxiliaries

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009511	0	34400 35710	FILTER, Cat 1/2	Two shielded cartridge filters (each designed for 50% duty) remove suspended solids down to 10µm from the bay water for cooling and purification.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Corrosion / Fouling (accumulation of deposits)		Incremental recommendations for Plant EOL (2020): Reactivate PMs for filter replacement (114597-01, 114598-01). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009514	0	34400 35710	HEAT EXCHANGER, Cat 1/2	These two HXs remove heat from re-circulated bay water.	Satisfactory	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Fouling (accumulation of deposits) Corrosion / Microbiological Influenced Corrosion Corrosion / Pitting Corrosion		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Initiate new PM tasks to clean HX and conduct Eddy Current Testing (ECT) on HXs every 4 to 5 years per Equipment Strategy Manual.
009521	0	34400 35710	PUMP, Cat 1/2	Two 100% duty horizontal end-suction centrifugal pumps re-circulate bay water through a train of filters, ion exchangers and heat exchangers for cooling and purification.	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Wear Mechanisms – Wear		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete a one-time external inspection.
011127	058	34400 34410	34410 IFB Cooling Heat Exchanger	Three 50% duty HXs remove heat from circulated bay water.	Good	Corrosion / General Corrosion Corrosion / Microbiological Influenced Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Corrosion / Pitting Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Corrosion / Fouling (accumulation of deposits) Corrosion / Stress Corrosion Cracking - Austenitic Stainless Steels		
011423	058	34400	34400 Irradiated Fuel Bay Auxiliaries- Cable - 4.16 kV, 600V, 125V, 250V - Power Cables	The cables used for P014 can be sub-divided into five (5) basic categories. There are 5 kV power cables, 600 V power cables, 600 V control cables, 300 V control cables and special definite purpose cables.	Good	Fatigue / Thermal Fatigue Fatigue / Mechanical Fatigue Radiation Induced Degradation / Radiation Embrittlement	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011447	058	34400 73170	73170 Irradiated Fuel Bay Ventilation - Motor Operated Dampers - CAT1&2	These components are air control dampers in the spent fuel bay ventilation system. MDP3 is an inlet isolation damper for filter FR501. MDP4 is a by-pass damper for filter FR501.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms – Wear		<u>Incremental recommendations for Plant EOL (2020):</u> Resolve spare parts issues. Specifically, there are no spare parts for 058-73170-MDP3/4 (actuator or damper). Recommend procuring P.V.C. flexible damper and jamb seals, damper nylon bearings, linkage brass bearings and actuator elastomer seals. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011457	058	34400 34410 34420 71310 71620	34410, 71310 Irradiated Fuel Bay Auxiliaries- Valves - Manual - CAT 3&4	These valves are isolators for heat exchangers 058-34410-HX1, 2 & 3. The isolators are required to allow inspection / repairs of the heat exchangers	Good	Corrosion / Flow Assisted Corrosion (Erosion-Corrosion) Corrosion / Microbiological Influenced Corrosion		<u>Incremental recommendations for Plant EOL (2020):</u> Resolve spare parts issue. Specifically, recommendation for 058-34410-V25-28, 31 & 33 is to purchase spare valves (Cat ID 148575).

				- Stores and cools fuel from all 4 P058 reactors. - Provides transparent shielding to allow storage and safeguarding operations to be carried out conveniently and safely. - Protects the environment from any leakage of water.		Expansion or Contraction Mechanical and Thermal Degradation / Shrinkage Radiation Induced Degradation / Radiation Embrittlement		<u>incremental to current periodic maintenance practices:</u> Complete repairs to liner cracks under Project 13-40703. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

System 0444 - Liquid Zone System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
009613	1,4	34800 34810	COMPRESSOR, Cat 1/2	These compressors provide helium cover gas for LZC system. Suction is taken from the Delay Tank and discharge is sent to the Helium Storage Tank. The compressors maintain pressure of the Helium Storage tank at set point.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue	Lubrication Inspection - Internal Predictive Maintenance - Vibration Monitoring	Incremental recommendations for Plant EOL (2020): Address compressor seal flow conditions through MV31/33. This is a known cause for compressor degradation. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009631	1,4	34800 34810	PUMP, Cat 1/2	These 100 percent duty pumps provide flow for the closed circuit demineralized water for the LZC system.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Incremental recommendations for Plant EOL (2020): Add lubrication/oil sampling to super route PM for this CG. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009654	1,4	34800 34810	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2	1/4-34810-MV105 provides emergency water supply from the Helium Storage tank to the Helium Supply Header when header pressure falls below 80 psi. 1/4-34810-MV15 is normally open, and fails closed to prevent the zones from draining.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009659	1,4	34800 34810	SOLENOID/SOLENOID OPERATED VAL, Cat 1/2	Solenoid valves are used to actuate valves 34810-MV105 & 34810-MV15. The water supply header distributes water from the supply pumps to the fourteen valves controlling the flow each into the zone compartments. Should the pressure fall due to pump or motor failure, pipe fracture or any other circumstance,	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation		Continue current practice. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				the change in pressure is detected by pressure switches. The low pump discharge pressure will cause closure of valve 34810-MV15 and opening of valve 34810-MV105.		/ Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Depletion of Material Properties Mechanical and Thermal Degradation / Thermal Aging		
011129	5,6,7,8	34800 34810	34810 Liquid Zone Control Compressor Motors	The LZC CP Motors drive one of two 100% duty helium compressors. During normal operation one is selected on Auto 1 while the other selected to Auto 2. The duty compressor (Auto 1) maintains storage tank pressure by operating in On/Off mode. If a compressor fails, the standby compressor (Auto 2) is selected to Auto 1 duty and represents a total loss of redundancy. Failure of both LZC compressor motors would result in the loss of helium storage tank pressure and likely a forced outage.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Radiation Induced Degradation / Radiation Depletion of Material Properties Mechanical and Thermal Degradation / Cracking Due to Cyclic Loading	Component Replacement Lubrication Predictive Maintenance - Vibration Monitoring	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete CR2012-01045 to re-instate PM for motor replacement every 4Yr. Incremental recommendations for Plant EOL (2020): Implement proactive replacement of compressor motors to address concerns regarding premature winding failures (ref. SCR P-2012-16220). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011130	5,6,7,8	34800 34810	34810 Liquid Zone Control Coolers	These Heat Exchangers cool the recirculated demineralized LZCS water.	Good	Corrosion / Pitting Corrosion Corrosion / Fouling (accumulation of deposits) Fatigue / Thermal Fatigue		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Based on OPEX showing poor condition, execution of PMs should not be deferred without detailed consideration. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020).

TETRA TECH

								Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011131	5,6,7,8	34800 34810	34810 Liquid Zone Control H2O Supply Valves	These valves are used to control the level in each of the 14 zone control compartments for the purpose of spatial flux control. These control valves fail open, filling the compartments.	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Overhaul/Refurbishment SRST - Functional Test Valve Diagnostics	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Continue replacing positioners with smart positioners as per ECR 15052. Incremental recommendations for Plant EOL (2020): Address vendor quality issues for Units 1&4 valves leaking through the O-rings Incremental recommendations for CO EOL (2024): Perform a one-time overhaul of the U6 actuators to reach CO EOL (2024).
011132	5,6,7,8	34800 34810	34810 Liquid Zone Control Return Header Isolating Valves	These valves are air to close, spring to open. These valves close and isolate zone outlets in case of low H2O supply header pressure (due to loss of supply pumps) thus preventing zones from draining.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Corrosion / Pitting Corrosion	Overhaul/Refurbishment SRST - Functional Test SRST - Stroke Test	Incremental recommendations for Plant EOL (2020): Follow-up on BOM for MVs and ensure spare parts procured. Incremental recommendations for CO EOL (2024): Re-initiate PMs for diagnostics every 4 years e.g. PM 97834-01.
011374	5,6,7,8	34800 34810	34810 Liquid Zone System-Helium Bubbler & Balance Header Pressure And Storage Tank Level Control Valves	These Air Operated Valves have various functions: CV53, CV71, CV64, CV70, CV68 and CV69 are used to control the Helium Bubbler Header and Helium Balance Header pressure at set point to ensure continuous bleed to bubbler tubes for zone level measurement. CV171 is used to control Helium Storage Tank level	Poor	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Erosion	Overhaul/Refurbishment SRST - Functional Test Valve Diagnostics	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete outstanding work orders to proactively replace the Bubbler Header Control Valves and the Back-up Balance Header Control Valves. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								Incremental recommendations for CO EOL (2024): Implement one-time internal inspections of valves.
011438	5,6,7,8	34800	34810, 63480 Liquid Zone System-Cable - 4.16 kV, 600V, 125V, 250V - Power Cables	The cables used for Pickering GS B can be sub-divided into five (5) basic categories. There are 5 kV power cables, 600 V power cables, 600 V control cables, 300 V control cables and special definite purpose cables.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Radiation Induced Degradation / Radiation Embrittlement	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011453	5,6,7,8	34800 34810	34810- Liquid Zone System-Non-Return Valves - CAT 2	These check valves are used to prevent reverse flow through the LZ pumps (34810-NV16, NV55, NV58), maintain an emergency water inventory in the Helium Storage Tank (34810-NV225) and prevent backflow from the H20 Supply Header to the Helium Storage Tank (34810-NV37).	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Flow Assisted Corrosion (Erosion-Corrosion)	SRST - Functional Test	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Continue to execute recommended actions from previous CA NK30-REP-34810-00012 R002 i.e. procure spares for NV225, one-time internal inspection of one of 5-8-34810-NV225 (see AR 1646265, WO 4814904), and inspect one of NV16, NV55, NV58 from U7 due to these valves being in service the longest. Incremental recommendations for Plant EOL (2020): Complete one-time inspection of 7-34810-NV37. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011465	5,6,7,8	34800 34810	34810 - Liquid Zone System-Tanks	The delay tank 34810-TK1 provides a delay time of approximately 5 minutes for return flow from components, to allow for decay of O-19 and N-16. The storage tank TK2 is sized to handle two fill/drain cycles of the zones between on/off cycles of the	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	SRST - Functional Test Tank Level Monitoring	Incremental recommendations for Plant EOL (2020): Implement periodic tank inspections. Incremental recommendations for CO EOL (2024): Depending on inspected condition, establish procurement route to purchase a new tank.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				compressors. This tank also receives compressor liquid ring seal and mechanical seal coolant flow. 34810-FA1/2 are flame arrestors upstream and downstream of recombination unit. They are designed to prevent any flame propagation from the recombination unit into parts of the circuit.		Fatigue / Mechanical Fatigue Radiation Induced Degradation / Radiation Embrittlement		
011474	5,6,7,8	34800 34810	34810 Liquid Zone System-CONTROLLER -HAND-CAT 1&2	The function is to provide a bumpless transfer from Auto to Manual control of the Liquid Zone Level control valves and also a bumpless transfer from Manual to Auto. The normal control signal is via the DCC computer and through the current generator to the zone CV I/P transducer (AUTO mode).	Good	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging Obsolescence / Immediate Obsolescence Concern		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Maintain spare part inventory as required per AR#28117445. Incremental recommendations for Plant EOL (2020): Perform one-time replacement of all hand controllers with new or refurbished units. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0445 - Moderator System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
008250	1,4	31200 63241 63243	ALARM, Cat 1/2	Flow indicating alarm meters, located in the Main Control Room panel, provide indication and low flow annunciation for the Calandra/Dump Tank spray.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging	Calibration Component Replacement	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008252	1,4	31200 63241	CAPACITOR, Cat 1/2	These capacitors provide electronic filtering within the Selector Switches which are part of the Calandria Dump Tank logic.	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration Component Replacement	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008253	1,4	31200 63241	CONTROL, Cat 1/2	Flow indicating controller for the Calandria Spray system.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging	Calibration	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
008254	1,4	31200 63241	CONVERTER, Cat 1/2	Current to current converters for the Calandria Spray system.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation	Calibration Component Replacement	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

						Seals, Gaskets, O-rings etc.)		
009905	1,4	33000 33320 33610 63320 63331 63332 63334	ELEMENT (FLOW), Cat 1/2	Generate signals representing flow rates for various HTS flow paths.	Good	Corrosion / Flow induced wear of the leading edge	Calibration	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009910	1,4	33000 33210 33340	FILTER (GLAND/BLEED), Cat 2/3	Filters remove soluble and insoluble impurities from the PHT Bleed Circuit (33210) and Gland Seal Circuit (33340). Impurities include activated corrosion products, fission products, non-active ionic impurities and particulates.	Good	Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Perform one-time inspection of filter housings, visual if possible (with remote camera), and ultrasonic for thickness measurement. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009921	1,4	33000 33320	HEAT EXCHANGER(BLEED COOLER), Cat 1/2	Cool the hot D2O condensate from the bleed condenser prior to condensate entering the bleed purification circuit, to prevent IX resin breakdown.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Corrosion / Fouling (accumulation of deposits) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion	Clean and Inspect	Incremental recommendations for Plant EOL (2020): Perform one-time inspection of heat exchangers, and if degraded repair / replace. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009923	1,4	33000 33340	HEAT EXCHANGER (GLAND), Cat 1/2	These heat exchangers are heat transport pump gland seal water coolers.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Corrosion / Fouling (accumulation of deposits) Corrosion / General Corrosion	Inspection - Internal	Incremental recommendations for Plant EOL (2020): 1. Remove an HX from U2 or U3, inspect to confirm good condition, then use it to replace an HX from Unit 4. The HX from U4 to be used to determine the current condition of the active gland cooler heat exchangers. 2. Based on findings, create WOs for replacement of HXs.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		3. Purchase spare HXs as needed based on findings. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009924	1,3,4	33000 33810	HEAT EXCHANGER (COLLECTION) , Cat 1/2	This HX cools D2O collected in the D2O collection tank to prevent vapor locking/cavitation of the D2O collection pumps and to protect resin beads in the purification system.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Corrosion / Fouling (accumulation of deposits) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Thermal Fatigue	Surveillance	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete WO 1418348 &1645320 to replace HXs. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Based on the condition of the replaced HXs, implement PMs to inspect/clean HX at frequency of 4 years, if required.
009926	1,4	33000 33320	HEATER (Bleed Cond), Cat 1/2	Provide heating to HTS bleed condensers.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Thermal Aging		Incremental recommendations for Plant EOL (2020): One-time inspection of heater, and if degraded repair/replace. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
009927	1,4	33000 33120	HEADER / MANIFOLD (33120), Cat 3/4	33120-HD1, HD6, HD7, HD12: Reactor Outlet Headers. 33120-HD3, HD4, HD9, HD10: Reactor Inlet Headers. 33120-HD2, HD5, HD8, HD11: PHT Pump Discharge Headers.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Fatigue / Thermal Fatigue		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Inspection of selected locations for headers and supports per PIP (NA44-PIP-03641.2-00001 for U1 and NA44-PIP-03641.2-00007). Based on inspection results, generate additional WOs for further inspection and/or repair, as required.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Thermal Aging		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Ensure the schedule for inspection of selected locations for headers and supports per PIP (NA44-PIP-03641.2-00001 for U1 and NA44-PIP-03641.2-00007 for U4 is updated to accommodate CO EOL (2024).
009931	1,4	33000 63320	INDICATOR, Cat 1/2	Provide indications of bleed filter flows.	Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009941	1,4	33000 63332 63333	MODULE, Cat 1/2	Execute a part of the logic to control the levels of bleed condenser and D2O storage tank.	Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
009943	1,4	33000 33120	MOTOR (MCP), Cat 2	Drive main HTS pumps which circulate heavy water (D2O) through the boilers.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Lubricant Degradation Radiation Induced Degradation /		Incremental recommendations for Plant EOL (2020): Refurbish sufficient number of removed motors to serve as spares. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0452 - Reactor Building

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010106	1,4	21000 21262	BLOW IN PANEL, Cat 1/2	The blow out panels activate in emergency conditions (e.g. LOCA) to relieve pressure in the overpressure areas in the Reactor Building.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue		Incremental recommendations for Plant EOL (2020): Revise PM 11083 to include inspection of panel 4-21262-BOP2053. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010111	1,2,3,4	21000 21030	EMBEDDED PART, Cat 1/2	Embedded Parts (EPs) are leak-tight sealed penetration through Reactor Building concrete walls or floors for cable, pipe or other component entries.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010113	1,2,4	21000 21032	EMBEDDED PART, Cat 1/2	Embedded Parts are opening in concrete structures for piping to penetrate into the Reactor Building structure.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010114	1,4	21000 21270	HATCH, Cat 3/4	The hatches or openings in reactor building concrete floors are used for the installation and maintenance of equipment.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Radiation Induced Degradation / Radiation Depletion of Material Properties		
010118	1	21000 21270	MOTOR, Cat 3/4	HDM1 is a pneumatic motor which operates the R/B shielding hatch.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Wear Mechanisms – Wear		Incremental recommendations for Plant EOL (2020): Implement a new PM to Lube and inspect the hatch itself or motor to ensure adequate operation and seal inflation. Refer to PM 11169 - 01. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010122	1,4	21000 62127	REGULATOR, Cat 1/2	These components regulate pressure from the instrument air system to the R/B shielding hatch seal inflation supply circuit.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete EC 117700 BOM verification on 1, 4 to ensure spare parts are be readily available. (Current CID for regulator replacement (0000673200) is: H/USER). Incremental recommendations for Plant EOL (2020): Implement a PM to check the set point of the Regulators (Reference PM 117098 - 01). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010129	1,4	21000 21270	VALVE, PRESSURE RELIEF, Cat 1/2	These RVs provide overpressure protection for instrument air supplied to devices in the hatch drive motor controls.	Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Creep and Stress Relaxation		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear		
011237	5,6,7,8	21000	21000 Reactor Building-Structural Concrete - Concrete Dome, Exterior Walls, Pressure walls, Columns, Slabs	The reactor building structural concrete components serves to form part of the containment structure to provide the airtight enclosure and shields staff and the public from radiation hazards.	Good	Corrosion of Embedded Steel / Corrosion of Embedded Steel Corrosion / Chemical Attack Mechanical and Thermal Degradation / Freeze-Thaw Corrosion / General Corrosion Mechanical and Thermal Degradation / Thermal Aging Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011316	5,6,7,8	21000	21000 Reactor Building - Foundations, Concrete	The foundation slab carries all loads from reactor building and forms part of the containment structure providing the bottom of the airtight enclosure.	Good	Corrosion of Embedded Steel / Corrosion of Embedded Steel Miscellaneous / Leaching Calcium Hydroxide	Sampling Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Cracking Due to Expansion/Contraction Corrosion / Chemical Attack Mechanical and Thermal Degradation / Freeze-Thaw		
011317	5,6,7,8	21000	21000 Reactor Building-Foundations, Steel H-Piles	The steel H-piles support the pile cap, which in turn is designed to support the entire RB structure.	Good	Corrosion / General Corrosion Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011348	5,6,7,8	21000 21260	21000 Reactor Building - Seals & Sealants	Elastomeric seals and sealants provide leak tightness for air and/or water penetrations.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO (2024).
011351	5,6,7,8	21000	21000 Reactor Building - Steel Liners	The steel liners on both sides of the shielding wall provide additional shielding to the maintenance personnel in the Fueling Machine Service Room. The steel liners on the East and West Fuelling Machine Vault roofs, through which the embedded re-circulating cooling water piping penetrate. The two steel liners also served as formwork for concrete at the time of construction.	Good	Corrosion / General Corrosion Radiation Induced Degradation / Radiation Embrittlement		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Repair/replace the damaged insulations which are attached to the fueling machine vault roof steel liners. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).

System 0453 - Reactor Regulating System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010131	1,4	63711 63174 63715	AMPLIFIER, Cat 1/2	Amplifier for Reactor Regulating system ion chamber signal. Amplifier for Shutdown System A in-core flux detector signal.	Very Good	Mechanical and Thermal Degradation / Electronic Aging		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Implement new life-cycle capacitor replacement PM's.
010132	1,4	63711 63174	AMPLIFIER, Cat 3/4	Amplifiers provide local indication in Main Control Room from In-Core flux detectors.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging Obsolescence / Immediate Obsolescence Concern		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete one-time amplifier replacement to reach CO EOL (2024).
010135	1,4	63711 63174	DETECTOR, Cat 1/2	The In-core Flux Detectors (ICFD) output a current proportional to the localized fission rate which is used by the RRS for spatial control of the reactor power.	Satisfactory	Radiation Induced Degradation / Radiation Depletion of Material Properties	Calibration	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Replace all detectors that were last replaced before 2004.
010138	1,4	63711 63101 63102	ELEMENT, Cat 1/2	Resistance temperature detectors are used to measure 22 channel inlet temperatures and 390 channel outlet temperatures. Temperature signals are fed to DCC1/2 and used for thermal power calculation & power control.	Good	Mechanical and Thermal Degradation / Thermal Aging Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Elevated Temperature		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010141	1,4	63711 63715	ION CHAMBER, Cat 1/2	Out-of-core ion chamber outputs a current proportional to reactor flux, signal is fed to an amplifier	Satisfactory	Radiation Induced Degradation / Radiation Depletion of Material Properties	Calibration Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				for Reactor Regulating system.				Incremental recommendations for CO EOL (2024): Replace all detectors that were last replaced before 2004.
010142	1,4	63711 63174	MODULE, Cat 1/2	Amplifier module receives input signal from in-core flux detector & outputs to Reactor Regulating system.	Very Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010147	1,4	63711 63171 63174 63715	POWER SUPPLY, Cat 1/2	Reactor Regulating system power supplies for adjuster rod position, In-core Flux Detector amplifiers & AC power transfer panel Channel A/B/C ion chambers.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging	Inspection - Visual SRST - Functional Test	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete replacement of AC Transfer Panels 4-63715-R1A/R1C-PS1 (ref. EC#30104, WO's 1377367 & 1377370), ensure spares are available for 1/4-63715-R1A/B/C-PS1. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete the rest of the lifecycle replacements of power supplies to reach CO EOL (2024).
010153	1,4	63711 63101 63171	TRANSMITTER, Cat 1/2	Differential pressure transmitters produce mA output signal proportional to channel flow, used by ZOTPR program to calculate reactor thermal power. Position sensing potentiometer for Adjuster Rod position provides an input to the DCC.	Good	Mechanical and Thermal Degradation / Electronic Aging		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete Differential Pressure Transmitter replacement under NICR's 77661 & 77549 for U1/4 respectively. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Procure spares for Adjuster Rod position sensing potentiometers (Cat ID 293908).
010154	1,4	63711 63101	VALVE, MANUAL/HAN	These are RRS flow transmitter manifold valves.	Good	Mechanical and Thermal Degradation		Current initiatives that need to be completed for Plant EOL (2020) that are

Connectors are used to connect following components to plant wiring: Adjuster Rod motors, Adjuster Rod position potentiometers, Control Absorber motors, Control Absorber electrical clutches, Control Absorber position potentiometers and RRS Vertical Flux Detectors, cable/connector for VFD assemblies are environmentally qualified.	Good	Mechanical and Thermal Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Thermal Aging	SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach CO EOL (2020). Incremental recommendations for CO EOL (2024): Perform one-time replacement of the VFD cable and ensure spare VFD cable assemblies are available.

System 0454 - Recirculating Cooling Water (RCW)

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010155	1,4	71320 67132	ALARM, Cat 1/2	The flow and temperature indicating alarm meters are used to measure flow and temperature and provides annunciation when low flow or High/Low temperatures are detected in the Recirculated Water System.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010156	1,4	71320 67132	CONTROL, Cat 1/2	The recirculated cooling water temperature at heat exchangers 7132-HX501 and HX502 is controlled by the 67132-T501-TIC1 via associated low pressure service water control valves 7131-CV583 and CV585.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010158	1,4	71320 67132	ELEMENT, Cat 1/2	Temperature and flow elements for the Recirculated Cooling Water system. Temperature elements provide a low voltage signal proportional to process temperature.	Good	Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Electronic Aging	Calibration	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Perform a one-time inspection of 1/4-67132-T501-TE1 and if degraded replace.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				These flow elements are orifice plates used in conjunction with transmitters that measure the differential pressure across the orifice plate to determine the process flow.		Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms – Erosion		<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Implement a PM program to test and inspect these TEs.
010163	1,4	71320 71320	HEAT EXCHANGER, Cat 1/2	To serve as heat sink to cool the demineralized water in the closed loop circuit of the RCW System during unit operation and unit shutdown. The safety function is to provide cooling water supply to support the operation of safety-related systems. Tube failure will result in lake water leak into demineralized water system. Isolation of one HX during summer could result in unit derating.	Poor	Corrosion / Pitting Corrosion Corrosion / Fouling (accumulation of deposits) Corrosion / Stress Corrosion Cracking - Nickel-base Alloys Corrosion / Stress Corrosion Cracking - Austenitic Stainless Steels Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Creep and Stress Relaxation	Clean and Inspect	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Maintain established PM frequency (cessation of repetitive PM deferral history), and complete outstanding WO#2164403 to obtain a spare floating end cap from Unit 2 and WO#03088812 to replace cover gasket. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
010169	1,4	71320 71320	POSITIONER, Cat 1/2	Positioners for Control Valves CV553 & CV554. These valves are modulated by temperature indicating controller's 63332-T19A/B-TIC1 as part of the Bleed	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				Cooler Temperature Control System.		Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Depletion of Material Properties		
010180	1,4	71320 67132 71320	TRANSMITTER, Cat 1/2	1/4-71320-CV553/CV554-AX1 are used to convert the current signal from T19A/T19B-TIC to a pressure signal to control the position of valves CV553/CV554 for the bleed cooler 3332-HX1. 1/4-67132-F501-FT1 are flow transmitters used to determine the gross recirculated water flow. The output is connected to 67132-F501-FIA1 which alarms in the event of low flow (AN-58). 1/4-67132-T501-TT1 are temperature transmitters used to monitor the temperature of the recirculated water system. The output is connected to 67132-T501-TIC1 which modulates CV583 and CV585.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Electronic Aging Radiation Induced Degradation / Radiation Embrittlement		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010189	1,4	71320 71320	VALVE, PNEUMATIC/ PNEUMATIC AC, Cat 1/2	These Air Operated Valves close automatically to isolate the RCW supply to the Bleed Cooler following activation of the service water load shedding circuit	Satisfactory	Corrosion / General Corrosion Fatigue / Mechanical Fatigue	Overhaul/Refurbishment SRST - Functional Test SRST - Stroke Test	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete NICRs to replace Unit 4 MV531/MV560.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				in response to a Class IV Power failure.		Mechanical and Thermal Degradation / Creep and Stress Relaxation Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms – Wear Obsolescence / Immediate Obsolescence Concern	Valve Diagnostics	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010191	1,4	71320 71320	VALVE, PRESSURE REGULATING, Cat 1/2	Pressure regulating valves for air supply to 1/4-71320-CV553/CV554 and 1/4-71320-MV531/MV560. The parent valves control or isolate RCW flow to the PHT Bleed Coolers.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Creep and Stress Relaxation Fatigue / Mechanical Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010193	1,4	71320 71320	VALVE, PRESSURE RELIEF, Cat 1/2	Provide overpressure relief for the heat exchangers/coolers of the various systems supplied by the RCW System.	Very Good	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Component Replacement Inspection - Visual	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011174	5,6,7,8	71320 71320	71320 RCW Heat Exchangers	These Heat Exchanges serve as a heat sink to cool the demineralized water in the closed loop circuit of the RCW System during unit	Satisfactory	Corrosion / Pitting Corrosion	Clean and Inspect	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				operation and unit shutdown. The safety function is to provide cooling water supply to support the operation of safety-related systems. Tube failure will result in lake water leak into demineralized water system. Isolation of one HX during summer could result in unit derating.		Corrosion / Fouling (accumulation of deposits) Corrosion / Stress Corrosion Cracking - Austenitic Stainless Steels Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Creep and Stress Relaxation Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Maintain established PM frequency (to address deferred PMs). Monitor wall losses and leakages, and raise Work Orders as necessary to address aging management issues. <u>Incremental recommendations for Plant EOL (2020):</u> 1. Procure sufficient spare parts to support potential gasket replacements, as needed. 2. Proactively establish procurement requirements for new HX, tube bundle and channel cover to reduce procurement time, should a replacement be required. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011401	5,6,7,8	71320 71320	71320 Recirc Cooling Water (RCW)-Valves - AOV-Standard-CAT1&2	Following a loss of Class IV Power, RCW flow is automatically reduced via a water reduction control circuit. Valves 71320-MV561/MV597 (on the inlet to the motor bearing and pump gland cooling for the HT circulating pumps 33120 P1 to P16) are closed when service water reduction is initiated. Solenoid valves MV561-SV1/MV597-SV1 control the air supply to the actuators of the parent valves.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / Environmental Degradation Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

						/ Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / Fouling (accumulation of deposits)		Replace valves that have not been replaced for 10 years.
011386	5,6,7,8 056, 078, 058, 018	71300 71310 71340	71310, 71340 Service Water Systems – Valves – Manual Gate & Globe – CAT 3&4	These manual valves provide isolation in various applications; HX2 LPSW inlet isolation valve, HPSW P3 discharge isolation valve, RB ACU outlet isolation etc.	Poor	Mechanical and Thermal Degradation / Wear Mechanisms – Wear Mechanical and Thermal Degradation / Wear Mechanisms – Erosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Corrosion / Fouling (accumulation of deposits)		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete work orders; 2789153, 4809944, 3017545, 2795881, 2872114, 3233306, 3212335 and 3217769. <u>Incremental recommendations for Plant EOL (2020):</u> Replace valves as they reach their 10 year life expectancy. <u>Incremental recommendations for CO EOL (2024):</u> Replace valves that have not been replaced for 10 years.
011387	056, 078, 058	71300 71310	71310 Service Water Systems-Valves – MOV – Butterfly – CAT1&2	MV401 is a normally open valve used to throttle flow for frazzle ice protection. MV402/403 and MV404/405 are normally closed valves used to allow RBSW discharge flow to the Screenhouse.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms – Wear Mechanical and Thermal Degradation	Inspection - Internal Inspection - Summerization Program Inspection - Visual Inspection - Winterization Program	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete inspections of 056-71310-MV402/ MV403 and 078-71310-MV404/405. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						/ Wear Mechanisms – Erosion Corrosion / Fouling (accumulation of deposits) Corrosion / Microbiological Influenced Corrosion		Complete a one-time actuator inspection for 056-71310-MV402/403 and 078-71310-MV404/405 similar to PM#18360.
011388	5,6,7,8,056,078	71300 71310 71340	71310 / 71340 Service Water Systems-Valves - AOV-Standard-CAT1&2	The majority of valves in this CG control the flow to the Heat Exchangers (HXs). CV505 is a control valve for generator H2 cooling water, and MV657 is a motorized valve for HP service water.	Poor	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Corrosion / Fouling (accumulation of deposits)	Calibration Overhaul/Refurbishment SRST - Functional Test SRST - Logic Test SRST - Stroke Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are Incremental to current periodic maintenance practices:</u> Complete outstanding WOs: WO for 8-71310-CV585 replacement (WO 4907606), WO for 5-71310-CV583 monitoring temp changes (WO 4907649), WO for 5-71310-CV585 replacement (WO 2508842), WO for 7-71310-CV585 troubleshooting (WO 3067647). Generate WR for 6-71310-CV585 replacement (no WO). <u>Incremental recommendations for Plant EOL (2020):</u> Complete a sample inspection of one CV, based on results repair/replace as necessary and implement further PM activities for remaining CVs. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011389	5,6,7,8	71300 67131 71310 71340	71340 Service Water Systems-Valves - SV-Solenoid Valves-CAT1&2	Electro-mechanical operated valve, position of mechanical plunger is controlled by an electric current flowing through a solenoid to open or close flow of HPSW to LPSW pump motor bearings.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Corrosion / Microbiological Influenced Corrosion	Surveillance	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011390	5,6,7,8	71300 71310 71340	71310 / 71340 Service Water Systems-Valves	Low Pressure Service Water (71310): The pressure regulating valve regulates	Good	Corrosion / Microbiological Influenced Corrosion	Calibration Component Diagnostics	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
			- PRV's- CAT1&2	supply of the ABFP with backup cooling water from the fire protection system. High Pressure Service Water (71340): Pressure regulating valve for supply of backup cooling water to HPSW, CCW & LPSW pump glands and bearings from the domestic water system. High Pressure Service Water (71340): Pressure regulating valve for supply of HPSW to CCW & LPSW pumps for gland and bearing cooling and lubrication.		Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / Fouling (accumulation of deposits) Corrosion / General Corrosion Fatigue / Mechanical Fatigue	Component Replacement SRST - Functional Test SRST - Stroke Test	
011391	5,6,7,8 ,056, 078	71300 71310 71340	71310 / 71340 Service Water Systems-Non Return Valves - CAT1&2	The function of the check valves is to protect against back-flow in the LPSW and HPSW systems. Application examples include; LPSW Strainer discharge, LPSW Pump outlet, HPSW gland supply.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Corrosion / Fouling (accumulation of deposits)	Component Replacement Inspection - Internal Inspection - Non - Intrusive SRST - Functional Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> 1. Complete a one-time practice per the check valve strategy manual P-MAN-04946-00001 for all equipment tags that are not covered by an active PM to reach Plant EOL (2020). 2. Complete all Work Orders and Change Requests in the Action List of the CA. 3. Complete WO's: 2853616, 04781418 02736496, 02733802, 02626810, 03060255, 01703138, 02626810, 02736588 and 2735252. <u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u>

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								No additional practices are recommended to reach CO EOL (2024).
011392	5,6,7,8	71300 67131 71340	71340 Service Water Systems-Cyclone Separators	The cyclone separators remove particulates from the cooling water for the HPSW, Main LPSW, and CCW pumps glands and motor bearing's.	Very Poor	Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Corrosion / General Corrosion		Incremental recommendations for Plant EOL (2020): Implement outstanding actions from ECR 16816, and complete a one-time replacement of all separators. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011393	5,6,7,8	71300 71349	71349 Service Water Systems-Piping-Hoses-CAT3&4	Flexible hoses used on the inlet/outlet of PHT Pump (33120) Stator Cooling.	Poor	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Fretting Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Thermal Aging		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete a one-time replacement of all hoses.
011394	5,6,7,8,056,078	71300 71310	71310 Service Water Systems-Valves - Cast Iron Manual Butterfly - CAT1&2	The valves in this CG are manual isolation valves for LPSW pumps and strainers. V370 is a normally closed isolator for MV15 bypass.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Corrosion / Fouling (accumulation of deposits)	Inspection - Visual SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Replace 5, 7, 8-71310-V370. Replace or refurbish six other valves in this CG based on OPEX. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011395	5,6,7,8	71300 71310	71310 Service Water Systems-Valves - Cast	These valves are manual isolators for service water loads such as 73110-	Good	Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
			Iron Manual Gate - CAT1&2	ACU30/ACU31, 32110-HX1/HX2.		Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		
011396	5,6,7,8	71300 71310 71340	71310, 71340 Service Water Systems - Valves - Cast Iron Manual Diaphragm - CAT3&4	Manual diaphragm valves in this CG are main and branch isolators.	Poor	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		<u>Incremental recommendations for Plant EOL (2020):</u> Perform a one-time replacement of valves as they approach their 10 year service life. <u>Incremental recommendations for CO EOL (2024):</u> Perform a one-time replacement of valves that have not been replaced for 10 years.
011397	5,6,7,8	71300 71310 71340	71310, 71340 Service Water Systems - Valves - Cast Iron Manual Butterfly - CAT3&4	Manual valves in this CG are used for isolation purposes.	Poor	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Deterioration of Material (Wiring,		<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete outstanding WOs WO#: 3129325, 1478301, and 03129325). <u>Incremental recommendations for Plant EOL (2020):</u> Perform a one-time replacement of valves as they approach their 10 year service life. <u>Incremental recommendations for CO EOL (2024):</u> Perform a one-time replacement of valves that have not been replaced for 10 years.

						Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Perform a one-time replacement of valves that have not been replaced for 10 years.
011400	5,6,7,8	71300 71340	71310, 71340 Service Water Systems - Valves - Manual Gate & Globe - Cat 1 & 2	Valves provide isolation as follows: 5/6/7/8-71310-V522 LPSW to RB ACU'S & FM HX1E 5/6/7/8-71340-V13 Fire Header Water Supply 5/6/7/8-71340-V30 HPSW to Cyclone Separator Isolation Valve 5/6/7/8-71340-V42 HPSW P1 Gland Supply Isolation Valve 5/6/7/8-71340-V43 HPSW P2 Gland Supply Isolation Valve 6-71340-V851 Emergency Boiler Water System Isolation Valve 7-71340-V851 Emergency Boiler Water System Isolation Valve	Poor	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Inspection - Visual Lubrication	<u>Incremental recommendations for Plant EOL (2020):</u> 1. Perform a one-time replacement of valves as they approach their 10 year service life. 2. Procure spare CAT ID 123565. <u>Incremental recommendations for CO EOL (2024):</u> Perform a one-time replacement of valves that have not been replaced for 10 years.
011410	058	71300	Service Water Systems-Cable - 4.16 kV, 600V, 125V, 250V - Power Cables	Cables feed power from source to load.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Radiation Induced Degradation / Radiation Embrittlement	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011482	058	71300	71650 Service Water Systems - Chlorine Piping - Cat3&4	The buried chlorine piping carries lake water for Low Pressure Service Water (LPSW), Emergency Water System, and Screen Wash	Satisfactory	Corrosion / Pitting Corrosion Corrosion / General Corrosion	Surveillance	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				(SW) systems. The chlorinated piping is for protection against Zebra mussels and biofouling.		Mechanical and Thermal Degradation / Wear Mechanisms - Erosion		
011530	5,6,7,8	71300 71340	71340 Main CLIV HPSW Pump Motors-4kV	The CLIV High Pressure Service Water (HPSW) Pump Motors drive the CLIV HPSW Pumps and are used to take water from the LPSW pumps to loads requiring cooling water above 274' elevation primarily in the reactor building. The HPSW pumps also supply water to the fire protection system.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Thermal Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

System 0458 - Shield Cooling System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010353	1,4	34100 34110	EXPANSION JOINT	The expansion joints allow for movement due to vibration and thermal expansion/ contraction between the inlet piping and the Calandria end shield.	Satisfactory	Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Cracking Due to Cyclic Loading Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Thermal Aging	Surveillance	Incremental recommendations for Plant EOL (2020): Add a task to routine RB operator rounds to perform a visual inspection of the expansion joints. Look for signs of mechanical/thermal degradation of the joints, as well as material deterioration resulting in cracking and failure of the pressure boundary. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010354	1	34100	EXPANSION JOINT	The expansion joints allow for movement due to vibration and thermal expansion / contraction between the inlet piping and the calandria end shield.	Satisfactory	Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Cracking Due to Cyclic Loading Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Thermal Aging		Incremental recommendations for Plant EOL (2020): Add a task to routine RB operator rounds to perform a visual inspection of the expansion joints. Look for signs of mechanical/thermal degradation of the joints, as well as material deterioration resulting in cracking and failure of the pressure boundary. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010355	1,4	34100 34110	VALVE, PRESSURE RELIEF	These RVs provide over pressure protection for the shell side of the main end shield cooling heat exchangers.	Very Good	Mechanical and Thermal Degradation / Creep and Stress Relaxation Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010356	1,4	34100 34310 63431	VALVE, CONTROL, Cat 1/2	CV provides bubbler flow for sump level measurement.	Satisfactory	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Overhaul/Refurbishment SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for CO EOL (2024): 1. Re-activate PMs to calibrate the actuator & components every 728 days. 2. Complete a one-time actuator overhaul / replace sub-components for all control valves.
010357	1,4	34100 34310	RELAY, Cat 1/2	Timer relays used in the Emergency Coolant Injection system FM Sump isolation valve Control Circuits.	Satisfactory	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging Obsolescence / Immediate Obsolescence Concern	Predictive Maintenance - Thermography	Incremental recommendations for Plant EOL (2020): 1. Implement a PM to periodically replace the relays. 2. Implement a PM to perform periodic inspection and testing. 3. Populate model information and Cat ID in Asset Suite for 1/4-34310-MV5-R61. 4. Contact vendor to confirm spare part availability for 1/4-34310-MV5-R61 following identification of the model(s). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010360	1,4	34100 34310	VALVE, PRESSURE REGULATING, Cat 1/2	The PRV's regulate instrument air supply pressure to their respective MVs.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Creep and Stress Relaxation Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue	Overhaul/Refurbishment SRST - Functional Test SRST - Logic Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010361	1,4	34100 34310	VALVE, PRESSURE	The relief valves provide overpressure protection to their respective MV.	Good	Mechanical and Thermal Degradation / Deterioration of	Inspection - Visual Overhaul/Refurbishment	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life

System 0459 - Shutdown Cooling System

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010375	1,4	33410 33410	ACTUATOR, Cat 1/2	These motorized actuators are used to open and close the shutdown cooling System isolation valves 1/4-33410-MV1, -MV2, -MV4 and -MV5, or -MV7, -MV8, -MV10 and -MV11.	Very Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Lubricant Contamination Mechanical and Thermal Degradation / Lubricant Degradation Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Overhaul actuators for EQ qualification that have not been overhauled prior to 1984.
010377	1,4	33410 63340	CONTROL, Cat 1/2	Control the shutdown cooling heat exchangers outlet temperature through modulating the service water valve and also provide indication of the temperature at the main control room.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Electronic Aging		Incremental recommendations for Plant EOL (2020): Perform proactive replacement of controller display screens. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010378	4	33410 63340	CONVERTER, Cat 1/2	Convert potentiometer signal to current signal to enable operators to manually control the outlet temperature of shutdown cooling heat exchanger.	Very Good	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging	SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010379	1,4	33410 33410 63340	ELEMENT, Cat 1/2	Measure the temperatures of shutdown cooling loops and pump seals.	Good	Fatigue / Thermal Fatigue Fatigue / Environmentally-Assisted Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Calibration SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010380	1,4	33410 33410	HEAT EXCHANGER, Cat 1/2	The heat exchangers act as a shutdown heat sink for the PHT system residual heat when HTS is below 350degF Additional functions include: - Emergency cooldown of the heat transport system. - Provide a flowpath for emergency coolant injection/recovery.	Good	Corrosion / Fouling (accumulation of deposits) Mechanical and Thermal Degradation / Creep and Stress Relaxation Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Fretting	Inspection - Ultrasonic Testing Inspection - Visual SRST - Functional Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete the implementation of EC's 107659 and 108155 to install new leak off valves for the isolators on 1, 4-33410-HX-1, 2, 3, 4. <u>Incremental recommendations for Plant EOL (2020):</u> 1. Perform a one-time inspection of 1, 4-33410-HX1, 2, 3, 4 to include inspection of tubes for cleanliness and eddy current inspection. 2. Complete internal and external inspections of the shell for MIC on 1, 4-33410-HX1, 2, 3 and 4 every outage. 3. Initiate a one-time inspection and tube cleaning of 1, 4-33410-HX5, 6, 7, 8. <u>Incremental recommendations for CO EOL (2024):</u> 1. Initiate new PMs for tube cleaning and internal inspections of 1, 4-33410-HX5, 6, 7, 8 every 4 years. 2. Complete shell replacements on 1-33410-HX1, 2.
010381	1,4	33410 63340	INDICATOR, Cat 1/2	Provide indication of shutdown cooling pump suction pressure.	Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Mechanical and Thermal Degradation / Thermal Aging		
010385	1,4	33410 33410	MOTOR, Cat 1/2	The pump motors are used to drive the shutdown cooling pumps which circulate heavy water (D2O) in the Heat Transport System (HTS) following unit shutdown.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Thermal Aging	Component Diagnostics Lubrication Overhaul/Refurbishment Predictive Maintenance - Vibration Monitoring	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Reinstate Baker Analysis and Megger Check for pump motors (e.g. PM #6709-/10/3).
010388	1,4	33410 33410	PUMP, Cat 1/2	The shutdown cooling system pumps are used to circulate main heat transport system fluid to the shutdown cooling system heat exchangers when HTS temperature is below 350degF. Additional functions include: - Emergency cooldown of the heat transport system. - To provide a flowpath for emergency coolant injection/recovery.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Visual Lubrication Predictive Maintenance - Thermography Predictive Maintenance - Vibration Monitoring	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010395	1,4	33410 33410	SWITCH, Cat 1/2	Operates associated pumps and valves of the Shutdown Cooling System.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010396	1,4	33410 33410	SWITCH, Cat 3/4	Operates associated MVs of the Shutdown Cooling System.	Very Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

						Seals, Gaskets, O-rings etc.)		
011454	5,6,7,8	31730 63173	63173 - Shutdown System 1 (SDS1)-SIGNAL CONDITIONER -CAT 1&2	The ESPM, via relay logic, stops power to S/A drive motor when the rod has reached a predetermined position limit when driving in either the "IN" or "OUT" direction. As well, it provides analog position indication of the shut off rod to a panel meter in the control room and the DCC's.	Poor	Thermal Aging / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Obsolescence / Immediate Obsolescence Concern		Incremental recommendations for Plant EOL (2020): Perform proactive replacements on Unit 7 & 8. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011468	5,6,7,8	31730 63721	63721 Shutdown System 1 (SDS1)-Independent PCB-S/R	The Rod Ready circuit displays the number of SORs outside the core, ready for a reactor trip. The circuit causes an alarm if the number is less than 26. The rod ready circuit is a duplicated system consisting of two identical rod ready chassis and two identical digital panel meters with alarms.	Poor	Thermal Aging / Thermal Aging Obsolescence / Immediate Obsolescence Concern	Inspection - Indication Checks SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Perform proactive replacements on Unit 7 & 8. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011469	5,6,7,8	31730 31741 63170 63173	31741, 63170, 63173 Shutdown System 1 (SDS1)-Reactivity Deck Receptacles / Connectors-Various Voltages A.C. and D.C.	Cables and connectors in this CG are used to connect the following components to plant wiring: Shutoff Rod motors, Shutoff Rod position potentiometers, Shutoff Rod "Rod Ready Switches", Shutoff Rod electrical clutches and SDS1 Vertical Flux Detectors.	Good	Mechanical and Thermal Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

System 0461 - Shutdown System 2 (SDS2)

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011128	5,6,7,8	34710 34710	34710 LISS Poison Addition & Sampling Pumps	Pumps used to mix, transfer, sample and adjust the gadolinium concentration in the main LISS injection Tanks.	Good	Mechanical and Thermal Degradation / Wear Mechanisms - Wear Obsolescence / Immediate Obsolescence Concern Corrosion / General Corrosion	SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Acquire a spare pump for 34710-P1. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011212	5,6,7,8	34710 63470 63738	63730 Shutdown System 2 (SDS2)-TRANSMITTER-ANALYTICAL-CAT 1&2	Fisher Temperature Transmitters are part of measurement loop for Heat Transport High Temperature Trip.	Satisfactory	Mechanical and Thermal Degradation / Thermal Aging Mechanical and Thermal Degradation / Radiation Embrittlement		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011245	5,6,7,8	34710 63470	63470 Shutdown System 2 (SDS2) Conductivity Probes	Conductivity probes/cells are used to monitor the conductivity of the liquid in each of the six injection lines from the LISS poison injection tanks during normal operation.	Good	Galvanic Corrosion / Galvanic Corrosion Wear Mechanisms - Erosion / Wear Mechanisms - Erosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011256	5,6,7,8	34710 34710	63730 SDS2 Check Valves	The NV's prevent instrument air back-flow into their associated LISS MV's in the event of a loss of instrument air supply. -NV13, 14 and 15 function as non-return valves and prevent the loss of helium from the helium header through the vent line. - NV217 and NV54 prevent reverse flow in the P2 discharge line and RB ventilation respectively. - NV9 is a check valve which prevents depressurization of the helium supply tank 3470-TK10 if the line upstream of	Satisfactory	Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Erosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / Fouling (accumulation of deposits) Corrosion / General Corrosion	Component Replacement Inspection - Internal Inspection - Non - Intrusive Leak Test Overhaul/Refurbishment	Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Complete all active work orders to replace and/or inspect valve internals. Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete one-time replacement of 6-34710-NV217 and 8-34710-NV15.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				the tank is depressurized accidently. Failure of this NV to open can delay start-up due to the inability to repoise the LISS after maintenance.				
011279	5,6,7,8	34710 34710 63734 63736 63739 63753 63754 63756	34710 Shutdown System 2 (SDS2)-Valves - Manual-Criticality Category 1 (RS2)	This commodity group contains a number of manually operated isolation valves that perform the following functions: Drain, Vent, Recirculation, Suction and Supply.	Good	Corrosion / Chemical Attack - Aggressive Mechanical and Thermal Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Wear Mechanisms - Wear	Component Replacement Leak Test SRST - Functional Test	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011280	5,6,7,8	34710 34710 63734 63736 63737 63739 63753 63754 63756	63730, 34710 Shutdown System 2 (SDS2) PRVs - CAT1&2	The PRV's are required to supply SDS2 (Liquid Injection Shutdown System) with a regulated air supply for SDS2 AOV operation and testing of process trip instrumentation. PRV7 supplies regulated helium pressure from bottle supplies to TK10.	Good	Thermal Aging / Thermal Aging Mechanical and Thermal Degradation / Wear Mechanisms - Wear Corrosion / General Corrosion Fatigue / Mechanical Fatigue	Logic Test Overhaul/Refurbishment	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011281	5,6,7,8	34710 31760 34710 63739 63754	31760 Shutdown System 2 (SDS2)-Piping-Piping Components-CAT1&2	Components in this CG includes instrument tubing, rupture disks, restricting orifices, manifold and filter assemblies. The header feeds helium through 1" SS piping to the six poison tanks in turn connected via 2-1/2" stainless steel pipes to the core horizontal injection nozzles. These components also facilitate the movement of helium and pressurized injection of D2O poison into the reactor core.	Good	Environmentally-Assisted Fatigue / Environmentally-Assisted Fatigue Thermal Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Creep and Stress Relaxation Corrosion / Fouling (accumulation of deposits)	Inspection - Internal Inspection - Visual SRST - Functional Test	Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): Complete mechanical design evaluation of the LISS Piping for continued operation and implementation of any findings.

