    - Once the required actions are completed that identify the scope of changes, a Document Change Request (DCR) is created summarizing the required SOE report revisions; and
    - The approved DCR becomes the basis for identifying and implementing any required changes to station operating documentation. This ensures operation in compliance with the revised SOE requirements including the basis for revising the SOE reports and any other documentation identified as part of the DCR process impacted by the change (e.g., the Safety Report).
- Revisions of the SOE Compliance Tables are required to reflect the resolution of previously identified gaps over time and changes made to station operating documentation not related to OSR and IUC report revisions, but which affect the referencing of SOE requirements.

Also, when uncertainty arises with respect to the operability of equipment to meet the functional requirements of the defined SOE, a Technical Operability Evaluation (TOE) is performed. N-PROC-MP-0045, "Technical Operability Evaluation" [38], provides a process for identifying and evaluating degraded station conditions when the ability of SSCs to carry out their defined safety-related functions come into question. A formal

TOE provides a substantiated engineering verification that a SSC is capable of fulfilling its minimum credited safety function(s).

Note: The L/R/C/S review of CSA N290.15, "Requirements for the Safe Operating Envelope of Nuclear Power Plants" is addressed in Section 4.2 of this Report.

Conclusion:

The conclusion of this Review Task assessment confirms that documentation and processes for defining, implementing and maintaining the SOE exists. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Postulated Events

Perform assessment of OPG's Deterministic Safety Analysis to determine if the postulated events, event sequences and event combinations covered by the existing analysis are sufficient when compared against those for a modern nuclear power plant in accordance with the methodology in CNSC REGDOC-2.4.1, "Deterministic Safety Analysis".

An event is comprised of a discrete initiating failure (also known as a Postulated Initiating Event (PIE) or initiating failure) and the subsequent response of the plant, including human interaction as per procedures. An event can be initiated by an equipment failure, a human error or an external failure/event. The scope of initiating events addressed by the existing deterministic safety analysis for Pickering 1,4 and 5-8 (Part 3 of the Safety Report) [18], [19], consists of single/dual failure events[8] based on the requirements of the Siting Guide [39].

As outlined in Section 2.1 of the Safety Report [18], [19], all systems and components are reviewed to identify those containing significant quantities of radioactive materials. For each source of radioactive material, it is possible to determine ways in which unplanned releases of this material can occur, based on knowledge of the plant processes and past experience in selecting initiating events. This process leads to a comprehensive list of internal initiating events. To complete the list, all combinations of internal initiating events and compounding failures in the special safety systems are identified. Table 2-1 of the Pickering 1,4 Safety Report [18] and Table S.2-1 of the Pickering 5-8 Safety Report [19], identify these events, where in the Safety Report the analysis details are located and the dose category for each event. The initiating event categories include:

- Fuel Handling System Failures;
- Electrical Failures;
- Control Failures;

[8] Single failures include failures in process systems, while dual failures are single failures combined with a failure of a special safety system.

- Small Break Loss of Coolant Accidents (SBLOCA);
- Large Break Loss of Coolant Accidents(LBLOCA);
- Heat Transport System Breaks Outside Containment, Steam Generator Tube Failure and Bleed Cooler Failure;
- Feedwater and Steam Supply System Failures;
- Shutdown Cooling System Failures;
- Main Moderator and Moderator Auxiliary System Failures; and
- Shield Cooling System Failures.

Section 4.2 of CNSC REGDOC-2.4.1 [14], requires a systematic process to identify events, event sequences and event combinations that can potentially challenge the safety or control functions for the station. As outlined in N-CORR-00531-07409 [29], OPG has developed an Implementation Plan to comply with the requirements of REGDOC-2.4.1 [14]. **Pickering PSR2 Gap SF5-4**, identified as part of the L/R/C/S review of REGDOC-2.4.1 [14] and described in Section 4.2 of this Report, relates to consideration of analysis updates to comply with REGDOC-2.4.1 for operation beyond 2020. Any changes to the REGDOC-2.4.1 Implementation Plan will be addressed under this gap, and therefore there is no incremental gap identified in the context of this Review Task.

Conclusion:

The conclusion of this Review Task assessment is that the postulated events, event sequences and event combinations covered by the existing analysis are identified in the existing deterministic safety analysis, as summarized and documented in the Pickering NGS Safety Reports. OPG has developed an Implementation Plan to comply with the requirements of REGDOC-2.4.1 [14]. **Pickering PSR2 Gap SF5-4**, identified as part of the L/R/C/S review of REGDOC-2.4.1 [14] and described in Section 4.2 of this Report, relates to consideration of analysis updates to comply with REGDOC-2.4.1 for operation beyond 2020. Any changes to the REGDOC-2.4.1 Implementation Plan will be addressed under this gap, and therefore there is no incremental gap identified in the context of this Review Task.

4.1.4 Review Task #4: Guidelines for Deterministic Safety Analysis

Review the adequacy of the documented guidelines for Deterministic Safety Analysis.

As outlined in the CANDU Owners Group (COG) "Principles and Guidelines for Deterministic Safety Analysis" [40], for currently operating CANDU stations the Safety Report contains analysis based on the Siting Guide [39] (single/dual failure events) or Consultative Document C-6 "Requirements for the Safety Analysis of CANDU Nuclear

Power Plants" (5 event classes)[9]. However, REGDOC-2.4.1 [14] supersedes both the Siting Guide and C-6. Under REGDOC-2.4.1 [14], a Safety Report may contain Anticipated Operational Occurrences (AOO)/DBA[10] analysis; analysis of legacy single failure/dual failure/class 5 events with beyond design basis accident (BDBA) frequency retained as part of the original design basis; and summaries of BDBA analysis. As outlined in Reference [29], OPG has developed an implementation plan, which defines the REGDOC-2.4.1 compliant analyses to be undertaken in the 2014-2017 timeframe.

The governing programmatic document for deterministic safety analysis is N-PROG-MP-0014, "Reactor Safety Program" [10], which defines the organizational responsibilities and key program elements for management of issues related to deterministic safety analysis and the following major components for safe operation:

1) The Safety Analysis Basis
   The Safety Analysis Basis is formed from the safety analysis, which has been performed to characterize and quantify the consequences of various design basis accident events and to demonstrate that regulatory requirements have been met.

2) The Safe Operating Envelope
   The SOE identifies and implements the operating limits required by the Safety Analysis Basis.

3) Severe Accident Management
   Severe Accident Management (SAM) examines BDBAs, which are low frequency event sequences that are not included in the plant design basis (due to the low frequency of occurrence) and is not bounded by analyses of the station design basis. If the consequences of such events are significant core degradation, these BDBAs are referred to as Severe Accidents (SA). Severe Accident Management Guidelines (SAMGs) provide a framework for responding to BDBAs, in order to manage residual risk.

N-PROC-MP-0086, "Safety Analysis Basis and Safety Report Update" [20] (which is an implementing procedure of N-PROG-MP-0014, "Reactor Safety Program" [10]), provides the basis for the establishment of the Safety Analysis Basis and the SRU process (Section 4.1.1 of this report provides details of the SRU process). N-MAN-03600-10002, "Nuclear Safety Analysis Planning" [41], provides staff with instructions for the preparation and application of safety analysis plans and describes the roles and

---

9 C-6 was applied to the Safety Analysis of the Darlington NGS only, while the Siting Guide was applied to Pickering NGS, Bruce A, Bruce B and Point Lepreau.

10 REGDOC-2.4.1 has subdivided the design basis events to include AOOs, which are events that are more complex than the normal operation manoeuvres, with the potential to challenge the safety of the reactor, and which might be reasonably expected to occur during the lifetime of a plant (previously analyzed as single failures under the Siting Guide). DBAs are not expected to occur during the lifetime of a plant, but in accordance with the principle of defence in depth, are considered in the design of a plant.

responsibilities of the staff involved. The preparation of the safety analysis plan allows the analyst to determine all aspects of the problem, including the plant systems, and items of existing analysis which may be affected by any work that is committed. N-MAN-03600-10003, "Nuclear Safety Analysis Execution" [42], provides instructions for the execution of the analysis plans.

N-STD-MP-0008, "Development, Qualification and Use of Scientific, Engineering, and Safety Analysis Software" [43], provides requirements for development, qualification and use of Scientific, Engineering and Safety Analysis software in design, analysis or support of the continued operation of OPG Nuclear stations. Particular attention is given to software that meets the CSA N286.7, "Quality Assurance of Analytical, Scientific and Design Computer Programs for Nuclear Power Plants" definition of scope as follows:

- Used in design activity associated with a system, structure or component associated with the facility Safety Related Systems list.
- Used in deterministic or probabilistic safety analysis or reliability study for the same systems.
- Used in reactor physics or fuel management calculations.
- Used in data transfer or pre- or post-processing calculations associated with any of the three activities above.

The Quality Assurance (QA) requirements for safety analysis and its associated computer software or data sets are defined in N-MAN-03600-10005, "Nuclear Safety Analysis" [44], which establishes the following:

- Defines general principles used to ensure that the likelihood of errors or omissions in safety analysis is small and continually reduced;
- Identifies quality attributes of the safety analysis and the computer software or data sets used;
- Identifies and reflects those external bases and standards incorporated in the safety analysis QA plan, which contribute to its adequacy and continuing improvement; and
- Stipulates the attitudes, values, perceptions, competencies and behaviours expected of all staff in conducting safety analysis work of high quality.

As a substantial amount of work is directly performed by external suppliers under contract to OPG, N-STD-MP-0014, "Managing Contracted Nuclear Safety Services" [45], defines requirements for procurement of Safety Analysis services, including Safety Analysis QA requirements.

Conclusion:

The conclusion of this Review Task assessment is that adequate guidelines for Deterministic Safety Analysis exist. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Design Extension Conditions

Evaluate the supporting analyses for design extension conditions to confirm that the arrangements aimed at preventing or mitigating severe core damage meet regulatory requirements.

N-STD-MP-0019, "Beyond Design Basis Accident Management" [46], defines the requirements for OPG's BDBA management. BDBA management is focussed primarily on the identification and implementation of operational strategies to:

- Mitigate the consequences of BDBAs and prevent progression to a SA, and thereby preclude or limit fuel and core damage;
- Terminate the progression and mitigate the consequences of SAs, and thereby minimize fuel and core damage;
- Maintain the integrity of the containment envelope;
- Limit both on-site and off-site releases; and
- Achieve a stable plant configuration as soon as possible and implement measures to sustain this state.

Collectively, the written guidance which implements these strategies is referred to as Emergency Mitigating Equipment Guidelines (EMEG)[11] and SAMG. Application of EMEG and SAMG may require temporary changes to permit operation of specific SSCs or EME to implement EMEG/SAMG objectives. For permanent changes to SSCs to facilitate EMEG/SAMG, N-GUID-01130-10000, "Modifications for Beyond Design Basis Accidents" [47], provides guidance related to the design, modification, procurement, operation and testing of SSCs, for managing the progression to BDBAs. Consistent with current regulatory direction (e.g. CNSC REGDOC-2.4.1 [14]), N-GUID-01130-10000 [47] refers to "BDBA" when referring to station conditions that can arise from low frequency events not considered in the plant design. Also, the term Design Extension Condition (DEC) is introduced (as per CNSC REGDOC-2.5.2, "Design of Reactor Facilities: Nuclear Power Plants" [48]) to describe a sub-set of BDBA conditions for which specific SSCs, referred to as Complementary Design Features, are provided for mitigation.

<u>Supporting Analysis</u>

Following the March 11, 2011 accident at Fukushima Daiichi Nuclear Power Plant, the CNSC requested all Canadian utilities to complete an assessment to review the impact of a similar event (i.e., earthquake and tsunami resulting in a total loss of power, subsequently resulting in a total loss of heat sinks to cool the fuel post-shutdown) at their respective stations. P-REP-03490-10012, "Fukushima Daiichi – Total Loss of Heat Sink Assessment for Pickering A and Pickering B" [49], consolidates the results from various evaluations performed and establishes the time line for progression of a total loss of heat sink event. P-REP-03490-10012 [49] also identifies mitigating provisions which could be put in place to prevent progression to a SA. Provisions to maintain or

[11] The term Emergency Mitigating Equipment (EME) was adopted to categorize the equipment that provides additional lines of defence to maintain critical safety functions.

re-establish the control, cool, contain and monitoring safety functions were examined to determine those that are most practical to implement and also meet specified requirements.

N-BDB-03600-00002, "OPG Emergency Mitigating Equipment for Beyond Design Basis Accidents: Technical Basis Document" [50], summarizes the technical basis for EME including:

- The bounding BDBA event sequence and associated analyses;
- The overall functional requirements for the EME; and
- Other information relevant to EME specification, design and procurement.

NA44-GUID-03600-00001, "Beyond Design Basis Functional Safety Requirements for Pickering 1-4 Nuclear Generating Station" [51] and NK30-GUID-03600-00001, "Beyond Design Basis Functional Safety Requirements for Pickering 5-8 Nuclear Generating Station" [52], identify the BDBA functional safety requirements for SSCs credited to manage and/or mitigate BDBAs, or to prevent progression to SAs. This includes:

- The functional safety requirements for temporary/portable BDBA mitigation equipment (e.g., EME);
- The functional safety requirements for permanent station equipment/connections having a BDBA mitigation function, and
- The incremental functional safety requirements for existing station SSCs that are part of BDBA mitigation strategies.

The BDBA Functional Safety Requirements for both Pickering 1,4 and 5-8 [51], [52], each possess a corresponding compliance table. The compliance tables identify the safety limits, surveillance requirements, preventative maintenance, impairment condition/response and any identified gaps for any of the equipment (e.g., EME pumps, EME generator and EME connection points)

From a Probabilistic Safety Assessment (PSA)[12] perspective, the Pickering NGS 1,4 and 5-8 Level 1[13] At-Power Internal Events Risk Assessment [53], [54] has been updated to take into account the Fukushima-related enhancements (e.g., BDBA procedures/guides and EME)[14]. One of the primary objectives for this update of the Level 1 PSA was to ensure that the PSA is consistent with the current station design and operation, which includes EME implementation. Likewise, the Level 2[15] PSA for Pickering NGS 1,4 and 5-8 has incorporated the risk benefits gained from the Fukushima-related enhancements [55], [56].

---

[12] Note, Probabilistic Risk Assessment is now referred to as PSA.
[13] For a Level 1 PSA, the frequency of damage to fuel in the core is estimated (i.e. core damage frequency).
[14] The utilities developed and implemented action plans to enhance the safety and capability of CANDU reactors in response to the Fukushima accident.
[15] A Level 2 PSA extends the analysis of the Level 1 PSA to include containment performance and the frequency of release to the environment.

Conclusion:

The conclusion of this Review Task assessment is that supporting analyses for design extension conditions exist and the arrangements aimed at preventing or mitigating severe core damage meet regulatory requirements. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Equipment Failures and Human Errors

Confirm that the impact of equipment failures and human errors, as well as the adequacy of engineering and administrative measures to prevent and mitigate accidents, have been analyzed and documented.

As outlined in the COG "Principles and Guidelines for Deterministic Safety Analysis" [40], the safety analysis framework consists of:

- the design and beyond design basis deterministic safety analysis documented in the Safety Report, PSA, SAMG and design documentation;
- the analysis acceptance criteria;
- the processes for event identification and classification;
- analysis procedures and quality assurance requirements; and
- the SOE which defines operational limits and conditions based on design basis analysis to ensure operation is in accordance with the safety analysis.

The safety analysis framework provides high confidence in safe operation following any upset/accident starting from any credible configuration and provides confirmation that the impact of equipment failures, as well as the adequacy of engineering and administrative measures to prevent and mitigate accidents, have been analyzed and documented. For example, the accident analysis of the Safety Report assesses equipment failures and demonstrates the adequacy of the engineered mitigating system (e.g., shutdown system effectiveness). Administrative measures such as the SOE, establish the safe operating limits and conditions (SOE limits) of operability. The SOE limits are captured in station operating documentation, which provide operators with the information required to ensure safe operation of the plant in conformance with the requirements of the Safety Analysis.

Events in the current Pickering 1,4 and 5-8 Safety Reports [18], [19] are classified as single or dual failures (based on frequency) and are all considered design basis, based on the requirements of the Siting Guide [39]. Operator error does not normally impact plant response with respect to deterministic safety analysis for DBA events [40]. For example, the development and testing of procedures, intensive operator training and conservative operator action times reduce the probability of operator failure sufficiently to preclude the need for introducing operator error assumptions. However, the PSA includes human interaction events in the fault tree model for significant human interface related events that could lead to an accident. Examples of such human interaction events include:

- Failure to perform a required task;
- Performing an incorrect operation; or
- Failure to detect an alarmed component failure.

Conclusion:

The conclusion of this Review Task assessment is that the impact of equipment failures and human errors, as well as the adequacy of engineering and administrative measures to prevent and mitigate accidents, have been analyzed and documented. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Capabilities of the Plant in its Current State

Confirm that the capabilities of the plant in its current state, and where relevant with account taken of planned safety improvements, have been demonstrated to be within regulatory requirements and expectations for both normal operation and accident conditions.

In addition, confirm that plans are in place to ensure that forecast operational conditions of the plant will meet acceptance criteria for the design basis, including adequacy of safety margins, throughout the period of PSR2.

As outlined in Part 3 of the Pickering NGS Safety Reports [18], [19], the primary objective of the accident analysis is to demonstrate that the radiological consequences of the event under assessment do not exceed the Siting Guide [39] accident-dependent reference dose limits. Siting Guide dose limits are specified for PIEs involving a single process failure and for events involving a single process failure in conjunction with failure of one of the special safety systems. The dose limits are given in the following table:

	Individual Dose Limit		Population Dose Limit	
	Thyroid Dose (mSv)	Whole Body Dose (mSv)	Thyroid Dose (Person mSv)	Whole Body Dose (Person mSv)
Single Failure	30	5	10^5	10^5
Dual Failure	2500	250	10^7	10^7

Derived acceptance criteria are employed for each of the safety systems. These criteria are sufficient to ensure that the applicable dose limits are not exceeded (as demonstrated in the Part 3 Appendices of the Pickering NGS Safety Reports) and are in compliance with regulatory requirements[16]. Section 3 (Part 3) of the Pickering NGS Safety Reports [18], [19], provides an overview of the accident sequences and the consequences of these accidents (which is further supported by the detailed analysis in the Part 3 Appendices). These concise overviews contain:

- A discussion of safety system effectiveness;
- A discussion of the relevant functional response(s) to the event; and
- A discussion of the impacts of impairments, as appropriate, in the conclusions.

During normal operation, the reactors operate within specified operational limits and conditions, including start-up, power operation, shutting down, shut down, maintenance, testing and refuelling. Analysis of normal operation is part of the deterministic safety analysis that is performed during the design phase of the plant and is not repeated unless significant design or operational changes are made that could impact normal operation. Such analysis demonstrates that the process controls and alarms are effective in avoiding the need for safety system action during normal operation, the safety systems initiate only when needed, and normal operation does not escalate to an accident condition. During normal operation, radiological emissions to the environment are required to be maintained below the applicable regulatory emission limits (Derived Release Limits (DRL)). The DRL for a given radionuclide (specified in Section 10.1 of the LCH) is the release rate that would cause an individual of the most highly exposed group to receive and be committed to a dose equal to the regulatory annual dose limit due to a release to air or surface water during normal operation over the period of a calendar year. Safety Factor Report 14, "Radiological Impact on the Environment" provides additional detail on DRLs [57].

As outlined in N-CORR-00531-07409, "OPG Safety Analysis Improvement and REGDOC-2.4.1 Implementation – Action Item 2014OPG-5461" [29], OPG has developed an action plan to comply with CNSC Regulatory Document REGDOC-2.4.1, "Deterministic Safety Analysis" [14] for both Pickering and Darlington NGS. A systematic process was utilized to prioritize Safety Report Appendices which are to undergo Safety Analysis Improvements based on their associated safety significance. For Pickering NGS, the analyses identified for development are the Common Mode Events Appendices.

Design and Operating margins are managed through the implementation of N-STD-MP-0020, "Margin Management" [58]. The Margin Management standard applies to all SSCs with an important role in safe and reliable plant operation and addresses low

---

[16] The current operating licence for Pickering NGS requires the implementation and maintenance of a safety analysis program in accordance with REGDOC-2.4.1, "Deterministic Safety Analysis"; and REGDOC-2.4.2, "Probabilistic Safety Analysis for Nuclear Power Plants". The corresponding Compliance Verification Criteria as documented in the Licence Conditions Handbook, identify the dose limits as specified in the Safety Report. Since the acceptance criteria for the accident analysis appendices ensure dose limits are met, the Pickering NGS Safety Reports demonstrate compliance with regulatory requirements.

margin issues arising from equipment degradation, plant configuration and operating procedure changes, engineering modifications and re-analysis. Safety Factor 4 Report, "Aging", provides further details on acceptance criteria and safety margins for safety related SSCs (refer to Review Task 8 in the Safety Factor 4 Report).

Heat Transport System Aging

An OPG Heat Transport System (HTS) Aging Management Program was initiated in 2000 to evaluate the impact of the HTS component aging on safety margins. The objective was to provide an integrated assessment of the collective effects of the identified aging mechanisms, and to develop effective safety margin management strategies based on the results of the assessment (note, Appendix 11 of the Pickering 1,4 and 5-8 Safety Reports [18],[19], provide details of the integration of HTS aging effects in DBA accident analysis). As identified in Section 4.4 of the Application for Renewal of Pickering NGS Power Reactor Operating Licence [30], the most critical accident scenarios from the perspective of HTS aging impacts were determined be:

- Slow Loss of Regulation (LOR) Accident (referred to as Neutron Overpower Protection (NOP))
  An enhanced NOP methodology (E-NOP) incorporating HTS aging effects was developed to perform NOP trip setpoint analysis at projected aged HTS conditions using Extreme Value Statistics (EVS) theory. As per CNSC correspondence [59], CNSC staff agreed that the stations (i.e., Pickering 1,4, Pickering 5-8 and Darlington NGS) are well protected against the Slow Loss of Regulation events by the required NOP trip setpoints calculated using the E-NOP EVS methodology and that there are adequate defence in depth provisions in place. Hence, there is a negligible risk to the station's physical barriers if an NOP event were to occur.

- Small Break Loss of Coolant Accident (SBLOCA) and Loss of Flow (LOF) Analysis
  For SBLOCA and LOF scenarios, it was determined that the major effects of aging are on dryout predictions as a result of Pressure Tube Diametral Creep (affecting Critical Heat Flux leading to earlier onset of dryout), feeder corrosion and roughness (affecting overall system resistance and subsequent decrease in core flow or flow redistribution between channels), and boiler tube fouling (increasing Reactor Inlet Header temperature). As outlined in the Progress Report on OPG HTS Aging Safety Analysis [60], the Pickering 1,4 analysis results for SBLOCA and LOF demonstrate adequate shutdown system trip coverage and ensure continued safe operation till December 2017 (6010 Effective Full Power Days (EFPD)) for the lead unit (Unit 1). Similarly, for Pickering Units 5-8, the SBLOCA and LOF analysis reports demonstrate adequate trip coverage till December 2018 (10300 EFPD) for the lead unit (Unit 6).

As noted above, the current safety analysis for Pickering 1,4 and 5-8, demonstrates adequate shutdown system trip coverage until 2017 and 2018 respectively for the SBLOCA and LOF scenarios. However, the impact of HTS component aging on the SBLOCA, LOF and Slow LOR accident scenarios, will need to be further assessed in order to demonstrate adequate safety margins exist beyond 2020, and therefore a gap exists for Pickering PSR2 (**Pickering PSR2 Gap SF5-1**). It is noted in Reference [60], that work is currently underway to perform Safety Analysis to support the initiative to extend Pickering commercial operation to 2024, accounting for possible mitigation strategies of life-limiting aging mechanisms. Note, a related gap has been captured in the Aging Safety Factor Report (PSR2 Gap SF4-18).

CANDU Safety Issues

As outlined in the 2014 Regulatory Oversight Report for Canadian Nuclear Power Plants [62], in 2007 the CNSC initiated a project to systematically reassess the status of potential design and safety analysis issues for CANDU reactors and to categorize them in order of safety significance (this project complemented the ongoing work at that time on Generic Action Items). These design and safety analysis issues became known as CANDU Safety Issues (CSIs), which were grouped as either Category 1, 2 or 3[17]. Per Reference [63], four CSIs remain in Category 3, of which three are related to LBLOCAs, while the remaining is non-LBLOCA related. For the LBLOCA CSIs, while the development of the industry's proposed Composite Analytical Approach (CAA) is on-going, the licensing basis of existing CANDU reactors for the LBLOCA scenario will continue to be based on conservative safety analysis for which acceptance criteria are established. For the non-LBLOCA CSI, the industry has applied to re-categorize the issue into a lower category based on analytical evidence and actions taken. Since four CSIs applicable to Pickering NGS (3 LBLOCA / 1 non-LBLOCA) are currently in Category 3 and are undergoing further assessment in order to re-classify into a lower category and address operation past 2020, a gap exists for Pickering PSR2 (**Pickering PSR2 Gap SF5-2**). Note, the 3 LBLOCAs CSIs are also captured as a gap in the PSR2 COP Report (Gap COP-20) [64] as they relate to Pickering B IIP Item I09. The 1 non-LBLOCA CSI is also identified as a gap in the Hazards Analysis Safety Factor Report (Gap SF7-1) [65] as it relates to pipe whip.

Conclusion:

The conclusion of this Review Task assessment is that the plant in its current state, and where relevant with account taken of planned safety improvements, has been demonstrated to be within regulatory requirements and expectations for both normal

[17] Category 1 CSI – The issue has been satisfactorily addressed in Canada; Category 2 CSI – The issue is a concern in Canada. However, the licensees have appropriate control measures in place to address the issue and to maintain safety margins; Category 3 CSI – The issue is a concern in Canada. Measures are in place to maintain safety margins, but further experiments and/or analyses are required to improve knowledge and understanding of the issue, and to confirm the adequacy of the measures.

operation and accident conditions. However, the impact of HTS component aging on the SBLOCA, LOF and Slow LOR accident scenarios, will need to be further assessed in order to demonstrate adequate safety margins exist beyond 2020, and therefore a gap exists for Pickering PSR2 (**Pickering PSR2 Gap SF5-1**) (note, a related gap has been captured in the Aging Safety Factor Report (PSR2 Gap SF4-18)). It is noted in Reference [60], that work is currently underway to perform Safety Analysis to support the initiative to extend Pickering commercial operation to 2024, accounting for possible mitigation strategies of life-limiting aging mechanisms. Also, since four CSIs applicable to Pickering NGS (3 LBLOCA / 1 non-LBLOCA) are currently in Category 3 and are undergoing further assessment in order to re-classify into a lower category and address operation past 2020, a gap exists for Pickering PSR2 (**Pickering PSR2 Gap SF5-2**) (Note, the 3 LBLOCAs CSIs are also captured as a gap in the PSR2 COP Report (PSR2 Gap COP-20) [64] as they relate to Pickering B IIP Item I09. The 1 non-LBLOCA CSI is also identified as a gap in the Hazards Analysis Safety Factor Report (PSR2 Gap SF7-1) [65] as it relates to pipe whip).

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for ten L/R/C/Ss with content applicable to Safety Factor 5 are provided in References [6], [7] and [8]. Associated findings applicable to Safety Factor 5 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 5

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 5
CSA N286-12, "Management Systems Requirements for Nuclear Facilities"	There are no PSR2 gaps for CSA N286-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N286-12.
CSA N290.15-10 (R2015), "Requirements for the Safe Operating Envelope of Nuclear Power Plants"	There are no PSR2 gaps for CSA N290.15-10 (R2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.15-10 (R2015).
CSA N286.7-16, "Quality Assurance of Analytical, Scientific and Design Computer Programs"	There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.
CNSC REGDOC-2.4.1 (2014), "Deterministic Safety Analysis"	There are two PSR2 CNSC REGDOC-2.4.1 (2014) gaps which relate to Safety Factor 5: 1. The REGDOC-2.4.1 Implementation Plan and associated gap assessments capture all gaps related to REGDOC-2.4.1 and incorporate a systematic selection of the scope of work to address the most pertinent gaps in accordance with the graded approach to upgrading existing analyses. REGDOC-2.4.1 compliant analysis activities and progress related to REGDOC-2.4.1 implementation in the Pickering Licence Conditions Handbook are tracked according to the CNSC Compliance Verification Criteria. Since the implementation is in progress, this has been identified

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 5
	as a PSR2 gap for Pickering NGS REGDOC-2.4.1 compliance (**Pickering PSR2 Gap SF5-3**). 2. As described in the REGDOC-2.4.1 Implementation Plan: "Limited upgrades are proposed in the Pickering A and B Plan, which has been developed with consideration for demonstration of continued safe operation while accounting for the limited remaining operating life of the Pickering Units". The REGDOC-2.4.1 Implementation Plan for Pickering did not consider operation past 2020 and therefore the need for review and update of the Implementation Plan in the context of operation of Pickering NGS beyond 2020 is identified as a PSR2 gap (**Pickering PSR2 Gap SF5-4**). This will be informed by the timeline of the Darlington REGDOC-2.4.1 Implementation Plan, and the limited additional years of Pickering NGS operation.
CNSC REGDOC-2.5.2 (2014), "Design of Reactor Facilities: Nuclear Power Plants"	There is one PSR2 CNSC REGDOC-2.5.2 (2014) gap which relates to Safety Factor 5: 1. Clauses 4.2.1, 6.4 and 7.3 of REGDOC-2.5.2 introduce new requirements and limits for AOOs, DBAs and BDBAs and include specific dose limits for AOOs and DBAs. Current Pickering Safety Report analyses do not identify and classify events into these categories. Dose limits currently used in Pickering are aligned with the single failure / dual failure limits in accordance with the Pickering Licence Conditions Handbook. This issue has therefore been identified as a PSR2 gap (**Pickering PSR2 Gap SF5-5**). It is being addressed as part of REGDOC-2.4.1 implementation.
CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	For Safety Factor 5, there are no PSR2 gaps for CNSC REGDOC-2.3.2 (2015).
CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"	The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement [9] states: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.
CNSC G-144 (2006), "Trip Parameter Acceptance Criteria for the Safety Analysis of CANDU Nuclear Power Plants"	There are no PSR2 gaps for CNSC G-144 (2006). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with G-144 (2006).
CNSC G-149 (2000), "Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors"	There are no PSR2 gaps for CNSC G-149 (2000). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with G-149 (2000).

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 5
CSA N288.2-14, "Guidelines for Calculating Radiological Consequences to the Public from a Release of Airborne Radioactive Material for Nuclear Reactor Accidents"	There is one PSR2 CSA N288.2-14 gap which relates to Safety Factor 5: 1. Safety Report upgrades currently underway for Pickering as part of REGDOC-2.4.1 implementation for the period of 2017-2021 will utilize methods consistent with N288.2-14. The REGDOC-2.4.1 Implementation Plan update will consider the incremental implications of Pickering operation beyond 2020, including any considerations of N288.2 revisions. This issue has therefore been identified as a PSR2 gap (**Pickering PSR2 Gap SF5-6**). It is being addressed as part of REGDOC-2.4.1 implementation.

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program reviewed for Safety Factor 5 is identified in Table 2, and details of the associated effectiveness review for this N-PROG are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 5 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 5 to determine impacts associated with operation of the Pickering Units past 2020.

Review of the Darlington IIP [13] for gaps that may be applicable in the context of Pickering PSR2 for operation past 2020, identified the following:

- **Gap SF5-7** – Darlington Gap IIP-OI 055 was related to use of the best estimate approach for analysis of operational events at Darlington NGS. The action for Darlington (AR 28175247, Target Completion Date Q1 2020) was to revise OPG governing document N-MAN-03600-10005, "Nuclear Safety Analysis", to require the use of the best estimate approach or a similarly conservative approach for analysis of operational events. This action is also applicable for Pickering NGS and is therefore a gap for Pickering PSR2.

Exemptions and concessions listed in the LCH [4] were reviewed to determine applicability to PSR2. There are no CNSC exemptions and concessions from the LCH that are applicable to Safety Factor 5.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [11] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2

FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were two PSR2 gaps identified in this Safety Factor 5 report that are already discussed in other Safety Factor Reports. PSR2 Gap SF5-1 identifies that the impact of HTS component aging on the SBLOCA, LOF and Slow LOR accident scenarios will need to be further assessed to demonstrate adequate safety margins beyond 2020. This gap is also identified as part of PSR2 Gap SF4-18 in the Aging Safety Factor Report as the work also relates to aging. In addition, there is one non-LBLOCA CSI captured in PSR2 Gap SF5-2 which relates to pipe whip. Since this CSI is related to hazard analysis, it is also identified as PSR2 Gap SF7-1 in the Hazard Analysis Safety Factor Report.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 5 were reviewed for the seven PSR2 Review Tasks in Section 4.1 of this report and resulted in Pickering PSR2 Gaps SF5-1 and SF5-2 below. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 5 were prepared per Sections 4.2 and 4.3, respectively, and resulted in PSR2 Gaps SF5-3 to SF5-6 below. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 5 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 5), which resulted in PSR2 Gap SF5-7.

The seven PSR2 gaps that will need to be addressed as part of Pickering PSR2 are:

- **Gap SF5-1**: Per Review Task #7, the current safety analysis for Pickering 1,4 and 5-8, demonstrates adequate shutdown system trip coverage until 2017 and 2018 respectively for the Small Break Loss of Coolant Accident (SBLOCA) and Loss of Flow (LOF) scenarios. However, the impact of Heat Transport System (HTS) component aging on the SBLOCA, LOF and Slow Loss of Regulation (LOR) accident scenarios will need to be further assessed in order to demonstrate adequate safety margins exist beyond 2020, and therefore a gap exists for Pickering PSR2. It is noted in Reference [60] that work is currently underway to perform Safety Analysis to support the initiative to extend Pickering commercial operation to 2024, accounting for possible mitigation strategies of life-limiting aging mechanisms. Note, a related gap has been captured in the Aging Safety Factor Report (PSR2 Gap SF4-18).

- **Gap SF5-2:** Per Review Task #7, for the Large Break Loss of Coolant Accident (LBLOCA) CANDU Safety Issues (CSIs), while the development of the industry's proposed Composite Analytical Approach (CAA) is on-going, the licensing basis of existing CANDU reactors for the LBLOCA scenario will continue to be based on conservative safety analysis for which acceptance criteria are established. For the Category 3 non-LBLOCA CSI, the industry has applied to re-categorize the issue into a lower category based on analytical evidence and actions taken. Since four CSIs applicable to Pickering NGS (3 LBLOCA / 1 non-LBLOCA) are currently in Category 3 and are undergoing further assessment in order to re-classify into a lower category and address operation past 2020, a gap exists for Pickering PSR2. Note, the 3 LBLOCAs CSIs are also captured as a gap in the PSR2 Continued Operations Plan (COP) Report (PSR2 Gap COP-20) as they relate to Pickering B Integrated Implementation Plan (IIP) Item I09. The 1 non-LBLOCA CSI is also identified as a gap in the Hazards Analysis Safety Factor Report (PSR2 Gap SF7-1) as it relates to pipe whip.

- **<u>Gap SF5-3</u>:** The REGDOC-2.4.1 Implementation Plan and associated gap assessments capture all gaps related to REGDOC-2.4.1 and incorporate a systematic selection of the scope of work to address the most pertinent gaps in accordance with the graded approach to upgrading existing analyses. REGDOC-2.4.1 compliant analysis activities and progress related to REGDOC-2.4.1 implementation in the Pickering Licence Conditions Handbook are tracked according to the CNSC Compliance Verification Criteria. Since the implementation is in progress, this has been identified as a PSR2 gap for Pickering NGS REGDOC-2.4.1 compliance.

- **<u>Gap SF5-4</u>:** As described in the REGDOC-2.4.1 Implementation Plan: "Limited upgrades are proposed in the Pickering A and B Plan, which has been developed with consideration for demonstration of continued safe operation while accounting for the limited remaining operating life of the Pickering Units". The REGDOC-2.4.1 Implementation Plan for Pickering did not consider operation past 2020 and therefore the need for review and update of the Implementation Plan in the context of operation of Pickering NGS beyond 2020 is identified as a PSR2 gap. This will be informed by the timeline of the Darlington REGDOC-2.4.1 Implementation Plan, and the limited additional years of Pickering NGS operation.

- **<u>Gap SF5-5</u>:** Clauses 4.2.1, 6.4 and 7.3 of REGDOC-2.5.2 introduce new requirements and limits for Anticipated Operational Occurrences (AOOs), Design Basis Accidents (DBAs) and Beyond Design Basis Accidents (BDBAs) and include specific dose limits for AOOs and DBAs. Current Pickering Safety Report analyses do not identify and classify events into these categories. Dose limits currently used in Pickering are aligned with the single failure / dual failure limits in accordance with the Pickering Licence Conditions Handbook. This issue has therefore been identified as a PSR2 gap. It is being addressed as part of REGDOC-2.4.1 implementation.

- **<u>Gap SF5-6</u>:** Safety Report upgrades currently underway for Pickering as part of REGDOC-2.4.1 implementation for the period of 2017-2021 will utilize methods consistent with N288.2-14. The REGDOC-2.4.1 Implementation Plan update will consider the incremental implications of Pickering operation beyond 2020, including any considerations of N288.2 revisions. This issue has therefore been identified as a PSR2 gap. It is being addressed as part of REGDOC-2.4.1 implementation.

- **<u>Gap SF5-7</u>**: The Darlington Integrated Implementation Plan (IIP) [13] identified a gap (IIP-OI 055) related to use of the best estimate approach for analysis of operational events at Darlington NGS. The action for Darlington (AR 28175247, Target Completion Date Q1 2020) was to revise OPG governing document N-MAN-03600-10005, "Nuclear Safety Analysis", to require the use of the best estimate approach or a similarly conservative approach for analysis of operational events. This action is also applicable for Pickering NGS and is therefore a gap for Pickering PSR2.

The review of Safety Factor 5 has confirmed that the deterministic safety analysis programs and procedures at OPG are comprehensive, resulting in a systematic and disciplined approach to identifying, prioritizing and addressing any safety analysis related issues.

PSR1	Periodic Safety Review 1 (earlier OPG PSR work and other associated assessments)
PSR2	Periodic Safety Review 2 (subsequent PSR per CNSC REGDOC-2.3.3)
QA	Quality Assurance
SA	Severe Accident
SAM	Severe Accident Management
SAMG	Severe Accident Management Guidelines
SBLOCA	Small Break Loss of Coolant Accident
SCR	Station Condition Record
SOE	Safe Operating Envelope
SRU	Safety Report Update
SSC	Structures, Systems and Components
TOE	Technical Operability Evaluation

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-MP-0014, "Reactor Safety Program"

The purpose of the Reactor Safety Program is to define organizational responsibilities and key program elements for the management of issues related to Nuclear Safety Analysis and the following major components of safe operation:

- Safety Analysis Basis;
- Safe Operating Envelope (SOE); and
- Severe Accident Management (SAM).

The Safety Analysis Basis includes nuclear safety assessments performed to ensure safe operation, in particular the Design Basis Accident (DBA) analyses contained in the Safety Report. SOE is defined by the Operational Safety Requirements (OSR), Instrument Uncertainty Calculations (IUC) and other safety related limits and system credits that ensure operation within the Safety Analysis Basis. SAM examines Beyond Design Basis Accidents (BDBAs). SAM guidelines (SAMGs) provide a framework for responding to BDBAs, in order to manage residual risk.

In June 2015, Nuclear Oversight conducted a performance based audit at Pickering and Darlington NGS, NO-2015-021 [B.1.1], to determine whether the Reactor Safety Program activities were being performed effectively and in compliance with program requirements for safe and reliable operations. The audit concluded that the managed system controls were effective. There were opportunities for improvement in the areas of nuclear safety assessment quality assurance, nuclear safety services contracting and the safety report update process.

Three SCRs were initiated to address the above findings, which required corrective actions to be implemented. Two SCRs have been completed (N-2015-10848 and N-2015-10867), while SCR N-2015-10785 (AR 28177966) has actions in place and is expected to be completed by Q2 2017.

The Reactor Safety department completed a self-assessment in April 2014, P14-000401-SA [B.1.2], in order to assess the preparation phase of the P1441 Pickering NGS outage against OPG outage management governance. Minor recommendations were generated; however, no findings/SCRs were initiated as a result of this self-assessment.

The Governance and Services Section at OPG completed a self-assessment in November 2015, BAS15-001614-SA [B.1.3], in order to assess the governance structure of N-PROG-MP-0014, "Reactor Safety Program", which is applicable for both Pickering and Darlington NGS. Minor recommendations were generated; however no findings/SCRs were initiated as a result of this self-assessment.

Revision Summary for Amec Foster Wheeler Report PS112/RP/012

Rev	Date	Author	Comments
R00	July 7, 2016	Brandon McLean / Ranil Jayasundera	Initial issue for OPG review and comment.
R01	March 2, 2017	Brandon McLean, Ranil Jayasundera, Ben Hryciw	Updated report addressing OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 6, *Probabilistic Safety Assessment (PSA)*, is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 6 were reviewed for the six PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 6 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 6 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 6).

The results of the review of Safety Factor 6 are discussed in Section 5.0. The review of Safety Factor 6 has confirmed that the PSA programs and procedures at OPG are comprehensive, resulting in a systematic and disciplined approach to identifying, prioritizing and addressing any PSA related issues. As discussed in Section 5.0, the review identified five gaps that will need to be addressed further as part of the PSR2 Global Assessment process.

TABLE OF CONTENTS

LIST OF TABLES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];
- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and
- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's Nuclear operations. As a result, where Pickering is confirmed to follow the same Nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Probabilistic Safety Assessment (PSA) Safety Factor 6 is to determine:

- The extent to which the existing PSA study remains valid as a representative model of the plant;
- Whether the results of the PSA show that the risks are sufficiently low and well balanced for all postulated initiating events and operational states;
- Whether the scope (which should include all operational states and identified internal and external hazards), methodologies and extent (i.e., Level 1, 2 or 3) of the PSA are in accordance with current national and international standards and good practices;
- Whether the existing scope and application of PSA are sufficient.

REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 6 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 6 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 6 Review Tasks are:

1) Confirm existence of a PSA and the assumptions used, the fault schedule, the representations of operator actions and common cause events, the modelled plant configuration and consistency with other aspects of the safety case.

2) Confirm existence of processes to assess the impact of changes in plant design, operation, and plant specific failure data and update the PSA to reflect the current plant status as required.

3) Confirm there are guidelines to account for operator actions, common cause events, cross-link effects, redundancy, and diversity.

4) Confirm that the accident management programs for accident conditions (design basis accident conditions and design extension conditions) are consistent with PSA models and results.

5) Confirm that the results of the PSA show that risks are sufficiently low and well balanced for all postulated initiating events and operational states, and meet relevant probabilistic safety criteria.

6) Review the extent to which hazards are represented in the PSA to verify that omissions are based on site specific justifications and that these omissions do not weaken the overall risk assessment for the plant.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this Report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Probabilistic Safety Assessment Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 6 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- <u>Incremental Review</u>: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6], [7] and [8]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for the Probabilistic Safety Assessment Safety Factor 6

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286	Management System Requirements for Nuclear Facilities	N286-12	5, 6, 9, 10, 11	Incremental	N286 addressed as part of Pickering B and Darlington ISRs.
2	CSA N286.7	Quality Assurance Of Analytical, Scientific And Design Computer Programs	N286.7-16	1, 5, 6, 7, 10	Incremental	N286.7 addressed as part of Pickering B and Darlington ISRs.
3	CNSC REGDOC-2.4.2	Probabilistic Safety Assessment (PSA) for Nuclear Power Plants	2014	6, 7	Incremental	S-294 addressed as part of Pickering B and Darlington ISRs. Implementation plan in place.
Additional L/R/C/Ss						
4	CNSC REGDOC-2.5.2	Design of Reactor Facilities: Nuclear Power Plants	2014	1, 5, 6, 7	Incremental	RD-337 and NS-R-1 (precursors to REGDOC-2.5.2) addressed as part of Darlington ISR. NS-R-1 also addressed as part of Pickering B ISR.
5	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.
6	CSA N286.7.1	Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants	N286.7.1-09	1, 5, 6, 7, 10	N/A [3]	N286.7.1 not addressed as part of Pickering B or Darlington ISRs.

[3] The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement [9] states: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
7	CNSC G-149	Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors	2000	1, 5, 6, 7	Incremental	G-149 addressed as part of Pickering B and Darlington ISRs.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 6 is listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results for the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Program Reviewed for Safety Factor 6

Document Number	Document Title
N-PROG-RA-0016 [10]	Risk and Reliability Program

2.4 Additional Reviews

The PSR2 Safety Factor 6 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 6):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 6 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 6 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [11] is provided in a separate PSR2 COP Review Report.

[4] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 6 review which are relevant to other Safety Factors are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Probabilistic Safety Assessment Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 6 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1; [5]
- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;
- Implications of extending Pickering NGS operation beyond 2020; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;
- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;
- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);
- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

[5] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 6 L/R/C/S reviews identify Compliances and Gaps as defined below:[6]

- <u>Compliance</u>:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 6.)

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 6.)

---

[6] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 6.)
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 6.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in

performance. As a result, the broad review scope of program audits focuses on identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [12]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 6):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 6 (as identified in the Darlington ISR Integrated Implementation Plan [13] and Pickering Units 5-8 Continued Operations Plan [11]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any)[7].

---

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 6 review which are relevant to other Safety Factors are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 6 Review Tasks.

4.1.1 Review Task #1: Current Probabilistic Safety Assessments and Assumptions

Confirm existence of a PSA and the assumptions used, the fault schedule, the representations of operator actions and common cause events, the modelled plant configuration and consistency with other aspects of the safety case.

OPG Standard N-STD-RA-0034 [14], "Preparation, Maintenance and Application of Probabilistic Risk Assessment", outlines the guidance for the preparation and maintenance of the Pickering Probabilistic Safety Assessment (PSA) program. This PSA standard ensures that the intent of the OPG Nuclear Safety Policy for the appropriate use of PSA in operating the plant, in compliance with CNSC Regulatory Standard S-294 [60] Probabilistic Safety Assessment for Nuclear Power Plants, is met at all OPG Nuclear Stations.

The R04 Pickering Licence Conditions Handbook [4] was revised to reflect "OPG request for PROL amendment [PROL 48.02/2018] to replace S-294 with REGDOC-2.4.2", effective December 18th, 2015. Per Section 5.1 of the R04 LCH:

> *REGDOC-2.4.2 Probabilistic Safety Assessment (PSA) for Nuclear Power Plants: Implementation Strategy: OPG will update the Pickering A PSA and Pickering B PSA using a graded approach as permitted by REGDOC-2.4.2. The PSA elements created as part of S-294 will be updated and the updated requirements of REGDOC-2.4.2, such as Irradiated Fuel Bay (IFB) risk assessment, will be addressed.*
>
> *The next Pickering B PSA update will be completed in 2017, including detailed risk re-quantification, in accordance with S-294. Similarly, the next Pickering A PSA update will be completed in 2018, including detailed risk re-quantification, in accordance with S-294.*
>
> *All the Pickering A PSA and Pickering B PSA updates extended to 2020 will be solely focused on the additional updated requirements of REGDOC-2.4.2 going beyond S-294 requirements, including for example, IFB risk assessment, and which are risk contributors of less significance. The updated requirements of REGDOC-2.4.2 may be dealt with through alternative methods to PSA for which guidance is currently being developed by industry.*

The results of the PSR2 review of REGDOC-2.4.2 are summarized in Section 4.2.

To support implementation of the PSA standard N-STD-RA-0034 [14], PSA Guides, N-GUID-03611-10001 Volumes 1 through 10 ([15] through [23]) provide for the preparation, maintenance and application of OPG PSAs including methodologies and assumptions used. Further station specific guidelines for Pickering Units 1,4 have also been prepared and are available in references [24], [25], [26], [27], [28] and [29]. The PSA for Pickering Units 5-8 did not require station specific guides since the N-GUIDs described above were applicable. Using these guidelines, OPG submitted S-294 compliant Pickering Units 5-8 and Units 1,4 PSAs to the CNSC (in 2012 and 2014 respectively) consisting of the following PSA documentation as outlined in [4]: [8]

- NA44-REP-03611-00011, Hazards Screening Analysis – Pickering A, [30]
- NA44-REP-03611-00012, Pickering NGS A Level 1 At-Power Internal Events Risk Assessment (PARA-L1P), [31]
- NA44-REP-03611-00013, Pickering NGS A Level -2 At-Power Internal Events Risk Assessment (PARA-L2P), [32]
- NA44-REP-03611-00014, Pickering NGS A Level -1 Outage Internal Events Risk Assessment (PARA-L1O), [33]
- NA44-REP-03611-00021, Pickering NGS A Internal Flood Probabilistic Risk Assessment (PARA Flood), [34]
- NA44-REP-03611-00022, Pickering NGS A PRA- Based Seismic Margin Assessment (PARA Seismic), [35]
- NA44-REP-03611-00023, Pickering NGS A Level 1 High Wind Probabilistic Risk Assessment, [36]
- NA44-REP-03611-00038, Pickering NGS A Probabilistic Risk Assessment (PRA) – Internal Fire Report, [37]
- NK30-REP-03611-00008, Hazards Screening Analysis – Pickering B, [38]
- NK30-REP-03611-00006, Pickering NGS B Level 1 At-power Internal Events Risk Assessment, [39]
- NK30-REP-03611-00010, Pickering NGS B At-Power Level 2 Probabilistic Risk Assessment (PRA) for Internal Initiating Events, [40]
- NK30-REP-03611-00009, Pickering NGS B Level 1 Outage Internal Events Risk Assessment, [41]
- NK30-REP-03611-00011, Probabilistic Risk Assessment Level 2 Outage Report – Pickering B, [42]
- NK30-REP-03611-00012, Pickering NGS B Probabilistic Risk Assessment - Internal Fire Report, [43]
- NK30-REP-03611-00013, Pickering NGS B (PNGS-B) PRA Based Seismic Margin Assessment (SMA), [44]
- NK30-REP-03611-00014, Pickering NGS B Internal Flood Probabilistic Risk Assessment (PBRA Flood), [45]
- NK30-REP-03611-00020, Pickering NGS B High Wind Probabilistic Risk Assessment, [46]

[8] Note that Probabilistic Risk Assessment (PRA) is now referred to as Probabilistic Safety Assessment (PSA).

Supplementary PSA analyses were also completed, as warranted, to address the Pickering Licence Hold Point, which among other things credit the use of Emergency Mitigating Equipment (EME) that was installed as part of the lessons learned from the Fukushima event. These supplementary analyses will be incorporated into the regulatory compliant PSAs as part of the regular PSA review and update cycles for each station, and have been listed here for completeness.

- NA44-REP-03611-00031 R000, Pickering NGS A Level-1 At-power Risk Assessment (PARA-L1P) - FAI Update, [47]
- NA44-REP-03611-00032 R000, Pickering NGS A Level-2 At-power Internal Events Risk Assessment (PARA-L2P) - Fukushima Action Item (FAI) Update, [48]
- NA44-REP-03611-00033 R000, Pickering NGS A High Wind Probabilistic Risk Assessment - FAI Update, [49]
- NA44-REP-03611-00034 R000, Pickering NGS A PRA-based Seismic Margin Assessment (para-seismic) - FAI Update, [50]
- NA44-REP-03611-00035 R000, Pickering NGS A Internal Flood Probabilistic Risk Assessment (PARA-flood) - FAI Update, [51]
- NK30-REP-03611-00025 R000, Pickering NGS B Level 1 At-power Internal Events Risk Assessment Fukushima Action Item Update, [52]
- NK30-REP-03611-00022 R000, Pickering NGS B Level 2 At-power Internal Events Risk Assessment Fukushima Action Item Update, [53]

<u>The Fault Schedule</u>

The list of initiating events (i.e., the fault schedule) is developed and documented for each OPG station as per the direction provided in Section 2.0 of [15] and [24]. The most current listings for Pickering are provided in:

- NK30-REP-03611-00021 R00, Pickering B Risk Assessment Summary Report [57]
- NA44-REP-03611-00036 R00, Pickering A Risk Assessment Summary Report [58]

<u>Representation of Operator Actions</u>

Section 2.6 of N-GUID-03611-10001 Volume 1 [15], "OPG Probabilistic Risk Assessment (PRA) Guide - Level 1 (At-Power)", and similarly Section 2.6 of [24], provides the requirement to account for operator actions during preparation of Level 1 PSA studies. Additional guidance relevant to specific PSA elements is provided in the PSA Guide volumes for those elements (e.g., [17] and [26] for outage PSA).[9]

[9] The OPG Level 1 At-Power PSA Guides [15] [24] provide general methodologies that are generic to the PSA models for all hazards and operating states. Other volumes of the PSA Guide provide specific additional guidance relevant to the analysis for that specific hazard or operating state, but refer back to the Level 1 At-Power Guides for the generic requirements. This Safety Factor 6 report therefore generally refers to the generic requirements described in the Level 1 At-Power PSA Guides.