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
011282	5,6,7,8	34710 34710 63753	34710 Liquid Injection Shutdown System (LISS) Tanks	The LISS tanks store the poison solution in readiness for injection. These tanks have a Polyethylene ball used for sealing. Other tanks and vessels in this CG are the helium supply tanks, instrument air tanks, gadolinium sample cabinet tanks, etc.	Good	Corrosion / General Corrosion Wear Mechanisms Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Pressure Test Inspection - Sampling Test Inspection - Visual Leak Test	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> 1. Perform internal inspections of one of the LISS Tanks in each of the Units (5/6/7/8-34710-TK1, TK2, TK3, TK4, TK5, and TK6). 2. Perform an internal inspection of the mixing tanks in each of the units (5/6/7/8-34710-TK11). 3. Perform an internal inspection of the Helium Supply Tank (5/6/7/8-34710-TK10) in each of the units.
011296	058	34710	34710 Shutdown System 2 (SDS2) - 600 Volt - Power Cables	Major Equipment associated with these cables are: Liquid Injection Poison Pumps (Unit-3471-PM1 / PM2).	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Radiation Embrittlement	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

System 0462 - Shutdown System A (SDSA)

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010405	1,4	63721 63104	ACTUATOR, Cat 1/2	This CG contains pneumatic actuators that retract the Ion Chamber Shutter Assembly. In its normal position, the shutter partially shields the Ion Chamber and thus reduces the thermal neutron flux at its location. The movement of each of the neutron-absorbing shutters creates a local neutron flux disturbance which is used to monitor the static and dynamic response of the associated Ion Chamber and its associated electronics.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Radiation Induced Degradation / Radiation Depletion of Material Properties		Current practices are adequate. No additional practices are recommended to reach CO EOL (2024).
010406	1,4	63721 63101 63312 63336 63721 63723 63725 63744 64323	ALARM, Cat 1/2	Most of the alarm units (including indication) responsible for process and neutronic trip coverage. HTLGF and some HTHP/LP units are for alarm only (not indication).	Good	Mechanical and Thermal Degradation / Electronic Aging		<u>Incremental recommendations for Plant EOL (2020):</u> Complete proactive replacement of obsolete/problematic Versatile meters. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
010407	1,4	63721 63725	AMPLIFIER, Cat 1/2	Generate linear, Log N and Log N Rate signals which are used for annunciation and trip logic.	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration SRST - Functional Test	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach CO EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> Initiate EQ PM to replace the amplifiers, as the amplifiers will be reaching their qualified life.
010409	1,4	63721 63716	ANALYZER, Cat 1/2	Single Channel Analyser is part of start-up instrumentation loop which measures neutron flux from when the reactor power is below the rationality limits of the Ion Chambers.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging	SRST - Functional Test	<u>Incremental recommendations for Plant EOL (2020):</u> No additional practices are recommended to reach Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u>

								Perform one-time replacement.
010412	4	63721 63720	CAPACITOR, Cat 1/2	4-63720-CAP/Dx/Ex/Fx reduce or eliminate relay 63720-R81 contact bounce when R81 is energized/de-energized. 4-63720-CAP1/2/3 is part of the RC circuits which provide the rate of change of the linear power to the trip alarm unit. The capacitance of the RC circuit is provided with capacitor (external to the amplifier), and the resistance by the internal impedance of the trip alarm unit.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging	SRST - Functional Test SRST - Logic Test	Incremental recommendations for Plant EOL (2020): Implement a comprehensive capacitor monitoring (thermography) PMs. Incremental recommendations for CO EOL (2024): Implement proactive replacement PMs.
010413	1	63721 63720	CAPACITOR, Cat 3/4	The capacitor is part of the RC circuits which provide the rate of neutron power changes to the SDSA High Linear N Rate trip alarm unit. The capacitance of the RC circuit is provided with capacitor (external to the amplifier and the trip alarm unit), and the resistance is by the internal impedance of the trip alarm unit.	Very Good	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010417	1,4	63721 63721	COMPUTER, Cat 1/2	The function of Dump Arrest Unit (DAU) is to prevent moderator dump following successful shutoff rod operation or to open the dump valves to allow the moderator to dump when the reactor power rundown is inadequate.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010418	1,4	63721 63744	CONTROL, Cat 1/2	Control the valves 1/4-63744-CV1 to perform Boiler Feedline Low Pressure trip tests.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging Mechanical and Thermal Degradation / Thermal Aging		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010419	1,4	63721 63721	CONVERTER, Cat 1/2	The signal converters are used to convert the 0 to -10 V output signal from the SDSA ion chamber amplifier to a 0 to +5 V signal for Dump Arrest Unit to use.	Satisfactory	Mechanical and Thermal Degradation / Electronic Aging		Incremental recommendations for Plant EOL (2020): Perform one-time proactive replacement to address the EPRI recommended 10 year age related limit. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010420	1,4	63721 63721 63725	DETECTOR, Cat 1/2	The flux detectors provide an analog signal representative of the neutron flux in the vicinity of each detector in the reactor core. These localized neutron flux signals are used to determine reactor power when the unit is operating at Full Power and trip the reactor when reactor power exceeds neutron overpower trip setpoint. The ion chambers detect thermal neutrons and generate a signal proportional to the Thermal neutron flux at their location, which is sent to the amplifier.	Satisfactory	Radiation Induced Degradation / Radiation Depletion of Material Properties	Calibration SRST - Logic Test	Incremental recommendations for Plant EOL (2020): Inspect all detectors, if needed repair/replace. Incremental recommendations for CO EOL (2024): Replace all ICFD.
010423	1,4	63721 63101 63312	ELEMENT, Cat 1/2	Generate signals representing reactor channel flows or outlet header temperatures.	Good	Mechanical and Thermal Degradation / Thermal Aging Radiation Induced Degradation / Radiation Embrittlement Corrosion / Flow induced wear of the leading edge		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010425	1,4	63721 63101 63173	INDICATOR, Cat 1/2	Provide indications of HTS flows, shutoff rod positions, or shutoff rod clutch currents.	Good	Mechanical and Thermal Degradation / Electronic Aging	Calibration SRST - Functional Test	Incremental recommendations for Plant EOL (2020): Complete one-time replacement of meters and position indicators.

011290	058	54600	54600, 54660 Standby Generators - Cables - 600V, 125V, 250V	Cables feed power / control signals from source to load.	Good	Fatigue / Mechanical Fatigue Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Inspection - Condition Monitoring Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011305	056, 078	54600 54600	54600 Standby Generators- Standby Generator	This CG covers several components that are part of the SG assembly. This includes: "Power Turbine" (PT) converts kinetic energy produced by the Gas Producer into rotational kinetic energy (torque). "Gear Box" is connected directly to the Power Turbine and reduces the P/T speed from 7500 RPM to 1800 RPM for the Generator. "Electric Generator" converts rotational kinetic energy into electrical energy. Each generator is capable of delivering Class III power to two units during a complete loss of class IV power.	Good	Fatigue / High Vibrations Fatigue / Thermal Fatigue Mechanical and Thermal Degradation / Wear Mechanisms - Wear Fatigue / Mechanical Fatigue Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)	Overhaul/Refurbishment Predictive Maintenance - Electrical Testing Predictive Maintenance - Vibration Monitoring SRST - Functional Test	<u>Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices:</u> Complete WO's for one-time inspections of power turbines (i.e. WO's 02696119, 02696120, 02696121, 02696116, 02696117 and 02696118). <u>Incremental recommendations for Plant EOL (2020):</u> Complete a one-time inspection of generator on 056 bank, similar to inspection performed on 078 bank (078-SG2, WO 2146890). Results of inspection to determine if corrective actions or further inspections on other SGs are required. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
011337	056, 078	54600	54660 Standby Generators Fuel Oil - Underground Piping	Fuel Oil System pipes supply fuel oil from the storage tanks to the Combustion Turbines that drive the Standby Generators	Satisfactory	Corrosion / Pitting Corrosion Corrosion / General Corrosion	Inspection - Buried Piping Program	Continue current practices. No additional practices are recommended to reach CO EOL (2024).

System 0466 – Structures

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010818	014	21000	Calandria Vault, Vault Structure Cooling, Shield Tank - Structural Concrete - Concrete Walls and Slabs	The main purpose of the vault structure is to provide shielding against the radiation from an operating unit and to provide structural support to Calandria in its operating and non-operating modes. The Calandria Vault and its demineralized light water provides operational and shutdown shielding for the immediately surrounding areas. The water also provides cooling for the calandria assembly and the vault concrete.	Good	Corrosion / Corrosion of Embedded Steel Mechanical and Thermal Degradation / Thermal Aging Radiation Induced Degradation / Radiation Embrittlement Mechanical and Thermal Degradation / Leaching Calcium Hydroxide		<u>Incremental recommendations for Plant EOL (2020):</u> Conduct one-time visual inspection of accessible areas of Calandria Vault structural concrete for Pickering NGS P1,4 to inspect the severity of any potential damage and identify mitigating/remedial measures needed to be carried out. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).
010819	014	21000	Calandria Vault/Vault Structure Cooling/Shield Tank - Embedded Parts and Supports	Reactivity Mechanism Deck Supports and Connections: The Reactivity Mechanism Deck is part of the reactor vault assembly. It closes the top of the calandria vault, thus providing a boundary between the vault and the boiler room atmospheres. The deck is supported by the calandria vault and it seals the vault atmosphere by seal plates welded to both the lower plate and the vault liner. End Shield Manhole: A manhole is located at the top of each End Shield, passing through both the support shell and the End Shield shell. It was used to provide access during fabrication and ball filing and was permanently sealed by welded cover plates.	Good	Radiation Induced Degradation / Radiation Embrittlement Corrosion / Corrosion of Embedded Steel		<u>Incremental recommendations for Plant EOL (2020):</u> Conduct one-time visual inspection of accessible areas to confirm the suitability of the components for Plant EOL (2020). <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010820	014	21000	Calandria Vault/Vault Structure Cooling/Shield Tank - Seals & Sealants	*Atmospheric SS Seals & Rubber Seals The Atmospheric seals together with the silicone rubber seals at elevation 317'-6" (extending to elevation 324'-0"), separate the east and west F/M room atmospheres. The Elastomer Silicone rubber seals at elevation 274'-0" prevent liquid spills into the 25mm (1inch) and 76mm (3inch) gaps around the Calandria Vault. Integrity of the barrier/seal has a direct effect on environment inside the Calandria Vault. *Inconel 600 Manhole Seal The Inconel 600 Manhole expansion joint seal is necessary to allow free movement of the seal plate due to a temperature differential. *Shear Key Joints The Horizontal keys (elev. 312'-0") and vertical keys (elev. 312'-0") in north and south cross-walls are provided to resist forces due to earthquake and unbalanced header failure pressure on the east or west face of the vault.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction		<u>Incremental recommendations for Plant EOL (2020):</u> 1. Complete one-time inspection of seals. 2. Replace the elastomeric seals if required. 3. Replace seals if they show advanced degradation. <u>Incremental recommendations for CO EOL (2024):</u> 1. Replace the elastomeric seals if required. 2. Replace seals if they show advanced degradation.
010821	014	21000	Calandria Vault/Vault Structure Cooling/Shield Tank-Liners - Steel Liners	Steel liner is a crucial part of the Calandria shielding system and provides a leak-tight seal for containment of the vault demineralised light water.	Good	Corrosion / General Corrosion		<u>Incremental recommendations for Plant EOL (2020):</u> Conduct one-time inspection for Pickering NGS P1,4 to verify if there is no evidence of component failure or degradation discovered. <u>Incremental recommendations for CO EOL (2024):</u> No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010822	014	21000	Calandria Vault/Vault Structure Cooling/Shield Tank-Penetrations - Steel Sleeves Surrounding Concrete Vault Openings	With the exception of the large diameter opening in each end shield wall and the rectangular opening in the roof slab the only other openings and penetrations in the vault wall are to provide support for moderator and other systems piping. These penetrations and their associated embedded parts for piping and other systems are designed to contain the shield water within the confines of the Calandria Vault.	Good	Radiation Induced Degradation / Radiation Embrittlement Corrosion / General Corrosion		Current initiatives that need to be completed for Plant EOL (2020) that are incremental to current periodic maintenance practices: Maintain demineralized light water shield at a pH of 10.0 to 10.5 and a conductivity of 10 to 100 micro mhos/cm. Chemical oxygen scavenging also takes place. Incremental recommendations for Plant EOL (2020): Perform one-time visual inspection of accessible areas and local leakage testing to confirm components' suitability. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010823	0	21000	Cooling Water Intake & Outfall - Foundations, Steel - Piles	The function of steel piles is to provide structural supports for the structures above by transferring the load to bedrock.	Good	Corrosion / General Corrosion Mechanical and Thermal Degradation / Cracking Due to Cyclic Loading		Continue current practice. No additional practices are recommended to reach CO EOL (2024).
010824	0	21000	Cooling Water Intake & Outfall - Foundations, Concrete - Footings	The concrete foundations for the trash removal area are designed to support the trash removal structure. The CW supply pipe anchor blocks provide support for the pipes that carry cooling water to the condenser units.	Good	Corrosion / Chemical Attack Mechanical and Thermal Degradation / Freeze-Thaw Mechanical and Thermal Degradation / Leaching Calcium Hydroxide Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction Corrosion / Corrosion of Embedded Steel		Continue current practice. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010825	0	21000	Cooling Water Intake & Outfall - Structural Concrete - Concrete Slabs, Piers, Walls	Provides lake water to the Cooling Water	Good	Mechanical and Thermal Degradation / Silt build-up and zebra mussel infestation Corrosion / Chemical Attack Mechanical and Thermal Degradation / Leaching Calcium Hydroxide Corrosion / Abrasion, Erosion and Cavitation Corrosion / Corrosion of Embedded Steel		Incremental recommendations for Plant EOL (2020): Perform one-time inspection on accessible concrete structures as per U.S.NRC Regulatory Guide 1.127 Inspection of Water-Control Structures Associated with Nuclear Power Plants. Incremental recommendations for CO EOL (2024): Conduct a detailed in-situ investigation during the next station outage to check the condition of the buried concrete and evaluate its structural safety and operational adequacy.
010826	018	21000	Relief Ducts - Foundations - Concrete Footings	The foundations are designed to support the PRD piers and frames which support the main relief duct structure.	Good	Corrosion / Chemical Attack Mechanical and Thermal Degradation / Freeze-Thaw Mechanical and Thermal Degradation / Leaching Calcium Hydroxide Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction Corrosion / Corrosion of Embedded Steel		Continue current practices. No additional practices are required to reach CO EOL (2024).
010827	018	21000	Relief Ducts - Foundations, Steel	The steel H-piles are designed to support the pile caps, which in turn support the PRD piers, frames and the main relief duct.	Good	Fatigue / Fatigue due to Vibration Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010828	018	21000	PRD - Bearing Plates & Sliding Joints	The intended function of bearing plates/sliding joints is to allow for bearing support, as well as East-West movement of the Pressure Relief Duct.	Good	Corrosion / Fouling (accumulation of deposits) Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010829	018	21000	PRD Structure and Seals	Concrete Structure: The PRD structure connects the four Pickering “B” units and four Pickering “A” units to the common VB via ‘bulkheads’. In an accident event, a large RB pressure build-up occurs and contaminants such as radioactive fission products including tritium could be released into the PRD to be transferred and contained in the VB. Seals and Sealants: The joints in the PRD box section are designed to allow differential settlement, longitudinal thermal contraction and expansion, and facilitate construction. Steel Parts: The steel parts, including embedded structural steels, clamping plates, bolts, washers, and tendons, are a portion of the joint assembly. They are designed for clamping the rubber seals to be firmly held in place without leakage.	Good	Mechanical and Thermal Degradation / Freeze-Thaw Mechanical and Thermal Degradation / Self Loosening Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction Corrosion / General Corrosion Corrosion / Corrosion of Embedded Steel		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010830	014	21000	Reactor Building - Foundations, Concrete	The foundation slab serves two main purposes. Firstly, to support the loads from the interior and exterior structure of the Reactor Building. Secondly, to form part of the containment structure and provide the	Good	Corrosion / Chemical Attack Mechanical and Thermal Degradation / Freeze-Thaw		Continue current practice. No additional practices are recommended for CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				bottom of the airtight enclosure. Therefore, the RB foundation slab forms part of the containment system and is designed to prevent leakage in the event of any postulated accident in the reactor or associated systems		Mechanical and Thermal Degradation / Leaching Calcium Hydroxide Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction Corrosion / Corrosion of Embedded Steel		
010831	014	21000	Reactor Building - Seals & Sealants	Elastomeric seals and sealants provide leak tightness for air and/or water penetrations.	Good	Radiation Induced Degradation / UV exposure Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.)		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010832	014	21000	Reactor Building - Steel Liners	(1) The steel liners are designed to provide additional shielding to the maintenance personnel in the F/M Service Rooms. Each shielding window allows remote viewing of the fuelling machine during fuel handling operation. (2) On the East and West Fuelling Machine Vault Roofs The steel liners on the East and West Fuelling Machine Vault roofs, through which the embedded re-circulating cooling water piping penetrate. The two steel liners also served as formwork for concrete at the time of construction.	Good	Radiation Induced Degradation / Radiation Embrittlement Corrosion / Corrosion of Embedded Steel		Continue current practice. No additional practices are recommended to reach CO EOL (2024).

TETRA TECH

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
010833	014	21000	Reactor Building-Foundations, Steel H-Piles	The steel H-piles support the pile cap, which in turn is designed to support the entire RB structure.	Good	Corrosion / Chemical Attack Fatigue / Fatigue due to Vibration Corrosion / General Corrosion Fatigue / Environmentally-Assisted Fatigue		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010834	014	21000	Reactor Building-Structural Concrete - Concrete Dome, Exterior Walls, Pressure walls, Columns, Slabs	The reactor building encloses the reactor with its fuel loading and discharge equipment, and the entire primary heat transport and moderator systems. It shields staff from radiation, and together with the vacuum building and pressure relief duct, acts as containment following accidents.	Good	Corrosion / Corrosion of Embedded Steel Mechanical and Thermal Degradation / Elevated Temperature Mechanical and Thermal Degradation / Freeze-Thaw Fatigue / High Vibrations Fatigue / Thermal Fatigue Corrosion / Chemical Attack		Continue current practices. No additional practices are recommended for CO EOL (2024).
010835	018	21000	VB/Emergency Water Tank & Spray System - Foundations, Concrete	The pile cap is designed to support the entire VB structure and serve as the floor slab of VB basement	Good	Corrosion / Chemical Attack Mechanical and Thermal Degradation / Freeze-Thaw Mechanical and Thermal Degradation / Leaching Calcium Hydroxide Mechanical and Thermal Degradation / Cracking Due to		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
						Expansion or Contraction Corrosion / Corrosion of Embedded Steel		
010836	018	21000	VB/Emergency Water Tank & Spray System - Foundations, Steel	The steel H-piles support the pile cap, which in turn is designed to support the entire VB structure and serves as the floor slab of the VB basement.	Good	Mechanical and Thermal Degradation / Cracking Due to Cyclic Loading Corrosion / General Corrosion		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010837	018	21000	VB/Emergency Water Tank & Spray System - Pre-Stressed Steel	The horizontal pre-stressed cables keep the ring girder in longitudinal compression and ensure that no tensile stresses can exist in the perimeter under any design condition. Crack paths are therefore closed and corrosion and leakage minimized. The vertical post-tensioned rods add compressive stresses in addition to the self-weight of the ring girder onto the upper part of the VB wall. The joint between the ring girder and the perimeter wall is therefore closed and leakage minimized. The horizontal post-tensioned rods hold the buttress walls onto the VB wall by creating a large compressive stress and resultant friction force at the interface. This friction force counteracts the self-weight of the Buttress Walls, loads from the supported piping, and seismic loads.	Good	Mechanical and Thermal Degradation / Creep and Stress Relaxation Mechanical and Thermal Degradation / Shrinkage Corrosion / Corrosion of Embedded Steel		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
010838	018	21000	VB/Emergency Water Tank & Spray System -	(1) Elastomeric Roof Seals provide continuation of the containment boundary between structurally	Good	Mechanical and Thermal Degradation / Self Loosening		Continue current practices No additional practices are recommended to reach CO EOL (2024).

Complete WOs 2810540 & 2956861 to do a post-mortem inspection of 0-34220-P3 (Sent to OEM, Waiting for Report). 2. Implement the applicable ACE recommendations written for SCR P-2014-30189, and implement the recommended changes resulting from the OEM inspection. 3. Complete WOs 2898045 and 2898043 to inspect the strainer/ separator on 0-34220-P1 and 0-34220-P3 respectively. 4. Complete WO 02956864 to overhaul 0-34220-P1. 5. Complete WO 04930103. 0-34220-P3 could not shutdown at target pressure. Repair / replace as necessary. 6. Complete WO 02953941 to rebuild the spare main volume pump and return to stores. 7. Complete WO 04808854 to investigate an oily mist observed at the pump inboard bearing. 8. Complete WO 02956863 0-34220-P2. Investigate and fix oil loss issue with P2. 9. Complete WO 04773326 and install In-pro Seals on P3. 10. Progress ECR 18400 to install permanent vibration transducers in pump bearing cartridges for improved

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
								transmission of high frequency signal. 11. Complete EC 88952 and install proper oil sampling ports on the pumps. 12. Complete EC 74633 to change the seal water distribution to each of the main volume vacuum pumps. 13. Complete EC 83997 to modify the breathers on the main volume vacuum pumps (0-34220-P1, P2, P3) to prevent pump oil leakage. 14. Complete EC 107060 for 0-34220-P1 and 0-34220-P2 to update the OEM flow diagram to as built conditions. 15. Complete EC 108025 for P2 0-71620-NICR Demin. Water piping change to support 0-34220-P2 Seal water float valve replacement. Incremental recommendations for Plant EOL (2020): Implement PdM activities to perform vibration testing, infrared readings and oil analysis. Incremental recommendations for CO EOL (2024): Review OEM inspection / recommendation from WOs 2810540, 2956861 and SCR P-2014-30189, and apply to assure condition of components to CO EOL (2024).
010749	0	25100 34220	PUMP, Cat 2	These are vacuum pumps which maintain differential pressure between vacuum building upper chambers and main chamber so that dousing is not initiated during normal operation.	Satisfactory	Corrosion / General Corrosion Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear		Incremental recommendations for Plant EOL (2020): Implement tasks for oil analysis, vibration analysis, and thermography. Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
010752	018,0	25100	REGULATOR, Cat 1/2,	These are pressure regulating valves for the air	Good	Mechanical and Thermal Degradation		Incremental recommendations for Plant EOL (2020):

		63420 63422	OPERATED VAL, Cat 1/2	pressure relief valves of the negative pressure containment system.		/ Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Mechanical and Thermal Degradation / Wear Mechanisms - Wear Mechanical and Thermal Degradation / Electronic Aging	Component Replacement Overhaul/Refurbishment Predictive Maintenance - Electrical Testing SRST - Functional Test	incremental to current periodic maintenance practices: Execute PMs that have not been performed in the last 10 years (e.g. PM #88954). Incremental recommendations for Plant EOL (2020): No additional practices are recommended to reach Plant EOL (2020). Incremental recommendations for CO EOL (2024): No additional practices are recommended to reach CO EOL (2024).
011310	018	25100	25100 VB/Emergency Water Tank & Spray System - Foundations, Concrete	The pile cap is designed to support the entire VB structure and serve as the floor slab of VB basement	Good	Corrosion / Corrosion of Embedded Steel Corrosion / Chemical Attack Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction Mechanical and Thermal Degradation / Leaching Calcium Hydroxide Mechanical and Thermal Degradation / Freeze-Thaw		Continue current practices. No other additional practices are recommended to reach CO EOL (2024).
011311	018	25100	25100 VB/Emergency Water Tank & Spray System - Foundations, Steel	The steel H–piles support the pile cap, which in turn is designed to support the entire VB structure and serves as a floor slab of the VB basement.	Good	Corrosion / General Corrosion Fatigue / Fatigue due to Vibration		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011342	018	25100	25100 VB/Emergency Water Tank & Spray System -	The Vacuum Building is a Negative Pressure Containment System (NPCS) structure and is designed for 0 psi absolute	Satisfactory	Corrosion / Corrosion of Embedded Steel		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
			Structural Concrete	pressure. It also houses the self-actuating Dousing System used for post-accident pressure suppression by steam condensation. The NPCS limits radioactivity release to the environment during accidents.		Mechanical and Thermal Degradation / Freeze-Thaw Mechanical and Thermal Degradation / Cracking Due to Expansion or Contraction		
011343	018	25100	25100 VB/Emergency Water Tank & Spray System-Tank	The Emergency Water Storage Tank supplies water for the Vacuum Building dousing spray system that condenses steam and reduces the Vacuum Building pressure. The Tank also provides water to the Calandria (moderator makeup) and to the bleed cooler, as necessary.	Good	Corrosion / Corrosion of Embedded Steel Mechanical and Thermal Degradation / Leaching Calcium Hydroxide		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011344	018	25100	25100 VB/Emergency Water Tank & Spray System - Seals & Sealants	(1) Elastomeric Roof Seals provide continuation of the containment boundary between structurally separated concrete elements –the VB perimeter wall and the VB roof slab, that contribute to the air tightness of the Vacuum Building containment. (2) Joint Sealants provide barrier from external atmospheric elements (water, ice, dirt) for the construction joints and other penetrations.	Good	Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) Corrosion / General Corrosion Mechanical and Thermal Degradation / Self-Loosening		Continue current practices. No additional practices are recommended to reach CO EOL (2024).
011345	018	25100	25100 VB/Emergency Water Tank & Spray System - Pre-Stressed Steel	The horizontal pre-stressed cables keep the ring girder in longitudinal compression and ensure that no tensile stresses can exist in the perimeter under any design condition. Crack paths are therefore closed and corrosion and leakage minimized.	Good	Mechanical and Thermal Degradation / Creep and Stress Relaxation Corrosion / Corrosion of Embedded Steel Miscellaneous / Pre-Stress Relaxation		Continue current practices. No additional practices are recommended to reach CO EOL (2024).

CG:	Units	USI#	CA Description	Function	Classification	Potential Aging Degradation Mechanisms	Current Practices	Incremental Work Recommended for Current and Extended Operating Life
				The vertical post-tensioned rods add compressive stresses in addition to the self-weight of the ring girder onto the upper part of the VB wall. The joint between the ring girder and the perimeter wall is therefore closed and leakage minimized. The horizontal post-tensioned rods hold the buttress walls onto the VB wall by creating a large compressive stress and resultant friction force at the interface. This friction force counteracts the self-weight of the Buttress Walls, loads from the supported piping, and seismic loads.				

System 0472 – Fuelling Machine

APPENDIX C. OPG'S INTEGRATED AGING MANAGEMENT PROGRAM

This Appendix describes OPG's Integrated Aging Management (IAM) Program and how it interfaces with and supports other OPG programs including the Equipment Reliability (ER) program. It provides additional context on how the actual condition of SSCs is assessed and documented. OPG's IAM program is documented in N-PROG-MP-0008, "Integrated Aging Management" [34].

The objective of the Integrated Aging Management (IAM) Program is to ensure the condition of critical Nuclear Power Plant (NPP) equipment is understood and that required activities are in place to ensure the health of these components and systems while the plant ages. This is accomplished by establishing an integrated set of programs and activities which ensure performance requirements of all critical station equipment are met on an ongoing basis. The program also requires preparation of life cycle plans and *condition assessments* for critical plant equipment.

The main activities associated with the program are the preparation of major component Life Cycle Management Plans (LCMPs) for fuel channels, feeder piping, steam generators and reactor structures and components, and condition assessments for the balance of critical plant equipment. However, successful implementation of the program is also dependent on many other station programs to ensure plant equipment is maintained in the required condition. Some of the most important supporting programs are: Component Programs, the Maintenance Program and the Equipment Reliability (ER) program (which includes System Performance Monitoring).

The Aging Management Program also defines the method of condition assessment for plant SSCs. Condition assessments are not required for all SSCs. As per Appendix A in N-PROG-MP-0008 [34], condition assessment is managed by either LCMPs, Condition Assessments (CAs), and/or by System and Component Surveillance. Not all plant SSCs require an assessment of condition to be documented in a Detailed CA. Only those SSCs not screened out via the Aging Management process require a detailed condition assessment. The condition of the balance of SSCs is addressed by System and Component Surveillance and other programs. This is elaborated on further below.

OPG's Integrated Aging Management Program is aligned with International Standards, including IAEA Safety Guide No. NS-G-2.12, "Ageing Management for Nuclear Power Plants" [99]. This Reference identifies nine attributes of an effective aging management program including; Scoping of the AM program, and detection of aging effects and mitigating aging effects. As per Appendix C in OPG's program document, N-PROG-MP-008 [34], these nine attributes form an integral part of the program from which the condition assessment process is defined.

OPG's Equipment Reliability (ER) program, N-PROG-MA-0026, 'Equipment Reliability" [80], is based on INPO AP-913 standard [10] on preparation and implementation of an ER program. An effective ER program consists of the following six main areas:

- Scoping and Identification of Critical Components
- Performance Monitoring
- Corrective Action
- Continuing Equipment Reliability
- Long Term Planning and Life Cycle Management
- Preventative Maintenance Implementation

OPG's Integrated Aging Management addresses the Long Term Planning and Life Cycle Management element in AP913 [10]. A flowchart showing how the six AP913 elements are integrated in OPG's Equipment Reliability program is provided in Figure C.1. The figure also includes other programs and procedures which support ER, including Obsolescence Management, Safety and Regulatory, Modifications, and Periodic Safety Review. The inputs and outputs of the Aging Management program are also shown. One of the AM program outputs are AM actions which are input into System and Component Health Reports. These aging management actions are prioritized and tracked to completion via the System Health Reporting process.

The programs and processes contained in Figure C.1 are also listed in Table C.1 along with their numbers used in the figures.

The preparation of Condition Assessments (CAs) is one of the main activities in the IAM program. N-PROC-MP-0060, "Aging Management Process" [7] outlines the systematic process for conducting CAs of Aging Critical Plant Systems, Structures and Components (SSCs). The process consists of:

1. Scoping
2. Screening
3. Condition Assessment

Scoping:

N-PROC-MP-0060 describes the detailed steps followed to derive the scope of OPG's Aging Management Program. These steps define the boundary of System, Structures and Components (SSCs) that are considered within the program. The first step in the process is to define the systems to be addressed. Important station systems, both safety related and production critical are included and their boundaries are defined. Components within these systems are included in scope, using the Master Equipment List (MEL) as a basis. Components not addressed in the MEL, e.g. structures, some piping, etc., are then considered and those required to support a safety function or could negatively impact on a safety function if they fail are included in scope. Systems supporting these important systems are also included.

Components within these systems having similar attributes, e.g. criticality, type, subject to the same degradation mechanisms are then collected into Commodity Groups (CGs). The next step in the process is to screen the in-scope SSCs to determine if they should be subject to detailed condition assessment.

Screening:

The objective of the aging management screening process is to review the large number of SSCs (greater than 500,000 for Pickering) in the scope of the program and by employing a systematic process using defined criteria, determine which SSCs should be subject to detailed condition assessment. Per OPG Aging Management governance, the condition of screened-out SSCs does not require an in-depth condition assessment, but rather, their condition is assessed and managed by other processes in the AM program, e.g. Equipment Reliability program including system performance monitoring.
The screening process is illustrated in a flowchart shown in Figure C.2.

The first step in the screening process is to screen out non-critical components. Component Criticality is defined in N-PROC-MA-0077, “OPG Procedure ‘Critical Equipment Identification and Categorization” [9]. In this procedure, components are assigned critical categories CC1, 2, 3 or 4. Criticality sub-codes are also assigned in the areas of Reactor Safety (RS), Production (P) and Cost, Conventional Safety, Environmental (CCSE). CC1 and 2 components are “critical” components and CC3 and 4 are “non-critical”.

CC3 and 4 components are screened out from further assessment. For PSR2, CC3/RS3, i.e. having a lower level of importance in safety related function than RS1 or RS2, e.g. a component used in a safety related test, are not screened-out. Other non-critical components can also be added to the scope as requested by the system engineer. Per Reference [7], Critical Structures (e.g. Reactor Buildings, Pressure Relief Duct and Vacuum Building) are also addressed in the review.

A preliminary assessment of all components screened in to this step is performed, which collects pertinent information needed to conduct further screening. The information collected for each SSC is (i) Aging Related Degradation Mechanisms (ARDMs), i.e. modes or processes resulting in degradation of the component, e.g. corrosion and (ii) Aging Management Practices (AMPs), i.e. the methods in place to detect and manage the component’s aging.

Screening is continued based on this preliminary assessment. The next step in the processes screens out non-AM critical SSCs. Non-AM critical components are those which:

- There is assurance of design life over the length of station operation or extended operation, e.g. some structures.
- There is low risk associated with component degradation, i.e. low cost having limited and simple ARDMs with effective regular practices to detect degradation. Typical components falling into this category are hand switches, push-buttons used for testing, etc.

The next step in the process, reviews the practices used to mitigate age related degradation for a component. Practices can consist a set of programmatic requirements, e.g. the HX program, or can be defined by maintenance strategies or preventative maintenance or other tasks. A set of practices is considered effective if it addresses all component ARDMs and it has proven to be effective, is aligned with industry best practices, or other criteria documented in N-PROC-MP-0060 [7].

Upon completion of this last step in the screening process, the set of remaining non-screened out SSCs are subject to detailed condition assessment. All of the information used in the screening process is documented for each system in a System Screening Report and stored in Asset Suite as a controlled document.

Before describing the condition assessment process used for screened-in components, a description is provided of the method of managing aging used for screened-out components, i.e. not requiring a Detailed CA.

Treatment of SSCs not Requiring a Detailed CA:

The condition of screened out components is managed on an ongoing basis via OPG's Equipment Reliability (ER) program and other supporting programs. OPG's ER program is aligned with best industry standards and is comprised of a set of processes whose objective is to ensure that the reliability of systems and components is managed on an ongoing basis, including ensuring that all nuclear safety requirements are met.

Example Supporting Equipment Reliability processes are:

(i) The Corrective Action Program, "Corrective Action", N-PROG-RA-003 [92], executed to identify adverse trends in performance or component failures and put corrective actions in place to prevent re-occurrence of the adverse condition;
(ii) System Performance Monitoring, "System Performance Monitoring", N-PROC-MA-0024 [93] which requires surveillance, tracking, reporting on overall health and preparation of System Health Action Plans to improve system health and component condition;
(iii) The Component and Equipment Surveillance Program, N-PROG-MA-0017 [87], which addresses a number of different types of components, e.g. Power Operated Valves, Buried Piping, Cables, Heat Exchangers, etc. and;
(iv) The Preventative Maintenance Program, "Conduct of Maintenance", N-PROG-MA-0004 [94] which uses component operating history to optimize component performance and maintenance practices via PM feedback mechanisms and

conducts the required maintenance on components. Work reports document the observed condition of equipment subjected to maintenance.

Ongoing assessment, monitoring and the documenting information on the condition of station systems and components is conducted per the ER program.

With respect to the documentation of the condition of screened-out components, the objective of screening is not to assign a condition or classification for screened out components. As per N-PROC-MP-0060 [7], this is only required for components for which a detailed condition assessment is performed. However, during the preliminary assessment of component aging used in the screening process, the condition of AM-critical components is reviewed based on operating history, system health reports and other data sources. This information is documented in the System Screening Reports.

In addition, a number of comprehensive programs are in place which document component condition including: System and Component Health Reporting; The Maintenance Program which documents as-found condition of components; Predictive Maintenance, e.g. vibration monitoring; the Corrective Action Program, documenting adverse conditions on equipment in SCRs; Annual Reliability Reports; Design Assessments and many other station processes.

Detailed Condition Assessment:

Aging Critical components not screened out are subject to detailed condition assessment.

Detailed Condition Assessments (CAs) involve:

- Identifying and understanding component degradation mechanisms.
- Collecting data to evaluate the degree of degradation experienced to date, e.g. SHR data, OPEX, SCRs, etc.
- Evaluating component condition by comparing experienced degradation against established limits.
- Establishing actions required to minimize and control Aging Related Degradation Mechanisms (ARDMs) and improving condition.

All of the information above is documented in a Detailed CA. A sample Detailed CA is attached to this Appendix in Attachment C.1. This sample shows all of the required fields to be completed to derive overall condition. Once all of the required information is collected, an assessment of classification is performed. An overall Condition Classification (Very Good, Good, Satisfactory, Poor, and Very Poor) is defined in N-PROC-MP-0060 [7], which accounts for:

- The physical condition of the component at the time of assessment, and
- The adequacy of the practices in place to manage component aging.

Condition Classification is assigned by selecting the lesser of these two criteria. For example if the physical condition of a component is “Good”, but the adequacy of practices is “Satisfactory”, the component condition classification is “Satisfactory”. The definitions of the classifications are provided in Table C.2.

Improvement actions are required for components with a “Poor” or “Very Poor” classification. In many cases, actions are also provided for “Satisfactory” or “Good” components to maintain or improve the classification.

AM actions are prioritized and captured in system health reports (SHRs). These actions are assessed on an on-going basis and tracked to completion in SHR action plans. Detailed CAs are maintained and updated on a periodic basis to capture new information relevant to aging.

Figure C.2 Aging Management Screening Process

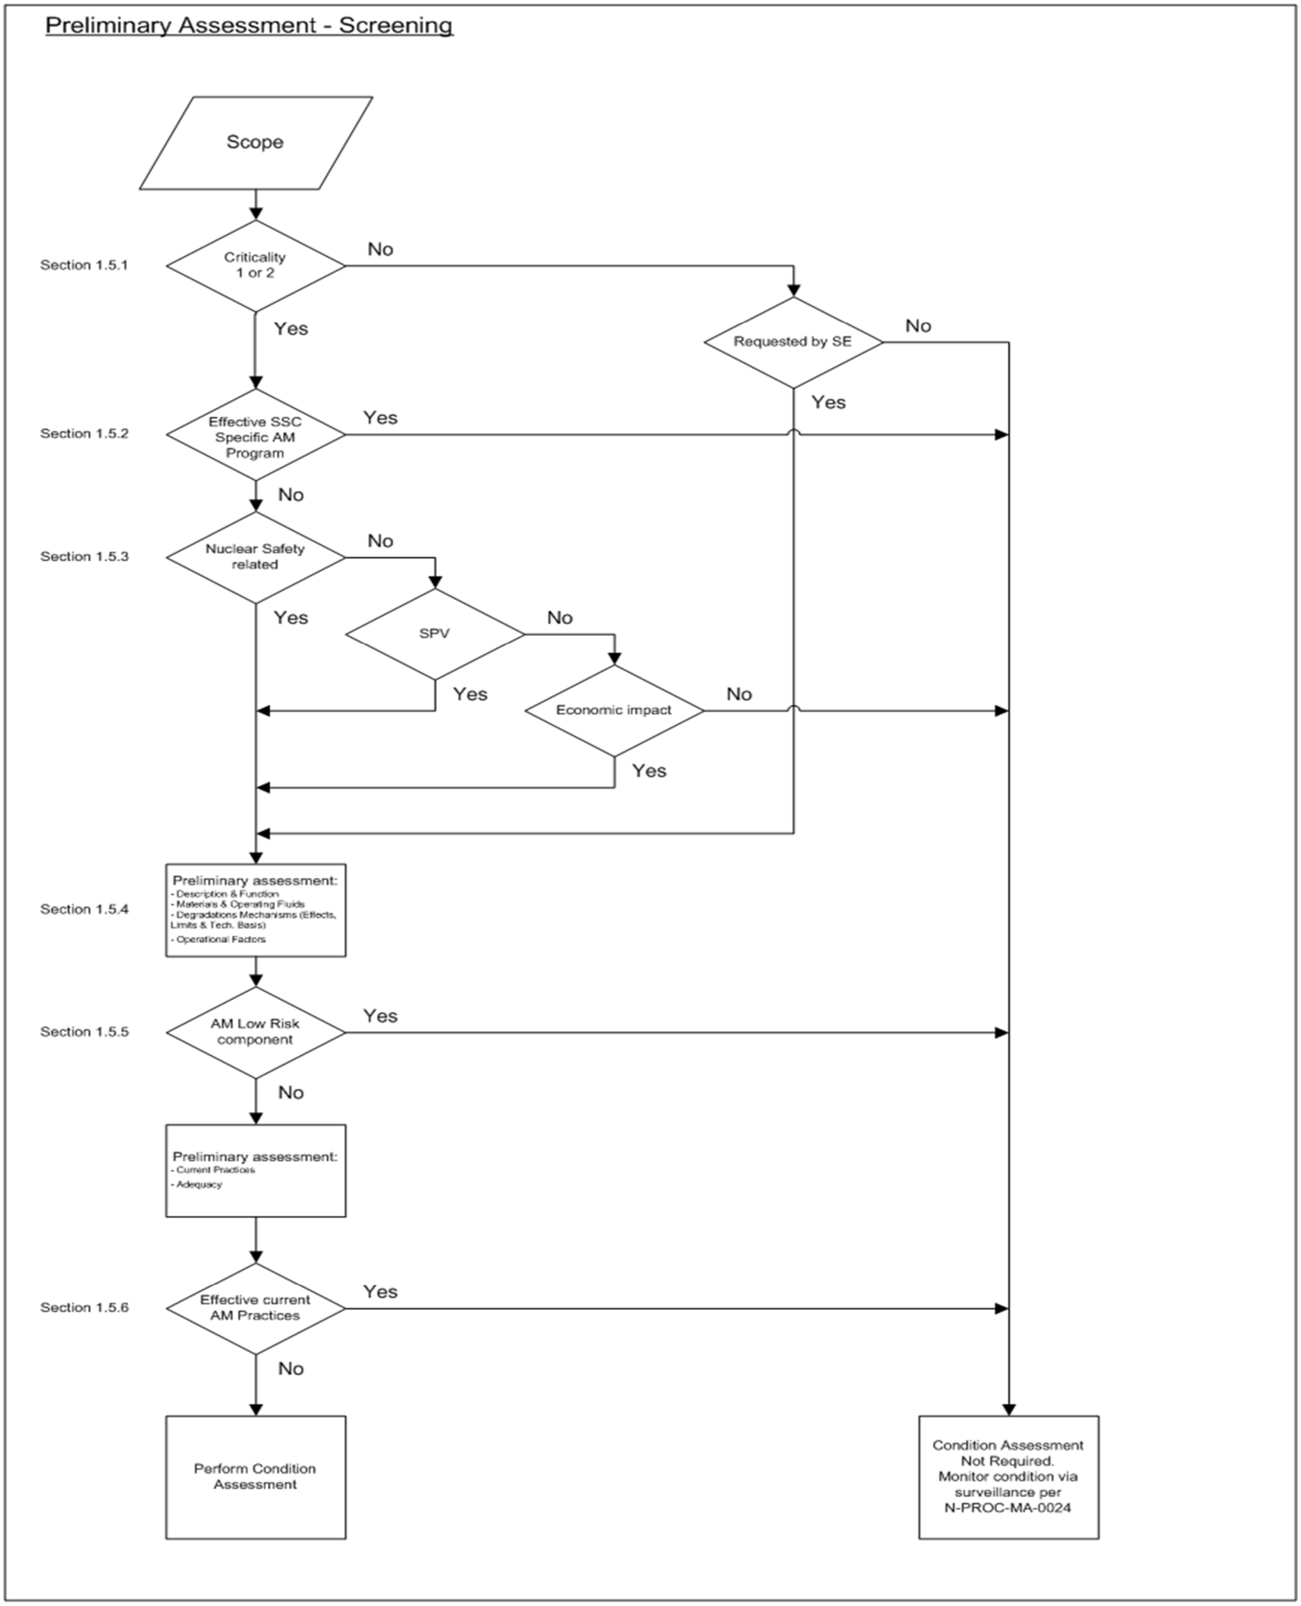

Table C.2 Classification of Component Condition and Aging Management Practices

Condition Classification	**Criteria**
Very Good	(a) The component meets all its functional design requirements, with no reduction in operating margin and exhibits no apparent degradation, (i.e., is in "like new" condition) <u>and</u>, (b) The *aging management* practices have been optimized to ensure the component remains in a "like new" condition.
Good	(a) The component meets all its functional design requirements, with only a slight reduction in operating margins. Some slight aging degradation is evident, <u>or</u>, (b) The *aging management* practices are adequate but has not been optimized to ensure that the component remains in a "like new" condition.
Satisfactory	(a) The component still meets all it functional design requirements, but operating margins are significantly eroded. This can be attributed to evidence of significant aging degradation, or, (b) The *aging management* practices are ineffective in only one area and should be reviewed and/or changed.
Poor	(a) The component can only marginally meet its functional design requirements and has lost all operating margin. Severe aging degradation is evident, <u>or</u>, (b) The *aging management* practices are ineffective in a number of areas and need to be revised.
Very Poor	(a) The component cannot meet one or more of its functional design requirements. The component needs immediate or near term maintenance, repair and/or replacement to restore its condition, <u>or</u>, (b) The current *aging management* practices are completely ineffective and need revision.