Specifically Section 2.6.8.1 of [15] [24], "Methodology for Human Interaction Re-Quantification", outlines a detailed process used to re-quantify any human operator interactions in the station PSA that are identified as being potentially significant contributors to risk. The process includes a formal review of significant human interactions with station operations staff and/or simulator training staff to confirm that the modelled operator tasks have been properly understood. Furthermore the PSA Guides for Level 1 and 2 PSA preparation [15] [16] [24] [25] also mandate that current operator actions/responses be captured via an in depth review of current station documentation and supporting references.

Representation of Common Cause Events

External and internal common cause hazards are assessed according to the guidelines specified in [21] (external), and [22] (internal). These guidelines outline a series of generic hazards comprised of 66 external natural hazards, 8 external human induced hazards and 16 internal hazard categories, including such examples as electromagnetic interference, volcanic activity and static electricity. They outline a precise methodology for screening each event for its inclusion in the PSA for any given station and include general principles and approaches for conducting both an initial qualitative and subsequent quantitative screening. The qualitative screening is based on the impact of the hazard on the plant's safe operation and the associated consequences while the quantitative screening is based on the probability of occurrence (frequency) of the hazards.

A list of screened internal and external common cause events compliant with these guidelines was developed as part of the Hazard Screening Analysis completed in 2012 for both Pickering Units 1,4 and Units 5-8 [30], [38]. Certain events such as fire, flood, high wind and seismic are, however, not contained in these guides as they are already included in the PSA. Fire, flood, high wind and seismic PSAs have each been prepared in accordance with their respective PSA guidelines as documented above.

For the hazards that have been included in the PSA models, the PSA Guides ([15] to [37]) provide guidance on the methodologies to be used in modelling common cause events. Specifically, Section 2.5 "Dependency Failure Analysis" of the Level 1 At-Power PSA Guide [15] [24] provides guidance on modelling of common cause events, which is applicable in the PSAs for all hazards and operating states. This includes guidance for addressing functional dependencies (e.g., failures involving shared sub-systems or support systems), physical interaction dependencies (e.g., involving hostile conditions in a shared environment), human interaction dependencies, and implicit residual common cause (e.g., for redundant equipment with common design features, common manufacturer, etc.).

Modelled Plant Configuration and Consistency with Safety Case

OPG Nuclear Program N-PROG-RA-0016 [10] states that "*risk information used in safety decision-making should be based to the extent practical on data and models that reflect the characteristics of the facility concerned*". Similarly, Section 1.3.6 of Nuclear Standard N-STD-RA-0034 [14] mandates that the response of the system to each initiating event of concern be modelled in a fault tree analysis, with the response as specified in Design Manuals, the Safety Report and the Abnormal Incidents Manuals (AIM).

The specific instructions for the preparation and maintenance of both Level 1 and Level 2 PSAs, contained in Sections 1.9 and 1.8 of N-GUID-03611-10001 Volume 1 [15] and Volume 2 [16] respectively (and similarly in [24] and [25]), dictate that the development of the PSAs rely on supporting references including but not limited to the stations' Safety Report, existing safety analysis, Operational Safety Requirements (OSRs), AIMs and System Operating Manuals. Furthermore these sections outline precisely how station documentation for each credited mitigating system and support system will be used to support the OPG PSAs, and that *"operational data including system alignment, safety related system testing, maintenance outage for plant systems and processes will be referenced to support as-built and as-operated system states for "realistic" input to the OPG PRAs."*, hence ensuring consistency with each station's safety case and current design.

A PSA based process of modelling, assessing and managing nuclear safety risk that results from maintenance, during either planned unit outages (outage risk) or at-power reactor operation (on-line risk), is documented in N-STD-RA-0030 "Risk Management for Outage Planning and On-Line Maintenance" [56]. This standard outlines requisite reactor safety assessments of work schedules, risk-informed advice to work planners and the quantification of the risk of individual maintenance configurations using an appropriate risk monitoring software platform. It therefore ensures that temporary maintenance configurations are adequately modelled and conform to PSA policies and principles.

Conclusion:

The conclusion of this Review Task assessment is that the existence of a PSA and the assumptions used, the fault schedule, the representations of operator actions and common cause events, the modelled plant configuration and consistency with other aspects of the safety case is confirmed. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Impact of Changes in Plant Design, Operation and Failure Data

Confirm existence of processes to assess the impact of changes in plant design, operation, and plant specific failure data and update the PSA to reflect the current plant status as required.

OPG Nuclear Program N-PROG-RA-0016 [10], "Risk and Reliability Program", states that "*risk information used in safety decision-making should be based to the extent practical on data and models that reflect the characteristics of the facility concerned*". The program specifies that facility-specific PSA updates are completed during regular review cycles or when warranted by design change [10], hence, ensuring the current condition of each station is reflected in all PSA related analyses.

Specifically, N-STD-RA-0034 [14], "Preparation, Maintenance and Application of Probabilistic Risk Assessment", provides requirements for the preparation, maintenance and application of PSA at OPG Nuclear facilities including the required standard elements which have been developed to meet the intent of CNSC Regulatory Standard S-294[10], Probabilistic Safety Assessment for Nuclear Power Plants. N-STD-RA-0034 further clarifies that the "*PRA shall reflect the current configuration of the facility*" and that "*PRA maintenance shall ensure that changes to the design, operation and maintenance of the facility are reflected in the PRA*".

Plant Design and As-Built Configuration

Design changes at both Pickering Units 1,4 and Units 5-8 are managed through the Engineering Change Control program, N-PROG-MP-0001, [59]. It requires that the changes be controlled such that plant configuration is maintained in conformance with the Safe Operating Envelope.

OPG Nuclear Program N-PROG-RA-0016 [10] states that any proposed changes to plant operation, configuration or procedures that may either significantly increase or decrease risks be reviewed and their impact on risk be quantified. It further mandates that the preparation, revision and maintenance of PSAs be conducted in accordance with OPG Nuclear Standard N-STD-RA-0034 [14] to reflect current design, operation basis and reliability data.

Clause 5.0 (3) of S-294[10] [60] requires that the PSA models reflect the plant's as-built and as-operated condition, as closely as reasonably achievable within the limitations of PSA technology and consistent with risk impact. The overall program direction contained in OPG Nuclear Standard N-STD-RA-0034 [14] and the specific instructions for the preparation and application of PSA at both Pickering Units 1,4 and Units 5-8 contained in [15] through [29] are compliant with the requirements of Clause 5.0 (3).

Operations

N-PROG-RA-0016 [9], "Risk and Reliability Program", states that any proposed changes to plant operation, configuration or procedures that may either significantly increase or decrease risks be reviewed and their impact on risk be quantified. It further mandates that the preparation, revision and maintenance of PSAs be conducted in accordance with OPG Nuclear Standard N-STD-RA-0034 [14] to reflect current design, operation basis and reliability data.

More specifically Section 2.6 of N-GUID-03611-10001 Volume 1 [15], "OPG Probabilistic Risk Assessment (PRA) Guide - Level 1 (At-Power)", and similarly Section 2.6 of [24], provides a requirement to account for, quantify and re-quantify applicable operator actions during preparation of the Level 1 PSA. These generic requirements similarly apply to the PSAs for other hazards and operating states. The preliminary

---

10 Note OPG request for PROL amendment [PROL 48.02/2018] to replace S-294 with REGDOC-2.4.2, effective December 18th, 2015 per the discussion included in Section 4.1.1 of this document. The results of the PSR2 review of REGDOC-2.4.2 are summarized in Section 4.2.

quantification is performed as part of the development of the fault tree while potentially significant human interactions are subsequently re-quantified using more detailed methods. Section 2.6.8.1 Methodology for Human Interaction Re-Quantification, outlines the detailed process used to re-quantify any human operator interactions in the station PSA identified as being potentially significant contributors to risk. This section includes a formal review of significant human interactions with station operations staff and/or simulator training staff to confirm that operator tasks modelled by the human interactions have been properly understood. The Level 1 and Level 2 PSAs also consider station operation impacts via an in depth review of current station documentation and supporting references. Per N-GUID-03611-10001 Volume 2 [16] (and similarly in [25]), "*Station documentation for each credited mitigating system and support system will be used to support the PSA. Specifically, operational data including system alignment, safety related system testing, maintenance outage for plant systems, operator actions/responses and processes will be referenced to support as-built and as-operated system states…*"

<u>Plant Specific Reliability Data</u>

N-PROG-RA-0016 [9] states that "component reliability data be compiled, analyzed, and applied to maintain risk and unavailability models". Consistent with the overall industry approach that the model reflect the plant as closely as reasonably achievable, the OPG Nuclear Standard N-STD-RA-0034 [14] similarly requires that the component reliability data and initiating event frequency data used in the PSA be updated on a regular basis and be representative of expected future performance at the facility (internal OPEX). It further requires that this data be quantified using information from the facility being studied to the extent possible; however, it states that generic data from other sources (external OPEX) may be used where facility-specific data is not available. It identifies sources for the reliability data including but not limited to, best available facility specific data, e.g., from the Annual Risk and Reliability Reports. The updated plant-specific reliability data is incorporated into the PSAs as part of the 5-year update cycle, using the detailed methodologies described in the OPG PSA Guides ([15] to [29]).

The requirements for reliability monitoring and reporting of the Systems Important to Safety are provided in OPG Nuclear Standard N-STD-RA-0033, Reliability Monitoring and Reporting of Systems Important to Safety [61].

Conclusion:

The conclusion of this Review Task assessment is that there are currently processes to assess the impact of changes in plant design, operation, and plant specific failure data and update the PSA to reflect the current plant status. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Guidelines for Probabilistic Safety Assessment

Confirm there are guidelines to account for operator actions, common cause events, cross-link effects, redundancy, and diversity.

OPG Nuclear Program N-PROG-RA-0016 [9], "Risk and Reliability Program", establishes the framework for the development and use of PSAs as a means to manage radiological risks and contribute to safe operation of OPG's nuclear generating stations.

N-STD-RA-0034 [14], "Preparation, Maintenance and Application of Probabilistic Risk Assessment", ensures that in conducting PSAs, OPG performs human reliability analysis with a structured approach, identifying potential human failure events and systematically estimating the probability of those events using data, models, or expert judgment.

Section 2 of N-GUID-03611-10001 Volume 1 [15], "OPG Probabilistic Risk Assessment (PRA) Guide - Level 1 (At-Power)", and similarly Section 2 of [24], provides the requirement to account for common cause events, cross-link effects, redundancies, non-diverse equipment (i.e., equipment susceptible to common cause failures) and operator actions (human interactions). These general requirements apply to the PSA models for all hazards and operating states. More specifically common cause events, cross-link effects, redundancy, and diversity considerations are analyzed and modelled in line with the guidelines discussed in Section 2.5 of N-GUID-03611-10001 Volume 1 [15] regarding dependent or common-cause failures[11] while human interactions are primarily discussed as part of Section 2.6 on Human Reliability Analysis.

Human interactions in particular are also included in the Outage PSA Guide N-GUID-03611-10001 Volume 4 [17], and similarly in [26]. Identification and quantification of human interaction initiators are unique in Outage PSA as during an outage, operations and maintenance activities are performed in more dynamic situations with greater requirements for manual control actions. The opportunity for human error to result in an initiating event is higher than in the At-Power PSA. Given the potential for human-based initiators, the Outage PSA explicitly identifies them. This differs from the accepted approach for At-Power PSA, which implicitly captures the pre-initiating human interaction events in the reliability data collected at the component, system and plant level (as opposed to quantifying each human-based initiator independently).

Conclusion:

The conclusion of this Review Task assessment is that there are guidelines in place to account for operator actions, common cause events, cross-link effects, redundancy, and diversity. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

[11] i.e., failures which can result in simultaneous impairment of multiple systems or reduce the designed redundancy within a system.

4.1.4 Review Task #4: Consistency of PSA with Accident Management Programs

> *Confirm that the accident management programs for accident conditions (design basis accident conditions and design extension conditions) are consistent with PSA models and results.*

The accident management program for OPG's nuclear power plants is defined in the Consolidated Nuclear Emergency Plan (CNEP) [62], its supporting suite of governing documents, and the implementing operational procedures. The planning basis for the CNEP is derived from sources such as the station's deterministic safety analysis (as documented in the Safety Report) and PSA. In particular, PSA studies are the primary tool for assessing the potential consequences of accidents arising from external events (e.g., seismic, high wind, flooding).

For Design Basis Accidents (DBAs), Pickering has a mature accident management program for all internal and external accidents. These events are fully assessed in the Safety Report, PSA and supplementary assessments. PSA consistency with the underlying Safety Analysis (including the Safety Report and by extension the OSRs and AIMs) is assured via the implementation of N-STD-RA-0034 [14], "Preparation, Maintenance and Application of Probabilistic Risk Assessment" which mandates that the PSA be consistent with operator actions, modelled plant configuration and the existing safety case. While procedures for the mitigation of DBAs are derived most directly from the deterministic safety analysis for the station, operator responses as specified in these procedures are modelled in detail in the PSA, as explained under Review Task 1, Section 4.1.1 of this Safety Factor report. This ensures consistency between the PSA and accident management for DBAs. PSA results are in turn used to confirm that credited accident management actions are appropriate, or to identify areas for improvement to reduce the risk contribution from post-accident operator actions.

References [63] and [64], applicable to Pickering Units 1,4 and Units 5-8 respectively, identify the Beyond Design Basis Accident (BDBA) functional safety requirements for Structures, Systems and Components (SSCs) credited to prevent progression to severe accidents. Accident management for BDBAs relies on plant SSCs and on the use of Emergency Mitigating Equipment (EME) that is specifically intended to respond to a scenario involving an extended loss of all AC power, with the consequential total loss of all heat sinks. This scenario was selected, in part, because of its contribution to severe core damage frequency and large release frequency based on Level 2 PSA studies. The EME technical basis [65] specifically uses Pickering PSA results to establish approximate timing(s) for accident progression (assuming no actions are taken) in order to demonstrate an achievable success path for EME to prevent BDBA progression to a severe accident.

The use of EME for beyond design basis accidents (in particular design extension conditions) at Pickering Units 5-8 has been modelled in supplementary PSA analyses ([52] to [55]) performed as part of the removal of the Pickering Licence Hold Point, subsequent to the completion of the 2012 Pickering B PSA. Among other things this analysis credits the use of EME that was installed as part of the lessons learned from the Fukushima event to provide emergency make-up water (e.g., to the steam generators and moderator), the installation of Passive Auto-Catalytic Recombiners (PARs) to reduce containment hydrogen levels, and other accident mitigating features. Similar analyses for Pickering Units 1,4 ([47] to [51]) were also completed alongside the Pickering A PSA in 2014, again as part of resolution of the Pickering Licence Hold Point [66]. PSA results reflect the modelling of certain Fukushima enhancements and are included in Reference [67]. Hence, current PSAs for Pickering are consistent with the accident management provisions that have been implemented to address design extension conditions for BDBAs.

PSA models and results for Pickering have also played a significant role in deriving the Severe Accident Management Guidelines (SAMG) that are in place to manage accident response should a BDBA progress to a severe accident. SAMG documentation has been approved for use under the NA44-SAM-09013-10000 document series for Pickering 1,4 and the NK30-SAM-09013-10000 document series for Pickering 5-8. The physical processes that govern severe accident phenomena are complex and, consequently, SAMG cannot be made highly dependent on detailed analyses because of uncertainties associated with severe accident causes and progression. However, reasonable strategies for coping with severe accident progression can be identified and one of the primary sources of insight used to develop SAMG for OPG stations is the PSA. For example, PSA studies have been used to inform SAMG development by characterizing the potential timing and magnitude of hazards during a severe accident, most notably elevated source terms for fission products and hydrogen generation, and peak pressures inside containment. This information has been used to create computational aids that are used to estimate in-plant conditions as part of SAMG response. In some cases, PSA results have been used to identify additional clarifications, instructions and cautions with respect to the use of certain mitigating strategies that have been incorporated into updates of the stations' SAMG documentation. In addition, Level 2 PSA analyses have been conducted to demonstrate the extent to which specific mitigation measures (e.g., PARs, venting) are expected to be effective to protect containment during severe accident progression. The results of PSA studies have also been used to demonstrate plant habitability and accessibility to perform SAMG actions, and to demonstrate the survivability of equipment and instrumentation used in SAMG. These studies provide confidence that SAMG strategies can be implemented and lead to a successful outcome, and illustrate how accident management for severe accidents relies upon PSA models and results.

Another important aspect of accident management is the need to demonstrate preparedness by periodically performing drills and exercises (in accordance with [68]) that provide a means to test the effectiveness of emergency response procedures, facilities, equipment and training, as well as to provide training for emergency responders and identify opportunities for continuous improvement. To meet these objectives, plausible scenarios with meaningful simulated plant data are required. These are typically derived from Level 2 PSA analyses.

Conclusion:

The conclusion of this Review Task assessment is that the accident management programs for accident conditions (design basis accident conditions and design extension conditions) are consistent with PSA models and results. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Compliance with Safety Criteria

Confirm that the results of the PSA show that risks are sufficiently low and well balanced for all postulated initiating events and operational states, and meet relevant probabilistic safety criteria.

N-PROG-RA-0016 [9], "Risk and Reliability Program" outlines the Ontario Power Generation Risk-Based Safety Goals applicable to both Pickering Units 1,4 and Units 5-8. The safety goals specified in the document are numerical PSA based criteria used to ensure the radiological risks arising from nuclear accidents associated with operation of nuclear reactors are low in comparison to risks to which the public is normally exposed.

N-PROG-RA-0016 [9], provides average risk-based safety goals of 10^{-4} per year for severe core damage, and 10^{-5} per year for a large off-site release, per each operating unit and applicable to each hazard. These safety goals are comparable to industry best practice and represent the accepted risk exposure above which corrective action shall be taken to reduce risk. If the risk cannot be returned to an acceptable level, N-PROG-RA-0016 states that the Chief Nuclear Engineer and the Director, Operations and Maintenance may direct the immediate and orderly shutdown of the affected units or stations. Furthermore the program also specifies administrative safety goal values that are 10 times smaller than their safety goals and represent the desired objective towards which the facility should strive.

PSA Guides [15] through [29] reference the safety goals from N-PROG-RA-0016 [9], as required, and hence ensure that the results of the PSAs remain within the specified safety goals for average risk.

Time-average PSA results are provided in [67] and are presented in Table 3 and Table 4 below for reference. These tables show both the S-294 compliant baseline PSA results submitted to the CNSC in 2012 and 2014, for Pickering Units 5-8 and Units 1,4 respectively, as well as the updated PSA results that include certain Fukushima enhancements as of Spring 2014, completed as part of addressing the Pickering Licence Hold Point.

When each hazard is considered individually by reactor, the time-average Severe Core Damage Frequency PSA results for certain S-294 PSA elements, in Table 3, are above the OPG specified Administrative Safety Goal (10^{-5}/r-yr) but within the OPG Safety Goal (10^{-4}/r-yr). After incorporating the PSA updates that include certain Fukushima enhancements, only the Pickering Units 1,4 at-power fire risk remains above the OPG specified Administrative Safety Goal for Severe Core Damage Frequency. This is therefore identified as a gap for Pickering PSR2 **(Pickering PSR2 Gap SF6-1)**.

When each hazard is considered individually by reactor, the time-average Large Release Frequency PSA results for certain S-294 PSA elements, in Table 4, are above the OPG specified Administrative Safety Goal (10^{-6}/r-yr) but within the OPG Safety Goal (10^{-5}/r-yr). After incorporating the PSA updates that include certain Fukushima enhancements, only the Pickering Units 1,4 at-power internal events and at-power fire risks remain above the OPG specified Administrative Safety Goal for Large Release Frequency. This is therefore identified as a gap for Pickering PSR2 **(Pickering PSR2 Gap SF6-2)**.

OPG has been actively working on risk reduction plans [69] to better address certain higher risk items, such as internal fires at Pickering Units 1,4, with the objective of reducing Pickering Units 1,4 risk for both Severe Core Damage Frequency and Large Release Frequency. These risk reduction plans include further refinements to the PSA analyses to address potential over-conservatisms in the existing results. Work on the risk reduction plans was initiated several years ago, as described in Section 5 of Reference [67], and this work continues at OPG. The PSA results presented in this report do not incorporate these enhancements and therefore are not reflective of the risk reduction activities currently underway as part of the development of a REGDOC-2.4.2 compliant PSA (See Section 4.2). Additionally, work is in progress relating to the treatment of aggregate risk as part of an industry initiative discussed in Section 3.3.2.3 of Reference [70] and in Section 2 of Reference [67].

To maintain safety during temporary outage or maintenance alignments, the impact that these alignments have on the PSA is evaluated in accordance with N-STD-RA-0030 [56]. To ensure that reasonable bounds are placed on these short-term risks (i.e., risks present for significantly less time than the one year time period assumed by the safety goals for average risk), N-PROG-RA-0016 [9], also defines instantaneous safety goals of $3x10^{-4}$ per year for severe core damage, and $3x10^{-5}$ per year for a large off-site release, per operating unit and applicable to each hazard. Operation in a higher risk state, for short periods above these values, requires approval by both the Chief Nuclear Engineer and the Director of Operations and Maintenance. These instantaneous safety goals hence provide a level of assurance that risks are well balanced over the one year time period assumed by the average risk. Although the instantaneous risk safety goals in N-PROG-RA-0016 [9] apply to Level 1 and Level 2 PSA for all hazards, the limitations of some PSA model elements lead to the current practice at Pickering NGS (and other Canadian utilities) where instantaneous risk is only evaluated using the Level 1 at-power internal events and Level 1 outage internal events PSA models. This is therefore identified as a gap for Pickering PSR2 **(Pickering PSR2 Gap SF6-3)**.

Although instantaneous risk is only currently evaluated by all Canadian utilities using the Level 1 internal events PSA models, there are other deterministic rules (e.g., shutdown requirements for impairments of special safety systems and safety related systems) that provide assurance of defense in depth during temporary outage or maintenance alignments. These deterministic considerations apply regardless of the potential hazard, and may often result in greater restrictions than would be imposed by the risk-based safety goals alone. Given the differences in PSA models and tools for some hazards, work is also underway to develop methodologies for application of the PSAs for other hazards (e.g., assessment of instantaneous risk) as part of an industry initiative via the Candu Owner's Group.

Table 3: Severe Core Damage Frequency (SCDF) PSA Results

PSA Element	**Severe Core Damage Frequency**			
	S-294 Baseline PSA		**Fukushima Enhancement Adjusted PSA**	
	P1,4 Per Reactor (x 10^{-5} per r-yr)	**P5-8 Per Reactor** (x 10^{-5} per r-yr)	**P1,4 Per Reactor** (x 10^{-5} per r-yr)	**P5-8 Per Reactor** (x 10^{-5} per r-yr)
At-Power Internal Events	1.63	0.42	0.83	0.08
At-Power Fire	4.73 Note 2	0.38	4.73	0.06
At-Power Flood	1.02	0.07	0.56	0.07 Note 5
At-Power Seismic	0.26	0.10	0.18	0.10 Note 5
At-Power High Wind	2.69 Note 2	0.80	0.30	0.03
Outage Internal Events	0.66	0.10	0.66 Note 3	0.10 Note 5
Outage Fire	Note 1	Note 1	Note 1	Note 1
Outage Flood	Note 1	Note 1	0.15 Note 4	Note 1
Outage Seismic	Note 1	Note 1	0.05 Note 4	Note 1
Outage High Wind	Note 1	Note 1	0.08 Note 4	Note 1

Notes:

1. Outage risk is bounded by all units at-power. SCDF for outage external events was not estimated in detail.
2. This S-294 PSA includes credits for Phase 1 of the Emergency Mitigating Equipment.
3. Bounded by S-294 Level 1 outage PSA for internal events.
4. Estimate of outage SCDF based on Fukushima enhancement results for at-power.
5. Fukushima enhancements SCDF judged to be lower than S-294 SCDF, therefore not calculated in detail.

Table 4: Large Release Frequency (LRF) PSA Results

PSA Element	Large Release Frequency			
	S-294 Baseline PSA		Fukushima Enhancement Adjusted PSA	
	P1,4 Per Reactor (x 10^{-5} per r-yr)	**P5-8 Per Reactor** (x 10^{-5} per r-yr)	**P1,4 Per Reactor** (x 10^{-5} per r-yr)	**P5-8 Per Reactor** (x 10^{-5} per r-yr)
At-Power Internal Events	0.47	0.39	0.17	0.03
At-Power Fire	0.84 Note 2	0.34 Note 6	0.66	0.04
At-Power Flood	0.20	< 0.07	0.09	< 0.07 Note 5
At-Power Seismic	0.26	0.10 Note 7	0.04	< 0.10 Note 5
At-Power High Wind	0.80 Note 2	< 0.80	0.07	< 0.03
Outage Internal Events	< 0.1	< 0.1	< 0.1 Note 3	< 0.1 Note 5
Outage Fire	Note 1	Note 1	Note 1	Note 5
Outage Flood	Note 1	Note 1	0.02 Note 4	Note 5
Outage Seismic	Note 1	Note 1	0.01 Note 4	Note 5
Outage High Wind	Note 1	Note 1	0.02 Note 4	Note 5

Notes:

1. Outage risk is bounded by all units at-power. LRF for outage external events was not estimated in detail.
2. This S-294 PSA includes credits for Phase 1 of the Emergency Mitigating Equipment.
3. Bounded by S-294 Level 2 outage PSA for internal events.
4. Estimate of outage LRF based on Fukushima enhancement results for at-power.
5. Fukushima enhancements LRF judged to be lower than S-294 LRF, therefore not calculated in detail.
6. LRF for PB At-Power Fire per [57].
7. LRF for PB At-Power Seismic Events per [57].

Conclusion:

The results of the latest PSA completed as part of the response to the Pickering Licence Hold Point show that time-average risks are sufficiently low for all postulated initiating events, with the exception of Pickering Units 1,4 at-power internal events (above the Administrative Safety Goal but below the Safety Goal for large release frequency) and Pickering Units 1,4 internal fire events (above the Administrative Safety Goals but below the Safety Goals for both severe core damage and large release). This Safety Factor report also recognized that instantaneous risk Safety Goals are provided for Severe Core Damage Frequency and Large Release Frequency, but that instantaneous risk is only evaluated for severe core damage from internal events and not for large release or for other hazards such as internal fires or seismic events. The PSA results described in this PSR2 report do not incorporate certain proposed analysis enhancements, and do not necessarily reflect the latest risk reduction activities currently underway at OPG. Three gaps, listed above, are therefore identified for Pickering PSR2.

4.1.6 Review Task #6: Impact of Omissions in Probabilistic Safety Assessment

Review the extent to which hazards are represented in the PSA to verify that omissions are based on site specific justifications and that these omissions do not weaken the overall risk assessment for the plant.

The requisite screening conditions which must be satisfied to omit specific hazards from the PSA are documented in the internal and external hazard screening PSA guides, references [22] and [21] respectively. These documents outline qualitative and quantitative screening criteria for each hazard type as well as for external hazard combinations, and take into account both Canadian and international regulations and standards as well as information on credible hazards at the OPG sites.

Site specific screened lists of internal and external events for both Pickering Units 1,4 and Units 5-8 were completed using these OPG Guides as part of the Hazard Screening Analysis in 2012 [30], [38] and are compliant with CNSC Regulatory Standard S-294.

Certain hazards such as high wind were not able to be screened out and were subsequently included in standalone station PSAs while others such as internal fire and seismic events were already provided in standalone assessments. Other hazards, such as the effects of high or low temperatures, have effects which have been built into either the Level 1 or the Level 2 PSAs. Further, more detailed information regarding hazard assessments can be found in the Hazard Analysis PSR2 Safety Factor Report [71].

Conclusion:

Based on the assessment above, it is confirmed that hazards are represented in the PSA and omissions are based on site specific justifications which do not weaken the overall risk assessment for the plant. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for seven L/R/C/Ss with content applicable to Safety Factor 6 are provided in References [6], [7] and [8]. Associated findings applicable to Safety Factor 6 are summarized in Table 5 below.

Table 5: PSR2 L/R/C/S Review Results for Safety Factor 6

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 6
CSA N286-12, "Management System Requirements for Nuclear Facilities"	There are no PSR2 gaps for CSA N286-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N286-12.
CSA N286.7-16, "Quality Assurance Of Analytical, Scientific And Design Computer Programs"	There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.
CNSC REGDOC-2.4.2 (2014), "Probabilistic Safety Assessment (PSA) for Nuclear Power Plants"	There is one PSR2 CNSC REGDOC-2.4.2 (2014) gap which relates to Safety Factor 6: 1. The REGDOC-2.4.2 Pickering Implementation Plan agreed to with the CNSC did not consider operation beyond 2020 and therefore, the review and update of the Implementation Plan in the context of operation of Pickering NGS beyond 2020 is required. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF6-4**).
CNSC REGDOC-2.5.2 (2014), "Design of Reactor Facilities: Nuclear Power Plants"	There is one PSR2 CNSC REGDOC-2.5.2 (2014) gap which relates to Safety Factor 6: 1. Clause 4.2.2 of REGDOC-2.5.2 introduces new requirements and limits for probabilistic analysis risk limits, such as a core damage frequency limit of $<10^{-5}$ yrs/yr. It has not been demonstrated that these requirements can be achieved. Therefore, this has been identified as a PSR2 gap (**Pickering PSR2 Gap SF6-5**).
CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	For Safety Factor 6, there are no PSR2 gaps for CNSC REGDOC-2.3.2 (2015).
CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"	The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement [9] states: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.
CNSC G-149 (2000), "Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors"	There are no PSR2 gaps for CNSC G-149 (2000). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with G-149 (2000).

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program reviewed for Safety Factor 6 is identified in Table 2 and details of the associated effectiveness review for this N-PROG are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 6 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 6 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 6.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [11] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 6 Report that are relevant to other Safety Factors.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 6 were reviewed for the six PSR2 Review Tasks in Section 4.1 of this report and resulted in Pickering PSR2 Gaps SF6-1, SF6-2, and SF6-3 below. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 6 were prepared per Sections 4.2 and 4.3, respectively, and resulted in PSR2 Gaps SF6-4 and SF6-5 below. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 6 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 6), which resulted in no additional PSR2 gaps.

The five PSR2 gaps that will need to be addressed as part of Pickering PSR2 are:

- **Gap SF6-1:** When each hazard is considered individually by reactor, the time-average Severe Core Damage Frequency Probabilistic Safety Assessment (PSA) results for certain S-294 PSA elements, in Table 3, are above the OPG specified Administrative Safety Goal (10^{-5}/r-yr) but within the OPG Safety Goal (10^{-4}/r-yr). After incorporating the PSA updates that include certain Fukushima enhancements, only the Pickering Units 1,4 at-power fire risk remains above the OPG specified Administrative Safety Goal for Severe Core Damage Frequency. The PSA results described in this PSR2 report, however, do not incorporate certain proposed analysis enhancements and do not necessarily reflect the latest risk reduction activities currently underway at OPG.

- **Gap SF6-2:** When each hazard is considered individually by reactor, the time-average Large Release Frequency Probabilistic Safety Assessment (PSA) results for certain S-294 PSA elements, in Table 4, are above the OPG specified Administrative Safety Goal (10^{-6}/r-yr) but within the OPG Safety Goal (10^{-5}/r-yr). After incorporating the PSA updates that include certain Fukushima enhancements, only the Pickering Units 1,4 at-power internal events and at-power fire risks remain above the OPG specified Administrative Safety Goal for Large Release Frequency. The PSA results described in this PSR2 report, however, do not incorporate certain proposed analysis enhancements and do not necessarily reflect the latest risk reduction activities currently underway at OPG.

- **Gap SF6-3:** Although the OPG instantaneous risk Safety Goals apply to Level 1 and Level 2 Probabilistic Safety Assessment (PSA) for all hazards, current practice at Pickering NGS is that instantaneous risk is only evaluated using the Level 1 at-power internal events and Level 1 outage internal events PSA models. This is similar to current practices at other Canadian utilities. There are other deterministic rules at Pickering NGS that provide assurance of defense in depth during temporary outage or maintenance alignments, and these deterministic considerations apply regardless of the potential hazard. Work is underway, via an industry initiative, to develop methodologies for assessment of instantaneous risk from other hazards included in the PSA.

- **Gap SF6-4:** The REGDOC-2.4.2 Pickering Implementation Plan agreed to with the CNSC did not consider operation beyond 2020 and therefore, the review and update of the Implementation Plan in the context of operation of Pickering NGS beyond 2020 is required. Therefore, this has been identified as a PSR2 gap.

- **Gap SF6-5:** Clause 4.2.2 of REGDOC-2.5.2 introduces new requirements and limits for probabilistic analysis risk limits, such as a core damage frequency limit of $<10^{-5}$ yrs/yr. It has not been demonstrated that these requirements can be achieved. Therefore, this has been identified as a PSR2 gap.

The review of Safety Factor 6 has confirmed that the PSA programs and procedures at OPG are comprehensive, resulting in a systematic and disciplined approach to identifying, prioritizing and addressing any PSA related issues.

SCDF	Severe Core Damage Frequency
SSC	Structures, Systems and Components

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-RA-0016, "Risk and Reliability"

The purpose of the Risk and Reliability program is to establish a framework for the development and use of Probabilistic Safety Assessment (PSA) at OPG Nuclear as a means to manage radiological risks from nuclear accidents and to contribute to safe operation of nuclear reactors. Program elements have been developed to meet the intent of the OPG Nuclear Safety Policy and the applicable Canadian Nuclear Safety Commission (CNSC) regulatory requirements.

Nuclear Oversight conducted a performance based audit, NO-2016-013 [B.1.1], in August 2016 in order to determine compliance with the requirements of the Risk and Reliability program for Pickering and Darlington NGS. The audit identified performance improvement opportunities applicable to Pickering NGS in the areas of training and qualification as well as implementation of some program elements (e.g., the Probabilistic Risk Assessment Issues Database, mission time testing, and documentation updates.)

Two SCRs were initiated to address the above findings (P-2016-20258 and N-2016-20262). Both are now complete.

The Nuclear Safety and Technology Department completed a self-assessment, NO14-000591-SA [B.1.2], in December 2014 in order to determine compliance with the requirements of the Risk and Reliability program for Pickering and Darlington NGS. The self-assessment concluded that Pickering NGS has good alignment with current governance and best industry practices; recent procedural changes are reflected in the work program; and the Pickering Risk and Reliability Program satisfies the intent of the governance. A performance improvement opportunity applicable to Pickering NGS was identified in the area of Reactor Safety training.

AR 28173197 was initiated to track the associated assignments for this corrective action. The final remaining action is expected to be completed by Q2 2017.

Rev	Date	Author	Comments
R00	July 4, 2016	Brandon McLean / Ranil Jayasundera	Initial issue for OPG review and comment.
R01	March 3, 2017	Brandon McLean / Ranil Jayasundera / Janice Cheng	Updated to address OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks", identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 7, *Hazard Analysis*, is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 7 were reviewed for the three PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 7 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 7 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 7).

The results of the review of Safety Factor 7 are discussed in Section 5.0. The review of Safety Factor 7 has confirmed the adequacy of protection of Pickering NGS against internal and external hazards, with account taken of plant design (including confirmation that analyses/methods address the condition of Structures, Systems and Components (SSCs) important to safety), site characteristics, and current analytical methods, safety standards and knowledge. As discussed in Section 5.0, the review identified one gap that will need to be addressed further as part of the PSR2 Global Assessment process.

TABLE OF CONTENTS

LIST OF TABLES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's Nuclear operations. As a result, where Pickering is confirmed to follow the same Nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Hazard Analysis Safety Factor 7 is to: "determine the adequacy of protection of the nuclear power plant against internal and external hazards, with account taken of the plant design, site characteristics, the actual condition of the Structures, Systems and Components (SSCs) important to safety and their predicted state at the end of the period covered by PSR2, and current analytical methods, safety standards and knowledge". REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 7 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 7 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 7 Review Tasks are:

1) Perform an assessment of the existing Deterministic and Probabilistic analyses to confirm existence of hazard analyses for hazards listed below. The following hazards are to be included in the assessment:

   (i) Internal Hazards:
   - Fire, Pipe whip, Steam release, Toxic gas, Flooding, Missiles, Spray, Explosion.

   (ii) External Hazards:
   - Changes in site characteristics, High winds (Tornado), Seismic, Toxic gas, Flooding, Extreme temperatures, Aircraft crash, Explosions.

2) Confirm that the analyses and/or methods take into account the plant design and the condition of SSCs important to safety (both at present and predicted for the end of the period covered by PSR2).

3) For each relevant hazard, verify, by means of current analytical techniques and data, that the frequency of occurrence and/or the consequences of the hazard are sufficiently low so that either no specific protective measures are necessary, or the preventive and mitigatory measures in place are adequate.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Hazard Analysis Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 7 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- <u>Incremental Review</u>: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6] and [7]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for the Hazard Analysis Safety Factor 7

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286.7	Quality Assurance Of Analytical, Scientific And Design Computer Programs	N286.7-16	1, 5, 6, 7, 10	Incremental	N286.7 addressed as part of Pickering B and Darlington ISRs.
2	CSA N293	Fire Protection for Nuclear Power Plants	N293-12	1, 7, 13	Incremental	N293 addressed as part of Pickering B and Darlington ISRs and PARTS.
3	CNSC REGDOC-2.4.1	Deterministic Safety Analysis	2014	5, 7	Incremental	C-6 addressed as part of the Pickering B ISR and PARTS. S-310 and RD-310 addressed as part of the Pickering B and Darlington ISRs, respectively. Implementation plan in place and gap assessment between REGDOC-2.4.1 and OPG Safety Analysis Program already performed.
4	CNSC REGDOC-2.4.2	Probabilistic Safety Assessment (PSA) for Nuclear Power Plants	2014	6, 7	Incremental	S-294 addressed as part of Pickering B and Darlington ISRs. Implementation plan in place.
Additional L/R/C/Ss						
5	CNSC REGDOC-2.5.2	Design of Reactor Facilities: Nuclear Power Plants	2014	1, 5, 6, 7	Incremental	RD-337 and NS-R-1 (precursors to REGDOC-2.5.2) addressed as part of Darlington ISR. NS-R-1 also addressed as part of Pickering B ISR.
6	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
7	CSA N286.7.1	Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants	N286.7.1-09	1, 5, 6, 7, 10	N/A [3]	N286.7.1 not addressed as part of Pickering B or Darlington ISRs.
8	CNSC G-149	Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors	2000	1, 5, 6, 7	Incremental	G-149 addressed as part of Pickering B and Darlington ISRs.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 7 is listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Program Reviewed for Safety Factor 7

Document Number	Document Title
N-PROG-RA-0012 [9]	Fire Protection

2.4 Additional Reviews

The PSR2 Safety Factor 7 Report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 7):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 7 to ascertain the implications of extending Pickering

[3] The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [8]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

[4] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 7 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [10] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 7 review which are relevant to other Safety Factors are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Hazard Analysis Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 7 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.

- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[5]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

[5] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 7 L/R/C/S reviews identify Compliances and Gaps as defined below[6]:

- <u>Compliance</u>:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 7.)

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 7.)

---

6 Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 7.)
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 7.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records (SCRs) and Action Requests (ARs) to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in

performance. As a result, the broad review scope of program audits focuses on identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [11]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 7):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 7 (as identified in the Darlington ISR Integrated Implementation Plan [12] and Pickering Units 5-8 Continued Operations Plan [10]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[7]

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's Nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same Nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 7 review which are relevant to other Safety Factors are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 7 Review Tasks.

4.1.1 Review Task #1: Internal and External Hazards in Deterministic and Probabilistic Analyses

Perform an assessment of the existing Deterministic and Probabilistic analyses to confirm existence of hazard analyses for hazards listed below. The following hazards are to be included in the assessment:

(i) Internal Hazards:
- Fire, Pipe whip, Steam release, Toxic gas, Flooding, Missiles, Spray, Explosion.

(ii) External Hazards:
- Changes in site characteristics, High winds (Tornado), Seismic, Toxic gas, Flooding, Extreme temperatures, Aircraft crash, Explosions.

The scope of initiating events addressed by safety analysis was originally defined deterministically by Atomic Energy Control Board (AECB) Consultative Document C-006-R001 [13]. Deterministic reviews of each of the stations' respective safety analyses against the scope of CNSC Consultative Document C-006-R001 [13] were completed as part of Reference [14], in 2001 for Pickering Units 1,4, and as part of the Pickering B ISR [15] during 2007 for Pickering Units 5-8. These reviews covered over 110 initiating events for each station including fire, earthquakes, explosions, toxic gases, internal and external flooding, aircraft crash and extreme weather including high wind and temperature extremes, and found no significant safety implications for any of these hazards. They further determined all C-006-R001 [13] events to be adequately addressed as being bounded by events explicitly analysed in supplementary reviews, including the Pickering B risk assessment, or the existing Safety Reports [16], [17].

Subsequently, a list of Internal and External Events, for inclusion in the Level 1/Level 2 Probabilistic Safety Assessments (PSAs) for Pickering Units 1,4 and Pickering Units 5-8 was prepared as part of the Hazard Screening Analyses completed in 2012 [18], [19]. This list is compliant with both CNSC Regulatory Standard S-294 [20] and international practice (such as IAEA 50-P-7 [21] and US Nuclear Regulatory Commission NUREG/CR-2300 [22]) and includes discussion of pipe whip, missiles, toxic gas (external), flooding (external), extreme temperatures, aircraft impacts, explosions and various hazard combinations including these, and other hazards, occurring concurrently.

The External Hazards Screenings contained in these reports rely on the concept of Review Level Conditions (RLCs) for external hazards against which the station's current design is reviewed. Originally defined and analysed for various external hazards in the Hazard Screening Analyses [18], [19], the RLCs were further analysed and refined for tornado, seismic, and external flooding hazards in [39] and further applied to modifications in place for Beyond Design Basis accident considerations, as per [40].

When a probabilistic analysis of hazards is required it is conducted in accordance with standard N-STD-RA-0034 [41], which identifies the scope of the PSAs with respect to internal and external hazards as follows:

- Risks associated with internal initiating events shall be addressed using a PSA with a unit operating at high power and while shutdown, with the exception of risks associated with internal fires and internal floods while a unit is shutdown, which may be addressed, with agreement of persons authorized by the Commission, using alternate analysis methods.

- Risks associated with fuelling machine events and Irradiated Fuel Bay (IFB) events may be addressed using a PSA or, with agreement of persons authorized by the Commission, by using alternate analysis methods.

- Risks associated with external events (internal hazards and external hazards) may be addressed using a PSA or, with agreement of persons authorized by the commission, by using alternate analysis methods.

Consistent with the guidance above, the hazards from internal flooding and fire, along with seismic and high wind, have been assessed as part of standalone PSAs for each station. Other hazards, such as extreme temperature (also assessed by the Hazard Screening Analyses [18], [19]) are modelled in the PSAs of both stations [23]. All OPG PSA documents have been completed in accordance with the applicable generic OPG PSA guidelines specified in References [23] through [32], and the applicable Pickering Units 1,4 specific guides [33] through [38].

Further events analysed under this Review Task such pipe whip, steam release and changing site conditions are deterministically considered by inclusion in the most current revisions of both the Pickering Units 1,4 and Pickering Units 5-8 Safety Reports [16], [17], while others including certain internal floods and sprays have been factored into elements of the current EQ program N-PROG-RA-0006 [42]. The Safety Reports for each station are currently being updated to incorporate a common mode event appendix similar to analyses already contained in [18] and [19].

Each of the internal and external hazards are addressed separately below.

INTERNAL HAZARDS

Each internal hazard is identified at a high level in Table 3: Internal Hazards Summary Table, shown on the next page, which summarizes the approach used to address the hazard. A hazard specific discussion follows the summary table. The most recent Internal Hazard Screening Analyses are [18] and [19], for Pickering 1,4 and Pickering 5-8 respectively.

The PSA Internal Hazards Screening Guide [31] (applicable to both Pickering 1,4 and Pickering 5-8) provides guidance on the screening of internal hazards at OPG facilities for inclusion in or exclusion from more detailed PSA analysis. Consequential effects and adverse conditions (e.g., pressure, temperature, humidity, radiation, steam/water spray, vibration, etc.) are identified, when relevant, in the analyses and assessed against relevant mitigating provisions (e.g., environmental qualification/protection and operating capabilities).

Many of the internal hazards have been assessed as part of the Environmental Qualification (EQ) Program, N-PROG-RA-0006 "Environmental Qualification" [42], which provides the EQ governing policy and the overall EQ methodology for the qualification of environmentally qualified equipment/components. It also defines the qualification program for systems and components that must be qualified or protected from the adverse environmental effects of design basis events. Additional details on documents that define the complete framework of the EQ Program are provided in Safety Factor 3 Report: Equipment Qualification (Seismic and Environmental) [43].

Certain hazards also have been assessed in standalone deterministic analyses. One such example includes internal fires, which were analysed in Pickering Fire Safety Assessments [44], [45].

Table 3: Internal Hazards Summary Table

Hazard	Assessment Approach				
	Deterministic		Probabilistic		Notes
	Pickering Units 1,4	Pickering Units 5-8	Pickering Units 1,4	Pickering Units 5-8	
Internal					
Fire	Yes	Yes	Yes	Yes	• Compliant with "fire protection" program N-PROG-RA-0012 [9]. • Part of PSA updates as per [36], [27]. • Pickering Fire Safety Assessments [44], [45]. • Included in existing PSA [46], [47].
Pipe Whip	Yes	Yes	N/R See Note 8	N/R See Note 8	• Discussed in Section 6.5 "release of stored energy" [18], [19]. • Safety Reports [48], [49]. • Included as CNSC CANDU Safety Issue CSI-IH 6 [50].
Steam Release	Yes	Yes	Yes	Yes	• Safety Reports [48], [49] and EQ program [42]. • Steam release events are included in the scope of the Level 1 PSAs [23].
Toxic Gas	See Note 9	See Note 9	N/R See Note 8	N/R See Note 8	• Discussed in various sections of [18], [19].
Flooding	Yes	Yes	Yes	Yes	• Safety Reports [16], [51]. • EQ program [42], [52], [53]. • Part of PSA updates as per [37], [28]. • Included in existing PSA [54], [55].
Missiles	See Note 9	See Note 9	N/R See Note 8	N/R See Note 8	• Mechanical Missile Impacts – Section 6.2 of [18], [19].
Spray	Yes	Yes	Yes	Yes	• Addressed in design as part of the EQ program [42]. • Spray events are captured as part of the PSA flood consequence analysis as per [28].
Explosion	See Note 9	See Note 9	N/R See Note 8	N/R See Note 8	• Explosions within the Generating Station – Section 6.3 of [18], [19].

N/R = Not Required

---

[8] The potential for these hazards was assessed in the Hazard Screening Analyses [18], [19] and screened out of the PSA.

[9] The Hazard Screening Analyses are done as part of the PSA program to determine which events need to be subjected to further PSA assessment. However, the hazards are evaluated based on a deterministic evaluation of the consequences and the frequency of occurrence and therefore, the screening assessments also demonstrate that the hazards have been identified and deterministically evaluated.

Fire

An overall program, N-PROG-RA-0012 "Fire Protection" [9], has been established to manage Fire Protection at OPG nuclear plants. This program identifies the processes, overall requirements, and staff accountabilities to ensure that an effective Fire Protection Program is established and maintained, thereby minimizing both the risks and consequences of fire. This document also describes the nuclear governing documents required to achieve the fire protection goals of Canadian Standards Association (CSA) N293 "Fire Protection for Nuclear Power Plants".

Regular fire inspections of accessible areas to ensure conformance with fire prevention regulations are conducted in accordance with N-PROC-RA-0054, Control of Transient Materials and Space Allocation Within the Site (Reference [56]), and N-PROC-RA-0057, Control of Ignition Sources And Hot Work Activities (Reference [57]), along with N-PROG-MA-0004, Conduct of Maintenance (Reference [58]), and N-STD-RA-0026, Fire Protection Surveillance Availability and Compensatory Measures (Reference [59]).

Deterministic fire hazard analyses were completed in the Fire Hazard Assessment (FHA) and the Fire Safe Shutdown Analysis (FSSA), which were both conducted to criteria based on N293-95. The FHA is an area by area assessment of plant fire risks and consequences while the FSSA is an assessment of the impact of fire on nuclear safety. These two reviews were combined into a Fire Safety Assessment and submitted to the CNSC on September 29, 2000 [44] for Pickering Units 1,4 and on December 9, 2011 [45] for Pickering Units 5-8. The initial FHA evaluations reviewed the plant on a fire area / zone basis for in situ fire hazards while the FSSAs evaluated the capability to achieve and maintain the shutdown state with postulated fire damage.

Fire related hazards are also in the scope of both the Pickering Units 1,4 and Pickering Units 5-8 PSAs as documented in general guidance for the preparation of internal Fire PSAs [36], [27]. The most current fire PSA analyses for both stations are documented in [46] and [47].

Pipe Whip

Pipe ruptures in Pickering NGS have been assessed for their potential to cause consequential damage to other components, which could then jeopardize the safe shutdown and continued cooling of the reactor. Pipe-whip effects are assessed as consequential failures in Section 6.5 "Release of Stored Energy" of the Hazard Screening Analyses [18], [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively. The reports conclude that critical components or equipment, particularly for the Primary Heat Transport (PHT), Shutdown System (SDS) and Emergency Coolant Injection (ECI) systems have been analysed for pipe whip potential at varying temperatures as per [60], [61], [62], [63] and [64].

Pipe whip effects are also discussed in the Internal Flooding Probabilistic Risk Assessment (PRA)[10] guide [28]. The Internal Flood PRAs, [54], [55], consider Pipe Whip; however, they defer to deterministic rules for screening distances and deterministic analysis for assessment of consequences. Pipe whip has been deterministically assessed in the analyses discussed below.

Part 3 of the Pickering Units 1,4 and Pickering Units 5-8 Safety Reports [48], [49] address consequential damage resulting from pipe-whip jet forces. The assessments presented similarly confirm that these hazards do not result in unacceptable consequences despite potential damage to in-core structures, damage due to deflection of a postulated failed fuel channel or damage to neighboring fuel channels and impairment of the insertion of the shutoff rods (Section 4.5.4 of the Pickering Units 1,4 and Pickering Units 5-8 Safety Reports [48], [49]).

A CNSC Category 3 CANDU Safety Issue (CSI), CSI-IH 6 regarding Pipe Whip, was determined to require further assessment as per [50]. A methodology for the assessment of pipe-whip and jet-impingement of high-energy piping inside the reactor buildings of Pickering Units 1,4 and Pickering Units 5-8 was subsequently developed [65]. An assessment for Pickering Units 5-8 based on this methodology, Reference [67], was completed in 2016 and confirmed that the layout of the high-energy piping and safety related systems inside of the reactor buildings of Pickering Units 5-8 are in compliance with the practices, expectations, and guidelines in modern standards such as IAEA NS-G-1.11 [68]. To address CNSC CANDU Safety Issue CSI-IH 6, the potential for, and possible impacts of, high-energy piping failures in Pickering Units 1,4 must also be assessed. This assessment is currently underway as per Reference [65] and has a target completion date in mid-2017 [66]. This item is therefore identified as a gap for Pickering PSR2 **(Pickering PSR2 Gap SF7-1)**.

Steam Release

Steam line failures are presented in Appendix 7 of the Pickering Units 1,4 and Pickering Units 5-8 Safety Reports, References [48] and [49] respectively. Various failures are presented that are associated with the steam systems as the result of control system failures, process upsets or, in the extreme, postulated catastrophic piping ruptures. The report presents the results of this analysis of the steam supply system failures in terms of safety system initiation, thermal hydraulic response, powerhouse environment assessment and radiological consequences.

The Environmental Qualification Program N-PROG-RA-0006 "Environmental Qualification" [42] provides assurance that equipment and components will perform their safety-related functions when exposed to harsh environmental conditions resulting from a Design Basis Accident (DBA).

As per the OPG PSA guidelines specified in [23], several pipe breaks, such as LOCAs and steam line breaks, are modelled as dependent initiating events (i.e. events which not only initiate a transient but may also contribute to failure of a mitigating system),

[10] Probabilistic Risk Assessment (PRA) is now referred to as Probabilistic Safety Assessment (PSA).

which impact a wide range of equipment due to the physical interactions with the associated hostile steam environment. The environmental impacts associated with these events are included as part of the station's Level 1 PSAs [69], [70].

Toxic Gas

Internal toxic gas hazards due to on site transportation accidents have been screened out based on low frequency as per Section 6.7.3 of the Hazard Screening Analyses for both stations [18], [19].

Similarly, the release of toxic gases from on-site storage has been assessed in Appendix A Table A1 of Hazard Screening Analyses [18], [19]. Of all the chemicals stored on site, only the five listed below have the potential to result in toxic effects and are stored in sufficiently large quantities such that further analysis was required. As detailed in the Hazard Screening Analyses [18], [19], each substance was then analysed further and screened out independently as follows:

- Sodium Hypochlorite: Screened out as a result of its propensity to react to form a neutral solution (stored in the Chlorine Building, south of the Powerhouse and the Reactor Auxiliary Bay).
- Hydrogen Peroxide: Screened out because only 35% concentrations are used on site while concentrations below 50% are only considered an irritant.
- Morpholine: Screened out based on maximum postulated concentrations in the control room being below the Immediately Dangerous to Life and Health (IDLH) concentrations[11].
- Hydrazine: Screened out based on the fact that advance warning would provide adequate time for individuals in the main control room to evacuate and/or don respiratory protective equipment before the IDLH is exceeded.
- Sodium Metabisulphite: Stored outside in temporary storage tanks (not in the Powerhouse or the Reactor Auxiliary Bay) and is therefore bounded by on site transportation accidents, which are screened out by frequency as per above.

The storage and movement of toxic materials on site are further controlled in accordance with OPG's hazardous materials management procedure [71] and Space Allocation for Transient Material (SATM) requirements [72]. These procedures outline requirements for both the storage and transit of toxic materials on site to minimize the likelihood and consequence of spills and/or dangerous reactions.

[11] As per the Hazard Screening Analyses [18], [19] the IDLH concentrations represent the values at which, in the event of respiratory failure, a worker could evacuate within 30 minutes without experiencing any escape-impairing or irreversible health effects.

Flooding

DBA conditions addressed by the EQ Program are a subset of service conditions that are addressed as part of equipment qualification. As stated in Section B.5.0 of N-PROG-RA-0006 [42], a flooding hazard inside containment for DBAs is considered as part of the equipment qualification program. Post-accident flooding conditions are included in the Room Conditions Manuals (RCMs) of both Pickering Units 1,4 and Pickering Units 5-8, References [52], [53] respectively, as mandated by EQ RCM Nuclear Instruction N-INS-03651-10003 [73].

Per Part 2, Section 1.3.3 of both the Pickering Units 1,4 and Pickering Units 5-8 Safety Reports [16] and [51] respectively, sufficient mitigating systems are designed to operate effectively even if consequential effects of the initiating event pose a threat to their operability. Such effects include harsh environments due to steam and water discharge (causing flooding), thrust forces on piping, and jet impingement, following a pipe break.

Flood related hazards are addressed in the Pickering Units 1,4 and Pickering Units 5-8 PSAs, and have been prepared based on the guidance for the preparation of internal flood PSAs [37], [28] for Pickering Units 1,4 and Pickering Units 5-8 respectively. The most current flood PSAs for both stations reflect flooding due to various sources including high energy secondary side pipe failures and service water pipe failures at different break locations, and are documented in [54] and [55].

External flooding hazards are assessed in the external hazards section below.

Missiles

The consequences of internally generated missiles are not currently discussed in the Pickering Safety Reports but have been assessed in Section 6.2 of the Hazard Screening Analyses [18], [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively. Possible missiles originating from turbine disintegration, the failure of various valves and pumps, and the explosion of acetylene bottles used for cutting and welding were assessed. The failure of turbines, pumps, and valves were screened out due to low impact after considering the separation of independent systems and the inclusion of protective barriers in the Pickering design, while missiles due to acetylene bottle explosions were screened out due to low frequency.

Spray

The spray hazard inside containment following Design Basis Accidents is addressed as part of the equipment qualification program, N-PROG-RA-0006 [42]. Additionally as per Part 2, Section 1.3.3 of both the Pickering Units 1,4 and Pickering Units 5-8 Safety Reports [16] and [51], respectively, sufficient mitigating systems are designed to operate effectively even if consequential effects of the initiating event pose a threat to their operability. Such effects include harsh environments due to steam and water discharge, thrust forces on piping, and jet impingement, following a pipe break and its subsequent spray.

Certain spray events are also captured as part of the flood consequence analysis included in the internal flooding PSA. The internal flooding PRA guide [28] requires that the impact on equipment be evaluated for failures by submergence, jet impingement, spray, humidity, condensation and temperature. It provides further general guidelines to assume that all unprotected electrical equipment will fail within a minimum horizontal distance of 3 m for liquid flood sources (or 6 m for high energy flood sources). The flooding PSAs for both Pickering Units 1,4 and Pickering Units 5-8 conservatively assume a variety of spray induced failures.

Explosion

The consequences of internally generated explosions have been assessed in Section 6.3 of the Hazard Screening Analyses [18], [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively. Possible hydrogen explosions in battery cells and in the turbine generator were analysed, as well as acetylene bottle explosions. Battery cell and acetylene bottle explosions were both determined to be improbable events and screened out by frequency while a hydrogen explosion in the turbine generator was deemed to be inconsequential due to adequate dispersion of hydrogen in the turbine hall and sufficient ventilation.

EXTERNAL HAZARDS

Each external hazard is identified at a high level in the Table 4: External Hazards Summary Table, shown on the next page, which summarizes the approach used to address the hazard, and is then individually addressed in a separate discussion. The most recent External Hazard Screening Analyses are shown in [18] and [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively.

The screening of external hazards relies on the concept of Review Level Conditions (RLCs) against which the station's current design is reviewed. Originally defined and analysed for various external events in the Hazard Screening Analyses [18], [19], the RLCs were further analysed and refined for tornado, seismic, and external flooding hazards in [39].

The PSA External Hazards Screening Guide [30] (applicable to both Pickering Units 1,4 and Pickering Units 5-8) provides guidance on the screening of external hazards at OPG facilities for inclusion in or exclusion from more detailed PSA analysis.

Table 4: External Hazards Summary Table

Hazard	Assessment Approach				
	Deterministic		Probabilistic		Notes
	Pickering Units 1,4	Pickering Units 5-8	Pickering Units 1,4	Pickering Units 5-8	
External					
Changes to Site Characteristics	See Note 12	See Note 12	N/R See Note 13	N/R See Note 13	• Impacts captured in development of models and methodology for hazard analyses. • [18], [19] consider the proximity of industries, shipping lanes, aircraft, etc.
High Winds (Tornado)	N/R See Note 14	N/R See Note 14	Yes	Yes	• Not screened out at either Pickering Units 1,4 or Pickering Units 5-8 [18], [19]. • Part of PSA updates as per [32]. • Included in existing PSA [80], [81].
Seismic	Yes	Yes	Yes	Yes	• Seismic Margin Assessments [77], [78], [82], [83]. • Part of PSA updates as per [29], [38]. • Included in existing PSA [82], [83].
Toxic Gas	See Note 12	See Note 12	N/R See Note 13	N/R See Note 13	• Addressed in various sections of [18], [19].
Flooding	Yes	Yes	N/R See Note 13	N/R See Note 13	• Safety reports [16], [51]. • Assessed in [74] and [75]. • Discussed in Section 4.4 "Flooding" of [18], [19].
Extreme Temperatures	See Note 12	See Note 12	Yes	Yes	• Discussed in Section 4.5 "Meteorological – Extremes" [18], [19]. • Currently modeled into the PSA of both stations.

[12] The Hazard Screening Analyses [18], [19] are done as part of the PSA program to determine which events need to be subjected to further PSA assessment. However, the hazards are evaluated based on a deterministic evaluation of the consequences and the frequency of occurrence and therefore, the screening assessments also demonstrate that the hazards have been identified and deterministically evaluated.

[13] The potential for these hazards was assessed in the Hazard Screening Analyses [18], [19] and screened out of the PSA.

[14] Wind loading was addressed as part of the building code requirements used during the construction of each station but not analysed as a Design Basis Event. High wind events were however, already included in each stations' PSA prior to the creation of the Hazard Screening Analyses [18], [19] and hence not screened out in these reports.

Hazard	Assessment Approach				
	Deterministic		Probabilistic		Notes

External					
Aircraft Crash	See Note 12	See Note 12	N/R See Note 13	N/R See Note 13	• Discussed in Section 3.1 "Aircraft Impact" [18], [19].
Explosions	See Note 12	See Note 12	N/R See Note 13	N/R See Note 13	• Addressed in various sections of [18], [19].

N/R = Not Required

Change in Site Characteristics

Land use surrounding the Pickering site is discussed in the Safety Reports [16], [17]. Part 1, Section 2 of the Pickering Units 1,4 and Pickering Units 5-8 Safety Report discusses the site location and access, surrounding populations, land use, local agriculture, industries, fishing, recreation and transportation. Any changes in site characteristics with an impact on nuclear safety would be captured during the Safety Report updates. The impacts of changes in the site characteristics would then be captured in the development of models and methodology for external hazard analyses.

The Hazard Screening Analyses [18], [19], also consider the proximity of certain industries to the site and the effects they could have on both the probability of and severity of various hazards. These include:

- the location and use of airports to screen out certain aircraft impact hazards (discussed as a separate hazard below);
- the proximity of wharfs and commercial shipping activities to rule out possible shipping accidents; and
- the proximity of highways, railways or fixed sources of compressed gas and how they influence explosion and toxic gas hazards.

The effects of weather on site characteristics, e.g., soil failures (slope instability, subsidence, soil frost), the path of flood runoff or the build-up of snowpacks, are also considered and screened out within these reports.

High Winds (Tornado)

A tornado was not considered a Design Basis Event during the design of either Pickering Units 1,4 or Pickering Units 5-8, but high winds were addressed as part of the building codes used during the construction of each station.

Tornado and hurricane winds were assessed in the Hazard Screening Analyses [18], [19], for Pickering Units 1,4 and Pickering Units 5-8 respectively. High wind hazards (tornados and straight line winds) are in the scope of both the Pickering Units 1,4 and

Pickering Units 5-8 PSAs as documented in the general guidance for the preparation of high wind hazard PSAs [32], applicable to both Pickering Units 1,4 Pickering Units 5-8. The most current high wind PSA analyses for both stations are documented in [80] and [81].

Seismic

Seismic assessment of Pickering Units 1,4 was performed following the design and construction stages. Although the Pickering Units 1,4 systems were not originally required to be seismically qualified, the equipment was evaluated and a Safe Shutdown Equipment List was defined by the 1998 Seismic Margin Assessment [77], [78], which identified the SSCs required for the seismic success path. A PSA-based seismic margin assessment was subsequently completed for Pickering Units 1,4 in [82].

Seismic qualification of Pickering Units 5-8 was established during the design and construction stages through the implementation of the overall safety design requirements documented in Engineering Design Guide DG-30-68000-2 [79]. A PSA-based seismic margin assessment was subsequently completed for Pickering Units 5-8 in [83].

There are a number of governing documents used to establish and maintain the Seismic Qualification of safety related SSCs. These are:

- N-PROG-MP-0009, "Design Management" [85];
- N-PROG-MP-0001, "Engineering Change Control" [86];
- N-PROG-MA-0004, "Conduct of Maintenance" [58];
- N-PROG-MP-0008, "Integrated Aging Management" [87];
- N-PROC-MA-0024, "System Performance Monitoring" [88]; and
- N-STD-MP-0025, "General Requirements for Seismic Qualification of OPG Nuclear Facilities" [89].

The specific applications for Seismic Qualification as captured in these programs are described in the Safety Factor 3 Report: Equipment Qualification (Seismic and Environmental) [43].

Toxic Gas

Toxic gas releases due to rail transportation, road transportation, fixed sources and onsite vehicle movements have all been assessed in the Hazard Screening Analyses [18] and [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively. Specifically, potential toxic chemical releases originating from the following sources were examined:

- One of the two rail lines that run “east-west” directly north of the Pickering NGS site: The CN Rail mainline runs north of the Pickering nuclear site, approximately 2.5 km north of the two powerhouses and is considered in the hazard screening assessment; the CP Rail mainline is located approximately 6 km north of the site, beyond the screening distance value for rail hazards and is not considered further in [18] and [19].

- Highway 401, which is no closer than 2.5 km away from the Pickering site.

- All possible external fixed sources of hazardous gases identified within a radius of 5 km of the Pickering site.

- Toxic Chemicals regularly transported to the site and stored in bulk on site.

The Hazard Screening Analyses [18], [19] present a conservative assessment of the consequences of possible accidents originating from each of these sources and conclude that any accidents of consequence to either of the Pickering stations can be screened out based on extremely low frequencies.

Flooding

External flooding was considered in the designs of both Pickering 1,4 and Pickering 5-8 per Part 2 Section 2.2 of their respective Safety Reports [16], [51]. The overall flood protection system for the Pickering site consists of the shoreline breakwater works, catch basins, and storm sewers. The ground surface elevation of the Pickering site is above the 1 in 200 year lake water level. In the event that overtopping of flood protection occurs due to a high magnitude storm coupled with high Lake Ontario level, lake water will be collected in the catch basins while the storm sewers will discharge this water either directly back to the lake, or to the intake channel.

Flood assessments in support of Pickering A Return to Service completed in 2002 and 2003 (References [74] and [75] respectively) assessed the potential for flooding of the Pickering site after a 1 in 100 year rainfall and a storm similar to the Hurricane Hazel storm in 1954. These assessments determined that there was potential for some flooding at Pickering NGS under certain extreme weather conditions, such as 21 cm of ponding for about 40 minutes as a result of a 100 year rainfall event coupled with wave overtopping. However, the assessments concluded this flooding was deemed to not represent a hazard to the station given that “all critical components and systems required for safe operation of the plant are either too far away or high above the critical catchment areas to be susceptible to any water damage”.

The consequences of external flooding events were further assessed in Section 4.4 of the Hazard Screening Analyses for both Pickering Units 1,4 and Pickering Units 5-8 [18], [19], which assessed the more severe Probable Maximum Precipitation (PMP) as defined in [93]. The PMP is significantly more severe than those events assessed in the previous studies and is discussed further below.

The hazard screening reports assessed a number of flooding sources and combination of sources for inclusion into the station PSA, including the following:

- Flooding due to runoff;
- Flooding due to river;
- Flooding due to waves;
- Flooding due to seiche (a large standing wave);
- Flooding due to tsunami;
- Flooding due to releases of water from natural or artificial storage; and
- Flooding due to ice-jamming.

The majority of these events were screened out for both Pickering Units 1,4 and Pickering Units 5-8 as a result of these assessments. As a result of the Fukushima event and follow-up, a flood hazard impact assessment for the PMP event was conducted for the Pickering site as described in the Hazard Screening Analyses [18], [19]. Based on this impact assessment, flooding due to runoff could not be screened out for Pickering Units 1,4. This is described further below.

Additional assessments, including site walkdowns, were completed as a follow-up to the Fukushima event in 2011, as discussed in Reference [94]. These assessments identified that the installation of new fences on site had the potential to negatively impact potential flood levels. Based on this, OPG proactively designed and installed flood protection barriers to prevent water ingress to the Standby Generator Fuel Forwarding Pump House, should potential flood conditions materialize. The as needed use of these barriers is now documented in NA44-OP-54600-0016 [91] as called for by N-PROC-RA-0095 [92], which documents severe weather emergency preparedness.

Given the findings of the qualitative impact assessment of the PMP event described above, a quantitative assessment of the PMP event was performed for the area that includes the Pickering Units 1,4 Standby Generator Fuel Forwarding Pump House and Standby Generators. The results demonstrated that flood threshold elevations for the key equipment in the Pickering Units 1,4 SG area will not be exceeded provided the overland flow paths and Intake Forebay outlet are not blocked following the PMP event [94].

The Fukushima Action Item Status Report [95] summarizes the work performed to evaluate external events at Pickering NGS as part of S-294 compliance activities. As part of this work, OPG also provided the rationale for screening out external flooding for Pickering Units 1,4, which was accepted by the CNSC in Reference [96].

In 2015, the industry, in coordination with the CANDU Owners Group (COG) Technical Committee, initiated a work package to revisit the treatment of external flooding analysis methodologies and potentially redefine the PMP event. This work is currently being conducted under COG work package 23207, detailed in Reference [76]. Once complete, the results will be evaluated with respect to impact on Pickering and addressed as required.

Extreme Temperatures

Both high and low temperature extremes have been assessed in Section 4.5 of the Hazard Screening Analyses [18], [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively.

For low temperatures these reports state that per the original versions of the Pickering 1,4 and Pickering 5-8 Safety Reports, the stations were built to withstand -20°C and -22°C respectively, both of which are greater than the RLC temperature of -40.0°C, which defines the minimum potentially credible temperature the stations could experience as per the Hazard Screening Analyses [18], [19]. Nevertheless the assessments in the Hazard Screening Analyses conclude that the effects on plant safety are negligible because the Class III power gas turbine generators are capable of a black-start during the RLC. The station itself would be heated through extraction steam and, in the event sufficient process steam is unavailable, through a fossil fuel based Auxiliary Boiler System powered by off-site Class IV power. Further, if there is a concurrent loss of grid event, the Auxiliary Power System (APS) will be able to supply Class IV power for auxiliary boiler powerhouse heating, thus mitigating the effects from low temperatures [18], [19].

Similarly both Pickering Units 1,4 and Pickering Units 5-8 were built to a maximum temperature of 30°C, equivalent to the National Building Code of Canada requirement, which is below the RLC of 46.6°C, which defines the maximum credible temperature the stations could experience as per the Hazard Screening Analyses [18], [19]. Nevertheless, at this maximum temperature it is expected that the Heating, Ventilation and Air Conditioning (HVAC) systems would provide sufficient cooling to maintain equipment rooms within design limits in both stations. Should a shutdown be required, it is improbable that power available through Class IV, APS, Standby Generators (SGs) and Emergency Power Generators (EPGs) (in the case of Pickering Units 5-8 only) would be insufficient for a safe shutdown and removal of decay heat [18], [19]. The EQ program [42] looks at conditions that are much more severe than the RLC and ensures the availability of safety significant equipment to function.

As per the Hazard Screening Analyses [18], [19], the effects of both high and low temperatures are built into the Level 1 PRA as per N-GUID-03611-10001 Volume 1 [23], Section 2.4.8.3, which provides specific failure probabilities for equipment susceptible to temperature extremes over different temperature ranges.

Aircraft Crash

The major hazard from air transport is the possibility of an accidental impact of a large aircraft on the station. As indicated in the Hazard Screening Analyses [18], [19], a study of this possibility at Pickering NGS has shown that the probability of this event is acceptably small given the current level of air traffic in the area.

Explosions

The consequences of external explosions were analysed in Sections of 3.2 and 3.3 in both Hazard Screening Analyses [18], [19] for Pickering Units 1,4 and Pickering Units 5-8 respectively. Specifically, explosions originating from the following sources were examined:

- One of the two rail lines that run "east-west" directly north of the Pickering NGS sites: the CN Rail mainline runs north of the Pickering nuclear site, approximately 2.5 km north of the two powerhouses and is considered in the hazard screening assessment; the CP Rail mainline is located approximately 6 km north of the site, beyond the screening distance value for rail hazards and so is not considered further in [18] and [19].

- Highway 401, which is no closer than 2.5 km away from the Pickering site.

All events originated in areas outside of their respective Screening Distance Value provided in [30] and were therefore screened out based on distance.

Conclusion:

Based on the assessment above, it is confirmed that hazard analyses exist for the internal and external hazards listed in the Review Task with the following exception:

- To address CNSC Category 3 CANDU Safety Issue CSI-IH 6, the potential for, and possible impacts of, high-energy piping failures in Pickering Units 1,4 must be assessed. This assessment is currently underway [65], [66]. This is therefore identified as a gap for Pickering PSR2 (**Pickering PSR2 Gap SF7-1**).

4.1.2 Review Task #2: Consideration of Plant Design and Condition of SSCs

Confirm that the analyses and/or methods take into account the plant design and the condition of SSCs important to safety (both at present and predicted for the end of the period covered by PSR2).

N-PROC-MP-0086 [90], "Safety Analysis Basis and Safety Report Updates", defines the Safety Analysis Basis and describes the established practices to ensure that the Safety Analysis Basis is maintained. This includes a description of the process for potential changes to the safety analysis portion of the Safety Report, and provides the necessary instructions for raising and initial processing of issues, processing of inputs, prioritizing and performing analysis, physically updating the Safety Reports on a periodic basis ([97] to [100]), closing the issues and reporting to the CNSC. In accordance with the operating license, it is a requirement per CNSC Standard REGDOC-3.1.1 , to update each of the stations' Safety Reports at least once in every five year period [16], [17], hence ensuring the most current analyses and present plant design/condition is reflected.

The current plant design and the condition of SSCs important to safety used in deterministic safety analysis is determined by the implementation of N-PROG-MP-0014, "Reactor Safety Program" [101], and its implementing and interfacing documents. These documents govern management of issues related to nuclear safety analysis and their impact on safe operation. Interfacing documents include, but are not limited to, OPG's Environmental Qualification [42], Integrated Aging Management [87], Engineering Change Control [86], Equipment Reliability [102] and Component and Equipment Surveillance [103] programs, which assure that both the present and predicted condition of SSCs important to safety are maintained as follows:

- N-PROG-MP-0008, "Integrated Aging Management"

  Ensures the condition of critical Nuclear Power Plant equipment is understood and that required activities are in place to ensure the health of these components and systems while the plant ages. The program also requires preparation of life cycle management plans and condition assessments for critical plant equipment.

- N-PROG-RA-0006, "Environmental Qualification"

  Provides auditable assurance that equipment, to which Safe Operating Envelope (SOE) requirements apply, will perform its intended function when exposed to harsh environmental conditions resulting from a DBA, and that this capability is preserved over the life of the station.

- N-PROG-MP-0001, "Engineering Change Control"

  Specifies the requirement for risk evaluation for engineering changes based on reactor safety criteria. Preliminary and detailed safety analysis is required to be conducted under the reactor safety program if the proposed engineering changes would impact the Safety Analysis Basis.

- N-PROG-MA-0026, "Equipment Reliability"

  Establishes requirements for system monitoring and reporting to ensure that equipment, to which SOE requirements apply, will function as intended following DBAs.

- N-PROG-MA-0017, "Component and Equipment Surveillance"

  Establishes an integrated and comprehensive surveillance monitoring process to ensure components and equipment continue to meet the SOE requirements.

Facility-specific PSA updates are completed during regular review cycles, or when warranted such as by a major design change [104], hence ensuring the current condition of each station is reflected in all PSA related analyses. Specifically, N-STD-RA-0034 [41], "Preparation, Maintenance and Application of Probabilistic Risk Assessment", provides requirements for the preparation, maintenance and application of PSA at OPG Nuclear facilities including the required standard elements that have been developed to meet the intent of CNSC Regulatory Standard S-294, Probabilistic Safety Assessment for Nuclear Power Plants [20]. N-STD-RA-0034 further clarifies that "*PRA shall reflect the current configuration of the facility*" and that "*PRA maintenance shall ensure that changes to the design, operation and maintenance of the facility are reflected in the PRA*".

Conclusion:

The conclusion of this Review Task assessment is that the analyses and/or methods take into account the plant design and the condition of SSCs important to safety (both at present and predicted for the end of the period covered by PSR2). The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Hazard Frequencies and Consequences

For each relevant hazard, verify, by means of current analytical techniques and data, that the frequency of occurrence and/or the consequences of the hazard are sufficiently low so that either no specific protective measures are necessary, or the preventive and mitigatory measures in place are adequate.

Both internal and external hazards are screened based on probability and/or impact as per OPG PSA guidelines contained in [30], [31] and [35]. As per the detailed discussions included in Section 4.1.1, the most recent Hazard Screening Analyses completed in 2012 for Pickering Units 1,4 and Pickering Units 5-8, [18] and [19] respectively, screened out internal hazards related to toxic gas, missiles and explosions as well as external hazards related to toxic gas, flooding (with the exception of flooding due to runoff at Pickering Units 1,4), aircraft crashes and explosions. Internal fire, internal flooding, seismic, high wind and ambient temperature extremes however are all explicitly addressed in the most current station PSA in accordance with the requirements outlined in PRA standard N-STD-RA-0034 [41], and its subsidiary guidelines [23] through [38]. The current PSA analyses, including [46], [47], [54], [55], [80], [81], [82] and [83], confirm that the current predicted severe core damage frequencies for each hazard are below the OPG safety goals.

The survivability of equipment exposed to steam releases, internal flooding and sprays are factored into elements of the current EQ program N-PROG-RA-0006 [42] while the effects of pipe whip, steam release and changing site conditions are all within each station's safety analysis basis by way of their consideration in the most current revision of the Safety Report for each station.

Furthermore, the Fukushima Action Items and Emergency Mitigating Equipment (EME) provisions documented in [84], will provide additional defence in depth measures (e.g., monitoring, power supplies and fuel cooling) that will further reduce the consequences of many of the hazard analyses discussed above.

Conclusion:

The conclusion of this Review Task assessment is that the frequency of occurrence and/or the consequences of each relevant hazard (with the exception of one PSR2 gap identified in Review Task #1) are sufficiently low such that either no specific protective measures are necessary, or the preventive and mitigatory measures in place are adequate. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for eight L/R/C/Ss with content applicable to Safety Factor 7 are provided in References [6] and [7]. Associated findings applicable to Safety Factor 7 are summarized in Table 5 below.

Table 5: PSR2 L/R/C/S Review Results for Safety Factor 7

L/C/R/S Reviewed	**PSR2 L/R/C/S Review Results for Safety Factor 7**
CSA N286.7-16, "Quality Assurance Of Analytical, Scientific And Design Computer Programs"	There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.
CSA N293-12, "Fire Protection for Nuclear Power Plants"	For Safety Factor 7, there are no PSR2 gaps for CSA N293-12.
CNSC REGDOC-2.4.1 (2014), "Deterministic Safety Analysis"	For Safety Factor 7, there are no PSR2 gaps for CNSC REGDOC-2.4.1 (2014).
CNSC REGDOC-2.4.2 (2014), "Probabilistic Safety Assessment (PSA) for Nuclear Power Plants"	For Safety Factor 7, there are no PSR2 gaps for CNSC REGDOC-2.4.2 (2014).
CNSC REGDOC-2.5.2 (2014), "Design of Reactor Facilities: Nuclear Power Plants"	For Safety Factor 7, there are no PSR2 gaps for CNSC REGDOC-2.5.2 (2014).
CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	For Safety Factor 7, there are no PSR2 gaps for CNSC REGDOC-2.3.2 (2015).
CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"	The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [8]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.
CNSC G-149 (2000), "Computer Programs Used in Design and Safety Analyses of Nuclear Power Plants and Research Reactors"	There are no PSR2 gaps for CNSC G-149 (2000). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with G-149 (2000).

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program reviewed for Safety Factor 7 is identified in Table 2 and details of the associated effectiveness review for this N-PROG are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 7 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 7 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not find any PSR2 gaps for Safety Factor 7.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [10] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There is one PSR2 gap identified in this Safety Factor 7 Report that is also discussed in the Safety Factor 5 Report (Deterministic Safety Analysis) [105]. Gap SF7-1 identifies the on-going assessment to address the Category 3 CSI IH-6 relating to pipe whip. This work is also captured in Gap SF5-2, which relates to all Category 3 CSIs applicable to Pickering NGS.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 7 were reviewed for the three PSR2 Review Tasks in Section 4.1 of this report and resulted in PSR2 Gap SF7-1 below. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 7 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no PSR2 gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 7 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 7), which resulted in no additional PSR2 gaps.

The one PSR2 gap that will need to be addressed as part of Pickering PSR2 is:

- **Gap SF7-1:** To address CNSC CANDU Safety Issue CSI-IH 6, the potential for, and possible impacts of, high-energy piping failures in Pickering Units 1,4 must be assessed. This assessment is currently underway [65], [66]. Therefore, this has been identified as a PSR2 gap.

The review of Safety Factor 7 has confirmed the adequacy of protection of Pickering NGS against internal and external hazards, with account taken of plant design (including confirmation that analyses/methods address the condition of SSCs important to safety), site characteristics, and current analytical methods, safety standards and knowledge.

SCR	Station Condition Record
SDS	Shutdown System
SG	Standby Generators
SOE	Safe Operating Envelope
SSC	Structures, Systems and Components

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-RA-0012, "Fire Protection"

The objective of the Fire Protection Program is to minimize the risk of radiological releases to the public due to fire; protect the plant and facility occupants from risks due to fire; and minimize economic loss resulting from fire damage to structures, equipment, and inventories. The specific elements of the Fire Protection Program are based on the requirements of CSA N293, "Fire Protection for CANDU Nuclear Power Plants", as it applies to the Pickering Nuclear Generating Station (NGS). This includes the codes and standards that are referenced within, such as the National Fire Code of Canada, the fire protection requirements of the National Building Code of Canada and applicable National Fire Protection Association standards.

Nuclear Programs and Training completed a self-assessment, NO12-000316-SA [B.1.1], in May 2012 in order to assess the health of N-PROG-RA-0012, "Fire Protection", governance framework, which is applicable to both Darlington and Pickering NGS. This involved a review of SCRs, the governance framework and ownership, revision records and previous program assessments. The self-assessment concluded that the Fire Protection program is in full compliance with the applicable requirements.

The Emergency Management and Fire Protection department completed a self-assessment in June 2016, NO15-001497-SA [B.1.2], in order to determine the causal and human performance factors related to Space Allocation for Transient Material (SATM) issues applicable to both Pickering and Darlington NGS. A performance improvement opportunity applicable to Pickering NGS was identified in the area of SATM training.

Nuclear Oversight completed a performance based audit, NO-2015-016 [B.1.3], in December 2015, in order to assess corrective action effectiveness from previous Nuclear Oversight findings, peer reviews, program changes and initiatives since 2012 applicable to both Pickering and Darlington NGS. The audit identified performance improvement opportunities applicable to Pickering NGS in the areas of SATM requirements and testing for Carbon Dioxide extinguishers. Two SCRs were initiated to address the above findings and both have been completed.

Rev	Date	Author	Comments
R00	July 15, 2016	M. Hoang, R. Jayasundera	Initial issue for OPG review and comment.
R01	December 16, 2016	M. Hoang, R. Jayasundera, J. Cheng	Updated report addressing OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 8, *Safety Performance*, is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 8 were reviewed for the eight PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 8 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 8 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 8).

The results of the review of Safety Factor 8 are discussed in Section 5.0 of this report. The review has confirmed that the safety performance indicators and records of operating experience, including the evaluation of root causes of plant events, exist and are utilized to ensure the safe operation of Pickering NGS. As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Safety Performance Safety Factor 8 is to: "determine whether the plant's safety performance indicators and records of operating experience, including the evaluation of root causes of plant events, indicate any need for safety improvements". REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant." For this Safety Factor 8 Report, the objective is to confirm that the safety performance indicators and records of operating experience, including the evaluation of root causes of plant events, exist and are utilized to ensure the safe operation of Pickering NGS. Per the Pickering PSR2 Basis Document [1], analysis of gaps and potential safety enhancements for Pickering NGS (including identification of improvements that are reasonable and practicable to implement) is addressed as part of the Global Assessment process. Preparation of a plan for the implementation of safety enhancements is addressed by the PSR2 Integrated Implementation Plan.

This report documents the results of the review of Safety Factor 8 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 8 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 8 Review Tasks are:

1) Confirm existence of a system for identifying, classifying and recording safety related incidents and operating experience including:

    - Safety related incidents, low level events and near misses;
    - Safety related operational data;
    - Maintenance, inspection and testing;
    - Replacements of Structures, Systems, Components (SSCs) important to safety owing to failure or obsolescence;
    - Modifications, either temporary or permanent, to SSCs important to safety;
    - Unavailability of safety systems;
    - Radiation doses (to workers, including contractors);
    - Off-site contamination and radiation levels;
    - Discharges of radioactive effluents; and
    - Generation of radioactive waste.

2) Confirm that safety related incidents are investigated using root cause analysis and that lessons learned from investigation of these incidents are fed back into the conduct of Operations and Maintenance.

3) Confirm that the results of the root cause analysis are used to minimize the chances of the same incident reoccurring.

4) Confirm that information from trend analysis of safety related incidents is fed back into the conduct of Operations and/or Maintenance.

5) Confirm there is an adequate set of performance indicators that provides a systematic and comprehensive method to record, trend and analyze safety related data including the major system parameters, and maintenance and inspection records. Performance indicators may include:

    - Frequency of unplanned trips while the reactor is critical;
    - Satisfactory performance of safety system tests within required limits;
    - Special Safety System unavailability;
    - Reliability of Systems Important to Safety;
    - Collective annual radiation dose of plant staff;
    - Amount of gaseous and liquid radioactive release relative to permitted limits;
    - Heavy water escape and loss rates;

- Fuel reliability;
- Chemistry index;
- Volume of Low Level radioactive waste;
- Change control index;
- Maintenance backlog;
- Training;
- Environment Index;
- Non-radioactive effluents, including hazardous substances;
- Non-radioactive wastes; and
- Spills.

6) Confirm that for cases where performance indicators show an unsatisfactory trend, corrective action is taken.

7) Review the adequacy of:

    - Records of the integrity of physical barriers for the containment of radioactive material;
    - Records of radiation doses to persons on the site;
    - Records of data from off-site radiation monitoring and records of the quantities of radioactive effluents;
    - Records of non-radioactive effluents, including hazardous substances;
    - Records of radioactive and non-radioactive waste;
    - Records of spills; and
    - Records of other environmental impacts.

8) Consider the effects of any changes in operation at the plant on safety performance. In particular, confirm that current indicators and other safety performance methods continue to be relevant in the context of current and future operations, and confirm that only relevant data and records are used.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Safety Performance Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 8 L/R/C/S reviews are high level or incremental in nature. The definitions of a High Level Review and Incremental Review are as follows:

- High Level: New L/R/C/Ss not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and,

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6] and [7]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Safety Performance Safety Factor 8

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N290.15	Requirements for the Safe Operating Envelope of Nuclear Power Plants	N290.15-10	8	Incremental	N290.15 not addressed as part of Pickering B or Darlington ISRs, but gap analysis has been performed against OPG Governance and N290.15.
2	CSA N288.1	Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities	N288.1-14	8, 14	Incremental	N288.1 addressed as part of Pickering B and Darlington ISRs.
3	CSA N288.4	Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills	N288.4-10	8, 14	Incremental	N288.4 addressed as part of Pickering B and Darlington ISRs.
4	CNSC REGDOC-2.9.1*	Environmental Protection Policies, Programs and Procedures	2013	8, 14	Incremental	REGDOC-2.9.1 addressed as part of Darlington ISR. S-296 also addressed as part of Pickering B and Darlington ISRs.
Additional L/R/C/Ss						
5	CNSC G-129	Keeping Radiation Exposures and Doses "As Low As Reasonably Achievable (ALARA)"	2004	8, 15	Incremental	G-129 addressed as part of Pickering B and Darlington ISRs.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
6	CNSC G-228	Developing and Using Action Levels	2001	8, 14, 15	Incremental	G-228 addressed as part of Pickering B and Darlington ISRs.
7	SOR/2000-203	The Radiation Protection Regulations	Amended in June 2015	8, 15	Incremental	SOR/2000-203 addressed as part of Pickering B and Darlington ISRs.
8	CSA N288.6	Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills	N288.6-12	8, 14	Incremental [3]	N288.6 not addressed as part of Pickering B or Darlington ISRs. Implementation Plan and clause-by-clause review have been prepared for Pickering Environmental Monitoring Program compliance with N288.6.
9	CSA N288.5	Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills	N288.5-11	8, 14	Incremental [3]	N288.5 not addressed as part of Pickering B or Darlington ISRs. OPG has performed a gap analysis and completed all actions in the implementation plan to satisfy mandatory requirements of N288.5.
10	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.
11	CNSC REGDOC-2.3.3	Periodic Safety Reviews	2015	8	High Level	REGDOC-2.3.3 not addressed as part of Pickering B or Darlington ISRs. New PSR methodology.

[3] Per Section 3.2.2 of the R02 PSR2 Basis Document [1]: "Table D1 identifies the review type to be applied to each of the Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis. Following further assessment of past work, the review type of a listed modern Law, Regulation, Code or Standard may be changed from Clause-by-Clause or High Level to Incremental." Past assessments of CSA N288.3.4, N288.5 and N288.6 were reviewed and implementation plans with gap assessments were identified. As a result, the Review Type for these three L/R/C/Ss was changed from High Level to Incremental since "… implementation plans exist for many of the codes and standards not addressed in PSR1 and therefore an incremental review will be applied to these documents" [1].

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
12	CSA N288.3.4	Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities	N288.3.4-13	8, 14	Incremental [3]	N288.3.4 addressed as part of Darlington ISR, but not addressed as part of Pickering B ISR. OPG has completed a gap analysis and is developing an implementation plan to satisfy mandatory requirements of N288.3.4.

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

2.3 OPG Program Effectiveness Reviews

The OPG Programs reviewed for Safety Factor 8 are listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of each of the N-PROGs and OPG-PROGs in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Programs Reviewed for Safety Factor 8

Document Number	Document Title
N-PROG-RA-0002 [8]	Conduct of Regulatory Affairs
N-PROG-RA-0003 [9]	Corrective Action
OPG-PROG-0010 [10]	Health & Safety Management System Program

2.4 Additional Reviews

The PSR2 Safety Factor 8 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 8):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

[4] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 8 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 8 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [11] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 8 review which need to be addressed in other Safety Factor reports are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Safety Performance Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 8 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.

- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[5]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

[5] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 8 L/R/C/S reviews identify Compliances and Gaps as defined below:[6]

- Compliance:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 8.)

---

[6] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 8.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance. As a result, the broad review scope of program audits focuses on

identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [12]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 8):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 8 (as identified in the Darlington ISR Integrated Implementation Plan [13] and Pickering Units 5-8 Continued Operations Plan [11]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[7]

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

---

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2. With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Any PSR2 gaps identified as a result of the Safety Factor 8 review which need to be addressed in other Safety Factor reports are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 8 Review Tasks.

4.1.1 Review Task #1: System for Identifying, Classifying, and Recording Safety Related Incidents

Confirm existence of a system for identifying, classifying and recording safety related incidents and operating experience including:

- *Safety related incidents, low level events and near misses;*
- *Safety related operational data;*
- *Maintenance, inspection and testing;*
- *Replacements of SSCs important to safety owing to failure or obsolescence;*
- *Modifications, either temporary or permanent, to SSCs important to safety;*
- *Unavailability of safety systems;*
- *Radiation doses (to workers, including contractors);*
- *Off-site contamination and radiation levels;*
- *Discharges of radioactive effluents;*
- *Generation of radioactive waste.*

The corrective action program, N-PROG-RA-0003, "Corrective Action" [9] establishes the processes to ensure deficiencies, non-conformances, weaknesses with a process, document, or service, or conditions that adversely impact, or may adversely impact plant operations, personnel, nuclear safety, the environment or equipment and component reliability, are promptly identified and corrected or dispositioned. Additionally, the corrective action program provides the processes for ensuring internal and external Operating Experience (OPEX) are evaluated, distributed to appropriate personnel, and applied to implement actions that improve plant safety and reliability. As shown in Figure 1 of N-PROG-RA-0003 [9], there are a number of implementing procedures and interfacing programs. The Corrective Action Program is described in Appendix B.2.

<u>Identifying Incidents</u>

Section 1.1.1 of N-PROG-RA-0003 [9] states that N-PROC-RA-0022, "Processing Station Condition Records" [14] ensures that designs, documents, tools, materials, parts, processes, services, and/or practices that do not meet requirements are promptly identified, documented, reported, analyzed, and corrected.

N-PROC-RA-0022 defines adverse conditions as undesired conditions that are to be screened relative to risk, significance, and consequence. A condition could be adverse if it detracts from the intended function or operation of structures, systems, components, procedures, or practices, and may be caused by inappropriate behaviours, inadequate compliance, acts of nature, or other factors that could impact safety. This definition encompasses adverse conditions related to:

- Safety related incidents, low level events and near misses;
- Safety related operational data;
- Maintenance, inspection and testing;
- Replacements of SSCs important to safety owing to failure or obsolescence;
- Modifications, either temporary or permanent, to SSCs important to safety;
- Unavailability of safety systems;
- Radiation doses (to workers, including contractors);
- Off-site contamination and radiation levels;
- Discharges of radioactive effluents; and
- Generation of radioactive waste.

Adverse conditions identified through interfacing programs (such as N-PROG-MA-0019, "Production Work Management" [15], N-PROG-MP-0004, "Pressure Boundary" [16], N-PROG-MP-0001, "Engineering Change Control" [17], and N-PROG-MA-0026, "Equipment Reliability" [18]), are documented, reviewed, evaluated, corrected and verified in accordance with N-PROC-RA-0022 [14]. As mentioned in P-REP-03680-00017, "Pickering NGS PSR2 Safety Factor 13 Report: Emergency Planning" [19], significant deficiencies identified during Emergency Preparedness drills and exercises also qualify as adverse conditions and are addressed in the Station Condition Record (SCR) process outlined below.

When an adverse condition is discovered, an SCR is initiated and submitted to the initiator's First Line Manager (FLM). The FLM then reviews the SCR to ensure it is in alignment with the SCR initiation process outlined in Section 1.2, "Initiating an SCR", of N-PROC-RA-0022 [14]. The initiator ensures that all required fields have been completed, that personnel names are not included, etc. The initiator then progresses the SCR to "FLM status", and by the end of the shift or within 24 hours, the FLM progresses the entry to "Management Review Meeting" (MRM) status.

Internal OPEX events are identified by the Senior Officer, Performance Improvement – OPEX or Nuclear Support OPEX Coordinator and Evaluating Organization (EO) Manager (or delegate) in accordance with N-GUID-04947.02-10001, "Guidelines for Classifying Internal Events" [20]. The external OPEX process entails identifying CANDU-related OPEX events after the CANDU Owners Group (COG) reviews recent OPEX events from a variety of sources, including World Association of Nuclear Operators (WANO), Institute of Nuclear Power Operators (INPO), and COG. N-GUID-04947.02-10000, "External Events Screening Guide" [21], provides screening guidelines for the review of external OPEX events.

Classifying Incidents

The process for identifying and evaluating degraded station conditions when the ability of SSCs to carry out their defined safety-related functions is questioned is described in the Technical Operability Evaluation (TOE) process in N-PROC-MP-0045, "Technical Operability Evaluation" [22]. The TOE process provides a substantiated engineering verification that a SSC is capable of fulfilling its minimum credited safety function(s). It is required when uncertainty arises with respect to operability of equipment to meet the functional requirements of the defined Safe Operating Envelope (SOE), and is initiated concurrently with an SCR.

The Discovery Issue Resolution Process described in N-PROC-RA-0094, "Discovery Issue Resolution Process" [23] is used when operation of a nuclear facility conforms with its defined SOE, but a problem or a potential problem with the station safety analysis upon which the SOE is based is identified, or when there is a change in analytical basis (such as a gap discovered in the definition of the SOE). This process is initiated to confirm that regulatory limits are met and risk is maintained at an acceptable level. It can also be instigated to put in place mitigating provisions. The Discovery Issue Resolution Process is applied after initiation of an SCR and concurrence is obtained from the appropriate manager, Reactor Safety Engineering Department of the applicable station.

SCR coordinators review all SCRs progressed to MRM status as per Section 1.5, "SCR Coordinator Dispositioning", of N-PROC-RA-0022 [14]. The SCR coordinator determines the Significance Level (S/L) and Resolution Category in accordance with Appendix B, "Station Condition Record Resolution Category Requirements", of N-PROC-RA-0022 [14] and N-LIST-01966-10000, "Station Condition Record Significance Level Criteria" [24].

Table 3, as outlined in N-LIST-01966-10000 [24], shows the various S/Ls for SCRs. S/L is a measure of the impact on Nuclear business deliverables. A detailed list of criteria is available in N-LIST-01966-10000, "Station Condition Record Significance Level Criteria" [24].

Table 3: Definition of Significance Levels 1 to 4

Significance	Description
Level 1	**A highly significant event** or adverse condition or programmatic implementation deficiency that causes a major reduction in the margin of safety to the public or to station personnel and/or which has a major impact on the environment or on production or on other business deliverables.
Level 2	**A significant event** or adverse condition or programmatic implementation deficiency that causes some reduction in the margin of safety to the public or to station personnel and/or which has some impact on the environment or production or on other business deliverables.
Level 3	**An event** or adverse condition or programmatic implementation deficiency, which is not significant by itself but which has the potential to be more significant or which may be the precursor to a more significant event.
Level 4	**A minor condition** adverse to quality, which should help to identify, by means of a trend analysis, those areas that need more attention.

The resolution category applies to the level of effort and investigative rigour that is required to identify and correct the adverse condition. The resolution categories are described in Appendix B of N-PROC-RA-0022 [14] and summarized in Table 4 below.

Table 4: Definition of Resolution Categories A to D

Resolution Category	Description
Category A	An investigation involving multidisciplinary Subject Matter Experts, including an assigned Evaluating Organization Manager accountable for oversight and direction of the team, and a qualified Root Cause evaluator, who will use multiple techniques to determine root cause(s). The causes shall have related Corrective Action(s) that will prevent recurrence.
Category B	An investigation involving a qualified Root Cause Evaluator, with Managers and Subject Matter Experts as required, that will determine root cause(s). The cause(s) will have related Corrective Action(s) that will prevent recurrence.

Resolution Category	Description
Category C	An evaluation of known facts by a person knowledgeable of the issue area that determines the causes and related Corrective Action(s) that will reduce the frequency of recurrence of adverse conditions.
Category D	An isolated incident of a failed barrier, procedural non-compliance or minor condition which can either be fixed or trended to identify areas needing more attention, or the impact associated is low such that no additional corrective action is warranted at this time.

For classifying, reporting, and recording worker and contractor safety incidents and regulatory events within OPG, a procedure is outlined in OPG-PROC-0120, "Safety Incident and Regulatory Event Response" [25]. Per OPG-PROC-0120 [25], line management is responsible for ensuring that all safety incidents are recorded as an SCR according to N-PROC-RA-0022 [14] or an OPG Corporate Report of Incident/Injury. The safety incident is subjected to the safety incident Maximum Reasonable Potential for Harm rating process, in which each incident is reviewed on a case by case basis to determine its potential severity. Upon agreement on the Maximum Reasonable Potential for Harm rating, line management initiates an appropriate investigation and corrective action according to "Safety Incident Investigation and Corrective Actions", OPG-PROC-0121 [26].

<u>Recording Incidents</u>

An SCR contains information fields such as: description of the incident or condition, apparent cause of the condition, recommended resolution, reportability, S/L, trending organization, causal factors (which are used for trending purposes), adverse trend contributing SCRs, and assignments which are part of the Corrective Action Plan (CAP). SCRs are documented through the OPG Station Condition Record system (the Pickering SCR Facility is used for the Pickering station). [8]

Corrective Actions (CAs) from the CAPs are then progressed as per N-PROC-RA-0022 [14], and the status of the SCR is set to IN PROG. Action Tracking Assignments are documented in the OPG document management database Asset Suite. Once all corrective assignments have been completed, the SCR is progressed to COMPLETE.

Procedures are in place for the recording of radiation doses, radioactive effluents, offsite radiation, and radioactive waste. Documentation includes quarterly reports on Safety Performance Indicators. These records are described in detail in Review Task #7.

---

[8] Wording has been revised from "SCR database" to "SCR Facility" to reflect the migration of SCR databases into a single web-based platform. "Facility" here does not refer to the physical plant.

The Radiation Protection program, as outlined in N-PROG-RA-0013, "Radiation Protection" [27], implements a series of standards and procedures for the conduct of activities within nuclear sites and with radioactive materials. Events or conditions that indicate real or potential deficiencies identified through the Radiation Protection program are filed as SCRs. The SCRs are subsequently reviewed to determine if reporting to the CNSC in accordance with the applicable CNSC license is necessary.

Further discussion of the use of OPEX is found in P-REP-03680-00013, "Pickering NGS PSR2 Safety Factor 9 Report: Use of Experience from Other Plants and Research Findings" [28].

Conclusion:

The assessment of this Review Task confirms the existence of a system for identifying, classifying, and recording safety related incidents and operating experience. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Safety Related Incidents Investigation – Feedback and Lessons Learned

Confirm that safety related incidents are investigated using root cause analysis and that lessons learned from investigation of these incidents are fed back into the conduct of Operations and Maintenance.

As discussed in Review Task #1, the Corrective Action program, N-PROG-RA-0003 [9], provides the system for identifying, classifying and recording safety related incidents. As part of the Corrective Action program, Root Cause Analyses (RCAs) and Apparent Cause Evaluations (ACEs) are initiated via the SCR process to ensure effective corrective actions are developed and implemented.

Appendix B, "Station Condition Record Resolution Category Requirements", of N-PROC-RA-0022 [14] outlines events that require a RCA or ACE based on an adverse condition's resolution category (A to C). See Review Task #1 for a description of S/L and resolution category. RCAs are required for adverse conditions having resolution category A and B, which are assigned to safety significant events. According to N-STD-RA-0008, "Incident Investigation" [29], the investigation process involves the following key activities:

- Meeting with the EO Manager and establishing terms of reference.
- Assigning team members, developing an investigation plan, meeting with an investigation team and assigning actions.
- Gathering and analyzing information.
- Determining extent of condition, causes, and extent of causes.

- Using operating experience, developing a CAP, and preparing an Incident Investigation Report.

EO Managers, according to N-PROC-RA-0022 [14], are involved in the resolution of all category A, B, and C conditions, and consequently in all RCAs and ACEs. EO Managers are responsible for ensuring:

- The root cause identified in the SCR is addressed with the CAs in accordance to N-PROC-RA-0022 [14], including contributing causes if appropriate.
- CAs from current evaluations address adverse conditions identified in closed out SCRs, and the causes encompass all SCRs closed out to the current evaluation.
- CAPs are developed to balance response with level of significance (risk) of the event or adverse trend.
- Concurrence is obtained from all Responsible Managers assigned responsibility for CA assignments before SCR progresses to "Approve" status.
- An EO Effectiveness Review action is generated for
    - S/L 1 and 2 SCRs.
    - "Corrective Action Review Board" (CARB) - flagged S/L 3 SCRs.
    - OPEX SCRs raised for WANO Significant Operating Experience Report /Significant Event Report and Level 1/2 INPO Event Reports.
- Actions are developed according to "Specific, Measurable, Achievable, Reasonable and Timely" criteria.
- Completion and success criteria are specified for each recurrence control (RC) action assignment.

The Corrective Actions listed in the CAP, in accordance with N-PROG-RA-0003 [9], address the fundamental causes of problems, any generic implications, and the actions to prevent reoccurrence. Further, CAs are documented, communicated to appropriate levels of management, and tracked to completion.

Feedback and Lessons Learned

According to N-STD-RA-0008 [29], RCAs and ACEs are conducted to reduce the probability of similar incidents reoccurring in the future. As outlined in N-PROC-RA-0022 [14], SCR related lessons are transferred and related information is communicated through OPEX mechanisms in accordance with N-PROC-RA-0035, "Operating Experience Process" [30]. This procedure ensures a consistent process is used to evaluate and integrate OPEX information at Ontario Power Generation Nuclear (OPGN). The Internal Information Process (Internal OPEX Process) detailed in N-

PROC-RA-0035 [30], communicates internal events and lessons learned to COG, WANO, and non-incident OPGN sites. Relevant OPEX lessons are also integrated into Training and Nuclear Refurbishment activities in accordance with N-PROC-RA-0035 [30]. In addition, as outlined in N-PROC-OP-0005, "Pre-Job Briefing and Post-Job Debriefing" [31], discussion of relevant OPEX is required during all Pre-job Briefs (PJBs) if the consequence of error is high (Level 3 or 4 PJBs). Internal and external OPEX is also identified in all Level 1 detailed work packages and relevant OPEX is included in all other work, in accordance with N-PROC-MA-0002, "Work Planning" [32]. The level of OPEX discussed during the PJB is determined by the risk of the job.