Equipment Description	CAT ID 694168 (Status: BOMONLY ; On-Hand:0) E-Tags: 5/6/7/8-73110-ACU1/ ACU5/ ACU6 Description: ACU: C/W 286T LEESON 20 HP MOTOR EQ & R.H. COIL Manufacturer: SHELDONS ENGINEERING LTD Model: 10-1 MODULAR ACU RH COIL CAT ID: 694171 (Status: BOMONLY ; On-Hand:0) E-Tags: 5/6/7/8-73110-ACU2/ ACU3/ ACU4 Description: ACU: C/W 286T LEESON 20 HP MOTOR EQ & L.H. COIL Manufacturer: SHELDONS ENGINEERING LTD Model: 10-1 MODULAR ACU LH COIL This DCA covers the ACU units including the coils. It does not cover the motors, cables, or solenoid valves.
Equipment Function	E-Tags: 5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6 Function: The Boiler Room Cooling system is comprised of six (6) Air Cooling Units (ACUs). The units are the draw-through fan-coil type which is supplied with cooling water from the process water system. These units are designed to limit the ambient temperature in the Boiler Room between 36°C (97°F) and 60°C (140°F). The Boiler Room ACUs are part of the safety system. The ACUs are Seismically Qualified to Category 'B' and have an alternative water supply from the EWS system. These ACUs are required to operate on demand in harsh environmental post-LOCA conditions. However, failure of the non-metallic materials (filters) would not prevent the ACUs from performing their function. Therefore the ACUs are not required to be environmentally qualified (NK30-EQL-73110-0001). Consequence of Failure: If the boiler room ACUs fail to operate, the boiler room temperature limit of 60°C (Reference P-SPM-73110-0465019 R003) could be exceeded. Prolonged operation above Safety Limit (65°C) would lead to local or global concrete deterioration. In addition, 3 ACUs are required to provide sufficient post-accident cooling. Therefore there is some redundancy with the ACUs. Reference NK30-OSR-08131.02-00003 Appendix A, Table A.1. Operating Limits: The ACUs operate to maintain the Boiler Room between 36°C (97°F) and 60°C (140°F). Duty Cycle: High Environment (Mild/Severe): Severe

	Operating Fluids: Tube side – HP service water, fin side – ambient air EQ: No Seismic: Yes (DBE 'B') Pressure Boundary: Yes STBR Phase: 3. Note that the system is required for phase 3. However, the cooling function is only required until phase 2. References: P-SPM-73110-0465019 R003, NK30-OSR-08131.02-00003, P-REP-01060-00002, NK30-SCL-73110-00001 Rev: 001, NK30-EQL-73110-0001
Section 2	Criticality and Consequences
AM Critical Components	Yes – based on: Nuclear Safety Related? Yes CG Criticality: Cat 1/2 CCA Requested by RSE? No Economic Impact? Yes Low Risk AM Component: No CG contains components with Criticality of 1 or 2 not classified as Non-AM Critical Components per Section 1.5.5 of N-PROC-MP-0060 Reactor Safety Ranking: 2 Overall CG Criticality: 2
Section 3	Condition Assessment and Life Cycle Issues
Summary	Scope
	ARDM Corrosion / Stress Corrosion Cracking - Carbon and low alloy steels **Effects:** Stress Corrosion cracking can lead to cracking, coil failures and leaks. Coil leaks are the major threat to ACUs availability and performance. **Limits:** It can be detected by observing brittle -appearing fracture and cracks at joints and high load bearing areas or by reduced performance of the ACU resulting in higher room temperatures. **Comments:** Stress corrosion cracking (SCC) is the unexpected sudden failure of normally ductile metals subjected to a tensile stress in a corrosive environment, especially at elevated temperature in the case of metals. Corrosion / Fouling (accumulation of deposits) **Effects:** Fouling of ACU components (including coils) **Limits:** Limited heat transfer – an increase in temperature of the 'cool' air being supplied to the control cubicle. **Comments:** Silting and Microbiological Influenced Corrosion (MIC) from HPSW impurities can contribute to accumulation of deposits and plugging drain lines on the tube side. Poor heat transfer will eventually prevent the component from meeting its performance requirements. Corrosion / General Corrosion **Effects:** General corrosion on coils, mounting brackets which the fan and motor are mounted causing failure at mountings. **Limits:** Component Failure **Comments:** Corrosion can cause reduced strength at mounts which can cause component failure. Mechanical and Thermal Degradation / Wear Mechanisms - Wear **Effects:** Bearings, and fan wear **Limits:** Component failure from unacceptable vibration levels **Comments:** Moving parts including bearings have a finite lifespan Mechanical and Thermal Degradation / Wear Mechanisms - Erosion **Effects:** Erosion of components from high pressure service water **Limits:** Reduction of coil thickness could eventually result in leakage.

	Comments: Silt, minerals, and MIC in HPSW could cause erosion on coil/inner tubes leading to leakage or loss of pressure boundary integrity. Fatigue / Mechanical Fatigue **Effects:** Vibration from the operation of the fan can lead to component malfunction. **Limits:** Component failure **Comments:** Mechanical fatigue is not expected to be a significant ARDM. Mechanical and Thermal Degradation / Deterioration of Material (Wiring, Seals, Gaskets, O-rings etc.) **Effects:** Deterioration of electrical components including insulation, windings, and connectors can cause the ACU to malfunction **Limits:** The ACU, including the motor and thermostat, fails to operate. **Comments:** While the ACU has material including insulation that will wear over time, the material degradation of electrical components is not expected to be significant compared to other ACU ARDMs
	Operational Factors N/A
	Condition: Satisfactory CHR REVIEW (Current Equipment Assessment Detail Report, dated 2/23/2016). A search was done using the equipment codes (5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6). The following status was found: 6-73110-ACU2 – Watch List - No recent vibration data. All other equipment tags were classified as Acceptable (Green). SHR REVIEW (“Reactor Building Cooling”; Q4-2015). A search was done using the equipment codes (5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6). The following information was found: WO# 02113023 (STATUS is ACTIVE). 7-73110-ACU4 END OF LIFE COIL PROACTIVE REPLACEMENT “There is one functional failure within 2 year rolling period. - WO 4767203, 6-73110-ACU4 and ACU5 isolated due to leak.” Level II Impairment due to ACU4 and ACU5 Isolated. P-2015-07286, WO# 4767703. Completion notes state “INVESTIGATED ACU5 FOR DRAIN BLOCKAGE AND FOUND NO ISSUES.” WO# 04767704 - 6-73110-ACU2 DRIP TRAY LINE LEAKING. Result: MM TIGHTEN FITTING ON DRIP TRAY LINE. REINSTALLED DRAIN LINE AS PER INSTRUCTIONS.” Task Status: FINISHED. WO# 04767705 - 6-73110-ACU1 DRIP TRAY LINE DISCONNECTED AND LEAKING. Result: “MM RECONNECT DRIP TRAY LINE. RECONNECTED DRAIN LINE AS PER INSTRUCTIONS.” Task Status: FINISHED. OPEX - SCR REVIEW (from 01Jan2010 to 15Jan2016). A search was done using the equipment codes (5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6). The following status was found:

	SCR P-2015-07286 - 6-73110-ACU1, -ACU2 and -ACU5 isolated due to leakage (Level 3 Impairment, and ACUs leaking water to the reactivity mechanism deck which could affect its performance.) (March 2015). Apparent Cause Evaluation determined problem with -ACU4 and -ACU5 (recently replaced in P1361 outage) Based on the completion notes for AR 28177085 – 01 (dated 16-FEB-2016), which was generated from this SCR, "Based on the conclusion of SATPS, no additional actions are required." Therefore it is not necessary to "confirm the integrity of the condensate drain lines (leak tight and are not plugged for all ACUs)." P-2014-13350 - Containment Impairment on U4 Boiler Room ACU4 (tripped on motor overload). Broke- Fix (WO# 03163606 – motor replaced). P-2011-25045 CMU Trending: 6-73110-ACU1 coil leak. WO# 2696947 documents the coil replacement to correct the issue, P-2010-14935 - 1-73110-ACU4 & 1-73110-ACU6 Boiler Room ACU's Coupling bolts found sheared. RESULT – Predefined maintenance initiated to replace bolts every outage. WO REVIEW (from 01Jan2010 to 15Jan2016): There were work orders created for the proactive replacement of the coils in each Pickering B ACU. A review shows that only one WO is outstanding (WO# 2113023 - 7-73110-ACU4. The other 23 ACU coils were replaced between 2012 and 2014. Many work orders have been created and closed to manage the completion of PMIDs. There are 35 work orders for ACU Coil Leak, Investigate/Repair /Acu1 End Of Life Coil Proactive Replacement. There were seven (7) work orders related to Unit 6 drip tray or drain line being disconnected or plugged. This relates to SCR P-2015-07286 mentioned above. One work order (WO# 02279446) was created for 8-73110-ACU3 tripping. This WO was completed by replacing the overload relay. This is considered a one off and this was the only instance documented of any of the 24 ACUs experiencing a faulty overload relay. There are four completed work orders for motor bearing replacements. Bearing replacements were performed on 5-73110-ACU3/ACU4; 7-73110-ACU6; 8-73110-ACU3/ACU4; Condition Summary (from 01Jan2010 to 15Jan2016): Based on the above CHR, SHR, WO and OPEX reviews, there is some evidence of degradation related to ARDMs. These have been managed and fixed as part of ACU maintenance strategy (coil replacements) or as required (bearing, relay, drip tray issues). Therefore, the component condition as described above is rated as 'SATISFACTORY' Condition Classification: The current Aging Management Practices (AMP) as detailed below, are rated as Satisfactory. Rationale: The component still meets all it functional design requirements, but operating margins are significantly eroded. This can be attributed to evidence of significant aging degradation In summary, the overall Condition Classification is rated as 'Satisfactory'. There was a previous concern about blocked drain lines that resulted in SCR P-2015-07286. Completion Notes for the related AR (28177085 – 01) concluded, "Based on the

	conclusion of SATPs, no additional actions are required". The aging management practices are ineffective in only one area and should be reviewed and/or changed.

Scope: Visual inspection and recording of any observed deficiencies.
Frequency: every outage.

Title: Routine Field Walkdown Plan (Operating)
Document #: P-SPM-73110-0465019 R003
E-tags: 5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6

	Scope: The ACUs are normally inaccessible during unit operation. The scope of this surveillance is to 1) review ANO Log, Long Term Status Log and Equipment Status Log and then document status/any concerns; 2). Obtain temperatures of the Boiler Room from the Unit ANO Frequency: Once per month. Title: Field walkdown –Planned outage Document #: P-SPM-73110-0465019 R003 E-tags: 5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6 Scope: The scope of this surveillance is to 1) review ANO Log, Long Term Status Log and Equipment Status Log and then document status/any concerns; 2). Obtain temperatures of the Boiler Room from the Unit ANO; 3) Meet with FSOS, SAT, SNO, Maintenance FLM and document any of their concerns; 4) Perform routine walkdown. In general, check housekeeping, water/oil leaks, Excessive pipe movement/vibrations (general state of pipe supports); Unusual noises from equipment; High operating temperatures on equipment; Material condition (e.g. Corrosion, state of insulation); Room/Area environment (lighting/ventilation/temperature); EQ Tags; Check for any non-conformances found e.g. unapproved operator field aids, Construction tags and marker, marker on equipment, documents posted in field without the approved field aid tag. Frequency: Every planned outage
	Adequacy E-Tags: 5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6 Industry Best Practices: The IQ Review Template “PB-Fans and Coolers“ is used as the model for best practice for the Boiler Room ACUs. Per this application, (criticality 2, high duty cycle, severe service condition), the recommended practices are: PREDICTIVE: Operator Rounds – Per Shift Engineer/Performance Monitoring - Yearly Thermography – every 6 months Vibration Analysis – Every 2 months PERIODIC: Bearing Lubrication – Every 2 years Coupling Lube/Inspection – Every 2 years Filter Clean and Inspection – As Required Pulley Sheave/Belt Inspection – Every 2 years. PLANNED: Auxiliary Inspection – As Required Adequacy of Current AMP: Evidence of ARDM related degradation: There has been evidence of aging in coils and bearings. The maintenance strategy for coils is covered by proactive life cycle replacement WO’s based on internal operating experience which indicate a service life of approximately 15 years. Compliance with Programmatic Requirements: Not applicable Adequacy of PMID/Testing/Inspections/Surveillance: The scope of PMID/Testing/Inspections/Surveillance matches with Industry Best Practices except there are no PMIDs to perform thermography analysis. A review of work orders shows that between 2001 and 2004, the ‘perform thermography’ work orders were cancelled. Given the good performance of the ACUs, the motor and coil replacements, vibration analysis and inspections, it is considered acceptable from a condition assessment perspective to not perform thermography.

TETRA TECH

	Status of Life-cycle Replacements: Coil replacement for 7-73110-ACU4 is in progress/WORKING status (Refer to Work Order 02113023). Coils in the other 23 ACUs have been completed in the previous 4 years. Once Work Order 02113023 has been completed, then the coils will last until the end of Phase 2 requirements (2029). As stated earlier, the system is required for phase 3 (2039) but the cooling function (i.e. cooling coil functionality) is only required for phase 2. Obsolescence and Spares: There are no unresolved obsolescence or spare issues. The amount of spares are sufficient to support planned and unplanned maintenance. Summary: The current aging management practices are adequate for the Boiler Room ACUs. As per SCR P-2015-07286, there was leaking of Unit 6 ACUs. The unit 6 ACUs were inspected and adequately fixed and addressed. Based on a review of the SCR and the AR completion notes, no further action is necessary to address the issue of blocked condensate drain lines.
	CP Adequate for EOL? No Recommendations to Reach Plant EOL (2020): Complete Work Order 02113023 to replace the coils in 7-73110-ACU4, by 2016.
	Additional AMP for LE? No
Obsolescence	**Obsolescence issues?** Yes **Issues resolved?** Yes Per Asset Suite:

E-tags	Item	Cat ID	Status
5/6/7/8-73110-ACU1/ ACU5/ ACU6	ACU	694168	BOMONLY
5/6/7/8-73110-ACU2/ ACU3/ ACU4	ACU	694171	BOMONLY

Per Proactive Obsolescence Management System (POMS):

E-tags	Existing Make/Model Per POMS	Obsolete per POMS? (Yes/No)	Replacement Make/Model per POMS
5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6	SHELDONENG/ 10-1 MODULAR ACU LH COIL	YES	N/A

Summary:
The following E-tags are deemed obsolete: (5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6). The rationale is that both of the CATIDs (694168 and 694174) are not at READY status and are listed as ‘BOMONLY’. However there are spares parts available for both CATIDs and these are set to READY status and are therefore the spare parts are considered to be available (not obsolete). It is not reasonable to expect that the entire ACU assembly would be replaced. Therefore obsolescence of the ACU assembly is not a significant issue.

Spares	**Spares applicable?** Yes **Issues resolved?** Yes **Replaceable/Repairable:** Repairable ACU Assembly spare status

* The Reorder point, and the current inventory quantity is not listed and is assumed to be 0.

The spare ACU coils are listed as READY and are not obsolete. There are no spares in stock. This is not an issue because all of the coils for 5/6/7/8-73110-ACU1/ ACU5/ ACU6 have been recently replaced and are not expected to require future replacement. There are no spare parts in stock for CATIDs 686418, 257528 (isolator spring and cooling fan). These are not considered to be critical spares. The status of these CATIDs is at 'READY' and therefore spares could be ordered if required. For other CATIDs, there are spare parts available to support planned and unplanned maintenance. Spare parts have CATIDs at READY status and quantities match or exceed the reorder points. To maintain environmental qualification of the ACU, care must be taken to ensure that seismic and EQ qualifications of fan motors are maintained.

Spares Conclusion: There are adequate spare parts for CATID 694168 to support future planned and unplanned maintenance.

Piece Parts to support repairs: (CATID 694171)

* Reorder point are current inventory is not listed and assumed to be 0.

The spare ACU coils are listed as READY and are not obsolete. There are no spares in stock. This is not an issue because all of the coils for 5/6/7/8-73110-ACU2/ ACU3/ ACU4 have been recently replaced except for 7-73110-ACU4 and are not expected to require future replacement. Based on Asset Suite notes, the two coils required to complete the coil replacement for 7-73110-ACU4 have been delivered and are awaiting installation in the field. Therefore, there are no issues with obsolescence or spare quantities of the coil (CATID 168783)

There are no spare parts in stock for CATIDs 686418, 257528 (isolator spring and cooling fan). These are not considered to be critical spares. The status of these CATIDs is at 'READY' and therefore spares could be ordered if required in the future. For other CATIDs, there are spare parts available to support planned and unplanned maintenance. Spare parts have CATIDs at READY status and quantities match or exceed the reorder points. To maintain environmental qualification of the ACU, care must be taken to ensure that seismic and EQ qualifications of fan motors are maintained.

Spares Conclusion: There are adequate spare parts for CATID 694171 to support future planned and unplanned maintenance.

Time Limited Aging Analysis	**TLAA issues?** No **Issues resolved?** N/A **TLAA Reference:** N/A The components in this CG are non-passive, (i.e. Continuously operated, poised and exercised during outages, or on stand-by and function tested periodically to confirm availability) and hence TLAA is not applicable as the component life is assessed based on monitored performance.

In general, check housekeeping, water/oil leaks, Excessive pipe movement/vibrations (general state of pipe supports); Unusual noises from equipment; High operating temperatures on equipment; Material condition (e.g. Corrosion, state of insulation); Room/Area environment (lighting/ventilation/temperature); EQ Tags; Check for any non-conformances found e.g. unapproved operator field aids, Construction tags and marker, marker on equipment, documents posted in field without the approved field aid tag.
Frequency: Every planned outage

Current AMP Adequacy	E-Tags: 5/6/7/8-73110-ACU1/ ACU2/ ACU3/ ACU4 ACU5/ ACU6

	Industry Best Practices: The IQ Review Template "PB-Fans and Coolers" is used as the model for best practice for the Boiler Room ACUs. Per this application, (criticality 2, high duty cycle, severe service condition), the recommended practices are: PREDICTIVE: Operator Rounds – Per Shift Engineer/Performance Monitoring - Yearly Thermography – every 6 months Vibration Analysis – Every 2 months PERIODIC: Bearing Lubrication – Every 2 years Coupling Lube/Inspection – Every 2 years Filter Clean and Inspection – As Required Pulley Sheave/Belt Inspection – Every 2 years. PLANNED: Auxiliary Inspection – As Required Adequacy of Current AMP: Evidence of ARDM related degradation: There has been evidence of aging in coils and bearings. The maintenance strategy for coils is covered by proactive life cycle replacement WO's based on internal operating experience which indicate a service life of approximately 15 years. Compliance with Programmatic Requirements: Not applicable Adequacy of PMID/Testing/Inspections/Surveillance: The scope of PMID/Testing/Inspections/Surveillance matches with Industry Best Practices except there are no PMIDs to perform thermography analysis. A review of work orders shows that between 2001 and 2004, the 'perform thermography' work orders were cancelled. Given the good performance of the ACUs, the motor and coil replacements, vibration analysis and inspections, it is considered acceptable from a condition assessment perspective to not perform thermography. Status of Life-cycle Replacements: Coil replacement for 7-73110-ACU4 is in progress/WORKING status (Refer to Work Order 02113023). Coils in the other 23 ACUs have been completed in the previous 4 years. Once Work Order 02113023 has been completed, then the coils will last until the end of Phase 2 requirements (2029). As stated earlier, the system is required for phase 3 (2039) but the cooling function (i.e. cooling coil functionality) is only required for phase 2. Obsolescence and Spares: There are no unresolved obsolescence or spare issues. The amount of spares are sufficient to support planned and unplanned maintenance. Summary: The current aging management practices are adequate for the Boiler Room ACUs. As per SCR P-2015-07286, there was leaking of Unit 6 ACUs. The unit 6 ACUs were inspected and adequately fixed and addressed. Based on a review of the SCR and the AR completion notes, no further action is necessary to address the issue of blocked condensate drain lines.
Current AMP Adequate to Reach Plant EOL?	No **Recommendations:** Recommendations to Reach Plant EOL (2020): Complete Work Order 02113023 to replace the coils in 7-73110-ACU4, by 2016.
Comp. End Mission Date	2039

Expected Degradation at CO EOL with CP	Assuming that the current AMP continue and the recommendations to reach Plant EOL (2020) are implemented (e.g. completion of WO#. 02113023), the expected condition at 2039 is SATISFACTORY. The rationale is as follows: - There will be effective AMP in-place to detect and mitigate the on-set of incipient age related degradation (vibration analysis and check seismic restraints inspections) - Life-cycle replacements will have effectively occurred (e.g. coil and EQ fan motor replacements) before the useful life of the component is exceeded. The aging management practices are adequate but has not been optimized to ensure that the component remains in a "like new" condition.
Additional AMP to Reach Plant CO EOL?	No **Recommendations:** N/A
Work Program Type	OM&A **Rationale:** WO#. 02113023-06 for replacement of 7-73110-ACU4 is already "Working".
Component Condition at CO EOL	Good **Comments and Basis:** Assuming that the current AMP continue, the expected condition at 2039 is 'Satisfactory'. The rationale is as follows: - There will be effective AMP in-place to detect and mitigate the on-set of incipient age related degradation (vibration analysis and check seismic restraints inspections) - Life-cycle replacements will have effectively occurred (e.g. coil and EQ fan motor replacements) before the useful life of the component is exceeded to restore the component to a like-new condition. - The cooling function of the ACUs will not be required post phase 2 (Units Being Defueled and Dewatered).
Comp. EOL Year	2039
Section 5	Cost and Schedule
Cost	$0.00 **Details:** Costs for Recommendations – Plant EOL (2020): $0 All estimates are considered Class III (+30% and -20% accuracy)". 1. Complete Work Order 02113023 to replace the coils in 7-73110-ACU4. Assumption – The work order is scheduled and the status is currently at 'WORKING'. This work is expected to be completed by 2016 and is assumed to be funded through the current work order process.
CCA Update	Next CCA Update Year: 2026 CCA Update Frequency: N/A

Action List	**Type:** **Tracking Number:** Plant EOL (2020) - Complete Work Order 02113023 to replace the coils in 7-73110-ACU4 by 2016.

Rev	Date	Author	Comments
R00	May 6, 2016	R. Jayasundera, A. Johnstone	Initial issue for OPG review and comment.
R01	July 13, 2016	R. Jayasundera, A. Johnstone	Updated report addressing OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 3, *Equipment Qualification (Seismic and Environmental)* (also referred to here as the "Equipment Qualification Safety Factor") is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Pickering NGS equipment qualification (environmental and seismic) were reviewed for the ten PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for Safety Factor 3 were prepared per Sections 4.2 and 4.3, respectively. This report also includes a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factor 3), as well as identification and review of previously identified PSR1 gaps related to Safety Factor 3 (to ascertain the implications of extending Pickering NGS operation beyond 2020), per Section 4.4.

The results of the review of the Equipment Qualification Safety Factor are discussed in Section 5.0 of this report. The review has confirmed that the Pickering NGS equipment important to safety has been properly qualified and that this qualification is being maintained through an adequate programme of maintenance, inspection and testing. As discussed in Section 5.0, the review identified six gaps that will need to be addressed further as part of the PSR2 Global Assessment process.

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission REGDOC-2.3.3 [2] and IAEA SSG-25 [3];
- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and
- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Equipment Qualification Safety Factor 3 is to: "determine whether plant equipment important to safety has been properly qualified (including for environmental conditions) and whether this qualification is being maintained through an adequate programme of maintenance, inspection and testing

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence.

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

that provides confidence in the delivery of safety functions throughout the period of the PSR." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 3 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 3 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 and IAEA SSG-25 are shown in Reference [4]. The Safety Factor 3 Review Tasks are:

1) Confirm there exists a suite of engineering programs or processes to ensure equipment qualification requirements are met and documented.

2) Confirm equipment qualification has been adequately established for all service conditions expected during normal operation, anticipated operational occurrences and accident conditions. These service conditions are subdivided into environmental conditions and operational conditions. Environmental conditions include ambient temperature, pressure, humidity/steam, radiation, water/chemical sprays, fluid submergence, fire and seismic vibration. Operational conditions include process related conditions such as vibration, load cycling, electrical loading parameters, electromagnetic interference, mechanical loads and process fluid condition.

3) Perform an objective confirmation that the installed equipment is qualified to perform its Design Basis function for its operational life and that effective programs exist to monitor for timely maintenance or replacement, as required.

4) Confirm existence of a process for ensuring compliance with equipment qualification programs and of documented previous qualification measures taken to ensure qualification throughout the equipment's installed life (i.e., prescribed testing, calibration, maintenance, and parts replacement).

5) Confirm existence of a surveillance program and a feedback procedure to ensure aging degradation of qualified equipment remains insignificant.

6) Confirm existence of monitoring of actual environmental conditions and identification of 'hot spots' of high activity or temperature.

7) Confirm existence of an assessment that determines the effects of equipment failures on equipment qualification and appropriate corrective actions and/or safety improvements to maintain equipment qualification.

8) Confirm there is protection and adequate separation of qualified equipment from adverse environmental conditions.

9) Confirm physical condition and functionality capability of qualified equipment is being checked by walkdowns.

10) Confirm that changes to equipment classification have occurred, as required, as a result of major design modifications made since PSR1.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this Report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Equipment Qualification Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 3 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed compliance assessment for each L/R/C/S is provided in Appendix B of Reference [5]. Associated findings are summarized in Section 4.2 of this Report.

Table 1: L/R/C/Ss Reviewed for Equipment Qualification Safety Factor 3

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N290.13	Environmental Qualification of Equipment for CANDU Nuclear Power Plants	N290.13-05	3, 4	Incremental	N290.13 addressed as part of Pickering B and Darlington ISRs
2	CSA N285.5	Periodic Inspection of CANDU Nuclear Power Plant Containment Components	N285.5-13	1, 2, 3, 4	Incremental	N285.5 addressed as part of Pickering B and Darlington ISRs
3	CSA N287.7	In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.7-08	2, 3, 4	Incremental	N287.7 addressed as part of Pickering B and Darlington ISRs
4	CNSC RD/GD-210*	Maintenance Programs for Nuclear Power Plants	2012	3, 4	Incremental	S-210 and RD/GD-210 addressed as part of Darlington ISR
5	CNSC RD/GD-98	Reliability Programs for Nuclear Power Plants	2012	3, 4	Incremental	RD/GD-98 addressed as part of Darlington ISR and S-98 as part of Pickering B ISR

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
6	CNSC REGDOC-2.6.3*	Aging Management	2014	3, 4	Incremental	Transition plan in place and gap assessment between RD-334 and OPG Nuclear Integrated Aging Management governance performed by OPG
Additional L/R/C/Ss						
7	CSA N287.2	Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.2-08	1, 2, 3, 4	Incremental	N287.2 addressed as part of Pickering B and Darlington ISRs and PARTS
8	CSA N289.1	General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants	N289.1-08	1, 3	Incremental	N289.1 addressed as part of Pickering B and Darlington ISRs
9	CSA N289.2	Ground Motion Determination for Seismic Qualification of Nuclear Power Plants	N289.2-10	1, 3	Incremental	N289.2 addressed as part of Pickering B and Darlington ISRs
10	CSA N289.3	Design Procedures for Seismic Qualification of Nuclear Power Plants	N289.3-10	1, 3	Incremental	N289.3 addressed as part of Pickering B and Darlington ISRs
11	CSA N289.4	Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components	N289.4-12	1, 3	Incremental	N289.4 addressed as part of Pickering B and Darlington ISRs
12	CSA N289.5	Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities	N289.5-12	1, 3	Incremental	N289.5 addressed as part of Pickering B and Darlington ISRs

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

2.3 Audit and Self-Assessment Reviews of OPG Programs

The OPG Nuclear Programs (N-PROGs) applicable to the Equipment Qualification Safety Factor are listed in Table 2 below. The methodology for the audit and self-assessment reviews is discussed in Section 3.3. The assessment results of each of the N-PROGs in Table 2 is provided in Appendix B, and findings are summarized in Section 4.3. It is noted that N-PROG-MP-0001, “Engineering Change Control”, N-PROG-MA-0004, “Conduct of Maintenance”, N-PROG-MP-0008, “Integrated Aging Management” and N-PROG-MP-0009, “Design Management” are examined in Appendix B in the context of any Pickering NGS seismic qualification related findings.

Table 2: OPG Programs Applicable to the Equipment Qualification Safety Factor

Document Number	Document Title
N-PROG-RA-0006 [6]	Environmental Qualification
N-PROG-MP-0001 [8]	Engineering Change Control
N-PROG-MA-0004 [9]	Conduct of Maintenance
N-PROG-MP-0008 [10]	Integrated Aging Management
N-PROG-MP-0009 [11]	Design Management

2.4 Additional Reviews

The PSR2 Safety Factor 3 Report includes a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factor 3). The Report also includes identification and review of previously identified PSR1 gaps related to Safety Factor 3 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4.

In addition, any PSR2 gaps identified as a result of the Safety Factor 3 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Task and L/R/C/S compliance, and Nuclear Program effectiveness for the Equipment Qualification Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [4]).

For each Safety Factor 3 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.

- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[3]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

L/R/C/Ss in the PSR2 Assessment Basis generally receive incremental reviews since PSR2 is an update of previous ISR assessments and clause-by-clause or high level reviews for the majority of the L/R/C/S in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous ISRs but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

3 "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;
- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and
- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

The Safety Factor 3 L/R/C/S reviews identify Compliances and Gaps as defined below:[4]

- <u>Compliance</u>:
  - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
  - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 3.)
  - For Clause-by-Clause reviews of modern Laws, Regulations, Codes and Standards, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 3.)
- <u>Gap</u>:
  - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
  - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 3.)
  - For Clause-by-Clause reviews of modern Laws, Regulations, Codes and Standards, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 3.)

[4] Safety Factor compliance assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the compliance arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (Fukushima actions are included as appropriate as commitments or actions), c) Identification of previously identified ISR gaps related to each Safety Factor and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

The reviews assume that use of the word:

- “Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 Audit and Self-Assessment Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent audit and self-assessment results. Nuclear Program audit and self-assessment results were prepared for Safety Factor 3 by reviewing recent and applicable:

- OPG Program Health reports;
- OPG Nuclear Oversight independent performance based Program audits (typically performed in 1 to 5 year cycles) and self-assessments (typically performed on a yearly basis). This includes review of associated Station Condition Records and Action Requests to confirm that any findings have been completed; and
- CNSC “Type I” and “Type II” inspections of the effectiveness and performance of OPG programs, where called-up by OPG Program Health reports, audits or self-assessments.

The focus of these reviews was on effectiveness of the Programs at Pickering NGS, where specific information is available.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

The PSR2 Safety Factor 3 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 3 (as identified in the Pickering B and Darlington ISR Integrated Implementation Plans [12][13] and Pickering Units 5-8 Continued Operations Plan [14]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[5]

A review was also performed of the following for Safety Factor 3 to determine if there are any impacts associated with operation of the Pickering Units past 2020:

- Commitments previously made to the CNSC in the R04 Pickering Licence Condition Handbook (LCH) [15];
- Open CNSC action items in the R04 Pickering LCH [15]; and
- Exemptions granted by the CNSC since the current operating licence was issued, per the R04 Pickering LCH [15] (Fukushima actions are included as appropriate as commitments or actions).

Any PSR2 gaps identified as a result of the Safety Factor 3 review which need to be addressed in other Safety Factor Reports are also discussed.

[5] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 3 Review Tasks.

4.1.1 Review Task #1: Equipment Qualification Engineering Programs/Process

Confirm there exists a suite of engineering programs or processes to ensure equipment qualification requirements are met and documented.

4.1.1.1 Environmental Qualification

The Pickering NGS Environmental Qualification (EQ) Program has been established in accordance with the requirements of N-PROG-RA-0006, "Environmental Qualification" [6]. This program document provides direct authority to the following documents:

- N-PROC-RA-0051 "Environmental Qualification Lists" [16];
- N-PROC-RA-0044 "Environmental Qualification Assessment" [17]; and
- N-INS-03651-10023 "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18].

The following text summarizes the contents of these program and procedure documents:

<u>N-PROG-RA-0006, "Environmental Qualification" [6]</u>

This program establishes the Environmental Qualification Program controls for OPG Nuclear and is applicable to all sites, including Pickering. The program establishes an integrated and comprehensive set of requirements that provide assurance that essential equipment can perform as required when exposed to harsh Design Basis Accident (DBA) conditions and that this capability is preserved over the life of the plant. Implementation of these program requirements provides the methodology, programmatic controls and interfaces for establishing and maintaining Environmental Qualification of equipment and components. N-PROG-RA-0006 Section 1.1.1 confirms that OPG's Environmental Qualification Program complies with CSA Standard N290.13-05 including Update 1, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants", which is the most recent version of this Standard. Note: The L/R/C/S review of CSA N290.13 is addressed in Section 4.2 of this Report.

<u>N-PROC-RA-0051, "Environmental Qualification Lists" [16]</u>

This procedure defines work activities and instructions required to identify and document the equipment, components and qualification parameters applicable to the Environmental

Qualification Program. The process to identify equipment and components that must be environmentally qualified requires development of the following inputs:

- Environmental Qualification Design Guide;
- Harsh DBA List;
- Environmental Qualification Room Conditions Manual (RCM);
- Environmental Qualification Technical Basis Documents; and
- Environmental Qualification List Development Packages.

These inputs lead to the development of the Environmental Qualification List (EQL), which identifies safety-related equipment and components that may be subjected to harsh environment conditions resulting from a DBA in which they are required to function, or not fail, and have a potential failure mode caused by the environment.

<u>N-PROC-RA-0044, "Environmental Qualification Assessments" [17]</u>

The Environmental Qualification Assessments (EQAs) ensure that equipment subject to Environmental Qualification Program requirements are qualified for the environmental and operating service conditions and mission times for which they operate. Qualification is established through testing, analysis, Operating Experience (OPEX), ongoing qualification or a combination of these methods. EQAs identify equipment specific design, configuration, maintenance and procurement requirements necessary to establish and maintain the qualified status of equipment.

<u>N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18]</u>

This instruction outlines the requirements for Environmental Qualification environment monitoring, equipment and barrier surveillance as applicable to the station. For example:

- Environments where EQL equipment and components are installed are monitored to ensure values used in qualification are conservative or justification must be approved for monitoring a subset of rooms.
- Surveillance is completed to ensure installed configuration of electrical EQL equipment conforms to Environmentally Qualified related design and configuration requirements specified in EQAs.
- Periodic inspection and maintenance of Environmental Qualification barriers are completed to ensure their integrity throughout the life of the plant.

4.1.1.2 Seismic Qualification

Seismic qualification of Pickering A was established following the design and construction stages. Seismic qualification of Pickering B was established during the design and construction stages.[6]

There are a number of engineering programs and procedures used to maintain the Seismic Qualification of safety related SSCs. The programs and procedures that ensure Seismic Qualification is maintained include the following:

- N-PROG-MP-0009, "Design Management" [11];
- N-PROG-MP-0001, "Engineering Change Control" [8];
- N-PROG-MA-0004, "Conduct of Maintenance" [9];
- N-PROG-MP-0008, "Integrated Aging Management" [10];
- N-PROC-MA-0024, "System Performance Monitoring" [19]; and
- N-PROC-MA-0031, "Protection of Seismic Equipment and Routes" [20]

The specific applications for Seismic Qualification as captured in these programs are described below:

<u>N-PROG-MP-0009, "Design Management" [11]</u>

Engineering design changes maintain seismic design measures. Section 1.2.4 of this program specifies that seismic requirements are to be incorporated as part of the design basis and included in design inputs.

<u>N-PROG-MP-0001, "Engineering Change Control" [8]</u>

Section 1.9.1.2 (d) of this program requires that permanent design modifications to seismically qualified equipment be subjected to the stakeholder review process to ensure that the Seismic Qualification is not altered by a proposed design change. This program requires that during the Non-Identical Component Replacement (NICR) process, the Seismic Qualification of components must be maintained. Also, Section 1.6.2 of N-PROG-MP-0001 requires engineering to perform an engineering evaluation, in accordance with N-INS-08173-10048 "Item Equivalency Evaluation" [21], to determine if a prospective replacement meets all of the original design requirements (i.e., while performing an Item Equivalency Evaluation (IEE), qualified staff shall review the items design parameters,

---

[6] As outlined further in Section 4.1.2.2 and 4.1.3.2 of this report, following the design and construction phase of Pickering A, the station was seismically assessed as part of the Seismic Margin Assessment and the necessary upgrades were made for those SSCs which belong to the seismic success path. For Pickering B however, Seismic Qualification was established during the design and construction phase. For the purposes of this report, when discussing the seismic status for both Pickering A and B, the generic term "Seismic Qualification" will be used despite the difference in qualification approach.

including requirements for seismic parameters during both normal operation and post-accident conditions).

N-FORM-10959, "Design Scoping Checklist", Item 3.19, "Seismic Requirements", is the mechanism within the Engineering Change Control (ECC) process which ensures that Seismic Qualification of SSCs is maintained. Item 3.19 ensures that the appropriate actions are taken when a modification will impact: a) Seismically qualified SSCs, b) SSCs where the seismic requirements in the National Building Code (NBC) or Ontario Building Code (OBC) apply, c) Non-seismically qualified systems or components in a station containing seismically qualified systems or components, d) Seismic routes, including entry or exit from doors on the route, or e) SSC for beyond design basis seismic effects.

<u>N-PROG-MA-0004, "Conduct of Maintenance" [9]</u>

This program establishes safe, uniform, and efficient maintenance practices at OPG Nuclear sites including Pickering. It ensures that effective implementation and control of maintenance activities are achieved by instituting high standards, providing a professional environment and sufficient resources, monitoring and assessing performance, and holding personnel accountable for their performance.

Section 1.2.4 of N-PROG-MA-0004 outlines precautionary measures to counter incidents that could impact the operation of seismically qualified equipment. It refers to N-PROC-MA-0031, "Protection of Seismic Equipment and Routes" [20] which sets criteria for controlling unsecured equipment and materials adjacent to seismically qualified SSCs in seismic areas and seismic routes (detailed below).

<u>N-PROG-MP-0008, "Integrated Aging Management" [10]</u>

The objective of the Integrated Aging Management (IAM) program is to ensure the condition of critical Nuclear Power Plant equipment is understood and that required activities are in place to ensure the health of these components and systems while the plant ages. The program also requires preparation of life cycle plans and condition assessments for critical plant equipment.

Section 1.3.11 of this program document states that the assessment of equipment condition shall consider established limits for the applicable degradation mechanisms as well as all applicable design requirements, including Seismic Qualification, in determining equipment condition.

<u>N-PROC-MA-0024, "System Performance Monitoring" [19]</u>

This procedure provides a consistent and comprehensive process for the designated system engineers to ensure effective monitoring, maintenance and enhancement of system performance and reliability.

Section 1.6.3 (h) requires that the acceptance band for system performance indicators or parameters have sufficient margin to allow for timely proactive intervention before component or system failures occur and are consistent with the requirements for Seismic Qualification.

N-PROC-MA-0031, "Protection of Seismic Equipment and Routes" [20]

This procedure establishes criteria to control unsecured equipment and material adjacent to seismically qualified SSCs and seismic routes, thereby ensuring operation, maintenance, modification or outage activities do not place seismically qualified SSCs at risk. The procedure includes guidelines for application of equipment restraints and separation distances to prevent interactions between unsecured equipment and material and seismically qualified SSCs during an earthquake.

4.1.1.3 Conclusion

The conclusion of this Review Task assessment is that there exists a suite of engineering programs or processes to ensure that environmental and seismic equipment qualification requirements are met and documented. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Establishment of Equipment Qualification Service Conditions

Confirm equipment qualification has been adequately established for all service conditions expected during normal operation, anticipated operational occurrences and accident conditions. These service conditions are subdivided into environmental conditions and operational conditions. Environmental conditions include ambient temperature, pressure, humidity/steam, radiation, water/chemical sprays, fluid submergence, fire and seismic vibration. Operational conditions include process related conditions such as vibration, load cycling, electrical loading parameters, electromagnetic interference, mechanical loads and process fluid condition.

4.1.2.1 Environmental Qualification

N-PROG-RA-0006, "Environmental Qualification" [6] defines the Environmental Qualification Program as a documented demonstration that equipment and components are capable of performing safety-related functions when subjected to environmentally harsh conditions resulting from DBAs. All equipment that is required to be Environmentally Qualified have EQAs prepared in accordance with N-PROC-RA-0044, "Environmental Qualification Assessment" [17]. The EQA is the design assurance document that demonstrates the capability of environmentally qualified equipment and components to perform their safety-related function(s) under the environmental stresses resulting from DBAs.

EQAs also dictate procurement, field configuration and maintenance activities necessary to maintain the equipment during its installed life to ensure operability. Operability is demonstrated through testing, analysis, OPEX or a combination of these methods.

Environmental Service Conditions

The normal and post-accident environmental service conditions for which equipment is qualified (temperature, pressure, radiation, humidity, flooding and chemical conditions) have been documented in the Pickering NGS Environmental Qualification RCMs (NA44-

MAN-03651-10001, "Environmental Qualification Room Conditions - Pickering A" [22] and NK30-MAN-03651-10001, "Environmental Qualification Room Conditions - Pickering B" [23]). The RCMs were prepared in compliance with N-INS-03651-10003, "Preparation of the Environmental Qualification Room Conditions Manual" [24], are based on safety analysis consistent with the Safety Report, and contain normal and accident service conditions for use in preparing EQAs. The RCMs contain the normal and limiting post-accident environmental conditions in the various rooms and areas inside and outside containment.

The accident transients and dose information inside containment are conservative, being derived from analytical simulations of a low probability large Loss of Coolant Accident (LOCA) event in conjunction with an impairment of the Emergency Coolant Injection (ECI) System. The accident conditions outside containment are bounded by a postulated Main Steam Line Break (MSLB) event.

Fire Protection

In terms of fire related environmental conditions (note, as per N-PROG-RA-0006 [6], the scope of the Environmental Qualification Program does not include fire protection) the Power Reactor Operating Licence requires compliance with the requirements of CSA N293, "Fire Protection for Nuclear Power Plants" which is defined in OPG program document N-PROG-RA-0012, "Fire Protection" [25]. The engineering evaluations which have assessed the station against the requirements of CSA N293 to ensure safe shutdown capability in the event of fire in any plant location include:

- Fire Protection Code Compliance Review: NA44-REP-71400-10001, "Pickering Nuclear Generation Station A Fire Protection Code Compliance Review" [26] and NK30-REP-71400-10001, "Fire Protection Code Compliance Review Pickering Nuclear Generating Station B" [27].

- Fire Hazard Assessment: NA44-REP-71400-10003, "Fire Hazard Assessment - Pickering A Nuclear Generating Station" [28] and NK30-REP-71400-10002, "Fire Hazards Assessment - Pickering B Nuclear Generating Station" [29].

- Fire Safe Shutdown Analysis: NA44-REP-71400-00023, "Fire Safe Shutdown Analysis - Pickering A Nuclear Generating Station" [30] and NK30-REP-71400-00001, "Fire Safe Shutdown Analysis - Pickering B Nuclear Generating Station" [31].