As stated in N-STD-RA-0008 [29], the status of incident evaluations and the assigned resolution category are presented at a MRM. MRMs, according to Section 1.7, "Management Review Meeting", of N-PROC-RA-0022 [14], ensure the appropriate disposition of SCRs. MRMs ensure sufficient details regarding the adverse condition are provided and ensure the disposition of SCRs is appropriate as outlined in N-PROC-RA-0022 [14]. Additionally, MRMs monitor SCRs to ensure adverse conditions are resolved in a timely manner. For Nuclear Support SCRs, MRMs confirm that any station impacts have been addressed as outlined in N-PROC-RA-0022 [14]. MRMs also determine Site and Department Event Free Day Resets, CAPs to be designated for "CARB Review", and OPEX SCRs requiring CARB Review. MRMs consist of representatives from several organizations, including Operations and Maintenance. In addition, the Chairperson of the Pickering MRMs is the Director of Operations and Maintenance, or their appointed delegate.

Further discussion regarding the OPEX process is provided in P-REP-03680-00013, "Pickering NGS Periodic Safety Review Safety Factor Report: Use of Experience from Other Nuclear Power Plants and Research Findings" [28].

Conclusion:

The assessment of this Review Task confirms that safety related incidents are investigated using root cause analysis and that lessons learned from investigation of these incidents are fed back into the conduct of operations and maintenance. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Minimizing Incident Reoccurrence Using Root Cause Analysis

Confirm that the results of the root cause analysis are used to minimize the chances of the same incident reoccurring.

Solutions to causes identified by Root Cause investigations are designed to prevent reoccurrence, as outlined in Section 1.5.12 of N-STD-RA-0008 [29]. Review Tasks #1 and #2 discuss conditions requiring an RCA, and how lessons are learned and fed back into the conduct of Operations and Maintenance. Reoccurrence of undesirable conditions is prevented by correcting the root cause. CAs are developed to address each identified root cause and, as appropriate, contributing causes in accordance with N-PROC-RA-0022 [14].

Incident investigations are initiated through the SCR process in accordance with N-PROC-RA-0022 [14] or OPG-PROC-0121 [26] for safety events. Appendix B of N-PROC-RA-0022 [14] outlines when to perform an RCA (typically resolution category A and B) or an ACE (typically resolution category C). The SCR process outlined in N-PROC-RA-0022 [14], entails developing a CAP with specific CAs that address each identified root cause. In order to prevent reoccurrence, the SCR process involves identifying adverse conditions, performing RCAs, implementing CAs, and the oversight of an EO Manager and the CARB. For RC, the EO Manager ensures evaluations have at least one RC action to prevent recurrence (for resolution category A and B evaluations) or reduce risk of recurrence (for resolution category C evaluations). See Review Task #1 for a description of S/L and resolution category. SCRs initiated due to safety significant conditions (S/L 1 or 2), as well as CARB-flagged S/L 3 SCRs, are all subject to an Evaluating Organization Effectiveness Review (EOER) as described in N-PROC-RA-0022 [14]. The EOER involves an EO Manager evaluating the effectiveness of S/L 1 and 2 and selected S/L 3 CAPs in accordance with N-GUID-01966-10001, "Evaluating Organization Effectiveness Reviews" [33]. As outlined in Section 1.15, "Evaluation Organization Effectiveness Review", of N-PROC-RA-0022 [14], the EOER should be completed within six months of completion of the last RC action. Further, as stated in Section 1.12 of N-PROC-RA-0022 [14], the Corrective Action Review Board is responsible for assuring the health of the Corrective Action Program. The CARB consists of Directors and senior management, and provides management level oversight of the Corrective Action Program to assure the overall health of the program and verify that significant adverse conditions are being identified and effectively addressed.

As an additional metric that provides fundamental feedback on program effectiveness, potential repeat events are confirmed through MRMs and the Performance Improvement department according to N-PROC-RA-0022 [14]. Repeat events are events previously evaluated via root cause analysis that have any one causal factor group the same and the same terminal condition as previously identified in the last three years.

Conclusion:

The assessment of this Review Task confirms that the results of RCAs are used to minimize the chances of the same incident reoccurring. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Feedback of Trend Analysis into Conduct of Operations and/or Maintenance

Confirm that information from trend analysis of safety related incidents is fed back into the conduct of Operations and/or Maintenance.

Trend Analysis of Safety Related Incidents

Safety related incidents are, as described in Review Task #1, identified, classified and recorded through the SCR process in accordance with N-PROG-RA-0003 [9]. N-PROC-RA-0022 [14] describes the reporting and evaluation process for identified adverse conditions to ensure that:

- Management reviews, screens, and validates identified circumstances of events or adverse conditions;
- Reoccurring or serious nonconforming conditions, potential trends, and significant in-house events are analyzed to determine their causes and generic implications, and corrected to prevent reoccurrence;
- CAs address the fundamental causes of problems, the generic implications, and the actions to prevent reoccurrence of serious nonconforming conditions and potential trends;
- CAs are tracked to completion;
- Overdue CAs are reported to applicable managers on a periodic basis;
- SCR related lessons are shared and communicated through OPEX mechanisms in accordance with N-PROC-RA-0035 [30];
- Trend codes are assigned for applicable trend categories;
- Early identification of potential adverse trends is documented and evaluated; and
- SCR Trend Reports are generated periodically and distributed to management.

When an adverse condition is identified and a subsequent SCR is initiated, the SCR Coordinator applies the appropriate SCR codes as required to perform trend analysis, in accordance with Section 1.5, "SCR Coordinator Dispositioning", of N-PROC-RA-0022 [14]. Trending Organizations are also added or corrected as necessary to identify the most appropriate group to perform trending of the SCR. Up to three Trending Organizations may be added to an SCR if the content of the SCR indicates multiple or cross-functional issues that may be trended and analyzed by additional groups, in accordance with Section 1.2, "Application of SCR Trend Codes", of N-INS-01966.1-10000 [34].

External independent assessments provided by a Nuclear Safety Review Board and the Nuclear Oversight Committee of the Board of Directors, as described in Section 1.1.7, "Independent Assessment", of N-CHAR-AS-0002, "Nuclear Management System" [35], provide a review of the significance of occurrences and trends that may affect nuclear safety and environmental matters. Site cross functional trending and analysis is performed by the department with the program area responsibility or the Performance Improvement Departments for areas not addressed by the program areas. Each quarter, the following station departments perform SCR trend analysis and prepare a Quarterly Performance Improvement Report in adherence to N-INS-01966.1-10000, "Trending and Analysis Instruction and Performance Improvement Reporting" [34]:

- Chemistry;
- Corrective Action;
- Engineering;
- Fuel Handling;
- Human Performance;
- Maintenance;
- Operations;
- Radiation Protection;
- Safety; and
- Work Management.

Other departments identified by an alert group which are assigned as the trending organization for more than 100 SCRs per quarter should perform a quarterly SCR trend analysis and prepare a Quarterly Performance Improvement Report. Line organizations maintain and revise Line Defined Codes as new issues arise that are required to be trended in more detail.

Section 1.5.4 of N-INS-01966.1-10000 [34] outlines the data analysis content included in trend reports at OPG. The reports include:

- SCR Generation Rate;
- Event Based Code Analysis;
- S/L 1 and 2 Analysis;
- Resolution Category Trends;
- Causal Factor Code Analysis;

- Human Performance Code/Event Analysis;
- S-99 Reportable Events; [9]
- Line Defined Code Analysis;
- Observation and Coaching (O&Cs);
- Employee Surveys; and
- Management Focus Areas (Nuclear Safety Culture).

Identification and Characterization of Adverse Trends

N-INS-01966.1-10000 [34] defines an *adverse trend* as follows:

> **Adverse Trend** is a change in performance data that is statistically valid, and that knowledge, experience, and judgement indicate that the performance change is unacceptable.

To facilitate the identification of adverse trends and common issue areas through trending and analysis, SCRs are coded with a minimum of one trend code. N-PROC-RA-0022 [14] states that once an SCR reaches the "MRM" status, the SCR Coordinator assigns any additional trend codes based on an EO Manager's evaluation. The trend codes are selected from the five code sections listed in N-LIST-01966-10001, "Trend Codes Applied to Station Condition Records" [37]. These sections are: Human Performance Trend Codes, Causal Factor Codes, Event Based Codes, Management Focus Area Codes, and Line Defined Codes. A minimum of one Event Based Code is assigned to all SCRs except for non-event SCRs. Non-event SCRs are SCRs that are entered in error, do not represent an adverse condition, are a duplicate of another SCR, or constitute an adverse condition for another facility rather than the originating facility.

For human performance related SCRs, a department Event Free Day Reset code may occur if the requirements described in N-INS-09030-10002, "Site and Department Level Event Free Day Resets" [38], are met. Human performance trend codes listed in Table 1 of N-LIST-01966-10001 [37] describe adverse job site conditions.

As outlined in N-LIST-01966-10001 [37], for all resolution category A, B, and C adverse conditions, at least one Causal Factor Code is required. Causal Factors of adverse conditions at the programmatic level related to Organizational Process and Values (Latent Organizational Weaknesses) are listed in Table 2 of N-LIST-01966-10001 [37].

[9] Per the Pickering License Conditions Handbook [4], the most recent Pickering PROL (48.02/2018) [59] has an amendment to replace S-99 [39] with REGDOC-3.1.1 [36].

For each SCR, at least one Event Based Code is required. Event Based Codes are applied to an SCR to characterize the undesirable incident (event) or observed condition (Job Site Conditions) described in the SCR and are listed in Table 3 of N-LIST-01966-10001 [37].

Reporting of maintenance performance at Pickering NGS is performed quarterly through the Pickering Maintenance Department Performance Improvement Report in accordance with N-INS-01966.1-10000 [34]. SCRs are analyzed to identify new trends, continuing trends, as well as closing trends. For example, in Q4 of 2015, Event Based Codes were applied to SCRs as outlined in P-REP-01966-0575908, "Pickering Maintenance Department Performance Improvement Report, Q4 2015" [40]. This report describes a potential trend identified by Performance Improvement with an Event Based Code. Adverse trend SCR P-2015-29318 was filed to document the potential adverse trend for missing/unavailable tooling and equipment. In response, Crew Event Free Day Resets were applied to SCRs related to missing tools. This allowed tracking on crew level report cards and added focus via review at Crew Management Review Board meetings.

Resolution of Adverse Trends

If analysis identifies an adverse trend, an SCR or Self Assessment is initiated to resolve the issue. An adverse trend SCR is at least resolution category C, as stated in Section 1.6, "Trend Analysis Techniques", of N-INS-01966.1-10000 [34]. As described in N-INS-01966.1-10000 [34], following identification of an adverse trend, the trend performance is tracked until performance is within the acceptable limits for two consecutive quarters. If the implemented actions taken by the EO Manager to reverse a trend are not effective in improving performance over two consecutive quarters, another adverse trend SCR is initiated.

Feedback of Trend Analysis into Conduct of Operations and/or Maintenance

Information from trend analysis is fed back into the conduct of Operations and/or Maintenance through several processes.

The Operations and/or Maintenance line organizations may be selected as one of the Trending Organizations for an SCR. Through the trending process, the Operations and/or Maintenance line organizations inherently share information within the organization.

MRMs involve reviewing all trend SCRs. See Review Task #2 for a description of MRMs. MRMs consist of representatives from several organizations, including Operations and Maintenance. In addition, the Chairperson of the Pickering NGS MRMs is the Director of Operations and Maintenance, or their appointed delegate.

All Performance Improvement Reports are completed and approved by the Department Manager within six weeks following the end of the calendar quarter in accordance with Section 1.3.3 of N-INS-01966.1-10000 [34]. In addition, the CARB reviews Performance Improvement reports to ensure adverse trends are identified and appropriate corrective actions have been identified as outlined in N-PROC-RA-0022 [14].

Conclusion:

The assessment of this Review Task confirms that the information from trend analysis of safety related incidents is fed back into the conduct of operation and/or maintenance. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Adequacy of Performance Indicators

Confirm there is an adequate set of performance indicators that provides a systematic and comprehensive method to record, trend and analyze safety related data including the major system parameters, and maintenance and inspection records.

Performance indicators may include:

- *Frequency of unplanned trips while the reactor is critical*
- *Satisfactory performance of safety system tests within required limits*
- *Special Safety System unavailability*
- *Reliability of Systems Important to Safety*
- *Collective annual radiation dose of plant staff*
- *Amount of gaseous and liquid radioactive release relative to permitted limits*
- *Heavy water escape and loss rates*
- *Fuel reliability*
- *Chemistry index*
- *Volume of Low Level radioactive waste*
- *Change control index*
- *Maintenance backlog*
- *Training*
- *Environment Index*
- *Non-radioactive effluents, including hazardous substances*
- *Non-radioactive wastes*
- *Spills.*

Performance Indicators provide a method of monitoring and measuring the station performance against safety goals and limits. There are two significant sources for measuring performance indicators.

a) In accordance with PROL 48.02/2018 [59], REGDOC-3.1.1 [36] identifies specific performance indicators that must be reported to the CNSC on a quarterly basis. OPG records and reports these in the Quarterly Report on Safety Performance Indicators.

b) OPG monitors performance indicators using the Electronic Performance Reporting (EPR) system to measure the performance of the stations against the business planning goals and targets.

OPGN has implemented a top-down/bottom-up approach to business planning where its leaders establish clear performance targets. The leaders then, in subsequent business plans, identify actions and accountabilities required to achieve these targets over a specified period of time.

The Nuclear business planning framework is a component of the management cycle. It consists of five components: Benchmarking, Setting Strategic Direction, Gap Closure Planning, Developing Detailed Business Plans, and Performance Reporting.

Part of the setting strategic direction phase is to establish the level of performance that the nuclear organization is expected to achieve within the business planning horizon through setting specific targets. Target setting at OPGN is detailed in Section 1.3.4 of N-PROC-AS-0080, "Nuclear Business Planning" [41].

The monitored and measured performance indicators are documented in OPG systems in accordance with N-PROC-AS-0078, "Nuclear Performance Monitoring and Reporting" [42]. N-PROC-AS-0078 [42] defines the requirements for the reporting of OPGN and Nuclear Projects business plan performance results and establishes a process to enable monitoring of performance, based on objective measures to promote and sustain improved performance. Within OPG, a tiered approach for performance indicators has been implemented based on industry best practice. Four tiers are used based on the relevance to the overall Nuclear and site strategic goals and objectives.

- **Tier 1** – Nuclear strategic indicators that tie to the business plan and are benchmarked against industry standards. Tier 1 measures are usually included as part of the Stakeholder Return Program. While Tier 1 measures are of importance to all within Nuclear, they are actively reviewed and managed at the Senior Vice President level and above.

- **Tier 2** – Operational level indicators tied to the business plan to meet strategic Tier 1 goals and are usually found on Nuclear and Site Report Cards. Tier 2 measures are also actively reviewed and managed by Senior Nuclear level management.

- **Tier 3** – Supporting indicators for various functional work groups that tie to the functional area business plans and department/site plans to meet Tier 2 goals. The measures are generally managed and used by the Stratum IV and V level. [10]

- **Tier 4** – Department/site specific indicators established, maintained, and monitored by individual departments, used as precursors to Tier 1, 2 or 3 measures. These measures are the most specific and visible to employees. They may reside in the EPR system or are managed locally by a site or business unit and are generally used by the Stratum III level and below.[11]

The reporting tools used for the collection and transmittal of information are the OPG EPR System and the World Association of Nuclear Operators Data Entry System (WANO DES).

Safety Performance Indicators are reported to the CNSC quarterly and are implemented as specified in Appendix B of REGDOC-3.1.1 [36]. These indicators are:

1) Collective Radiation Exposure
2) Personnel Contamination Events
3) Unplanned Dose/Unplanned Exposure
4) Loose Contamination Events
5) Environmental Releases – Radiological
6) Spills
7) Mispositioning Index
8) Number of Unplanned Transients
9) Reactivity Management Index
10) Unit Capability Factor
11) Unplanned Capability Loss Factor
12) Forced Loss Rate
13) Reactor Trip Rate
14) Corrective Maintenance Backlog
15) Deficient Maintenance Backlog

[10] Director and VP levels.
[11] Manager level.

16) Deferral of Preventive Maintenance

17) Safety System Test Performance

18) Preventive Maintenance Completion Ratio

19) Chemistry Index

20) Chemistry Compliance Index (non-Guaranteed Shutdown State and Guaranteed Shutdown State)

21) Conventional Health and Safety

22) Radiological Emergencies Performance Index

23) Emergency Response Organization Drill Participation Index

24) Emergency Response Resources Completion Index

25) Low- and Intermediate-Level Radioactive Solid Waste Generated

The EPR System is used to report Nuclear business performance management measures. Each EPR measure is assigned a Manager, Verifier and Inputter (MVI) contact at the organizational level to report the measure. The MVI has the responsibility of collecting, inputting, explaining, and verifying information; they must also analyze and initiate actions to correct adverse trends.

WANO DES is used to support the sharing of experience by collecting, trending and disseminating nuclear plant performance in key areas of plant performance. The WANO DES is updated by the DES Inputter. It is the Inputter's job to calculate the performance values each quarter according to WANO specifications.

The detailed process of adding, revising and deleting performance measures is found in N-INS-08115-10000, "Addition, Deletion, and Revision of EPR Performance Measures" [43]. The addition of a new performance measure must be evaluated by the Program Owner (or a delegate), concurred by all affected parties, and approved by the Senior Manager (Planning and Reporting) or Director (Controllership).

Appendix A, "Performance Measure Selection Criteria for Tier Assignment", of N-PROC-AS-0078 [42] identifies the performance measures selection criteria according to the Tier (1, 2, 3, or 4).

The assessment of individual performance indicators is provided in Review Task #6.

Conclusion:

The assessment of this Review Task confirms that there is an adequate set of performance indicators that provides a systematic and comprehensive method to record, trend and analyze safety-related data including the major system parameters and maintenance and inspection records. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Confirmation of Corrective Actions for Unsatisfactory Trends

Confirm that for cases where performance indicators show an unsatisfactory trend, corrective action is taken.

N-PROC-AS-0078 [42] defines the requirements for the reporting of OPGN and Nuclear Projects business plan performance results and establishes a process to enable the monitoring of performance, based on objective measures to promote and sustain improved performance. In particular:

- Section 1.2.4, "Performance Analysis", states that results shall be analyzed and interpreted by focusing on a comparison between the results and the established set of business plan targets. Where performance is not meeting targeted results or is trending adversely, analysis of the data is performed to explain variances and mitigating actions.

- Section 1.5.1, "Data Collection", outlines the required information to analyze, discuss and report for each performance measure by the MVI. This includes a summary of the analysis, year-end and monthly year-to-date performance targets and results, year-end projection, drivers/root causes, mitigating actions completed, and planned actions necessary to close any identified performance gaps.

- Section 1.5.2, "Manager, Verifier, and Inputter", discusses the roles for the MVI. Specifically, subsection (c) states that the Manager is responsible for identifying performance issues and adverse trends, initiating appropriate actions when necessary, and ensuring escalation of performance issues to senior management/Program Owner when adverse performance is not resolved and performance gaps are not closed in a timely manner.

According to N-PROC-AS-0078 [42], the reporting tools for the collection and transmittal of information are the EPR system and the WANO DES. The EPR system and WANO DES are discussed in Review Task #5.

The EPR system standardizes data collection, analysis, and the performance indicator reporting process. It tracks Nuclear, station, and business unit performance measure targets and results in a single repository. Monthly results are rated and colour coded based on performance results versus target. The EPR system, in accordance with N-PROC-AS-0078 [42], is designed to:

- Summarize performance;

- Identify adverse trends and the effectiveness of actions to improve those trends;

- Compare performance between multiple stations and business units on a standardized basis;

- Promote root cause analysis and the development of corrective action plans; and

- Promote ownership and accountability of staff in improving performance.

Section 1.17 of N-PROC-RA-0022 [14] identifies inputs included by the Trend Analysts when performing analysis. This includes corrective action trends, management observations, performance indicators, benchmarking, self-assessment results, and structure, system, equipment and/or component condition data. The trend analysis for these items is performed in accordance with N-INS-01966.1-10000 [34].

The process for initiating and progressing corrective actions when unsatisfactory trends have been identified from trend analysis is described further in Review Task #4.

Conclusion:

The assessment of this Review Task confirms that for cases where performance indicators show an unsatisfactory trend, corrective action is taken. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Adequacy of Records

Review the adequacy of: - *Records of the integrity of physical barriers for the containment of radioactive material.* - *Records of radiation doses to persons on the site.* - *Records of data from off-site radiation monitoring and records of the quantities of radioactive effluents.* - *Records of non-radioactive effluents, including hazardous substances.* - *Records of radioactive and non-radioactive waste.* - *Records of spills.* - *Records of other environmental impacts.*

N-PROG-OP-0006, "Environmental Management" [44] is the program that ensures OPG Nuclear activities are conducted such that adverse environmental effects are prevented or mitigated. The program covers the following activities:

- Requirements of the Ontario Power Generation Environmental Management System that provide the framework for environmental protection within Nuclear; and

- Management's approach to ensure compliance with applicable environmental, legal and other requirements, and conformance with the requirements of the International Organization for Standardization 14001 standard.

As part of the procedures and standards that implement the "Environmental Management" program (N-PROG-OP-0006 [44]), N-STD-OP-0031 "Monitoring of Nuclear and Hazardous Substances in Effluents" [45] establishes minimum requirements for the surveillance and monitoring of nuclear and hazardous substances in airborne and waterborne effluents from OPGN facilities under normal and abnormal operating conditions.

All records and relevant documents are managed through adhering to the standards and procedures outlined in OPG-PROG-0001, "Information Management" [46]. This program lays out requirements for managed systems of activities related to information and documents and establishes uniform, efficient processes for management, maintenance, and final disposition of records and documents throughout Nuclear.

In addition, the following are submitted to CNSC per REGDOC-3.1.1 [36] in accordance with Pickering NGS's Power Reactor Operating Licence, PROL 48.02/2018 [59]:

- Pickering quarterly reports on Safety Performance Indicators, (such as P-CORR-00531-04692 [50] and P-CORR-00531-04625 [51]); and
- An annual environmental protection report.

In OPG, records may be stored in a variety of locations, including the EPR System, Asset Suite, and at Nuclear Records. Each type of record identified in the Review Task is discussed below.

(a) Records of integrity of physical barriers for the containment of radioactive material

N-PROC-MA-0064, "Administrative Requirements for the Periodic Inspection of Nuclear Power Plant Containment Components" [47] provides the administrative process for conducting periodic inspections of CANDU Nuclear Power Plant Containment Components in accordance with Canadian Standards Association (CSA) Standard CAN/CSA-N285.5-08 [48]. Periodic inspection program schedules, inspection records, and inspection reports are stored in Asset Suite. All inspection records from the same inspection campaign are stored electronically and assigned one document number in Asset Suite. This document number is referenced in the inspection report. Further, permanent records and inspection records are maintained in accordance with clauses 12.1 and 12.2 of CSA-N285.5-08 [48], respectively.

In addition, inspection reports are submitted to the CNSC for inspections performed during scheduled maintenance outages (within 90 days of outage completion) and for inspections performed outside a maintenance outage covering a maximum one year period (within 90 days of planned inspection campaign completion).

(b) Records of radiation doses to persons on the site

As described in N-MAN-03416-10000, "Radiation Dosimetry Program-General Requirements" [49], all dose records for Nuclear Energy Workers (both employees and visitors) are transmitted to the National Dose Registry at least once quarterly. The Pickering quarterly reports on Safety Performance Indicators, such as P-CORR-00531-04692 [50] and P-CORR-00531-04625 [51], also contain records of worker collective radiation doses as part of the Collective Radiation Exposure Safety Performance Indicator and are stored in Asset Suite.

(c) Records of data from off-site radiation monitoring and records of the quantities of radioactive effluents.

Information related to the Environment Index, including tritium emissions, is stored in the EPR System. The Pickering quarterly reports on Safety Performance Indicators, such as P-CORR-00531-04692 [50] and P-CORR-00531-04625 [51], also contain records of the quantity of routinely-discharged radioactive effluents and hazardous substances as part of the Environmental Releases Safety Performance Indicator and are stored in Asset Suite.

(d) Records of non-radioactive effluents, including hazardous substances.

The amount of hazardous substances (including concentrations, flow rates, and loadings) released to the environment is monitored as part of OPG's effluent/emission monitoring program and stored in Asset Suite. The amount is also measured in the environment as part of the Environmental Monitoring Program. This information is recorded in the annual report on environmental protection, as outlined in REGDOC-3.1.1 [36].

(e) Records of radioactive and non-radioactive waste.

Records of the amount of low- and intermediate-level radioactive solid waste generated are documented in quarterly reports on Safety Performance Indicators and are stored in Asset Suite, as outlined in REGDOC-3.1.1 [36].

Records of hazardous chemical waste shipments are contained in Ontario Ministry of Environment and Climate Change (MOECC) Waste Manifests, as outlined in P-INS-79000-00010, "Completion of Ministry of the Environment and Climate Change Waste Manifests" [52] for Pickering NGS. These records are sent to the MOECC and stored by Pickering NGS for a minimum of 2 years as required by provincial regulation.

In accordance with N-LIST-00500-10000, "Routine Environment Regulatory Reports/Correspondence" [53], changes in polychlorinated biphenyl (PCB) waste inventories are reported to the MOECC in annual Pickering reports such as "PCB

Waste Inventory Change for Pickering Nuclear", P-CORR-00541-00824 [54], as well as in annual online reports to Environment Canada.

(f) Records of spills.

Reportable spills are immediately reported, as described in N-STD-OP-0026 [55], "Spill Management", to the Ministry of the Environment (now known as MOECC) and other stakeholders. In addition, follow-up written reports are submitted to the regulators within the time limits stipulated by the regulators in accordance with N-PROC-RA-0005, "Written Reporting to Regulatory Agencies" [56]. Further, reportable spills are recorded in the EPR database under Categories A, B, and C as appropriate. Exempted and potential spills are recorded in the EPR database as Category D. Spills may be reported in quarterly safety performance indicator reports if conditions of the spill satisfy definitions outlined in Appendix B, Section 6 of REGDOC-3.1.1 [36].

(g) Records of other environmental impacts.

In accordance with REGDOC-3.1.1 [36], as part of the annual report on environmental protection submitted to CNSC, the amount of nuclear substances measured in the environment is recorded as part of the licensee's Environmental Monitoring Program and stored in Asset Suite.

Conclusion:

The assessment of this Review Task confirms the adequacy of:

- records of the integrity of physical barriers for the containment of radioactive material;
- records of radiation doses to persons on the site;
- records of data from off-site radiation monitoring and records of the quantities of radioactive effluents;
- records of non-radioactive effluents;
- records of radioactive and non-radioactive wastes;
- records of spills; and
- records of other environmental impacts.

The intent of Review Task #7 is met and therefore Pickering NGS is compliant.

4.1.8 Review Task #8: Effect of Changes in Plant Operation on Safety Performance

Consider the effects of any changes in operation at the plant on safety performance. In particular, confirm that current indicators and other safety performance methods continue to be relevant in the context of current and future operations, and confirm that only relevant data and records are used.

Adverse conditions, such as those caused by changes (whether intentional or unintentional) in the operating environment at the plant, are undesired, and are detractions from the intended function or operation of structures, systems and components, and the implementation of procedures and practices. The process for identifying, classifying, and recording these incidents with SCRs has been described in Review Task #1. Additionally, all safety incidents affecting OPG workers and contractors as a result of OPG operations are investigated according to "Safety Incident Investigation and Corrective Actions", OPG-PROC-0121 [26], and are subject to the appropriate CAs. Root cause evaluation tools, such as the fault trees outlined in "Analysis Techniques for Apparent and Root Cause Evaluations", N-GUID-01966-10002 [57], guide evaluators in the analysis process to consider operational problems when determining root causes. In these processes, performance indicators provide the quantitative indications of nuclear plant safety and reliability, plant efficiency, and personnel safety. Performance indicators are therefore used during the data analysis and trending of SCRs, and must be relevant in the context of current and future operations. Appropriate performance indicators are established and produced in support of Nuclear plant operations in accordance with two procedures:

- N-PROC-AS-0078, "Nuclear Performance Monitoring and Reporting" [42], which outlines monitoring of performance based on measures to promote and sustain improved performance.
- N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [12], which describes the process for performing a program health and performance review to monitor and routinely report on overall program effectiveness.

According to N-PROC-RA-0022 [14], when initiating SCRs, initiators are responsible for describing adverse conditions clearly and with relevant facts and documents. Similarly, as described in N-PROC-AS-0078 [42], data collected by the Inputter for each performance measure in the WANO DES must be consistent with approved definitions and terminology. Performance measures must be used and applied for the appropriate timeline, as well as reported in a timely manner in the approved format. Data collection, analysis, and the performance indicator reporting process are recorded in the EPR system. The Nuclear performance monitoring and reporting process is based on the accurate and timely reporting of performance results and analysis for a set of performance measures identified during the business planning process.

Performance measures continue to be updated as appropriate against targets established during the business planning process in order to improve system performance. Benchmarking and use of external oversight support the effort to ensure performance indicators are current and useful. The performance level that the nuclear organization is expected to achieve is established during target setting meetings, according to N-PROC-AS-0080 [41]. Through this business planning cycle, irrelevant data and records are omitted from the target setting process and, therefore, are not a part of the process for creating performance measures. Specific targets, such as operational targets, continue to be updated and revised in the first two years of the business planning horizon. During Integration Meetings, attendees are responsible for assessing the potential operational and financial impact of new initiatives intended for the achievement of these targets. To further define and categorize the relevance of performance indicators, N-PROC-AS-0078 [42] indicates that relevance to the overall Nuclear and site strategic goals and objectives is used to rank performance measures into four tiers. For instance, tying directly to the Nuclear Business Plan are Tier 2 performance level measures, meaning they are categorized between corporate level measures and functional level measures in the tiered approach ranking. Tier 2 measures are also selected because they include leading measures, which provide insight on changing performance before the changes significantly impact overall plant operation. A more detailed description of the targets setting process and method of monitoring and measuring station performance is provided in Review Task #5.

N-PROC-MA-0024, "System Performance Monitoring" [58], establishes a process for the effective monitoring, maintenance and enhancement of system performance and reliability. All Pickering safety systems (including systems important to safety, safety related systems, and safety support systems) are monitored in accordance with N-PROC-MA-0024. As part of this process, system performance goals and target values are defined and updated based on sources such as station and department goals, OPEX, and design and safety documentation. Direct and indirect performance indicators of system health are specified to support the collection and analysis of relevant data and records to measure success against these targets. Results of system performance monitoring are used to identify proactive actions to address trends in system health. Performance goals, targets and indicators are documented in System Performance Monitoring Plans, which are reviewed every 2 years (at a minimum) to ensure monitoring objectives are being met and to validate adequacy of equipment surveillance. As shown in Figure 1 of N-PROC-MA-0024, the feedback process for system performance monitoring ensures that performance measures are maintained relevant for current and future operations.

Conclusion:

The assessment of this Review Task confirms that current indicators and other safety performance methods continue to be relevant in the context of current and future operations, and confirm that only relevant data and records are used. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for twelve L/R/C/Ss with content applicable to Safety Factor 8 are provided in References [6] and [7]. Associated findings applicable to Safety Factor 8 are summarized in Table 5 below.

Table 5: PSR2 L/R/C/S Review Results for Safety Factor 8

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 8
CSA N290.15-10, "Requirements for the Safe Operating Envelope of Nuclear Power Plants"	There are no PSR2 gaps for CSA N290.15-10 (R2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.15-10 (R2015).
CSA N288.1-14, "Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities"	There are no PSR2 gaps for CSA N288.1-14. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.1-14.
CSA N288.4-10, "Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.4-10. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.4-10.
CNSC REGDOC-2.9.1 (2013), "Environmental Protection Policies, Programs and Procedures"	There are no PSR2 gaps for CNSC REGDOC-2.9.1 (2013). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.9.1 (2013).
CNSC G-129 (2004), "Keeping Radiation Exposures and Doses 'As Low As Reasonably Achievable (ALARA)'"	There are no PSR2 gaps for CNSC G-129 Revision 1 (2004). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-129 Revision 1 (2004).
CNSC G-228 (2001), "Developing and Using Action Levels"	There are no PSR2 gaps for CNSC G-228 (2001). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-228 (2001).
SOR/2000-203 (Amended June 2015), "The Radiation Protection Regulations"	There are no PSR2 gaps for the Radiation Protection Regulations (Amended June 2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the Radiation Protection Regulations (Amended June 2015).
CSA N288.6-12, "Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.6-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.6-12.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 8
CSA N288.5-11, "Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.5-11. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.5-11.
CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	For Safety Factor 8, there are no PSR2 gaps for CNSC REGDOC-2.3.2 (2015).
CNSC REGDOC-2.3.3 (2015), "Periodic Safety Reviews"	There are no PSR2 gaps for CNSC REGDOC-2.3.3 (2015). Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.3.3 (2015).
CSA N288.3.4-13, "Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities"	There are no PSR2 gaps for CSA N288.3.4-13. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.3.4-13.

4.3 OPG Program Effectiveness Reviews

The OPG Programs reviewed for Safety Factor 8 are identified in Table 2 and details of the associated effectiveness reviews for each of the N-PROGs are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 8 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 8 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not find any PSR2 gaps for Safety Factor 8.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [11] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 8 Report that require discussion in other Safety Factor Reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 8 were reviewed for the eight PSR2 Review Tasks in Section 4.1 of this report and resulted in no Pickering PSR2 Gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 8 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no PSR2 gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 8 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 8), which resulted in no PSR2 gaps.

The review of Safety Factor 8 has confirmed that the safety performance indicators and records of operating experience, including the evaluation of root causes of plant events, exist and are utilized to ensure the safe operation of Pickering NGS.

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-RA-0002, "Conduct Of Regulatory Affairs"

The purpose of the Conduct of Regulatory Affairs program is to ensure Ontario Power Generation (OPG) complies with regulatory requirements in an effective and efficient manner. The program describes the procedures related to licensing, regulatory interpretations, event reporting, regulatory approvals, Canadian Nuclear Safety Commission (CNSC) inspections, issue management, and communications.

The program includes broad guidelines for managing the interface with regulatory agencies, primarily the CNSC, to ensure effective and efficient compliance with regulatory requirements and to ensure open, honest and timely communications. Successful interface with regulatory agencies is critical in meeting OPG Nuclear objectives.

Nuclear Oversight conducted an audit of the of the Regulatory Affairs and Safeguards programs in July 2012, NO-2012-001 [B.1.1], for both Pickering and Darlington NGS. The objective of the Audit was to confirm that the Conduct of Regulatory Affairs program (as well as the Safeguards program) are effectively managed and in compliance with governing documents. This audit found the Regulatory Affairs program to be effective and consistently met OPG Nuclear requirements. An improvement opportunity was identified regarding Regulatory Affairs training deficiencies. SCR N-2012-03670 (AR 28146389) was initiated to address this and has since been closed with corrective actions completed to address the underlying issues.

Nuclear Regulatory Affairs completed a self-assessment in May 2012, NO12-000075-SA [B.1.2], in order to confirm the adequacy of the Nuclear Regulatory Affairs governance and program implementation for Pickering and Darlington NGS. The self-assessment determined that a number of Nuclear Regulatory Affairs governance documents were beyond their review cycle. SCR N-2012-03002 was initiated to address this and has since been closed with corrective actions completed to address the underlying issues.

The Operations and Maintenance Support department completed a self-assessment in April 2013, NO13-000230-SA [B.1.3], in order to assess the health of N-PROG-RA-0002, "Conduct of Regulatory Affairs". This involved a review of related SCRs, governance framework, revision records and previous program assessment reports. No findings/SCRs were initiated as a result of this self-assessment.

[B.1.3] Self-Assessment Report, NO13-000230-SA, *Program Management Assessment-N-PROG-RA-0002,* April 11, 2013.

B.2 N-PROG-RA-0003, "Corrective Action"

The Corrective Action program establishes the processes to ensure deficiencies; non-conformances; weaknesses with a process, document, or service, or conditions that adversely impact, or may potentially adversely impact plant operations; personnel; nuclear safety; the environment or equipment; and component reliability, are promptly identified and corrected or dispositioned. For those deficiencies considered significant or repetitive in nature, these processes ensure appropriate levels of management are notified, causes identified and actions taken to minimize or prevent recurrence and actions taken to address the identified issues are verified to be complete and effective.

Utilizing Operating Experience (OPEX) from within OPG Nuclear and the industry is an integral part of the Corrective Action Program. Hence, this program also provides the processes to ensure internal and external OPEX is evaluated, distributed to appropriate personnel, and applied to implement actions that improve plant safety and reliability.

Nuclear Oversight conducted a performance based audit of the OPG Nuclear Corrective Action Program in December 2013, NO-2013-023 [B.2.1], for both Pickering and Darlington NGS. The purpose of the audit was to determine the effectiveness of the OPG Nuclear Corrective Action program across the fleet. The audit concluded that performance improvement opportunities applicable to Pickering NGS existed associated with Corrective Action program expectations, management oversight for SCR dispositioning, trending and analysis, and monitoring of staff training qualifications.

Four SCRs (N-2014-02323, N-2014-02324, P-2014-02325 and N-2014-02329) were initiated during this audit, which required corrective actions to be implemented. The necessary corrective actions were completed to address the underlying issues and these SCRs have since been closed.

Nuclear Oversight completed a self-assessment in May 2013, NO13-000038-SA [B.2.2], in order to assess the effectiveness of the 2012 and 2013 Corrective Action program Improvement Plans. This self-assessment is applicable to both Pickering and Darlington NGS. It was concluded that substantial improvements were made to the Corrective Action program, however there were opportunities to improve in the areas of self-assessment approval, governance streamlining, and training and qualification updates.

All the necessary corrective actions were completed to address the underlying issues and the associated SCR (N-2013-02155) has since been closed.

[B.2.2] Self-Assessment Report, N013-000038-SA, *OPGN Corrective Action Program for NOA-2013-023,* May 2013.

B.3 OPG-PROG-0010, "Health and Safety Management System Program"

The Ontario Power Generation (OPG) Health and Safety Management System program establishes the process requirements that must be implemented and maintained to ensure that health and safety risks to workers are being mitigated. It also outlines the responsibilities of the various levels of the organization to ensure these activities are carried out. The Health and Safety Management System includes:

- Occupational conditions and factors that could affect the health and safety of workers, in all workplaces or from work-related activities under the control of OPG.
- Non-occupational health-related conditions and factors that could affect the health of OPG workers where it impacts achievement of OPG's business objectives.
- Contractor safety.

Nuclear Oversight completed a self-assessment in March of 2013, NO13-000121-SA [B.3.1], in preparation for Nuclear Oversight's Conventional Safety Program[12] audit, which is applicable for both Darlington and Pickering NGS. The scope of the self-assessment included a review of previous Nuclear Oversight audit corrective actions associated with gaps/findings in order to confirm completion status as well as a review of specific conventional safety hazard/risk areas (i.e., Asbestos Management, Electrical Safety and On-Site Driving). All previous Nuclear Oversight audit corrective actions were found to be completed or on-track for completion as committed and the conventional safety hazard/risk areas assessed were found to meet or exceed applicable requirements. No findings/SCRs were initiated as result of this self-assessment.

Nuclear Oversight conducted a performance based audit of the Conventional Safety Program in October 2013, NO-2013-027 [B.3.2], for Pickering and Darlington NGS. The objective of the audit was to ensure that applicable requirements are being met and that risks to workers and members of the public are appropriately mitigated. The audit concluded that performance improvement opportunities applicable to Pickering NGS existed in the areas of Conventional Safety training, use of performance improvement tools by the Conventional Safety group, documentation to support Personal Protective Equipment and scaffold storage racks, and Ontario Health and Safety Act notice boards compliance.

Five SCRs were initiated to address the above findings which required corrective actions to be implemented, of which four have been completed (SCRs N-2013-14928,

---

12 Note, this self-assessment was based on the requirements of N-PROG-HR-0004 R003, "Conventional Safety" which has been superseded by OPG-PROG-0010, "Health and Safety Management System Program". Since the fundamental Health and Safety requirements have not changed between the two documents, a discussion on findings related to N-PROG-HR-0004 (as opposed to OPG-PROG-0010) is considered appropriate.

N-2013-14930, N-2013-14931 and N-2013-14934), while the remaining (SCR N-2013-14933) is expected to be completed by Q4 2017.

Revision Summary – For Amec Foster Wheeler Report PS112/RP/002

Rev	Date	Author	Comments
R00	October 28, 2015	S. B. Harvey	Initial issue for OPG review and comment.
R01	July 22, 2016	S. B. Harvey	Addressed OPG comments and aligned with updated PSR2 Basis Document (P-REP-03680-00001 R02)
R02	September 26, 2016	S. B. Harvey	Addressed OPG comments, and incorporated Fukushima Action Item assessment in Appendix D.
R03	October 20, 2016	S. B. Harvey	Addressed OPG comments, and moved Fukushima Action Item assessment to a stand-alone report. Discussion of COP actions was also moved to a stand-alone report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 9, *Use of Experience from Other Nuclear Power Plants (NPPs) and Research Findings* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 9 were reviewed for the six PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for Safety Factor 9 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 9 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 9).

The results of the review of Safety Factor 9 are discussed in Section 5.0 of this report. The review has confirmed for Pickering NGS that there is adequate feedback of relevant experience from other nuclear power plants and from findings of research, and that this is used to introduce reasonable and practicable safety improvements at the plant or in the operating organization. As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

Page

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009, in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Use of Experience from Other Nuclear Power Plants (NPPs) and Research Findings, Safety Factor 9, is to: "determine whether there is adequate feedback of relevant experience from other nuclear power plants and from the findings of research and whether this is used to introduce reasonable and practicable safety improvements at the plant or in the operating organization." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 9 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 9 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 9 Review Tasks are:

1) Confirm existence and adequacy of a program for the sending and receiving of experience relevant to safety to and from other nuclear power plants and relevant nonnuclear plants. ("Other nuclear power plants" specifically include the IAEA, OECD/NEA[3], WANO[4], INPO[5] as well as CANDU[6] Owners Group[7] (COG) and experience within OPG at Darlington.)

2) Confirm existence of a program for receiving of information on the findings of relevant research programs.

3) Confirm there is a process for assessing the significance of operating experience from other plants and incorporating the lessons learned into improving safety performance at the station.

4) Confirm that there is a process for assessing the significance of research findings and technology developments and for incorporating relevant improvements into the station's design and operation.

5) Review adequacy and effectiveness of the feedback arrangements and timely implementation of assessment findings. (Assess program audit results).

6) List the major OPEX[8] events and resulting plant changes that have resulted since PSR1 was completed.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this Report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Use of Experience from Other NPPs and Research Findings Safety Factor are identified in

---

3 Organization for Economic Cooperation and Development, Nuclear Energy Agency
4 World Association of Nuclear Operators
5 Institute of Nuclear Power Operations
6 CANada Deuterium Uranium
7 CANDU Owners Group (COG)
8 "Operating Experience" (OPEX) is a term that encompasses Experience from Other NPPs and Research Findings

Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 9 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed compliance assessment for each L/R/C/S is provided in Reference [6]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Use of Experience from Other NPPs and Research Findings Safety Factor 9

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286	Management System Requirements for Nuclear Facilities	N286-12	5, 6, 9, 10, 11	Incremental	N286 addressed as part of Pickering B and Darlington ISRs.

2.3 Audit and Self-Assessment Reviews of OPG Programs

There are no OPG Nuclear Programs assessed for the Use of Experience from Other NPPs and Research Findings in this report. Audit and self-assessment results for N-PROG-RA-0003 [7], "Corrective Action" are provided in P-REP-03680-00012, "Pickering NGS PSR2 Safety Factor 8 Report: Safety Performance" [8]. The methodology for the audit and self-assessment reviews is discussed in Section 3.3.

2.4 Additional Reviews

The PSR2 Safety Factor 9 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 9):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 9 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 9 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan [9] is provided in Reference [10].

In addition, Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in Reference [11].

Any PSR2 gaps identified as a result of the Safety Factor 9 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Task and L/R/C/S compliance, and Nuclear Program effectiveness for Use of Experience from Other NPPs and Research Findings Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 9 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[9]
- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;
- Implications of extending Pickering NGS operation beyond 2020; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;
- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;
- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);
- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

9 "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 9 L/R/C/S reviews identify Compliances and Gaps as defined below:[10]

- <u>Compliance</u>:

  - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

  - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 9.)

  - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 9.)

[10] Safety Factor compliance assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the compliance arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 9.)
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 9.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 Audit and Self-Assessment Reviews

As discussed earlier, there are no OPG Nuclear Programs assessed for the Use of Experience from Other NPPs and Research Findings in this report. Effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted in other PSR2 Safety Factor reports, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where called-up by OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 9):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 9 (as identified in the Darlington ISR Integrated Implementation Plan [12] and Pickering Units 5-8 Continued Operations Plan [9]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[11]

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in Reference [11].

Any PSR2 gaps identified as a result of the Safety Factor 9 review which need to be addressed in other Safety Factor Reports are also discussed.

---

[11] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 9 Review Tasks.

4.1.1 Review Task #1: Program for Sending and Receiving OPEX

Confirm existence and adequacy of a program for the sending and receiving of experience relevant to safety to and from other nuclear power plants and relevant nonnuclear plants. ("Other nuclear power plants" specifically include the IAEA, OECD/NEA, WANO, INPO as well as CANDU Owners Group and experience within OPG at Darlington.)

Overview

The OPG process for the Use of Experience from Other NPPs and of Research Findings is briefly described below.

A weekly COG OPEX screening meeting, facilitated and administered by COG, serves as an initial screening forum to review event reports from CANDU stations, nuclear industry and non-nuclear sources for applicability and significance to CANDU units. Committee members include representatives from all CANDU facilities (including OPG Pickering), vendors, research organizations and World Association of Nuclear Operators (WANO).

Prior to the weekly meeting, the Senior Officer, OPEX screens the recent events at their site, and selects those events that they believe may be of relevance to other sites for review at the COG OPEX Weekly Screening Meeting. On behalf of the utilities, COG provides the initial screening of the international nuclear industry reports and relevant non-industry events.

OPEX representatives at Pickering, Darlington, and Nuclear Support each submit relevant OPG significant events to be presented at the COG OPEX Weekly Screening Meeting as per N-PROC-RA-0035, "Operating Experience Process" [13]. When potentially significant, these events have been investigated according to N-STD-RA-0008, "Incident Investigation" [14], entered into the OPG Station Condition Record (SCR) process and evaluated according to N-PROC-RA-0022, "Processing Station Condition Records" [15].

Upon completion of the COG OPEX Weekly Screening Meeting, plant OPEX staff in consultation with line staff and/or appropriate OPEX Single Point of Contacts (SPOCs) performs a further screening of the Weekly Screening Meeting events from other utilities/non utilities. Items believed to be applicable and actionable at the plant are dispositioned in an Action Request (AR) and if a significant gap is identified an SCR is created and the gap is evaluated according to N-PROC-RA-0022 [15]. This process includes not only consideration of potential weaknesses of the plant equipment and operation, but also opportunities for improvement and utilization of research findings. Items for which applicability cannot be determined in a timely manner due to Subject Matter Expert or System Responsible Engineer unavailability, awaiting vendor information, or awaiting testing results, are reviewed via the AR process (tracked by AR mechanism until complete), and an SCR is filed if applicability is confirmed.

When an external operating experience item is entered into the electronic SCR system, it is analyzed by the relevant line department as an OPEX SCR, and processed and stored according to the Corrective Action Program specified in N-PROG-RA-0003 [7].

Any finding related to safety analysis that may affect the Safe Operating Envelope (SOE) goes through the Discovery Issue Resolution Process (DIRP) per N-PROC-RA-0094, "Discovery Issue Resolution Process" [16] to confirm that regulatory limits are met and the risk is maintained at an acceptable level, or to put in place mitigating provisions.

The Research and Development (R&D) at OPG is primarily governed by N-STD-MP-0023, "Technology & Research" [17]. This standard specifies the essential elements that are used when processing R&D issues and research findings derived from collaboration with COG R&D members. An R&D Program Advisory Review Team, comprised of senior managers associated with the Nuclear R&D program, provides leadership, support and oversight for the effective development and implementation of Nuclear R&D programs. As specified in N-PROC-MP-0092, "Technology and Research Program Management" [18], at the identification phase of a potential R&D issue, the use of OPEX from other plants and research findings is evaluated to determine if an R&D issue should be developed. R&D issues that progress beyond the identification phase go through a planning and development phase. Upon receipt of the R&D research deliverables, the R&D issue is progressed to the implementation and closeout phase.

The adequacy of the program for the sending and receiving of experience relevant to safety is monitored and assessed through audits and self-assessment prescribed by N-PROG-RA-0010, "Independent Assessment" [19], N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [20] and N-PROC-RA-0097, "Self-Assessment and Benchmarking" [21]. Findings are documented in audit reports and self-assessment reports. Any adverse conditions are documented in SCRs per N-PROC-RA-0022 [15] to be resolved through corrective actions per N-PROG-RA-0003 [7].

The hierarchy of OPG governance is defined in N-CHAR-AS-0002, "Nuclear Management System" [22]. The charter identifies requirements for sustaining and improving station performance that include utilization of internal and industry OPEX to improve human, plant and equipment performance and design, procurement, construction, commissioning, and operating requirements and practices. Specifically with regard to OPEX, the charter gives direction to the Corrective Action Program specified in N-PROG-RA-0003 [7]. This program identifies the processes that ensure in-house and industry OPEX are distributed to appropriate personnel, and are applied to implement actions that improve plant safety and reliability.

The Corrective Action Program is implemented through a number of procedures including N-PROC-RA-0022 [15] and N-PROC-RA-0035 [13].

Lessons learned from significant in-house events and equipment problems are shared with the industry in accordance with N-PROC-RA-0035 [13].

The specific details of the process for sending and receiving of experience relevant to safety are specified in N-PROC-RA-0035 [13]. These are described below.

Receiving OPEX

There is a substantial amount of industry experience (including research findings) generated and made available to OPG from a variety of sources. Some of the information contains lessons that, if applied within OPG, may have a significant impact on reducing repeat events and on improving safety, productivity, and performance.

N-PROC-RA-0035 [13] provides details on how and from where the OPEX information from other NPPs and relevant non-nuclear plants is received by OPG. Sources of OPEX external to OPG include but are not limited to:

- WANO Significant Operating Experience Reports (SOERs);
- WANO Significant Event Reports (SERs);
- Level 1 INPO Event Reports (IERs);
- Level 2 IERs;
- COG OPEX;
- WANO Event Reports; and
- Level 3 and 4 IERs.

Pickering also considers applicability of experience within OPG from other sites (e.g. Darlington). This is addressed in Section 1.3.1 of Reference [13] which describes the process and responsibilities for identification of OPEX events from other OPG sites.

A wide range of sources of external OPEX are considered. While there is no specific reference to IAEA or OECD/NEA as listed in the Review Task, such sources are used since sources in N-PROC-RA-0035 [13] are meant to be illustrative rather than exhaustive. Evidence of use of IAEA and OECD/NEA OPEX was found in the COG screened events database. For example, in March 2015 there were two IAEA reports and two NEA reports assessed.

Sending OPEX

Sharing of OPG experience with the industry is required to ensure industry cooperation and is also a requirement of membership in WANO. Lessons learned from significant in-house events and equipment problems are shared with the industry in accordance with N-PROC-RA-0035 [13]. In order to share this information, COG OPEX Weekly Screening Meetings are held, chaired by COG and attended by representatives of COG members and of WANO. OPG shares selected events with other utilities, vendors and research facilities through these COG Weekly Screening Meetings. This forum provides an additional review to ensure that any events that meet the WANO reporting criteria are shared with WANO.

OPEX representatives at Pickering, Darlington, and Nuclear Support each submit relevant OPG internal events to be presented at the COG OPEX Weekly Screening Meeting.

Conclusion

In conclusion, OPG procedures for sending and receiving experience relevant to safety from other nuclear power plants and relevant non-nuclear plants are in place. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Program for Receiving Research Findings

Confirm existence of a program for receiving of information on the findings of relevant research programs.

As specified in N-PROC-RA-0035 [13], OPEX information that includes research information, is dispensed to relevant line organizations for further screening and/or analysis. This process is described in Section 4.1.1 of this report. Whenever such research information is found that is contradictory or supplemental to the knowledge used in the safety or design analysis, an SCR is issued. Opportunities for improvement are also assessed and evaluated either through the SCR or the AR process.

Any finding related to safety analysis that may affect the SOE goes through the DIRP per N-PROC-RA-0094 [16] to confirm that regulatory limits are met and risk is maintained at an acceptable level, or to put in place mitigating provisions when required.