Operational Service Conditions

When environmentally qualifying equipment, operational service conditions that can have a demonstrably deleterious effect on the equipment are included in the testing and qualification of equipment as defined in the Environmental Qualification Program N-PROG-RA-0006, "Environmental Qualification Program" [6]. Operational service conditions that are reviewed include conditions such as temperature (this accounts for ambient temperature and heat rise due to the process fluid temperature as applicable), pressure, radiation, voltage, current frequency, load (e.g., mechanical loading), and frequency and magnitude of cycling.

Qualification requirements have been primarily specified in the design phase through imposition of technical specifications for equipment that have required demonstration of qualification by test. For example, the technical specification for electrical and electronic components and assemblies requires immunity (i.e., qualification) against electromagnetic interference, electrical transient interference, electrostatic discharge and external magnetic fields. As per N-INS-00700-10007, "Preparation of Modification Design Requirements" [32], N-DG-60407-10000 R000, "Guidelines for Electromagnetic Compatibility Test" [33] should be consulted and referenced during the preparation of Modification Design Requirements (MDR) for engineering changes to assist in identifying Electromagnetic Interference (EMI) and Radiofrequency Interference (RFI) design requirements. Design Guide N-DG-60407-10000 R000 [33] (which is applicable to all OPG Nuclear equipment that are either susceptible to and/or emits electromagnetic interferences) provides background and guidance for specifying requirements for electromagnetic compatibility tests to be applied to electrical/electronic equipment and systems for use within the plant environment. The recommended tests in N-DG-60407-10000 R000 are based primarily on TR-102323 Rev. 3, "EPRI Guidelines for Electromagnetic Interference Testing of Power Plant Equipment" together with operating experience from within OPG. By following the EPRI Guideline, the user fills out the template provided in the document which summarizes the applicable tests and associated information. The completed template is then included as part of an Engineering Specification.

N-PROG-MA-0004, "Conduct of Maintenance" [9] requires surveillance activities to be carried out, which include vibration monitoring. This assures early detection of deteriorating equipment conditions in order to ensure safe, reliable and economical operation of station equipment. The Environmental Qualification Surveillance Program is further detailed in Review Task 5.

Aging effects on equipment caused by operational stressors (e.g., vibration and mechanical loading) are addressed through application of Preventive Maintenance, Predictive Maintenance and Aging Management Programs which are discussed in detail in the Pickering PSR2 Safety Factor 4 (Aging) Report.

4.1.2.2 Seismic Qualification

Seismic Qualification for Pickering A was established by analysis. When the station was designed, no explicit seismic design standards for nuclear power plants were available and the seismic design provisions of the 1965 National Building Code of Canada were adopted for seismic design of the nuclear structures. Although the Pickering A systems were not originally required or designed to be Seismically Qualified, the equipment was subsequently evaluated and a Safe Shutdown Equipment List was defined by the 1998 Seismic Margin Assessment (SMA) [34]. A Probabilistic Risk Assessment (PRA) based SMA was then completed in 2013 [35] and a Seismic Equipment List was completed which identifies the SSCs required for the seismic success path.

Seismic qualification of Pickering B was established during the design and construction phases. Nuclear Safety Design Guide DG-30-68000-2, "Seismic Qualification of Safety Related Systems" [36] defines the fundamental seismic design requirements for safety related systems. It establishes the basis of Seismic Qualification and identifies those systems which are required to be qualified to permit execution of the basic safety functions following the occurrence of a low probability severe earthquake at the station site. This Design Guide also describes the two seismic categories (Design Basis Earthquake and Site Design Earthquake) that define functional requirements during or following an earthquake, as well as the levels of seismic excitation that structures or equipment must withstand. Acceptable methods for demonstrating qualification are also listed. The requirements of the Nuclear Safety Design Guides were implemented in design output documents such as Design Manuals, System Design Requirements, Technical Specifications and Specification Data Sheets for equipment, and System Flow Diagrams. More recently, the information related to the Pickering site seismic hazard has been included in the Pickering B PRA based SMA [37].

The NA44-SCL-USI/SCI and NK30-SCL-USI/SCI "System Classification List" are produced in accordance with the requirements of CSA N285.0, "General Requirements for Pressure-Retaining Systems and Components in CANDU Nuclear Power Plants". These lists identify the seismic qualification (as defined by DG-30-68000-2 "Seismic Qualification of Safety Related Systems" [36]) for applicable pressure boundary systems.

4.1.2.3 Conclusion

The conclusion of this Review Task assessment is that environmental and seismic equipment qualification has been adequately established for all service conditions expected during normal operation, anticipated operational occurrences and accident conditions. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Qualification of Installed Equipment

Perform an objective confirmation that the installed equipment is qualified to perform its Design Basis function for its operational life and that effective programs exist to monitor for timely maintenance or replacement, as required.

4.1.3.1 Environmental Qualification

OPG Environmental Qualification Program N-PROG-RA-0006, "Environmental Qualification Program" [6] provides assurance that equipment and components will perform their safety related functions when exposed to harsh environmental conditions resulting from a DBA. The scope of the Environmental Qualification Program includes the following:

- Defining the list of equipment and components required to be environmentally qualified and maintaining the list current with plant licencing basis, design basis and service conditions;
- Ensuring auditable proof of performance under harsh DBA conditions is developed and maintained current with plant licencing basis, design basis, service conditions, and configuration; and
- Providing assurance that equipment and components within the Environmental Qualification Program are purchased, stored, installed, configured, maintained, monitored, and replaced to ensure qualified status is preserved.

Preparation of the EQL uses input from the following documents:

- Environmental Qualification Design Guide;
- Harsh DBA List;
- Environmental Qualification RCM;
- Environmental Qualification Technical Basis Documents; and
- EQL Development Packages.

Through these documents, the required safety function of the equipment requiring qualification is fully defined. The process for identifying equipment subject to Environmental Qualification is shown graphically in Figure 1 below (as documented in N-PROG-RA-0006 [6]).

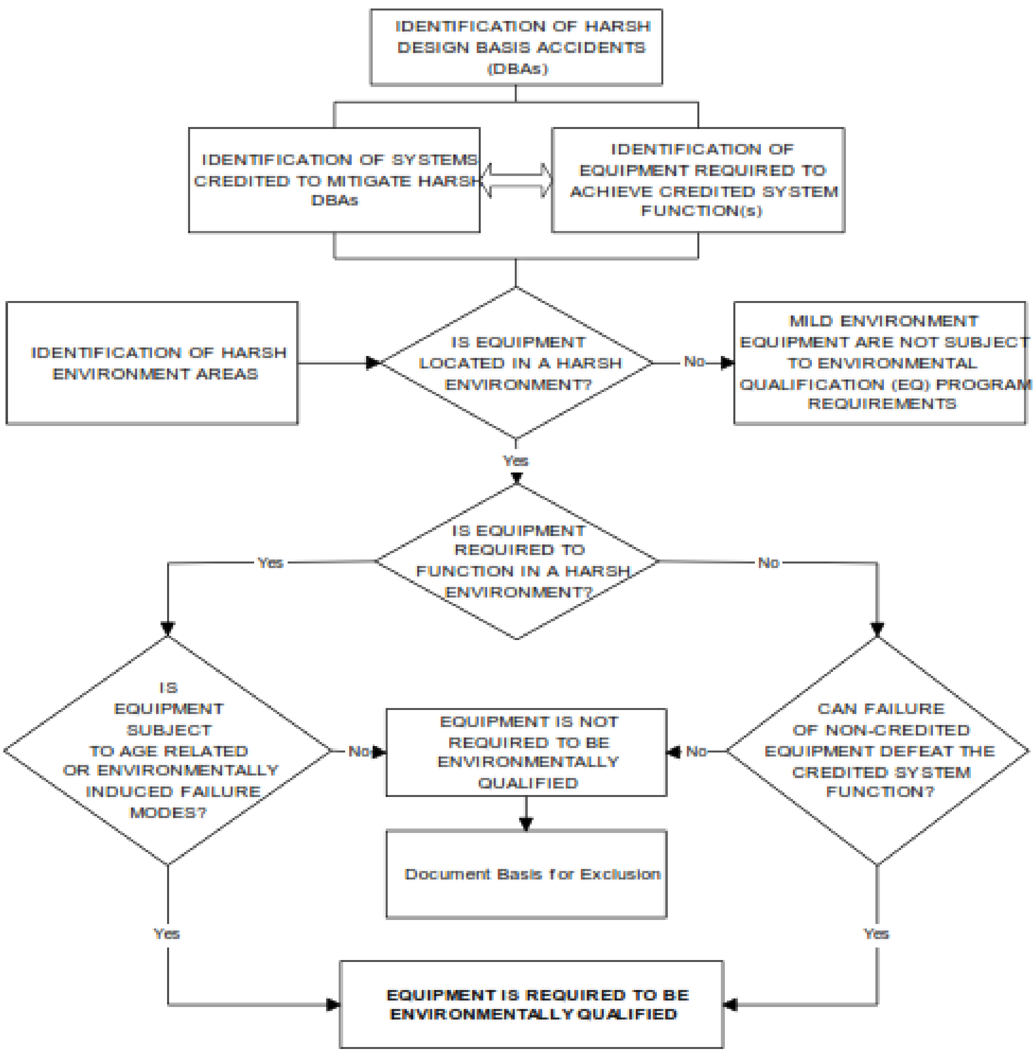

Figure 1: Criteria for Identifying Equipment Subject to Environmental Qualification Requirements

The EQA is a design assurance document that demonstrates the capability of environmentally qualified equipment and components to perform their safety-related function(s) under the environmental stresses resulting from DBAs. A typical EQA includes a summary of qualification levels by equipment tag, including required performance parameters. It also specifies configuration, maintenance, replacement, and purchasing requirements on a plant-specific equipment basis. EQAs are specifically designed to facilitate their use by plant engineering, maintenance and procurement personnel who plan, schedule, and maintain equipment and associated procedures and processes.

The EQA provides an evaluation of test and analysis documentation which establishes the basis for qualification, including a quantitative summary of any conditions of qualification. Additionally, it dictates Environmental Qualification configuration and maintenance requirements, and provides a quick overview of the complete list of potential conditions and limitations of qualification that have been identified which may be applied to plant-specific equipment. The evaluation is based either on plant and equipment-specific conditions, or a set of environmental conditions which envelop the worst case normal and DBA conditions postulated to occur at Pickering NGS.

Preventive maintenance requirements as well as any limitations on the life of the equipment are documented in the EQAs. In establishing maintenance intervals, margins are included to reduce the probability of exceeding the qualified life of components. These requirements are managed by N-PROG-MA-0004, "Conduct of Maintenance" [9] which provides the requirements for managing the execution of preventive maintenance. For components under the scope of the Environmental Qualification Program, extensions to maintenance intervals require acceptance from the Environmental Qualification Single Point of Contact (SPOC) to ensure compliance with the Environmental Qualification Program. In cases where the required maintenance date is missed, a Station Condition Record (SCR) is required to document the event, assess the impact and correct the situation. Individual equipment records for qualified equipment are recorded in the Asset Suite in accordance with N-GUID-03651-10002 "Environmental Qualification Asset Suite Data Conventions" [38]. This guideline establishes the convention used for storing equipment, component, and material data.

The Environmental Qualification Program N-PROG-RA-0006 "Environmental Qualification Program" [6] requires that whenever equipment on the EQL approaches the end of its qualified life, action must be taken to sustain the qualified status of that equipment regardless of what the station current life is taken to be. Hence, all EQAs will need to be re-assessed to ensure qualification is maintained in order to support continued operation of Pickering NGS beyond 2020. The current Environmentally Qualified life of all Pickering NGS SSCs may not necessarily extend to 2028 and a full review of Environmentally Qualified life-limited components impacted by operation past 2020 will need to be undertaken prior to life extension of Pickering NGS. This is therefore identified as a gap exists for Pickering PSR2 (**Pickering PSR2 Gap SF3-1**). It is noted that work to address this gap is currently underway as part of the update of Pickering NGS Condition Assessments for safety related systems and Life Cycle Management Plans for major components.

4.1.3.2 Seismic Qualification

Pickering B was designed to be seismically qualified through the implementation of the overall safety design requirements documented in Engineering Design Guide DG-30-68000-2 [36]. This formally established the design requirements for safety related systems to meet the seismic aspects of Canadian nuclear safety principles specified in CSA N289.1, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants" (Table 2-2 of the Pickering B Safety Report, Part 2 [39] contains a list of seismically qualified systems). Note: The L/R/C/S review of CSA N289.1 is addressed in Section 4.2 of this Report.

Section 6.4 of DG-30-68000-2 [36] specifies the qualification method for civil, structural and mechanical equipment. The overall seismic design requirement is for the station to be resistant to the effects of a severe earthquake such that execution of the four critical safety functions is assured (i.e., safe shutdown of the reactors; decay heat removal; containment button up; and monitoring of critical safety parameters). The seismic design guide defines the scope, earthquake design levels, the extent to which systems must remain operational and the methodology of the seismic design of the station. It lists by Universal Subject Index (USI) the systems that are required to be qualified and the applicable earthquake level, and indicates the seismic classification category (i.e. Category A or B). Seismic Qualification of Safety System Instrumentation is covered in a separate specification [40].

The implemented seismic design requirements appear in various design documents (e.g., Design Manuals, Design Requirements, Drawings, Design Flow Diagrams, Design Reports, Qualification Test Reports, Technical Specification Data Sheets and Procurement Specifications). Correspondence between Ontario Hydro and Atomic Energy Control Board (AECB) in 1978 indicates that the regulator accepted the Pickering B seismic design [41]. Evidence that the overall design is in conformance to relevant codes, standards and regulations and in accordance with the Safety Report is indicated in correspondence with the AECB [42]. The Safety Design Matrix "Operation after an Earthquake" discusses the provisions made at Pickering Units 5-8 to cater to a Design Basis Earthquake. It concluded that: "The safety precautions described are more than adequate to ensure that the generating station poses negligible additional risk to the public after the worst credible seismic event".

As outlined in Section 2.3 of the Pickering A Safety Report – Part 2 [43], the Pickering Unit 1,4 SSCs required to perform the above mentioned critical safety functions during and following an earthquake were not originally required to be seismically qualified. However, the common containment structures (Reactor Building, Pressure Relief Duct and Vacuum Building) were designed to exceed the National Building Code 1965 seismic design provisions and were subsequently confirmed analytically to meet Pickering B Design Basis Earthquake seismic design requirements. The Pickering A Seismic Margin Assessment [34] evaluated the seismic capacity of the Pickering A SSCs required to perform the critical safety functions and identified necessary seismic upgrades. Seismic success path SSCs are identified in Reference [34], and are summarized in Table 32 of the Pickering A Safety Report Part 2 [43]. Adjacent or associated (including Unit 0) SSCs whose failure might impair functionality of seismic success path systems were also evaluated. NA44-DG-03650-00001, "Seismic Design Guide for Seismic Qualification of Pickering NGS A Success Path Structures, Systems and Components" [44], specifies the acceptable seismic design and qualification criteria for maintenance, replacements and modifications to Pickering A seismic success path SSCs.

The SMA methodology is based on documented performance of power and heavy industrial plant components in major earthquakes, on seismic fragility analysis and on seismic testing of components. Walkdown screening criteria evaluate seismic demand at the component location, anchorage adequacy, seismic interactions as well as equipment type-specific seismic susceptibilities. Where components do not satisfy screening criteria, seismic analysis methods consistent with the seismic margin assessment methodology have been utilized.

Low seismic capacity components were replaced; structure and component anchorage were upgraded and potential seismic interactions were dispositioned for the return to service of Units 1,4 [43]. A listing of these seismic upgrades includes:

- Boiler Room shield wall upgraded;
- Switchgear and panel anchorage upgraded;
- Anchoring of heat exchangers in Vacuum Building basement enhanced;
- Standby Generator oil pump house masonry block wall reinforced;
- Supports for Standby Generator batteries enhanced;
- Supports for Class I batteries enhanced;
- Main Control Room and Control Equipment Room panel anchorage upgraded;
- Control Equipment Room structural upgraded;
- Rerouted emergency air supply for airlocks;
- Anchored temporary breathing air system near Emergency Low Pressure Service Water pumps;
- Enhanced supports for bleed valves;
- Enhanced spring hangers;
- Restrained gas bottles and fire extinguishers;
- Improved supports for Reactor Building ACUs;
- Reviewed proximity issues for various valves;
- Improved Deaerator Storage Tank anchoring system;
- Provided lateral restraints for the High Pressure Feedwater Heaters;
- Reviewed the fuel channel positioning assembly rod;

- Reviewed anchor bolts used on the Fuelling Machine support column;
- Upgraded mercoid switches;
- Upgraded relays;
- A Seismic AIM was issued and staff was trained to respond to a seismic event;
- Periodic testing of systems credited in seismic analysis;
- Administrative controls added;
- Pressure Relief Duct analysis completed; and
- Piping supports on recirculating cooling water piping added.

Evaluation using the SMA methodology provides an equivalent level of assurance of seismic capacity to that provided by seismic qualification by conventional seismic design methods (per CSA N289.3, "Design Procedures for Seismic Qualification of Nuclear Power Plants) and seismic testing (per CSA N289.4, "Testing Procedures for Seismic Qualification of Nuclear Power Plant Structures, Systems and Components" and IEEE 344, "Standard for Seismic Qualification of Equipment for Nuclear Power Generating Stations"). Note: The L/R/C/S reviews of CSA N289.3 and N289.4 are addressed in Section 4.2 of this Report.

To ensure effective monitoring, maintenance and enhancement of system performance and reliability, N-PROC-MA-0024, "System Performance Monitoring" [19] provides a consistent and comprehensive process for System Engineers. Field walkdowns are the mechanism used for performing a field evaluation of system performance and forms an essential part of System Performance Monitoring. Walkdowns by System Engineers complement the routine inspections done by operations staff. Where adverse conditions are noted during walkdowns, appropriate corrective actions are initiated to restore equipment functionality. As per Section 1.8.1.4 of N-PROC-MA-0024 [19], the System Engineers are required to observe general conditions such as seismic route concerns (refer to N-PROC-MA-0031, "Protection of Seismic Equipment and Routes" [20]). This procedure is discussed in detail in Section 4.1.1.2 of this report. N-PROC-RA-0022, "Processing Station Condition Records" [45] provides a consistent reporting and evaluation process for identifying adverse conditions at OPG Nuclear. Upon identifying an adverse condition that directly impacts the ability of the station to operate safely, or one that represents an actual or potential operability concern, or one that represents a condition reportable under the operating licence, an SCR is initiated to document the condition. A corrective action plan is then developed to correct the adverse condition, as required. All actions are tracked to completion under the OPG Action Tracking system.

4.1.3.3 Conclusion

The installed equipment is seismically qualified to perform its Design Basis function for its operational life and effective programs exist to monitor for timely maintenance or replacement. However, the current Environmentally Qualified life of all Pickering NGS SSCs may not necessarily extend to 2028 and a full review of Environmentally Qualified life-limited components impacted by operation past 2020 will need to be undertaken prior to life extension of Pickering NGS. This is therefore identified as a gap for Pickering PSR2 (**Pickering PSR2 Gap SF3-1**). It is noted that work to address this gap is currently underway as part of the update of Pickering NGS Condition Assessments for safety related systems and Life Cycle Management Plans for major components.

4.1.4 Review Task #4: Compliance with Applicable Programs

Confirm existence of a process for ensuring compliance with equipment qualification programs and of documented previous qualification measures taken to ensure qualification throughout the equipment's installed life (i.e., prescribed testing, calibration, maintenance, and parts replacement).

4.1.4.1 Environmental Qualification

The processes for ensuring Environmental Qualification of Pickering NGS under the Environmental Qualification Program has been discussed in detail in Section 4.1.3. Measures are taken via interfacing programs to ensure qualification throughout the equipment's installed life. These interfacing programs are provided in N-PROG-RA-0006 "Environmental Qualification" [6] and include testing, calibration, maintenance and parts replacement.

OPG Training Program N-PROG-TR-0005, "Training" [46] provides the structure, processes and tools for defining, developing, implementing, documenting, assessing and improving required training. Engineering Support Personnel are required to take the Program Element Identification (PEL ID) 3875 "Introduction to EQ Engineering" and PEL ID 65799 "Environmental Qualification Refresher for Engineering" as part of the qualification "Engineering Support Personnel – Core Training" (Qualification Identification 6168) [47].

Maintenance staff receive training for PEL ID 3874 "EQ for Maintainers and Operators" and Supply Chain staff receive training for either PEL ID 3875 "Introduction to EQ Engineering" or PEL ID 3873 "EQ for Supply Chain". These training courses provide the high level EQ requirements expected from all staff. There are also more specialized training courses for staff performing the role of Environmental Qualification SPOC. N-PROG-AS-0002, "Human Performance" [48] provides initiatives under the Human Performance Program to ensure compliance with procedures and processes. Human performance tools such as pre-job and post-job briefings, self-check and peer verification are used to ensure that all required Environmental Qualification procedures and processes are followed.

The Training and Human Performance Programs are supplemented by regular Environmental Qualification Program self-assessments and audits as defined in N-PROG-RA-0010, "Independent Assessment" [49] and N-PROC-RA-0097, "Self-Assessment and Benchmarking" [50] which are conducted to ensure the Environmental Qualification Program is being sustained. The Environmental Qualification Program is audited with an interval of no greater than five years by Nuclear Oversight (NO) while self-assessments are conducted annually. Note: Recent audit and self-assessment results for N-PROGs applicable to the Equipment Qualification Safety Factor are addressed in Section 4.3 of this report.

Environmental Qualification issues identified by staff are documented through the SCR process and are reviewed on a daily basis. Relevant SCRs are also reviewed during the preparation of Environmental Qualification Program health reports and trends are identified. These activities ensure that problems are identified and corrected in a timely manner.

4.1.4.2 Seismic Qualification

The following engineering procedures describe processes for maintaining the original seismically qualified design configuration:

- N-PROC-MP-0090, "Modification Process" [51];
- N-PROC-MP-0047, "Design Verification" [52];
- N-PROC-MA-0031, "Protection of Seismic Equipment and Routes [20];
- N-PROC-MA-0024, "System Performance Monitoring" [19]; and
- N-PROC-TR-0008, "Systematic Approach to Training" [53].

These procedures are discussed below:

<u>N-PROC-MP-0090, "Modification Process" [51]</u>

This procedure provides guidelines for all engineering disciplines on maintaining and controlling the configuration of equipment when implementing design modifications in a system. For design modifications which involve a NICR process, the Seismic Qualification of components must be maintained. Also, while performing an IEE, qualified staff shall review the item's design parameters, including requirements for seismic parameters during both normal operation and post-accident conditions.

N-FORM-10959, "Design Scoping Checklist", Item 3.19 provides a list of issues which must be addressed to ensure Seismic Qualification is maintained for Non-Identical Component Replacement modifications. Appendix E of N-PROC-MP-0090 provides guidelines for the "Field Initiated Changes" and Section E.3.2 prohibits minor field-initiated changes from being applied to seismically qualified safety-related systems.

<u>N-PROC-MP-0047, "Design Verification" [52]</u>

This procedure provides direction for a systematic and uniform approach for design verification related to modification, licencing, operating and decommissioning activities at OPG. Section 1.2.1.2 of N-PROC-MP-0047 requires that design verification of seismically qualified equipment be performed only by qualified personnel. Section 1.2.4 also requires that if seismic testing is part of qualification testing that it demonstrates that the equipment or system meets the specified seismic requirements. It allows such testing to be performed in lieu of, or in addition to, analysis. Appendix C of N-PROC-MP-0047 provides guidelines for the design engineer to specify installation and operational requirements in the design of seismically qualified equipment.

N-PROC-MA-0031, "Protection of Seismic Equipment and Routes" [20]

This procedure receives its authority from N-PROG-MA-0004, "Conduct of Maintenance" [9], which has been discussed in detail in Section 4.1.1.2 of this report. N-PROC-MA-0031 is discussed in detail in Section 4.1.1.2 of this report.

N-PROC-MA-0024, "System Performance Monitoring" [19]

The system performance monitoring process associated with N-PROC-MA-0024 is discussed in detail in Section 4.1.1.2 of this report.

N-PROC-TR-0008, "Systematic Approach to Training" [53]

Training is provided to ensure that engineering, operations and maintenance staff are aware of station requirements (e.g. Seismic Qualification) while performing their respective duties. These duties may include, but are not limited to, ongoing testing, calibration, maintenance, and replacement of seismically qualified equipment. OPG Computer Assisted Learning Course 64196, "Seismic Qualification for Engineers", as well as ECC training, is part of the mandatory basic engineering qualification training for System Engineers, Design Engineers and Project Engineers.

Similar to Environmental Qualification, the Training and Human Performance Programs are supplemented by regular Program self-assessments and audits as defined in N-PROG-RA-0010, "Independent Assessment" [49] and N-PROC-RA-0097 "Self-Assessment and Benchmarking" [50] which are conducted to ensure the Seismic Qualification Program is being sustained. Note: Recent audit and self-assessment results for N-PROGs applicable to Seismic Qualification are addressed in Section 4.3 of this report.

4.1.4.3 Conclusion

The conclusion of this Review Task assessment is that a process exists for ensuring compliance with environmental and seismic equipment qualification programs and for documenting previous qualification measures taken to ensure qualification throughout the equipment's installed life. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Surveillance Program and Feedback Procedure

Confirm existence of a surveillance program and a feedback procedure to ensure aging degradation of qualified equipment remains insignificant.

4.1.5.1 Environmental Qualification

Equipment condition monitoring for age degradation is conducted to identify premature age related failures which negatively impact the Environmentally Qualified component's qualified life, and to ensure equipment failures are random and not common mode in nature.

Consistent with industry practice, and as per CANDU Owners Group (COG) Guideline GL 2008-02 "Environmental Qualification - Condition Monitoring of the Equipment" [54], equipment condition monitoring at Pickering NGS assesses the immediate and long-term operational readiness of Environmentally Qualified equipment through effective surveillance and feedback as outlined by the procedures and programs below.

N-PROG-RA-0006 "Environmental Qualification" [6] ensures that aging degradation is identified and mitigated through the following actions:

- The Environmental Qualification SPOC is required to ensure condition monitoring is conducted using the activities detailed in N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18] which includes periodic walkdowns of Environmentally Qualified equipment to confirm configuration requirements are met as specified in the applicable EQA.

- The Environmental Qualification SPOC reviews Environmental Qualification related SCRs, OPEX, and Environmental Qualification work reports to identify unanticipated age-related degradation which could affect the qualified life of Environmentally Qualified equipment/components. When failure trends or degradation is discovered, the Environmental Qualification SPOC initiates the actions to further evaluate and correct the situation, thereby providing the required feedback.

- The Manager Engineering Program Integration is responsible for generating and maintaining the EQA Part II[7] packages in accordance with N-PROC-RA-0044, "Environmental Qualification Assessment" [17] to support obsolescence, design changes and revised test reports.

N-PROG-MA-0026, "Equipment Reliability" [55] provides both surveillance and feedback to ensure aging degradation remains insignificant. There are various aspects of the System Engineer's role which support Environmental Qualification Condition Monitoring. Among these are:

- Functional failure evaluations, which are a surveillance and feedback process which include:
    - Evaluation of root cause;
    - Checking OPEX for similar failures and corrective actions;
    - Determination of the extent of condition; and
    - Setting up an action plan to prevent future repeat failures.

- System performance monitoring;

[7] EQA Part II is an evaluation of test and analysis documentation which establishes the basis for equipment Environmental Qualification. It is based either on plant and equipment specific environmental conditions, or a set of environmental conditions that envelop the worst-case conditions, normal and DBA, postulated to occur. EQA Part I evaluates qualification of individual equipment at station specific conditions based on generic equipment qualification evaluation completed in EQA Part II.

- Field walkdowns; and
- Preparation of System Health Reports which document the overall condition of the system, summarize the significant observations made during field walkdowns, and provide action plans listing the work activities which must be completed in order to improve system health.

Environmental Qualification monitoring is supported by N-PROG-MA-0004, "Conduct of Maintenance" [9] which is further detailed in the implementing procedure N-PROC-MA-0020, "Predefined Process" [56]. It requires as found conditions to be reported via work reports by maintenance personnel when equipment is disassembled, inspected or overhauled during preventive maintenance. In cases where unusual degradation is found, additional maintenance activities are initiated as required. Surveillance activities include infrared thermography, vibration monitoring, and lubricant analysis applied to equipment. These activities are performed to assure early detection of deteriorating equipment conditions in order to ensure safe, reliable and economical operation of station equipment. Predictive maintenance test and inspection data are trended using baseline or previous data for reference to determine extent of degradation. Data evaluation is performed by qualified maintenance personnel, reviewed and verified by the Predictive Maintenance Technology Owner and distributed to Component and Equipment Engineering and Performance Engineering.

N-PROG-MA-0017, "Component and Equipment Surveillance" [7] complements N-PROG-MA-0026, "Equipment Reliability" [55] by performing activities that evaluate, inspect, test and report on the health of specific component groups, including Environmentally Qualified equipment. These are monitored to provide assurance that the effects of aging are adequately managed during the operating life. Monitoring results are provided to the station System Engineers for incorporation into the system condition assessments. A specific example of component and equipment surveillance is the cable monitoring program implemented in accordance with N-PROC-MA-0099, "Cable Surveillance" [57].

N-PROG-OP-0001, "Nuclear Operations" [58] contributes to the overall surveillance of Environmentally Qualified equipment. Operator surveillance ensures that equipment and systems are operating within their design basis, that abnormalities are detected and that actions to resolve these abnormalities are completed in a timely fashion. Operator surveillance consists of operator rounds, readings, routines, predefines and tests. Operator rounds consist of checking accessible areas and equipment on a regular basis. All performance issues, deficiencies and problems are recorded and investigated to determine their cause. Follow up actions are performed or initiated to resolve issues.

N-PROG-RA-0003, "Corrective Action" [59] provides a consistent reporting and evaluation process for identified adverse conditions. Operations, Maintenance and Engineering personnel use the corrective action program to document any undesirable or questionable conditions. This process ensures the following:

- Adverse conditions are adequately documented;
- The cause of the adverse condition is determined;
- The extent of condition is determined; and

- Corrective actions are implemented to correct the adverse condition and where appropriate, to prevent the recurrence or reduce the risk of recurrence of similar adverse conditions.

The Corrective Action Program also provides a communication method of lessons learned (internal and external) to other facilities by providing a factual summary of the event or condition including the initial actions and observations.

4.1.5.2 Seismic Qualification

N-PROG-MA-0017, "Component and Equipment Surveillance" [7] outlines a set of activities that evaluate, inspect, test and report on the health of specific component groups, including seismically qualified equipment. The objective of these activities is to provide assurance that licensing, reactor safety, equipment reliability and conventional safety requirements are being met on an ongoing basis.

N-PROC-MA-0024, "System Performance Monitoring" [19] provides a consistent and comprehensive process for System Engineering to ensure effective monitoring, maintenance and enhancement of system performance and reliability. Field walkdowns are the mechanism used for performing a field evaluation of system performance and forms an essential part of System Performance Monitoring. Walkdowns by System Engineers complement the routine inspections completed by operations staff. Where adverse conditions are noted during walkdowns, appropriate corrective actions are initiated to restore equipment functionality.

N-PROG-MA-0004, "Conduct of Maintenance" [9], establishes safe, uniform and efficient maintenance practices. It ensures that effective implementation and control of maintenance activities are achieved by monitoring and assessing performance. The program includes work planning, work execution, and tool calibration and control, personnel and training, and performance indicators and assessment.

N-PROG-MP-0008, "Integrated Aging Management" [10] ensures that the condition of critical equipment (which includes seismically qualified equipment) is understood and that required activities are in place to ensure the health of the equipment while the plant ages. This is accomplished by establishing an integrated set of programs and activities which ensure performance requirements of all critical equipment are met on an ongoing basis. One of these activities are the Condition Assessments (CAs) covered under N-PROC-MP-0060, "Aging Management Process" [60] which are used to manage aging of critical plant equipment.

The practices that are being followed at Pickering NGS to identify and mitigate equipment aging include the following activities (as per Section 1.5.4.2 in N-PROC-MP-0060, "Aging Management Process" [60]):

- Operational tests and predefines;
- Engineering walkdowns;
- Component engineer review of maintenance results;

- Define component program activities (e.g., piping and valve periodic inspections);
- Activities to maintain Environmental Qualification, including preventative and predictive maintenance;
- In-plant inspections;
- Repair and replace strategies;
- Obsolescence strategies; and
- Research and development activities.

These practices supplement the aging information gathered under the IAM program. By managing the condition of the equipment, Seismic Qualification is also maintained.

Maintaining the integrity of system pressure boundaries of qualified systems during an earthquake is the fundamental requirement of seismic Category A.[8] Surveillance of pressure boundary components is accomplished through the Pickering NGS Periodic Inspection Program documents:

- NA44-PIP-03641.2-00001, "Pickering Nuclear Generating Station A Periodic Inspection Plan For Unit 1" [61];
- NA44-PIP-03641.2-00007, "Pickering Nuclear Generating Station A Periodic Inspection Plan For Unit 4" [62];
- NK30-PIP-03641.2-00001 "Pickering Nuclear Generating Station B Periodic Inspection Plan For Unit 5" [63];
- NK30-PIP-03641.2-00002 "Pickering Nuclear Generating Station B Periodic Inspection Plan For Unit 6" [64];
- NK30-PIP-03641.2-00003 "Pickering Nuclear Generating Station B Periodic Inspection Plan For Unit 7" [65]; and
- NK30-PIP-03641.2-00004 "Pickering Nuclear Generating Station B Periodic Inspection Plan For Unit 8" [66].

These plans provide in-service monitoring for degradation of fluid boundary portions of components, piping and supports of the Heat Transport System (HTS) and systems that are essential to reactor shutdown and safe cooling of fuel. The HTS is seismically qualified to maintain the pressure boundary integrity, and the Periodic Inspection Program (PIP) monitors aging degradation mechanisms such as pipe thinning due to Flow

---

8 Category A systems must retain their structural and pressure boundary integrity during and following the earthquake to ensure and maintain the safety-related system function. Category B systems must retain their pressure boundary integrity and/or must function mechanically and/or electrically during and/or following an earthquake, to ensure and maintain the safety-related system function.

Accelerated Corrosion (FAC), formation and growth of cracks and flaws that are potential failure mechanisms under seismic excitation.

N-PLAN-01060-10001 "Feeders Life Cycle Management Plan" [67] requires monitoring of feeder piping wall thinning rate due to FAC. This has relevance to Seismic Qualification as the HTS is seismic Category A, and reduced wall thickness of feeder piping renders it susceptible to rupture during Design Basis Earthquake (DBE) induced loads.

In-service inspection programs for seismically qualified civil containment structures are also in place at Pickering NGS to support the surveillance program. The in-service inspections for the Reactor Buildings, Vacuum Building, and Pressure Relief Duct are performed in accordance with N-PROC-MA-0066, "Administrative Requirements for In Service Inspection And Testing For Concrete Containment Structures" [68]. This is performed in accordance with CSA N287.7, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants". Note: The L/R/C/S review of CSA N287.7 is addressed in Section 4.2 of this Report.

4.1.5.3 Conclusion

The conclusion of this Review Task assessment is that a surveillance program and feedback procedure exist to ensure that aging degradation of qualified equipment remains insignificant. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Monitoring of Environmental Conditions

Confirm existence of monitoring of actual environmental conditions and identification of 'hot spots' of high activity or temperature.

4.1.6.1 Environmental Qualification

Pickering NGS temperature and radiation conditions are monitored on an ongoing basis. Regular monitoring of environmental parameters is the responsibility of the Station Environmental Qualification SPOC in accordance with Section 1.0 of N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18]. Pickering A is exempt from Radiation Surveillance based on the conservatism of the Pickering A RCM, as well as abnormal radiation conditions being reported through the SCR process. However, all other sections of N-INS-03651-10023 apply for Pickering Units 1,4.

Pickering NGS uses fixed on-line and portable batch environmental monitoring systems and devices to collect temperature and radiation data. The environmental room condition information is maintained in the Pickering NGS RCMs (NA44-MAN-03651-10001 "Environmental Qualification Room Conditions - Pickering A" [22] and NK30-MAN-03651-10001 "Environmental Qualification Room Conditions - Pickering B" [23]).

The Pickering NGS Environmental Qualification SPOC is responsible for the following environmental condition information:

- Maintaining records of environmental monitoring activities;

- Maintaining the Pickering NGS environmental conditions information in the RCM; and

- Preparing reports documenting any major deviations from the RCM and reviewing associated impacts to EQAs.

The process of collecting and analyzing data to review or revise the normal temperature profiles and normal radiation levels in the RCM is performed in accordance with NK30-INS-03651-00001, "Acquisition and Analysis of Temperature/Radiation Data for Environmental Monitoring to Preserve Environmental Qualification at Pickering NGS B" [69] (Note: As per N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18], with the Pickering amalgamation, identified Pickering Units 1,4 rooms are to be monitored in accordance with NK30-INS-03651-00001). NK30-INS-03651-00001 addresses:

Temperature Monitoring

The Plant Information (PI) system interface has been set up to monitor and trend reactor vault temperatures in four quadrants of each unit. The PI system provides temperature data on-line.

Radiation Monitoring

As per N-INS-03651-10023 [18], on-line monitoring provides trends of gamma radiation levels in different rooms using data from on-line radiation monitoring units. The resulting temperature and radiation information is used to update the RCM. Areas/rooms which are not instrumented, are periodically monitored and radiation surveys may be performed to acquire radiation measurements. The survey period should provide sufficient data for the establishment of a typical radiation dose level or for the verification of an established radiation dose level in the RCM for the Environmentally Qualified room of interest.

Addressing "Hot Spots" Of High Activity or Temperature

The first line of response in identifying abnormal room temperatures and radiation level is the station operators who respond to control room annunciations or local alarms during operator routines. When temperature/radiation levels exceed alarm set points and cannot be addressed by returning to normal levels within a reasonable amount of time, the alarm response manuals are followed.

The Radiation Protection department maintains a list of radiation "hot spots" within the station, which identifies the specific location and radiation level. Radiation "hot spots" are often highlighted in SCRs when station staff recognizes problems with radiation levels.

The qualified life of equipment located in the area of one time excursions is reviewed in accordance with Section 1.4.1.1 of N-INS-03651-10003, "Preparation of the Environmental Qualification Room Conditions Manual" [22]. Following an excursion, a check is made to ensure that the qualified life of qualified equipment in the area has not been significantly reduced. The excursion is initially documented through an SCR by station staff and later the review, cause of excursion and corrective actions are documented as part of the

Environmental Qualification history of the station. It is required that this documentation be retrievable and auditable.

In addition to temperature and radiation conditions, a variety of factors (including operation or maintenance activities) can impact the assessed qualified life. In order to maintain Environmental Qualification, a surveillance program monitors Environmentally Qualified equipment and components. The basis of the surveillance program relies on existing programs such as System Performance monitoring, Predictive Maintenance, Preventive Maintenance, Calibration Program and Corrective Action.

4.1.6.2 Seismic Qualification

This Review Task is not applicable to Seismic Qualification as monitoring of environmental conditions, and Radiation "hot spots" in particular, are not required to support seismic qualification.

4.1.6.3 Conclusion

The conclusion of this Review Task assessment is that actual environmental conditions are monitored and "hot spots" of high activity or temperature are identified and addressed. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Effects of Equipment Failures on Equipment Qualification

Confirm existence of an assessment that determines the effects of equipment failures on equipment qualification and appropriate corrective actions and/or safety improvements to maintain equipment qualification.

4.1.7.1 Environmental Qualification

This Review Task is closely associated with Review Task #5 (Section 4.1.5) which discusses the programs, processes and feedback procedures which ensure that equipment qualification is maintained.

In accordance with Section 1.4.2.2 of N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18] the Environmental Qualification SPOC is required to review Environmental Qualification related SCRs, OPEX and sample Environmental Qualification work reports to identify unanticipated age related degradation which could affect the qualified life of Environmentally Qualified equipment. When trends identify degradation, the Environmental Qualification SPOC initiates actions to further evaluate or correct the situation. Through this process, the failure histories of Environmentally Qualified equipment are reviewed and in-service degradation trends are identified. The Environmental Qualification SPOC recommends appropriate corrective actions to prevent equipment failures, including where required, a Technical Operability Evaluation.[9]

[9] A Technical Operability Evaluation (TOE) provides a substantiated engineering verification that a System, Structure or Component is capable of fulfilling its minimum credited safety function(s).

As per Section 1.4.2.2 of N-INS-03651-10023 [18], the Environmental Qualification SPOC performs, or assists in performing, the apparent or root cause analysis of Environmental Qualification related SCRs. This allows for the identification of potential common cause failure mechanisms and degraded conditions which could affect the qualified life of Environmentally Qualified equipment. This process is performed in accordance with guidelines specified in N-PROG-RA-0003, "Corrective Action" [59] which establishes the failure trending and analysis program and provides the program controls required for compliance to Environmental Qualification Industry Standards.

4.1.7.2 Seismic Qualification

N-PROC-MA-0024, "System Performance Monitoring" [19], which is discussed in Section 4.1.1.2 of this report, establishes the process for monitoring health of a system by trending performance and initiating proactive investigative and maintenance activities before failure can occur. This process is supported by N-PROG-MA-0017, "Component and Equipment Surveillance" [7] which lists a set of activities aimed at assuring the health of critical components by evaluating, inspecting, testing and reporting on the health of specific component groups.

N-PROG-MA-0004, "Conduct of Maintenance" [9], ensures that effective implementation and control of maintenance activities are achieved by monitoring and assessing performance. The program includes work planning, work execution, and tool calibration and control, personnel and training, and performance indicators and assessment. In accordance with N-PROC-MA-0020, "Predefined Process" [56] Preventative Maintenance tasks have been established for critical SSCs including Seismically Qualified equipment to assess the condition of equipment on a periodic basis and take appropriate corrective action to avoid functional failures. When failures occur, they are tracked, trended and appropriate actions (including a review of equipment design) are undertaken where required. Where modification of the plant is indicated to resolve the cause of failure, the ensuing activities are governed by N-PROC-MP-0090, "Modification Process" [51] which is discussed in Review Task #4 (Section 4.1.4.2). This process assesses the effects of equipment failures on Seismic Qualification and the appropriate corrective actions required to maintain Seismic Qualification.

4.1.7.3 Conclusion

The conclusion of this Review Task assessment is that programs and processes are in place to monitor the effects of equipment failures on equipment (environmental and seismic) qualification and to take appropriate corrective actions or safety improvements as required. The intent of Review Task #7 is met and therefore Pickering NGS is compliant.

4.1.8 Review Task #8: Equipment Protection from Adverse Environmental Conditions

Confirm there is protection and adequate separation of qualified equipment from adverse environmental conditions.

4.1.8.1 Environmental Qualification

Protection of equipment from adverse environmental conditions is addressed by OPG standard N-STQ-03651-10004, "Harsh Environment Protected Rooms" [70]. It defines the requirements for protected rooms located outside of the containment envelope which may be exposed to harsh environments during DBAs.

Environmental Qualification barriers are also controlled during modifications. In accordance with N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18] and N-GUID-03651-10000, "Guide to Environmental Qualification Completion Assurance" [71], the Environmental Qualification SPOC completes N-FORM-10649, "Environmental Qualification Completion Assurance". This form identifies barriers related to Environmental Qualification so that their effectiveness will be retained. In addition, the form verifies that required protective barriers and adequate separation of qualified equipment from adverse environmental conditions are in place.

To improve mitigation of powerhouse harsh environment events at Pickering NGS, the "H-line" concrete block wall and steam doors separating the powerhouse and reactor auxiliary bay, is designed to withstand steam pressure transients due to a postulated main steamline failure in the powerhouse. For Pickering A, the entire length of the block wall is supported with supplementary steel, erected along it at elevations 254ft, 274ft and 294ft [43]; while for Pickering B the block wall is reinforced with vertical beams and tiebacks at elevations 274ft and 294ft [39].

For Pickering B plant systems are separated into two groups (Group 1 and Group 2) for accident mitigation. This ensures that there is always a qualified safe shutdown success path for low-probability common mode events (e.g. local fires, turbine missiles), and events with widespread harsh environment conditions such as Main Steam Line Breaks. This ensures that sufficient systems remain available from at least one group to provide the required safety functions.

4.1.8.2 Seismic Qualification

An earthquake is a common mode event that is site wide and cannot be countered by two-group separation since both the groups are affected. The approach used has been to seismically qualify critical systems so that the capability to carry out essential safety functions is available following a DBE.

Pickering B was designed to be seismically qualified through the implementation of the overall safety design requirements documented in Engineering Design Guide DG-30-68000-2 [36]. This formally establishes the design requirements for safety related systems to meet the seismic aspects of Canadian nuclear safety principles specified in CSA N289.1, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants" (Table 2-2 of the Pickering B Safety Report, Part 2 [39] contains a list of seismically qualified systems).

When Pickering A was designed, explicit seismic design standards for nuclear power plants were not available. Instead, the seismic design provisions of the 1965 National Building Code of Canada were adopted for seismic design of the nuclear structures. Although the Pickering A systems were not originally required to be seismically qualified, the equipment was evaluated and a Safe Shutdown Equipment List was defined by the 1998 Seismic Margin Assessment [34] which identifies the SSCs required for the seismic success path.

4.1.8.3 Conclusion

The conclusion of this Review Task assessment is that there is protection and adequate separation of qualified equipment from adverse environmental conditions. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.1.9 Review Task #9: Condition and Functionality of Qualified Equipment

Confirm physical condition and functionality capability of qualified equipment is being checked by walkdowns.

4.1.9.1 Environmental Qualification

The physical condition and functionality of environmentally qualified equipment is monitored by walkdowns on an ongoing basis. Walkdowns are part of the Condition Monitoring Program detailed in N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18].

The Environmental Qualification SPOC supports Performance Engineering for condition monitoring of Environmentally Qualified equipment. The Environmental Qualification SPOC works with the System Engineers to ensure that any adverse conditions found during the walkdowns are documented in the System Performance Monitoring Plans (SPMP) walkdown check sheets and integrated into the System Health Reports. In accordance with N-PROC-MA-0024, "System Performance Monitoring" [19], walkdowns are performed in accordance with an approved schedule (the normal expectation for routine walkdowns is weekly). SPMPs are used to detect deficiencies and anomalies associated with the Environmental Qualification equipment by checking equipment and system parameters. Any identified deficiencies are documented in SCRs and managed by N-PROG-RA-0003, "Corrective Action" [59].

N-GUID-03651-10001, "Field Guideline for Environmental Qualification Inspections and Walkdown" [72], provides guidance for Engineering personnel during field walkdowns of Environmentally Qualified equipment. It covers the most common Environmentally Qualified installations and concerns for all CANDU plants and is intended to augment site procedures, engineering drawings and other Environmental Qualification training programs.

In accordance with N-INS-03651-10023, "EQ Environment Monitoring and Equipment/Barrier Surveillance" [18], the Environmental Qualification SPOC ensures that field walkdowns are completed after installation of new or replaced Environmentally Qualified equipment to check that design and configuration requirements are met prior to the device being declared available for service. The Environmental Qualification SPOC also ensures that Environmental Qualification barriers (e.g., steam doors and radiation shielding) are checked periodically to ensure that environmentally qualified equipment, protected by these barriers, remains environmentally qualified.

4.1.9.2 Seismic Qualification

Field walkdowns to maintain physical condition and functional capability of Seismically Qualified SSCs are an essential part of the System Performance Monitoring process in accordance with N-PROC-MA-0024, "System Performance Monitoring" [19] and the results of these walkdowns are documented in System Health Reports. The purpose of these walkdowns is to identify any signs of degradation, functional failure or evidence of poor workarounds and complement the routine inspections completed by operations staff. Walkdowns of some equipment and components that are not accessible during the routine walkdowns are performed during Unit Planned Outages. Any deficiencies identified during walkdowns may generate an SCR or corrective work order, depending on the nature of the observation.

N-PROG-MA-0004, "Conduct of Maintenance" [9], ensures that effective implementation and control of maintenance activities are achieved by monitoring and assessing performance. The program includes work planning, work execution, and tool calibration and control, personnel and training, and performance indicators and assessment. N-PROG-MA-0004 provides authority to N-PROC-MA-0031, "Protection of Seismic Equipment and Routes" [20] establishes criteria to control unsecured equipment and material adjacent to seismically qualified SSCs and seismic routes, thereby ensuring operation, maintenance, modification or outage activities do not place seismically qualified SSCs at risk. The procedure includes guidelines for application of equipment restraints and separation distances to prevent interactions between unsecured equipment and material and seismically qualified SSCs during an earthquake. N-PROC-MA-0031 specifies good practices for maintaining seismic route integrity. It also includes a requirement for field walkdowns to confirm that designated internal and external seismic routes are maintained and accessible at all times.

4.1.9.3 Conclusion

The conclusion of this Review Task assessment is that field walkdown processes are in place to confirm the physical condition and functionality capability of qualified equipment is adequate. The intent of Review Task #9 is met and therefore Pickering NGS is compliant.

4.1.10 Review Task #10: Update to Equipment Classification

Confirm that changes to equipment classification have occurred, as required, as a result of major design modifications made since PSR1.

A listing of some of the major safety design modifications at Pickering NGS since PSR1, as outlined in Part 2 of the Pickering A and B Safety Reports ([39] and [43]) and the 2012 Power Reactor Operating Licence Renewal Application [73], are provided below:

- Fukushima Project related modifications, including:
    - Installation of Passive Autocatalytic Recombiners (PARs) on all units;
    - Addition of Emergency Mitigating Equipment including portable diesel pumps and diesel generators; and
    - Enhancements to water makeup/cooling capability for the Irradiated Fuel Bays; and

    - Additional flood barriers installed around the Pickering A Standby Generator Fuel Forwarding Pump house.

- Seismic Monitoring System Upgrades;
- ECI Strainer Capacity Margin increase;
- Airlock related Design improvements;
- Fuel Handling Equipment Reliability Improvement;
- Addition of Inter-Station Transfer Bus (ISTB); and
- Units 2 and 3 safe storage.

The bullets below provide examples of how some of the above mentioned design modifications have impacted equipment classification (i.e., Environmental/Seismic Qualification status) or where additional analysis demonstrated that equipment classification was not impacted:

- The PARS will mitigate hydrogen excursions, and are completely passive and do not rely on electrical power or operator intervention. The PARs are Seismically Qualified, but are not required to be Environmentally Qualified (i.e., do not have any known Environmentally Qualified degradation mechanisms);
- The airlocks in Pickering Units 1,4 were upgraded to be Environmentally and Seismically Qualified;
- Fuelling machine equipment seismic restraints have been added in order to avoid contributing to a LOCA;
- As part of Units 2 and 3 safe storage, the Unit 2 Class 1 batteries were replaced with new batteries in Seismically Qualified racks;
- In order to mitigate an MSLB in the Pickering A powerhouse, the ISTB was installed as a standby power source to transfer power from Pickering Units 5-8 to Units 1 and 4; and
- A review of the impact of Units 2 and 3 safe storage on Environmental Qualification conditions following MSLB or LOCA in the EQ Room Conditions Manual determined that the resulting impacts are acceptable [74].

The conclusion of this Review Task assessment is that equipment classification for major design modifications has occurred as required since PSR1 (Seismic and Environmental Qualification is being managed through the Engineering Change Control process). The intent of Review Task #10 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed compliance assessments for twelve L/R/C/Ss with content applicable to Safety Factor 3 are provided in Reference [5]. Associated findings applicable to Safety Factor 3 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Compliance Assessment Results for Safety Factor 3

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 3
N290.13-05, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants"	There are no PSR2 gaps for N290.13-05. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N290.13-05.
N285.5-13, "Periodic Inspection of CANDU Nuclear Power Plant Containment Components"	For Safety Factor 3 there are no PSR2 gaps for N285.5-13.
N287.7-08, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	For Safety Factor 3 there are no PSR2 gaps for N287.7-08.
CNSC RD/GD-210 (2012), "Maintenance Programs for Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD/GD-210. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-210.
CNSC RD/GD-98 (2012), "Reliability Programs for Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD/GD-98. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-98.
CNSC REGDOC-2.6.3 (2014), "Aging Management"	For Safety Factor 3 there are no PSR2 gaps for CNSC REGDOC-2.6.3.
N287.2-08, "Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N287.2-08. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N287.2-08.
N289.1-08, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N289.1-08. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N289.1-08.
N289.2-10, "Ground Motion Determination for Seismic Qualification of Nuclear Power Plants"	There are no PSR2 gaps for CSA N289.2-10. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N289.2-10.

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 3
N289.3-10, "Design Procedures for Seismic Qualification of Nuclear Power Plants"	There is one PSR2 gap for Pickering NGS compliance with N289.3-10 which is applicable to Safety Factor 3 (**Pickering PSR2 Gap SF3-2**): 1. Clause 4.4.4.5 of CSA N289.3-10 states: "The power spectral density (PSD) function of each time-history shall be calculated and shown to not have any significant gaps in energy over the frequency intervals outlined in Table 2…." The calculation of PSD is not addressed in the Pickering A or B PRA Based SMAs. The Pickering NGS A PRA Seismic Guide and the OPG PRA Guide do not identify any requirements for PSD. Also, evidence in the form of a calculation for time histories which represent the design ground motion was not found (which is a precursor for the PSD calculation). The lack of evidence of calculated time histories was also identified as a gap in the Darlington ISR (ISR Issues #D352 and #D617 – Documented evidence in the form of a calculation to show that the generated time history correctly represents the design ground response spectrum within the prescribed requirements has not been provided). The closure reference for #D352 and #D617 makes use of the detailed assessment performed in NK38-REP-03680-10224 R000 which is specific to Darlington. A similar assessment for Pickering NGS could not be found. As a result, there is a gap for PSR2 to provide similar evidence to show that: a) the generated time history used within seismic analyses of safety-related systems correctly represents the design ground response spectrum for the Pickering site in compliance with N289.3-10, and b) the PSD function of each time-history has been calculated and shown to not have any significant gaps in energy over the frequency intervals.
N289.4-12, "Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components"	There is one PSR2 gap for Pickering NGS compliance with N289.4-12 which is applicable to Safety Factor 3 (**Pickering PSR2 Gap SF3-3**): 1. Station-specific documents (including the Darlington seismic design guide, Darlington Reports and Darlington-specific technical specifications for seismic qualification) were used as the basis for compliance in the clause-by-clause Darlington code refresh review for clauses 4.2.1, 4.2.2.2, 4.2.3.1, 4.2.5, 4.3.2, 5.2.2.2.5, 5.7, 5.8.1, 5.8.1.2, 7.2.1, 7.7.1, 7.7.4 and 8.2. Pickering-specific seismic design guides, reports and technical specifications that are equivalent to those used to demonstrate Darlington compliance with the changes made in CSA N289.4-12 were identified. However, a detailed review to confirm that the Pickering-specific documents fully comply with the requirements of the clauses listed above is needed. As a result, this is a PSR2 gap.
N289.5-12, "Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities"	There is one PSR2 gap for Pickering NGS compliance with N289.5-12 which is applicable to Safety Factor 3 (**Pickering PSR2 Gap SF3-4**): 1. Darlington ISR Issues #D622, D623 and D624 require no further action for Darlington as they were either classified as Acceptable Deviations or were closed. However, the issues are identified as a PSR2 gap for the following reasons: (Note: These gaps are closely related and are therefore identified as a single PSR2 gap.) o Darlington ISR Issue #624 refers to specific Darlington instrumentation in order to classify the gaps as Acceptable Deviations. It must be demonstrated that Pickering seismic instruments have the same capabilities as the Darlington instruments (fleet-wide or Pickering-specific standards that would ensure that the Pickering seismic instruments have the same capabilities as the Darlington instruments could not be found). Therefore, this is identified as a gap for PSR2.

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 3
	◦ Darlington ISR Issue #D622 was deemed to be of low safety significance. The same rationale may apply at Pickering, but first it must be demonstrated that Pickering has the same set up of seismic instruments as Unit 0 at Darlington. Therefore, this is identified as a gap for PSR2. ◦ Darlington ISR Issue #D623 was deemed to be of low safety significance. The same rationale may apply at Pickering, but first it must be demonstrated that similar accelerometers are used at Pickering, and that their locations are not affected by strong ambient vibration. Therefore, this is identified as a gap for PSR2.

4.3 Audit and Self-Assessment Reviews

The OPG Nuclear Programs specifically applicable to the Equipment Qualification Safety Factor are identified in Table 2, and details of the associated audit and self-assessment results for each of the N-PROGs are provided in Appendix B. Based on the Appendix B.1 assessment of recent N-PROG-RA-0006 [6] audit and self-assessment results there are two gaps for Pickering PSR2 relating to the Environmental Qualification Program:

1) The Environmental Qualification documentation backlog (e.g., Document Change Requests for Environmental Qualification Assessments) increased from 9% in Q4 2013 to 14% in Q4 2014. As a result, CNSC staff requested that OPG assess and create a corrective action plan to ensure Environmental Qualification information remains current and more specifically to reduce and manage the document revision backlog. This is a gap (**Pickering PSR2 Gap SF3-5**) since the CNSC has identified this issue in an Action Notice following a regulatory inspection and the associated action (AR#28179009) is due to be completed by Q3 2016.

2) OPG is in non-compliance with N-PROC-RA-0044, "Environmental Qualification Assessment" for not correcting the documentation discrepancy for Unit 5-8 Vertical Flux Detector Tefzel cables with justification for a new qualified life value. As a result, CNSC staff requested that OPG revise the Environmental Qualification Assessment for Tefzel cables to reflect the change of qualified life of the Vertical Flux Detectors. This is a gap (**Pickering PSR2 Gap SF3-6**) since the CNSC has identified this issue in an Action Notice following a regulatory inspection and the associated action (AR#28170757) is due to be completed by Q4 2016.

The above-mentioned gaps are being tracked to completion and a Regulatory Management Action is in place to provide an update to the CNSC in August 2016 (per AR# 28179713).

In terms of the Component and Equipment Surveillance Program [7] and the Seismic Qualification Program (which consists of a series of engineering programs and procedures), no additional audit or self-assessment-related gaps were identified.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 3 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued, per the R04 Pickering LCH [15], to determine if there are any associated impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified PSR1 gaps related to Safety Factor 3 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not find any additional gaps to those already discussed in Section 4.2 (L/R/C/S reviews) or Section 4.3 (Audit and Self-Assessments Results) for Safety Factor 3.

There were no PSR2 gaps identified in this Safety Factor 3 Report that require discussion in other Safety Factor Reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Pickering NGS equipment qualification (environmental and seismic) were reviewed for the ten PSR2 Review Tasks in Section 4.1 of this report and resulted in Pickering PSR2 Gap SF3-1 below. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for Safety Factor 3 were prepared per Sections 4.2 and 4.3, respectively, and resulted in PSR2 Gaps SF3-2 to SF3-6. This report also included a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factor 3), as well as identification and review of previously identified PSR1 gaps related to Safety Factor 3 (to ascertain the implications of extending Pickering NGS operation beyond 2020), per Section 4.4, which resulted in no additional PSR2 gaps.

The six PSR2 gaps that will need to be addressed as part of Pickering PSR2 are:

- **<u>Gap SF3-1</u>**: Per Review Task #3, the Environmental Qualification Program N-PROG-RA-0006, "Environmental Qualification Program" requires that whenever equipment on the EQL approaches the end of its qualified life, action must be taken to sustain the qualified status of that equipment regardless of what the station current life is taken to be. Hence, all EQAs will need to be re-assessed to ensure qualification is maintained in order to support continued operation of Pickering NGS beyond 2020. The current Environmentally Qualified life of all Pickering NGS SSCs may not necessarily extend to 2028 and a full review of Environmentally Qualified life-limited components impacted by operation past 2020 will need to be undertaken prior to life extension of Pickering NGS. This is therefore identified as a gap exists for Pickering PSR2. It is noted that work to address this gap is currently underway as part of the update of Pickering NGS Condition Assessments for safety related systems and Life Cycle Management Plans for major components.

- **<u>Gap SF3-2</u>**: For N289.3-10, "Design Procedures for Seismic Qualification of Nuclear Power Plants" there is a gap associated with Safety Factor 3. Clause 4.4.4.5 of CSA N289.3-10 states: "The power spectral density (PSD) function of each time-history shall be calculated and shown to not have any significant gaps in energy over the frequency intervals outlined in Table 2…." The calculation of PSD is not addressed in the Pickering A or B PRA Based SMAs. The Pickering NGS A PRA Seismic Guide and the OPG PRA Guide do not identify any requirements for PSD. Also, evidence in the form of a calculation for time histories which represent the design ground motion was not found (which is a precursor for the PSD calculation). The lack of evidence of calculated time histories was also identified as a gap in the Darlington ISR (ISR Issues #D352 and #D617 – Documented evidence in the form of a calculation to show that the generated time history correctly represents the design ground response spectrum within the prescribed requirements has not been provided). The closure reference for #D352 and #D617 makes use of the detailed assessment performed in NK38-REP-03680-10224 R000 which is specific to Darlington. A similar assessment for Pickering NGS could not be found. As a result, there is a gap for PSR2 to provide similar evidence to show that: a) the generated time history used within seismic analyses of safety-related systems correctly represents the design ground response spectrum for the Pickering site in compliance with N289.3-10, and b) the PSD function of each time-history has been calculated and shown to not have any significant gaps in energy over the frequency intervals.

- **Gap SF3-3**: For N289.4-12, "Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components" there is a gap associated with Safety Factor 3. Station-specific documents (including the Darlington seismic design guide, Darlington Reports and Darlington-specific technical specifications for seismic qualification) were used as the basis for compliance in the clause-by-clause Darlington code refresh review for clauses 4.2.1, 4.2.2.2, 4.2.3.1, 4.2.5, 4.3.2, 5.2.2.2.5, 5.7, 5.8.1, 5.8.1.2, 7.2.1, 7.7.1, 7.7.4 and 8.2. Pickering-specific seismic design guides, reports and technical specifications that are equivalent to those used to demonstrate Darlington compliance with the changes made in CSA N289.4-12 were identified. However, a detailed review to confirm that the Pickering-specific documents fully comply with the requirements of the clauses listed above is needed. As a result, this is a PSR2 gap.

- **Gap SF3-4**: For N289.5-12, "Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities" there is a gap associated with Safety Factor 3. Darlington ISR Issues #D622, D623 and D624 require no further action for Darlington as they were either classified as Acceptable Deviations or were closed. However, the issues are identified as a PSR2 gap for the following reasons: (Note: These gaps are closely related and are therefore identified as a single PSR2 gap.)

    - Darlington ISR Issue #624 refers to specific Darlington instrumentation in order to classify the gaps as Acceptable Deviations. It must be demonstrated that Pickering seismic instruments have the same capabilities as the Darlington instruments (fleet-wide or Pickering-specific standards that would ensure that the Pickering seismic instruments have the same capabilities as the Darlington instruments could not be found). Therefore, this is identified as a gap for PSR2.
    - Darlington ISR Issue #D622 was deemed to be of low safety significance. The same rationale may apply at Pickering, but first it must be demonstrated that Pickering has the same set up of seismic instruments as Unit 0 at Darlington. Therefore, this is identified as a gap for PSR2.
    - Darlington ISR Issue #D623 was deemed to be of low safety significance. The same rationale may apply at Pickering, but first it must be demonstrated that similar accelerometers are used at Pickering, and that their locations are not affected by strong ambient vibration. Therefore, this is identified as a gap for PSR2.

- **Gap SF3-5**: The Environmental Qualification documentation backlog (e.g., Document Change Requests for Environmental Qualification Assessments) increased from 9% in Q4 2013 to 14% in Q4 2014. As a result, CNSC staff requested that OPG assess and create a corrective action plan to ensure that Environmental Qualification information remains current and more specifically to reduce and manage the document revision backlog. This is a gap for PSR2 since the CNSC identified this issue in an Action Notice following a regulatory inspection and the associated action (AR#28179009) is due to be completed by Q3 2016.

- **<u>Gap SF3-6</u>**: Pickering NGS is in non-compliance with N-PROC-RA-0044, "Environmental Qualification Assessment" for not correcting the documentation discrepancy for Unit 5-8 Vertical Flux Detector Tefzel cables with justification for a new qualified life value. As a result, CNSC staff requested that OPG revise the Environmental Qualification Assessment for Tefzel cables to reflect the change of qualified life of the Vertical Flux Detectors. This is a gap for PSR2 since the CNSC identified this issue in an Action Notice following a regulatory inspection and the associated action (AR#28170757) is due to be completed by Q4 2016.

The review of Safety Factor 3 has confirmed that the Pickering NGS equipment important to safety has been properly qualified and that this qualification is being maintained through an adequate programme of maintenance, inspection and testing.

Appendix A: Nomenclature

AECB	Atomic Energy Control Board
CANDU	CANada Deuterium Uranium
CAP	Corrective Action Plan
CA	Condition Assessment
CMP	Control Maintenance Procedure
CNSC	Canadian Nuclear Safety Commission
COG	CANDU Owners Group
DBA	Design Basis Accident
DBE	Design Basis Earthquake
DCR	Document Change Request
ECC	Engineering Change Control
ECI	Emergency Coolant Injection
EMI	Electromagnetic Interference
EQA	Environmental Qualification Assessment
EQL	Environmental Qualification List
EQ	Environmental Qualification
FAC	Flow Accelerated Corrosion
GAR	Global Assessment Report
HTS	Heat Transport System
IAEA	International Atomic Energy Agency
IAM	Integrated Aging Management
IEE	Item Equivalency Evaluation
IIP	Integrated Implementation Plan
ISR	Integrated Safety Review
ISTB	Inter-Station Transfer Bus
LOCA	Loss of Coolant Accident
MDR	Modification Design Requirements
MSLB	Main Steam Line Break
NBC	National Building Code
NGS	Nuclear Generating Station
NICR	Non-Identical Component Replacement
OBC	Ontario Building Code

OPEX	Operating Experience
OPG	Ontario Power Generation
PARs	Passive Autocatalytic Recombiners
PARTS	Pickering A Return to Service
PEL ID	Program Element Identification
PI	Plant Information
PIP	Periodic Inspection Program
PRA	Probabilistic Risk Assessment
PSR	Periodic Safety Review
PSR1	Periodic Safety Review 1 (earlier OPG PSR work and other associated assessments)
PSR2	Periodic Safety Review 2 (subsequent PSR per CNSC REGDOC-2.3.3)
RCM	Room Conditions Manual
RFI	Radiofrequency Interference
SCR	Station Condition Record
SDE	Site Design Earthquake
SMA	Seismic Margin Assessment
SPOC	Single Point of Contact
SSC	Structures, Systems and Components
SPMP	System Performance Monitoring Plan
USI	Universal Subject Index

Appendix B: Audit and Self-Assessment Results

B.1 N-PROG-RA-0006, "Environmental Qualification"

The Environmental Qualification program provides assurance that essential equipment can perform as required when exposed to harsh DBA conditions and that this capability is preserved over the life of the plant. The OPG EQ Program complies with CSA Standard N290.13-05, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants". Note: The L/R/C/S review of CSA N290.13 is addressed in Section 4.2 of this Report.

The EQ program consists of three distinct areas which are integrated to establish and maintain auditable proof of qualification throughout the life of station units:

- Documentation of EQ requirements: Defining list of equipment and components required to be environmentally qualified which is maintained current with the plant licensing basis, design basis and service conditions.

- Demonstration of qualification: Ensuring auditable proof of performance under harsh DBA conditions is developed and maintained current with plant licensing basis, design basis, service conditions and configuration.

- Implementation and preservation: Providing assurance that equipment and components within the EQ program are purchased, stored, configured, maintained, monitored and replaced to ensure qualified status is preserved.

In January 2014, Nuclear Oversight conducted a performance based audit at Pickering NGS, NO-2014-105 [B.1.1] to determine if the actions taken to address the issues identified in the EQ audit NO-2013-111 [B.1.2] are effective. NO-2013-111 [B.1.2] had identified deficiencies in EQ Room Condition Monitoring and Reporting, deficiencies in EQ Equipment surveillance, and untimely resolution of document change requests (DCRs) backlog on EQ documents. It was concluded in NO-2014-105 [B.1.1] that the previously identified deficiencies were resolved and the actions taken to address the issues were effective.

The Equipment Reliability department completed a self-assessment in March 2015 for Pickering NGS, P15-000842 [B.1.3] in order to provide a gap analysis of the corrective actions from the 2013 CNSC EQ Type II inspection [B.1.4] and the 2013 Nuclear Oversight Audit [B.1.2]. Overall, the corrective actions which were completed were considered to be completed with satisfactory results. However, a trend was identified that EQ DCRs on both Environmental Qualification Assessments and Environmental Qualification List Development Packages had a backlog increase. As part of the self-assessment, an action plan was put in place for managing the EQ document backlog.

A CNSC Type II inspection of the EQ program was conducted in March 2015 for Pickering NGS [B.1.5]. The audit was deemed successful and the CNSC recognized OPG for its effort in improving the EQ program from a "RED" program performance in 2013 to a "WHITE" by Q4-2014. The CNSC provided a final report in June 2015 which identified 4 Action Notices and 2

Recommendations (all Action Notices and Recommendations were known issues). As part of OPG's response to the CNSC, one Action Notice was closed out, while the remaining Action Notices had Corrective Action Plans put in place to enable tracking to completion. The Action Notices were related to:

- The Environmental Qualification documentation backlog (e.g., DCRs for Environmental Qualification Assessments) increased from 9% in Q4 2013 to 14% in Q4 2014. As a result, CNSC staff requested that OPG assess and create a corrective action plan to ensure Environmental Qualification information remains current and more specifically to reduce and manage the document revision backlog (tracked per Action Request (AR) #28179009, Due Q3 2016).

- OPG is in non-compliance with N-PROG-RA-0006, "Environmental Qualification" for not ensuring that all Environmental Qualification requirements are addressed in corresponding Control Maintenance Procedures (CMPs). As a result, CNSC staff requested that OPG ensure that all Environmental Qualification requirements are addressed in corresponding CMPs by performing a review between the maintenance requirements listed in all Pickering EQA Part 1 and those listed in the latest revision of applicable CMPs (tracked per AR#28179010, which is now complete, hence this is not a gap for PSR2).

- OPG is in non-compliance with N-PROC-RA-0044, "Environmental Qualification Assessment" for not correcting the documentation discrepancy for Unit 5-8 Vertical Flux Detector Tefzel cables with justification for a new qualified life value. As a result, CNSC staff requested that OPG revise the Environmental Qualification Assessment for Tefzel cables to reflect the change of qualified life of the Vertical Flux Detectors (tracked per AR#28170757, Due Q4 2016).

- The CNSC requested that OPG assess the cause of the low compliance (60%) of the Pickering NGS maintenance records and provide a corrective action plan to ensure the status of Environmentally Qualified equipment is validated and preserved. This has been tracked per AR#28174743, which is now complete, hence this is not a gap for PSR2.

There is high confidence that these actions will be completed successfully and are being tracked to completion since a Regulatory Management Action (AR#28179713) is in place to provide an update to the CNSC by August 2016.

Based on the above assessment of recent N-PROG-RA-0006 audit and self-assessment results there are two gaps for Pickering PSR2 relating to the Environmental Qualification Program:

1) The Environmental Qualification documentation backlog (e.g., DCRs for Environmental Qualification Assessments) increased from 9% in Q4 2013 to 14% in Q4 2014. As a result, CNSC staff requested that OPG assess and create a corrective action plan to ensure Environmental Qualification information remains current and more specifically to reduce and manage the document revision backlog. This is a gap (**Pickering PSR2 Gap SF3-5**) since the CNSC has identified this issue in an Action Notice following a

regulatory inspection and the associated action (AR#28179009) is due to be completed by Q3 2016.

2) Pickering NGS is in non-compliance with N-PROC-RA-0044, "Environmental Qualification Assessment" for not correcting the documentation discrepancy for Unit 5-8 Vertical Flux Detector Tefzel cables with justification for a new qualified life value. As a result, CNSC staff requested that OPG revise the Environmental Qualification Assessment for Tefzel cables to reflect the change of qualified life of the Vertical Flux Detectors. This is a gap (**Pickering PSR2 Gap SF3-6**) since the CNSC has identified this issue in an Action Notice following a regulatory inspection and the associated action (AR#28170757) is due to be completed by Q4 2016.

B.2 Seismic Qualification (Per N-PROG-MP-0001 "Engineering Change Control", N-PROG-MP-0009 "Design Management", N-PROG-MA-0004 "Conduct of Maintenance" and N-PROG-MP-0008 "Integrated Aging Management")

There are a series of engineering programs and procedures used to maintain the Seismic Qualification of safety related SSCs, as per N-PROG-MP-0009, "Design Management", N-PROG-MP-0001, "Engineering Change Control", N-PROG-MA-0004, "Conduct of Maintenance", N-PROG-MP-0008, "Integrated Aging Management", and N-PROC-MA-0021, "System Performance Monitoring". Details of the audit and self-assessment results for compliance with the seismic elements of the applicable programmatic documents are described below.

Nuclear Oversight conducted a performance based audit of the ECC program for Pickering NGS in November 2014 per NO-2014-030 [B.2.1] to determine if ECC-related activities were being performed effectively and in compliance with program requirements for safe and reliable operations. In terms of Seismic related findings, it was determined that there was a misalignment between vendor documents associated with seismic classification/requirements. An SCR (N-2014-30369) was initiated which required corrective actions to be implemented. This SCR is now complete and the necessary corrective actions were finalized to address the underlying issues.

An Evaluating Organization Effectiveness review (EOER) was completed for Pickering NGS in May 2014 per P14-000541 [B.2.2] in which adverse conditions related to seismic equipment and routes were identified. The following 6 actions were generated (tracked under SCR P-2014-26922):

1) Assign a program owner to ensure compliance with N-PROC-MA-0031, "Protection of Seismic Equipment and Routes";

2) Develop a broad action plan which will address items such as management expectations, worker awareness and training, oversight of program compliance, etc;

3) Conduct a pre-effectiveness review of Corrective Action Plan (CAP) actions to determine the effectiveness of corrective actions initiated;

4) Conduct an EOER for SCR P-2014-26922;

5) Ensure oversight of the Seismic Program at the safety cornerstone meeting and review appropriate metrics as feasible; and

6) Identify training gaps within the Seismic Program and PELs to be updated accordingly.

EOER P16-000023 [B.2.3] was initiated in September 2015 (completed as per item 4 above) and determined that the corrective actions identified in SCR P-2014-26922 were effective at addressing the adverse conditions.

The above results for the audit and self-assessments therefore reveal that there are no gaps associated with implementation of the Seismic Program at Pickering NGS.

R00	May 6, 2016	R. Guhathakurta, A. Johnstone, R. Jayasundera	Initial issue for OPG review and comment.
R01	July 13, 2016	R. Guhathakurta, A. Johnstone, R. Jayasundera	Updated report addressing OPG comments on R00.

EXECUTIVE SUMMARY

OPG is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 4, *Aging* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 4 were reviewed for the ten PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for both Safety Factors 2 and 4 were prepared per Sections 4.2 and 4.3, respectively. This report also includes a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factors 2 or 4), as well as identification and review of previously identified PSR1 gaps related to Safety Factor 4 (to ascertain the implications of extending Pickering NGS operation beyond 2020), per Section 4.4.

The results of the review of the Aging Safety Factor are discussed in Section 5.0 of this report. The review has confirmed that aging aspects affecting Structures, Systems and Components (SSCs) important to safety are being effectively managed and that an effective aging management program is in place at Pickering NGS. As discussed in Section 5.0, the review identified eighteen gaps that will need to be addressed further as part of the PSR2 Global Assessment process.

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

OPG is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering NGS beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3];
- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and
- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Aging Safety Factor 4 is to: "determine whether aging aspects affecting Systems, Structures and Components (SSCs) important to safety are being effectively managed and whether an effective aging management programme is in place so that all required safety functions will be delivered for the design lifetime of the plant." REGDOC-2.3.3 [2] requires that: "The licensee shall

[1] Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence.

[2] Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 4 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessment

The Pickering PSR2 Safety Factor 4 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 and IAEA SSG-25 are shown in Reference [4]. The Safety Factor 4 Review Tasks are:

1) Confirm there is a documented method and criteria for identifying safety related SSCs covered by the Aging Management Program.

2) Ensure there is an effective Aging Management Program and dedicated organization with clearly defined roles and responsibilities with sufficient resources to continually assess aging effects in safety related SSCs.

3) Establish a list of SSCs covered by the aging management program and records that provide information in support of the management of aging.

4) Evaluate and document impact of potential aging degradation of safety related SSCs.

5) Confirm or develop understanding of dominant aging mechanisms of safety related SSCs.

6) Confirm existence of predictive maintenance program.

7) Ensure existence of programs for timely detection and mitigation of aging mechanisms and/or aging effects of any SSCs important to safety, including obsolescence of technology used in the plant or obsolescence of services or supplies external to the plant.

8) Establish acceptance criteria and required safety margin for safety related SSCs for the period of PSR2 through reliability and risk assessments.

9) Confirm adequacy of management of the effects of aging on those parts of the plant that will be required for safety when the reactor has ceased operation, for example the spent fuel storage facilities.

10) Confirm the models used to predict the evolution and advancement of aging degradation are properly supported in accordance with current accepted practices pertaining to aging degradation.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Safety Factor for Aging are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2. Note that L/R/C/S reviews associated with Safety Factor 2, *Actual Condition of SSCs Important to Safety*, are also provided in this Safety Factor report.

All of the Safety Factor 2 and 4 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed compliance assessment for each L/R/C/S is provided in Appendix B of Reference [4]. Associated findings are summarized in Section 4.2 of this Report.

Table 1: L/R/C/Ss Reviewed for Safety Factors 2 and 4

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N290.13	Environmental Qualification of Equipment for CANDU Nuclear Power Plants	N290.13-05	3, 4	Incremental	N290.13 addressed as part of Pickering B and Darlington ISRs
2	CSA N285.4	Periodic Inspection of CANDU Nuclear Power Plant Components	N285.4-14	1, 2, 4	Incremental	N285.4 addressed as part of Pickering B and Darlington ISRs
3	CSA N285.5	Periodic Inspection of CANDU Nuclear Power Plant Containment Components	N285.5-13	1, 2, 3, 4	Incremental	N285.5 addressed as part of Pickering B and Darlington ISRs
4	CSA N287.7	In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.7-08	2, 3, 4	Incremental	N287.7 addressed as part of Pickering B and Darlington ISRs
5	CNSC RD/GD-210*	Maintenance Programs for Nuclear Power Plants	2012	3, 4	Incremental	S-210 and RD/GD-210 addressed as part of Darlington ISR
6	CNSC RD/GD-98	Reliability Programs for Nuclear Power Plants	2012	3, 4	Incremental	RD/GD-98 addressed as part of Darlington ISR and S-98 as part of Pickering B ISR
7	CNSC REGDOC-2.6.3*	Aging Management	2014	3, 4	Incremental	Transition plan in place and gap assessment between RD-334 and OPG Nuclear Integrated Aging Management governance performed by OPG
Additional L/R/C/Ss						
8	CSA N287.2	Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.2-08	1, 2, 3, 4	Incremental	N287.2 addressed as part of Pickering B and Darlington ISRs and PARTS

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
9	CSA N285.8	Technical Requirements for In-Service Evaluation of Zirconium Alloy Pressure Tubes in CANDU Reactors	N285.8-15	2, 4	Incremental	N285.8 addressed as part of Pickering B and Darlington ISRs

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

2.3 Audit and Self-Assessment Reviews of OPG Programs

The OPG Nuclear Programs (N-PROGs) applicable to the Safety Factor for Aging are listed in Table 2 below. The methodology for the audit and self-assessment reviews is discussed in Section 3.3. The assessment results of each of the N-PROGs in Table 2 is provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Programs Applicable to the Safety Factor for Aging

Document Number	Document Title
N-PROG-MP-0008 [6]	Integrated Aging Management
N-PROG-MA-0025 [8]	Major Components
N-PROG-MA-0026 [9]	Equipment Reliability
N-PROG-MA-0017 [10]	Component and Equipment Surveillance
N-PROG-MA-0004 [11]	Conduct of Maintenance
N-PROG-OP-0004 [13]	Chemistry
N-PROG-MA-0019 [15]	Production Work Management
N-PROG-MA-0016 [16]	Fuel

Audit and self-assessments results for N-PROGs associated with Safety Factor 2, *Actual Condition of SSCs Important to Safety*, are also provided in Appendix B, and findings are summarized in Section 4.3. The N-PROGs applicable to the Actual Condition of SSCs Safety Factor 2 are listed in Table 3 below.

Table 3: OPG Programs Applicable to the Actual Condition of SSCs Safety Factor

Document Number	Document Title
OPG-PROG-0009 [26]	Items and Services Management
N-PROG-MP-0001 [27]	Engineering Change Control
N-PROG-MP-0004 [28]	Pressure Boundary

2.4 Additional Reviews

The PSR2 Safety Factor 4 Report includes a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factors 2 or 4). The Report also includes identification and review of previously identified PSR1 gaps related to Safety Factor 4 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is provided in Section 3.4.

In addition, any PSR2 gaps identified as a result of the Safety Factor 4 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Task and L/R/C/S compliance, and Nuclear Program effectiveness for the Aging Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [4]).

For each Safety Factor 4 Review Task identified in Section 2.1, confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[3]
- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;
- Implications of extending Pickering NGS operation beyond 2020; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

L/R/C/Ss in the PSR2 Assessment Basis generally receive incremental reviews since PSR2 is an update of previous ISR assessments and clause-by-clause or high level reviews for the majority of the L/R/C/S in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous ISRs but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;
- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;
- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);
- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

3 "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;
- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and
- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

The Safety Factor 4 L/R/C/S reviews identify Compliances and Gaps as defined below:[4]

- Compliance:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 4.)
    - For Clause-by-Clause reviews of modern Laws, Regulations, Codes and Standards, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 4.)
- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 4.)
    - For Clause-by-Clause reviews of modern Laws, Regulations, Codes and Standards, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 4.)

[4] Safety Factor compliance assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the compliance arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (Fukushima actions are included as appropriate as commitments or actions), c) Identification of previously identified ISR gaps related to each Safety Factor and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 Audit and Self-Assessment Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent audit and self-assessment results. Nuclear Program audit and self-assessment results were prepared for Safety Factor 4 by reviewing recent and applicable:

- OPG Program Health reports;
- OPG Nuclear Oversight independent performance based Program audits (typically performed in 1 to 5 year cycles) and self-assessments (typically performed on a yearly basis). This includes review of associated Station Condition Records and Action Requests to confirm that any findings have been completed; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where called-up by OPG Program Health reports, audits or self-assessments.

The focus of these reviews was on effectiveness of the Programs at Pickering NGS, where specific information is available.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

The PSR2 Safety Factor 4 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 4 (as identified in the Pickering B and Darlington Integrated Implementation Plans (IIPs) [32][33] and Pickering Units 5-8 Continued Operations Plan (COP) [34]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[5]

A review was also performed of the following for both Safety Factors 2 and 4 to determine if there are any impacts associated with operation of the Pickering Units past 2020:

- Commitments previously made to the CNSC in the R04 Pickering Licence Condition Handbook (LCH) [31];
- Open CNSC action items in the R04 Pickering LCH [31]; and
- Exemptions granted by the CNSC since the current operating licence was issued per the R04 Pickering LCH [31] (Fukushima actions are included as appropriate as commitments or actions).

Any PSR2 gaps identified as a result of the Safety Factor 4 review which need to be addressed in other Safety Factor Reports are also discussed.

[5] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 4 Review Tasks.

4.1.1 Review Task #1: Criteria for Identifying Safety Related SSCs

Confirm there is a documented method and criteria for identifying safety related SSCs covered by the Aging Management Program.

The Integrated Aging Management (IAM) Program, N-PROG-MP-0008, "Integrated Aging Management" [6] ensures the condition of critical Nuclear Power Plant (NPP) equipment is understood and that required activities are in place to assure the health of these components and systems while the plant ages. The IAM program covers all critical SSCs having nuclear safety, production, cost, conventional safety and environmental significance.

Aging Management (AM) is managed through the implementation of several programs including:

- N-PROC-MP-0060, "Aging Management Process" [7];
- N-PROG-MA-0025, "Major Components" [8];
- N-PROG-MA-0026, "Equipment Reliability" [9];
- N-PROG-MA-0016, "Fuel" [16]; and
- N-PROG-MA-0017, "Component and Equipment Surveillance" [10].

N-PROC-MP-0060 "Aging Management Process" [7] is the predominant method for identifying SSCs to be included in the Aging Management Program. Selection of components to be included in the aging management scope is based on their criticality as determined through the process outlined in N-PROC-MA-0077, "Critical Equipment Identification and Categorization" [19]. Critical components that have effective maintenance practices (for example Periodic Inspection) that address Age Related Degradation Mechanisms (ARDMs) are excluded.

N-PROG-MA-0025, "Major Components" establishes an integrated set of processes and activities to justify fitness for service of Feeders (N-PLAN-01060-10001, "Feeders Life Cycle Management Plan" [35]), Fuel Channels (N-PLAN-01060-10002, "Fuel Channels Life Cycle Management Strategy and Plan" [36]), Reactor Components & Structures (N-PLAN-01060-10003, "Reactor Components and Structures Life Cycle Management Plan" [37]), and Steam Generators (N-PLAN-33110-10009, "Steam Generators Life Cycle Management

Plan" [38]). N-PROG-MA-0025, "Major Components" develops long-term Life Cycle Management strategies that support continued fitness for service.

It is noted that N-PROG-MA-0016, "Fuel" [16] establishes requirements to integrate and review Fuel-related data in order to ensure fuel performs safely and reliably over the life of the stations, consistent with design and licensing bases, while optimizing station reliability, production, and cost effectiveness. Fuel-related data includes any information that may impact fuel throughout its life-cycle including (but not limited to) manufacturing, inspections, research, station operating conditions, and fuel channel interactions. Also included is fuel channel data that may impact safety analysis, or the safety report, however, this program does not include responsibilities for fuel channel life-cycle management and fitness for service that are covered by N-PROG-MA-0025, "Major Components" [8].

Life Cycle Management Plans (LCMPs) outline the requirements to manage the aging of the major components and associated sub-systems which are developed based on the methodology identified in N-PROG-MP-0008, "Integrated Aging Management" [6]. These documents as well as the procedural methods used in preparing and revising LCMPs collectively ensure that critical NPP equipment is understood and that required activities are in place to support component and overall system health as the plant ages. LCMPs are to be updated within a timeframe that allows for the specified requirements (e.g., inspections) to be captured in the business planning cycle.

The Major Components program specifies the requirements for monitoring, integrating, and assessing information related to Feeders, Steam Generators, Reactor Components & Structures, and Fuel Channels. It also details the documentation requirements associated with demonstrating compliance with the requirements and limits applicable to the four major components areas. The program addresses all processes that impact or have the potential to impact the integrity and performance of the major components, including design, operation, chemistry, inspection, maintenance, and modifications.

N-PROG-MA-0026, "Equipment Reliability" [9] is the governing document that establishes the process for Equipment Reliability (ER) for critical components. The ER Program and its implementing procedures ensure that critical components meet their defined/desired level of reliability for the lifespan of the NPP.

N-PROG-MA-0017, "Component and Equipment Surveillance" [10] Program defines requirements for establishing programs to ensure the health of select nuclear power plant components and equipment. It also provides additional focus and program oversight which provides assurance that licensing, reactor safety, equipment reliability, environmental and conventional safety requirements are met on an ongoing basis. The program identifies component programs, ownership, roles, accountabilities, and component monitoring activity requirements driven by regulatory, safety (nuclear, conventional, environmental), and business (production) requirements. Not all component and equipment lines warrant the oversight of a unique component program, as critical components that have effective maintenance practices that address the ARDMs are excluded. Components not in the scope of N-PROG-MA-0017 are managed under N-PROG-MA-0025, "Major Components" [8] or N-PROG-MA-0026, "Equipment Reliability" [9].

The Component and Equipment Surveillance Program addresses both components and program health. Steam generators, fuel and fuel channels, feeder piping, and reactor components are excluded, as they are covered by formal Life Cycle Plans. Component programs within the scope of the Component and Equipment Surveillance Program include: Heat Exchangers, Power Operated Valves, Check Valves, Periodic Inspection of Pressure Retaining Nuclear Components, Periodic Inspection of Containment Components, In-service Examination and Testing of Concrete Containment Structures, Pressure Relief Devices, Buried Piping, Pipe Wall Thinning (Microbial Induced Corrosion, Flow Accelerated Corrosion), Lubrication, Pressure Vessel Certification, Calibration Process Engineering Requirements, Valve Stem Packing, Machine Safeguarding, Pump Testing, Critical Pipe Support Inspection and Cable Surveillance Program. This program defines the requirements for establishing component programs that manage component and equipment health including inspection, maintenance, certification and testing [10].

These specific component programs establish requirements relating to the following:

1. Performance criteria and monitoring: Parameters are in place to ensure that limiting conditions and equipment performance can be monitored to ensure that nuclear safety, reliability, and availability targets are met as follows:

    a. To identify specific alert levels and acceptance criteria for condition monitoring;

    b. To establish mission time testing requirements where required for specified poised and stand-by safety related equipment;

    c. To identify leading indicators that predict performance as well as indicators based on failures;

    d. To relate monitored parameters and acceptable levels of performance to measureable indications of component degradation.

2. Licensing and Regulatory requirements: Activities are in place to comply with Licensing and Regulatory requirements by ensuring special testing, design reviews and evaluations are identified and conducted;

3. Maintenance and Condition Monitoring: Activities are specified utilizing predictive and preventive maintenance processes;

4. Establishing action levels and to initiate action to correct problems or deviations from expected performance; and

5. Understanding, identifying and managing equipment aging issues by defining maintenance, inspection and other activities necessary to manage component aging.

N-PROC-MA-0077, "Critical Equipment Identification and Categorization" [19] is one of the implementing procedures under the ER umbrella. It identifies criticality coding and single point vulnerabilities. This procedure establishes a process for identification of critical components that is consistent with the guidance provided by INPO AP913, "Equipment Reliability Process Description". This includes:

- Identifying the basis and considerations for categorization and significance in supporting plant functions;
- Defining high, low, non-critical, run to maintenance and single point vulnerable components; and
- Application of component categorization methodology.

Part of the Aging Management Process (AMP) is the ongoing evaluation of the condition of critical SSCs. This is accomplished through the condition assessment process, which identifies actions required to assure the health of the SSCs as the plant ages. N-PROC-MP-0060, "Aging Management Process" [7] describes the process used to perform condition assessment of critical components.

The AMP outlines the process of scope definition and screening to identify the critical components requiring condition assessment. This includes:

- Identifying the SSCs subject to screening and defining the boundaries of each system;
- Grouping the components in order to manage the screening and condition assessment in an efficient manner; and
- Ensuring the effectiveness of the condition assessment process.

The AMP also provides guidance in preparing condition assessments to identify actions required to assure health of SSCs as the plant ages.

For other station components that do not have a component program or established periodic activities, Condition Assessments (CAs)[6] are prepared to determine and document the actual condition and to identify actions to maintain performance. CAs document the current condition of SSCs, relevant aging mechanisms and any actions required to mitigate aging related degradation. CAs are issued in Asset Suite and are also stored in a CA database which is reviewed and updated to incorporate new information (e.g. OPEX). System health reports summarize the results of Condition Assessments and identify action plans required to resolve aging related issues.

Conclusion:

The procedures and processes identified above provide a documented method and criteria for identifying safety related SSCs covered by the Aging Management program. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

[6] The terminology currently used is Condition Assessment (CA) instead of Component Condition Assessment (CCA). "Condition Assessment" will be used throughout this Report.