The external information received through the OPEX program is used to identify the need for specific research for OPG NPPs. The R&D at OPG is primarily governed by N-STD-MP-0023 [17]. As specified in N-PROG-MP-0092 [18], the R&D program incorporates issue identification, R&D program development, R&D program implementation, and application of R&D results.

OPG guide, N-GUID-08800-10000, "Technology & Research Department Management Guideline" [23] outlines requirements and processes for the management of the Technology and Research Program. It describes the process of receiving information on the findings of relevant research programs from R&D suppliers, typically through COG or University Network of Excellence in Nuclear Engineering, managing the development and implementation of the R&D program, monitoring of program effectiveness and the dissemination of relevant technical R&D information and results. OPG is a member of the Electric Power Research Institute which is also a source of useful information.

Conclusion

In conclusion, OPG procedures for receiving information on the findings of relevant research programs and for distribution of internal and external research findings are in place. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Assessing and Incorporating Operating Experience

Confirm there is a process for assessing the significance of operating experience from other plants and incorporating the lessons learned into improving safety performance at the station.

Safety Significance Classification Process

In support of N-PROC-RA-0035 [13], the significance of OPEX events is assessed in accordance with:

- N-GUID-04947.02-10000, "External Events Screening Guide" [24]. WANO Guideline GL 2003-01, "Guidelines for Operating Experience at Nuclear Power Plants" [25] provides factors and criteria to be considered in screening. Items assessed to be applicable and where a vulnerability to the plant is identified, are entered into the plant's SCR process and evaluated within a specified time allowance as per N-PROC-RA-0022 [15] and N-PROG-RA-0003 [7] to assess the significance and remedial actions as required. The determination of SCR safety significance level is performed by a SCR Coordinator or by Management Review Meeting (MRM) in accordance with N-PROC-RA-0022 [15].

- N-GUID-04947.02-10001, "Guideline for Classifying Internal Events (WANO, COG, Fleetwide)" [26] provides guidance to the Senior Officer OPEX, Nuclear Support OPEX Coordinator, and Evaluating Organization (EO) Manager, for selecting SCRs to be shared as OPEX with WANO, COG and within OPG Nuclear (designated 'Fleetwide' sharing).

Incorporating Lessons Learned

Items from the COG OPEX Weekly Screening Meeting that are assessed to be applicable and where a potential vulnerability to the plant is identified, are entered into the plant's SCR process and evaluated according to N-PROC-RA-0022 [15] and N-GUID-04947.02-10000 [24]. In particular, the MRM:

- Reviews SCRs with a focus on safety, reportability, and operability resulting in an impact on the facility or business unit;
- Confirms that any immediate or interim station impacts are documented; and
- Establishes a screening meeting to facilitate efficient review of SCRs prior to MRM review, including the review for potentially significant issues of reportability, operability, radiological or conventional safety requiring immediate attention.

If an SCR identifies an adverse condition in which a design basis requirement is potentially not met, the MRM, a Department Manager or Shift Manager will identify an Operability issue. The Technical Operability Evaluation (TOE) process described in N-PROC-MP-0045, "Technical Operability Evaluation" [27] will be applied. A formal TOE provides a substantiated engineering verification that a Structure, System, or Component is capable of fulfilling its minimum credited safety function(s).

Subsequently, the EO ensures that a corrective action plan is prepared with appropriate corrective actions identified and assigned to Action Managers. Specifically, the EO Manager ensures that all Significance Level 1, 2, and 3 SCRs (i.e. the most significant SCRs) have at least one corrective action to prevent reoccurrence. As required, corrective action plans are presented to the Corrective Action Review Board (CARB) for review. Once the corrective action plan is approved, the line organization tracks the completion of corrective actions through Action Tracking. After assignments in Action Tracking have been completed, the EO Manager reviews the adequacy of the completion notes and closes the SCR.

Review of items for applicability may be deferred due to Subject Matter Expert or System Responsible Engineer unavailability, awaiting vendor information, or awaiting testing results. Such deferred items are reviewed via the AR process. This process also has a specified time allowance to ensure a timely review. If an item does not apply to the plant, the personnel making that determination document their reasons in the AR closure notes. If a potential applicable item is determined to create a vulnerability to the plant, then an OPEX SCR is issued [15]. Events that are categorized as "For Information" may also be reviewed further by OPEX SPOCs and communicated to appropriate line personnel for awareness. They are stored in COG's database for future utilization in pre job briefs, tailboards, or training.

In N-PROC-RA-0035 [13], OPG Nuclear staff is directed to review and use OPEX, as required, for the work activities they are responsible for including:

- Pre-job briefings;
- Engineering changes;
- Preparation and delivery of training;
- Root Cause investigations; and
- Assessing.

OPEX information is available for all employees through internal and external OPEX search tools which are conveniently available from the OPEX website. These include:

- COG database (external OPEX);
- WANO database (external OPEX);
- INPO database (external OPEX);
- PowerSearch for SCRs (internal OPEX);
- Darlington/Pickering SERs which are internal legacy documents that pre-date SCRs that were introduced in May 1998. These are different from external WANO / INPO SERs;
- Just in Time (JIT) Briefings (for pre-job briefings); and
- WANO SOERs and SERs.

OPG incorporates external lessons learned into training, per N-INS-08920-10029, "Incorporating Operating Experience into Training" [28].

Design verification activities, as detailed in N-PROC-MP-0047, "Design Verification" [29], require past experience with operation and maintenance of the system or component being modified (i.e., OPEX) to be considered.

Other than the direct use of OPEX issues described above, there are two other mechanisms of incorporating the OPEX from other plants and lessons learned into improving safety performance at the Pickering station:

- JIT briefings contain lessons learned from a number of similar events associated with a specific evolution or type of activity. They were developed for use in pre-job briefings and other applications to assist station staff in performing error free activities. Each JIT briefing contains a list of questions or reminders to consider when planning the work. Hundreds of JIT briefings have been prepared by staff of CANDU stations, COG and WANO, and are listed by title in alphabetical order, and in groups according to the subject content. They can be easily downloaded from the COG online website. The review of OPEX in the pre-job briefings and lessons learned in a post-job debriefing are input into N-FORM-11056, "Engineering Pre-Job Brief and Post-Job Debriefing Checklist" [30], as specified by N-GUID-01900-10000, "Human Performance Event Free Tools for Knowledge Work" [31].

- The Risk Based Modification Process, governed by N-PROG-MP-0001, "Engineering Change Control" [32] incorporates OPEX and lessons learned.

Conclusion

In conclusion, processes for assessing the significance of OPEX from other plants and incorporating the lessons learned into improving safety performance at the station are in place. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Assessing and Incorporating Research Findings

Confirm that there is a process for assessing the significance of research findings and technology developments and for incorporating relevant improvements into the station's design and operation.

Safety Significance Classification Process

Section 4.1.2 of this report describes the process for receiving internal and external research OPEX information and findings.

When operation of a nuclear facility conforms with its defined SOE (as determined through a TOE), but the Safety Analysis upon which the SOE is based is itself suspect, or when a gap is discovered in the definition of the SOE, then the DIRP [16] is initiated to determine whether the regulatory limits are met and if the risk is at an acceptable level, or to put in place mitigating provisions if not. An SCR is raised to further process issues related to either station operation or the DIRP, including determination of safety significance level in accordance with N-PROC-RA-0022 [15].

For internal research findings, N-STD-MP-0023 [17] provides direction for identification and selection of R&D issues or new technology opportunities.

Incorporating Relevant Improvements into the Station's Design and Operation

Research findings are communicated to the Design and Operation organization through the OPEX process via the Corrective Action Program, DIRP and Technology & Research Program.

The Corrective Action Program specified in N-PROG-RA-0003 [7] provides the processes to ensure in-house and industry OPEX is evaluated, distributed to appropriate personnel, and applied to implement actions that improve plant safety and reliability.

Research findings and technology developments with potential applicability to the plant and communicated through OPEX are formally reviewed by line staff per N-PROC-RA-0035 [13]. If an item is determined to have applicability, and is significant to safety then it is entered into the plant's SCR system. Subsequently, an overall corrective action plan is developed within the prescribed time from the date of the MRM where the item was discussed. The corrective action plan includes assignments for appropriate organizations with due dates for assignments specified in accordance with N-PROC-RA-0022 [15]. Improvements to the station's design and/or operations are performed through the Risk Based Modification Process, governed by N-PROG-MP-0001 [32].

The DIRP [16] specifies that upon discovery of a problem or a potential problem with Safety Analysis, not only an SCR is raised, but the Safety Report Update process is initiated and, as required, Senior Management, CNSC, and industry partners are informed and updated. Subsequently it is assessed during the Engineering Judgment Phase whether the Regulatory Dose Limit or Risk Increase Limit might have been exceeded and confirmed through further assessment. Significant DIRP issues usually affect more than one CANDU station, thus COG becomes involved.

Conclusion

In conclusion, processes are in place for assessing the significance of research findings and technology developments and for incorporating relevant improvements into the station's design and operation. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Adequacy, Effectiveness and Timely Implementation

Review adequacy and effectiveness of the feedback arrangements and timely implementation of assessment findings. (Assess program audit results)

Feedback Arrangements

N-PROG-RA-0003 [7] provides the processes to ensure in-house and industry OPEX is evaluated, distributed to appropriate personnel, and applied to implement actions that improve plant safety and reliability. This program gives direction to both N-PROC-RA-0035 [13] and N-PROC-RA-0022 [15] for managing incorporation of improvements into the station's design and operation.

N-PROG-RA-0003 [7] is an essential element for a Learning Organization as it drives the organization to learn from minor incidents to prevent significant events. This improvement process includes the identification of adverse conditions and practices, the investigation of selected incidents and adverse trends to identify their causes, the development and timely implementation of actions to address these causes, and verification that the actions have been effective. The organization's effectiveness at implementing the Corrective Action Program is monitored by the Corrective Action Program Health Indicators, periodic self-assessments and audits.

The lessons learned from OPEX items are fed back to all parts of the organization, including management, engineering, operations and maintenance staff. For example, methods such as JIT reviews (refer to Section 4.1.3) of applicable OPEX during pre-job and pre-evolution activities are used to remind managers, engineers, supervisors, and other workers of lessons learned and how to apply them to prevent similar problems.

Timely Implementation of Findings

N-PROC-RA-0035 [13] provides guidelines for initiation of an SCR for OPEX findings. For OPEX determined to be very significant to OPG Nuclear, an OPEX SCR is required to be generated within 5 working days. N-PROC-RA-0022 [15] provides guidelines for processing an SCR and implementing corrective actions. This procedure provides detailed timelines for initiating an SCR, for approval by the first line manager, for disposition by the SCR coordinator and the MRM, for preparation of OPEX Significant Operating Experience Reports, for approval of the corrective actions and for completion of corrective actions.

N-PROC-RA-0094 [16] provides guidelines for time allocated for issue classification and for required actions. For example, it has to be determined within 7 days whether the Regulatory Dose Limit or Level 1 Risk Increase Limit associated with safety analysis could be exceeded. Immediate corrective action is initiated to return within the Regulatory Dose Limit or Level 1 Risk Increase Limit, up to and including a safe and timely shutdown.

Actions arising from SOERs are periodically assessed to confirm they remain effective. The key goal of conducting periodic reviews of SOERs (and other significant external OPEX) is to detect the inadvertent weakening over time of barriers put in place following the initial OPEX evaluation [33].

Effectiveness

As described in P-CORR-00531-03719, "Application for Renewal of Pickering Nuclear Generating Station Power Reactor Operating Licence" [34]:

- During two station assessments by external industry peers in 2011, use of OPEX by the line organizations in their daily work activities was observed and received as positive feedback.

- In Q4 2011, an internal Nuclear Oversight surveillance audit was conducted on processing of industry experience, processing of internal experience, sharing of OPEX events with COG and other nuclear industry associations, process for integration of OPEX into training and processing of nuclear industry SOERs. The audit results concluded the managed system controls for the OPEX process are effective.

- In 2010, a training needs analysis was performed for Root Cause and Apparent Cause training for EO managers. The result was delivery of EO Manager gap training for existing managers, and EO Manager initial training for new managers in 2011.

- In 2011, a training needs analysis was performed for Apparent Cause Evaluator training. Initial training content was enhanced to include a practical classroom component. Continuing training was implemented and included a computer-based training module with a proof of practice to validate that the evaluator skill level is being maintained.

- In March 2012, Pickering Nuclear implemented corrective actions to increase the effectiveness of the Corrective Action Program. Significant among the changes implemented were: revised criteria to reduce duplication of SCR reporting, revised evaluation requirements and a new root cause report format to improve report quality. SCR Screening Meeting and MRM frequency was increased to daily meetings in order to improve the timeliness of processing SCRs. An industry benchmarked "repeat event" metric was implemented to measure Corrective Action Program effectiveness (i.e., to avoid repeat events which would indicate the OPEX program had not been effective).

- Changes to the trending and analysis process and the new tools resulted from external benchmarking performed by Pickering in 2009. A new trend report template N-INS-01966.1-10000 was implemented in 2010 at Pickering to focus on various aspects of organizational learning feedback received from SCRs and other sources. The reporting template was adopted by the OPG fleet as a standardized practice in 2011.

- Improvements in Corrective Action Program training were identified including:

    - Apparent cause evaluator training was revised to include the new causal analysis techniques to improve quality of analysis and determination of corrective actions;

    - CARB member training was conducted to review industry guidelines on CARB roles and responsibilities as they relate to Corrective Action Program oversight and effectiveness, and communicate upcoming changes to the Corrective Action Program; and

    - MRM member training was conducted to align the MRM members with CARB expectations, roles and responsibilities and communicate upcoming changes to the Corrective Action Program.

As identified during the Darlington ISR [35], there were corrective actions, audits and self-assessments performed to ensure that the process for feedback arrangements and timely implementation of findings is effective and efficient. All associated corrective actions were completed.

Review Task #6 (Section 4.1.6) provides further evidence of the adequacy and effectiveness of the feedback arrangements and timely implementation of assessment findings.

Conclusion

In conclusion, processes are in place for reviewing the adequacy and effectiveness of the feedback arrangements, and for timely implementation of assessment findings. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Application of OPEX

List the major OPEX events and resulting plant changes that have resulted since PSR1 was completed.

External OPEX

SOERs represent the most significant external OPEX that is reviewed by OPG as described in Section 4.1.1. SOERs are key industry events and lessons learned of continuing importance. An SOER Module of the Observation and Coaching Self Assessment database is used to document SOERs and how they are addressed.

OPG Procedure N-PROC-RA-0035 [13] requires that corrective actions resulting from SOERs or Level 1 IERs be reviewed every 2 years. These biennial effectiveness reviews ensure that all corrective actions implemented in response to the original OPEX event are still adequate, taking into account any changes to processes or design since the corrective actions were initially implemented [37].

NK38-REP-03680-10104, "Darlington Integrated Safety Review – Final ISR Report" [36] contained a review of the corrective actions taken in response to external safety significant OPEX. The review included safety significant operating experience reports from June 1st, 2001 to May 30th, 2011 [37]. OPG subsequently assessed lessons from major external events including SOERs following the completion of the Darlington ISR in NK38-REP-03680-10207 R000, "Darlington NGS Integrated Safety Review Emerging Issues Report" [37]. That assessment addressed major external events up to the end of 2013 and is applicable to Pickering. An illustrative sample of these event reports is summarized in Appendix C, Table C1. The full list is available in Reference [37]. Appendix C summarizes the OPEX source, and how lessons were applied. WANO SOERs after August 1, 2013 are considered in Appendix C, Table C2. As demonstrated in Appendix C, the changes implemented as a result of the OPEX program provide confidence in the effective implementation of the elements of the OPEX program as summarized in Review Tasks 1 through 5.

The most significant of the external events in the review period was the Fukushima Daiichi accident on March 11, 2011. OPG conducted a rigorous review of the preparedness of its stations to deal with Beyond Design Basis Accidents (BDBA) in N-REP-03500-0401509, "Implications of the Fukushima Daiichi Event on OPG Nuclear Power Plants" [38]. For each of OPG's stations (Darlington, Pickering 1,4 and Pickering 5-8), the areas of review included:

- Design Basis Events;
- External Hazards and Events;
- BDBAs;
- Severe Accident Management; and
- Emergency Preparedness and Response.

The following conclusions and changes have been made:

- The current design and operation of OPG stations are robust and existing design provisions are, in general, sufficient to mitigate beyond design basis external hazards.
- Emergency Mitigating Equipment (EME) has been provided for events resulting in total loss of Alternating Current (AC) power. This EME (i.e., portable pumping capability with mobile diesel powered pumps), is on site and available to supply water to critical loads. This equipment can be fuelled from on-site tanker trucks with sufficient capacities to allow for sustained operation of required equipment. EME also includes portable equipment to provide temporary power supplies for alternate control and monitoring of critical equipment to successfully manage a BDBA and preclude fuel and/or core damage.
- At least one connection point has been provided to supply make up water to steam generators, Heat Transport System, Moderator System and Irradiated Fuel Bays (IFB), and a power supply provides continuous monitoring of critical parameters as needed to maintain the heat sinks, as discussed in N-CORR-00531-06822 R000, "Pickering NGS and Darlington NGS – OPG Specific Action Items Related to Closed Fukushima Action Items – Progress Update No. 4" [39].
- Operational guidelines supporting use of the EME equipment have been developed [34]. Validation has been performed of the effectiveness of EME deployment which includes human factors assessments through site drills and exercises [39].
- BDBA considerations (e.g., EME deployment and severe accident management) have been included in the N-PROG-RA-0001, "Consolidated Nuclear Emergency Plan" [39].

- Improvements to Severe Accident Management Guidelines have been made to improve response to BDBAs including Severe Accidents. Severe Accident Management Guidelines, derived from industry standards, have been issued and authorized staff has been trained in their use.

- Emergency drills and exercises have been expanded to include BDBAs.

- Installation of Passive Autocatalytic Recombiners which do not rely on electrical power, addresses mitigation of the potential for hydrogen hazards inside Containment, as discussed in N-CORR-00531-05574 R000, "Ontario Power Generation Comments on CNSC Staff Action Plan on CNSC Fukushima Task Force Recommendations" [40].

- Improved instructions have been provided to the operations crews for loss of cooling or normal water addition capability in the IFBs [40].

- Enhancements to the water makeup/cooling capability for the IFBs have been implemented [34].

- Additional studies, improvements and actions are being tracked to closure [39].

A review of Fukushima Action Items was performed for PSR2 in Reference [11] to identify implications of extending Pickering NGS operation beyond 2020.

Internal OPEX

Internal OPEX is used to improve performance as demonstrated by the following examples:

- A significant success within the Pump Program is seen through the refinement of the Shutdown Cooling (SDC) pump seal maintenance strategy. This strategy includes the incorporation of station OPEX into operating procedures for SDC pump operation and further improving maintenance practices. Through these activities a reduced forced loss rate due to SDC pump seal failures has been achieved [34].

- Improvements in radiation exposure performance were realized through the implementation of increased line accountability for the control of radiation exposure, including Departmental Dose Reduction Plans. Several initiatives developed during the process, including reducing radiation exposure to Operations staff during resin slurries, improvements to management of scaffolding tasks based on industry OPEX, and improvements in the quality of work performed by Fuel Handling, have resulted in performance better than target [34].

- Innovative uses of shielding, including custom designed shielding (e.g., in-boiler head applications and improved reactor face applications) and enhancements to support structures to decrease installation time (e.g., for boiler drains) have been implemented by the Radiation Protection Department, and OPEX/applications developed at other sites [34].

Conclusion

In conclusion, processes are in place for reviewing major OPEX events and for implementing the resulting plant changes. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, a detailed compliance assessment for one L/R/C/S with content applicable to Safety Factor 9 is provided in Reference [6]. Associated findings applicable to Safety Factor 9 are summarized in Table 2 below.

Table 2: PSR2 L/R/C/S Compliance Assessment Results for Safety Factor 9

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 9
CSA N286-12, "Management System Requirements for Nuclear Facilities"	There are no PSR2 gaps for CSA N286-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N286-12.

4.3 Audit and Self-Assessment Reviews

There were no OPG Nuclear Programs reviewed for the Use of Experience from Other NPPs and Research Findings in this report. Audit and self-assessment results for N-PROG-RA-0003 [7], "Corrective Action" are provided in "Pickering PSR2 Safety Factor 8 Report: Safety Performance" [8].

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 9 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 9 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 9.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [9] are provided in Reference [10]. Findings from the review of Fukushima Action Items are provided in Reference [11]. Results from the

Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 9 report that require discussion in other Safety Factor reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 9 were reviewed for the six PSR2 Review Tasks in Section 4.1 of this report and resulted in compliance with all aspects of the Review Tasks. L/R/C/S reviews for Safety Factor 9 were prepared per Section 4.2 and resulted in no PSR2 gaps. There were no OPG Nuclear Program audit and self-assessment reviews prepared for Safety Factor 9 per Section 4.3. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 9 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 9), which resulted in no PSR2 gaps.

The review of Safety Factor 9 has confirmed for Pickering NGS that there is adequate feedback of relevant experience from other nuclear power plants and from findings of research, and that this is used to introduce reasonable and practicable safety improvements at the plant or in the operating organization.

Appendix B: Audit and Self-Assessment Results

There were no OPG Nuclear Programs reviewed for the Use of Experience from Other NPPs and Research Findings in this report. Audit and self-assessment results for N-PROG-RA-0003 [7], "Corrective Action" are provided in the "Pickering NGS PSR2 Safety Factor 8 Report: Safety Performance" [8].

Appendix C: OPEX Events

The following table lists a sample of significant OPEX events to demonstrate that plant changes have resulted since the last ISR was completed. The *Darlington NGS Integrated Safety Review Emerging Issues Report* [37] identified 24 significant external events that occurred after the Darlington ISR (May 31, 2011) and up to December 31, 2013. A full listing of outcomes is provided in Appendix A of that report and a sample of that appendix is summarized in the following table. These results are applicable to Pickering as well as to Darlington.

Table C1: Sample of significant external operating experience events from 2011 to 2013 identified in the *Darlington NGS Integrated Safety Review Emerging Issues Report* [37]

WANO SOER 2011-3[12]	**Fukushima Daiichi Nuclear Station Spent Fuel Pool/Pond Loss of Cooling and Makeup:** Following a magnitude 9.0 earthquake and subsequent tsunami, on 11 March 2011, power supplies and equipment necessary to provide cooling, monitoring, and makeup to the Spent Fuel Pools (SFPs) became unavailable or inoperable for an extended period. This could have resulted in damage to the fuel stored	OPEX - WANO SOER 2011-3: Fukushima Daiichi Nuclear Station Spent Fuel Pool/Pond Loss of Cooling and Makeup	Closed	*AR 28134711 was created with specific assignments for the Pickering and Darlington stations to address the recommendations in this WANO SOER. A dedicated team has been assembled at OPG to implement actions related to Fukushima events and the EO Manager responsibility for SCR N-2011-04547 was transferred to the Director – Fukushima Project in early November 2011. An Evaluating Organization Effectiveness Review (EOER) is to be completed six months after the completion of the Corrective Action Plan. As per AR# 28134711, a nuclear business level EOER for this SOER has been completed and documented in the Self Assessment database under NO12-000376.* *AR #28145651 has been created to conduct a biennial effectiveness review for this SOER.*

[12] Subsequent to the Darlington ISR Emerging Issues Report, WANO SOER 2011-3 has been superseded by WANO SOER 2011-3 Rev 1 (discussed in Table C2).

Source	Report Title	SCR Title	SCR Status	Outcome *(Summarized from Darlington ISR Emerging Issues Report)* [37]
	in the Fukushima Daiichi nuclear power station SFPs. At the time of the event, Units 1, 2, and 3 were in operation and Units 4, 5, and 6 were shut down for refueling. The Unit 4 SFP contained both spent fuel and the full offloaded core from the most recent operating cycle. This SOER documents immediate actions required as a result of Fukushima Daiichi SFP problems.			*In April 2012, WANO issued additional documents based on the analysis of responses received from the member companies. OPG created SCR N-2012-02658 to assess the impact to OPG and document lessons learned. The industry responses were compared to OPG's response to SOER 2011-3. No gaps were found and no additional actions were required. N-2012-02658 has been completed.* *This WANO SOER was updated with SOER 2011-3 Rev 1 as noted below.*
WANO SOER 2011-4[13]	**Near-Term Actions to Address an Extended Loss of All AC Power:** This WANO SOER is issued as a result of the Fukushima event. Extended loss of all AC power resulted in emergency core cooling systems being unable to prevent fuel damage at	OPEX – WANO SOER 2011-4: Near-Term Actions to Address an Extended Loss of All AC Power-Fukushima Daiichi OPEX – INPO IER[14] L1 11-4:	Closed Closed	*This OPEX contains five recommendations for the member utilities to implement. The recommendations of this SOER call for the development of preplanned contingencies for protection from extended loss of AC power and beyond station blackout events similar to those experienced at Fukushima Daiichi.* *A dedicated team has been assembled at OPG to implement actions related to Fukushima events as communicated to the CNSC via N-CORR-00531-05574, "Ontario Power Generation Comments on CNSC Staff Action Plan on CNSC Fukushima Task*

[13] A review of Fukushima Action Items for applicability to PSR2 is provided in Reference [11]. Subsequent to the Darlington ISR Emerging Issues Report, WANO SOER 2011-4 has been superseded by WANO SOER 2013-2 Rev 1 (discussed in Table C2).

[14] INPO Event Report

Source	Report Title	SCR Title	SCR Status	Outcome *(Summarized from Darlington ISR Emerging Issues Report)* [37]
	three of the six units. This WANO SOER establishes the near term actions to improve margins for beyond design basis loss of AC power events pending longer-term industry actions to address Fukushima Daiichi lessons learned. Recommendations for this SOER assume the reactor is at full power as the initial condition. The recommendations of this SOER call for the development of preplanned contingencies for protection from extended loss of AC power and beyond station blackout events similar to those experienced at Fukushima Daiichi.	Near-Term Actions to Address the Effects of an Extended Loss of All AC Power in Response to the Fukushima Daiichi Event		*Force Recommendations". OPG Report N-REP-03500-0401509, "Implications of the Fukushima Daiichi Event on OPG Stations: A Summary Report" discusses OPG's response and recommendations contained in various Fukushima related WANO SOERs, SERs, and INPO IERs in detail. Section 3.0 of the report deals specifically with the review of the DNGS against Fukushima events and discusses completed or in-progress actions to address recommendations.*[15] *AR 28140560 was raised to track the actions resulting from the recommendations specific to this SOER. All actions including the Final EOER have been completed. The final fleet level assignment under AR# 28140560 provided Enhanced Communications for Emergency Response events.* *This WANO SOER was issued as a result of the INPO Level 1 IER 11-4. Please refer to the IER 11-4 discussion below.*
WANO SOER 2013-1	**Operator Fundamental Weaknesses** Several significant events have occurred that highlight weaknesses in the knowledge, skills,	OPEX – WANO SOER 2013-1: Operator Fundamentals Weaknesses	Closed	*This SOER 13-1 contains recommendations identified in INPO IER 11-3. A line by line comparison of SOER 13-1 and INPO IER 11-3 was completed as per AR and identified some activities that were not addressed in previous self-assessments as well as additional review activities under "Special Considerations for*

[15] The equivalent review of Pickering 1,4 and 5-8 are in Sections 4.0 and 5.0 respectively.

Source	Report Title	SCR Title	SCR Status	Outcome *(Summarized from Darlington ISR Emerging Issues Report)* [37]
	behaviours, and practices essential for operators to operate the plant safely and effectively – operator fundamentals. In some cases, individuals caused events during operations activities. In other instances, individuals did not mitigate the effects of power transients. Events include reactor trip, loss of reactor coolant system inventory, unplanned reactivity additions and damage to plant equipment. This SOER establishes actions to help members to self-assess the effectiveness of operator fundamentals and training programmes at their stations. This SOER also establishes actions to ensure operator fundamentals are well			*Review". Further corrective actions have been initiated as required.* *Self-Assessment, D14-000127*[16] *was performed to provide a snapshot status review of the station initiatives against SOER 2013-1 recommendations, identify gaps and/or weaknesses, and develop action plans to meet the objectives of the SOER recommendations.* *Reviews performed as part of the self-assessment identified that action plans are in place or have been implemented to address the SOER recommendations. Additionally, action plans have been developed to address areas requiring improvement.* *Corrective actions have been raised to ensure the successful implementation of Operator Fundamentals. These actions include the creation of an action plan to improve operator's risk awareness, performing a follow up self-assessment on training effectiveness in addressing operator fundamentals, and conducting an EOER.*

[16] Self-assessment PNGS P14-000618-SOER [41] was performed at Pickering in December 2014. It was a cold body review of SOER 2013-1 (INPO IER 11-3). The assessment is tracked via AR# 28156277-01 for the 2014 Pickering (014 and 058) review of this SOER. Improvement actions were identified. Fleet actions are being tracked via AR# 28172928. Pickering actions are being tracked via AR# 28167726.

	ingrained in and rigorously applied by operators.			
WANO SOER 2013-2[17]	**Post-Fukushima Daiichi Nuclear Accident Lessons Learned** This SOER documents actions required as a result of problems experienced at Fukushima Daiichi, following the 11 March 2011 earthquake and tsunami. The purpose of this SOER is to discuss and provide recommendations for significant lessons from the event. These lessons were drawn from a review of the March 2011 Fukushima Daiichi event and a similar event at the Fukushima Daini site. In addition, it provides a central location for all previously issued Fukushima-related SOERs and recommendations.	OPEX – WANO SOER 2013-2: Post-Fukushima Daiichi Nuclear Accident Lessons Learned;	Closed	*This OPEX contained 11 major recommendations, which address the leadership, organisational, cultural, resource and training issues that contributed to the event and that detracted from an effective emergency response.* *These recommendations had been reviewed through separate related Fukushima Daiichi OPEX. OPG performed a review of all 11 major recommendations and where existing measures or planned actions were determined to be insufficient to address specific recommendations, further actions have been identified.* *This WANO SOER was updated with SOER 2013-2 Rev 1 as noted below.*

[17] A review of Fukushima Action Items for applicability to PSR2 is provided in Reference [11]. Subsequent to the Darlington ISR Emerging Issues Report, WANO SOER 2013-2 has been superseded by WANO SOER 2013-2 Rev 1 (discussed in Table C2).

Source	Report Title	SCR Title	SCR Status	Outcome *(Summarized from Darlington ISR Emerging Issues Report)* [37]
	This SOER and the associated recommendations address the leadership, organisational, cultural, resource and training issues that contributed to the event and that detracted from an effective emergency response.			
INPO IER L1-13-10	**Nuclear Accident at the Fukushima Daiichi**	OPEX - INPO IER L1-13-10: Nuclear Accident at the Fukushima Daiichi Nuclear Power Station SCR# N-2013-01618	Closed	*N-2013-01618, issued in response to INPO IER L1-13-10, has been closed to SCR N-2013-01709, which was issued in response to WANO SOER 2013-2. See WANO SOER for discussion of the assessment against this INPO IER.*

Table C2 lists WANO SOERs since August 1, 2013 and the status of actions to implement plant changes based on OPEX lessons.

Table C2: WANO SOER events from August 2013 to January 2016

Source	Report Title/Scope	SCR Title	SCR Status	Outcome
WANO SOER 2011-3 Rev 1	**Spent Fuel Facility Degradation, Loss of Cooling or Makeup**	OPEX - WANO SOER 2011-3 UPDATE (R1): Spent Fuel Facility Degradation, Loss of Cooling or Makeup (Fukushima Daiichi) SCR# N-2013-22082	Closed	Updates were made to two recommendations from the earlier version of the SOER listed in Table C1 and one new recommendation was made. This includes a new requirement for monitoring of irradiated fuel bay level and temperature and radiation levels from an accessible location and requirements for assessment and monitoring of Dry Fuel Storage areas. The Corrective Action Plan was developed and implemented. Pickering has successfully completed a review against SOER 2011-3 Rev 1 during its 2015 WANO Review.
WANO SOER 2013-2 Rev 1	**Post-Fukushima Daiichi Nuclear Accident Lessons Learned** This SOER builds on earlier Fukushima SOERs and experience based on implementation and evaluation of the Fukushima event. The purpose of this SOER is two-fold. First, it discusses and provides recommendations for significant lessons from the	OPEX - WANO SOER 2013-2: Post-Fukushima Daiichi Nuclear Accident Lessons Learned SCR# N-2013-01709	Closed	The Corrective Action Plan developed for this SCR reflects the actions and activities undertaken as part of OPG's response to the Fukushima SOERs and other Fukushima-related OPEX. This includes the following: • WANO SOER 2011-02 (SCR N-2011-01646) • WANO SOER 2011-02 Addendum (SCR N-2012-02403) • WANO SOER 2011-03 (SCR N-2011-04547) • WANO SOER 2011-04 (SCR N-2011-06587) • INPO 11-005 Addendum (SA N012-000545) Because of the large amount of work already undertaken by OPG at its facilities since the

Source	Report Title/Scope	SCR Title	SCR Status	Outcome
	event. These lessons were drawn from a review of the March 2011 Fukushima Daiichi event and a similar event at the Fukushima Daini site. Second, it provides a central location for all previously issued Fukushima-related SOERs and recommendations.			Fukushima event, and in particular in response to the OPEX items above, many of the recommendations were already at least partly satisfied. Each of the 11 recommendations has been reviewed. Where existing measures, or planned actions were determined to be insufficient to address a specific recommendation, further actions were identified and these were the basis of the Corrective Action Plan for this SCR, which has been completed and implemented. Pickering has successfully completed a review against SOER 2013-2 Rev 1 during its 2015 WANO Review.
WANO SOER 2015-1 Rev 1 [42]	Safety Challenges from Open Phase Events[18] Undetected conditions during open phase events have resulted in the inoperability of important components, losses of shutdown or maintenance cooling, and the potential to affect all trains of safety systems from a common mode failure.	WANO SOER 2015-1 Rev 1: Safety Challenges from Open Phase Events SCR# N-2015-03998	Approved	Pickering is now compliant with all of the recommendations in this SOER.

[18] An open phase event is defined where power in one (or possibly two) of the three phases of an offsite power source feed is lost for a long duration.

Source	Report Title/Scope	SCR Title	SCR Status	Outcome
WANO SOER 2015-2	Risk Management Challenges Some events demonstrated that individuals exhibited at-risk behaviours based on overconfidence from past successful performances, perceived time pressures or complacency. Like individuals, the decisions made by committees, forums or groups of supervisors and managers can be adversely influenced by business pressures, where plant and corporate leaders may inadvertently display a non-conservative risk tolerance. Several events occurred as a result of weaknesses in risk management during the project or modification process, especially for large first-of-a-kind or first-in-a-while projects.	OPEX - WANO SOER 2015-2: Risk Management Challenges SCR# N-2015-28710	Approved	A comprehensive evaluation on risk awareness was performed under N-2016-04704 resulting in the following actions: 1. AR# 28188287-01 - Create OPGN Risk Management Governance 2. AR# 28188287-04 - Select Standardized Risk Management Tool for OPGN 3. AR# 28188287-05 - Implement a systematic approach to delivering risk management training to the Nuclear Division 4. AR# 28188287-08 - Risk Mitigation Plan Workshop for OPG Leadership All of these ARs are in progress with due dates up to February 28, 2017.

Revision Summary – For Amec Foster Wheeler Report PS112/RP/015

Rev	Date	Author	Comments
R00	July 29, 2016	R. Jayasundera, M. Hoang and L. Macdonald	Initial issue for OPG review and comment.
R01	December 12, 2016	R. Jayasundera, M. Hoang, L. Macdonald and J. Cheng	Updated report addressing OPG comments on R00 Report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 10, *Organization, Management System, and Safety Culture* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 10 were reviewed for the fifteen PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 10 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 10 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 10).

The results of the review of Safety Factor 10 are discussed in Section 5.0. The review has confirmed that the Pickering NGS organization, management system and safety culture are adequate and effective for ensuring the safe operation of the plant. As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

[1] Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

[2] Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's Nuclear operations. As a result, where Pickering is confirmed to follow the same Nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of the Organization, Management System and Safety Culture Safety Factor 10 is to: "determine whether the organization, Management System and safety culture are adequate and effective for ensuring the safe operation of the plant." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 10 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 10 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 10 Review Tasks are:

1) Review organization and administrative procedures to ensure they play a significant role in defining safety culture and evaluate the adequacy of safety culture indicators.

2) Establish existence of a safety policy to ensure that safety takes precedence over production where a conflict between these two requirements exists.

3) Identify the method for setting performance targets and confirm that these targets are regularly and systematically reviewed. Confirm that appropriate actions are initiated if safety targets are not met.

4) Confirm that the published Nuclear organization, including any recent changes made to the organization, clearly defines the roles and responsibilities of all individuals and work groups who are involved in activities that could influence the safe operation of the station. Ensure that this organization is understood and that adequate and effective procedures are in place to ensure the availability of these resources and control changes to this organization.

5) Establish that mechanisms for maintaining configuration control of the plant and its documentation are effective and up-to-date.

6) Confirm that there are formal arrangements for employing external technical, maintenance or other specialist staff, and confirm that the contracting procedures ensure that contract employees are qualified to do the work assigned to them.

7) Confirm that there is an approved Quality Assurance program and that regular Quality Assurance audits are conducted involving both internal and independent assessors.

8) Confirm that a program for self-assessment and continuous improvement has been adequately and effectively implemented including feedback of experience relating to organizational and management failures.

9) Confirm there is a system to ensure that comprehensive, easily retrievable, and auditable records exist of baseline design information, and operational and maintenance history.

10) Confirm there is an effective framework in place to support the management of regulatory affairs.

11) Confirm that the organization and Management System include the processes and supporting information that explain how work is to be specified, prepared, reviewed, performed, recorded, assessed and improved.

12) Confirm there is control of purchasing of equipment and services where this affects plant safety.

13) Confirm there are comprehensive communication policies in place.

14) Confirm that a questioning attitude exists and conservative decision making is undertaken in the organization.

15) Verify that there is a process in place for prioritization of safety issues, with realistic objectives and timescales that ensures that these issues receive proper resources.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Organization, Management System and Safety Culture Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 10 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6] and [7]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Organization, Management System and Safety Culture Safety Factor 10

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286	Management System Requirements for Nuclear Facilities	N286-12	5, 6, 9, 10, 11	Incremental	N286 addressed as part of Pickering B and Darlington ISRs.
2	CSA N286.7	Quality Assurance Of Analytical, Scientific And Design Computer Programs	N286.7-16	1, 5, 6, 7, 10	Incremental	N286.7 addressed as part of Pickering B and Darlington ISRs.
3	CNSC RD-204	Certification of Persons Working at Nuclear Power Plants	2008	10	Incremental	RD-204 addressed as part of Darlington ISR.
4	CNSC REGDOC-3.1.1	Reporting Requirements for Nuclear Power Plants	2014	10	Incremental	CNSC S-99 (precursor to REGDOC-3.1.1) addressed as part of Pickering B and Darlington ISRs.
Additional L/R/C/Ss						
5	CNSC G-323	Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement	2007	10, 12	Incremental	G-323 addressed as part of Darlington ISR.
6	S.C. 1997, C.9	Nuclear Safety and Control Act (NSCA) and its associated Regulations	Amended in February 2015	10	Incremental	S.C. 1997, C.9 addressed as part of Darlington ISR.
7	SOR/2000-202	The General Nuclear Safety and Control Regulations	Amended in June 2015	10, 15	Incremental	SOR/2000-202 addressed as part of Pickering B and Darlington ISRs.
8	CNSC REGDOC-2.2.2	Personnel Training	2014	10	Incremental	REGDOC-2.2.2 not addressed as part of Pickering B or Darlington ISRs. Transition Plan and gap analysis has been prepared for REGDOC-2.2.2.
9	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
10	CSA N286.7.1	Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants	N286.7.1-09	1, 5, 6, 7, 10	N/A [3]	N286.7.1 not addressed as part of Pickering B or Darlington ISRs.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Programs (N-PROGs) reviewed for Safety Factor 10 are listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of each of the N-PROGs in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Programs Reviewed for Safety Factor 10

Document Number	Document Title
N-PROG-AS-0001 [9]	Managed Systems
N-PROG-AS-0002 [10]	Human Performance
N-PROG-RA-0010 [11]	Independent Assessment

2.4 Additional Reviews

The PSR2 Safety Factor 10 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 10):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 10 to ascertain the implications of extending Pickering

[3] The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [8]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

[4] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 10 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [12] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 10 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Organization, Management System and Safety Culture Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 10 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[5]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

5 "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 10 L/R/C/S reviews identify Compliances and Gaps as defined below:[6]

- <u>Compliance</u>:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 10.)

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 10.)

---

[6] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
  - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
  - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 10.)
  - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 10.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in

performance. As a result, the broad review scope of program audits focuses on identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [13]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was also performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 10):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 10 (as identified in the Darlington ISR Integrated Implementation Plan [14] and Pickering Units 5-8 Continued Operations Plan [12]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[7]

---

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's Nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same Nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 10 review which need to be addressed in other Safety Factor Reports are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 10 Review Tasks.

4.1.1 Review Task #1: Role of Procedures in Defining Safety Culture

Review organization and administrative procedures to ensure they play a significant role in defining safety culture and evaluate the adequacy of safety culture indicators.

N-POL-0001, "Nuclear Safety Policy" [15], which takes its authority from OPG-POL-0032, "Safe Operations Policy" [16] and is approved by the OPG Board of Directors, states in part:

> *Nuclear Safety shall be the overriding priority in all activities performed in support of OPG nuclear facilities. Nuclear Safety shall have clear priority over schedule, cost and production.*
>
> *Everyone shall demonstrate respect for nuclear safety by:*
>
> - *Knowing how your work impacts on **C**ontrol the power, **C**ool the fuel, and **C**ontain radioactivity (3C's).*
> - *Applying Event-Free tools and defences to prevent events.*
> - *Reporting adverse conditions so they can be corrected.*
>
> *Everyone shall conduct themselves in a manner consistent with the following Traits for a Healthy Nuclear Safety Culture:*
>
> 1. *Personal Accountability*
> 2. *Questioning Attitude*
> 3. *Effective Safety Communication*
> 4. *Leadership Safety Values and Actions*
> 5. *Decision-Making*
> 6. *Respectful Work Environment*
> 7. *Continuous Learning*

8. *Problem Identification and Resolution*

9. *Environment for Raising Concerns*

10. *Work Processes*

The Chief Nuclear Officer is accountable to the Chief Executive Officer and the Board of Directors to establish a management system that fosters nuclear safety as the overriding priority. This policy shall be reviewed at an appropriate interval.

As described by OPG in the 2013 PROL renewal application, Section 3.1.1, "Relevance and Management", of P-CORR-00531-03860 [17], safety culture at OPG is characterized by the following attributes:

- Safety Demonstrated as a Value - Policies, objectives, and standards are established and communicate the overriding importance of safety;

- Effective Management Systems - Documented processes and procedures establish accountabilities for safety and control work activities;

- Appropriate Behaviours - Clear expectations are established and appropriate tools and methods are provided to ensure that leaders and staff adopt behaviours which foster safety;

- Continuous Learning - Processes are in place for staff observations and concerns, for applying internal and external operating experience, for effective self-assessment and oversight, and for generating and completing appropriate corrective actions; and

- Good Safety Performance - Performance measures and results reflect a healthy regard for safety.

A safety culture program has been integrated in all areas of operation to ensure that individuals at all levels of the organization consider safety as the overriding priority, per N-POL-0001, "Nuclear Safety Policy" [15]. A healthy safety culture underpins high levels of performance in all 14 Safety and Control Areas (SCAs). The Management System SCA and Human Performance SCA are particularly impacted by safety culture. According to P-CORR-00531-03860 [17], in order to monitor and assess the health of safety culture, Pickering NGS was in the process of implementing new management oversight meetings, including Continuous Improvement and the Nuclear Safety Culture Monitoring Panel. Per N-PROC-AS-0083, "Nuclear Safety Culture Monitoring Panels" [18], the Nuclear Safety Culture Monitoring Panel has since been implemented to monitor process inputs that are indicative of the health of the organization's nuclear safety culture in order to identify strengths and potential concerns. As described in P-CORR-08120-0453327, "Pickering Oversight Meeting Structure" [19], continuous improvement is incorporated into "Ready & Reliable – A Strategy for Continuous Improvement" meetings. It is also addressed in Nuclear Safety Oversight Committee reviews of self-assessment and audit results.

A nuclear safety culture assessment is conducted at Pickering NGS every 3 years, in accordance with N-PROC-AS-0077, "Nuclear Safety Culture Assessment" [20].

Corporate Commitment

The Board of Directors takes an active role in communicating the importance of safety. This is demonstrated through N-POL-0001 [15].

N-CHAR-AS-0002, "Nuclear Management System" [21], which takes authority from the Nuclear Safety Policy, N-POL-0001 [15], gives authority to the OPG Nuclear safety processes and defines responsibilities. It specifies that the Chief Nuclear Officer (CNO) is accountable for:

> *"the effectiveness of the overall Nuclear Management System in ensuring our Nuclear facilities are operated and maintained using sound Nuclear safety and defense-in-depth practices to ensure radiological risks to workers, the public, and environment are as low as reasonably achievable, and in keeping with the Nuclear Safety Policy, and the best practices of the international Nuclear community."*

The OPG Nuclear Management System is the framework that establishes the processes and programs required to ensure that OPG and Pickering NGS achieve their safety objectives and continuously monitor their performance against these objectives.

Management Level

OPG has a well-defined organizational structure and strong lines of authority. N-CHAR-AS-0002 [21], describes the Nuclear quality program, while N-STD-AS-0020, "Nuclear Management Systems Organizations" [22] outlines its implementation. N-STD-AS-0020 [22] establishes the lines of authority and definition of duties. It provides a summary of the interfacing organizations that own programs supporting the Nuclear Management System. Operation and maintenance of the station as per regulatory requirements and Nuclear standards for public safety are directed by the Director, Operations and Maintenance, who also coordinates with the centre-led organizations to effectively use resources to achieve performance targets. The quality and quantity of services provided by these centre-led support organizations is monitored by the site Senior Vice President, who holds responsibility for establishing site requirements and priorities, and the Nuclear Executive Committee, which has a key oversight role. Position specific role documents, N-MAN-08131-10000 (numerous sheets) [23], describe the duties, authorities and accountabilities of the positions described in the standard.

Additional guidance is given in N-PROG-OP-0001, "Nuclear Operations" [24], N-PROG-MA-0004, "Conduct of Maintenance" [25], and N-PROG-MP-0007, "Conduct of Engineering" [26]. The training and qualification description document, N-TQD-601-00001, "Leadership and Management Training and Qualification Description" [27] provides qualification and professional development requirements for supervisors and managers which includes Safety Culture for Managers.

Managers ensure that tasks are executed as defined through N-PROG-AS-0002, “Human Performance” [10]. This program is specifically designed to achieve higher levels of nuclear and industrial safety, higher unit reliability, and reduced operating costs through event-free operation. This performance is accomplished through pre-job briefings, post-job debriefings, self-checking programs, communications, self-assessments, and an observation and coaching program.

Qualified Resources

Resources

OPG develops and funds resources through N-PROG-AS-0005, “Business Planning” [28]. The program requires that the business plans consist of generation, costs, and staff plans. Business plans are detailed by each division. Other inputs to this process include relevant work programs for cost categorization and risk management, defined benchmarking with other nuclear utilities, demographic profiles, and minimum shift complement staffing requirements as specified in the plant operating licence and OPG instruction P-INS-09100-00003, “Pickering Minimum Shift Complement” [29]. Strict limits on hours of work are imposed via N-PROC-HR-0002, “Limits of Hours of Work” [30].

OPG also has consultants and contractors available to support the operating organizations.

Qualification and Training

N-PROG-TR-0005, “Training” [31] describes the Training Program for regular staff, contractors, temporary personnel, and other staff assigned work at Nuclear. It includes the structure, processes and tools for defining, developing, implementing, documenting, assessing and improving the training required to ensure Nuclear staff have the appropriate knowledge, skill, and attitudes for safe and efficient plant operation.

As described in Section 1.6.3 of P-CORR-00531-03719, “Application For Renewal Of Pickering Nuclear Generating Station Power Reactor Operating Licence” [32], OPG identifies qualified and competent individuals for key positions. With career development and succession planning being key elements in the management capability strategy, a corporate succession plan ensures that individuals with high leadership potential are identified to help continue excellence in nuclear safety.

Self-regulation

Nuclear safety oversight is established to ensure that the requirements of N-POL-0001, “Nuclear Safety Policy” [15], and N-CHAR-AS-0002, “Nuclear Management System” [21] are implemented throughout Nuclear. The framework, accountabilities for nuclear safety oversight, as well as the external and internal processes used for oversight and assessment of nuclear safety are summarized in N-STD-AS-0023, “Nuclear Safety Oversight” [33].

Nuclear safety oversight is conducted in a manner consistent with the "Traits of a Healthy Nuclear Safety Culture" defined in N-POL-0001 [15]. A variety of internal and external oversight forums and processes are used to review, evaluate and critique the nuclear safety performance of the organization.

Deficiencies, non-conformances, and weaknesses with a process, document, service, or condition are treated as learning experiences and captured in the "Corrective Action Program", N-PROG-RA-0003 [34]. Individuals are encouraged to identify conditions adverse to safety or quality, and notify appropriate levels of management in order to identify causes and minimize or prevent recurrence. This process is well-defined and sufficiently controlled so that concealment of errors is actively discouraged.

<u>External Oversight and Assessments</u>

The Nuclear Safety Review Board (NSRB), composed of senior external nuclear experienced individuals, provides the CNO with an annual independent assessment of OPG Nuclear activities at each station that may impact nuclear safety and performance. The scope and terms of reference for the operation of the NSRB are described in N-STD-RA-0035, "Nuclear Safety Review Board" [35].

OPG also invites the World Association of Nuclear Operators (WANO) to conduct Peer Reviews at each Nuclear site every 2 years. An external team of experts reviews all key functional and organizational areas against the WANO Performance Objectives and Criteria. These assessments identify areas for improvement at the host plant and note strengths that could be useful to share with other plants.

Both the NSRB and WANO reviews provide valuable insight on opportunities for improvement. Utilizing industry peers in these evaluations provides fresh perspectives on plant issues and useful improvement opportunities.

<u>Internal Oversight and Assessment</u>

As described in N-STD-AS-0023, "Nuclear Safety Oversight" [33], critical oversight is conducted internally on all activities affecting nuclear safety in order to identify and report adverse conditions for correction, as well as to strengthen nuclear safety and improve performance.

The Nuclear Oversight Committee (replaced by the Generation Oversight Committee, after the PSR2 documentation freeze date) is a committee of the OPG Board of Directors. The committee is responsible for oversight of safe and efficient operations of the OPG Nuclear business, regulatory compliance of facilities, review of reports from independent oversight of operations, reviews of management and organizational matters, security of OPG's nuclear facilities and substances, and oversight of nuclear waste and decommissioning liabilities and management. The OPG Nuclear Oversight group proactively assesses changes expected in Canadian Standards Association (CSA) N286-12, "Management System Requirements for Nuclear Power Plants" [36] and their impact on the Nuclear Management System.

Per N-STD-AS-0023 [33], the Nuclear Executive Committee (NEC) reviews nuclear safety performance, safety margins, and potential threats to nuclear safety as part of its normal business reviews. This review is fully integrated into the business/operating reports, and takes account of related information such as independent evaluations, internal self-assessments and international operating experience. NEC members participate in the Fleetview Program Health and Performance reporting oversight process per N-PROC-RA-0023 [13]. As outlined in NK38-REF-09701-0561144, "Nuclear Executive Committee Terms of Reference" [37], NEC members include the Chief and Deputy Nuclear Officers, Chief Nuclear Engineer, Chief Supply Officer, Senior Vice Presidents for both Pickering and Darlington stations, as well as a number of Vice Presidents.

N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [38] establishes the methodology and requirements for planning, scheduling, staffing, preparing, performing, reporting and follow up of audits and assessments performed by Nuclear Oversight. This procedure takes direction from N-PROG-RA-0010, "Independent Assessment" [11].

N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [13], specifies requirements for performing a Program health and performance review and reporting on overall effectiveness of the Management System to support the management assessment of the effectiveness requirements of CSA N286-05 [39] [8]. This procedure takes direction from N-PROG-AS-0001, "Managed Systems" [9].

Nuclear Safety Oversight is established at each of the nuclear operating sites. As per N-STD-AS-0023, "Nuclear Safety Oversight" [33], its purpose is to review station performance related to nuclear safety and initiate appropriate action as required, consistent with plant initiatives and goals.