4.1.2 Review Task #2: Aging Management Program Effectiveness

Ensure there is an effective Aging Management Program and dedicated organization with clearly defined roles and responsibilities with sufficient resources to continually assess aging effects in safety related SSCs.

N-PROG-MP-0008, "Integrated Aging Management" [6], uses CNSC Regulatory Document RD-360, "Life Extension of Nuclear Power Plants", February 2008, CNSC Regulatory Document RD-310, "Safety Analysis for Nuclear Power Plants", February 2008 and CNSC Regulatory Document RD-334 , "Aging Management of Nuclear Power Plants", June 2011 as the bases for its program [6].

The IAM Program, N-PROG-MP-0008, "Integrated Aging Management" ensures the condition of critical NPP equipment is understood and that required activities are in place to assure the health of these components and systems while the plant ages [6].

This is accomplished by establishing an integrated set of programs and activities that ensure the performance requirements of all critical station equipment are met on an ongoing basis. These programs and activities all serve an integral function to ensure critical equipment degradation due to aging is managed such that operation of the NPP remains within the licensing basis of the facility and allows for station operational goals to be met.

The program also requires preparation of life cycle plans for critical plant equipment. The purpose of these plans is to determine and document actions required to ensure plant equipment will meet all design and operating objectives over the life of the plant in consideration of aging. The life cycle plans are established by a comprehensive condition assessment process. Condition assessments supplement the ongoing engineering surveillance activities in place which monitor and optimize system performance.

The IAM program consisting of this set of integrated programs and activities, provides for a sound technical basis for achievement of design life. The implementation of the integrated set of programs and activities to support the IAM program follows a "Plan-Do-Check-Act" feedback model, as shown in Figure 1, below, from N-PROG-MP-0008, "Integrated Aging Management" [6]. One of the objectives of the Integrated Aging Management Program is to ensure the actions required to meet equipment reliability objectives are identified and input into the system health reports.

To meet the requirements of the "Plan-Do-Check-Act" model, the Integrated Aging Management program interfaces with a number of programs. The programs listed below also have a role in managing equipment degradation and aging. These programs include:

- N-PROG-MA-0026, "Equipment Reliability" [9]
- N-PROG-MA-0019, "Production Work Management" [15]
- N-PROG-MA-0004, "Conduct of Maintenance" [11];
- N-PROG-OP-0001, "Nuclear Operations" [12];

- N-PROG-OP-0004, “Chemistry” [13]; and
- N-PROG-RA-0016, “Risk and Reliability Program” [14].

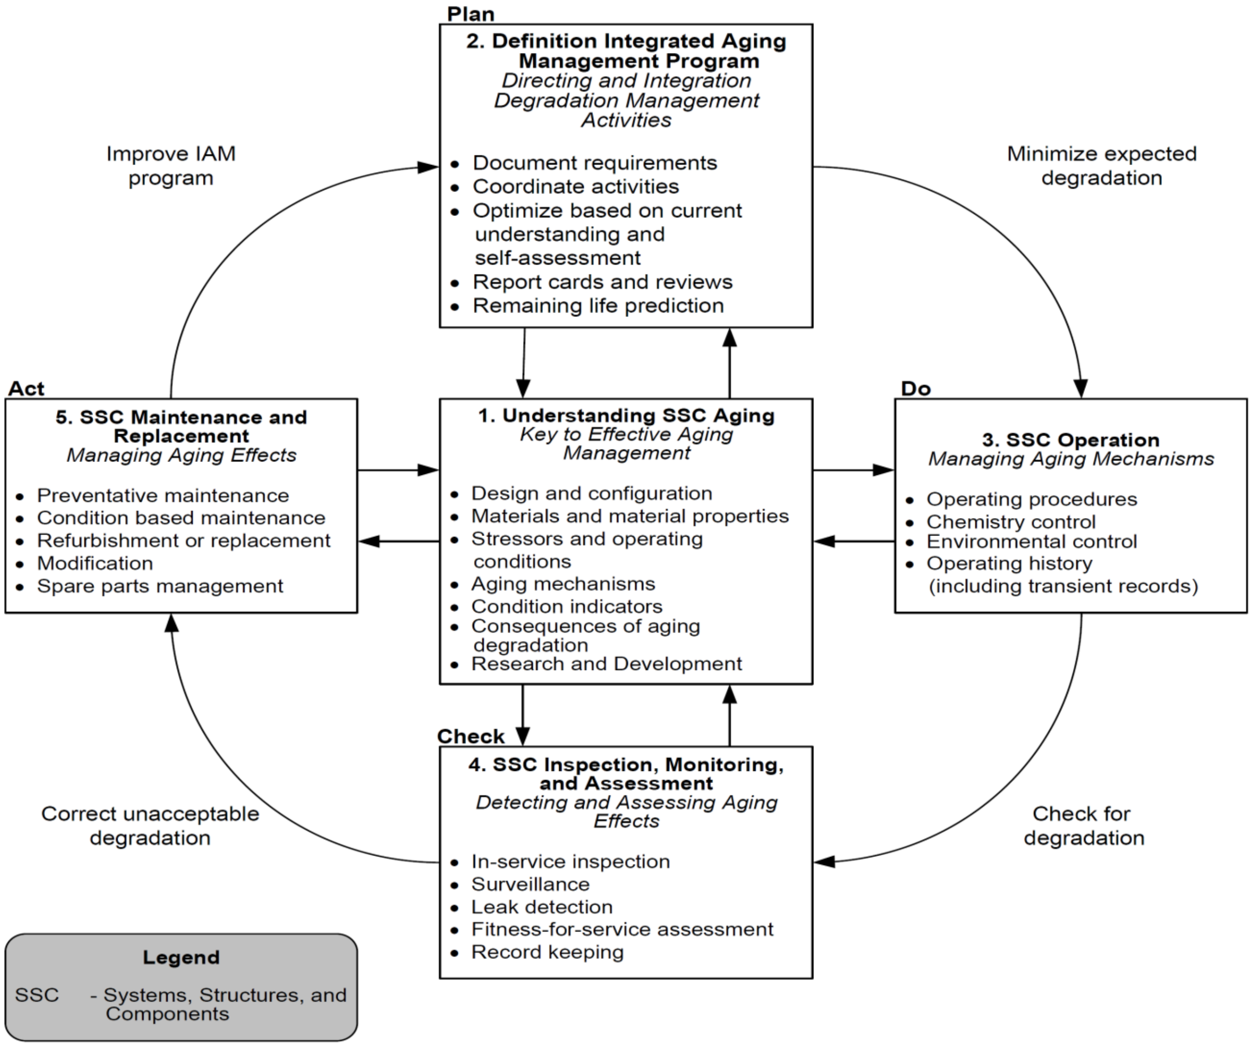

Figure 1: Aging Management Model

The Equipment Reliability program ensures that there are defined activities ensuring that equipment aging issues are identified, understood and effectively managed for equipment important to nuclear safety and equipment reliability. Any Aging Management station actions are captured in the system health reports and managed through the Production Work Management program.

The Production Work Management program specifies the requirements for identifying, prioritizing, planning, scheduling and performing work in support of plant operation, maintenance and modifications. As well, it establishes safe, uniform and efficient work control practices. Work management is the process by which maintenance, modifications, surveillances, testing, engineering support, and any work activities that require plant coordination or schedule integration are implemented. Accountabilities in this process are established from work initiation to work completion, and compliance is ensured through monitoring [15].

P-INS-06931-00003, "Accountability and Ownership for Pickering A and Pickering B Systems and Structures" [39] assigns ownership and responsibility for the SSCs common to both plants located at the Pickering site. Accountability for the scheduling of work pertaining to these SSCs rests with the organization defined in the Production Work Management program. Many of the documents contained in these programs are referred to or provide specific direction for the planning of activities and the performance of work. Common priority systems, work processes and methodologies are consistently applied in scheduling all work in support of the operation, maintenance, and modification of nuclear facilities across the fleet. The Production Work Management program facilitates the prioritization and scheduling of work for SSCs. It is through the work management system that the resources identified in the Production Work Management program [15] are assigned to perform the work.

The maintenance program includes activities required to ensure continued equipment reliability in accordance with defined equipment strategies, consisting of preventative and predictive elements. The implementation of this program is such that information from maintenance activities is fed back to engineering departments to enable effective completion of condition assessments. Results of condition assessments are implemented into maintenance programs as required to optimize equipment performance while the plant ages. These activities are highlighted in N-PROG-MA-0004, "Conduct of Maintenance" [11].

Equipment aging can be sensitive to the operating environment seen by the components. Systems are to be operated and tested consistent with approved operating procedures and chemistry specifications, to ensure aging degradation experienced remains as documented in the design basis and completed condition assessments. These activities are addressed in N-PROG-OP-0001, "Nuclear Operations" [12] and N-PROG-OP-0004, "Chemistry" [13].

N-PROG-RA-0016, "Risk and Reliability Program" [14] ensures that the reliability of systems important to nuclear safety meet requirements and that station public safety risk goals are met. In consideration of equipment aging, failure rates representative of actual plant condition are used in these analyses to ensure the conclusions are valid.

N-PROG-MP-0014, "Reactor Safety Program" [18] defines activities related to nuclear safety analysis including defining the Safe Operating Envelope (SOE). The aging management program establishes the activities required to maintain equipment performance, such that the requirements of the safety analysis and licensing basis are met. Safety limits for equipment performance used in condition assessments are defined in the SOE. Where component aging is not practical to mitigate, the rate of degradation must be determined and taken into account in the safety analysis (e.g., pressure tube diametrical creep) [6].

N-PLAN-01060-10009, "Integrated Aging Management Self-Assessment Plan" specifies the scope and the schedule of the IAM self-assessments in a three-year cycle [40]. The scope includes program execution, performance elements, and comparison against industry standards and best practices. Subsequent to this, per section 1.9.2 of N-PROC-MP-0060, "Aging Management Process" [7], the IAM program self-assessments are conducted at the site and corporate levels at a frequency determined by the Manager, Engineering Programs Integration department in accordance with N-PROC-RA-0097, "Self-Assessment and Benchmarking" [41] to measure the effectiveness of the AMP [7].

The Integrated Aging Management program, N-PROG-MP-0008, "Integrated Aging Management" [6] and its implementing document N-PROC-MP-0060, "Aging Management Process" [7] identify and define the roles of the owners and responsible persons involved in the AMP. The responsibility for the IAM program is split between corporate groups and the station:

- The Director, Components Engineering is the Integrated Aging Management program owner who provides oversight of the IAM program and engineering programs with aging management related activities to ensure program effectiveness;

- The Director of Station Engineering ensures program requirements in this document are implemented at the station and ensures adequate resources are available to effectively address aging management of critical components as required;

- The Manager, Engineering Program Integration Department monitors program implementation for consistency and compliance with program requirements, and monitors adequacy of the program through specific program performance, review of audit findings, benchmarking, and Station Condition Records [6], [7].

Ultimately, the responsibility of providing sufficient resources to continually assess aging effects in safety related SSCs is with the Directors and Managers stated above. In order to meet the requirements of the IAM, they provide the support to the staff so they can perform Aging Management engineering activities. The scope of IAM self-assessments confirms that sufficient resources are in place to sustain the program. Note that audit and self-assessments results for N-PROGs associated with Safety Factor 4 are summarized in Section 4.3.

Conclusion:

The procedures and processes identified above verify that there is an effective Aging Management Program and a dedicated organization with clearly defined roles and responsibilities with sufficient resources to continually assess aging effects in SSCs important to safety. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Aging Management Program SSCs and Records

Establish a list of SSCs covered by the aging management program and records that provide information in support of the management of aging.

N-PROC-MP-0060, "Aging Management Process" [7] describes the process used to perform condition assessments of critical components which uses a systematic and comprehensive approach consisting of the following two steps:

(a) Scope definition and screening to identify the critical components requiring condition assessment.

(b) Condition assessment to identify actions required to assure health of SSCs as the plant ages.

The purpose of scoping is to:

- Identify the SSCs subject to screening and define the boundaries of each system; and

- Group the components in order to manage the screening and condition assessment in an efficient manner.

The purpose of screening is to ensure the effectiveness of the condition assessment process and to apply the most effort to:

- Critical components;

- Components posing the highest risk both from a nuclear safety and economic perspective; and

- Components most susceptible to aging degradation.

The main steps in the screening process are:

(a) Screen-out components based on Criticality Code (CC).

(b) Screen-out major components in the scope of the SSC-specific aging management programs.

(c) Screen-out components that are non-safety related, unless they are Single Point Vulnerabilities (SPV) or have a cost-benefit impact.

(d) Screen-out non-AM critical components.

(e) Screen-out components with effective practices in place.

For the remaining components, a condition assessment report is prepared. The purpose of condition assessment is to evaluate the following:

- Possible and actual aging related degradation mechanisms (ARDM).

- Preventive actions to minimize and control ARDMs.

- Methods for detecting, monitoring and trending aging effects.

- Methods for mitigating aging effects.

The condition assessment evaluates the actual condition of the SSCs and recommends actions to maintain health as the plant ages.

The sustaining aspects of the IAM program are accomplished by periodically reviewing and assessing component condition based on new observations and information.

Also as described in N-PROC-MP-0060, "Aging Management Process" [7], a data collection and record keeping system is required to support aging management activities and to provide a basis for decisions on the type and timing of aging management actions. Management of data is in accordance with N-PROG-AS-0006, "Records and Document Control" [42]. This program governs management of records and documents throughout their life cycle.

Data and records relevant to aging management are divided into the following categories:

- Baseline information, consisting of data on the design and the condition at the beginning of the service life of SSCs;

- Operating history, covering service conditions and data on testing of availability and failure of SSCs;

- Maintenance history, including data on the monitoring of the condition and maintenance of SSCs; and

- Records of SSC screening and condition assessments.

All records are maintained in an approved records repository, in accordance with OPG-PROC-0019, "Records and Document Management" [43].

Documents that describe the current condition of components and identify actions required to maintain or restore performance, or ensure fitness for service, per the IAM program include the following:

- Life Cycle Management Plans (in N-PROG-MA-025, "Major Components" [8]);

- Condition Assessments (in N-PROC-MP-0060, "Aging Management Process" [7]);

- System Health Reports (in N-PROC-MA-0024, "System Performance Monitoring" [20]);

- Component Health Reports (in N-PROG-MA-0017, "Component and Equipment Surveillance" [10]);

- Inspection Program Reports (in N-PROG-MA-0017, "Component and Equipment Surveillance" [10]);

- Test Program Reports (in N-PROG-MA-0017, "Component and Equipment Surveillance" [10]); and

- Engineering Program Health Reports (in N-PROG-MA-0017, "Component and Equipment Surveillance" [10]).

Life Cycle Management Plans are developed and implemented for the major components (Feeders, Steam Generators, Fuel Channels and Reactor Components and Structures) in accordance with N-PROG-MA-0025, "Major Components" [8].

These documents outline the requirements to manage the aging of the major components and associated sub-systems which are developed based on the methodology identified in N-PROG-MP-0008, "Integrated Aging Management" [6]. These documents and the procedural methods used in preparing and revising LCMPs collectively ensure that critical Nuclear Power Plant (NPP) equipment is understood, and that the required activities are in place to support component and overall system health as the plant ages. LCMPs are updated within a timeframe that allows for the specified requirements (e.g., inspections) to be captured in the business planning cycle which is identified in the specific LCMP [6].

Per N-PROG-MA-0025, "Major Components" [8], the following elements are addressed in the Component Aging Management Strategies and Plans:

- Strategy and rationale for inspection scopes and schedules based on criteria that consider areas at the highest risk for the degradation mechanisms identified for each component or sub-system. This is considered within the context of the current understanding of the factors (environmental and otherwise) that affect the degradation mechanisms and corresponding rates;

- Acceptance and repair criteria for inspections;

- Identification of preventative and required maintenance activities;

- Identification of required modifications.

Aging Management practices identified are implemented through System Health Reports, which are created in accordance with N-PROC-MA-0024, "System Performance Monitoring" [20]. The actions from the Condition Assessments and Component Health Reports are monitored, tracked and documented in the System Health Report (or through other traceable means such as action tracking assignments, or in the work management system [7]) until completion. Other records used to support the System Health Reports include; Inspection Program Reports, Test Program Reports and Engineering Program Health Reports [20].

Component Health Reports are for components that are part of component programs. These component programs are covered under N-PROG-MA-0017, "Component and Equipment Surveillance" [10], which identifies a set of activities (component, inspection and test programs) to assure the health of a select group of components. Component Health Reports summarize component failures, inspection results, and performance trends. The reports also review current preventive and predictive maintenance practices to ensure that existing Aging Management measures are effective. The Component Health Reports also report on the health of the component program [10].

Inspection and test programs are implemented for components and equipment that have been identified as requiring a documented process for mandated inspection and test activities required by licensing, codes and standards, and regulatory commitments. Examples of inspection and test programs in N-PROG-MA-0017 include Periodic Inspection of Nuclear Pressure Retaining Components (CSA N285.4) and Containment Components (CSA N285.5), In-Service Examination and Testing of Concrete Containment (CSA N287.7), and Pressure Relief Devices (CSA N285.0 and B51). Inspection and test reports are issued following each inspection or test campaign. These reports document inspection or test results and any corrective actions taken to mitigate aging degradation. Additionally, Engineering Program Health Reports report on the status of program implementation execution for all the programs. Component Health Reports and Engineering Program Health Reports are issued at minimum once a year [10].

Conclusion:

The procedures and processes identified above confirm that a list of SSCs covered by the aging management program and records providing information in support of the management of aging have been established. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Aging Degradation of SSCs

Evaluate and document impact of potential aging degradation of safety related SSCs.

N-PROC-MA-0077, "Critical Equipment Identification and Categorization" [19] provides the methodology for categorizing structures and components into critical rankings based on their importance. Criticality rankings ensure reactor safety, production, cost, conventional safety, public safety and environmental requirements are satisfied. Criticality rankings are used to define suitable maintenance strategies, prioritize work activities and ensure appropriate levels of other programmatic activities are in place [19].

Considerations for categorizations include:

- Determination of component criticality is consequence-based. The higher the consequence associated with component failure, the higher the criticality ranking.
- Normal, accident and post-accident functions of a component should be considered.
- Consideration should be given to the role of a component in a system. In a critical system, not all components are critical and each should be examined separately.

The initiator ensures the plant components are categorized into the following categories:

1. Highly critical components - Criticality Code 1 (CC1): CC1 components are components defined as SPV where failure of a single component will result in an immediate (within 24 hrs) reactor trip, turbine trip, manual shutdown (including shutdowns within 24hrs due to risk to public safety) and/or a stepback of >10%. The highest level of preventive, predictive, testing surveillance and other activities would normally be in place for CC1 equipment to support the objective of "zero tolerance for their failure".

2. Low critical components - Criticality Code 2 (CC2): CC2 components exclude CC1 and are components whose individual failure would cause impairment of the reactor or the turbine, which would result in a shutdown of the station in 7 days if not rectified (including shutdowns within 7 days due to risk to public safety), de-rates the station by 5 to 10%, or reduces the redundancy of a System Important to Safety (SIS). For CC2 components a moderate amount of preventive maintenance (PM) or predictive maintenance (PdM) would normally be in place.

3. Non-critical components - Criticality Code 3 (CC3): CC3 components exclude CC1, CC2 and are components whose individual failure would cause a de-rate of the station less than 5%. CC3 components are also deemed to be more cost effective to maintain than replace providing a savings of greater than $500,000, or cause a shutdown of the station due to impairment after 7 days (including shutdowns after 7 days due to risk to public safety). For CC3 components basic PM or PdM activities would normally be in place. Risk may be acceptable if PM or PdM is not performed. An evaluation of the benefits of PM activities may be performed on a case by case basis to determine the value returned.

4. Run to maintenance components - Criticality Code 4 (CC4): CC4 components exclude CC1, CC2, and CC3 and are components that can tolerate equipment unavailability for extended periods of time without causing a trip, or de-rating of the station due to the components individual failure. These components are operated until they require maintenance or fail. Run to Maintenance (RTM) in this context means preventive or predictive maintenance is not performed on the component. Periodic testing may still be performed on some RTM components where no specific maintenance activities are performed. PM or PdM would normally not be in place for CC4 equipment.

N-PROC-MP-0060, "Aging Management Process" [7] outlines the process and provides guidance on scope definition and screening to identify the critical components requiring condition assessment. The AMP also provides guidance on preparing condition assessments to identify actions required to assure health of SSCs as the plant ages [7].

SSC screening and condition assessments are documented. The following are recorded and stored in such a way that they are secure and retrievable:

- Screening records are documented as Quality Assurance (QA) records and retained in Asset Suite. The screening records provide the disposition, i.e., technical justification, assessments, and rationale to screen out the SSCs from further evaluation.

- Condition assessments are documented as QA records and retained in Asset Suite as controlled documents. Condition assessments evaluate the condition of the SSC and recommend actions to minimize and control ARDMs.

- The recommended actions are traceable; for example, as action tracking assignments, in system health reports action plans, or in work management.

A condition assessment application (i.e., AM database), has been developed in order to facilitate all steps required for this process, i.e. scoping, component grouping, screening, and condition assessment. This application is not the official repository of the aging management information. The outputs of this application (i.e. Screening records, and Condition Assessment Reports) are reviewed and approved, and then issued in Asset Suite as official records.

Degradation mechanisms are documented in the System Performance Monitoring Plans (SPMP), Equipment Strategy Manuals (for components addressed in component programs) and external sources such as industry reports (external OPEX). Sources such as the Electric Power Research Institute (EPRI) Aging Assessment Field Guide and IAEA documents supplement these sources by providing extensive information on aging mechanisms. These sources are used in assessing and addressing degradation mechanisms that are likely to affect particular plant components.

Per Section 1.5.4.1 of N-PROC-MP-0060, available sources for degradation mechanism limits include:

- SPMPs;
- Operating Manuals;
- Impairments Manuals;
- Operational Safety Requirements (OSRs); and
- Design Manuals and reports for limits not addressed in the Safety Report or OSRs.

To assess the effects of degradation mechanisms, the as-found condition of a component is compared against baseline data and the effects of the degradation are determined by comparing current condition to the baseline. The baseline can be retrieved from the manufacturer's recommendations, operating limits established by applying appropriate margin to safety analysis limits, and OPEX where appropriate. For those components where no established baseline exist, engineering judgement based on past experience is used to assess degradation.

If a component group is not screened out, a condition assessment is prepared to evaluate the condition and recommend any additional actions required to maintain the health of the component. The report contains the following information:

- Component ID(s) indicating system application.
- Degradation mechanisms and limits, including whether obsolescence is applicable.
- Applicable environmental conditions (e.g., temperature, radiation).
- Operational factors including stressors.
- Applicable operating history including a review of pertinent operating transients.
- Aging management practices in place.

- Review of component aging information sources.
- Current physical condition of component.
- Actions required to maintain performance.

The condition evaluation technique depends on the nature of the component, its degradation mechanisms and available information. One of the following evaluation techniques is used to determine the component condition:

(a) In most cases, the condition of a component can be directly determined by a review of obtained results pertaining to its performance, such as from maintenance, testing, and inspections.

(b) In some cases, where condition cannot be determined based on observed results (e.g., piping not subject to periodic inspection), special testing or inspections may be required. Also, specific analyses or Research & Development (R&D) may be warranted (e.g., stress analysis for mechanical components).

(c) In special cases, component condition is determined by Time Limited Aging Assessment (TLAA). TLAA considers parameters either directly or typically associated with operating time. Examples of these parameters considered in TLAA are:

  - Number of allowable stress cycles, fatigue usage.
  - Corrosion rate.
  - Crack growth rate.

Where unanticipated aging is detected, it is reported in a Station Condition Record in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [44], and evaluation and mitigation is managed through N-PROG-RA-0003, "Corrective Action" [17].

Conclusion:

The procedures and processes identified above indicate there is an evaluation and documentation of the impact of potential aging degradation of SSCs important to safety. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Dominant Aging Mechanisms

Confirm or develop understanding of dominant aging mechanisms of safety related SSCs.

N-PROG-MA-0017, "Component and Equipment Surveillance" [10] program defines requirements for establishing programs to ensure the health of unique critical nuclear power plant components and equipment. The program identifies component programs, ownership, roles, accountabilities, and component monitoring activity requirements driven by regulatory, safety (nuclear, conventional, environmental), and business (production) requirements. Not all component and equipment lines warrant the oversight of a unique component program, resulting in components or equipment excluded from this program [10]. Components not in the scope of N-PROG-MA-0017 are managed under N-PROG-MA-0026, "Equipment Reliability" [9]. In general, the scope of components and equipment in a component program are critical components as categorized in N-PROC-MA-0077, "Critical Equipment Identification and Categorization" [19].

The Component and Equipment Surveillance Program addresses both components and program health. Steam generators, fuel and fuel channels, feeder piping, and reactor components are excluded, as they are covered by formal Life Cycle Plans under N-PROG-MA-0025, "Major Components".

Component programs within the scope of the Component and Equipment Surveillance Program include: Heat Exchangers, Power Operated Valves, Check Valves, Periodic Inspection of Pressure Retaining Nuclear Components, Periodic Inspection of Containment Components, In-service Examination and Testing of Concrete Containment Structures, In-service Examination and Testing of Concrete Containment Structures, Pressure Relief Devices, Buried Piping, Pipe Wall Thinning (Microbial Induced Corrosion, Flow Accelerated Corrosion), Lubrication, Pressure Vessel Certification, Calibration Process Engineering Requirements, Valve Stem Packing, Machine Safeguarding, Pump Testing, Critical Pipe Support Inspection and the Cable Surveillance Program [10].

Program deliverables include component health reports, program health reports, and component program self-assessments.

System performance is assessed by collecting data from plant sources that is trended, analyzed, and reported as part of the system health report, as identified in N-PROC-MA-0024, "System Performance Monitoring" [20]. The SPMP includes functional failure evaluations, where the objective is to prevent system functional failures through the measurement, monitoring, trending, analysis, and correction of component or equipment functional failures for typical CC1 and CC2 components. The critical system functions and major components and equipment that provide those functions are identified. Failure mechanisms are then determined, and the parameters for measuring degradation mechanisms are monitored and trended with the intent of preventing any equipment functional failures.

The SPMP also includes the Performance Monitoring Equipment List (PMEL) which includes a column for degradation mechanisms. The degradation mechanisms and indicators are defined by taking the following into consideration:

1. Associated physical, electrical, mechanical, cyber, and chemical properties that can cause degradation, as well as short and long-term aging and operational wear processes.

2. Consultation with appropriate technical experts and specialists as required.

3. Sources of information on degradation mechanisms including but not limited to equipment/component strategy documents, maintenance histories, OPEX, vendor

manual and EPRI reports. (This information is also found in N-PROC-MP-0060, "Aging Management Process".)

Identifying and understanding component degradation mechanisms is critical in the condition assessment process. Component degradation mechanisms and degradation mechanism limits are one of the inputs in the screening. N-PROC-MP-0060, "Aging Management Process" specifies that, during the screening process, a preliminary assessment is to be performed for each Component Group based on degradation mechanisms and degradation mechanism limits, and identifies the practices in place to manage degradation. Understanding of dominant aging mechanisms is developed through required training [7].

Staff implementing aging management activities defined in this document are trained and qualified in accordance with N-TQD-403-00001, Nuclear Engineering Support Personnel Training and Qualification Description [66]. Specifically Program Element (PEL) 68601, "Aging Management" is a qualification which represents specific nuclear fundamentals training which are required across all duty areas within Engineering [66].

Conclusion:

The procedures and processes identified above confirm that the Aging Management Program results in understanding of dominant aging mechanisms of safety related SSCs. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Predictive Maintenance Program

Confirm existence of a predictive maintenance program.

N-PROC-MA-0034, "Predictive Maintenance Program Requirements" [24] is an implementing document of N-PROG-MA-0026, "Equipment Reliability Process" [9]. N-PROC-MA-0034, "Predictive Maintenance Program Requirements" establishes a process that manages the Predictive Maintenance (PdM) Program [24]. The PdM program applies to specific critical equipment (Criticality Code 1, 2 and possibly 3) identified through N-PROC-MA-0077, "Critical Equipment Identification and Categorization" [19] to ensure early detection of deteriorating equipment components, to ensure safe and reliable operation.

The Predictive Maintenance program examines and trends critical component data to assess immediate signs of premature aging. PdM test and inspection data are trended using baseline or previous data for reference to determine extent of degradation. Test and inspection data are trended to determine the extent of degradation. Abnormal inspection and test data is reviewed to determine the extent of equipment degradation, and to identify any additional inspection and testing requirements and mitigating actions required to prevent failure. The Predictive Maintenance program has the capability to facilitate identification of precursors for component and equipment degradation.

Briefly, the PdM process encompasses the following steps:

- Equipment selection, including documentation of PM bases;

- Develop/review alarm limits;
- Determine periodicity of PdM monitoring for equipment set by failure types while accounting for duty cycle, equipment history and design information. This information is included in the technical basis (co-ordinating with outages and/or existing safety system tests where applicable);
- Monitoring Intervals (Frequencies are defined through technical basis and documented in IQ Review[7] database. Any exceptions to the technical basis template is noted in IQ Review under individual equipment); and
- Establishing Predefineds.

Critical component monitoring is performed using a number of techniques including N-ED-09183-10001, "Predictive Maintenance Infrared Thermography Program" [45], N-ED-09183-10002, "Predictive Maintenance Vibration Monitoring Program" [46] and N-ED-09183-10000, "Predictive Maintenance Lubrication Screening Program" [47]. Following replacement or refurbishment, all equipment within the scope of the Predictive Maintenance program is subject to post maintenance baseline testing in accordance with N-STD-MA-0004, "Post Maintenance Testing" [21] and the results are documented for benchmarking purposes.

For anomalies that have a high potential of causing a unit outage or de-rating, the PdM Technology Owner, together with the appropriate Component and Equipment Engineer, and Performance Engineer, immediately assesses the problem and develop an action plan. N-PROG-RA-0003, "Corrective Action" [17] identifies the overall corrective action process.

In general, all maintenance personnel involved in PdM activities enter the acquired data into the appropriate PdM database, and summarize their analysis in OPG's reporting application (Plant IQ).[8]

Conclusion:

The procedures and processes identified above confirm the existence of a predictive maintenance program. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

---

[7] IQ Review is a web based software application that is designed to document the technical basis for PdM program scope including equipment selection, performed tests, frequency and limits at a site and across OPG Nuclear [24].

[8] Plant IQ is a web based software application that is designed to automate the process of documenting, and reporting the condition of equipment (from PdM results) at a site and across OPG Nuclear. Inputs to the systems are generated from within the PdM group and outputs are directed towards Maintenance, Operations, Engineering, Work Control and any other group that is concerned with plant equipment health [24].

4.1.7 Review Task #7: Detection and Mitigation of Aging Mechanisms

> *Ensure existence of programs for timely detection and mitigation of aging mechanisms and/or aging effects of any SSCs important to safety, including obsolescence of technology used in the plant or obsolescence of services or supplies external to the plant.*

N-PROC-MP-0060, "Aging Management Process" outlines evaluation techniques to be used in assessing component condition as well as practices in place to mitigate equipment aging [7]. The recommended actions from the CAs are traceable and often tracked through system health report action plans.

When new information becomes available that introduces uncertainty with respect to the component's continued performance, the condition assessment is reviewed and revised, if necessary, to identify any additional required station activities. This is managed thorough N-PROC-MP-0060, Section 1.7.1.1 Revision of a Condition Assessment.

N-PROC-MA-0024, "System Performance Monitoring" [20], establishes a consistent and comprehensive process for effective monitoring, maintenance, and system performance and reliability. It establishes requirements for a structured, standardized reporting program (SystemIQ)[9] for system monitoring and performance to ensure Systems Important to Safety (SIS) and production will perform their intended functions under the design basis. In addition, system health is continuously monitored by trending performance. The SPMP is based on a comparison of performance indicators against established targets in order to improve system performance. These targets include direct measures of a system's health, such as the number of functional failures, as well as indirect measures, such as the operating corrective maintenance backlog. System performance is assessed by collecting data from plant sources that is trended, analyzed, and reported as part of the System Health Report.

N-PROG-MA-0017, "Components and Equipment Surveillance" [10], identifies a set of activities to assure the health of a select group of nuclear power plant components. The program consists of a number of program elements and managed processes. Program elements consist of Component, Inspection and Test Programs. These programs are implemented for component and equipment groups that have been identified [10].

N-PROC-MA-0020, "Predefined Process" [67], provides a process to manage preventive maintenance being performed on equipment of greater functional importance and related to the more stringent requirements applicable to nuclear safety, production or equipment reliability.

The primary objectives of the N-PROG-MA-0025, "Major Components" [8] program is to establish an integrated set of processes and activities to justify fitness for service of Feeders, Fuel Channels, Reactor Components & Structures, and Steam Generators and

---

9 SystemIQ is a web-based software application that is designed to assist System Engineers and Managers in optimizing the operational performance and condition of Plant systems. SystemIQ centralizes, standardizes, and automates System Health Reporting, Performance and Condition Monitoring, and the generation and organization of System Notebooks [20].

develop long-term Life Cycle Management strategies that support preservation of these assets. Strategies and plans are developed and implemented to ensure sufficient monitoring is conducted and appropriate data is acquired to demonstrate that each of the major components is compliant with its respective design basis documents.

LCMPs address inspection requirements based on the criteria which consider areas at highest risk for the degradation mechanisms identified for each component or sub-system. The Life Cycle Management Plans document acceptance and repair criteria for inspections, preventive maintenance activities and any required modifications. The LCMPs incorporate inspection results, degradation mechanisms, various inspections and examinations (including non-destructive examinations in accordance with N-STD-MA-0021, "Non-Destructive Examination" [25]), updates to programs or processes and any new novel R&D information for the component.

Obsolescence Management is governed by N-STD-MA-0024, "Obsolescence Management" [22]. This standard defines and implements a sustaining program to manage the proactive and reactive obsolescence issues associated with critical equipment and components. The activities interface with equipment reliability and life-cycle management strategies designed to sustain continued safe and reliable plant operation.

The Obsolescence Management program provides direction on managing obsolescence issues pertaining to all critical equipment and components, as defined in N-PROC-MA-0077, "Critical Equipment Identification and Categorization" [19] related to the safe and reliable operation of the plant.

As identified in [22], the general approach to managing obsolescence is:

- Identifying obsolescence issues (proactively and reactively);
- Prioritizing and ranking obsolescence issues;
- Evaluating and developing cost effective resolution strategies;
- Executing and managing solutions to completion;
- Obsolescence reporting;
- Integrating with the existing reactive identification and resolution processes; and
- Maintaining information in applicable databases up to date.

Proactive Obsolescence Management includes the use of industry tools to implement the Obsolescence program. These tools are:

- Proactive Obsolescence Management System (POMS): A software database provided by Rolls Royce that proactively identifies when an item (equipment, component) is becoming obsolete. This service is performed by collecting equipment information from member utilities and contacting each manufacturer of installed equipment on a regular basis to determine if the model number is still supported. In addition the POMS priority mechanism looks at the manufacturer/model number, criticality of the equipment and stock availability. This allows for timely identification of obsolescence vulnerabilities by forecasting the impact in the station based on available stock.

- Obsolescence Manager (OM): A software application added to POMS, designed to facilitate the prioritization and resolution of obsolescence related issues. The goal of OM is to assist the Obsolescence Process Coordinator (OPC) in resolving a large amount of identified obsolescence issues in POMS.

- Obsolete Item Replacement Database (OIRD): A database that may be used for sharing information with other nuclear utilities that are subscribed to OIRD about components and spare parts that have been determined to be obsolete or manufactured in a different form.

Other OPG resources available to proactively identify obsolescence issues include the Equipment Reliability Plan, Aging Management Plan, Condition Assessments, Component Health Reports, and Station/System Health Reports. The Obsolescence Management Program facilitates an interactive approach with Engineering and other stakeholders.

The Reactive Obsolescence process is driven by the plant demand to support emergent and scheduled work. The identification of reactive issues is typically from:

- Maintenance Material Requests;

- Supply Chain Request for Quote or Purchase Orders;

- Maintenance assessment of Bill of Material;

- Maintenance emergent/discovery work;

- Performance/Components and Equipment Engineering.

Procurement Engineering and the OPC manage the prioritization and track the reactive obsolescence issues to completion.

Proactive and Reactive Obsolescence as described in N-STD-MA-0024, "Obsolescence Management" focuses on the obsolescence issues associated with critical equipment and components. The program activities interface with equipment reliability and life cycle management strategies designed to sustain continued safe and reliable plant operation. The standard does not explicitly address obsolescence of services or supplies external to the plant.

To effectively manage the Proactive and Reactive Obsolescence issues, the OPC uses the data in Asset Suite that has been prioritized along with the information from POMS to develop a Site Obsolescence List.

N-GUID-08173-10007, "Smart Ordering" [48] is a process for anticipated demands related to planned strategies for systematically replacing items in multiple end-uses. Proactive procurement of these types of materials improves the availability of materials, thus resulting in better work schedule adherence, outage scope stability, equipment reliability and economic benefit.

N-CHAR-AS-0002, "Nuclear Management System" [68], indicates that the Materials Management system owned and implemented by Supply Chain, ensures equipment, components, materials, and services meet appropriate and applicable design and quality requirements through review and approval of suppliers' quality programs, and audits or in-process surveillance of the suppliers' activities. Equipment, components, materials, and services are purchased to required specifications and codes.

Conclusion:

The procedures and processes identified above confirm that programs for timely detection and mitigation of aging mechanisms and/or aging effects, including obsolescence of technology, have been established. However, N-STD-MA-0024, "Obsolescence Management" does not explicitly address obsolescence of services or supplies external to the plant. This is therefore identified as a gap for Pickering PSR2 (**Pickering PSR2 Gap SF4-1**).

4.1.8 Review Task #8: Acceptance Criteria and Safety Margins for Safety Related SSCs

Establish acceptance criteria and required safety margin for safety related SSCs for the remaining life of the station through reliability and risk assessments.

N-STD-MP-0020, "Margin Management" [23] defines the expectations for the management of design and operating margins associated with systems, structures and components (SSCs) important to safe and reliable plant operation, including the processes and oversight mechanisms.

The IAM program is required to ensure that the impacts of age related degradation potentially affecting nuclear safety are identified, understood, and conservatively managed. This objective is achieved through execution of a number of programs and procedures that assess the condition of the SSCs and establish the activities required to maintain equipment performance such that the requirements of the safety analysis and licensing basis are continuously met.

The potential for plant aging to adversely impact safety margins and reactor operation (e.g., de-rating) is a recognized concern. Of particular concern are the degradation mechanisms that affect major reactor components, that are not easily replaced during the planned life of the reactor, and for which mitigation is not available without a refurbishment outage and/or extremely costly expenditure (e.g., Pressure Tubes and Steam Generators).

N-PROG-RA-0016, "Risk and Reliability Program" [14] establishes the framework for the development and use of Probabilistic Risk Assessment (PRA) as a means to manage radiological risk and to contribute to safe operation of nuclear reactors. Program elements have been developed to provide a high level framework for both risk assessment activities and reliability program requirements to meet the intent of the OPG Nuclear Safety Policy and CNSC standards on risk and reliability [14].

N-STD-RA-0033, "Reliability Monitoring and Reporting of Systems Important to Safety" [49] provides direction on carrying out reliability program activities at the station consistent with S-98, "Reliability Programs for Nuclear Power Plants" (now RD/GD-98, "Reliability Programs for Nuclear Power Plants")[10] and S-99 "Reporting Requirements for Operating Nuclear Power Plants" (now REGDOC-3.1.1, "Reporting Requirements for Nuclear Power Plants").[11]

N-PROG-MP-0014, "Reactor Safety Program", defines the organizational responsibilities and key program elements for the management of issues related to Nuclear Safety Analysis, in particular Generic Action Items, and the following major components of safe operation: Safety Analysis Basis (Safety Report and Analysis of Record), Safe Operating Envelope and Severe Accident Management.

N-STD-RA-0030, "Risk Management for Outage and On-Line Maintenance" [50] and N-STD-RA-0034, "Preparation, Maintenance and Application of Probabilistic Risk Assessment" [51] provide direction on the preparation of OPG PRAs and on carrying out risk assessments for units in a planned outage, as well as non-standard configurations in units at high power [52].

The reliability program collects data and uses this information to derive an annual result for system predicted future unavailability. Generic industry component failure data is used as the starting point and station-specific actual failure data is added to obtain updated failure rates. As part of the implementation of the reliability program, Annual Reliability Reports are submitted to the CNSC consistent with S-99 and REGDOC-3.1.1.[11] The results from this report allow OPG to assess system performance against the predicted future unavailability (PFU) targets, as well as to identify and take corrective actions in case the PFU results are below target [52].

At OPG, Design and Operating margins are managed through the implementation of N-STD-MP-0020, "Margin Management" [23]. The Margin Management standard applies to all SSCs with an important role in safe and reliable plant operation. N-INS-03600-10001 "Margin Management Implementation" [53] provides guidance on how to identify low margin issues, assess low margin conditions and develop a resolution plan. Determination of whether a margin issue is in the scope of the Margin Management program requires the assistance of the Margin Management Coordinator to complete N-FORM-11371, "Low Margin Assessment Form" [54]. The completion of N-FORM-11371 requires the combined effort of the Margin Management Coordinator and station staff [53]. N-FORM-11371 documents the low margin condition. Part 1 contains the System Operating and Design Margin Identification, and Part 2 contains the Risk Score Determination which also identifies a number of Risk Scenarios, such as "Major Reduction in margin of Safety (significant risk to public or station personnel or major impact on environment)", "Total loss or serious degradation of a special safety system, system for reactor power control or S-98 system", "Unplanned production loss of more than 30 Equivalent Full Power days"

---

10 CNSC Regulatory Document RD/GD-98, "Reliability Programs for Nuclear Power Plants", has been issued and replaces S-98 in the regulatory framework. Per the Pickering License Conditions Handbook [31], the requirements set out in the newly issued document remain unchanged from those established in S-98.

11 Per the Pickering License Conditions Handbook [31], the most recent Pickering PROL (48.02/2018) has an amendment to replace S-99 with REGDOC-3.1.1.

and "Radiation Exposure to personnel in excess of regulatory limits" to provide a few examples [54].

Margin management addresses low margin issues arising from equipment degradation, plant configuration and operating procedure changes, engineering modifications, and reanalysis. The intent of the margin management standard is to provide assurance of SSC availability and operability, at least to its next planned maintenance or inspection cycle [53].

To resolve a low margin issue, the Issue Owner (typically the System Engineer), develops a resolution plan and priorities based on the risk posed by the low margin issues. The issue owner tracks the resolution of the low margin issue and communicates updates to the Margin Management Coordinator to ensure timely oversight scheduling is provided. The Margin Management Coordinator performs quarterly reviews of the list of margin issues to check for possible aggregate impact of margin concerns on an SSC. A combined impact of more than one margin issue on an SSC may require increasing the priority of the involved margin concerns. Resolution plans, as contained in the System and/or Component Health Reports are executed using existing station processes (i.e. On-line or Outage Work Management, Engineering Change Control, and Action Tracking). A low margin issue may be deemed resolved when the resolution plan has been executed, all corrective actions completed, and adequate margin has been restored [53].

In order to determine the available margins, the acceptance criteria must be known and understood. The margin is the gap between the acceptance criteria and the actual (or predicted) performance for a SSC. The acceptance criteria are the values of operational and design constraints found in operating and design documents.

The following documents may be consulted to determine the acceptance criteria for the SSC:

- Operating Manuals;
- Abnormal Incidence Manuals;
- Annunciation / Alarm Response Manuals;
- Operational Safety Requirements;
- Environmental Qualification Technical Basis Documents;
- System Performance Monitoring Plans;
- Condition Assessments;
- Design Manuals and Design Descriptions;
- Safety Report.

In 2000, OPG initiated a study to address the effects of aging of the Heat Transport System (HTS) on the Safety Analysis margins at Pickering B and Darlington NGS. This study, documented in N-REP-33000-10000 [55] concluded that in terms of impact on nuclear safety, Heat Transport System aging would have the largest impact on safety margin. The report acknowledged that the potential reduction in the safety margins might require operational and/or design changes to maintain adequate margins [55]. This report did not address Pickering A (Units 1,4); however, the strategy developed for Pickering Units 5-8 has been applied to Pickering Units 1,4 [74].

N-CORR-00531-06781 [56] provides a progress report on the Heat Transport System Aging safety analysis for Pickering Units 1, 4, Pickering Units 5-8 and Darlington which was provided to the CNSC in February 2015.

N-CORR-00531-06781 includes a status of the assessments completed to date for Pickering A and B:

- Completed Loss of Flow (LOF), Small Break Loss of Coolant Accident (SBLOCA) and neutron overpower protection (NOP) analysis for Darlington, Pickering Units 1,4 and Pickering Units 5-8 for future aged HTS conditions to demonstrate continued safe operation of each station with aged HTS;

- Improvement of safety margins through application of revised channel power limits, bundle power limits and improvement in trip coverage through modification to Shutdown System trip setpoints;

- Independent Technical Panel on trip acceptance criteria and completion of final report with recommendations;

- Interfacing with Pickering Continued Operations Plan to demonstrate continued safe operation to end of commercial operation; and

- Planning of REGDOC 2.4.1 "Deterministic Safety Analysis" compliance activities including initiation of the first Safety Analysis associated with the implementation plan for REGDOC-2.4.1.

The following analysis has been completed for Pickering Units 1,4 and Pickering Units 5-8:

- Pickering Units 1,4: SBLOCA, LOF, and NOP Analysis for 6010 Effective Full Power Days (EFPD) [56].

- Pickering Units 5-8: SBLOCA, and LOF for 10300 EFPD [75].

- Pickering Units 5-8: NOP Analysis for 10300 EFPD [56].

With respect to the NOP analysis, the CNSC has accepted that the enhanced NOP (E-NOP) Extreme Value Statistics (EVS) methodology can be used to determine NOP Trip Setpoints (TSPs) and stated it is acceptable to use previously submitted E-NOP EVS-based analyses results for station compliance purposes [69].