Reactivity management practices are implemented in accordance with N-STD-OP-0009, "Reactivity Management" [44] and are consistent with good industry practices including performance targets, such that reactivity of the reactor core is always respected and controlled.

N-STD-OP-0036, "Operational Decision Making" [45] provides principles for effective operational decision making and a systematic approach for the application of these principles enabling operational decisions that support safe and reliable plant operation, both in the near and long term. Conservative decision-making is one of the event-free tools used during operational decision-making.

---

[8] Pickering NGS is required to comply with CSA N286-05 per the Pickering NGS PROL [40] while Darlington NGS is required to comply with CSA N286-12 per the Darlington NGS PROL [41]. As a result of the Darlington NGS PROL renewal, OPG was compliant with N286-12 by December 31, 2015 [42]. As discussed in NK38-CORR-00531-06780 [43], there are a large number of OPG documents that need to be revised to reflect the numbering change from N286-05 to N286-12. This administrative revision will be completed over the course of a few years and may not be reflected in OPG Governance as of the PSR2 freeze date.

N-INS-09030.2-10000, “Event Free Challenge Process” [46] provides direction for conducting an Event Free Challenge Meeting, which allows a task execution group to perform a final oversight of preparedness prior to the execution of a task. The process is used for situations where the likelihood and consequence of error are high, to put appropriate defenses/barriers in place to ensure safe execution of work.

N-STD-MA-0016, “Reactor Safety Support of Outages” [47] provides requirements for reactor safety support and oversight for nuclear unit outage planning and execution. Shutdown safety is maintained by working in compliance with a well-developed and reviewed outage schedule.

Periodic safety report updates are performed per the CNSC Regulatory document REGDOC-3.1.1, “Reporting Requirements for Nuclear Power Plants” [48] in accordance with the OPG procedure N-PROC-MP-0086, “Safety Analysis Basis and Safety Report Updates” [49]. Probabilistic Safety Assessments are implemented in accordance with N-PROG-RA-0016, “Risk and Reliability Program” [50].

Third party activities, which contribute to the technical basis of plant safety, are formally qualified through N-PROC-MM-0021, “Supply Inspection” [51]. These suppliers are added to the list of approved nuclear suppliers via N-PROC-MM-0010, “Establishing and Maintaining OPG Approved Suppliers List” [52].

Individuals

A questioning attitude is instilled in all staff performing safety related tasks. Active participation, demonstrated through asking questions, is expected during briefings, as stated in N-PROC-OP-0005, “Pre-Job Briefing and Post-Job Debriefing” [53]. For tasks with novel content, additional requirements are specified in N-PROC-OP-0001, “Conduct of Infrequently Performed Tests or Evolutions” [54].

The tools for rigorous and prudent approach are all documented in N-PROG-AS-0002, “Human Performance” [10] and more specifically in N-STD-AS-0002, “Procedure Use and Adherence” [55].

Detailed guidance on the importance of precise communication and tools for implementation are described in N-STD-OP-0002, “Communications” [56].

Nuclear Safety Performance Measures

The Nuclear Safety Policy N-POL-0001 [15] requires that nuclear safety undergoes constant examination through a variety of monitoring techniques to ensure the organization is alert to detect and respond to indicators that signal declining performance.

International Nuclear Safety Advisory Group, Safety Culture, Safety Series No. 75-INSAG-4, IAEA, Vienna (1991) Appendix [57] was used as a guide to ensure that appropriate and sufficient safety culture indicators are in place.

N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [13] is a fleet-wide functional review and reporting process for monitoring and reporting on overall program effectiveness.

Corporate Policy Level

As discussed above, a corporate safety policy exists and is reinforced periodically with staff.

Nuclear Executive Level

As per N-INS-08920-10017, "Training Committees" [58], the Nuclear Training Oversight Committee meets on a biannual basis to review performance of the Nuclear Training Program. These meetings may be part of a scheduled NEC meeting. These NEC meetings also normally include the Fleetview Program Health and Performance report review. Quality and completeness of the Fleetview report are reviewed critically by NEC members, and acceptance or rejection of the reports are decided in meetings.

N-STD-AS-0023, "Nuclear Safety Oversight" [33] summarizes the framework, accountabilities for nuclear safety oversight, as well as the external and internal processes used for oversight and assessment of nuclear safety. This standard applies to all aspects of nuclear operations and to all work and other activities undertaken at or in support of the stations.

Power Plant Level

Nuclear safety oversight is established at each of the nuclear operating sites in accordance with N-STD-AS-0023, "Nuclear Safety Oversight" [33]. Nuclear safety performance measures are incorporated with various monitoring techniques to ensure that declining performance is detected and responded to. N-STD-AS-0023 [33] specifically describes the Nuclear Performance Index as a measure to be reviewed. This metric is reported quarterly and is a weighted composite of WANO Performance Indicators related to safety and production performance reliability. This metric is also used to trend the performance and monitor the effectiveness of various improvement programs and allows OPG Nuclear to benchmark against other nuclear plants worldwide.

Other metrics related to the measure of nuclear safety performance include:

- Reactivity Management Index: This index includes all reactivity management events over a 12 month rolling average. Calculating and reporting of this metric are conducted in accordance with criteria in "Reactivity Management", N-STD-OP-0009 [44].

- Site Event Free Day Resets: The Event Free Day Reset program is one of the tools used to identify human performance events. This indicator is reported monthly at each site and reflects the effectiveness of management in reducing errors and improving organizational processes and activities to reduce the significance and frequency of human performance events. Performance improvement is accomplished by identifying human performance events, investigating the causes to determine corrective actions, performing trending and analysis to identify reoccurring and common issue areas, and communicating the results throughout all levels of the organization. The guidance and criteria for application and administration of this metric are identified in N-INS-09030-10002, "Site and Department Level Event Free Day Resets" [59].

- Integrated Risk Management: N-GUID-03611-10005, "Integrated Risk Management Guidelines" [60] establishes the administrative controls, responsibilities, duties for direction, control, conduct, and oversight of risk significant activities (Nuclear Safety, Conventional Safety, Environmental, Generation and Radiological), Infrequently Performed Tests or Evolutions, and Infrequent Maintenance Activities at OPG Nuclear.

N-PROC-AS-0077, "Nuclear Safety Culture Assessment" [20], which derives its authority from N-PROG-AS-0001, "Managed Systems" [9], has the objective to evaluate the strength of an organization's nuclear safety culture against the traits of a healthy nuclear safety culture identified in N-POL-0001 [15]. Nuclear safety culture assessment focuses on Operations, Maintenance and Engineering staff, but also will assess all site staff and is performed every 3 years.

Conclusion:

The conclusion of this Review Task assessment is that OPG organization and administrative procedures are well established and play a significant role in defining safety culture. Safety culture indicators are monitored and adequate. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Safety Takes Precedence Over Production

Establish existence of a safety policy to ensure that safety takes precedence over production where a conflict between these two requirements exists.

OPG has a document hierarchy that addresses the requirements of this Review Task.

1. A statement of corporate safety policy

   N-POL-0001, "Nuclear Safety Policy" [15] approved by the OPG Board of Directors states in part:

   > *Nuclear Safety shall be the overriding priority in all activities performed in support of OPG nuclear facilities. Nuclear Safety shall have clear priority over schedule, cost and production…*

Everyone shall conduct themselves in a manner consistent with the following Traits of a Healthy Nuclear Safety Culture:

1. *Personal Accountability*
2. *Questioning Attitude*
3. *Effective Safety Communication*
4. *Leadership Safety Values and Actions*
5. *Decision-Making*
6. *Respectful Work Environment*
7. *Continuous Learning*
8. *Problem Identification and Resolution*
9. *Environment for Raising Concerns*
10. *Work Processes*

The Chief Nuclear Officer is accountable to the Chief Executive Officer and the Board of Directors to establish a management system that fosters Nuclear safety as the overriding priority. This policy shall be reviewed at an appropriate interval.

2. Processes and responsibilities that exist to implement the policy

N-CHAR-AS-0002, "Nuclear Management System" [21], defines the nuclear safety processes and responsibilities. It also specifies that the CNO is accountable for:

> *"the effectiveness of the overall Nuclear Management System in ensuring our Nuclear facilities are operated and maintained using sound Nuclear safety and defense-in-depth practices to ensure radiological risks to workers, the public, and environment are as low as reasonably achievable, and in keeping with Nuclear Safety Policy, and the best practices of the international Nuclear community."*

N-PROG-AS-0002, "Human Performance" [10] derives its authority from the Charter N-CHAR-AS-0002 [21]. The Human Performance (Hu) program, which describes key accountabilities and core processes associated with Hu management, addresses many elements of the organization and administration portion of Safety Factor 10.

3. Standards that provide implementation tools for management expectations

   N-STD-OP-0012, "Conservative Decision Making" [61], derives its authority from the Human Performance program. It specifically states in Section 1.2.4, "*Safety shall remain the number one priority ahead of production or cost*." N-STD-OP-0012 [61] requires the operators to reduce reactor power, trip the unit, or take necessary actions to place the plant in a safe condition when key plant parameters deviate from expected conditions.

4. Instructions and procedures used in day-to-day operations

   A questioning attitude is instilled in all staff performing safety related tasks. A formal process is defined in N-PROC-OP-0005, "Pre-Job Briefing and Post-Job Debriefing" [53].

   The tools for maintaining a rigorous and prudent approach during daily operations are documented in N-PROG-AS-0002 [10] and more specifically in N-STD-AS-0002, "Procedure Use and Adherence" [55].

Conclusion:

The conclusion of this Review Task assessment is that OPG has a safety policy in place that requires nuclear safety take precedence over production where a conflict between these two requirements exists. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Method for Setting Performance Targets

Identify the method for setting performance targets and confirm that these targets are regularly and systematically reviewed. Confirm that appropriate actions are initiated if safety targets are not met.

The Nuclear Safety Policy N-POL-0001 [15] requires that nuclear safety undergoes constant examination. The Nuclear Management System Charter, N-CHAR-AS-0002 [21], identifies expectations for the organization to develop priorities based on performance indicators and known challenges.

These expectations and targets are achieved through a variety of monitoring techniques to ensure the organization is alert to detect and respond to indicators that signal declining performance. In order to improve performance, a set of key performance indicators is established, measured, and trended. Identified adverse trends are analyzed, forming the basis for development of corrective actions designed to improve plant and equipment performance, operating requirements and practices, and overall human performance. Performance analysis, per N-PROC-AS-0078, "Nuclear Performance Monitoring and Reporting" [62], requires comparison of results and established business plan targets. Where performance is not meeting targeted results or is trending adversely, analysis of the data to explain variances is required and mitigating actions shall be provided.

Nuclear Performance Index

As described in "Nuclear Performance Monitoring and Reporting", N-PROC-AS-0078 [62], this metric is reported quarterly and is a weighted composite of ten WANO Performance Indicators related to safety and production performance reliability. This metric is also used to trend the performance and monitor the effectiveness of various improvement programs and allows OPG Nuclear to benchmark against other nuclear plants worldwide.

Reactivity Management Index

This index includes all reactivity management events over a 12 month rolling average. Calculating and reporting of this metric are conducted in accordance with criteria in "Reactivity Management", N-STD-OP-0009 [44].

Site Event Free Day Resets

This indicator is reported monthly and reflects the effectiveness of management in reducing errors and improving organizational processes and activities to reduce the significance and frequency of human performance events. The criteria for application and administration of this metric are identified in N-INS-09030-10002, "Site and Department Level Event Free Day Resets" [59].

Performance Monitoring and Reporting

OPG monitors performance indicators to measure the performance of the stations against the business planning goals and targets. The monitored and measured indicators are documented in OPG systems in accordance with N-PROC-AS-0078, "Nuclear Performance Monitoring and Reporting" [62]. This document provides the following:

- Requirements and descriptions of performance measures for nuclear and divisional level reporting;

- Specifications for internal and external performance reports; and

- Requirements for performance measure data, OPG Nuclear performance index, and reporting of performance indicators.

Revision of Performance Measures

OPG Instruction N-INS-08115-10000, "Addition, Deletion and Revision of EPR Performance Measures" [63] provides staff with detailed guidelines and instructions for the introduction of new performance measures, and the revision or deletion of existing performance measures in the Electronic Performance Reporting (EPR) system used for Operational Performance Reporting. The document also defines the requirements for setting and revising targets. It states, "Targets are goals set each year during the business planning process in Nuclear to track progress toward achieving Nuclear excellence and becoming a world class organization. Targets are assessed on a monthly basis as they work toward achieving year-end goals."

Performance measures and other metrics are also found outside of the EPR system. While the EPR system is used for reporting Nuclear business performance management measures, the World Association of Nuclear Operators Data Entry System is used for reporting Nuclear Performance Index performance measure results to WANO. WANO collects, checks, and collates data for each operating nuclear plant and reactor unit after each quarter to produce a range of indicators. As described in Section 1.2.3, "Consistency", of N-PROC-AS-0078, "Nuclear Performance Monitoring and Reporting" [62], definitions and methods of calculation and collection for performance measures input to the EPR system and the WANO Data Entry System must be consistent across sites and business units, as well as remain the same year-over-year to act as a basis for comparison and benchmarking. Other measures, such as the Tier 4 measures also defined in N-PROC-AS-0078 [62], are department or site specific. They are established, maintained, and monitored by individual departments, and managed locally by a site or business unit.

A detailed review of OPG processes for assessing performance indicators is presented in the Pickering NGS PSR2 Safety Factor 8 Report (Safety Performance) [64]. The specific task assessed in Section 4.1.5 of the Safety Performance Safety Factor Report [64] that addresses the requirements of this Review Task is:

- Confirm that there is an adequate set of Performance Indicators that provides a systematic and comprehensive method to record, trend and analyze safety-related data including the major system parameters, maintenance and inspection records.

In accordance with the PROL 48.02/2018 [40], OPG is required to comply with the CNSC standard REGDOC-3.1.1 [48] and report to the CNSC on a quarterly basis the specific performance indicators specified in REGDOC-3.1.1 [48].

Corrective Action

OPG Program N-PROG-RA-0003, "Corrective Action" [34] provides requisite measures to ensure non-conformances and abnormal occurrences are promptly identified, documented in sufficient detail, and reported. Non-conformances are evaluated using a graded approach based on significance. When appropriate, the root cause is identified, which forms the basis for development of immediate corrective actions and actions to prevent recurrence. The aspect of using Operating Experience from within OPG Nuclear and the industry is an integral part of this program.

Further details of OPG processes for assessing performance indicators are presented in the Pickering NGS PSR2 Safety Factor 8 Report (Safety Performance) [64].

Conclusion:

The conclusion of this Review Task assessment is that OPG has processes in place for setting, managing, and regularly reviewing performance targets, and for initiating corrective actions if safety targets are not met. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Nuclear Organization

Confirm that the published Nuclear organization, including any recent changes made to the organization, clearly defines the roles and responsibilities of all individuals and work groups who are involved in activities that could influence the safe operation of the station. Ensure that this organization is understood and that adequate and effective procedures are in place to ensure the availability of these resources and control changes to this organization.

Organization

OPG has a well-defined organizational structure and strong lines of authority. OPG Standard N-STD-AS-0020, "Nuclear Management Systems Organizations" [22] outlines the organization and establishes the lines of authority and definition of duties for implementation. Operation and maintenance of the station as per regulatory requirements and Nuclear standards for public safety are directed by the Director, Operations and Maintenance, who also coordinates with the centre-led organizations to effectively use resources to achieve performance targets. The quality and quantity of services provided by these centre-led support organizations is monitored by the site Senior Vice President, who holds responsibility for establishing site requirements and priorities, and the Nuclear Executive Committee, which has a key oversight role. Position specific role documents N-MAN-08131-10000 (numerous sheets) [23], describe the duties, authorities and accountabilities of the positions described in the standard.

Additional guidance is given in N-PROG-OP-0001, "Nuclear Operations" [24], N-PROG-MA-0004, "Conduct of Maintenance" [25], and N-PROG-MP-0007, "Conduct of Engineering" [26]. The training and qualification description document, N-TQD-601-00001, "Leadership and Management Training and Qualification Description" [27] provides qualification and professional development requirements for supervisors and managers. The responsibilities of Duty Managers are documented in N-STD-OP-0008, "Expectations of Duty Managers" [65].

<u>OPG Business Transformation</u>

As described in P-CORR-00531-03719 [32], improvements have been made to the organization structure and accountabilities within OPG Nuclear as part of the OPG initiative on Business Transformation. Changes made in May 2012 in accordance with OPG-PROC-0166, "Organization Design Change" [66], maximize consistent application of OPG programs across the fleet while providing direct support in the plant on an ongoing basis, and improve accountability for organizational outcomes. As outlined in P-CORR-00531-03860 [17], the process included organizational and governance streamlining, as well as shifting from a station reporting structure to a more centre-led structure for certain organizational functions. This centre-led structure describes reporting relationships at the leadership level, and how teams are aligned or grouped together under a function. Although all functions in the organizational structure support operating units, some portions, such as the Commercial Operations and Environment unit, are centre-led under OPG as a whole rather than specifically under Nuclear.

Despite modifications to the reporting line, a safety culture program is integrated in all areas of operation, and individuals at all levels of the organization continue to consider safety as the overriding priority per the Nuclear Safety Policy, N-POL-0001 [15]. The quality and quantity of services provided by these centre-led support organizations is monitored by the site Senior Vice President, who holds responsibility for establishing site requirements and priorities, and the Nuclear Executive Committee, which has a key oversight role.

OPG-POL-0033, "OPG Business Model" [78], defines roles and accountabilities using an organizational structure with centre-led functions supporting operating units. This policy requires that each operating unit and function has a Management System designed to efficiently and effectively achieve the goals and objectives of the operating unit and function. Appendix A of OPG-POL-0033 [78] clearly outlines responsibilities of various business decision areas, including those that affect safe operation of the station such as conventional safety and training. The Decision Rights table is a part of OPG's Integrated Framework, which describes how the company's governance, Management Systems, risk processes, and assurance function interact to guide operation. The Integrated Framework is designed to support the needs of the Board and OPG leadership by providing clear expectations and guidance that ensure the enterprise is meeting policies and requirements while adequately managing risks.

Change Control

Changes in organizational structure are managed and controlled using OPG procedure OPG-PROC-0166, "Organization Design Change" [66]. It sets out a procedure for managing minor and material organizational changes in alignment with Organization Design Principles and Components, and assigns accountabilities and related requirements for preparing, reviewing, approving, and implementing changes to the OPG Nuclear organization structure. This procedure is used to:

- Review impacts to governance (including role documents) and initiate change as required per OPG-PROC-0001, "Process Administrative Governance Documents" [67];
- Create or move an entire organization unit;

- Add new positions to an organization, which increases staff level beyond the approved business plan;
- Create temporary positions that are expected to last longer than 2 years;
- Make material organization changes; and
- Transfer positions which impact Band H/MP6 level and above (i.e., accountabilities and jurisdiction).

For organizations named in N-STD-AS-0020, "Nuclear Management Systems Organizations" [22], OPG-PROC-0166 [66] is also used to:

- Initiate changes that may have an impact on the Nuclear Pressure Boundary quality program; and
- Initiate changes to role documents that require CNSC notification and approval.

The organizational change control procedure identifies requirements for organizational change. In order to ensure organizational changes are controlled, changes must:

- Not affect safe and reliable operation of OPG facilities;
- Give adequate consideration of best practices for organization design and change management;
- Be justified by business objectives;
- Meet license and regulatory requirements;
- Comply with corporate policies and procedures, and collective agreements;
- Be consistent with human resource practices in areas such as labour relations;
- Be consistent with OPG organization design principles; and
- Have approval in accordance with the Organizational Authority Register.

For changes to key management positions in the organization and Operations staff in the Control Room, regulatory approvals are requested before making the changes. Section 2.1 of the Pickering NGS PROL [40] specifies that a Management System is to be implemented and maintained in accordance with CSA N286-05, "Management System Requirements for Nuclear Power Plants" [39].

Adequacy of Resources

OPG develops and directs resources through N-PROG-AS-0005, "Business Planning" [28]. Other inputs to this process include relevant work programs for cost categorization, defined benchmarking with other nuclear utilities, demographic profiles, and minimum staffing levels as specified in the plant operating licence and OPG procedure P-INS-09100-00003, "Pickering Minimum Shift Complement" [29]. Strict limits on hours of work are imposed via N-PROC-HR-0002, "Limits of Hours of Work" [30].

Conclusion:

The conclusion of this Review Task assessment is that the roles and responsibilities of individuals responsible for safe operation are clearly defined and documented in the published Nuclear organization. This organization is understood and effective governance is in place to ensure availability of these resources and control organizational changes. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Configuration Management

Establish that mechanisms for maintaining configuration control of the plant and its documentation are effective and up-to-date.

Configuration Management is the industry accepted method to ensure that the plant documentation is prepared, is consistent with the plant design basis and licensing basis, and matches the physical plant. Pickering NGS implements configuration management through N-PROG-MP-0005, "Configuration Management" [68]. This Nuclear Program provides the overall direction to ensure the plant is operated, maintained, and modified in conformance with the design and licensing basis and to ensure configuration documentation matches the physical plant.

This program and its effectiveness of implementation at Pickering NGS are discussed in detail in Section 4.1.2 and Appendix B.3 to the Pickering NGS PSR2 Plant Design Safety Factor 1 Report. The assessments in this Safety Factor report conclude that Pickering NGS has a configuration management program that conforms to industry best practices.

Conclusion:

The conclusion of this Review Task assessment is that mechanisms for maintaining configuration control of the plant and its documentation exist and are effective and up-to-date. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Arrangements for Employing External Staff

Confirm that there are formal arrangements for employing external technical, maintenance or other specialist staff, and confirm that the contracting procedures ensure that contract employees are qualified to do the work assigned to them.

N-STD-MP-0014, "Managing Contracted Nuclear Safety Services" [69], provides general requirements for procurement, retention, interfacing, monitoring, and control of external suppliers of nuclear safety services for OPG Nuclear. The range of nuclear safety services covered is listed in Appendix A of this standard. The standard also defines the contracting strategy, qualification of the supplier's Quality Assurance (QA) program, and training and qualifications of the contractor's personnel.

OPG-PROC-0160, "Contractor Safety Management" [70] establishes requirements for managing contracted work to ensure the work is performed safely. Guiding principles of this procedure state that OPG shall pre-qualify and select suppliers, general contractors, and specialized contractors based on their ability to manage contracted work to OPG's safety and other applicable requirements. Furthermore, in accordance with OPG-PROC-0160 [70], line management ensures that:

1. Contract workers have the required qualifications and training identified in the contract document before starting work (such as Certificate of Qualification, licenses, and/or external safety training certificates); and

2. External training qualifications are evaluated for equivalency to OPG requirements and/or any applicable regulatory training standards.

The requirements of N-PROG-MP-0001, "Engineering Change Control" [72], ensure that all problems requiring a modification improve or maintain operability, maintainability, radiological and conventional safety, regulatory or license compliance, and production at an acceptable cost. These requirements also apply to contractors and design agencies performing engineering activities on behalf of OPG Nuclear. When participating in the initiation, design, installation, and commissioning of physical changes and controlled document changes associated with Structures, Systems and Components (SSCs), software, and engineering tooling, contractors must comply with N-PROG-MP-0001 [72], unless they act in accordance with a Quality Program approved by OPG Nuclear.

N-PROG-AS-0007, "Project Management" [73], describes the organizational responsibilities, interfaces, and key program elements for managing and executing projects in OPG Nuclear, and includes Project Oversight and Contract Management. N-STD-AS-0030, "Project Oversight Standard" [71], outlines the criteria and behavioural requirements for Project Oversight and the key elements for oversight of projects executed in OPG Nuclear. It is applicable (but not limited to) to procurement, suppliers, and contractors. Key oversight elements are tailored to include modification of the level of oversight to reflect current project performance and changes in risk profile. For instance, levels of oversight increase where suppliers are new or have performed less well than expected on current and previous projects, or during instances of fabrication by sub-contractors. N-STD-AS-0030 [71] requires that oversight is applied in a manner that respects contract terms and conditions. It does not direct the work of suppliers who are performing under their own approved Management System. The oversight plan is reviewed and updated when required to meet the project objectives in alignment with project and supplier performance.

Contract management incorporates oversight of supplier personnel to ensure they meet all safety, quality, cost, schedule, and performance requirements. It enables parties to meet obligations in order to deliver the objectives required from the contract, and involves active monitoring and anticipation of future issues throughout the contract life cycle. N-PROG-AS-0007 [73] also outlines management of supplemental personnel, which includes contractors and vendors who perform work on and off-site. N-STD-AS-0032, "Oversight of Supplemental Personnel" [74], provides the oversight principles and requirements to be applied to work packages initiated and/or executed within OPG by supplemental personnel.

N-PROG-TR-0005, "Training" [31] describes the program for training regular staff, contractors, temporary personnel, and other staff assigned work at OPG Nuclear.

Conclusion:

The conclusion of this Review Task assessment is that OPG governance exists for employing external technical, maintenance, or other specialist staff and ensuring their qualification for the work assigned to them. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Approved Quality Assurance Program

Confirm that there is an approved Quality Assurance program and that regular Quality Assurance audits are conducted involving both internal and independent assessors.

OPG Charter N-CHAR-AS-0002, "Nuclear Management System" [21], and supporting documents referenced in the charter establish the Nuclear Management System for OPG Nuclear, which assures that systems, equipment, and activities are of the required quality throughout the life of the nuclear facilities. Supporting organizations and contractors who do not have a quality program approved by the Nuclear organization follow Nuclear Management System requirements. The following OPG Nuclear programs and procedures are established to ensure that the Nuclear Management System is effectively audited and assessed on a regular basis, by both internal and independent assessors.

Procedure N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [13] describes the process for performing a program health and performance review and reporting on overall effectiveness of the Nuclear Management System to support the management assessment of effectiveness requirements of N286-05[8], "Management System for Nuclear Power Plants" [39].

The standard, N-STD-AS-0023, "Nuclear Safety Oversight" [33], describes independent assessment (external and internal) processes used for oversight and assessment of nuclear safety. Internal independent assessments are performed by Nuclear Oversight, in accordance with N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [38]. External independent assessments are performed by the NSRB in accordance with N-STD-RA-0035, "Nuclear Safety Review Board" [35].

The implementation of the Nuclear Oversight program is done through OPG procedure, N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [38]. This procedure establishes the methodology and requirements for planning, scheduling, staffing, preparing, performing, reporting and follow-up of audits and assessments performed by Nuclear Oversight. The objective of the audit program is to confirm that the overall Nuclear Management System is established and implemented effectively. As per the requirements of N-PROC-RA-0048 [38], audits are carried out at frequencies determined through risk based assessments, with sufficient frequency to confirm conformance with the QA program and related programs, procedures, and instructions. Audit frequency ranges from one to five years, depending on results of the risk based frequency assessment documented in the Nuclear Operations Assurance Map. Objectives of N-PROC-RA-0048 [38] include identification and documentation of conditions adverse to quality in accordance with N-PROG-RA-0003, "Corrective Action" [34], verification of compliance and effectiveness of the Pressure Boundary quality assurance program, as well as verification of compliance and effectiveness of the Pressure Boundary quality assurance manual for testing and repairing relief valves.

Scheduled audits are supplemented by additional independent audits of specific subjects when effectiveness is questioned. The Nuclear Oversight Matrix table found in Appendix A of N-PROC-RA-0048 [38] provides details of the scope and frequency of audits under the Nuclear Oversight Program as defined in this procedure.

Appendix B of this report, in which the results of audits and self-assessments for Nuclear programs (Managed Systems, Human Performance, and Independent Assessment) are discussed, confirms that audits are not only scheduled, but conducted and findings addressed.

Conclusion:

The conclusion of this Review Task assessment is that there is an approved Quality Assurance program and that regular Quality Assurance audits are conducted involving both internal and independent assessors. The intent of Review Task #7 is met and therefore Pickering NGS is compliant.

4.1.8 Review Task #8: Program for Self-Assessment and Continuous Improvement

Confirm that a program for self-assessment and continuous improvement has been adequately and effectively implemented including feedback of experience relating to organizational and management failures.

N-CHAR-AS-0002, "Nuclear Management System" [21] establishes the overall requirements for sustaining and improving station performance. This is accomplished by:

- Establishing and implementing a managed system of governing documents that communicate the essential elements of Nuclear business;
- Reinforcing individual accountability for performance and implementing various self-verification and independent oversight techniques;
- Identifying, documenting, evaluating, and correcting in a timely manner, conditions adverse to quality;
- Utilizing internal and industry Operating Experience to improve human, plant, and equipment performance and design, procurement, construction, commissioning, and operating requirements and practices; and
- Providing information to the people who need it through the managed systems that establish how necessary information is identified, targeted to required users, maintained current, and communicated effectively.

The Charter identifies a requirement to have planned audits and surveillances designed to provide a comprehensive and critical evaluation of activities to meet all regulatory and OPG objectives. To meet this requirement, audits and assessments are carried out at a sufficient frequency by personnel who neither performed nor verified activities being audited. Results of the audit are promptly documented and communicated to affected groups or individuals, and a corrective action plan is developed to ensure issues are resolved.

As outlined in N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [38], audits are managed and conducted by the Nuclear Oversight organization. Audits of OPG Nuclear programs are scheduled on a one to five-year cycle with audit frequency determined through risk based assessments. Higher risk-ranked programs are audited more frequently (i.e., annually), with no program being audited less than once every 5 years. Results of the risk based frequency determination are documented in the Nuclear Operations Assurance Map. The results of the audit are presented to program owners and site management for acceptance and corrective actions.

The following OPG Nuclear programs and procedures are established to ensure that OPG Nuclear programs are effectively audited and assessed on a regular basis.

OPG Program N-PROG-RA-0010, "Independent Assessment" [11] provides independent assessment (internal and external) processes and a Management System review process to perform a comprehensive and critical evaluation of all activities affecting OPG Nuclear. Written observations, findings, and recommendations are submitted to the CNO after each assessment and an annual report is presented to the Nuclear Oversight Committee of the Board of Directors (replaced by the Generation Oversight Committee, after the PSR2 documentation freeze date).

Procedure N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [13] describes the process for performing a program health and performance review and reporting on overall effectiveness of the Management System to support the management assessment of effectiveness requirements of CSA N286-05[8], "Management System for Nuclear Power Plants" [39].

Above N-PROC-RA-0023 [13] in the governance hierarchy (as outlined on page 3 of N-PROG-RA-0010, "Independent Assessment" [11]) is N-PROG-AS-0001, "Managed Systems" [9]. For all Nuclear Management System programs and supporting activities, N-PROG-AS-0001 [9] establishes a business framework consisting of "Plan", "Do", "Check", and "Act/Adjust" elements. In particular, the "Check" and "Act/Adjust" components involve monitoring and process improvement. The Managed Systems Program ensures that self-assessments and independent assessments are performed to determine the effectiveness of the Nuclear Management System in achieving expected results, including safety objectives. The Managed Systems Program also ensures that non-compliance issues and improvement opportunities are identified and addressed.

N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [38] establishes the methodology and requirements for planning, scheduling, staffing, preparing, performing, reporting and follow-up of audits and assessments performed by Nuclear Oversight. The objective of the audit program is to confirm that the overall Nuclear Management System is established and implemented effectively.

N-PROC-RA-0097, "Self-Assessment and Benchmarking" [75] specifies the requirements for self-assessment activities for the functional and line organizations of OPG Nuclear. It defines the elements required to plan, execute, report, and monitor Divisional Level Self-Assessments, Departmental Level Self-Assessments, and Snapshot Self-Assessments. The self-assessments include evaluations of business programs, processes, and performance.

The Program Management assessment of OPG's Independent Assessment program, N-PROG-RA-0010 [11], is performed every three years. Audits and self-assessments of N-PROG-RA-0010 [11] are discussed in Appendix B.3. Results of audits and self-assessments for other programs, including those discussed in Appendix B, help identify opportunities for improvement (which includes those related to organizational and management issues).

Pickering's two-week Nuclear Safety Culture Assessment completed early in 2015, conducted per N-PROC-AS-0077, "Nuclear Safety Culture Assessment" [20], further confirms successful implementation of self-assessment and continuous improvement programs focusing on Nuclear Safety. Although the Nuclear Safety Culture Assessment report is confidential, an email from the Senior Vice President, Pickering Nuclear, to all Pickering staff entitled "Nuclear Safety Culture Assessment – Results" [76] and dated February 25, 2015 is paraphrased below:

> This assessment consisted of a survey, interviews and field observations. The 81-question survey was sent to all Pickering employees and resulted in 1259 survey responses and over 900 comments. In addition, 65 on-site interviews and 18 field observations were completed by a team of 17 individuals composed of both internal and external team members. This yielded an additional 950 comments. In conclusion, the assessment team determined that Pickering has a healthy Nuclear Safety Culture and a respect for nuclear safety not compromised by production priorities.

Conclusion:

The conclusion of this Review Task assessment is that programs for self-assessment and continuous improvement are fully developed and effectively implemented at OPG, including feedback of experience relating to opportunities for improvement (which includes those related to organizational and management issues). The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.1.9 Review Task #9: Record Management

Confirm there is a system to ensure that comprehensive, easily retrievable, and auditable records exist of baseline design information, and operational and maintenance history.

OPG Program OPG-PROG-0001, "Information Management" [77] which takes its authority from OPG-POL-0033, "OPG Business Model" [78], establishes a set of standards and procedures for the management of OPG's information throughout its life cycle regardless of media, including electronic systems such as e-mail, SharePoint, and the Intranet to ensure consistent and appropriate use. It defines uniform and efficient processes for management, maintenance, and final disposition of records and documents through OPG. OPG-PROG-0001 [77] also establishes the overall OPG process for governance including electronic filing, approval, distribution, and maintenance of the OPG Governance Framework. Records are retained and stored to ensure essential records, as defined in referenced procedures, and subsequent revisions are legible, retrievable, traceable, routinely inspected, and available to provide documented evidence of implementation of the quality program. OPG-PROC-0001 [67] ensures a current listing of all Nuclear records is identified and maintained, and also provides a uniform retention schedule to ensure that final disposition of records is carried out according to regulatory and business requirements. Revision control and communication is established through an Approved Information Management System (Asset Suite). Asset Suite also acts as an on-line repository for documents, procedures, and maintenance records.

QA Records are defined in OPG-PROC-0179, "Nuclear Quality Assurance Records" [79], as essential records providing evidence of licensing, design, construction, operation, maintenance, testing, and modification of nuclear facilities. Implementing procedure OPG-PROC-0019, "Records and Document Management" [80] provides direction to ensure that records in the custody or control of OPG are consistently managed, protected, and accessible throughout their life cycle. OPG-PROC-0179 [79] ensures that Nuclear QA records and QA Vaults are managed to protect records against damage by fire, flooding, environmental deterioration, theft, and misuse by unauthorized personnel.

OPG-PROC-0179 [79] identifies the requirements for consistent management and quality checks of Nuclear QA records generated or collected by or for OPG Nuclear. The process for managing the life cycle of Controlled Documents (documents with a defined revision process for their entire lifecycle) is outlined in OPG-PROC-0178, "Controlled Document Management" [81]. Quality Checks are performed for the purpose of self-evaluation, and are less formal and narrower in scope than audits. Annual Quality Checks are conducted on a minimum of 5% of document collections where only paper is maintained. Corrective actions are assigned as required based on results of the Quality Check.

OPG-PROC-0179 [79] identifies the requirements for maintaining Life of Facility, permanent, and all Pressure Boundary QA records which are sole-source. This includes maintenance in a temperature and humidity controlled QA vault for protection against unauthorized access, natural disasters, unsafe environmental conditions, and infestation of insects, mould, or rodents.

N-LIST-01300-10000, "Bounded Document Set" [82] defines the configuration documents that should be updated when modifying the physical or station design. Specifically, Appendix A of N-LIST-01300-10000 [82] lists the set of documentation or data that maintains the physical plant in a state consistent with the design requirements.

N-PROG-MP-0001, "Engineering Change Control" [72], ensures that all modifications to OPG Nuclear SSCs are planned, designed, installed, commissioned, placed into service, or removed from service within the Safe Operating Envelope or Safety and Design Envelope, design basis, and licensing conditions. Along with N-PROG-MP-0009, "Design Management" [99], which specifies requirements for documentation identifying and controlling the design basis and outputs, N-PROG-MP-0001 [72] helps describe a system for maintaining baseline design information.

Conclusion:

The conclusion of this Review Task assessment is that there is a system to ensure that comprehensive, easily retrievable, and auditable records exist of baseline design information, and operational and maintenance history. The intent of Review Task #9 is met and therefore Pickering NGS is compliant.

4.1.10 Review Task #10: Management of Regulatory Affairs

Confirm there is an effective framework in place to support the management of regulatory affairs.

N-PROG-RA-0002, "Conduct of Regulatory Affairs" [83] provides the guidelines for managing the interface with regulatory agencies to ensure effective and efficient compliance with regulatory requirements and to ensure open, honest, and timely communications. Successful interface with regulatory agencies is critical in meeting OPG's overall objectives. This program defines a set of processes to ensure these expectations are met. These implementation procedures are described below. The effectiveness of the Regulatory Affairs program is addressed is Appendix B of the Pickering NGS PSR2 Safety Factor 8 Report (Safety Performance) [64].

N-PROC-RA-0005, "Written Reporting to Regulatory Agencies" [84] defines roles, accountabilities, and processes for complying with regulatory requirements for written event reports to regulatory agencies and for scheduled reports to the CNSC. The Regulatory Agencies include the following:

- CNSC;
- Ministry of Environment and Climate Change;
- Environment Canada;
- Ministry of Labour;
- Transport Canada; and
- Electrical Safety Authority.

N-PROC-RA-0006, "Regulatory Action Management" [85] defines the requirements for the identification and tracking of Regulatory Commitments, Regulatory Obligations, and Regulatory Management Actions. Regulatory Commitments and Regulatory Management Actions are initiated by authorized representatives of OPG.

N-PROC-RA-0020, "Preliminary Event Notifications" [86] defines the requirements and processes for verbally notifying facility and offsite organizations, management, and external officials and agencies after a reportable event has occurred.

N-PROC-RA-0028, "Support of CNSC Type I/II Inspections" [87] defines the roles and responsibilities, as well as provides steps and processes, for OPG staff in supporting CNSC Type I and Type II inspections.

OPG Procedure N-PROC-RA-0047, "Communications with the Canadian Nuclear Safety Commission" [88] defines the planning, review, approval, and records required for communications with the CNSC.

N-PROC-RA-0053, "Evaluation of Proposed Changes for Canadian Nuclear Safety Commission Approval, Consent or Notification" [89] defines the steps for evaluating whether CNSC approval or consent of a proposed change must be obtained prior to implementation, or whether notification of the CNSC is required. Also, the Pickering NGS PROL identifies key organizational documents, and requires that any changes to the Nuclear organization be made in accordance with OPG-PROC-0166, "Organization Design Change" [66].

The reporting requirements of REGDOC-3.1.1 [48] required by the PROL are included in OPG governance as per N-PROC-RA-0020 [86]. This procedure identifies the requirements and process for verbally notifying facility and off-site organizations, management, and external officials and agencies, after a reportable event has occurred. Written notifications to the CNSC after an event are directed through N-PROC-RA-0005, "Written Reporting to Regulatory Agencies" [84].

Conclusion:

The conclusion of this Review Task assessment is that there is an effective framework in place to support the management of regulatory affairs. The intent of Review Task #10 is met and therefore Pickering NGS is compliant.

4.1.11 Review Task #11: Processes and Supporting Information Governing Work

Confirm that the organization and management system include the processes and supporting information that explain how work is to be specified, prepared, reviewed, performed, recorded, assessed and improved.

As discussed in Section 4.1.4, OPG has an organization of centre-led functions supporting the operating units. The OPG organization is described in OPG-POL-0033, "OPG Business Model" [78].

Each function and operating unit of the OPG organization has a Management System sufficient to meet its specific accountabilities. Every Management System is based on the principles of Plan - Do - Check - Act and embraces continuous improvement. An Integrated Framework describes how the company's governance, Management Systems, risk processes and assurance function interact to guide the operation of OPG.

The Nuclear Management Systems Organizations are described in N-STD-AS-0020, "Nuclear Management Systems Organizations" [22]. Work performed at Pickering is specified, prepared, reviewed, performed, recorded and improved by the nuclear operating unit's Operations, Maintenance, Engineering, Nuclear Waste Management, Emergency Services, Inspection & Maintenance Services, Work Management and Projects directorates. Work performed at Pickering is retained by a Business and Administrative Services Function unit called Information Management. Work performed at Pickering is self-assessed by the nuclear operating unit's directorates and independently assessed by the assurance directorates Internal Audit and Nuclear Oversight as well as other third party reviews (e.g. WANO, etc.).

The Nuclear Management System work processes are described in N-CHAR-AS-0002 [21], "Nuclear Management System". Sections of governing documents are cross referenced to clauses of CSA N286-05, "Management System Requirements for Nuclear Power Plants", as required by the Pickering NGS PROL [40], in N-LIST-08130-10023, "CSA N286-05 to OPGN Governance Cross Matrix" [90], and CSA N286-12, "Management System Requirements for Nuclear Facilities", as required by the Darlington NGS PROL [41], in N-LIST-08130-10025, "CSA N286-12 to OPGN Governance Cross Matrix" [91]. The sections of the governance such as N-PROG-RA-0003, "Corrective Action" [34], N-PROG-RA-0010, "Independent Assessment" [11], and N-PROG-RA-0013, "Radiation Protection" [92] also contain cross references to the applicable clauses of CSA N286-05 [39] and CSA N286-12 [36]. There are many programs and procedures that include the processes and supporting information that explain how work is to be specified, prepared, reviewed, performed, recorded, assessed and improved.

Examples of Nuclear work specification, preparation, review, performance and record governance from N-LIST-08130-10025 [91] include:

- N-PROG-MA-0004, "Conduct of Maintenance" [25] Sections 1.1 "Work Planning", 1.2 "Work Execution" and 1.3 "Calibration and Tool Control";

- N-PROG-MA-0019, "Production Work Management" [93] Sections 1.4 "Site On-Line Work Management Processes" and 1.5 "Outage Work Management Processes";

- N-PROG-MP-0004, "Pressure Boundary" [94] Sections 1.5.2 "Pressure Boundary Repair and Replacement, N-PROC-MP-0087" and 1.5.3 "Pressure Boundary Modifications, N-PROC-MP-0088"; and

- N-PROG-RA-0013, "Radiation Protection" [92] Section 1.5.5 "Radioactive Work Planning and Execution".

Examples of Nuclear independent assessment governance from N-LIST-08130-10025 [91] include:

- N-CHAR-AS-0002, "Nuclear Management System" [21] Section 1.1.7 "N-PROG-RA-0010, Independent Assessment" [11]; and

- N-PROG-RA-0010, "Independent Assessment" [11] Sections 1.1 "Independent Assessment – Internal" and 1.2 "Independent Assessment - External".

Examples of Nuclear self-assessment and improvement governance including some cross references from N-LIST-08130-10025 [91] include:

- N-CHAR-AS-0002, "Nuclear Management System" [21] Sections 1.1.1 "N-PROG-AS-0001, Managed Systems" and 1.1.6 "N-PROG-RA-0003, Corrective Action";

- N-PROG-AS-0001, "Managed Systems" [9] Sections 1.3 "Monitoring (CHECK)" and 1.4 "Process Improvement (ACT/ADJUST)";
- N-PROG-RA-0003, "Corrective Action" [34] Section 1.1 "Identification and Resolution of Problems", sub-section 1.1.1 "N-PROC-RA-0022, Processing Station Condition Records", 1.2 "N-PROC-RA-0035, Operating Experience Process", 1.3 "N-PROC-AS-0019, Action Item Management", 1.4 "N-PROC-RA-0097, Self-Assessment and Benchmarking" and Section 1.6 "Performance Indicators and Review", which cites N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [13]; and
- N-PROG-MA-0004, "Conduct of Maintenance" [25] Section 1.6 "Performance Indicators and Review", which cites N-PROC-RA-0023, "Fleetview Program Health and Performance Reporting" [13] and N-PROC-RA-0097, Self-Assessment and Benchmarking" [75].

Conclusion:

The conclusion of this Review Task assessment is that the organization and Management Systems include the processes and supporting information that explain how work is to be specified, prepared, reviewed, performed, recorded, assessed and improved. The intent of Review Task #11 is met and therefore Pickering NGS is compliant.

4.1.12 Review Task #12: Control of Purchasing of Equipment and Services

Confirm there is control of purchasing of equipment and services where this affects plant safety.

As discussed in Section 4.1.11, sections of governing documents are cross referenced to clauses of CSA N286-05, "Management System Requirements for Nuclear Power Plants" and CSA N286-12, "Management System Requirements for Nuclear Facilities" in N-LIST-08130-10023, "CSA N286-05 to OPGN Governance Cross Matrix" [90] and N-LIST-08130-10025, "CSA N286-12 to OPGN Governance Cross Matrix" [91] respectively. The sections of the governance such as OPG-PROG-0009, "Items and Services Management" [95] also contain cross references to the applicable clauses of CSA N286-05 [39] and CSA N286-12 [36]. There are many programs and procedures that control purchasing of equipment and services where this affects plant safety.

Examples of Nuclear purchasing governance from N-LIST-08130-10025 [91] include:

- N-CHAR-AS-0002, "Nuclear Management System" [21] Section 1.3.3 "N-PROG-MM-0001, Materials Management" [9];

[9] OPG-PROG-0009 [95] revision 2 supersedes N-PROG-MM-0001, "Materials Management".

- OPG-PROG-0009, "Items and Services Management" [95] Sections 1.1 "Process Management", 1.2 "Core Processes", 1.3 "Procurement of Items and Services", 1.4 "Contract Administration", 1.5 "Nuclear Warehousing" and 1.6 "Item Surplus and Disposal";

- N-PROG-MA-0013, "Welding" [96] Section 1.6 "Procurement of Welded Components and Welding Services";

- N-PROG-RA-0012, "Fire Protection" [97] Section 1.12.3 "OPG-PROG-0009, Items and Services Management";

- N-PROG-MP-0006, "Software" [98] Section 1.4(a) "N-PROC-MP-0049, Procurement of Software and Products Containing Software";

- N-PROG-MP-0009, "Design Management" [99] Section 1.2.9 "Procurement Engineering Process"; and

- N-PROG-MA-0026, "Equipment Reliability" [100] Sections 1.1.1(f) "Identifying and predicting aging and obsolescence issues on important components and embedding mitigating strategies and actions into the business plan" and 1.2.10.3 "Critical Spares".

OPG-PROG-0009, "Items and Services Management" [95] Section 2.12 defines the roles and accountabilities of the Manager, Design Engineering to establish requirements for a managed process of creating and maintaining procurement specifications for replacement items, materials, equipment, components, parts, and services. The processes identified in this program ensure that items, services, and nuclear fuel materials and bundles are purchased in accordance with stated requirements and controlled through proper identification, handling, storage, issuance, and shipping to ensure the quality of equipment and components is preserved.

Purchase Orders for safety-related items and services are subject to Purchase Order verification by the Purchasing Agent to ensure the Purchase Order or contract is correct and complete per Section 1.16.1 of OPG-PROC-0058 [101]. Per Section 1.2.2 (d)(1) of OPG-PROG-0009 [95], changes to item description data require evaluation and approval by qualified staff. For items identified as being safety-related, Pressure Boundary or Nuclear Class, such technical changes are performed in accordance with the Procurement Engineering process outlined in N-PROC-MP-0098, "Procurement Engineering Activities" [102], which includes pre-purchase technical review of items and services and support in resolving technical issues related to purchases. Per Section 1.3.3(b)(1) of OPG-PROG-0009 [95], the Purchasing Agent is not permitted to alter the item description data for safety-related items. Per Section 1.3.3(c)(3) of OPG-PROG-0009 [95], the quotation or proposal evaluation performed by the Purchasing Agent confirms that items or services offered meet technical requirements, which may include safety and reliability.

The controls for establishing and maintaining the OPG Approved Supplier List are documented in Section 1.3.2(b) of N-PROC-MM-0010, "Establishing and Maintaining

Ontario Power Generation Approved Suppliers List" [52]. N-PROC-MM-0010 [52] describes the methods used to originate, request, evaluate, qualify, and maintain the qualification of suppliers of items and services requiring Quality Assurance programs or other OPGN defined Quality requirements (e.g., for Nuclear Class items).

OPG-PROG-0009 [95] is not applicable to the handling, storage, or control of nuclear fuel at OPG power facilities, and items or services specifically described in other approved governing programs and supporting documents. The handling, storage and control of those items is in accordance with requirements stated in the applicable interfacing programs shown in Figure 1 of OPG-PROG-0009 [95].

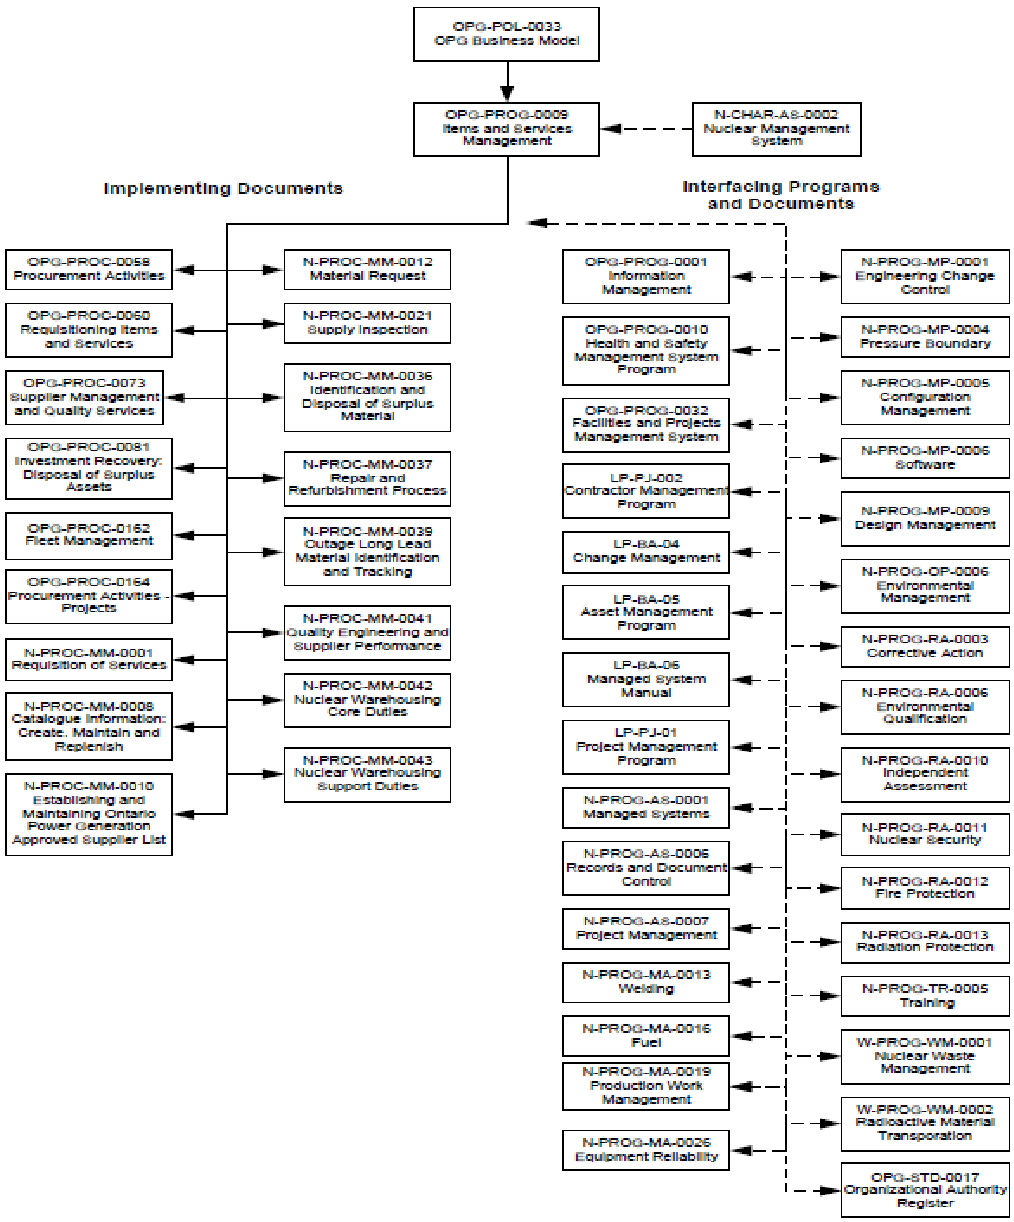

Figure 1: Governing Document Hierarchy for Supply Chain (OPG-PROG-0009 [95])

Conclusion:

The conclusion of this Review Task assessment is that there is control of purchasing of equipment and services where this affects plant safety. The intent of Review Task #12 is met and therefore Pickering NGS is compliant.

4.1.13 Review Task #13: Communication Policies

Confirm there are comprehensive communication policies in place.

N-POL-0001, "Nuclear Safety Policy" [15] states that everyone shall conduct themselves in a manner consistent with the listed Traits for a Healthy Nuclear Safety Culture. One of these traits is effective safety communication.

As discussed in Review Task #11: Processes and Supporting Information Governing Work, sections of governing documents are cross referenced to clauses of CSA N286-05, "Management System Requirements For Nuclear Power Plants" and CSA N286-12, "Management System Requirements For Nuclear Facilities" in N-LIST-08130-10023, "CSA N286-05 to OPGN Governance Cross Matrix" [90] and N-LIST-08130-10025, "CSA N286-12 to OPGN Governance Cross Matrix" [91] respectively. The sections of the governance such as N-PROG-AS-0002, "Human Performance" [10] also contain cross references to the applicable clauses of CSA N286-05 [39] and CSA N286-12 [36]. There are many programs and procedures that implement the communication policies.

Examples of Nuclear governance related to communication from N-LIST-08130-10025 [91] include:

- N-PROG-AS-0002, "Human Performance" [10] Sections 1.2.1 "N-PROC-OP-0005, Pre-Job Briefing and Post-Job Debriefing", 1.2.2 "N-STD-AS-0002, Procedure Use and Adherence", 1.2.3 "N-STD-OP-0002, Communications" and 1.2.10 "N-INS-09030-10004, Observation and Coaching".

N-PROC-AS-0077, "Safety Culture Assessment" [20] Appendix A has survey questions on Safety Communication to assess whether comprehensive communication policies are in place:

(15) Information is freely shared between work groups

(16) There is regular communication about how to work safely

(17) Explanations of operational decisions are promptly communicated

(18) Managers explain the reasoning behind difficult decisions to avoid conflicting messages about safety

(19) There is effective downward flow of information from management

(20) There is effective upward flow of information to management

(21) Management frequently communicates the importance of nuclear safety

(22) Expectations for performing work that can affect safety are communicated to all contractors/vendors

Communication policies applicable to emergencies are described in the Pickering NGS PSR2 Safety Factor 13 Report (Emergency Planning) [120].

In addition, there are OPG corporate level communication policies in place to address nuclear safety, such as communication protocols for nuclear emergencies which include OPG-PROC-0028, "Crisis Management & Communications Centre (CMCC) Procedure" [103] and OPG-PROC-0112, "Corporate Relations and Communications Emergency Preparedness and Response Procedure" [104].

Conclusion:

The conclusion of this Review Task assessment is that there are comprehensive communication policies in place. The intent of Review Task #13 is met and therefore Pickering NGS is compliant.

4.1.14 Review Task #14: Questioning Attitude and Conservative Decision Making

Confirm that a questioning attitude exists and conservative decision making is undertaken in the organization.

N-POL-0001, "Nuclear Safety Policy" [15] states that everyone shall conduct themselves in a manner consistent with the listed Traits for a Healthy Nuclear Safety Culture. Two of these traits are questioning attitude and decision making.

N-PROG-AS-0002, "Human Performance" [10] achieves higher levels of nuclear and industrial safety through event-free operation. It includes Sections 1.2.4 "N-STD-OP-0004, Self-Check" and 1.2.5 "N-STD-OP-0012, Conservative Decision-Making".

N-STD-OP-0004, "Self-Check" [105] describes the features of the Nuclear Self-Check Program:

- Per Section 1.1.2(g), "If uncertain, **stop** and resolve any questions or concerns before proceeding"; and
- Per Appendix A.2(c), "THINK-Understand what should happen when correct action is taken on the correct component. If uncertain, use the questioning-attitude tool".

N-STD-OP-0012, "Conservative Decision-Making" [61] provides management expectations for conservative decision-making in support of a Nuclear Safety culture. Section 4.3 of N-STD-OP-0012 identifies the following performance references:

- N-POL-0001, "Nuclear Safety Policy" [15];
- N-PROG-AS-0002, "Human Performance" [10];
- N-STD-OP-0004, "Self-Check" [105];
- N-STD-OP-0005, "Main Control Room Panel Monitoring, Operation, and Alarm Response" [106]; and
- N-STD-OP-0009, "Reactivity Management" [44].

N-STD-OP-0036, "Operational Decision-Making" [45] provides a systematic approach for the application of principles enabling operational decisions that support safe and reliable plant operation. It states:

- Section 1: Direction
    - *Staff are responsible to ensure individual behaviours and actions are consistent with principles and conservative rules identified in this standard, and applied directly to decision making situations faced on a day-to-day basis.*
    - *Conservative Decision Making is an Event-Free Tool that is used by people when faced with uncertainty or the need to make a decision on the next course of action.*
- Appendix D.1: Operate Conservatively
    - *Conservative operation means you take the 'safe road', i.e., where judgment is required, decisions shall be made which are clearly within established and accepted boundaries of safety.*

N-GUID-01900-10000, "Human Performance Event Free Tools for Knowledge Work" [107] provides guidelines for application of a set of event free tools specifically designed to consider the different work activities in an engineering environment. This guideline outlines when and how engineering staff should apply questioning attitude to help them ensure that planning, judgment and decision making are appropriate for the product in development.

N-PROC-AS-0077, "Safety Culture Assessment" [20] Appendix A has survey questions to assess whether a questioning attitude exists and conservative decision making is undertaken in the organization:

> *(7) Employees understand the unique hazards of nuclear technology.*
>
> *(8) New employees understand working here requires special attention to nuclear safety.*
>
> *(9) Employees stop when they encounter uncertain conditions.*

(10) Employees question unexpected results.

(11) Regardless of position in the organization, people are comfortable questioning each other when they feel something is not correct.

(12) Employees question the assumptions of other employees when the work can affect safety.

(13) Employees maintain a questioning attitude when at work.

(14) Employees remain vigilant for potential problems, even when the plant is operating well.

(39) Employees use a systematic approach when making decisions.

(40) Safety risks are considered in all activities.

(41) Safety is a high priority when decisions are made.

(42) Employees do not justify existing conditions for the sake of completing a task quickly.

(43) When an important nuclear safety decision must be made, it is clear who is responsible to make it.

(44) Important safety decisions are made by the correct person.

As discussed in Section 4.1.8, Pickering completed a Nuclear Safety Culture Assessment in early 2015 in accordance with N-PROC-AS-0077, which concluded that Pickering has a healthy Nuclear Safety Culture.

In addition, the use of questioning attitude and decision making is monitored and reported quarterly in accordance with N-PROC-AS-0083, "Nuclear Safety Culture Monitoring Panels" [18]. For example, in Q1 2015, the application of questioning attitude and decision-making was rated as a strength for several work groups [108].

Conclusion:

The conclusion of this Review Task assessment is that a questioning attitude exists and conservative decision making is undertaken in the organization. The intent of Review Task #14 is met and therefore Pickering NGS is compliant.

4.1.15 Review Task #15: Prioritization of Safety Issues

Verify that there is a process in place for prioritization of safety issues, with realistic objectives and timescales that ensures that these issues receive proper resources.

As discussed in Review Task #11: Processes and Supporting Information Governing Work, sections of governing documents are cross referenced to clauses of CSA N286-05, "Management System Requirements for Nuclear Power Plants" and CSA N286-12, "Management System Requirements for Nuclear Facilities" in N-LIST-08130-10023, "CSA N286-05 to OPGN Governance Cross Matrix" [90] and N-LIST-08130-10025, "CSA N286-12 to OPGN Governance Cross Matrix" [91] respectively. The sections of the governance such as N-PROG-RA-0003, "Corrective Action" [34] also contain cross references to the applicable clauses of CSA N286-05 [39] and CSA N286-12 [36]. There are many programs and procedures that implement safety issue resolution.

Examples of nuclear safety issue prioritization governance including some cross references from N-LIST-08130-10025 [91] include:

- N-PROG-RA-0003, "Corrective Action" [34] Section 1.1 "Identification and Resolution of Problems", sub-sections 1.1.1 "N-PROC-RA-0022, Processing Station Condition Records" and 1.1.2 "N-STD-RA-0008, Incident Investigation", and Section 1.3 "N-PROC-AS-0019, Action Item Management"; and

- N-PROG-MP-0007, "Conduct of Engineering" [26] Sections 1.4.3 "N-STD-MP-0023, Technology and Research" and 1.4.4 "N-PROC-MP-0092, Technology and Research Program Management".

N-PROC-RA-0022 Section 1.5 "SCR Coordinator Dispositioning" [109] has a process for determining the resolution category and significance level for prioritization of safety issues. Sections 1.4 "First Line Manager Review", 1.5.1 "SCR Coordinator Dispositioning", 1.7 "Management Review Meeting", 1.8 "Performance Improvement Department", 1.12 "Corrective Action Review Board" and Appendix A "Corrective Action Process and Status Control Matrix" have timelines for processing Station Condition Records (SCRs), including those related to safety issues.

N-STD-RA-0008, "Incident Investigation" [110], Table 1 has resolution categories for prioritization of safety issues. This standard also addresses timelines and assignment of resources.

N-PROC-MP-0045, "Technical Operability Evaluation" [111] provides a uniform process for identifying and evaluating degraded station conditions when the ability of SSCs to carry out their defined safety-related functions comes into question. It includes a timeline for resolving the issue.

N-PROC-RA-0094, "Discovery Issue Resolution Process" [112] identifies due diligence actions required of staff when issues are identified with the Safety Analysis of an OPG Nuclear station. Discovery issues may result from sources such as new operational information, errors in Safety Analysis development, Research and Development results, and Operating Experience. There are three related governing procedures describing the specific process to be followed when uncertainty arises about safe operation of the plant:

(a) When uncertainty arises with respect to the Deterministic Safety Analysis basis which defines the Safe Operating Envelope, N-PROC-RA-0094 [112] is followed.

(b) When uncertainty arises with respect to operability of equipment to meet the functional requirements of the defined Safe Operating Envelope, N-PROC-MP-0045 [111] is followed.

(c) When a discovery issue challenges the Probabilistic Safety Assessment, N-PROC-RA-0132 "Management of Incremental Risk from Abnormal Plant Configurations" [113] and N-PROC-RA-0131 "Probabilistic Risk Assessment Issues Database Management" [114] apply.

N-PROC-RA-0094 provides a high level guide to key actions required to ensure assessed public risk is maintained within acceptable limits, regulatory limits are respected, and key organizations are involved whenever a Deterministic Safety Analysis issue is discovered. It ensures issues are handled in a managed fashion commensurate with the associated risk.

N-PROC-MA-0008, "Work Initiation, Approval and Prioritization" [115] outlines the processes for identifying, approving, prioritizing, and processing nuclear production work needs, such as work required to address plant equipment deficiencies. Appendix B of N-PROC-MA-0008 provides a Prioritization Matrix that is used to define work priority dependent on the significance of the deficiency and the safety impact. Also in Appendix B, the identified priorities are directly linked to scheduling guidance, i.e., timescale to address the Work Order. Appendix C is used to assign "Importance to Plant" scores to Work Orders, further assisting with prioritization of work in accordance with plant impact, for which safety impact is a large factor. N-PROC-MA-0022, "Integrated On-line Work Schedule" [116] defines the process for scheduling, resourcing, coordinating and tracking on-line work. A high priority scheduling process is provided for urgent work needs with a high impact on the station. N-PROC-MA-0013, "Planned Outage Management" [117] establishes the process for preparation and execution of planned outage work, including schedule development and resource planning. This document confirms that shutdown safety, i.e., ensuring key safety systems and components provide an appropriate margin of plant safety while a unit is shutdown, is the top outage priority.

N-STD-MP-0023, "Technology and Research" [118] establishes the processes for effective management of Research and Development programs for Nuclear in support of safe, reliable and competitive performance of Nuclear Facilities. This standard establishes the scope, requirements and processes that govern consistent inputs, activities and outputs of all stakeholders to form an integrated managed system. Nuclear research and development programs are annually developed and implemented in response to issues that address the plant safety design basis and licensing basis, maintain or improve safe operating margins, minimize radiation and environmental impacts of Nuclear Facilities, and maximize effective utilization of Nuclear assets.

N-PROC-MP-0092, "Technology and Research Program Management" [119] describes the life cycle and associated stakeholder activities for the development and implementation of Research and Development programs for Nuclear, starting from issue identification through program development, execution, application, close-out, and evaluation.

Conclusion:

The conclusion of this Review Task assessment is that there are processes in place for prioritization of safety issues, with realistic objectives and timescales that ensure that these issues receive proper resources. The intent of Review Task #15 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for ten L/R/C/Ss with content applicable to Safety Factor 10 are provided in References [6] and [7]. Associated findings applicable to Safety Factor 10 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 10

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 10
CSA N286-12, "Management System Requirements for Nuclear Facilities"	There are no PSR2 gaps for CSA N286-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N286-12.
CSA N286.7-16, "Quality Assurance Of Analytical, Scientific And Design Computer Programs"	There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.
CNSC RD-204 (2008), "Certification of Persons Working at Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD-204 (2008). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC RD-204 (2008).
CNSC REGDOC-3.1.1 (2014), "Reporting Requirements for Nuclear Power Plants"	There are no PSR2 gaps for CNSC REGDOC-3.1.1 (2014). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-3.1.1 (2014).

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 10
CNSC G-323 (2007), "Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement"	There are no PSR2 gaps for CNSC G-323 (2007). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-323 (2007).
S.C. 1997, C.9 (Amended in February 2015), "Nuclear Safety and Control Act (NSCA) and its associated Regulations"	There are no PSR2 gaps for the Nuclear Safety and Control Act (Amended 2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the NSCA (Amended 2015).
SOR/2000-202 (Amended in June 2015), "The General Nuclear Safety and Control Regulations"	There are no PSR2 gaps for the General Nuclear Safety and Control Regulations (Amended June 2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the General Nuclear Safety and Control Regulations (Amended June 2015).
CNSC REGDOC-2.2.2 (2014), "Personnel Training"	There are no PSR2 gaps for CNSC REGDOC-2.2.2 (2014). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.2.2 (2014).
CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	For Safety Factor 10, there are no PSR2 gaps for CNSC REGDOC-2.3.2 (2015).
CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"	The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [8]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Programs reviewed for Safety Factor 10 are identified in Table 2, and details of the associated effectiveness reviews for each of the N-PROGs are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 10 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 10 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 10.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [12] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 10 Report that require discussion in other Safety Factor Reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 10 were reviewed for the fifteen PSR2 Review Tasks in Section 4.1 of this report and resulted in no PSR2 gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 10 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no PSR2 gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 10 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 10), which resulted in no PSR2 gaps.

The review of Safety Factor 10 has confirmed that the Pickering NGS organization, management system and safety culture are adequate and effective for ensuring the safe operation of the plant.

PARTS	Pickering A Return to Service
PROL	Power Reactor Operating Licence
PSR	Periodic Safety Review
PSR1	Periodic Safety Review 1 (earlier OPG PSR work and other associated assessments)
PSR2	Periodic Safety Review 2 (subsequent PSR per CNSC REGDOC-2.3.3)
QA	Quality Assurance
SCA	Safety and Control Area
SCR	Station Condition Record
SSC	Structures, Systems and Components
WANO	World Association of Nuclear Operators

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-AS-0001, "Managed Systems"

The Managed Systems Program establishes a business framework that consists of "Plan", "Do", "Check", "Act/Adjust" elements, that are common to all Nuclear Management System programs and supporting activities. The elements collectively ensure:

- Management system principles of CSA N286, "Management System Requirements for Nuclear Facilities" are consistently and effectively applied to all activities defined in N-CHAR-AS-0002, "Nuclear Management System".
- Nuclear Management System processes and their supporting technologies are standardized to the greatest extent possible.

Nuclear Oversight conducted an audit in May 2012, NO-2012-017 [B.1.1], of the Managed Systems Program, for both Pickering and Darlington NGS. The objective of the audit was to confirm that the Managed System Program was effectively managed and in compliance with regulatory and OPG governance requirements. The audit concluded that the Managed Systems program controls are effective and no findings/SCRs were initiated as a result of the audit.

The Operations and Maintenance Support department completed a self-assessment in February 2014, NO14-000388-SA [B.1.2], in order to assess the health of the Managed Systems governance framework for both Pickering and Darlington NGS. This involved a review of related SCRs, governance framework, Asset Suite and revision records. No findings/SCRs were generated as a result of this self-assessment.

The Engineering Services division completed a self-assessment in October 2014, NO14-000820-SA [B.1.3], in order to confirm that the Pickering NGS Chemistry Laboratory operations comply with the corresponding Quality Management System (N-MAN-01802.1-10000, "Chemistry Laboratory Quality Manual"). Twelve findings were generated (ten of these were against an instrument in the process of being replaced). Corrective actions were captured under AR 28170848, which has since been closed and the necessary corrective actions were completed to address the underlying issues.

B.2 N-PROG-AS-0002, “Human Performance”

The objective of the Human Performance (Hu) program is to continually reduce the frequency and severity of events through the systematic reduction of human error and the management of defences in pursuit of zero events of consequence. The Hu program:

- Establishes a systematic framework for Hu management across Ontario Power Generation (OPG) Nuclear;
- Achieves higher levels of nuclear and industrial safety, higher unit reliability and reduced operating costs through event-free operation; and
- Describes key accountabilities, core processes and related activities associated with the conduct of Hu management across all facets of Nuclear.

Nuclear Oversight conducted a performance based audit in December 2015, NO-2015-321 [B.2.1], for both Pickering and Darlington NGS. The objective of the audit was to follow-up the Human Performance Audit NO-2014-012 [B.2.2] and determine if the corrective actions identified at that time had been completed, implemented and sustained. The audit identified additional performance improvement opportunities applicable to Pickering NGS in the areas of Event Free Day Resets, Hu self-assessments and site Hu working and steering committee meeting frequency. SCR N-2015-29665 (AR# 28186262) was initiated to address these performance improvement opportunities with corrective actions. Actions related to the site Hu working and steering committee meeting frequency have been completed, while the remaining actions are targeted to be completed by Q4 2016.

The Governance and Services section completed a self-assessment in December 2015, BAS15-001733-SA [B.2.3], in order to assess compliance with the Human Performance Program, which is applicable to both Pickering and Darlington NGS. No findings/SCRs were initiated as result of this self-assessment.

The Operations and Maintenance Support department completed a self-assessment in December 2015, NO15-000996-SA [B.2.4], in order to confirm worker behaviors are managed through coaching and reinforcement as appropriate for both Pickering and Darlington NGS. The self-assessment concluded that there has been an increase in the supervisor field presence at both sites, however consistency in supervisory oversight and compliance with oversight controls was a finding. SCR P-2015-28988 was initiated to address this finding, which required corrective actions to be implemented. This SCR has since been closed and the necessary corrective actions were completed to address the underlying issues.

B.3 N-PROG-RA-0010, "Independent Assessment"

The Independent Assessment program provides the independent assessment (internal and external) processes to perform a comprehensive and critical evaluation of all activities affecting Ontario Power Generation (OPG) Nuclear. It ensures the Management System under N-CHAR-AS-0002, "Nuclear Management System", is reviewed with sufficient frequency to confirm its continuing effectiveness. The Independent Assessment program is comprised of the following processes:

- Internal independent assessment performed by Nuclear Oversight; and
- External independent assessment performed by the Nuclear Safety Review Board.

Processes conducted under this program are credited in N-STD-AS-0023, "Nuclear Safety Oversight", to assess and report on nuclear safety.

Nuclear Oversight completed a self-assessment in November 2012, NO12-000001-SA [B.3.1], in preparation for a Nuclear Industry Evaluation Program (NIEP) audit of OPG Nuclear's independent oversight functions in 2013. The scope of the self-assessment was to follow-up on findings from the 2010 NIEP Evaluation (NO-2010-069); and to assess if OPG's Nuclear Oversight, Supply Chain Quality Services and Nuclear Safety Review Board organizations are effective in performing independent oversight activities. Performance improvement opportunities were identified in the areas of audit deferrals, audit and assessment scoping, corrective action plan completion, and Nuclear Safety Review board membership.

Four SCRs were initiated to address the above findings (SCRs N-2012-05506, N-2012-05509, N-2012-05510 and N-2012-05513), which required corrective actions to be implemented. These SCRs have since been closed and the necessary corrective actions were completed to address the underlying issues.

The Operations and Maintenance Support department completed a self-assessment in April 2013, NO13-000232-SA [B.3.2], in order to assess the health of the Independent Assessment Program, which is applicable to both Pickering and Darlington NGS. This involved a review of related SCRs, governance framework, revision records and previous program assessment reports. No findings/SCRs were initiated as a result of this self-assessment.

A third party review (as part of the NIEP) of OPG Nuclear' s independent oversight functions for Nuclear Oversight, Supply Chain Quality Services and Off-site Independent Review Process/organizations was conducted in August 2013 [B.3.3]. NIEP reviews are peer evaluations conducted primarily by Nuclear Oversight personnel from other utilities. They are broad comprehensive reviews of the independent oversight function. The audit focused on the performance of Nuclear Oversight functions based on the requirements of CSA N286-05, "Management System Requirements for Nuclear Power Plants", OPG's Nuclear Management System (N-CHAR-AS-0002) as well as industry standards and commitments. The audit concluded that Nuclear Oversight, Supply Chain Quality Services and Off-site Independent Review Process/organizations are effective; however there was an opportunity to improve in the screening of issues identified by external regulatory bodies and the World Association of Nuclear

Operators (WANO), for missed opportunity evaluations as required by Section 10.4 of N-GUID-01070-10001, "Nuclear Oversight Performance Based Audit and Assessment Handbook".

One SCR was initiated to address the above finding (SCR N-2013-13588), which required corrective actions to be implemented. This SCR has since been closed and the necessary corrective actions were completed to address the underlying issues.

R02	October 20, 2016	R. Jayasundera, J. Morris, and J. Cheng	Updated report addressing OPG comments on R01 report.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 11, *Procedures* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 11 were reviewed for the thirteen PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for Safety Factor 11 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes review of previously identified PSR1 gaps related to Safety Factor 11 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 11).

The results of the review of Safety Factor 11 are discussed in Section 5.0 of this report. The review has confirmed that the Pickering NGS processes for managing, implementing and adhering to operating and working procedures and for maintaining compliance with operational limits and conditions and regulatory requirements are adequate and effective and ensure plant safety. As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

TABLE OF CONTENTS

Page

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];
- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and
- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Procedures Safety Factor 11 is to: "determine whether the operating organization's processes for managing, implementing and adhering to operating and working procedures and for maintaining compliance with operational limits and conditions and regulatory requirements are adequate and effective and ensure plant safety." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 11 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 11 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. As noted in the Pickering PSR2 Basis Document [1], the review of this Safety Factor will focus on those procedures that have the highest safety significance. The Safety Factor 11 Review Tasks are:

1) Determine if there is a process for the development, approval, and documenting of all safety related procedures.

2) Confirm there is a formal process for modifying procedures affecting safety, including adequate arrangements for tracking changes.

3) Confirm there is a program for assessing procedures and performance audits to determine if there is regular review and maintenance of these procedures.

4) Confirm that self-assessments are performed to ensure that the procedures are followed.

5) Establish that there is a means for assessing the adequacy of safety related procedures in comparison with industry good practices.

6) Confirm that there are operating procedures that apply comprehensively to normal, abnormal and emergency conditions (including anticipated operational occurrences, design basis accident conditions, post-accident conditions, and design extension conditions).

7) Confirm there is a means for assuring the clarity of procedures taking into account human factors.

8) Evaluate processes to update procedures to allow for changes in the assumptions made and/or the limits and conditions arising from the safety analysis, plant design and operating experience.

9) Verify that the analysis and justification of the accident management procedures are documented.

10) Verify that an appropriate process is in place for the categorization of procedures in accordance with their significance to safety.

11) Examine whether there is adequate involvement in the development of procedures by the staff who will use them.

12) Evaluate the distribution process for the control, copying and removal of obsolete versions of procedures, so that only the last approved edition is used.

13) Evaluate audits, self-assessments, safety performance and events to determine whether there is adequate understanding and acceptance of these procedures by managers and staff.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Procedures Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 11 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed compliance assessment for each L/R/C/S is provided in Reference [6]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Procedures Safety Factor 11

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N286	Management System Requirements for Nuclear Facilities	N286-12	5, 6, 9, 10, 11	Incremental	N286 addressed as part of Pickering B and Darlington ISRs.

2.3 Audit and Self-Assessment Reviews of OPG Programs

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 11 is listed in Table 2 below.[3] The methodology for the audit and self-assessment reviews is discussed in Section 3.3. The assessment results of the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Program Reviewed for Safety Factor 11

Document Number	Document Title
N-PROG-OP-0001 [7]	Nuclear Operations

2.4 Additional Reviews

The PSR2 Safety Factor 11 Report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 11):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 11 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 11 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan [8] is provided in Reference [9].

In addition, Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in Reference [10].

Any PSR2 gaps identified as a result of the Safety Factor 11 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

---

[3] The list of Nuclear Programs to be assessed for PSR2 through review of audit and self-assessment results was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Task and L/R/C/S compliance, and Nuclear Program effectiveness for the Procedures Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 11 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.

- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[4]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

[4] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 11 L/R/C/S reviews identify Compliances and Gaps as defined below:[5]

- Compliance:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 11.)

---

[5] Safety Factor compliance assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the compliance arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- o For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 11.)

- Gap:

  - o Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.

  - o Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 11.)

  - o For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 11.)

The reviews assume that use of the word:

- “Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;

- "Should" is used to express a recommendation or that which is advised but not required;

- "May" is used to express an option or that which is permissible within the limits of the standard; and

- "Can" is used to express possibility or capability.

3.3 Audit and Self-Assessment Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and

- CNSC “Type I” and “Type II” inspections of the effectiveness and performance of OPG programs, where called-up by OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 11):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 11 (as identified in the Darlington ISR Integrated Implementation Plan [11] and Pickering Units 5-8 Continued Operations Plan [8]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[6]

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in Reference [10].

Any PSR2 gaps identified as a result of the Safety Factor 11 review which need to be addressed in other Safety Factor Reports are also discussed.

---

[6] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 11 Review Tasks.

4.1.1 Review Task #1: Process for Developing Procedures

Determine if there is a process for the development, approval, and documenting of all safety related procedures.

N-PROG-OP-0001, "Nuclear Operations" [7], establishes safe, uniform, and efficient operating practices and processes within Nuclear facilities that provide nuclear professionals the ability to ensure facilities are operated in such a manner that Reactor Operating License, Operating Policies and Principles, and other applicable regulations and standards are followed. This program applies to all technical procedures which direct the operation, maintenance, or testing of plant structures, systems, or components. This program is applicable to nuclear personnel who are involved in the development, review, validation, verification, approval, implementation, and evaluation of technical procedures.

Technical procedures ensure that the nuclear generating facilities are operated safely, reliably, and in accordance with their respective design and licensing basis. They provide information and instructions for the operation, maintenance and testing of a system, structure, or component. Technical procedures include the following [12]:

- Abnormal Incident Manuals (AIMs);
- Alarm Response Manuals (ARMs);
- Chemistry Control Procedures;
- Chemistry Laboratory Procedures;
- Common Technical Procedures;
- Forms;
- Maintenance Procedures;
- Operating Manuals (OMs);
- Operating Memos (OPMs);
- Operating Procedures;

- Overall Unit Manuals; and
- Safety-Related System Tests (SRSTs).

N-PROC-AS-0028, "Development, Review, and Approval of Technical Procedures" [13], defines the process and establishes requirements for the development, review, validation, verification, and approval of technical procedures.

Procedures are developed in accordance with N-STD-AS-0014, "Requirements for Technical Procedures" [12]. This standard specifies requirements for the structure, minimum content, and format of technical procedures. Compliance with this standard ensures that technical procedures developed and used throughout OPG Nuclear facilities:

- Promote safe and efficient operation;
- Reflect industry best practice; and
- Document compliance with regulatory requirements.

In addition, compliance with N-STD-AS-0014 ensures that procedures are prepared using approved instructions and templates.

Per Section 1.14 of N-PROC-AS-0028, once a procedure has been approved the document owner (or delegate) ensures that the final approved technical procedure is processed through Business Services for issuing, distribution, and retention [13].

Governance documents such as administrative procedures that are related to safety are prepared, reviewed, and approved in accordance with OPG-PROC-0001, "Process Administrative Governance Documents" [14]. These documents generally have a lower safety significance in comparison to technical procedures. Thus, in accordance with Section 2.1, which states that the review of this Safety Factor will focus on those procedures that have the highest safety significance, the supporting discussion in subsequent Review Tasks will be primarily focused on technical procedures.

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place for the development, approval, and documentation of all safety related procedures. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Process for Modifying Procedures

Confirm there is a formal process for modifying procedures affecting safety, including adequate arrangements for tracking changes.

The processes identified in Section 4.1.1, Review Task #1, for the development, approval, and documentation of procedures are also applicable to the revision of existing procedures.

N-PROC-AS-0028 defines the process and establishes requirements for the development, review, validation, verification, and approval of technical procedures [13]. Per Section 1.1 of N-PROC-AS-0028 [13], requests for a revision to an existing technical procedure are initiated through the completion of N-FORM-10014, "Technical Procedure Action Request (TPAR)" [15]. Once the TPAR has been approved, the revision of the procedure, including the necessary verification, validation, review, and approval activities, is completed per N-PROC-AS-0028. All technical procedures are modified in accordance with this procedure, irrespective of their safety significance.

Modifications to procedures are made in accordance with N-STD-AS-0014. Per Section 1.3.3 of N-STD-AS-0014, revisions bars are used to mark new or modified material in a procedure unless the procedure has been modified extensively [12]. Per Section 1.2.10 of N-STD-AS-0014, a summary of changes made or a revision history is included in the revised procedure [12]. If a procedure has been modified extensively, a statement to this effect is included in the summary of changes and revision bars are not used to mark new or modified material.

Per Section 1.14 of N-PROC-AS-0028, once a revised procedure has been approved the document owner (or delegate) ensures that the final approved technical procedure is processed through Business Services for issuing, distribution, and retention [13].

Document Change Requests (DCRs) are used to administer and monitor changes to governance documents that are related to safety. DCRs are processed in accordance with OPG-INS-00700-0001, "Document Change Request Data Administration" [16].

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place for modifying procedures affecting safety, including adequate arrangements for tracking changes. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Regular Review of Procedures

Confirm there is a program for assessing procedures and performance audits to determine if there is regular review and maintenance of these procedures.

Assessing the adequacy of procedures and the initiation of required improvements or corrective actions is part of ongoing efforts to achieve higher levels of nuclear and industrial safety, higher unit reliability, and reduced operating costs through event-free operation. N-CHAR-AS-0002, "Nuclear Management System" [17] establishes the overall requirements for sustaining and improving performance. This is accomplished by the following [17]:

- Establishing and implementing a managed system consisting of governing documents communicating essential elements of Nuclear business;
- Reinforcing individual accountability for performance and implementing various self-verification and independent oversight techniques;
- Identifying, documenting, evaluating, and correcting in a timely manner, conditions adverse to quality;
- Using internal and industry Operating Experience (OPEX) to improve human, plant, and equipment performance and design, procurement, construction, commissioning, and operating requirements and practices; and
- Providing information to the people who need it through the managed systems that establish how necessary information is identified, targeted to required users, maintained current, and communicated effectively.

N-PROG-AS-0002, "Human Performance" [18], establishes a systematic framework for Human Performance management across OPG Nuclear. In accordance with N-PROG-AS-0002, the adequacy of a procedure is assessed each time it is used. The following documents provide further direction on the relevant processes used to evaluate the adequacy of procedures:

- N-PROC-OP-0005, "Pre-Job Briefing and Post-Job Debriefing" [19]; and
- N-STD-AS-0002, "Procedure Use and Adherence" [20].

Prior to starting a task, relevant procedures are identified in accordance with N-STD-AS-0002 [20]. In addition, N-PROC-OP-0005 specifies that a pre-job brief must be delivered prior to performing any task [19]. At a minimum, the pre-job brief will summarize and communicate the task that is to be performed and identify any critical steps associated with that task.

Section 1.4 of N-STD-AS-0002 describes the required actions on how to address challenges encountered regarding procedure adherence [20]. Specifically, if the procedure is unclear, cannot be performed as written, would result in an unsafe condition or result in an unexpected response, or is otherwise inappropriate, the user will stop the activity and contact their supervisor for direction. If the condition that is preventing adherence to the procedure cannot be corrected, then the supervisor will initiate a TPAR in accordance with N-PROC-AS-0028 [13].

Following the completion of the task, a post-job debriefing is held in accordance with N-PROC-OP-0005 [19]. If there are lessons learned or successes need to be recorded, they are documented using the appropriate work process (i.e., a TPAR would be initiated in accordance with N-PROC-AS-0028 to incorporate any procedural improvements/enhancements that were identified during the course of performing the task).

The ongoing assessment of procedures each time they are used is complemented by a range of other processes that ensure there is regular review and maintenance of procedures. These processes are as follows:

- N-PROC-RA-0023, "Fleetwide Program Health and Performance Reporting" [21];
- N-PROC-RA-0048, "Conducting Performance Based Audits and Assessments" [22]; and
- N-PROC-RA-0097, "Self-Assessment and Benchmarking" [23].

N-PROC-RA-0023 [21] describes the process for performing a program health and performance review and for reporting on the overall effectiveness of the Nuclear Management System governance to support the requirements of CSA N286-05, "Management System for Nuclear Power Plants" [24]. Every program implemented either directly or indirectly by N-CHAR-AS-0002 [17] must be reviewed in accordance with N-PROC-RA-0023 [21]. The assessment of the overall health of technical procedures is addressed under the evaluation of N-PROG-OP-0001 [7]. Program health reports for N-PROG-OP-0001 take into consideration findings resulting from audits and self-assessments.

N-PROC-RA-0048 establishes the methodology and requirements for planning, scheduling, staffing, preparing, performing, reporting, and follow-up of audits and assessments performed by OPG Nuclear Oversight [22]. The objective of the performance-based audit and assessment process is to confirm that the overall Nuclear Management System is established and effective. The audit frequency is determined using a risk-based approach, which utilizes industry and OPG Nuclear experience on inherent risk and residual risk, to prioritize programs that constitute the Nuclear Management System. Per Section 1.3.4 of N-PROC-RA-0048 [22], adverse findings identified during audits as requiring attention are documented in a Station Condition Record (SCR), in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [27].

N-PROC-RA-0097 specifies the requirements for self-assessment and benchmarking activities for functional and line organizations of OPG Nuclear [23]. Self-assessment and benchmarking are performance improvement tools and include evaluations of business programs, processes, and performance. They provide a structured method to compare performance with management expectations, industry standards of excellence, and regulatory requirements to identify areas needing improvement. Self-assessments include evaluations of business programs, processes, and performance. Per Section 1.6 of N-PROC-RA-0097, the results of the self-assessment are documented in a Self-Assessment Report, with Action Requests (ARs) generated for improvement opportunities identified and SCRs filed for adverse conditions identified [23].

N-PROG-RA-0010, "Independent Assessment" [25], ensures that audits and self-assessments are carried out at regular intervals as specified by their specific implementation procedures. The purpose of N-PROG-RA-0010 is to ensure that the management system under N-CHAR-AS-0002, including the associated implementation programs that receive their authority from N-CHAR-AS-0002, is reviewed with sufficient frequency to confirm its continuing effectiveness [25]. Per the Pickering PSR2 Basis Document [1], effectiveness reviews (at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis are conducted for PSR2, using recent audit and self-assessment results. Audit and self-assessment results applicable to N-PROG-RA-0010 are summarized in Section 4.3 and Appendix B of P-REP-03680-00014, "Pickering NGS PSR2 Safety Factor 10 Report: Organization, Management System, and Safety Culture" [26].

Conclusion:

The conclusion of this Review Task assessment is that there is governance for assessing procedures and identifying requirements for performance audits to determine if there is regular review and maintenance of these procedures. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Procedural Adherence

Confirm that self-assessments are performed to ensure that the procedures are followed.

The extent to which procedures are to be followed is described in N-STD-AS-0002, which documents the requirements for use of all approved procedures [20]. This standard is applicable to all governance, administrative procedures, and technical procedures.

The level of use for a procedure is determined by considering the risk associated with the task and is specified as Usage Classification that is assigned to the procedure. The three classifications of usage for procedures are continuous, reference, and information [20].

N-STD-AS-0002 documents the minimum requirements for usage of each class of procedures [20]. Per Section 2.0 of N-STD-AS-0002, line supervisors are responsible for applying appropriate oversight of the task to verify procedural adherence, with management having overall responsibility to provide procedures of sufficient quality to accomplish intended tasks and verification of adherence to N-STD-AS-0002 [20].

Compliance with procedural adherence requirements is evaluated in part through the use of self-assessment and benchmarking activities. N-PROC-RA-0097 defines the elements required to plan, execute, report, and monitor self-assessments and benchmarking activities for the functional and line organizations of OPG Nuclear [23]. Self-assessment and benchmarking are performance improvement tools that provide a structured method to compare performance with management expectations, industry standards of excellence, and regulatory requirements to identify areas needing improvement. Self-assessments include evaluations of business programs, processes, and performance. There are three types of self-assessments [23]:

1) Divisional Self-Assessment

    - Requires significant advanced planning, involving a team with membership external to the area being assessed, and typically has a duration of 1-2 weeks.

2) Departmental Self-Assessment

    - Objective and scope is generally within the purview of a department and typically has a duration of 2-7 days.

3) Snapshot Self-Assessment

    - Originates at the department level or lower and is normally performed by one person (i.e., person knowledgeable in the subject area). It has a narrow focused objective and scope and is short in duration.

Per Section 1.4 of N-PROC-RA-0097, Directors and Stratum IV Managers plan and schedule divisional and departmental level self-assessments for the following year by December 15th of the preceding year [23]. Planned self-assessments are reviewed in order to co-ordinate fleetwide self-assessment activities and confirm coordination and scheduling at the site level. Directors and Stratum IV Managers are expected to review and revise the self-assessment schedule periodically due to developing issues or changing business priorities.

N-PROG-RA-0010 ensures that audits and self-assessments are carried out at regular intervals as specified by their specific implementation procedures [25]. Per the Pickering PSR2 Basis Document [1], effectiveness reviews (at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis are conducted for PSR2, using recent audit and self-assessment results. Audit and self-assessment results applicable to N-PROG-RA-0010 are summarized in Section 4.3 and Appendix B of P-REP-03680-00014 [26].

Conclusion:

The conclusion of this Review Task assessment is that there is adequate governance outlining the requirements for performing self-assessments to ensure that procedures are followed. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Procedures Follow Industry Good Practices

Establish that there is a means for assessing the adequacy of safety related procedures in comparison with industry good practices.

As discussed in Review Tasks #1 and #2, Sections 4.1.1 and 4.1.2 respectively, safety-related procedures are prepared and revised following the process documented in N-PROC-AS-0028 [13].

Section 1.4.1 of N-PROC-AS-0028 specifies that for new technical procedures and major revisions to existing technical procedures, the preparation stage of the process must involve a review of OPEX lessons learned, event information, and just-in-time packages to incorporate applicable information [13]. This ensures that industry best practices are incorporated in the procedure development process. In addition, all new procedures and major revisions to existing procedures are validated either in the simulator or in the field prior to use per N-PROC-AS-0028 [13]. The completion of applicable validation activities is consistent with industry best practice.

Per Section 1.4 of N-PROC-AS-0028 [13], technical procedures are prepared or revised by applying the structure and minimum content requirements established in N-STD-AS-0014 [12]. This standard specifies requirements for the structure, minimum content, and format of technical procedures. Compliance with this standard ensures that technical procedures developed and used throughout OPG Nuclear facilities [12]:

- Promote safe and efficient operation;
- Reflect industry best practice; and
- Document compliance with regulatory requirements.

Section 4.3.2 of N-STD-AS-0014 identifies several developmental references that were used to support the development of this standard, including the following documents [12]:

- American Institute of Chemical Engineers: Guidelines for Writing Effective Operating and Maintenance Procedures, New York, Center for Chemical Process Safety, 1996;
- Blake G, Bly RW: The Elements of Technical Writing, New York: Macmillan USA, 1993;

- Campbell JJ, Zimmerman C: Fundamentals of Procedure Writing, Columbia: GP Publishing, Inc., 1988;

- Haramundanis K: The Art of Technical Documentation, Boston: Digital Press, 1998; and

- Wieringa D, Moore C, Barnes V: Procedure Writing, Principles and Practices, Columbus: Battelle Press, 1998.

Collectively, these references demonstrate that industry best practices are applied to the development and documentation of all technical procedures.

As discussed in Review Task #3, Section 4.1.3, regular reviews of approved procedures are used to assess the adequacy of safety-related procedures in comparison with industry best practices. Specifically, pre-job briefings and post-job debriefings are used to assess the adequacy of safety-related procedures. In addition, continuing training on procedures is provided, as appropriate, through classroom, field, and/or simulator training.

Section 1.6 of N-PROC-OP-0005 provides direction on the use of OPEX during pre-job briefings [19]. The review of OPEX prompts staff to consider any industry best practices which may have emerged since the applicable procedure was last revised or used. Following the execution of the procedure, the post-job debriefing process documented in N-PROC-OP-0005 directs staff to document lessons learned or opportunities for improvement using the appropriate work process (i.e., a TPAR would be initiated in accordance with N-PROC-AS-0028 to incorporate any procedural improvements/enhancements that were identified during the course of performing the task) [19].

The adequacy of safety-related procedures is also assessed through the ongoing OPEX process described in N-PROC-RA-0035, "Operating Experience Process", which monitors events around the world to determine if there is any unforeseen event that may have applicability to Pickering NGS [28]. If/when an event is deemed to be applicable, existing procedures are reviewed to identify any vulnerabilities or weaknesses that could result in similar events or problems, with corrective actions initiated as required.

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place that provides a means for assessing the adequacy of safety-related procedures in comparison with industry good practices. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Procedures for Normal, Abnormal and Emergency Conditions

Confirm that there are operating procedures that apply comprehensively to normal, abnormal and emergency conditions (including anticipated operational occurrences, design basis accident conditions, post-accident conditions, and design extension conditions).

N-PROG-OP-0001 implements for OPG Nuclear a series of standards and procedures to ensure the safety of public, environment, plant personnel, and plant equipment. This program establishes safe, uniform, and efficient operating practices and processes within Nuclear facilities that provide nuclear professionals the ability to ensure facilities are operated in such a manner that Reactor Operating License, Operating Policies and Principles, and other applicable regulations and standards are followed [7]. There are a range of operating procedures governed by this program that are used to operate Pickering NGS under normal, abnormal, and emergency operating conditions, as described below.

Normal Conditions

Pickering NGS Operations staff normally operate the plant through the use of approved Operating Manuals (OMs), Operating Procedures (OPs), Alarm Response Manuals (ARMs), and Safety-Related System Tests (SRSTs). OMs are produced for individual plant systems and provide instructions on equipment operation and controls. As specified in N-INS-08120-10000, "Operating Manuals", system OMs follow a standardized format, with each section of the OM representing a stand-alone document that can be revised and issued independently [29].

For normal operating conditions, operation of plant equipment is performed in accordance with the direction provided in Section 4.0, "Standard Operating Conditions" of the applicable system OM. These documents are issued in Asset Suite under the NA44-OM-XX-YYYYY-04.ZZ[7] document series for Pickering Units 1,4. Similarly, OMs for Pickering Units 5-8 are issued in Asset Suite under the NK30-OM-XX-YYYYY-04.ZZ[7] document series.

Abnormal Conditions

Operations staff will initially attempt to respond to an abnormal condition via the system-based OMs or ARMs, as applicable. Specifically, the following sections of OMs are applicable to the initial response to abnormal conditions:

- Section 5.0, "Non-Standard Operating Conditions";
- Section 6.0, "Actions Following Trips and Alarms"; and

---

[7] Where XX denotes the applicable unit(s) for the Operating Manual, YYYYY denotes the System Classification Index (SCI), and ZZ denotes the applicable subsection in Section 4.0 of the OM.

- Section 8.0, “Auxiliary Services Failures”.

As discussed above, the system OMs are issued in Asset Suite. Similarly, the ARMs are also issued in Asset Suite.

If it is not possible to address the abnormal condition through the system OMs and/or ARMs, staff will respond per the applicable Abnormal Incident Manual (AIM). AIMs are issued in Asset Suite under the following series of documents:

- NA44-AIM-014-09013-XX[8];
- NK30-AIM-058-09013-XX[8]; and
- P-AIM-018-09013-XX[8].

The AIMs are used to respond to both abnormal and emergency conditions. Of particular relevance to abnormal conditions are Sections 3 and 4 of the AIMs, which address faults (commonly referred to as impairments) that reduce the effectiveness of safety systems or other safety-related systems.

If the abnormal condition is the result of a process upset that results in a reactor trip, sustained reactor setback to less than or equal to 2 %FP, reactor stepback to any power level, or a forced power reduction to less than or equal to 2 %FP, the Critical Safety Parameter (CSP) monitoring and restoration procedures will be entered [31], [32]. These procedures are executed in parallel with the event-based AIMs and are used by operating staff to perform an independent check of key parameters indicative of overall unit health, to determine if any further actions are required.

Collectively, the system OMs and AIMs are used to implement the station response to abnormal conditions, including Anticipated Operational Occurrences (AOOs).

Emergency Conditions

Upon confirmation or diagnosis of emergency conditions, including Design Basis Accidents (DBAs), staff respond per the event-based AIMs and continue to monitor conditions as per the CSP AIM. Continued use of the CSP AIM ensures that operating staff perform independent checks of key parameters indicative of overall unit health, to determine if any further actions are required to complement the event-based AIMs that are in use. The objectives of the event-based AIMs are to:

- Shut down the reactor and maintain it in a shutdown state;
- Maintain adequate heat sinks to cool the fuel and reactor structures; and
- Maintain integrity of the containment system to prevent release of radioactive materials.

8 Where XX denotes the applicable subsection of the AIM.

Once AIM actions to achieve these objectives have been successfully implemented, there is subsequent direction on longer-term actions that need to be completed in order to effectively manage post-accident conditions resulting from the event.

If plant conditions are more severe such that AIM actions, on their own, cannot mitigate the event progression, this implies that the event has progressed to a Beyond Design Basis Accident (BDBA). A BDBA refers to a low frequency event sequence that is not included in the plant design basis (due to the very low probability of occurrence) and is not necessarily bounded by the analyses of the station design basis. If the consequences of such events are significant core degradation, these BDBAs are referred to as Severe Accidents (SAs).

BDBA management strategies are described in N-STD-MP-0019, "Beyond Design Basis Accident Management" and implemented through Emergency Mitigating Equipment Guidelines (EMEGs) and Severe Accident Management Guidance (SAMG) [33]. EMEGs and SAMG are used to respond to all BDBAs, including Design Extension Conditions (DECs) and SAs[9].

EMEGs are entered when entry conditions specified in the event-based AIMs are met. EMEGs have a primary focus on fuel cooling and are used to mitigate accident progression when design basis equipment is unable to provide adequate core cooling. The intent of EMEG use is to prevent a BDBA sequence from progressing to a SA [33].

SAMG is a set of written guidance to implement strategies should a BDBA progress to a SA. SAMG is entered based on entry conditions in the EMEGs, CSPs, or event-based AIMs being met. Entry to SAMG implies that adequate fuel cooling has been lost and severe core damage is either imminent or has occurred. The goals of SAMG are to terminate progression of core damage, if possible, by restoring cooling, and to maintain containment integrity and minimize radioactive releases. The SAMG allows flexibility in application and the SAMG document set is referred to as "guidance" [33]. In addition, the SAMG aids in identifying longer-term actions that will be required to address post-accident conditions once the station has been returned to a controlled, stable state.

Conclusion:

The conclusion of this Review Task assessment is that there are operating procedures that apply comprehensively to normal, abnormal, and emergency conditions (including AOOs, DBAs, post-accident conditions, and DECs). The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

[9] It is recognized that EMEGs and SAMG are guidelines as opposed to procedures. However, within the context of this report the EMEGs and SAMG are treated as procedures as these are the documents that are used to respond to BDBAs.

4.1.7 Review Task #7: Clarity of Procedures

Confirm there is a means for assuring the clarity of procedures taking into account human factors.

As discussed in Review Tasks #1 and #2, Sections 4.1.1 and 4.1.2 respectively, procedures are prepared and revised following the process documented in N-PROC-AS-0028 [13].

Per Section 1.4 of N-PROC-AS-0028 [13], technical procedures are prepared or revised by applying the structure and minimum content requirements established in N-STD-AS-0014 [12]. This standard specifies requirements for the structure, minimum content, and format of technical procedures. In addition, N-STD-AS-0014 ensures that procedures are developed using approved instructions and templates specific to the type of procedure being developed. Compliance with this standard ensures that technical procedures developed and used throughout OPG Nuclear facilities [12]:

- Promote safe and efficient operation;
- Reflect industry best practice; and
- Document compliance with regulatory requirements.

Section 4.3.2 of N-STD-AS-0014 identifies several developmental references that were used to support the development of this standard, which include the following [12]:

- American Institute of Chemical Engineers: Guidelines for Writing Effective Operating and Maintenance Procedures, New York, Center for Chemical Process Safety, 1996;
- Blake G, Bly RW: The Elements of Technical Writing, New York: Macmillan USA, 1993;
- Campbell JJ, Zimmerman C: Fundamentals of Procedure Writing, Columbia: GP Publishing, Inc., 1988;
- Haramundanis K: The Art of Technical Documentation, Boston: Digital Press, 1998; and
- Wieringa D, Moore C, Barnes V: Procedure Writing, Principles and Practices, Columbus: Battelle Press, 1998.

The references cited above relate to best practices for technical writing and procedure writing. Thus, developing procedures in accordance with N-STD-AS-0014 promotes the development of procedures which are sufficiently clear to support safe and efficient operation of the station.

N-PROC-AS-0028 [13] includes direction to ensure that procedures are prepared in accordance with N-STD-AS-0014. Specifically, Step 1.4.1 of N-PROC-AS-0028 prompts the document author to complete N-FORM-10141, "Writer's Guide Review Checklist". The completion of N-FORM-10141 establishes that the procedure has been reviewed for consistent format, presentation, level of detail, attention to detail, and other requirements specified in N-STD-AS-0014 [34]. In addition, N-PROC-AS-0028 directs the document author to determine the required validation, verification, and review activities to support finalizing the procedure [13]. The completion of these activities aids in identifying issues that may impact on the clarity of the procedure from the user's perspective so that such issues can be resolved prior to the procedure being issued for use. The completion of the activities described above ensures that considerations for human factors are taken into account during the procedure development process.

The clarity of existing procedures is also evaluated through regular reviews of procedures, as described in Review Task #3, Section 4.1.3. Per Section 1.4 of N-STD-AS-0002, staff are expected to stop work and contact their supervisor for direction if the procedure they are using is unclear, cannot be performed as written, would result in an unsafe condition or expected response, or is otherwise inappropriate [20]. If issues are identified with regard to the clarity of a procedure, a TPAR is initiated to revise the procedure per the process documented in N-PROC-AS-0028 [13]. Similarly, TPARs may also be issued in response to feedback from continuing training provided to Operations staff where procedures are reviewed for clarity and ease of use.

Adherence to N-PROC-AS-0028 also ensures that TPARs initiated to improve the clarity of a procedure or improve the usability of the procedure from a human factors perspective (i.e., reduce potential for error resulting from use of the procedure) are appropriately prioritized [13]. Per Step 1.3 of N-PROC-AS-0028, TPAR requests are categorized using Appendix C, "TPAR Categorization Criteria" [13]. One of the categories listed in Appendix C of the procedure is "Enhancement", which explicitly acknowledges human factors improvements to procedures that are intended to reduce error potential.

TPARs to improve the clarity of existing procedures can also be initiated from OPEX reviews (per N-PROC-RA-0035 [28]), self-assessments (per N-PROC-RA-0097 [23]) or N-PROG-RA-0003, "Corrective Action" [35].

Conclusion:

The conclusion of this Review Task assessment is that governance exists which provides a means of assuring the clarity of procedures taking into account human factors. The intent of Review Task #7 is met and therefore Pickering NGS is complaint.