N-CORR-00531-06781 concluded that the future aged conditions demonstrate continued safe operation of the plants until reactor operation reaches the specified target EFPD [56]. The target aged HTS condition projections are limited by the availability and quality of the station data. This typically means projecting to a future aged condition three to four years from the time analysis is completed. Therefore currently the assessment does not address the plans for extended operation.

As Pickering pursues continued operation, the HTS aging issues and remaining life will be addressed. N-CORR-00531-06781 identifies the strategy for the management of HTS Aging Impact on Safety Margins which essentially includes two areas:

- Safety analysis methodology improvements to demonstrate larger margins; and
- Design and operational changes.

The CNSC has recently concurred with the industry proposed Derived Acceptance Criteria [70].

Conclusion:

The procedures and the study identified above confirms the known existence of the acceptance criteria and required safety margin for SSCs important to safety for the remaining life of the plant through reliability and risk assessments. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.1.9 Review Task #9: Management of Aging for Spent Fuel Storage Facilities

Confirm adequacy of management of the effects of aging on those parts of the plant that will be required for safety when the reactor has ceased operation, for example the spent fuel storage facilities.

Safe Storage of the Pickering Units will be addressed outside of the scope of PSR2, which is focussed on safe plant operation. The Pickering NGS Stabilization Activity Plan (SAP) [58] outlines OPG's plan for managing the arrangements and activities that will be conducted in support of the Safe Storage Project. As the operational footprint of the station is reduced, all unnecessary SSCs will be placed into an Inactive Safe State, that is, they will be removed from the design basis, de-energized, drained of gas or fluids and isolated from operational systems. SSCs which remain necessary to support continued operations will be reclassified and reconfigured, as required, to meet Storage with Surveillance operational demands. The resulting Safe Storage configuration will include a station with the following systems remaining available [58]:

- Irradiated fuel bays (IFBs), including cooling, purification and monitoring equipment. IFBs will remain in service until all fuel has been transferred to dry storage containers and relocated to designated dry storage areas on site;
- Select heavy water storage facilities located at various locations across the facility, including helium storage tanks and various storage, inventory and feed tanks;
- Spent resin storage and handling systems;
- The Pickering Waste Management Facility, including the means to receive, package and store dry storage containers containing spent fuel;

- Select fire protection equipment;
- Environmental monitoring equipment for intermittent or continuous monitoring of select atmospheric and liquid emission streams, as required;
- Radiation monitoring equipment;
- Active and inactive drainage systems, including the means to collect, store, treat and discharge liquid waste streams, as required;
- Low and intermediate level waste management systems, including the means to collect, store, package, and ship low and intermediate level waste generated on site;
- Heating and ventilation systems required to maintain minimum temperatures in all in-service (or partially in-service) areas;
- Security systems; and
- Auxiliary systems which will be required to support the above noted operational systems including, but not limited to, power supplies, lighting, air supplies, service water, domestic water and demineralized water supplies.

The Safe Storage Project will plan and execute the transition of the Pickering NGS from its final shutdown state to its Safe Storage State. OPG will continue to manage the effects of aging as required using the current Aging Management Program.

With respect to the above-mentioned Safe Storage SSCs, the primary consideration for management of aging relates to the Pickering IFBs which are discussed further below.

The safety related functions of the Pickering IFBs are to [57]:

- Maintain the containment boundary; and
- Provide cooling and storage of irradiated fuel.

There are three IFBs at Pickering NGS. These are the Pickering 1-4 IFB, the Pickering 5-8 IFB and the Pickering Auxiliary IFB. The IFBs at Pickering NGS will be required to operate safely for at least 15-20 years after all reactors have ceased operation to allow for decay of radioactivity of the fuel and so it can be moved to dry storage [59].

As discussed in Review Task #1, N-PROC-MP-0060, "Aging Management Process" [7] describes the process used to perform condition assessment of critical components. NK30-REP-21500-00001 R002, "PB Nuclear - Aging Management Program Component Condition Assessment 21500 - IFB (Irradiated Fuel Bay)" is a Condition Assessment written for the Pickering 5-8 IFB last revised in April 2015 [60].

From the CA it was identified that the IFB is a passive component which requires periodic maintenance and repair. The IFB is subject to surveillance and its life is determined based on performance.

A program to clean up the bottom of the fuel bay is identified as a current practice [60]. Other initiatives for the IFBs include [60]:

1. Maintaining the temperature of the bay water within limits: 28°C - 32 °C (with the minimum and maximum limits of 15°C and 50°C determined by design), so that the integrity of the bay structure and its ability to hold water is not challenged;

2. Maintaining the IFB-B Sumps 2A, 2B, 3A and 3B operation in AUTO;

3. Regularly monitoring sump level to ensure Auto operation control as part of operator rounds and so that the sump level is maintained at low level as per design requirements (below the groundwater levels). This is so that the bay interspace is maintained dry and the bay water does not migrate to the groundwater (environment);

4. Permanently monitoring the leak rate from IFB-B into the sumps. As past trending has shown, the amount of the leakage from IFB-B is seasonal with a very low leak rate during fall/winter months and higher leak rate during the spring/summer months;

5. Inspecting all four IFB-B sumps; and

6. Ensuring that the IFB-B purification system is available to control bay leakage.

The CA determined that the Pickering 5-8 IFB will reach its component End of Life (2035 assumed in the CA) provided the current practices are permanently in place with current Aging Management practices. No other CAs have been performed for the Pickering 1-4 IFB or Pickering Auxiliary IFB to date. System Condition Assessments were performed for the Irradiated Fuel Bays [71] and Irradiated Fuel Bay Auxiliaries [72]. These documents do not meet the requirements of the current Aging Management governance N-PROG-MP-00060. These documents do not provide sufficient detail to determine if the current AM practices are adequate to meet the required end of life (EOL) for the IFBs.

NK30-REP-34410-00002 R001 "PB Nuclear - Aging Management Program Component Condition Assessment 34410 IFB Cooling Heat Exchanger" [61] is a condition assessment written for Pickering 5-8 IFB Cooling Heat Exchanger (HX). The CA indicates that the current practice of HX tube cleaning, eddy current inspection and leak testing every four years is adequate to reach component End of Life (which is stated to be 2035 in the CA). However, according to P-CHAR-04660-00001 "Heat Exchangers Replacement and Procurement of Critical Spares" [73], in 2017 058-34410-HX1, 2, 3 tube bundle will be replaced with the same tube material. The 2018 replacement plan is to replace 0-34410-HX3 tube bundle with Titanium tubes similar to HX1, 2.

NK30-REP-344100-00003 R002, "PB Nuclear - Aging Management Program Component Condition Assessment 34410, 71310 Irradiated Fuel Bay Auxiliaries – Valves-Manual- CAT 3&4" [62] is a CA written for Pickering 5-8 IFB Auxiliary isolation valves to the heat exchangers. The CA indicates that the current practice of engineering surveillance, operator rounds, and repairing deficiencies under corrective work orders, plus an additional action to determine testing and maintenance strategies for the IFB HX isolation valves, is adequate to reach component EOL (which is stated to be 2040 in the CA).

Conclusion:

The Pickering NGS Safe Storage Project will plan and execute the transition of the Pickering NGS from its final shutdown state to its Safe Storage State. OPG will continue to manage the effects of aging as required using the current Aging Management Program.

As discussed above, CAs for the Pickering 5-8 IFB, IFB Cooling Heat Exchanger (HX) and HX isolation valves have been performed and it was concluded that the Pickering 5-8 IFB and HX will reach their End of Life in 2035 and HX isolation valves will reach their End of Life in 2040 with current Aging Management practices. However, no CAs have been performed for Pickering 1-4 IFB, IFB Cooling HX or HX isolation valves or the Pickering Auxiliary IFB, IFB Cooling HX or HX isolation valves to date. To meet the intent of N-PROC-MP-0060, "Aging Management Process", a CA is required for Pickering 1-4 IFB SSCs and the Pickering Auxiliary IFB SSCs.

The conclusion of this Review Task is that there is a gap with respect to the Aging Management practices of IFB facilities at Pickering NGS; that is to specifically produce a CA for the Pickering 1-4 IFB SSCs and the Pickering Auxiliary IFB SSCs. It is noted that work to address this gap is currently underway as part of the Pickering NGS Condition Assessments for the Pickering IFBs that will be addressed under Safety Factor Report 2, "Actual Condition of Structures, Systems and Components." Since this work is not yet complete, this is identified as a gap for Pickering PSR2 (**Pickering PSR2 Gap SF4-2**).

4.1.10 Review Task #10: Aging Degradation Models

Confirm the models used to predict the evolution and advancement of aging degradation are properly supported in accordance with current accepted practices pertaining to aging degradation.

Aging Management of SSCs is performed in accordance with the Integrated Aging Management Program, N-PROG-MP-0008 [6]. This program establishes a framework for ensuring that activities and conditions required to optimize equipment condition are in place. In addition, the program defines the condition assessment process used to evaluate the health of critical components and establish actions necessary to maintain health. The "Plan-Do-Check-Act" model illustrates the systematic, proactive life cycle Aging Management approach defined by the Integrated Aging Management Program. The "Plan-Do-Check-Act" model introduced in Review Task #2 addresses how the Integrated Aging Management program implements the integrated set of programs and activities and closely adheres to the "Plan-Do-Check Act" model developed in the IAEA document, "Implementation and Review of a Nuclear Power Plant Ageing Management Programme", Safety Reports Series No.15, (1999). This is applicable to all SSCs.

To meet the requirements of the "Plan-Do-Check-Act" model, the Integrated Aging Management program interfaces with a number of programs. The programs listed below also have a role in managing equipment degradation and aging. These programs include:

- N-PROG-MA-0026, "Equipment Reliability" [9]
- N-PROG-MA-0019, "Production Work Management" [15]

- N-PROG-MA-0004, "Conduct of Maintenance" [11];
- N-PROG-OP-0001, "Nuclear Operations" [12];
- N-PROG-OP-0004, "Chemistry" [13]; and
- N-PROG-RA-0016, "Risk and Reliability Program" [14].

Details of how these programs integrate into the Aging Management process are discussed in Review Task #2.

The IAM program is implemented by fulfilling the requirements of interfacing programs having a role in managing equipment degradation and aging. Specifically, N-PROG-MA-0025, "Major Components" [8], and N-PROC-MA-0100, "Major Components Life Cycle Management Plan" [63] call for all major components LCMPs to define, schedule, and provide justification for all long term actions that need to be performed over at least the next business planning cycle to ensure long-term safety and reliability of major components.

In order to achieve this, the following Life Cycle Management Strategies, outage and non-outage activities must be identified and performed:

1. Life Cycle Management Strategies
   - Identify current practices for managing various active and plausible degradation mechanisms to ensure safe and reliable operation of the system according to its design basis.
   - Define the required inspection and maintenance activities over short-term (1-2 years), mid-term (3-5 years), and long term (10 years or end of life) to meet the objective above.
   - Delineate proactive activities that are the subject of on-going Research and Development (R&D) programs, and provide recommendations for their implementation.
   - Address major life limits (to the end of design life) and key strategic issues.
2. Summary of outage actions
   - Identify life cycle management actions (summarized in tabular form) required during station outages.
   - Summary tables are unit specific and include all actions to be performed on the component or structure in the particular outage. The actions represent the results of all the assessments carried out and cover a specified time interval (10 years) to satisfy generation planning requirements of N-PROC-AS-0043, "Nuclear Outage and Generation Planning" [64].
   - Required actions are categorized by the following criteria:

    - Legal requirements;
    - Fitness-for-service requirements;
    - Asset preservation related activities;
    - The definition of each of the above criteria are clearly stated in the respective program LCMP.
  - Outage actions identified in the LCMP undergo stakeholder review to ensure they are practical and feasible.

3. Non-Outage and support activities :
   - LCMP may also include a summary table for non-outage and/or generic activities that support the LCMP. If included, this table may list R&D activities, engineering assessments or evaluations, management initiatives, and other actions as required. It is also acceptable to provide references to other applicable documents or plans for these non-outage activities.
   - The table provides action, owner and target completion dates for each activity.
   - It is important that activities be identified as pre-requisites to any outage related activities, where applicable.

In complying with these requirements, the Major Components LCMP:

- Identifies component degradation mechanisms, potential degradation sites, and consequences of aging degradation and failures.
- Evaluates component condition by comparing observed degradation against established limits.
- Implements all relevant codes, standards, regulatory commitments, Periodic Inspection Program (PIP) requirements, and OPG Nuclear program requirements into plans to mitigate the consequences of identified degradation mechanisms from both a safety and an economic perspective.
- Identifies risks, cost range estimates, tooling requirements, and other inputs as required for business planning.
- Identifies the schedule associated with inspection, repair, or modification activities.
- Serves as a basis for OPG strategic and long-range investment planning.

Through the LCMP process, activities are in place to monitor the degradation of the major components. The inputs from the inspections provide a means/model for evaluation of the fitness for service of the components.

In addition to the foregoing strategies and programs, the discussion of compliance with modern codes and standards in Section 4.2 demonstrates that current accepted practices are followed. Also the Report for Safety Factor 9, *Use of Experience from other NPPs and Research Findings*, will document the processes used to identify lessons and improvements across all disciplines.

Conclusion:

The procedures identified above confirm the models used to predict the evolution and advancement of aging degradation are properly supported in accordance with current accepted practices pertaining to aging degradation. The intent of Review Task #10 is met, and therefore, Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed compliance assessments for nine L/R/C/Ss with content applicable to Safety Factors 2 and 4 are provided in Appendix B of Reference [4]. Associated findings applicable to Safety Factor 4 are summarized in Table 4 below. (Note: There were no PSR2 L/R/C/S gaps identified for Safety Factor 2).

Table 4: **PSR2 L/R/C/S Compliance Assessment Results for Safety Factor 4**

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 4
N290.13-05, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants"	There are no PSR2 gaps for N290.13-05. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N290.13-05.
N285.4-14, "Periodic Inspection of CANDU Nuclear Power Plant Components"	There are six PSR2 CSA N285.4 gaps which all relate to Safety Factor 4. The first five of these N285.4 gaps are applicable to compliance with N285.4-09 including Updates 1 and 2. The sixth N285.4 gap is applicable to compliance with N285.4-14. 1. N285.4 PIP Governance references N285.4-05, not N285.4-09 including Updates 1 and 2. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2 (<u>**Pickering PSR2 Gap SF4-3**</u>). 2. There has been a significant change in the wording of clause 4.2.7 in CSA N285.4-09 including Updates 1 and 2. I-PROC-AS-0009, "Inspection Qualification of Non-Destructive Examination Processes" does not identify the authorized inspector as a qualifying authority as directed by clause 4.2.7. Instead it establishes the CANDU Inspection Qualification Bureau (CIQB) as the organization that would approve procedures and personnel. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2 (<u>**Pickering PSR2 Gap SF4-4**</u>). 3. New erosion and corrosion inspection requirements in N285.4-09 including Updates 1 and 2 are not reflected in current PIP governance. NK38-REP-03680-10137 R000 states that: "It should be noted specifically that [this ISR Issue] is likely to have a major impact on piping PIPs because sub-clauses 7.4.7.X in CSA N285.4-09 including UPD1 and UPD2 include substantive changes. Under the new standard erosion and corrosion inspection exemptions can no longer be justified

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 4
	on the basis of [sic] that conditions are determined to be non-erosive and non-corrosive." This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2 (**Pickering PSR2 Gap SF4-5**). 4. Extended life inspection schedules in N285.4-09 including Updates 1 and 2 are not reflected in PIP governance. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2 (**Pickering PSR2 Gap SF4-6**). 5. An assessment of the prior operating non-conforming state, as required by N285.4-09 including Updates 1 and 2, is required when dispositioning inspection results. This requirement has not been included in the feeder PIP plan. This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2 (**Pickering PSR2 Gap SF4-7**). 6. There is a PSR2 gap for Pickering NGS against N285.4-14 (**Pickering PSR2 Gap SF4-8**) to address: o Revised requirements for pressure tube volumetric and dimensional inspection (Clause 12.2), pressure tube hydrogen equivalent determination (Clause 12.3) and pressure tube material property testing (Clause 12.4); o Clause 12.5 which specifies minimum annulus spacer surveillance examination and testing requirements; o Selection criteria for identifying candidate tube for pressure tube surveillance examination and testing (Annex E) to include selection criteria for annulus spacer surveillance examination and testing; and o Clause 7.4.8 which specifies requirements for inspection of Environmentally Assisted Cracking, and Clauses 7.5.1/7.5.2 which specify requirements for inspection of identical components.
N285.5-13, "Periodic Inspection of CANDU Nuclear Power Plant Containment Components"	There are two PSR2 CSA N285.5 gaps which both relate to Safety Factor 4: 1. There were a number of concessions granted from the CNSC for compliance with N285.5-M90 that will need to be reconciled for Pickering for the period of PSR2: (Since these gaps are all concession-related and associated with N285.5-M90, they are tracked under a single PSR2 gap (**Pickering PSR2 Gap SF4-9**).) o The Pickering B ISR gap associated with N285.5-M90 clause 4.5.1 is closed. However, the disposition of the gap refers to OPG receiving a concession from the CNSC on the inspection of components deemed to be inaccessible. A similar (updated) concession may be required for Pickering operation past 2020. Therefore, this is a gap for PSR2. o The Darlington ISR disposition of the gaps for N285.5-M90 clauses 8.4.2.1 and 8.4.2.2 refer to OPG receiving a concession from the CNSC that insulation will not be removed in the absence of visible damage to a component, and only "light weight" access covers will be removed. The Darlington ISR states: "This is a concession from the regulator which is not assured in the case of a refurbished plant. As such, this represents a gap". By the same logic it will need to be

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 4
	reconciled for Pickering for the period of PSR2 (life extension past 2020). ○ The Darlington ISR disposition of the gap for N285.5-M90 for clause 8.5.2.2 refers to an exception of the numerical rules of this clause for reasons of practicality, and that a concession was received from the CNSC. The Darlington ISR stated "… it is categorized as a Gap, because a concession from the CNSC is not assured for a refurbished plant.". By the same logic it will need to be reconciled for Pickering for the period of PSR2. ○ Per the Darlington ISR disposition of the gap for N285.5-M90 clause 8.6.3, although CNSC acceptance was obtained, there is still a non-compliance with a portion of the clause related to the timing of inspections which is noted as needing to be reconciled for a refurbished station. The Darlington ISR stated "This represents a gap that will need to be reconciled with the regulator for a refurbished station." By the same logic it will need to be reconciled for Pickering for the period of PSR2. 2. The changes in N285.5-13 relative to N285.5-08 that are applicable to Fiberglass Reinforced Plastic material that is used at Pickering NGS have only been assessed for fitness for service to 2024 in the Pickering Continued Operations Plan. These changes related to aging management (monitoring and test programs) for FRP materials. As a result, additional assessment is required for Pickering to address FRP aging management at Pickering for operation to 2028, and to confirm the current program aligns with N285.5-13 clauses 8.2, 8.3.3, 8.3.4 and A.6.1.2 (**Pickering PSR2 Gap SF4-10**). (Note: This gap only exists if Pickering NGS intends to operate past 2024.)
N287.7-08, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	There are three PSR2 CSA N287.7 gaps which all relate to Safety Factor 4: 1. N287.7-08 clause 7.11.2 Table 1 involving non-compliance with accuracy and repeatability requirements for dewpoint temperature was a gap for Darlington. No evidence can be found that this has been addressed for Pickering NGS. This is therefore a gap for Pickering PSR2 (**Pickering PSR2 Gap SF4-11**). 2. OPG initiated a Regulatory Management action to provide the CNSC with the latest Dow Corning 995 material test report in response to an Action Notice raised in the CNSC Type II Inspection. The work is currently in progress. Therefore, this is a gap for Pickering PSR2 (**Pickering PSR2 Gap SF4-12**). 3. Actions #31, #32, and #33 from the Pickering Units 5-8 Continued Operations Plan are related to N287.7 and although complete, need to be re-assessed for Pickering operation past 2020 (**Pickering PSR2 Gap SF4-13**). (IIP Action #31 involved submission of Periodic Inspection Plans and Life Cycle Management Plans for a number of safety-significant civil structures. IIP Action #32 involved submission of Aging Management Plans for concrete containment structures to the CNSC for acceptance. IIP Action #33 involved revising the Reactor Building Periodic Inspection Plan and submitting to the CNSC for acceptance.)
CNSC RD/GD-210 (2012), "Maintenance Programs for Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD/GD-210. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-210.

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 4
CNSC RD/GD-98 (2012), "Reliability Programs for Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD/GD-98. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-98.
CNSC REGDOC-2.6.3 (2014), "Aging Management"	There are two PSR2 REGDOC-2.6.3 gaps which both relate to Safety Factor 4: 1. OPG is not compliant with N-PROC-MP-0060 Aging Management Process, Section 1.7 for "not reviewing and updating the Component Condition Assessments[12] within the review cycle of the component, and when new information or feedback from the program was received." OPG has since revised these CAs, which are now valid until 2020. OPG has stated they will develop an implementation plan to prevent reoccurrence of: a) not reviewing and revising the CAs within the review cycle, and b) not updating the CAs when pertinent new information becomes available. OPG stated they will provide an update and a target implementation date on this action to the CNSC by October 30, 2016. This is a gap for Pickering PSR2 (**<u>Pickering PSR2 Gap SF4-14</u>**). 2. OPG is not compliant with N-PROC-MA-0077, "Critical Equipment Identification and Categorization", Section 1.2 because "the Reactor Safety (RS) category code and rationale for critical components was not always accurate or consistently applied in the CCAs[12]." OPG has stated they have since completed a review and update of the RS category code and rationale for a portion of the components to become fully compliant with N-PROC-MA-0077. However, OPG has stated that a review of the CAs will be conducted to ensure consistency with the revised Reactor Safety codes and that an update will be provided to the CNSC by October 30, 2016. This is a gap for Pickering PSR2 (**<u>Pickering PSR2 Gap SF4-15</u>**).
N287.2-08, "Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N287.2-08. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N287.2-08.
N285.8-15, "Technical Requirements for In-Service Evaluation of Zirconium Alloy Pressure Tubes in CANDU Reactors"	There is one PSR2 gap for Pickering NGS compliance with N285.8-15 which is applicable to Safety Factor 4: 1. For the Pickering B ISR, no clause-by-clause review of the Standard was conducted on the basis that the pressure tubes will be replaced during the refurbishment outage for Pickering Units 5-8, and the condition of these components is well understood and managed through their own specific, detailed life cycle plans and fitness-for-service criteria. However, in November 2015, OPG issued Plan N-REP-31100-10061 R002 for Pickering NGS compliance with pressure tube in-service evaluation requirements in CSA N285.8-15. OPG had submitted a previous compliance plan for the long term use of the 2010 edition of CSA N285.8 and this compliance plan was accepted by the CNSC. The compliance plan was revised to document OPG's compliance to the 2015 edition of CSA N285.8. Since OPG has committed to fulfillment of the commitments in N-REP-31100-10061 R002, successful fulfillment by OPG of the commitments in the compliance plan is required for Pickering operation past 2020. This is

[12] The terminology currently used is Condition Assessment (CA) instead of Component Condition Assessment (CCA).

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 4
	therefore a gap for Pickering PSR2 (**<u>Pickering PSR2 Gap SF4-16</u>**). In particular, the significant changes to CSA N285.8-15 per the CSA Impact Statement will need to be reflected in Pickering procedures, including: o Implementation of statistically based fatigue crack initiation evaluation curves for axial flaws (Clauses D.4.2, D.4.3, and D.3.6); o Implementation of closed-form engineering relation for threshold peak stress for Delayed Hydride Cracking (DHC) initiation (Clauses D.5 and 5.4.3.4); o Implementation of statistically based threshold relation for peak stress for crack initiation due to hydrided region overloads (Clause D.5); o Implementation of new fracture toughness models for axial through-wall flaws (Clause D.13.2); and o Implementation of Methods 1 and 2 Probabilistic Leak-Before-Break (Clauses 3.1, 7.3 and 7.4).

4.3 Audit and Self-Assessment Reviews

The OPG Nuclear Programs specifically applicable to Safety Factors 2 and 4 are identified in Table 2 and Table 3 respectively, and details of the associated audit and self-assessment results for each of the N-PROGs are provided in Appendix B. Based on the Appendix B audit and self-assessment results for Safety Factors 2 and 4 related N-PROGs, there is one gap for Pickering PSR2:

- Per Section B.1, Nuclear Oversight conducted a performance based audit (NO-2016-027) of the IAM Program in March 2016. The purpose of the audit was to determine whether IAM program requirements are being met and are effectively implemented to support safe and reliable operation. The audit concluded that the managed system controls are not fully effective and identified the following two open findings applicable to Pickering NGS which result in a PSR2 gap (**<u>Pickering PSR2 Gap SF4-17</u>**) (Note: These gaps are closely related and are therefore identified as a single PSR2 gap.):
  - o The IAM program requires that the interfacing programs affecting critical component condition should be comprehensive and sufficiently integrated to ensure critical information and assumptions used in completing condition assessments and Aging Management activities are valid and effective. However, a lack of integrated life cycle initiatives has been identified, which has the potential to impact equipment health. In addition, the program defines the requirements for program oversight and implementation. However, issues were identified in the completion of Condition Assessments and the execution of related recommendations due to ineffective oversight and implementation of the IAM program. SCR N-2016-08041 (AR# 28189056) has been raised to address this issue and is expected to be completed by Q4 2017. This is a gap for PSR2 since the SCR is not yet closed, and missing information in Condition Assessments and incomplete

actions may lead to ineffective management of the aging equipment and impact the reliability of SSCs.

- The IAM implementing procedure identifies the requirement for qualified individuals to perform Aging Management engineering activities such as preparing and reviewing Condition Assessments and screening reports. The audit identified that some Engineering Support Personnel performed engineering work independently while they were not qualified in the Training Information Management System. SCR P-2016-08008 (AR# 28189028) has been raised to address this issue and is expected to be completed by Q3 2016. This is a gap for PSR2 since the SCR is not yet closed, and unqualified staff performing work independently could impact the quality of Engineering work including Aging Management work activities.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 4 Report includes a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factors 2 or 4). The Report also includes identification and review of previously identified PSR1 gaps related to Safety Factor 4 to ascertain the implications of extending Pickering NGS operation beyond 2020.

Review of the Pickering Units 5-8 Continued Operations Plan [34] identified the following closed gaps from the Pickering B ISR that will need to be revisited in the context of continued operation past 2020 for PSR2 Safety Factor 4 (**Pickering PSR2 Gap SF4-18**):

COP [34] Appendix A Item #	IIP [32] Reference Number	Issue*
4	G01-04	Demonstrate adequate safety margins to operate Pickering B units from a Heat Transport System aging perspective to Jan 31, 2021. The 2015 strategy update to CNSC staff provided a progress report on HTS Aging Safety Analysis and related activities, and an updated revision of the HTS Aging Management Strategy for the period 2015-2020. This needs to be expanded to cover operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2.
10, 11, 12, 13	F01 (including F01-1, F01-2, F01-3, F01-4)	Develop a strategy to provide evidence that the Calandria Tube (CT) - Liquid Injection Shutdown System (LISS) nozzle gap will be maintained beyond 240,000 Effective Full Power Hours (EFPH) for all Pickering B units. The strategy for CT - LISS nozzle gap preservation may apply beyond 2025, but this needs to be confirmed. Therefore, this is a gap for Pickering PSR2.
14	F02	Develop R&D justification for extending Fuel Channel design life beyond 240,000 EFPH in the areas of hydrogen ingress, fracture toughness, spacer mobility and integrity.

COP [34] Appendix A Item #	IIP [32] Reference Number	Issue*
		Actions were constrained by the shutdown date of 2020 assumed in the 2011 business plan. This needs to be expanded to cover operation past 2020 and is therefore a gap for Pickering PSR2. Note: An interim LCMP update for major components is documented in P-CORR-01060-0587604 R000 [76], which describes life cycle management strategies for major components to achieve extended operations to 2024. Strategies in this document may apply beyond 2024, but this needs to be confirmed as part of the resolution of this COP-related PSR2 gap.
19	F13	Update the NOP analysis for Pickering B. Actions were constrained by the shutdown date of 2020 assumed in the 2011 business plan. This is primarily relevant to Safety Factor 5 but is also of relevance to Safety Factor 4. This needs to be expanded to cover operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2.
21	F14-1a	With respect to the Feeder LCMPs, clarify the impact of fuel channel axial elongation during operation beyond the fuel channel assumed design life of 210,000 EFPH on feeder stress analysis and acceptable feeder thickness. This was only addressed to 2025. This needs to be expanded to cover operation to 2028. Therefore, this is a gap for Pickering PSR2. Note: An interim LCMP update for major components is documented in P-CORR-01060-0587604 R000 [76], which describes life cycle management strategies for major components to achieve extended operations to 2024. Strategies in this document may apply beyond 2024, but this needs to be confirmed as part of the resolution of this COP-related PSR2 gap.
30	F14-4.1	Include the periodic inspection programs and LCMPs for the secondary side pressure retaining components and submit them for CNSC review. Although the action to submit PIPs and LCMPs for the secondary side pressure retaining components is complete, these documents will need to be extended to cover operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2.
52	I15-1a	Perform Time Limiting Aging Analysis (TLAAs) and include such TLAAs in the LCMPs and in the CAs. OPG to provide commitment that TLAAs necessary to determine the actual conditions of components will be completed. Although the action is complete, this will need to be updated to cover operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2.

COP [34] Appendix A Item #	IIP [32] Reference Number	Issue*
69	I15-7a	Include relevant information from COG JP 4271 Calandria and internals. Fitness for Life Extension Guidelines in N-PLAN-01060-10003 "Reactor Components and Structures Life Cycle Management Plan (LCMP)" and submit the LCMP to the CNSC in accordance with Pickering B PROL 08.20/2013 LC 1.2. Although the action is complete, this will need to be updated to cover operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2. Note: An interim LCMP update for major components is documented in P-CORR-01060-0587604 R000 [76], which describes life cycle management strategies for major components to achieve extended operations to 2024. Strategies in this document may apply beyond 2024, but this needs to be confirmed as part of the resolution of this COP-related PSR2 gap.
Appendix C, Item 5	F11	Update the Pickering B HTS aging model. This action is complete but needs to be reviewed to assess impact of operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2.
Appendix C, Item 6	F12	Update the Pickering B HTS aging management strategy. This action is complete but needs to be reviewed to assess impact of operation past 2020 for Pickering Units 1,4 and Units 5-8. Therefore, this is a gap for Pickering PSR2.

* Closed Pickering Units 5-8 COP actions were reviewed to determine whether they need to be reassessed (PSR2 gaps identified) to address operation past 2020. Where applicable, equivalent Pickering Units 1,4 PSR2 gaps are also identified where reassessment will be required for operation past 2020.

Review of the Darlington IIP [33] for gaps that may need to be reassessed in the context of Pickering PSR2 for operation past 2020 did not identify any additional gaps for Safety Factor 4.

The following concession in the R04 Pickering Licence Conditions Handbook [31] is applicable to Safety Factor 4 in the context of operation past 2020:

- "OPG shall carry out periodic inspections in accordance with the accepted PIP documents. If a deviation from the accepted PIP program is anticipated during inspection planning activities, OPG shall obtain CNSC acceptance prior to conducting the affected inspections. However, for any findings, discoveries or deviations from the accepted PIP that are identified during an inspection, OPG shall provide justification to CNSC in the inspection report submission following OPG governance, OPEX and Best Industry Practices. For permanently required exemptions to the requirements of CSA PIP standards, OPG shall revise the affected PIP document accordingly prior to issuing the next scheduled revision of the PIP document." The LCH wording provides a way for handling a deviation from the accepted PIP program. If a permanent concession is needed as a result of future updates to CSA Standards associated with PIPs, this concession will need to be revisited. CNSC acceptance will be obtained at that time if it is needed. This is therefore not a PSR2 gap.

The following concession in the Pickering LCH is applicable to Safety Factor 2 in the context of operation past 2020:

- "With respect to N285.4-05 clause 14.2.5.1.3, CNSC staff have accepted OPG's request to use COG Report 07-4089 R1 "Fitness-for-Service Guidelines for Steam Generator and Preheater Tubes", with one exception pertaining to the use of the Level D safety factors stipulated in ID 2.3.2.2 Paragraph (a), *Deterministic Leak-Before-Break,* to other load levels (levels A, B, C) and any other portions of the Fitness for Service Guidelines (FFSG) that invoke the use of ID-2.3.2.2 (per CNSC letter e-Doc 4298097). Instead, OPG is required to continue using the safety factors defined in ID 2.3.2.2 Paragraph (a) of Revision 0 of the fitness-for-service guidelines for the appropriate load levels." This exception relates to a pressure limit for which tubes pulled from an SG need to be tested for showing either Leak Before Break or Maximum Tolerable Flaw Size calculations. This value does not change as the SG tubes age and does not need to be revisited for operation past 2020. This is therefore not a PSR2 gap.

Per Appendix B.5 of this report, there were three PSR2 gaps identified that are associated with the Conduct of Maintenance Program and related to Foreign Material Exclusion, Work Planning and organizational learning. These gaps are not directly related to Aging and will be captured under Safety Factor Report 11, "Procedures".

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Aging Safety Factor 4 were reviewed for the ten PSR2 Review Tasks in Section 4.1 of this report and resulted in Pickering PSR2 Gaps SF4-1 and SF4-2 below. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for both Safety Factors 2 and 4 were prepared per Sections 4.2 and 4.3, respectively, and resulted in PSR2 Gaps SF4-3 to SF4-17. This report also includes a review of OPG commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC since the current operating licence was issued (all related to Safety Factors 2 or 4), as well as identification and review of previously identified PSR1 gaps related to Safety Factor 4 (to ascertain the implications of extending Pickering NGS operation beyond 2020), per Section 4.4, which resulted in PSR2 Gap SF4-18.

The eighteen PSR2 gaps that will need to be addressed as part of Pickering PSR2 are:

- **<u>Gap SF4-1</u>**: The conclusion of Safety Factor 4 Review Task #7 is that programs for timely detection and mitigation of aging mechanisms and/or aging effects, including obsolescence of technology, have been established. However, N-STD-MA-0024, "Obsolescence Management" does not explicitly address obsolescence of services or supplies external to the plant. This is therefore identified as a gap for Pickering PSR2.

- **<u>Gap SF4-2</u>**: Per Safety Factor 4 Review Task #9, there is a gap with respect to the Aging Management practices of IFB facilities at Pickering NGS that is to specifically produce a CA for the Pickering 1-4 IFB SSCs and the Pickering Auxiliary IFB SSCs. It is noted that work to address this gap is currently underway as part of the Pickering NGS Condition Assessments for the Pickering IFBs that will be addressed under Safety Factor Report 2, "Actual Condition of Structures, Systems and Components." Since this work is not yet complete, this is identified as a gap for Pickering PSR2.

- **<u>Gap SF4-3</u>**: N285.4 PIP Governance references N285.4-05, not N285.4-09 including Updates 1 and 2. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **<u>Gap SF4-4</u>**: There has been a significant change in the wording of clause 4.2.7 in CSA N285.4-09 including Updates 1 and 2. I-PROC-AS-0009, "Inspection Qualification of Non-Destructive Examination Processes" does not identify the authorized inspector as a qualifying authority as directed by clause 4.2.7. Instead it establishes the CANDU Inspection Qualification Bureau as the organization that would approve procedures and personnel. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **<u>Gap SF4-5</u>**: New erosion and corrosion inspection requirements in N285.4-09 including Updates 1 and 2 are not reflected in current PIP governance. NK38-REP-03680-10137 R000 states that: "It should be noted specifically that [this ISR Issue] is likely to have a major impact on piping PIPs because sub-clauses 7.4.7.X in CSA N285.4-09 including UPD1 and UPD2 include substantive changes. Under the new standard erosion and corrosion inspection exemptions can no longer be justified on the basis of [sic] that conditions are determined to be non-erosive and non-corrosive." This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **<u>Gap SF4-6</u>**: Extended life inspection schedules in N285.4-09 including Updates 1 and 2 are not reflected in PIP governance. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **<u>Gap SF4-7</u>**: An assessment of the prior operating non-conforming state, as required by N285.4-09 including Updates 1 and 2, is required when dispositioning inspection results. This requirement has not been included in the feeder PIP plan. This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **<u>Gap SF4-8</u>**: There is a PSR2 gap for Pickering NGS against N285.4-14 to address:

    - Revised requirements for pressure tube volumetric and dimensional inspection (Clause 12.2), pressure tube hydrogen equivalent determination (Clause 12.3) and pressure tube material property testing (Clause 12.4);

    - Clause 12.5 which specifies minimum annulus spacer surveillance examination and testing requirements;

    - Selection criteria for identifying candidate tube for pressure tube surveillance examination and testing (Annex E) to include selection criteria for annulus spacer surveillance examination and testing; and

    - Clause 7.4.8 which specifies requirements for inspection of Environmentally Assisted Cracking, and Clauses 7.5.1/7.5.2 which specify requirements for inspection of identical components.

- **<u>Gap SF4-9</u>**: There were a number of concessions granted from the CNSC for compliance with N285.5-M90 that will need to be reconciled for Pickering for the period of PSR2: (Since these gaps are all concession-related and associated with N285.5-M90, they are tracked under a single PSR2 gap.

    - The Pickering B ISR gap associated with N285.5-M90 clause 4.5.1 is closed. However, the disposition of the gap refers to OPG receiving a concession from the CNSC on the inspection of components deemed to be inaccessible. A similar (updated) concession may be required for Pickering operation past 2020. Therefore, this is a gap for PSR2.

    - The Darlington ISR disposition of the gaps for N285.5-M90 clauses 8.4.2.1 and 8.4.2.2 refer to OPG receiving a concession from the CNSC that insulation will not be removed in the absence of visible damage to a component, and only "light weight" access covers will be removed. The Darlington ISR states: "This is a concession from the regulator which is not assured in the case of a refurbished plant. As such, this represents a gap". By the same logic it will need to be reconciled for Pickering for the period of PSR2 (life extension past 2020).

  - The Darlington ISR disposition of the gap for N285.5-M90 for clause 8.5.2.2 refers to an exception of the numerical rules of this clause for reasons of practicality, and that a concession was received from the CNSC. The Darlington ISR stated "… it is categorized as a Gap, because a concession from the CNSC is not assured for a refurbished plant.". By the same logic it will need to be reconciled for Pickering for the period of PSR2.

  - Per the Darlington ISR disposition of the gap for N285.5-M90 clause 8.6.3, although CNSC acceptance was obtained, there is still a non-compliance with a portion of the clause related to the timing of inspections which is noted as needing to be reconciled for a refurbished station. The Darlington ISR stated "This represents a gap that will need to be reconciled with the regulator for a refurbished station." By the same logic it will need to be reconciled for Pickering for the period of PSR2.

- **Gap SF4-10**: The changes in N285.5-13 relative to N285.5-08 that are applicable to Fiberglass Reinforced Plastic material that is used at Pickering NGS have only been assessed for fitness for service to 2024 in the Pickering Continued Operations Plan. These changes related to aging management (monitoring and test programs) for FRP materials. As a result, additional assessment is required for Pickering to address FRP aging management at Pickering for operation to 2028, and to confirm the current program aligns with N285.5-13 clauses 8.2, 8.3.3, 8.3.4 and A.6.1.2 (Note: This gap only exists if Pickering NGS intends to operate past 2024.).

- **Gap SF4-11**: N287.7-08 clause 7.11.2 Table 1 involving non-compliance with accuracy and repeatability requirements for dewpoint temperature was a gap for Darlington. No evidence can be found that this has been addressed for Pickering NGS. This is therefore a gap for Pickering PSR2.

- **Gap SF4-12**: OPG initiated a Regulatory Management action to provide the CNSC with the latest Dow Corning 995 material test report in response to an Action Notice raised in the CNSC Type II Inspection. The work is currently in progress. Therefore, this is a gap for Pickering PSR2.

- **Gap SF4-13**: Actions #31, #32, and #33 from the Pickering Units 5-8 Continued Operations Plan are related to N287.7 and although complete, need to be re-assessed for Pickering operation past 2020. (IIP Action #31 involved submission of Periodic Inspection Plans and Life Cycle Management Plans for a number of safety-significant civil structures. IIP Action #32 involved submission of Aging Management Plans for concrete containment structures to the CNSC for acceptance. IIP Action #33 involved revising the Reactor Building Periodic Inspection Plan and submitting to the CNSC for acceptance.).

- **Gap SF4-14**: OPG is not compliant with N-PROC-MP-0060 Aging Management Process, Section 1.7 for "not reviewing and updating the Component Condition

Assessments[13] within the review cycle of the component, and when new information or feedback from the program was received." OPG has since revised these CAs, which are now valid until 2020. OPG has stated they will develop an implementation plan to prevent reoccurrence of: a) not reviewing and revising the CAs within the review cycle, and b) not updating the CAs when pertinent new information becomes available. OPG stated they will provide an update and a target implementation date on this action to the CNSC by October 30, 2016. This is a gap for Pickering PSR2.

- **<u>Gap SF4-15</u>**: OPG is not compliant with N-PROC-MA-0077, "Critical Equipment Identification and Categorization", Section 1.2 because "the Reactor Safety (RS) category code and rationale for critical components was not always accurate or consistently applied in the CCAs[13]." OPG has stated they have since completed a review and update of the RS category code and rationale for a portion of the components to become fully compliant with N-PROC-MA-0077. However, OPG has stated that a review of the CAs will be conducted to ensure consistency with the revised Reactor Safety codes and that an update will be provided to the CNSC by October 30, 2016. This is a gap for Pickering PSR2.

- **<u>Gap SF4-16</u>**: For the Pickering B ISR, no clause-by-clause review of CSA N285.8 was conducted on the basis that the pressure tubes will be replaced during the refurbishment outage for Pickering Units 5-8, and the condition of these components is well understood and managed through their own specific, detailed life cycle plans and fitness-for-service criteria. However, in November 2015, OPG issued Plan N-REP-31100-10061 R002 for Pickering NGS compliance with pressure tube in-service evaluation requirements in CSA N285.8-15. OPG had submitted a previous compliance plan for the long term use of the 2010 edition of CSA N285.8 and this compliance plan was accepted by the CNSC. The compliance plan was revised to document OPG's compliance to the 2015 edition of CSA N285.8. Since OPG has committed to fulfillment of the commitments in N-REP-31100-10061 R002, successful fulfillment by OPG of the commitments in the compliance plan is required for Pickering operation past 2020. This is therefore a gap for Pickering PSR2. In particular, the significant changes to CSA N285.8-15 per the CSA Impact Statement will need to be reflected in Pickering procedures, including:

    - Implementation of statistically based fatigue crack initiation evaluation curves for axial flaws (Clauses D.4.2, D.4.3, and D.3.6);

    - Implementation of closed-form engineering relation for threshold peak stress for Delayed Hydride Cracking (DHC) initiation (Clauses D.5 and 5.4.3.4);

    - Implementation of statistically based threshold relation for peak stress for crack initiation due to hydrided region overloads (Clause D.5);

---

[13] The terminology currently used is Condition Assessment (CA) instead of Component Condition Assessment (CCA).

    - Implementation of new fracture toughness models for axial through-wall flaws (Clause D.13.2); and

    - Implementation of Methods 1 and 2 Probabilistic Leak-Before-Break (Clauses 3.1, 7.3 and 7.4).

- **<u>Gap SF4-17</u>**: Per Section B.1, Nuclear Oversight conducted a performance based audit (NO-2016-027) of the IAM Program in March 2016. The purpose of the audit was to determine whether IAM program requirements are being met and are effectively implemented to support safe and reliable operation. The audit concluded that the managed system controls are not fully effective and identified the following two open findings applicable to Pickering NGS which result in a PSR2 gap (Note: These gaps are closely related and are therefore identified as a single PSR2 gap.):

    - The IAM program requires that the interfacing programs affecting critical component condition should be comprehensive and sufficiently integrated to ensure critical information and assumptions used in completing condition assessments and Aging Management activities are valid and effective. However, a lack of integrated life cycle initiatives has been identified, which has the potential to impact equipment health. In addition, the program defines the requirements for program oversight and implementation. However, issues were identified in the completion of Condition Assessments and the execution of related recommendations due to ineffective oversight and implementation of the IAM program. SCR N-2016-08041 (AR# 28189056) has been raised to address this issue and is expected to be completed by Q4 2017. This is a gap for PSR2 since the SCR is not yet closed, and missing information in Condition Assessments and incomplete actions may lead to ineffective management of the aging equipment and impact the reliability of SSCs.

    - The IAM implementing procedure identifies the requirement for qualified individuals to perform Aging Management engineering activities such as preparing and reviewing Condition Assessments and screening reports. The audit identified that some Engineering Support Personnel performed engineering work independently while they were not qualified in the Training Information Management System. SCR P-2016-08008 (AR# 28189028) has been raised to address this issue and is expected to be completed by Q3 2016. This is a gap for PSR2 since the SCR is not yet closed, and unqualified staff performing work independently could impact the quality of Engineering work including Aging Management work activities.

- **<u>Gap SF4-18</u>**: Per Section 4.4, review of the Pickering Units 5-8 Continued Operations Plan [34] identified 11 closed gaps from the Pickering B ISR that will need to be revisited in the context of continued operation past 2020 for PSR2. These relate to COP Appendix A Actions #4, 10, 11, 12, 13, 14, 19, 21, 30, 52, 69, and Appendix C Items 5 and 6. A number of these gaps will also need to be addressed for Pickering Units 1,4.

The review of Safety Factor 4 has confirmed that aging aspects affecting SSCs important to safety are being effectively managed and that an effective aging management program is in place at Pickering NGS.

WANO	World Association of Nuclear Operators

Appendix B: Audit and Self-Assessment Results

B.1 N-PROG-MP-0008, "Integrated Aging Management"

The objective of the Integrated Aging Management Program is to ensure that the condition of critical OPG Nuclear equipment is understood and that required activities are in place to ensure the health of these components and systems while the plant ages. This is accomplished by establishing an integrated set of programs and activities which ensure performance requirements of all critical station equipment are met on an ongoing basis. These programs and activities all serve an integral function to ensure critical equipment degradation due to aging is managed, such that operation of the station remains within the licensing basis and allows for station operational goals to be met.

N-PROG-MP-0008 also requires preparation of life cycle plans for critical plant equipment. The purpose of these plans is to determine and document actions required to ensure plant equipment will meet all design and operating objectives over the life of the plant in consideration of aging. The life cycle plans are established by a comprehensive condition assessment process. Condition assessments supplement the ongoing engineering surveillance activities in place to monitor and optimize system performance.

Nuclear Oversight conducted a performance based audit of IAM Program in March 2016, NO-2016-027 [B.1.1], for both Pickering and Darlington NGS. The purpose of the audit was to determine whether IAM program requirements are being met and are effectively implemented to support safe and reliable operation. The audit concluded that the managed system controls are not fully effective and identified the following two findings applicable to Pickering NGS:

- The IAM program requires that the interfacing programs affecting critical component condition should be comprehensive and sufficiently integrated to ensure critical information and assumptions used in completing Condition Assessments and aging management activities are valid and effective. However, a lack of integrated life cycle initiatives has been identified, which has the potential to impact equipment health.

  In addition, the program defines the requirements for program oversight and implementation. However, gaps were identified in the completion of Condition Assessments and the execution of related recommendations due to ineffective oversight and implementation of the IAM program.

- The IAM implementing procedure identifies the requirement for qualified individuals to perform Aging Management engineering activities such as preparing and reviewing Condition Assessments and screening reports. The audit identified that some Engineering Support Personnel performed engineering work independently while they were not shown as qualified in the Training Information Management System (TIMS).

Two SCRs (N-2016-08041 and P-2016-08008), were initiated to address the above findings, which required corrective actions to be implemented and are expected to be completed by Q4 2017 (N-2016-08041) and Q3 2016 (P-2016-08008).

Engineering Programs completed a self-assessment in February 2016, NO16-000190-SA [B.1.2] in order to assess the effectiveness of the IAM program and to identify areas for improvement for both Pickering and Darlington NGS as well as the Nuclear Waste Management Division. It was concluded that the primary configuration of the IAM Program is aligned with industry practices as well as CNSC expectations. However, areas for improvement were identified as follows:

- Various measures to improve IAM program effectiveness were identified. For example, revision of the 3 year cycle for the IAM self-assessment plan (N-PLAN-01060-10009) from 2016 to 2018; a roll out or briefing card to operations, maintenance and management staff to create an adequate awareness on IAM; and a review the applicability of DCR 126201 (AR 28185478);

- Revision to the governance document;

- Update to the Program Health Report Indicators; and

- IAM training requirements.

Two SCRs (N-2016-01710 and N-2016-02451) and an Action Request (AR 28185478) were initiated as a result of the self-assessment, which required corrective actions to be implemented. Although the Action Request is expected to be completed by Q2 2016, a check has confirmed that the two SCRs have already been closed and the necessary corrective actions were completed to address the underlying issues.

The above results for the audits and self-assessments revealed the following PSR2 gap related to the IAM Program (**Pickering PSR2 Gap SF4-17**):

- The IAM program requires that the interfacing programs affecting critical component condition should be comprehensive and sufficiently integrated to ensure critical information and assumptions used in completing Condition Assessments and Aging Management activities are valid and effective. However, a lack of integrated life cycle initiatives has been identified, which has the potential to impact equipment health.

  In addition, the program defines the requirements for program oversight and implementation. However, issues were identified in the completion of Condition Assessments and the execution of related recommendations due to ineffective oversight and implementation of the IAM program. SCR N-2016-08041 (AR# 28189056) has been raised to address this issue and is expected to be completed by Q4 2017. This is a gap for PSR2 since the issue is outstanding and missing information in Condition Assessments and incomplete actions may lead to ineffective management of the aging equipment and impact the reliability of SSCs.

- The IAM implementing procedure identifies the requirement for qualified individuals to perform Aging Management engineering activities such as preparing and reviewing Condition Assessments and screening reports. The audit identified that some Engineering Support Personnel performed engineering work independently while they were not shown as qualified in the Training Information Management System. SCR P-

2016-08008 (AR# 28189028) has been raised to address this issue and is expected to be completed by Q3 2016. This is a gap for PSR2 since the issue is outstanding and unqualified staff performing work independently could impact the quality of Engineering work including Aging Management work activities.

B.2 N-PROG-MA-0025, "Major Components"

The major components program establishes an integrated set of processes and activities to justify fitness for service of Feeders, Fuel Channels, Reactor Components and Structures, and Steam Generators (SGs) and develops long-term Life Cycle Management strategies that support preservation of these assets. The program incorporates the reporting requirements associated with demonstrating compliance with design basis documentation relevant to each of the Major Components Program areas. Also described are processes for conducting regular cross-discipline reviews of information to ensure each of the major components cited above contributes to the safe operation of Pickering NGS.

The program calls for an effective, formal, and systematic process for integrating and reviewing data reported from each of the major components, which includes, but is not necessarily limited to, the following:

- Component design and manufacturing;
- Component inspection;
- Surveillance of sub-components (e.g. SG tubing and internal tube supports);
- Station operating conditions (e.g. physics, temperature, chemistry, etc.); and
- Research described in the technical basis documentation of the Life Cycle Management Plans (LCMP) applicable to the respective major component.

The Governance and Services Section completed a self-assessment in December 2015, BAS15-001756-SA [B.2.1] in order to assess program compliance with N-PROG-MA-0025 for both Pickering and Darlington NGS. The self-assessment concluded that the program is performing well with no overdue documents. No findings/SCRs were generated as a result of the self-assessment. Audit reports specifically for the Major Components Program have not been prepared and hence there are no pertinent findings.

The above results for the self-assessment reveal that there are no gaps for PSR2 related to the Major Components Program.

[B.2.1] OPG Self-Assessment Report, BAS15-001756-SA, *Program Assessment of N-PROG-MA-0025 Major Components*, December 2015.

B.3 N-PROG-MA-0026, "Equipment Reliability"

The purpose of the Equipment Reliability (ER) Program is to ensure ongoing high levels of reliable performance of components important to nuclear safety, production, and environmental protection. Reliable performance of components means very low numbers of component failures, degraded equipment condition is minimized, and redundancy is maintained on key Pickering NGS systems.

The ER Program contains the following elements which ensure ongoing high levels of reliable performance of critical components:

- Identifying critical components that require focused attention;
- Specifying the required maintenance strategies to maintain high levels of reliability, and continuously improving the maintenance strategies based on corrective actions and maintenance feedback;
- Executing Predictive Maintenance, and Preventive Maintenance programs;
- Monitoring system and component condition and implementing plans to restore and maintain system and component health;
- Taking prompt and effective action, when critical equipment fails, to understand the technical and organizational causes and to prevent a recurrence; and
- Identifying and predicting aging and obsolescence issues on important components and embedding mitigating strategies and actions into the business plan.

Nuclear Oversight conducted a performance based audit of the ER Program in May 2013, NO-2013-002 [B.3.1] for both Pickering and Darlington. The objective of the audit was to assess the implementation of the ER Program and to ensure on-going high levels of reliable performance of components important to safety, production and environmental protection. The audit found performance deficiencies in the following three areas:

- Preventive Maintenance Implementation;
- System Surveillance Activities; and
- Predictive Maintenance Implementation and Health Reporting.

Three Pickering NGS SCRs (P-2013-07134, P-2013-07136 and P-2013-07138) were initiated to address the above findings which required corrective actions to be implemented. These SCRs have since been closed and the necessary corrective actions were completed to address the underlying issues.

Operations and Maintenance Support completed a self-assessment in February 2014, NO14-000381-SA [B.3.2] in order to assess the health of the Equipment Reliability governance framework, which is applicable for both Darlington and Pickering. This involved a review of related SCRs, governance framework, revision records and previous program assessment reports. No actions were generated as a result of the self-assessment.

The above results for audits and self-assessments reveal that there are no gaps for PSR2 related to the Equipment Reliability Program.

B.4 N-PROG-MA-0017, "Component and Equipment Surveillance"

The Component and Equipment Surveillance program is a set of activities to assure the health of a select group of OPG Nuclear components. A series of program elements (component, inspection, and test) and managed processes have been developed under the authorization of this program. Program oversight provides assurance that licensing, reactor safety, equipment reliability, environmental and conventional safety requirements are met on an ongoing basis. For example, the periodic inspection program is in place to ensure compliance with applicable CSA Standards and the Power Reactor Operating Licence. The power operated valve program complements the in-service inspection test program by demonstrating the functionality of critical valves following design basis accidents.

OPG's comprehensive component and equipment monitoring is accomplished through the implementation of this program and the integration of interfacing activities that are managed under the Equipment Reliability program consisting of system performance monitoring, as well as component monitoring and response to equipment failures and degradation.

Operations and Maintenance Support completed a self-assessment in January 2014, NO13-000857-SA [B.4.1] in order to assess the health of the Component and Equipment Surveillance governance framework, which is applicable for both Darlington and Pickering NGS. This involved a review of the Governance Framework, SCR database, Asset Suite, and revision records. DCR #0000125104 was initiated against N-PROG-MA-0017 to capture the following observations of the self-assessment:

- Revisions/Addition to several implementing references;
- Reference to CSA N286-12, "Management System Requirements for Nuclear Facilities"; and
- Removal of non-governance documents which were identified as an implementing program document.

DCR #0000125104 has since been completed and the necessary corrective actions were finalized to address the underlying issues. Audit reports specifically for the Component and Equipment Surveillance Program have not been prepared and hence there are no pertinent findings.

The above results for the self-assessment reveal that there are no gaps for PSR2 related to the Component and Equipment Surveillance Program.

References

[B.4.1] OPG Self-Assessment Report, NO13-000857-SA, *Program Assessment: N-PROG-MA-0017, Component and Equipment Surveillance*, January 2014.

B.5 N-PROG-MA-0004, "Conduct of Maintenance"

The purpose of the Maintenance program is to ensure personnel and public safety, protection of the environment and reliable operation. The program includes work planning, work execution, calibration and tool control, personnel and training, and performance indicators and assessment.

Nuclear Oversight conducted a performance based audit of the Maintenance program in December 2015 for Pickering NGS, NO-2015-030 [B.5.1]. The purpose of the audit was to determine whether the Maintenance program requirements have been effectively implemented to support safe and reliable operation. The audit concluded that the managed system controls are not fully effective and identified the following findings:

- Foreign Material Exclusion (FME) is the process used to prevent the intrusion of Foreign Material into systems, equipment, or components. The goal of FME is to ensure that all staff plan and execute their activities to include precautions to prevent introducing foreign material into plant equipment. Significant gaps were found in the FME health reporting and event characterization and field issues were also noted (SCR P-2015-28880).

- OPG Governance requires that learning behaviours such as observation and coaching, self-assessments and benchmarking are used to continuously improve operations. Pickering Maintenance is not effectively utilizing performance improvement tools. Actions from the observation and coaching, self-assessment, and corrective action programs are lacking continuity, content and depth. This has resulted in gaps not being identified, actioned or effectively corrected (SCR P-2015-28884).

- N-PROC-MA-0002, "Work Planning", describes the requirements to establish the process for planning work to ensure common base requirements are uniformly supported. The process starts with a Work Request in which work requirements and constraints have not been identified and ends with fully planned Work Order with associated tasks ready to be scheduled. However, inconsistent quality in Work Instruction and non-compliances were noted (SCR P-2015-28887).

- Non-compliances with governance or management expectation were observed in work reporting, walk down feedback and Pre Job Briefing form use (SCR P-2015-28890).

Four SCRs were initiated to address the above findings which required corrective actions to be implemented. One SCR has been completed (P-2015-28890), while the remaining SCRs (P-2015-28880, P-2015-28884 and P-2015-28887) have actions in place and are all expected to be completed by Q2 2016 (P-2015-28884 and P-2015-28887) or Q3 2017 (P-2015-28880).

The Maintenance department completed a self-assessment in February 2014, P14-000101-SA [B.5.2], in order to validate the effectiveness of current actions, identify potential gaps and recommend additional actions required to address the Areas For Improvement (AFIs) identified in the 2013 WANO Peer Evaluation related to Conduct of Maintenance for Pickering NGS. The review identified the following AFIs:

- Maintenance Workers are sometimes not applying fundamental maintenance practices and following standards such as procedural use and adherence. This has resulted in a forced outage, a reactor trip, returning a unit to a guaranteed shutdown state, and rework. Managers and first line managers not enforcing standards is a contributing factor.

- Late, deferred, and late-in-grace preventive and predictive maintenance tasks have led to several critical component failures, loss of redundancy, and degraded system health. Contributors are ineffective corrective actions and an acceptance of ineffective execution of preventive maintenance and predictive maintenance tasks.

The self-assessment concluded that the current actions were not effective and provided recommendations to address the corrective actions related the AFIs, which were captured under two ARs (28159866 and 28160182). These ARs have since been closed and the necessary corrective actions were completed to address the underlying issues.

The above results for the audits and self-assessments, revealed that the Conduct of Maintenance Program possesses the following gaps:

1) Foreign Material Exclusion is the process used to prevent the intrusion of Foreign Material into systems, equipment, or components. The goal of FME is to ensure that all staff plan and execute their activities to include precautions to prevent introducing foreign material into plant equipment. Significant gaps were found in the FME health reporting and event characterization and field issues were also noted. SCR P-2015-28880 (AR# 28186936) has been raised to address this issue and is expected to be completed by Q3 2017. This is a gap for PSR2 since the SCR is not yet closed and inaccurate reporting of FME program health allows conditions to remain latent and increases the risk of a consequential event (Note: Since FME is not directly related to Aging, this gap will be captured under Safety Factor Report 11, "Procedures").

2) OPG Governance requires that learning behaviours such as observation and coaching, self-assessments and benchmarking are used to continuously improve operations. Pickering Maintenance is not effectively utilizing performance improvement tools. Actions from the observation and coaching, self-assessment, and corrective action programs are lacking continuity, content and depth. This has resulted in gaps not being identified, actioned or effectively corrected. SCR P-2015-28884 (AR# 28186012) has been raised to address this issue and is expected to be completed by Q2 2016. This is a gap for PSR2 since the SCR is not yet closed and organizational learning and progress cannot effectively occur without input from observation and coaching. Also, industry OPEX prevents duplication of errors and potential vulnerabilities can continue to exist without the use of effectiveness checks. (Note: Since organizational learning is not directly related to Aging, this gap will be captured under Safety Factor Report 11, "Procedures").

3) N-PROC-MA-0002, "Work Planning", describes the requirements to establish the process for planning work to ensure common base requirements are uniformly supported. The process starts with a Work Request in which work requirements and

constraints have not been identified and ends with fully planned Work Order with associated tasks ready to be scheduled. However, inconsistent quality in Work Instruction and non-compliances with N-PROC-MA-0002 were noted. SCR P-2015-28887 (AR# 28186347) has been raised to address this issue and is expected to be completed by Q2 2016. This is a gap for PSR2 since the SCR is not yet closed and this issue could increase the risk of errors by maintenance staff in the field. (Note: Since Work Planning is not directly related to Aging, this gap will be captured under Safety Factor Report 11, "Procedures").

B.6 N-PROG-OP-0004, "Chemistry"

The purpose of the Chemistry program is specify processes, requirements and staff accountabilities to ensure effective control of Pickering NGS chemistry, including provision of analytical services. The Chemistry program covers activities associated with overall objectives of controlling plant chemistry, including the following:

- Identification of issues or conditions that may impact on chemistry control performance;
- Maintenance of specifications for chemistry control;
- Control of laboratory methods;
- Sampling and analysis;
- Data management;
- Application of actions to maintain or restore chemistry control;
- Performance monitoring, including data review; and
- Control of process chemical quality.

Nuclear Oversight conducted a performance based audit of the Chemistry program for Pickering NGS in May 2014, NO-2014-024 [B.6.1] in order to determine if chemistry activities are being performed effectively and in compliance with the program requirements for safe and reliable operations. The audit noted positive insights in the areas of intra-laboratory testing and good work practices during both sampling collection and chemistry lab analysis. However, the audit determined that the performance of the managed system controls for the Chemistry Program is not fully effective and identified three findings:

- Deficiencies with inspection and maintenance of chemistry lab fume hoods;
- Untimely resolution of long standing issues; and
- Misalignment between chemistry specifications, chemistry control procedures and Chemistry and Environmental Monitoring (CEM) database.

Three SCRs (P-2014-16543, P-2014-16546 and P-2014-16550) were initiated to address the above findings, which required corrective actions to be implemented. These SCRs have since been completed (although the three SCRs have an "Approved" status, all the associated assignments have been completed) and the necessary corrective actions were completed to address the underlying issues.

Operations and Maintenance Support completed a self-assessment in April 2013, NO13-000227-SA [B.6.2] in order to assess the health of the Chemistry governance framework, which is applicable for both Darlington and Pickering NGS. This involved a review of related SCRs, governance framework, revision records and previous program assessment reports. No further actions or recommendations were generated as a result of the self-assessment.

The above results for the audit and self-assessment reveal that there are no gaps for PSR2 related to the Chemistry Program.

[B.6.2] OPG Self-Assessment Report, NO13-000227-SA, *Program Management Assessment: N-PROG-OP-0004, Chemistry*, April 2013.

B.7 N-PROG-MA-0019, "Production Work Management"

The Production Work Management program specifies the requirements for identifying, prioritizing, planning, scheduling, and performing work in support of the operation, maintenance, and modification of OPG Nuclear stations. The program also establishes safe, uniform, and efficient work control practices for nuclear sites.

The following objectives are satisfied through the implementation of the Production Work Management Program:

- Standardization: Common priority systems, work processes and methodologies are consistently applied in scheduling all work in support of the operation, maintenance, and modification of nuclear facilities across the fleet;
- Possible safety consequences of concurrent or sequential maintenance, testing, or operations are considered;
- Operational readiness of required equipment is ensured and the plant is not placed in a high-risk configuration;
- Accountabilities in this process are established from work initiation to work completion, and compliance is ensured through monitoring;
- Value for money: Resource utilization is maximized to ensure health of the systems and to satisfy internal and external commitments of the business plan; and
- Schedule compliance is continually reinforced.

Nuclear Oversight conducted a performance based audit of the Online Work Management Process (which is an element of the Work Management Program) in March 2013, N-NO-2013-012 [B.7.1], for both Pickering and Darlington. The purpose of the audit was to verify that the online work management process is utilized to identify, select, plan schedule and execute work in a manner that ensures high levels of safe and reliable plant operation. The audit concluded that the managed system controls were not effective and identified the following two findings applicable to Pickering:

- Work integral to maintaining safe and reliable plant operation at Pickering is not surviving through the stability window; and
- The current practice for mitigating emergent work at Pickering is not fully effective in meeting its objectives.

Two SCRs (P-2013-03748 and P-2013-03751) were initiated to address the above findings, which required corrective actions to be implemented. These SCRs have since been closed (although P-2013-03748 has an "Approved" status, all the associated assignments have been completed) and the necessary corrective actions were completed to address the underlying issues.

The Governance and Services Section completed a self-assessment in November 2015, BAS15-001596-SA [B.7.2] in order to assess compliance with N-PROG-MA-0019 for both Pickering and Darlington. It was concluded that the Production Work Management Program performed well with only minor recommendations identified (e.g., incorporate DCRs on superseded references at next revision; consideration for the addition of best practices text to the program). No findings/SCRs were initiated as result of this self-assessment.

The above results for the audit and self-assessment reveal that there are no gaps for PSR2 related to the Production Work Management Program.

[B.7.2] OPG Self-Assessment, BAS15-001596-SA, *Assessment of N-PROG-MA-0019 Production Work Management Program compliance to OPG-PROC-0001/OPG-STD-0001*, November 2015.

B.8 N-PROG-MA-0016, "Fuel"

The Fuel Program establishes a formal and systematic process for integrating and reviewing information related to fuel, and reporting its performance, condition, and compliance with associated design basis documents. N-PROG-MA-0016 specifies the requirements for monitoring, integrating and assessing fuel-related information and details the documentation requirements for issues identified by this program. N-PROG-MA-0016 also incorporates the reporting requirements associated with demonstrating fuel compliance with fuel design basis documentation. These activities are performed to ensure fuel performs safely and reliably over the life of the stations, maintaining fuel design basis, license bases, and Operational Safety Requirements, while optimizing station reliability, production, and cost effectiveness.

The Fuel Program also takes responsibility for integrating and reviewing fuel channel data which may impact safety analysis or the safety report. It is compliant with the requirements specified in applicable subsections (Section 7.3 through to Section 7.9) of N286-12, "Management System Requirements for Nuclear Facilities".

Operations and Maintenance Support completed a self-assessment in February 2013, NO13-000174-SA [B.8.1], in order to assess the health of the N-PROG-MA-0016 governance framework which is applicable for both Pickering and Darlington NGS. The self-assessment concluded that there were no program compliance issues and no findings/SCRs were generated.

Nuclear Oversight conducted a performance based audit of the Fuel Program in December 2014, NO-2014-025 [B.8.2] in order to determine if the requirements defined in governance have been met and effectively implemented for both Pickering and Darlington NGS. The audit determined that performance of the managed system controls for the Fuel program and related activities is not fully effective and identified the following four findings:

- Weaknesses in Fuel Program Oversight;
- Challenges to Timely Resolution of In-Core Fuel Defects;
- Weaknesses in Fuel Program Implementation; and
- Deficiencies in Fuel Program Governance.

Four SCRs (SCRs N-2014-34717, P-2014-34722, N-2014-34724 and N-2014-34726) were initiated to address the above findings, which required corrective actions to be implemented. These SCRs have since been completed and the necessary corrective actions were completed to address the underlying issues.

The above results for the audit and self-assessment reveal that there are no gaps for PSR2 related to the Fuel Program.

B.9 OPG-PROG-0009, "Items and Services Management"

The Items and Services Management program supports Supply Chain activities across all of OPG and is summarized by the following points:

- The processes identified in this program ensure:
    - Procurement is planned, and that purchased, stored, and issued items and purchased services meet appropriate and applicable design and quality requirements.
    - Requirements for a managed process are in place to ensure that the procurement of nuclear fuel is planned, and that purchased fuel materials and services meet appropriate design and quality requirements.
    - Items, services, and nuclear fuel materials and bundles are purchased in accordance with stated requirements and controlled through proper identification, handling, storage, issuance, and shipping to ensure the quality of equipment and components is preserved.
- The execution of requisitioning and procurement processes shall be fair and transparent and shall be conducted in accordance with OPG-STD-0017, Organizational Authority Register, and OPG's Business Code of Conduct.
- This program supports Quality Assurance requirements stated in the CSA N285 and N286 series of standards.
- This program is applicable to the purchase, storage and handling of items or services used to support construction, operation, maintenance and decommissioning activities within OPG nuclear power facilities, waste management and nuclear fuel materials and services for use in OPG reactors and support programs, and aligns with requirements of N-MAN-01913.11-10000, "Pressure Boundary Program Manual".
- This program is not applicable to the handling, storage, or control of nuclear fuel at OPG nuclear facilities, and items or services specifically described in other approved governing programs and supporting documents.

Nuclear Oversight conducted a performance based audit of the Items and Services Management program in October 2015 for Pickering NGS, NO-2015-024 [B.9.1]. The purpose of the audit was to assess the implementation effectiveness of the Items and Services Management Program in: meeting performance expectations; pressure boundary QA requirements; and safety and reliability concerns. The audit concluded that the managed system controls are effective, however the following two findings were generated:

- Requirements for maintaining the approved supplier list and warehousing activities are not always met; and

- Training records and qualifications for some Supply Chain staff were not maintained as per requirements.

Two SCRs (N-2015-24495 and N-2015-24497) were initiated to address the above findings, which required corrective actions be implemented. These SCRs have since been completed and the necessary corrective actions were completed to address the underlying issues. Audit reports specifically for the Items and Services Management Program have not been prepared and hence there are no pertinent findings

The above results for the self-assessment reveal that there are no gaps for PSR2 related to the Items and Services Management Program.

References

[B.9.1] OPG Nuclear Oversight Report, N-REP-01070-0566991 T10, *NO-2015-024, Items and Services Management Program (including Pressure Boundary)*, October 2015.

B.10 N-PROG-MP-0001, "Engineering Change Control"

The Engineering Change Control (ECC) program ensures all modifications to SSCs, including software and engineered tooling, are planned, designed, installed, commissioned, placed into service or removed from service within the Safe Operating Envelope or Safety and Design Envelope, design basis and licensing conditions. This program ensures all problems or betterment ideas requiring a modification are reviewed prior to approval to ensure they improve or maintain operability, maintainability, radiological and conventional safety, regulatory or licence compliance, and production at an acceptable cost.

Nuclear Oversight conducted a performance based audit of the ECC program for Pickering NGS in November 2014, NO-2014-030 [B.10.1] and the Nuclear Waste Management Facilities. The purpose of the audit was to determine if ECC related activities are being performed effectively and in compliance with program requirements. The audit concluded that the managed system controls are not fully effective and identified the following three findings:

- Quality issues in engineering vendor products affecting the ECC process (N-2014-30369);

- Examples of non-compliance and gaps in engineering administrative activities were identified in several modification packages across Pickering Plant Design and Pickering Projects Design. Ineffective oversight, the lack of attention to detail and insufficient knowledge of the ECC process by OPG and the vendors may be contributing to these gaps. Although, the impact of these gaps individually may not be significant, the cumulative effect of these gaps in the modification packages are challenging the product quality and configuration management due to long delays in close outs (SCR P-2014-30444); and

- Staff signing ECC related documents do not have the required qualifications or training as per governance requirements (SCR N-2014-30373).

Three SCRs were initiated to address the above findings, which required corrective actions to be implemented. Two SCRs have been completed (N-2014-30369 and N-2014-30373), while the remaining SCR (P-2014-30444) has actions in place and is expected to be completed by Q2 2016.

Operations and Maintenance Support completed a self-assessment in March 2013, NO2013-000200-SA [B.10.2] in order to assess the health of the ECC governance framework, which is applicable for both Darlington and Pickering NGS. This involved a review of related SCRs, governance framework, revision records and previous program assessment reports. No findings were identified or SCRs initiated as a result of this self-assessment.

The above results for the audit and self-assessment reveal that there are no gaps for PSR2 related to the Engineering Change Control Program (note, although SCR P-2014-30444 is still open, the identified gap is administrative in nature and is not considered safety significant).

References

[B.10.1] OPG Nuclear Oversight Report, N-REP-01070-0519973 T06, *Audit OPGN NO-2014-030: Engineering Change Control (ECC) Audit*, November 2014.

B.11 N-PROG-MP-0004, "Pressure Boundary"

The Pressure Boundary (PB) Program defines the managed process to control the quality of PB activities at Ontario Power Generation's nuclear facilities. It provides the requirements and defines the responsibilities for compliance with and maintenance of the PB Quality Assurance Program and provides the governance framework for the execution of PB field work activities. This is to ensure nuclear facilities retain the PB Certificates of Authorization necessary to perform PB activities and, remain compliant with the Nuclear Station Power Reactor Operating Licences, Waste Facility Operating Licences and applicable CSA standards.

The PB Program covers activities related to quality at Pickering NGS and is applicable to the following:

- Pressure-retaining systems, components, storage tanks and supports that are registered or eligible for registration with an Authorized Inspection Agency as per CSA N285.0 and CSA B51;
- Component supports (American Society of Mechanical Engineers (ASME) Class NF) mandated by Codes and Standards applicable to this PB Program; and
- Propane systems.

The program complies with CSA N285.0, N286, B51 and ASME Boiler and Pressure Vessel Code versions as referenced in the applicable facility's Operating Licence.

Nuclear Oversight conducted a performance based audit of the Pressure Boundary Program for Pickering NGS in October 2013, N-NO-2013-018 [B.11.1]. The purpose of the audit was to verify compliance with applicable sections of the Pressure Boundary Program Manual (N-MAN-01913.11-10000), review areas of risk identified in previous PB audit findings and identify any potential opportunities for improvement at the station or its support facilities, with a focus on safety and reliability. The audit concluded that the managed system controls associated with the Pressure Boundary program are effective and no findings were identified or SCRs issued as a result of the audit.

The Governance and Services Section completed a self-assessment in November 2015, BAS15-001616-SA [B.11.2] in order to assess the governance structure of N-PROG-MP-0004, "Pressure Boundary" which is applicable for both Pickering and Darlington NGS. No findings/SCRs were generated as a result of the self-assessments. However, two recommendations were generated which were dispositioned as part of the technical review process for N-PROG-MP-0004 (e.g., simplification of roles to those driven by the PB Program alone and the update of referenced forms).

The above results for the audit and self-assessment reveal that there are no gaps for PSR2 related to the Pressure Boundary Program.

Revision Summary – For Amec Foster Wheeler Report PS112/RP/006

Rev	Date	Author	Comments
R00	July 4, 2016	R. Jayasundera	Initial issue for OPG review and comment.
R01	March 2, 2017	R. Jayasundera, A. Johnstone	Updated report addressing OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 5, *Deterministic Safety Analysis*, is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 5 were reviewed for the seven PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 5 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 5 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 5).

The results of the review of Safety Factor 5 are discussed in Section 5.0. The review of Safety Factor 5 has confirmed that the deterministic safety analysis programs and procedures at OPG are comprehensive, resulting in a systematic and disciplined approach to identifying, prioritizing and addressing any safety analysis related issues. As discussed in Section 5.0, the review identified seven gaps that will need to be addressed further as part of the PSR2 Global Assessment process.

TABLE OF CONTENTS

Page

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's Nuclear operations. As a result, where Pickering is confirmed to follow the same Nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Deterministic Safety Analysis Safety Factor 5 is to: "determine to what extent the existing deterministic safety analysis is complete and remains valid when the following aspects have been taken into account:

- The actual plant design, including all modifications of Structures, Systems and Components (SSCs) since the last update of the safety analysis report or the last PSR;
- Current operating modes and fuel management;
- The actual condition of SSCs important to safety and their predicted state at the end of the period covered by the PSR;
- The use of modern, validated computer codes;
- Current deterministic methods;
- Current safety standards and knowledge (including research and development outcomes); and
- The existence and adequacy of safety margins".

REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 5 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 5 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 5 Review Tasks are:

1) Confirm the existence of current deterministic safety analyses and the assumptions used to perform these analyses.

2) Evaluate the documentation and processes for defining, implementing, and maintaining the Safe Operating Envelope.

3) Perform assessment of OPG's Deterministic Safety Analysis to determine if the postulated events, event sequences and event combinations covered by the existing analysis are sufficient when compared against those for a modern nuclear power plant in accordance with the methodology in CNSC REGDOC-2.4.1, "Deterministic Safety Analysis".

4) Review adequacy of the documented guidelines for Deterministic Safety Analysis.

5) Evaluate the supporting analyses for design extension conditions to confirm that the arrangements aimed at preventing or mitigating severe core damage meet regulatory requirements.

6) Confirm that the impact of equipment failures and human errors, as well as the adequacy of engineering and administrative measures to prevent and mitigate accidents, have been analyzed and documented.

7) Confirm that the capabilities of the plant in its current state, and where relevant with account taken of planned safety improvements, have been demonstrated to be within regulatory requirements and expectations for both normal operation and accident conditions.

   In addition, confirm that plans are in place to ensure that forecast operational conditions of the plant will meet acceptance criteria for the design basis, including adequacy of safety margins, throughout the period of PSR2.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Deterministic Safety Analysis Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 5 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6], [7] and [8]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Deterministic Safety Analysis Safety Factor 5

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286	Management System Requirements for Nuclear Facilities	N286-12	5, 6, 9, 10, 11	Incremental	N286 addressed as part of Pickering B and Darlington ISRs.
2	CSA N290.15	Requirements for the Safe Operating Envelope of Nuclear Power Plants	N290.15-10	5, 8	Incremental	N290.15 not addressed as part of Pickering B or Darlington ISRs, but gap analysis has been performed against OPG Governance and N290.15.
3	CSA N286.7	Quality Assurance of Analytical, Scientific and Design Computer Programs	N286.7-16	1, 5, 6, 7, 10	Incremental	N286.7 addressed as part of Pickering B and Darlington ISRs.
4	CNSC REGDOC-2.4.1	Deterministic Safety Analysis	2014	5, 7	Incremental	C-6 addressed as part of the Pickering B ISR and PARTS. S-310 and RD-310 addressed as part of the Pickering B and Darlington ISRs, respectively. Implementation plan in place and gap

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
						assessment between REGDOC-2.4.1 and OPG Safety Analysis Program already performed.
Additional L/R/C/Ss						
5	CNSC REGDOC-2.5.2	Design of Reactor Facilities: Nuclear Power Plants	2014	1, 5, 6, 7	Incremental	RD-337 and NS-R-1 (precursors to REGDOC-2.5.2) addressed as part of Darlington ISR. NS-R-1 also addressed as part of Pickering B ISR.
6	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.
7	CSA N286.7.1	Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants	N286.7.1-09	1, 5, 6, 7, 10	N/A [3]	N286.7.1 not addressed as part of Pickering B or Darlington ISRs.
8	CNSC G-144	Trip Parameter Acceptance Criteria for the Safety Analysis of CANDU Nuclear Power Plants	2006	5	Incremental	G-144 addressed as part of Pickering B and Darlington ISRs
9	CNSC G-149	Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors	2000	1, 5, 6, 7	Incremental	G-149 addressed as part of Pickering B and Darlington ISRs
10	CSA N288.2	Guidelines for Calculating Radiological Consequences to the Public from a Release of Airborne Radioactive Material for Nuclear Reactor Accidents	N288.2-14	5	Incremental	N288.2 addressed as part of Pickering B and Darlington ISRs

[3] The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement [9] states: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 5 is listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Program Reviewed for Safety Factor 5

Document Number	Document Title
N-PROG-MP-0014 [10]	Reactor Safety Program

2.4 Additional Reviews

The PSR2 Safety Factor 5 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 5):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 5 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 5 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [11] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 5 review which are relevant to other Safety Factors are discussed in Section 4.4 of this report.

---

[4] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Deterministic Safety Analysis Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 5 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[5]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

[5] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 5 L/R/C/S reviews identify Compliances and Gaps as defined below:[6]

- <u>Compliance</u>:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 5.)

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 5.)

---

[6] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 5.)
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 5.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in

performance. As a result, the broad review scope of program audits focuses on identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [12]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 5):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 5 (as identified in the Darlington ISR Integrated Implementation Plan (IIP) [13] and Pickering Units 5-8 Continued Operations Plan [11]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[7]

---

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's Nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same Nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 5 review which are relevant to other Safety Factors are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 5 Review Tasks.

4.1.1 Review Task #1: Current Deterministic Safety Analyses and Assumptions

Confirm the existence of current deterministic safety analyses and the assumptions used to perform these analyses.

As defined in CNSC REGDOC-2.4.1, "Deterministic Safety Analysis" [14], deterministic safety analysis is an analysis of a facility's response to an event, which is performed by using predetermined rules and assumptions (e.g., those concerning the initial facility operational state, availability and performance of facility systems and operator actions). Analysis of such events is retained in the Pickering 1,4 and 5-8 Safety Reports, which are made up of three parts:

- Part 1 – Plant/Site Description [15], [16];
- Part 2 – Design Description [15], [17]; and
- Part 3 – Accident Analysis [18], [19].

The licensing basis for deterministic safety analysis is contained in Part 3 of the Safety Report [18], [19], which was last updated in October 2013 for Pickering 1,4 and October 2014 for Pickering 5-8.

As outlined in N-PROC-MP-0086, "Safety Analysis Basis and Safety Report Update" [20], the Analysis of Record (AoR) is a collection of documents which consists of the latest revision of the Safety Report as well as CNSC submissions that update or supersede analysis reported in the latest revision of the Safety Report. Guidelines for the maintenance and control of the AoR are provided in N-INS-09000-10004, "Guidelines for the Control of the Analysis of Record" [21]. The latest revisions of the Pickering 1,4 AoR (NA44-REP-00531.7-10001, "Pickering A Analysis of Record" [22]) and Pickering 5-8 AoR (NK30-REP-00531.7-00001, "Pickering B Analysis of Record" [23]) were issued in November 2015.

<u>Safety Report Update</u>

Per Section 4.1 of CNSC Regulatory Document REGDOC-3.1.1, "Reporting Requirements for Nuclear Power Plants" [24], the Safety Report is required to be updated and submitted to the CNSC within five years of the date of the previous submission, to incorporate new findings and analyses. N-PROC-RA-0094, "Discovery Issue Resolution Process" [25], also requires that upon discovery of an issue (or potential issue) with deterministic safety analysis (termed Discovery Issue Resolution Process (DIRP)), a Station Condition Record (SCR) must be raised and the Safety

Report Update process must be initiated. N-PROC-MP-0086, "Safety Analysis Basis and Safety Report Update" [20], outlines the Safety Report Update (SRU) process, which is further detailed in the following instructions:

- N-INS-09000-10001, "Processing of Safety Report Analysis Issues: Overview" [26]
  This instruction provides an overview of the steps involved in updating the Safety Report, including the process for managing safety analysis issues.

- N-INS-09000-10002, "Guidelines for Evaluating and Prioritizing Safety Report Analysis Issues" [27]
  This instruction describes guidelines for evaluating and prioritizing Safety Report analysis issues. Potential safety report analysis issues of varying complexity and safety significance are transmitted to the Nuclear Safety and Technology Department for dispositions and the issues are assessed to determine whether they impact the current Safety Report analysis sections and whether new analysis is required.

- N-INS-09000-10004, "Guidelines for the Control of the Analysis of Record [21]
  This instruction provides guidance to determine when a submission needs to be included in the AoR and how to maintain the AoR for each station. This instruction is intended to apply to portions of the Safety Report which present safety analysis results (i.e. Part 3 – Accident Analysis).

- N-INS-09000-10005, "Safety Report Issue Database Management" [28]
  This instruction provides guidance for the management of the Safety Report Analysis Issue Database, which is a Microsoft Access Database which has been developed for recording Safety Report issue information.

As outlined in N-CORR-00531-07409, "OPG Safety Analysis Improvement and REGDOC-2.4.1 Implementation – Action Item 2014OPG-5461" [29], OPG has developed an action plan to comply with CNSC Regulatory Document REGDOC-2.4.1, "Deterministic Safety Analysis" [14] for both Pickering and Darlington NGS. A systematic process was utilized to prioritize Safety Report Appendices which are to undergo Safety Analysis Improvements based on their associated safety significance. For Pickering NGS, the analyses identified for development are the Common Mode Events Appendices. Note: The L/R/C/S review of REGDOC-2.4.1 [14] is addressed in Section 4.2 of this Report.

Safety Analysis Assumptions

Each initiating event analyzed in the Appendices of Part 3 of the Safety Report [18], [19], is characterized by a description of its conditions, including:

- Definition of initiating events;
- Initial conditions of the system and applicable boundary conditions;
- Control system conditions and logic;

- Availability/credits for systems and components;
- Operator actions;
- Key phenomenon and process;
- Method of analysis;
- Deterministic assumptions;
- Demonstration of computer code(s) applicability; and
- Acceptance criteria.

Some of the key generic assumptions included in deterministic safety analysis are as follows:

- Plant State and Configuration - Plant states are divided into normal operation and accident conditions. This includes specifying both system and component configurations and corresponding initial condition values for plant parameters. Plant models used in deterministic safety analysis (Table 1-12 and Table S.1-11 in Part 3 of the Pickering 1,4 and 5-8 Safety Report respectively [18], [19]) reflect the design of the plant, consistent with its current state, and the operating period to be covered. Depending on the analysis methodology, simplified conservative representation and conservative boundary conditions are assumed, which results in a conservative estimate of the safety margin.

- Operator Actions - Tables 1-2 to 1-11 and Tables S.1-1 to S.1-10 in Part 3 of the Pickering 1,4 and 5-8 Safety Report respectively [18], [19], summarize all required operator action credits. Typically, the earliest time of required operator action following a signal is 15 minutes for control room action and 30 minutes for field action.

- Impact of Aging –Plant aging has the potential to adversely impact safety margins and reactor operation. As identified in Section 4.4 of the Application for Renewal of Pickering NGS Power Reactor Operating Licence [30], an OPG Heat Transport System (HTS) Aging Management Program was initiated in 2000 to evaluate the impact of the HTS component aging on safety margins. The objective was to provide an integrated assessment of the collective effects of the identified aging mechanisms, and to develop effective safety margin management strategies based on the results of the assessment. Appendix 11 of the Pickering 1,4 and 5-8 Safety Reports [18],[19], provide details of the integration of HTS aging effects in Design Basis Accident (DBA) analysis (Note, Section 4.1.7, Review Task #7 provides further details on the status of HTS aging at Pickering 1,4 and 5-8).

Conclusion:

The conclusion of this Review Task assessment is that there exist current deterministic safety analyses and assumptions used to perform these analyses. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Documentation for Safe Operating Envelope

Evaluate the documentation and processes for defining, implementing and maintaining the Safe Operating Envelope.

The Safe Operating Envelope (SOE) is the set of limits and conditions within which the plant shall be operated to ensure conformance with the Safety Report and that the Safety Report conclusions remain valid. N-STD-MP-0016, "Safe Operating Envelope" [31], provides requirements for defining, implementing and maintaining the SOE. The specific objectives of the SOE are to establish the following:

- Thorough and current record of safety credits and operating limits in the form of Operational Safety Requirements (OSRs) and associated Instrument Uncertainty Calculation (IUC) reports. Safe Operating Limits and Conditions of Operability (SOE Limits) are captured in station operating documentation, which provide plant operators with the information required to ensure safe operation of the plant in conformance with the requirements of the Safety Analysis.
- A compliance framework whereby plant operation within the requirements established as part of the SOE is verified on a regular basis and appropriate corrective actions are initiated upon discovery of plant operation outside of the SOE.
- Infrastructure by which the SOE is integrated with other relevant business processes and maintained current over the life of the station.

The methodology for the preparation and revision of OSR reports is described in N-ST-08131.02-10000, "Preparation of Operational Safety Requirements" [32]. The OSR reports contain the following information (as outlined in Section 1.2.4 of N-STD-MP-0016 [31]):

- A brief overview of the safety functions of the system in relation to the Design Basis Accidents for which it is credited;
- Safety limits defining the minimum acceptable standards with respect to component or parameter performance;
- Surveillance requirements identifying specific objectives of tests or checks to ensure plant operation within the defined Safety Limits; and
- Conditions of Operability defining the impact on overall availability of the system or safety function in the event of operation outside of the defined Safety Limits.

N-STI-03602-10000, "SOE Instrument Uncertainty and Allowable Value Calculations" [33], describes the methodology for the preparation and revision of IUC reports. The IUC reports contain the following calculations for applicable instrumentation loops (as outlined in Section 1.2.7 of N-STD-MP-0016 [31]):

- Total uncertainty for instrument loops having a credited post-accident function, for comparison against the allowance for uncertainty made in the safety analysis or design, to confirm the existence of an adequate safety margin;
- Allowable values to confirm instrument loop availability during calibration for instrument loops required for the post-accident actuation of credited safety functions;
- Surveillance limits to define the limiting acceptable indicated value of parameters for instrument loops required to perform indication functions (either post-accident or during surveillance); and
- As-found and as-left tolerances for use during calibration to confirm instrument operation within the normal expected range for all instrument loops associated with a numerical Safety Limit.

Implementation of SOE

As per Section 1.3.2 of N-STD-MP-0016, "Safe Operating Envelope" [31], information contained in the OSR and IUC reports is incorporated into affected station operating documentation (e.g., Operating Manuals, Abnormal Incident Manuals, Safety Related System Tests and the preventative maintenance program) in accordance with N-INS-03602-10001, "Preparation of Safe Operating Envelope Compliance Tables" [34]. This requires that a gap analysis be performed comparing the content of the OSR and IUC reports to the corresponding station operating documents. The SOE Compliance Table lists all the SOE parameters for a given system and provides references showing where each of the SOE Limits and surveillance requirements are captured within the applicable station operating documentation.

Section 4.1 of the Pickering Licence Conditions Handbook [4], states that OPG has had an implemented SOE program since 2012 and a complete set of SOE documentation (i.e. OSRs, IUCs and Compliance Tables) exists for the following Pickering 1,4 and 5-8 systems important to safety:

- Shutdown Systems;
- Emergency Coolant Injection System;
- Negative Pressure Containment System;
- Fuel and Reactor Physics;
- Reactor Regulating System;
- Heat Transport System;
- Moderator System;
- Shutdown Cooling System;
- Main Steam Supply System;
- Feedwater System;
- Emergency Boiler Water Supply System (Pickering 1,4) / Emergency Water Supply System (Pickering 5-8);
- Boiler Emergency Cooling System;
- Powerhouse Emergency Venting System;
- Service Water Systems;
- Electrical Power System (Pickering 1,4) / Group 1 Electrical Power Supplies;

- Emergency Power Supply System (Pickering 5-8);
- Fuel Handling System and Irradiated Fuel Bay;
- Shield Cooling System;
- Annulus Gas System;
- Critical Safety Parameter Monitoring Instrumentation;
- Inter-Station Transfer Bus (Pickering 1,4);
- High Pressure Emergency Coolant Injection Power Supplies; and
- Powerhouse Environmental Protection.

<u>SOE Maintenance</u>

As per Section 1.3.4 of N-STD-MP-0016, "Safe Operating Envelope" [31], SOE is maintained by ensuring the following:

- Revisions of OSR and IUC reports are kept current in relation to changes in plant design, operation, Safety Analysis (e.g., SRU) or license requirements.
- The need for revision to the OSR report, SOE Compliance Table or IUC reports may be identified by any of the following processes:
    - N-PROC-MP-0086, "Safety Analysis Basis and Safety Report Updates" [20];
    - N-PROC-AS-0028, "Development, Review and Approval of Technical Procedures" [35];
    - N-PROG-MP-0001, "Engineering Change Control" [36]; and
    - N-PROG-RA-0003, "Corrective Action" [37].
- Changes to SOE reports are managed using the Engineering Change Control process as follows:
    - Engineering Change Request initiated;