4.1.8 Review Task #8: Processes to Update Procedures

> *Evaluate processes to update procedures to allow for changes in the assumptions made and/or the limits and conditions arising from the safety analysis, plant design and operating experience.*

As discussed in previous Review Tasks, the need to update a procedure can be identified through various processes. This Review Task will focus on the following activities which may prompt the initiation of a request to update existing station procedures.

1) Receipt of OPEX that identifies vulnerabilities and/or weaknesses in procedures, which require correction.

2) Modifications to the plant design through the Engineering Change Control (ECC) process.

3) New safety analysis has been performed that introduces new operating limits or revises assumptions associated with previously existing operating limits.

OPEX

Per the OPEX Safety Factor report [36], the CANDU Owners Group (COG) reviews recent OPEX events from a variety of sources (WANO, INPO, COG members, etc.) at the COG OPEX Weekly Screening Meeting.

SCRs are initiated for items from the Weekly Screening Meeting where a potential vulnerability is identified that is assessed to be applicable and actionable for Pickering NGS. SCRs are processed in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [27]. An outcome of the SCR process may include corrective actions to update existing procedures. If required, a TPAR would be initiated to implement the necessary procedural changes in accordance with N-PROC-AS-0028 [13].

Modifications to Plant Design

N-PROG-MP-0001, "Engineering Change Control" ensures all modifications to OPG Nuclear structures, systems, and components (SSCs), including software and engineered tooling, are planned, designed, installed, commissioned, placed into service, or removed from service within the Safe Operating Envelope (SOE) or Safety and Design Envelope (SDE), design basis, and licensing conditions [37].

Per Section 1.9 of N-PROG-MP-0001, SSCs impacting the design basis are modified following a risk-based process outlined in N-PROC-MP-0090, "Modification Process" [38]. Adherence to N-PROC-MP-0090 ensures that plant configuration is controlled and maintained by updating design, operating, maintenance, and training documentation impacted by design changes. Engineering Changes (ECs) include an Affected Documents List (ADL) which identifies engineering, operations, maintenance, and training controlled documents that are affected by the modification and require revision [38]. In accordance with N-PROC-MP-0090 [38], procedures included on the ADL will be revised through the TPAR process documented in N-PROC-AS-0028 [13]. Revised procedures are issued and available for use prior to Operations acceptance of the modification following the completion of installation activities.

Changes to Safety Analysis

N-PROG-MP-0014, "Reactor Safety Program", defines the organizational responsibilities and key program elements for the management of issues related to nuclear safety analysis, including Generic Action Items, and the following major aspects of safe operation that are relevant to the content in existing procedures [39]:

- Safety Analysis Basis (Safety Report and Analysis of Record); and
- Safe Operating Envelope (SOE).

N-PROC-MP-0086, "Safety Analysis Basis and Safety Report Update" defines the Safety Analysis Basis and describes the established practices used to ensure that the Safety Analysis Basis is maintained [40]. It also defines the process and provides the instructions for processing changes to the Safety Analysis part of the Safety Report (i.e., Part 3 of the Safety Report). The resolution of Safety Report issues does not always require changes to station procedures (i.e., resolution of an issue may be limited to revising an analytical assumption that does not change how the plant is operated). However, Step 1.4.3 of N-PROC-MP-0086 [40] specifies that if it becomes apparent in the process of analyzing an issue that the issue is better addressed by making an engineering change to the plant or a change to operating procedures, then work should proceed in accordance with N-PROG-MP-0001 [37]. As described above for the process that is followed to update procedures to reflect design modifications, TPARs would be initiated to revise affected procedures.

In addition to ongoing work to update the Safety Report, discovery issues may be encountered that result in changes to the assumptions, limits, or conditions used in the existing safety analysis. N-PROC-RA-0094, "Discovery Issue Resolution Process" requires that upon discovery of an issue (or potential issue) with deterministic safety analysis, a SCR be raised and the Safety Report Update process be initiated [41]. That is, any changes required to the safety analysis would be processed per N-PROC-MP-0086, as described above.

N-STD-MP-0016, "Safe Operating Envelope", defines the processes, organizational responsibilities, and key program elements to ensure that the SOE is defined and documented in a correct, complete, and consistent manner and reflected as required in the station operating documentation [42]. Figure 1 of N-STD-MP-0016 illustrates the process by which SOE revisions are defined and implemented. This figure illustrates that revisions to the SOE are initiated in accordance with N-PROG-MP-0001 [37], with any gaps identified in station operating documentation addressed through the initiation of TPARs that are processed per N-PROC-AS-0028 [13].

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place to update procedures as required in response to changes in the assumptions made and/or the limits and conditions arising from the safety analysis, plant design and operating experience. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.1.9 Review Task #9: Accident Management Procedures

Verify that the analysis and justification of the accident management procedures are documented.

As discussed in Review Task #6, Section 4.1.6, accident management procedures[10] include the following types of documents:

- OMs/ARMs;
- AIMs/CSPs;
- EMEGs; and
- SAMG.

The appropriateness of accident management procedures is demonstrated and documented through a combination of procedure validation activities, training activities, probabilistic safety analysis, and deterministic safety analysis.

Per Review Task #1, Section 4.1.1, all procedures are developed in accordance with N-PROC-AS-0028 [13]. Adherence to N-PROC-AS-0028 [13] ensures that appropriate validation activities are performed to confirm the usability and technical validity of the procedure, per the validation and review requirements identified from the completion of N-FORM-10212 [43].

Review Task #1 of the Deterministic Safety Analysis Safety Factor report [44] discusses various assumptions that are used in the deterministic safety analysis. One of the generic assumptions discussed in this report is the required operator action credits. More specifically, the report references Tables 1-2 and 1-11 and Tables S.1-1 to S.1-10 in Part 3 of the Pickering 1,4 and 5-8 Safety Reports respectively, as summarizing all required operator action credits. These actions generally correspond to actions that would be taken by operating staff per OMs or AIMs.

[10] As noted in Section 4.1.6, it is recognized that EMEGs and SAMG are guidelines as opposed to procedures. However, within the context of this report the EMEGs and SAMG are treated as procedures as these are the documents that are used to respond to BDBAs.

Similarly, Review Task #2 of the Probabilistic Safety Assessment (PSA) Safety Factor report [45] discusses assumptions and requirements related to the modelling of operator actions in the station PSAs. More specifically, the report references N-GUID-03611-10001 Volume 1, "OPG Probabilistic Risk Assessment (PRA[11]) Guide – Level 1 (At-Power)", which provides a requirement to account for, quantify and re-quantify applicable operator actions during the PSA Level 1 preparation. The Level 1 and Level 2 PSAs also consider station operation impacts via an in-depth review of current station documentation and supporting references, including the EMEGs.

If actions identified in OMs and AIMs are unsuccessful in terminating the accident progression, actions will be taken per the EMEGs to prevent the accident from progressing to a SA. N-BDB-03600-00002, "OPG Emergency Mitigating Equipment for Beyond Design Basis Accidents: Technical Basis Document" [46] summarizes the technical basis for EME including:

- The bounding BDBA event sequence and associated analyses;
- The overall functional requirements for the EME; and
- Other information relevant to EME specification, design, and procurement.

N-BDB-03600-00002 constitutes the analysis basis for the EMEGs, which are used to deploy EME when required as part of the response to an accident at Pickering NGS.

If a BDBA were to progress to a SA, SAMG would be used to respond to the event. SAMG is a set of written guidance that is used to terminate progression of core damage, if possible, by restoring cooling, and to maintain containment integrity and minimize radioactive releases. The physical processes that govern SA phenomena are complex and, consequently, SAMG cannot be made highly dependent on detailed analysis because of limited understanding of certain SA phenomena and other uncertainties associated with SA causes and progression. However, reasonable strategies for coping with SA progression can be identified and developed using "state of the art" reviews, Probabilistic Safety Assessments, and insights on accident behaviours from accident analyses. Each station-specific SAMG document is supported by a station-specific SAMG Background Document that provides the rationale for aspects of the response.

Conclusion:

The conclusion of this Review Task assessment is that supporting documentation exists for the analysis and justification of accident management procedures. The intent of Review Task #9 is met and therefore Pickering NGS is compliant.

---

[11] Note that PRA is now referred to as PSA.

4.1.10 Review Task #10: Categorization of Procedures Based on Safety Significance

Verify that an appropriate process is in place for the categorization of procedures in accordance with their significance to safety.

As discussed in Review Task #6, Section 4.1.6, it has been confirmed there are existing procedures that apply comprehensively to normal, abnormal, and emergency conditions (including AOOs, DBAs, post-accident conditions, and DECs). This framework is also applied to categorize new procedures in accordance with their significance to safety.

Procedures that apply to normal and abnormal conditions are typically structured to be used as part of an event-based response. That is, procedures which fall into this category are used to respond to higher frequency, lower consequence events (in comparison to procedures used in certain emergency conditions) where it is practicable to predict the applicable event sequences in advance.

If actions taken through procedures used in response to normal or abnormal conditions are unsuccessful, plant conditions will eventually deteriorate to the point where procedures for emergency conditions are initiated. Procedures which fall into this category are typically structured to be used as part of symptom-based response. That is, critical parameters for monitoring the health of a unit are identified, with mitigating actions taken to return key plant parameters to a desired value.

If a new technical procedure is identified as being required, a TPAR is submitted per N-PROC-AS-0028. Step 1.3.1(d) of N-PROC-AS-0028 provides the following direction on how to process TPARs [13]:

If request is for a new technical procedure, perform the following:

1) *Ensure request does not meet criteria for a Work Plan.*

2) *Determine procedure category.*

3) *Identify appropriate system to be used in procedure number, if applicable (sequence number to be determined by Controlled Document Records personnel).*

Thus, adherence to N-PROC-AS-0028 ensures that as part of approving the TPAR new procedures are categorized based on their significance to safety (i.e., through the determination of the appropriate procedure category).

Following the approval of the TPAR, the document author prepares a draft procedure. Per Step 1.4.1(c) of N-PROC-AS-0028 [13], the draft technical procedure is prepared by applying the structure and minimum content requirements established in N-STD-AS-0014 and supporting instructions specific to the procedure category [12].

N-STD-AS-0014 specifies the requirements for the structure, minimum content, and format of technical procedures. This standard also provides direction on additional requirements that are specific to various procedure categories. Technical procedures addressed under N-STD-AS-0014 include the following [12]:

- AIMs, which are prepared in accordance with N-INS-08120-10003, "Emergency Operating Procedure Format" [47];
- ARMs, which are prepared in accordance with N-INS-08120-10002, "Alarm Response Manuals" [48];
- Chemistry Control Procedures, which are prepared in accordance with N-INS-08120-10008, "Chemistry Control Procedure Format" [49];
- Chemistry Laboratory Procedures, which are prepared in accordance with N-INS-08120-10009, "Chemistry Laboratory Procedures Format" [50];
- Common Technical Procedures, which are prepared in accordance with N-INS-08120-10010, "Common Technical Procedures" [51];
- OMs, which are prepared in accordance with N-INS-08120-10000, "Operating Manuals" [29];
- OPMs, which are prepared in accordance with N-INS-08120-10005, "Operating Memos" [52];
- Operating Procedures, which are prepared in accordance with N-INS-08120-10006, "Operating Procedures Format" [53];
- Overall Unit Manuals, which are prepared in accordance with N-INS-08120-10001, "Overall Unit Manual Format" [54]; and
- SRSTs, which are prepared in accordance with N-INS-08120-10004, "Safety-Related System Tests and Operator Test Procedures" [55].

In addition to providing direction on specific requirements for the various categories of technical procedures, N-STD-AS-0014 also provides direction to the document author on how to determine the usage classification of the procedure. Specifically, Step 1.1.9 of N-STD-AS-0014 provides the following direction [12]:

> *Usage classification specifies the required frequency and method by which users shall refer to a technical procedure while performing an activity or task:*
>
> - *A technical procedure shall be assigned the appropriate usage classification based on risks associated from performing an activity from memory.*
> - *Activities may change usage classification within a single technical procedure. A change of usage classification within a technical procedure shall be clearly indicated.*

- *Criteria for the three usage classifications; continuous, reference and information, are described in N-STD-AS-0002 [20].*

Adherence to N-PROC-AS-0028 and N-STD-AS-0014 ensures that a consistent process is followed for classifying procedures in accordance with their significance to safety. This includes determining the type of procedure required, adherence to generic requirements for the development of all procedures, adherence to requirements specific to the type of procedure being prepared, and identification of the usage classification of the procedure based on risks associated with performing the procedure.

Conclusion:

The conclusion of this Review Task assessment is that governance is in place to ensure that procedures are categorized in accordance with their significance to safety. The intent of Review Task #10 is met and therefore Pickering NGS is compliant.

4.1.11 Review Task #11: Staff Involvement in Development of Procedures

Examine whether there is adequate involvement in the development of procedures by the staff who will use them.

Per Review Tasks #1 and #2, Sections 4.1.1 and 4.1.2 respectively, existing procedures are modified and new procedures are created in accordance with N-PROC-AS-0028 [13]. Frequently, these changes are initiated by TPARs that were filed based on feedback from staff participating in training activities (e.g., staff participating in simulator training). This demonstrates that staff who will use the procedures are involved in identifying the need to revise existing procedures or create new procedures.

In many cases, staff from Operations Support and Maintenance Support who prepare the procedures are drawn from the Operations and Maintenance crews who are responsible for executing the procedures. In addition, the review, validation, and verification stages of the procedure development process described in N-PROC-AS-0028 are used to obtain input from staff who will ultimately be using the procedure.

<u>Review</u>

Per Section 1.5 of N-PROC-AS-0028, the review process ensures that documents are correct, meet the intended function, and are usable by a qualified individual [13]. The document author identifies review requirements by completing N-FORM-10212 [43].

Staff identified as reviewers for a procedure complete a review of the procedure for acceptability within their jurisdiction. The document author addresses reviewer feedback and obtains concurrence from individual reviewers on the dispositions to their comments. Once reviewers are satisfied with the contents of the procedure, the procedure is circulated for validation.

Validation

Per Section 1.5 of N-PROC-AS-0028, the validation process ensures that documents are correct, meet the intended function, and are usable by a qualified individual. The method selected for technical procedure validation depends on various considerations such as the complexity of the document, availability of a suitable validation site, and the number of disciplines involved in the performance of the tasks. Validation methods include the following [13]:

- Field Validation: a validation method that requires tasks specified in the technical procedure be performed on actual plant equipment.
- Simulated Performance Validation: a validation method that requires tasks specified in the technical procedure be performed on simulators, models, mock-ups, or on shop equipment that is not considered to be plant equipment.
- Table-Top Discussion and Walk Through: a validation method that requires instructions in the technical procedure be talked through step-by-step followed by the steps being walked through in the normal work environment.

Irrespective of the validation method selected for a given procedure, the validation process requires involvement from staff who will be using the procedure, once it is approved. The document author addresses feedback from the validation process and obtains concurrence from individual validators on the dispositions to their comments. Once feedback from the validation process has been incorporated into the procedure, the procedure is circulated for verification.

Verification

Per Section 1.11 of N-PROC-AS-0028, the verification process ensures that documents are correct, meet the intended function, and are usable by a qualified individual [13].

The verifier of a procedure is a person, other than the document author, who is knowledgeable of the system or equipment to which the procedure applies, and qualified to at least the minimum level position necessary to perform the procedure or be considered a system expert. In addition, Section 1.12.2 of N-PROC-AS-0028 identifies requirements for certain Operations procedures to be verified by a Shift Manager or Control Room Shift Supervisor [13]. The document author addresses verifier feedback and obtains concurrence from the verifier on the dispositions to their comments. Once the verifier is satisfied with the contents of the procedure, the procedure is submitted for approval in accordance with N-PROC-AS-0028 [13].

Conclusion:

The conclusion of this Review Task assessment is that there is adequate involvement in the development of procedures by the staff who will use them. The intent of Review Task #11 is met and therefore Pickering NGS is compliant.

4.1.12 Review Task #12: Distribution and Control of Procedures

Evaluate the distribution process for the control, copying and removal of obsolete versions of procedures, so that only the last approved edition is used.

N-PROG-MP-0005, "Configuration Management", ensures that Pickering NGS is operated, maintained, and modified in accordance with the design and licensing basis for the station [56]. Compliance with this program ensures that the physical configuration of the plant matches configuration documents (e.g., procedures) for all states, including normal operation, upset, post-accident, and emergency conditions.

As discussed in Review Task #8, Section 4.1.8, there are various processes (e.g., receipt of new OPEX, changes to assumptions/limitations in safety analysis, or planned modifications to the plant), which may result in the need to revise existing procedures. If required, technical procedures are revised following the process documented in N-PROC-AS-0028. Per Section 1.14.1 of N-PROC-AS-0028, the document owner (or delegate) is responsible for ensuring the final approved technical procedure and procedure reference package is processed through Business Services[12] for issuance, distribution, and retention of the new procedure [13].

The issuance, distribution, and retention of new procedures is managed through OPG-PROC-0178, "Controlled Document Management" [57]. This procedure defines a process for managing the life cycle of controlled documents, including procedures, across OPG in order to:

- Ensure the latest applicable revision of a controlled document is identified and available for use;
- Minimize the risk of inadvertent use of obsolete and superseded documents; and
- Ensure approved Document Change Requests (DCRs) are linked to the applicable controlled documents, maintained, dispositioned, and available.

Per OPG-PROC-0178, prior to initiating work on revising an existing procedure, the document owner submits a request for the latest electronic version of the procedure to be checked out. This ensures that the last approved revision of the procedure is used as the starting point for implementing the required changes as part of the subsequent revision cycle. Following approval of the revised procedure, Business Services will issue the revised procedure in Asset Suite, so that it is available for use. As part of this process, the previous revision of the procedure is set to "Revised" in Asset Suite to mitigate the risk of inadvertent use of an obsolete or superseded procedure [57]. In the infrequent event that the revised procedure needs to be used while the old revision remains at "Issued" status in Asset Suite, Section 1.14.5 of N-PROC-AS-0028 specifies the mitigating actions that are implemented to ensure the latest revision of

[12] Business Services is now called the Information Management Execution Controlled Documents Unit.

the procedure is used in these situations [13]. Paper copies of revised procedures are distributed as required and are limited to essential and operationally significant locations (e.g., Main Control Room) [57].

The risk of staff using an obsolete version of a procedure is further mitigated through direction contained in N-STD-AS-0002 [20]. This standard provides direction to all staff on how to use and adhere to all governance including administrative and technical procedures. Specifically, Step 1.1.4 of N-STD-AS-0002 prompts staff to ensure the procedure they intend to use is the current in-use revision by obtaining it from a controlled copy storage location or confirming the revision in Asset Suite, in accordance with the direction per the usage classification [20].

Conclusion:

The conclusion of this Review Task is that there is a distribution process in place for the control, copying, and removal of obsolete versions of procedures, so that only the last approved edition is used. The intent of Review Task #12 is met and therefore Pickering NGS is compliant.

4.1.13 Review Task #13: Understanding and Acceptance of Procedures

Evaluate audits, self-assessments, safety performance and events to determine whether there is adequate understanding and acceptance of these procedures by managers and staff.

Assurance of adequate understanding and acceptance of procedures is established in part through the delivery of training to staff. N-PROG-TR-0005, "Training" [58], describes the training program for regular staff, contractors, temporary personnel, and other staff assigned work at OPG Nuclear. The training program provides the structure, processes, and tools for defining, developing, implementing, documenting, assessing, and improving the training required to ensure Nuclear staff have the appropriate knowledge, skill, and attitudes for safe and efficient plant operation.

The training program is complemented by the Human Performance program, which is documented in N-PROG-AS-0002 [18]. This program establishes a systematic framework for Human Performance management across OPG Nuclear to achieve higher levels of nuclear and industrial safety, higher unit reliability, and reduced operating costs through event-free operation. Ensuring that there is adequate understanding and acceptance of procedures by managers and staff is a key focus of the Human Performance program. The following aspects of the program are of particular relevance:

- N-PROC-OP-0005, "Pre-Job Briefing and Post-Job Debriefing" [19]
    - Effective pre-job briefs assist in the safe and efficient planning, preparation, and execution of plant activities that operate, maintain, or modify plant equipment.

- N-INS-09030.2-10000, "Event Free Challenge Process" [59]
    - Event free challenge meetings allow a task execution group to perform a final check on its state of readiness just prior to executing a task. Its use is intended for situations where the likelihood and consequence of error are high, to put appropriate defenses/barriers in place to ensure safe execution of work.
- N-STD-AS-0002, "Procedure Use and Adherence" [20]
    - This standard provides direction to all staff on how to use and adhere to all governance including administrative and technical procedures.
- N-INS-09030-10004, "Observation and Coaching" [60]
    - This instruction provides expectations for conducting workplace observations and coaching. It provides a means to reinforce standards of performance (e.g., procedure use and understanding) with a goal of achieving event-free plant operation.

Based on the above, whether there is adequate understanding of procedures by managers and staff can be determined by evaluating the effectiveness of N-PROG-TR-0005 [58] and N-PROG-AS-0002 [18]. Per the Pickering PSR2 Basis Document [1], effectiveness reviews (at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis are conducted for PSR2, using recent audit and self-assessment results. Audit and self-assessment results applicable to N-PROG-AS-0002 [18] are summarized in Section 4.3 and Appendix B of P-REP-03680-00014, "Pickering NGS PSR2 Safety Factor 10 Report: Organization, Management System, and Safety Culture" [26]. P-REP-03680-00014 [26] states that the review of audit and self-assessment findings associated with N-PROG-AS-0002 did not identify any gaps. Similarly, audit and self-assessment results applicable to N-PROG-TR-0005 [58] are summarized in Section 4.3 and Appendix B of P-REP-03680-00016, "Pickering NGS PSR2 Safety Factor 12 Report: Human Factors" [61]. P-REP-03680-00016 states that the review of audit and self-assessment findings associated with N-PROG-TR-0005 did not identify any gaps [61].

Conclusion:

The conclusion of this Review Task assessment is that there is an adequate understanding and acceptance of procedures by managers and staff. The intent of Review Task #13 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

Per Section 2.2 of this report, a detailed compliance assessment for one L/R/C/S with content applicable to Safety Factor 11 is provided in Reference [6]. Associated findings applicable to Safety Factor 11 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Compliance Assessment Results for Safety Factor 11

L/C/R/S Reviewed	PSR2 Compliance Assessment for Safety Factor 11
CSA N286-12, "Management System Requirements for Nuclear Facilities"	There are no PSR2 gaps for CSA N286-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N286-12.

4.3 Audit and Self-Assessment Reviews

The OPG Nuclear Program reviewed for the Procedures Safety Factor is identified in Table 2, and details of the associated audit and self-assessment results for this N-PROG are provided in Appendix B.

In addition, P-REP-03680-00007, "Pickering NGS PSR2 Safety Factor 4 Report: Aging" [62], identified the following information related to the Conduct of Maintenance Program for consideration in this Safety Factor 11 report. Nuclear Oversight conducted a performance based audit, NO-2015-030 [63], of the Maintenance Program in December 2015 for Pickering NGS to determine whether requirements defined in governance are being effectively implemented. The audit concluded that the performance was not fully effective, identifying performance improvement opportunities in the areas of work planning, foreign material exclusion, use of performance improvement tools and staff practices. Four SCRs were initiated to address the findings through implementation of corrective actions. Three have been completed (P-2015-28890, P-2015-28884 and P-2015-28887). The remaining open SCR is related to improvements in foreign material exclusion practices. Associated corrective actions are expected to be completed in Q1 2017, with an effectiveness review in Q2 2017 (SCR P-2015-28880, AR# 28186936).

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 11 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 11 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 11.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [8] are provided in Reference [9]. Findings from the review of Fukushima Action Items are provided in Reference [10]. Results from the Continued Operations Plan and Fukushima Actions Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 11 report that require discussion in other Safety Factor reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 11 were reviewed for the thirteen PSR2 Review Tasks in Section 4.1 of this report and resulted in no Pickering PSR2 gaps. L/R/C/S and OPG Nuclear Program audit and self-assessment reviews for Safety Factor 11 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no Pickering PSR2 gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 11 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 11), which resulted in no Pickering PSR2 gaps.

The review of Safety Factor 11 has confirmed that the Pickering NGS processes for managing, implementing and adhering to operating and working procedures and for maintaining compliance with operational limits and conditions and regulatory requirements are adequate and effective and ensure plant safety.

Appendix B: Audit and Self-Assessment Results

B.1 N-PROG-OP-0001, "Nuclear Operations"

The Nuclear Operations Program for Ontario Power Generation (OPG) Nuclear, encompasses a series of standards and procedures to ensure safety of the public, environment, plant personnel and plant equipment. The program establishes safe, uniform, and efficient operating practices and processes within Nuclear facilities, which provide nuclear professionals the ability to ensure facilities are operated in compliance with the Power Reactor Operating License, Operating Policies and Principles, and other applicable regulations and standards. The Nuclear Operations Program format is based on the operations-related sections of the World Association of Nuclear Operators (WANO) Performance Objectives and Criteria. These sections are:

- Foundations;
- Functional Areas; and
- Cross-Functional Areas.

The Governance and Services section completed a self-assessment in September 2015, BAS15-001424-SA [B.1.1], in order to assess the health of the Nuclear Operations Program governance framework, which is applicable for both Pickering and Darlington NGS. No findings/SCRs were generated from this self-assessment, however it was recommended to initiate a DCR in order to reference Canadian Standards Association (CSA) N286-12, "Management System Requirements for Nuclear Facilities" which has since been completed.

The Operations and Maintenance division completed a self-assessment in August 2015, P15-000134-SA [B.1.2], of the Common Services Department Conduct of Operations at Pickering NGS (e.g., review of Common Services operator behaviours as well as an evaluation of Supervising Nuclear Operators ability to provide effective task oversight). It was concluded that the operations team, operators, and supervising nuclear operators completed routines and tasks in accordance with OPG governance. No SCRs were generated as a result of this self-assessment.

Nuclear Oversight conducted a performance based audit which assessed the effectiveness of Pickering NGS' conduct of field operations against the requirements of N-PROG-OP-0001, "Nuclear Operations", in March 2015 (NO-2015-001) [B.1.3]. The audit concluded that the performance was not fully effective, identifying performance improvement opportunities in the area of monitoring and reinforcement of operator fundamentals for routine tasks. One SCR was initiated to address the above finding (SCR P-2015-05319), which required corrective actions to be implemented. All of the necessary corrective actions associated with this SCR have been completed and the underlying issues have been addressed.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 12, *Human Factors* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 12 were reviewed for the eight PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 12 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 12 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 12).

The results of the review of Safety Factor 12 are discussed in Section 5.0. The review has confirmed that the various human factors that may affect the safe operation of Pickering NGS have been appropriately addressed. As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence.

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Human Factors Safety Factor 12 is to: "evaluate the various human factors that may affect the safe operation of the nuclear power plant and to seek to identify improvements that are reasonable and practicable." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant." For this Safety Factor 12 Report, the objective is to confirm that the various human factors that may affect the safe operation of Pickering NGS have been appropriately addressed. Per the Pickering PSR2 Basis Document [1], analysis of gaps and potential safety enhancements for Pickering NGS (including identification of improvements that are reasonable and practicable to implement) is addressed as part of the Global Assessment process. Preparation of a plan for the implementation of safety enhancements is addressed by the PSR2 Integrated Implementation Plan.

This report documents the results of the review of Safety Factor 12 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 12 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 12 Review Tasks are:

1) Confirm that there are procedures to ensure that a minimum number of qualified staff, appropriate to the operating state of the plant, is available at all times.

2) Confirm that adequate staff training facilities, training staff and training programs exist.

3) Confirm that the method of selecting staff for new positions and for promotions involves systematic and validated staff selection methods and a method for succession planning.

4) Confirm that there are appropriate programs for initial, refresher, and upgrade training. For operating staff, this should include the use of simulators.

5) Establish that there is training in safety culture, including for management staff, that includes work supervision practices and internal communication practices and expectations.

6) Confirm there are fitness for duty guidelines relating to hours of work, health and substance abuse.

7) Confirm that the human–machine interface is considered in the design of the control room and other workstations, that analysis of human information requirements and task workload is performed, and that there is linkage to the Probabilistic Safety Assessment, Deterministic Safety Analyses and Hazard Analysis. This review should include a discussion of how guidance such as U.S. NRC NUREG-0700 Revision 2, "Human-System Interface Design Review Guidelines" [6], and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model" [7], identified in CNSC REGDOC-2.5.2 are relevant to the design of Pickering Units 1,4 and Units 5-8. (Note: Review Task #7 is addressed in the Plant Design Safety Factor report.)

8) Confirm the style and clarity of procedures provides an appropriate level of detailed guidance for staff through a review of plant events identifying inadequate procedures as a contributing cause.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this Report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Human Factors Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 12 L/R/C/S reviews are incremental in nature. The definition of an Incremental Review is as follows:

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in Appendix B of Reference [8]. Associated findings will be summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Human Factors Safety Factor 12

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
Additional L/R/C/Ss						
1	CNSC G-323	Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement	2007	10, 12	Incremental	G-323 addressed as part of Darlington ISR.
2	CNSC G-278	Human Factors Verification and Validation Plans	2003	1, 12	Incremental	G-278 addressed as part of Pickering B and Darlington ISRs.
3	CNSC G-276	Human Factors Engineering Program Plans	2003	1, 12	Incremental	G-276 addressed as part of Pickering B and Darlington ISRs.
4	CSA N290.12	Human Factors in Design for Nuclear Power Plants	N290.12-14	1, 12	Incremental [3]	N290.12 not addressed as part of Pickering B or Darlington ISRs. OPG has completed a gap analysis against mandatory requirements of N290.12.

[3] Per CNSC's request in P-CORR-03680-0607223, "Pickering PSR2 – Change to Review Type for CSA N290.12" [9], the Review Type for CSA N290.12-14 was changed from High Level to Incremental.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 12 is listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Program Reviewed for Safety Factor 12

Document Number	Document Title
N-PROG-TR-0005 [10]	Training

2.4 Additional Reviews

The PSR2 Safety Factor 12 Report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 12):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 12 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 12 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [11] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 12 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

---

4 The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Human Factors Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 12 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[5]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where an L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

[5] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 12 L/R/C/S reviews identify Compliances and Gaps as defined below:[6]

- Compliance:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met. (Note: No High Level reviews were performed as part of Safety Factor 12.)
    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 12.)
- Gap:

[6] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.

- Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met. (Note: No High Level reviews were performed as part of Safety Factor 12.)

- For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 12.)

The reviews assume that use of the word:

- “Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC “Type I” and “Type II” inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance. As a result, the broad review scope of program audits focuses on identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [12]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 12):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 12 (as identified in the Darlington ISR Integrated Implementation Plan [13] and Pickering Units 5-8 Continued Operations Plan [11]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[7]

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 12 review which need to be addressed in other Safety Factor Reports are also discussed.

---

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG’s nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 12 Review Tasks.

4.1.1 Review Task #1: Procedures to Ensure Minimum Number of Qualified Staff

Confirm that there are procedures to ensure that a minimum number of qualified staff, appropriate to the operating state of the plant, is available at all times.

P-INS-09100-00003, "Pickering Minimum Shift Complement" [14] is the procedure that defines the Minimum Shift Complement (MSC) staffing requirements to ensure safe conditions are maintained during normal operations along with the capability to be able to respond to all station emergencies. Per P-INS-09100-00003 [14], MSC is the minimum number of qualified workers who shall be present at all times to ensure the safe operation of the Pickering facility, respond to all credible events, and to ensure adequate emergency response capability for the most resource intensive conditions. P-INS-09100-00003 [14] is written to comply with CNSC guidelines G-323, "Ensuring the Presence of Sufficient Qualified Staff at Class I Nuclear Facilities – Minimum Staff Complement" and G-278, "Human Factors Verification and Validation Plans".

The MSC for the Operations Work Group (Shift Management Team and Operators), Emergency Response Team (Emergency Response Management, Maintenance, Chemistry, Stores), and the Emergency Response Organization (ERO) (Emergency Response Management, Shift Management, Operations, Maintenance, Fuel Handling, Plant and Resource Coordinators) is defined in Tables 1-1, 1-2, and 1-3 of P-INS-09100-00003 [14], respectively.

P-INS-09260-00008, "Duty Crew Minimum Complement Assurance" [15], defines the responsibilities and processes to ensure that the MSC according to P-INS-09100-00003 [14] is met, as well as the correct use and updating of the local area network based Minimum Complement Compliance Program (MCCP), which is used to ensure MSC is met. The instruction defines: actions required when below complement, duty crew accounting, absence reporting, "step-up" (i.e., designating a temporary (but qualified) change in work group or ERO assignment), Minimum Availability Requirement (MAR), emergency role qualification, and position assignments.

Per N-PROG-OP-0001, "Nuclear Operations [16]," the Director of Operations and Maintenance – Operations (DOM-O) is accountable for ensuring qualified competent staff are in place to implement requirements of the Nuclear Operations program.

N-INS-03490-10003, “Minimum Shift Complement Resources, Qualifications and Procedures Required for Responding to Resource Limiting Events” [17], provides instructions to ensure that procedures and qualifications linked to the MSC are maintained such that Pickering NGS remains compliant with the MSC. Table 1 of N-INS-03490-10003 [17] lists the Training and Qualification Documents (TQDs) associated with MSC staff qualification requirements.

Training, qualification and certification processes for control room and certain field positions ensure that the staff is competent to perform the functions assigned to them. The simulator is used extensively for initial training and qualification, as well as for refresher / requalification training. Per N-INS-08920-10002, “Simulator-based Initial Certification Examinations for Shift Personnel” [18], Simulator Exercise Guides are used as part of training for certified staff. Trainees are assessed per N-INS-09110-10059, “Simulator Performance Observation and Crew Critiques” [19].

N-TQD-503-00001, “Nuclear Emergency Response Organization Training and Qualification Description” [20], lists the qualification requirements for staff required to fill ERO roles in the event of an emergency. Appendix A of N-TQD-503-00001 [20] lists the Radiation Protection qualification requirements for each ERO position.

Conclusion:

The conclusion of this Review Task assessment is that OPG has programs and procedures in place to ensure that minimum staffing levels of qualified staff are available for all modes of operation. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Adequate Staff Training Programs and Resources

Confirm that adequate staff training facilities, training staff and training programs exist.

OPG Program N-PROG-TR-0005, “Training” [10], describes the Training Program for regular staff, contractors, temporary personnel and other staff assigned work at OPG Nuclear. The Training Program provides the structure, process and tools for defining, developing, implementing, documenting, assessing, and improving the training required for nuclear staff. The Training Program equips staff with the appropriate knowledge, skills, and attitude for safe and efficient plant operation. Training is also used to minimize the impact of plant operation on the environment, health and public safety, and to drive human performance improvements. The program describes structure and content of Nuclear Training governing documents. The structure of training program governance is presented in the figure below.

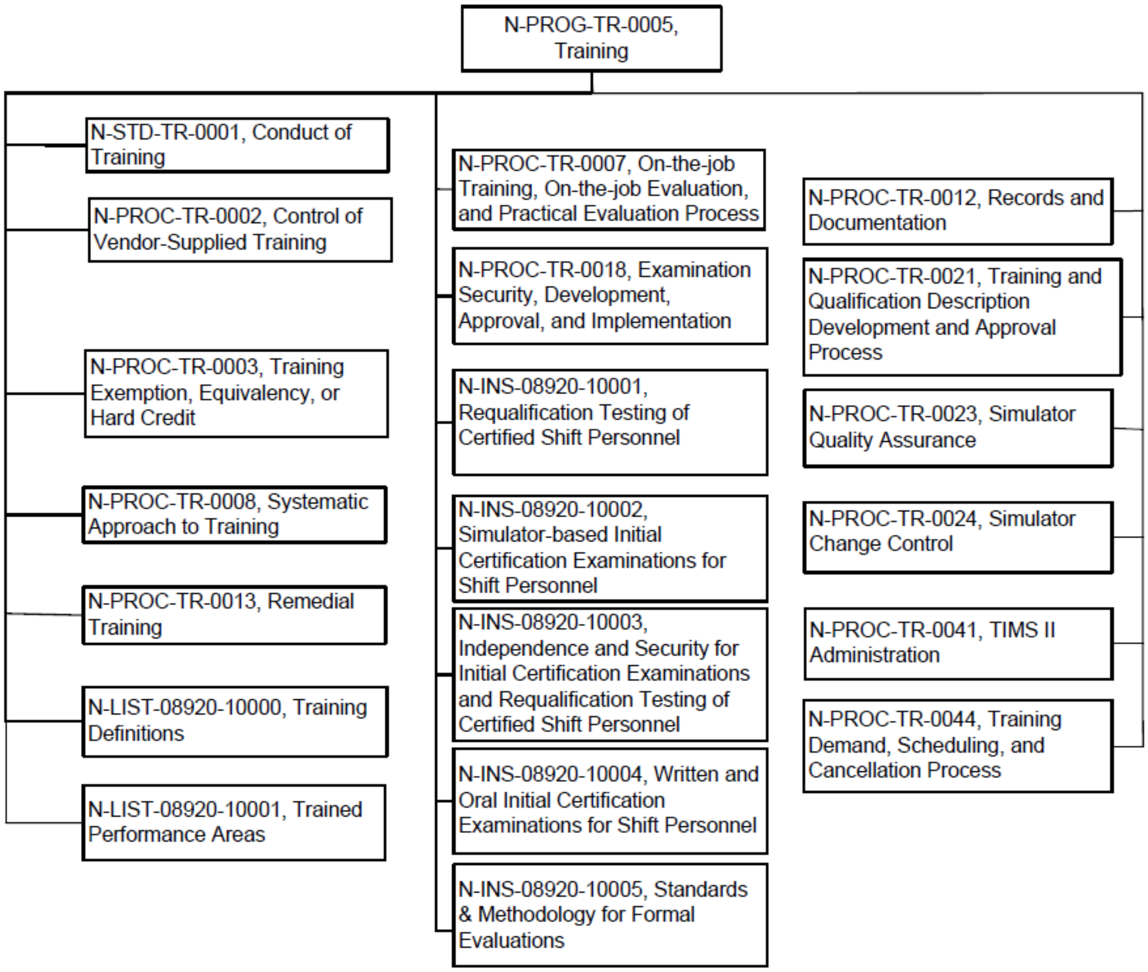

Figure 1: Nuclear Training Program Governing Documents (Per N-PROG-TR-0005 [10])

In general, Nuclear Training Program content originated from the following sources:

- CNSC objectives and criteria for regulatory evaluations of training, licence conditions, and applicable standards;
- World Association of Nuclear Operators;
- United States Department of Energy Training Handbooks and Guides to Good Practices;
- Institute of Nuclear Power Operations; and
- Training procedures used at other nuclear power generating utilities.

Training governing documents define the following:

- Formal training standards and processes;
- Systematic approach for analysis of potential training opportunities and design, development, delivery, evaluation and revision of quality training;
- Requirements for qualifying staff to meet performance expectations, improve job performance and operational efficiency;
- Qualification tracking and maintenance process; and
- Training material filing, and maintenance requirements.

To facilitate its training program, Pickering NGS makes use of various training facilities (both on-site and off-site), including the simulator, the Pickering Learning Centre, facilities at the University of Ontario Institute of Technology and conference centres.

OPG Procedure, N-PROC-TR-0021, "Training and Qualification Description Development and Approval Process" [21] provides requirements for developing, approving, revising, and implementing the TQDs and Qualification Guides (QGs).

TQDs associated with specific performance areas are listed in N-LIST-08920-10001, "Trained Performance Areas" [22]. The list indicates the:

- Organization responsible for supporting the associated training; and
- TQDs that form part of the Major Trained Performance Areas.

The Manager, Training, Planning and Design, is required to approve the TQDs included in N-LIST-08920-10001 [22].

OPG Procedure N-PROC-TR-0008," Systematic Approach to Training" [23], provides the process used to identify potential training changes, to confirm training requirements through training needs analysis, to specify specific training requirements through job and task analysis, and to design, develop, implement, and evaluate training. The procedure describes the following processes:

- Communication of a perceived training need to the Training organization;
- Analysis of a perceived training need;
- Design, development, implementation, and evaluation of training to support proper job performance and individual development;
- Linkage of training to conditions, scope, complexity, actions, and standards associated with job performance expectations; and
- Incorporation of operating experience into training.

The standard, N-STD-TR-0001, "Conduct of Training" [24], identifies specific accountabilities when implementing Training Programs. The standard provides general requirements for a Trainer and describes requirements and accountability for implementing Nuclear Training. The Trainer collectively refers to contract, temporary, Subject Matter Expert, or trainer who delivers nuclear training programs presented in the TQDs listed in N-LIST-08920-10001 [22]. Trainers should be qualified in accordance with N-TQD-602-00001, "Nuclear Trainer Training and Qualification Description" [25].

Training effectiveness, quality, and efficiency is optimized through prudent use of trainers, facilities, equipment, and training technologies to ensure the following:

- Facilities and training methods are appropriate for the type of learning involved and level of proficiency required;
- Training schedules are issued in a timely manner;
- Training is integrated with other Nuclear work programs to provide a complete overview of resource availability and allocation; and
- Personnel attend training at scheduled times.

N-PROC-TR-0002, "Control of Vendor-Supplied Training" [26], establishes requirements, processes, and accountabilities for control of training developed by Vendors and training delivered by Vendors within OPG Nuclear premises and externally. This procedure addresses the following:

- Vendor instructor capabilities and qualifications to instruct OPG Nuclear staff; and
- Requirements for review, verification, and acceptance of Vendor-supplied training prior to and after training delivery.

N-INS-08920-10001, "Requalification Testing of Certified Shift Personnel" [27], provides instruction for:

- Requirements for requalification tests that OPG Nuclear Certified Shift Personnel will have successfully completed when seeking renewal of certification, in accordance with Class I Nuclear Facilities Regulations;
- Processes that OPG Nuclear will follow in developing, conducting and grading written and simulator-based requalification tests that demonstrate that Certified Shift Personnel have retained the knowledge and skills required to work competently in their assigned positions; and
- Ensuring requalification tests are administered in a consistent manner and in accordance with requirements endorsed by the CNSC.

OPG employs an electronic management system, Training Information Management System, Version II (TIMS II) (N-PROC-TR-0041, "TIMS II Administration" [28]) to assist with administration of training support functions. This system ensures consistent, high quality training is efficiently and effectively delivered, documented, and archived as evidence of worker qualification status.

OPG Procedure, N-PROC-TR-0044, "Training Demand, Scheduling and Cancellation Process" [29], describes the process for planning and scheduling training using TIMS II to streamline scheduling functions. With respect to adequacy of training resources, including training facilities, this procedure requires that the Training Managers, Nuclear Programs and Training:

- Ensure training plans are consistent with the 5-year business plan;
- Ensure adequate delivery resources to support training schedules;
- Ensure Business Unit Line Management is informed of any shortfalls;
- Approve and communicate short-term modifications; and
- Develop a draft training schedule based on training demand, trainer availability and training facility availability.

The "Health of Training" reports for trained performance, described in N-PROG-TR-0005 [10], are produced quarterly and assess training quality and effectiveness based on the following objectives:

- Objective 1: Training for Performance Improvement;
- Objective 2: Management of Training Processes and Resources;
- Objective 3: Initial Training and Qualification;
- Objective 4: Continuing Training;
- Objective 5: Conduct of Training and Trainee Evaluation; and
- Objective 6: Training Effectiveness Evaluation.

OPG Instruction N-INS-08920-10017, "Training Committees" [30], provides training oversight requirements of the Nuclear Training Oversight Committee, Training Councils, Training Program Review Committees, and Curriculum Review Committees (CRC).

The "Health of Training" reports are discussed during quarterly Training Program Review Committee meetings for each major training performance area. These meetings are attended by senior management for the specific performance area and held with the following objectives (example of Engineering Performance Area):

- Define Initial and Continuing Training Programs;
- Provide oversight of the Training Program effectiveness and training efficiencies;
- Review and evaluate new training requests from the CRCs;
- Review the "Health of Training" report to ensure action plans address identified risks or weaknesses;
- Review and approve recommendations to Training and Line Management concerning training curricula, content, and schedules for initial and continuing training;
- Ensure that training program impact assessments adequately address changes from industrial guidelines, regulatory requirements, internal procedures and processes, plant modifications, organizational changes affecting roles and responsibilities, Operating Experience (OPEX), or emerging performance shortfalls;
- Ensure consistency between sites;
- Review impact of proposed TQD/QG changes to staff indicators and the need for a communication plan for significant changes;
- Review and approve changes to TQDs and changes to QGs that affect more than one CRC;
- Ensure line support is provided to review TQD/QGs per governance;
- Ensure sufficient number of qualified staff are in place to support safe operation and outage programs;
- Determine if supporting CRCs are required; and
- Oversee deliverables from CRCs.

Conclusion:

The conclusion of this Review Task assessment is that OPG has processes and oversight in place to confirm that adequate staff training facilities, training staff and training programs are available. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Staff Selection and Succession Management

Confirm that the method of selecting staff for new positions and for promotions involves systematic and validated staff selection methods and a method for succession planning.

Staff Selection

As mentioned in the addendum to the Darlington ISR (NK38-REP-03680-10080-ADD-001 [31]) the staff selection processes at OPG follow proven, validated, industry standard methods. These processes have been created and improved over many years of experience by Human Resources professionals in conjunction with reviews of industry methods. Interviews, reference and performance checks, as well as (in some instances where necessary) performance testing are used as part of the selection process. Below are a few examples of procedural documents for the hiring of specific staff:

- Maintenance Trades: N-INS-08930-10001 R000, "Hiring of Maintenance Trades";
- Operators: N-INS-08930-10002 R001, "Nuclear Operator Hiring Process"; and
- New Graduate Engineers: N-INS-08930-10003 R000, "New Graduate Engineer Hiring Process".

For management positions Stratum IV and above (nominally department managers and higher) role documents are in place, which outline managerial requirements for the role and identify key role accountabilities. The information in the role documents, N-MAN-08131-10000 (multiple sheets) [32], is used as a source of selection criteria for these management positions. Additionally, OPG has a leadership model which identifies expected behaviours of all employees at each level of the organization. These behaviours are also integrated into selection/training programs and for management staff, they are integrated into performance measurement and succession processes. Selection criteria for these roles may reference both governance and other OPG documentation, including: Job Documents (Job Evaluation System), Role Documents (Nuclear Governance), Job Family and Leadership Training Qualification Descriptions, and the OPG Leadership Model.

Selection of individuals to fill licenced positions is based on the guide, N-GUID-08930.12-10000, "Nuclear Operator Recruitment Guide" [33]. This document is classified as confidential and therefore further details from this guide are not provided here. The authorized training program applies for the selected individuals to fill the licenced positions.

Nuclear Operators are hired per N-INS-08930-10002, which describes the process for internal and external hiring of Nuclear Operators in Training (NOIT). Qualified applicants are invited to perform the standardized ability tests (which are developed by an external company) and subsequently attend candidate interviews. For

Maintenance Trades, staff are hired per N-INS-08930-10001, which describes the requirements for the sourcing and selection process for Electrical & Control Technicians, Mechanical Technicians, and both external and internal Apprentice positions. Similar to recruiting for NOIT, qualified candidates perform standardized testing and interviews.

At OPG, job descriptions identify role specific knowledge and skills. Individuals recruited to these roles bring the identified knowledge and skills and/or are provided training as documented in Training Qualification Descriptions (TQDs) and Qualification Guides (QGs). Prior to being assigned independent work, needed training is required and individuals must be deemed competent by their supervisor. The procedure N-PROC-TR-0021 [21], provides requirements for developing, approving, revising, and implementing the TQDs and QGs. TQDs identified in N-LIST-08920-10001 [22], and supporting QGs, reside within the N-PROC-TR-0021 [21] framework. TQDs and QGs document entry-level, initial and continuing training requirements.

The new hire engineering support training is intended to support the continued availability of trained and competent staff for technical positions within Engineering. N-TQD-403-00001, "Nuclear Engineering Support Personnel Training and Qualification Description" [34], provides the education background requirement for the new hire engineering support as engineering graduates or equivalent. Once recruited, the new hires are required to go through a structured training program (per N-PROC-TR-0008 [23]). The program is based on what a new graduate engineer needs to know to work at a nuclear power plant. There are initial and continuing training elements which apply to all Engineering Support Personnel as well as Duty Area elements which are specific to the different positions within Engineering. Completion of the qualifications required to perform work independently in the different engineering departments varies and could take a number of years.

Professional Engineer (P. Eng.) accreditation is stated as necessary for the specific activities identified in Appendix A of N-LIST-01300-10000, "Bounded Document Set" [35].

Training and qualification description documents are also available for Operations and Maintenance staff. New hires perform training per their training schedule. N-LIST-08920-10001 [22] identifies the list for trained performance jobs (i.e., performance areas in the training program), and supporting QGs reside within the N-PROC-TR-0021 [21] framework. These TQDs and QGs include but are not limited to:

- Authorized Nuclear Operator;
- Control Room Shift Supervisor;
- Fire protection;
- Health Physicist;
- Security;

- Shift Manager/Control Room Shift Supervisor;
- Trainer;
- Unit 0 Control Room Operator;
- Welder, welding operators, brazers, and examination personnel; and
- Maintenance.

Succession Management

The Succession Planning process at OPG is described on the OPG Powernet Human Resources page. As required by the Charter of the OPG Compensation, Leadership and Governance committee of the Board of Directors, OPG reports, at least annually, on key elements of OPG's workforce profile, talent recruitment and retention strategies, and succession plans for the President and CEO, Direct Reports to the CEO, and Nuclear senior management positions. This reporting is achieved through an annual enterprise-wide succession and talent management process that includes a talent review process, which assesses and calibrates individual performance and potential. This information is used as a source for succession planning processes, where identification of Ready Now, Ready Short and Ready Long Term successors are identified for key roles, and needed development actions are identified to close gaps to readiness. Leaders utilize a Succession Planning Toolkit (including reviews, individual development plans and other tools as required) to satisfy both the corporate requirements and to support them in local succession planning efforts. In the Nuclear Business Unit of OPG, an integrated, functionally based succession planning process is in place for key roles across Nuclear Operations and Nuclear Projects. This process is facilitated by Human Resources and succession activities are implemented by Nuclear Peer teams, including the Nuclear Executive Committee.

OPG also has a program titled ACCELERATE, which is designed to develop and accelerate the development of a pipeline of "Ready Now" employees for future leadership roles. The program is intended to address the development interests of a small portion of OPG's talent pool, specifically those who aspire to leadership roles two or more levels higher. More information on the program is available via OPG Powernet or in the OPG 2014 Sustainable Development Report found on the OPG public website [36].

Within the Engineering disciplines, N-GUID-00130-10002, "Guide for Engineering Knowledge Retention" [37] supplements the OPG Succession Planning process by providing a strategy for identifying any current risk areas for each Engineering Department, and the degree of effectiveness and possible improvements for retaining the necessary knowledge within the department through effective knowledge transfer.

Conclusion:

The conclusion of this Review Task assessment is that OPG has methods of selecting staff for new positions and promotions involving systematic and validated staff selection methods. OPG also has a systematic method in place for succession planning. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Initial, Refresher and Upgrade Training

Confirm that there are appropriate programs for initial, refresher, and upgrade training. For operating staff, this should include the use of simulators.

OPG Procedure N-PROC-TR-0021, "Training and Qualification Description Development and Approval Process" [21], provides requirements for developing, approving, revising, and implementing the TQDs and QGs. The TQDs and the QGs document entry-level, initial and continuing training requirements.

TQDs contain details of training stages and requirements for each stage as follows:

- Initial Training: introduce and develop job related knowledge, skills, and performance standards, preparing personnel to independently perform assigned duties and tasks; and

- Continuing Training: used to maintain and enhance knowledge and skills, and address areas such as plant equipment and procedure changes, infrequently used and difficult skills, knowledge and skills weaknesses, and lessons learned from operating experience. Continuing training may also provide refresher type training at a specified frequency, and may be required to maintain qualified status.

Continuing training is developed in accordance with N-INS-08920-10021, "Continuing and Requalification Training- Curriculum Development and Implementation Process" [38]. Annual continuing training requirements, including impact on qualification status, are presented in the TQD. These requirements include reference to any existing continuing training plan. The continuing training meets the needs of both refresher and upgrade training.

OPG instruction document N-INS-08920-10002, "Simulator-Based Initial Certification Examinations for Shift Personnel" [18], provides specific instructions on the application of IAEA- EG2, "Competency Assessments for Nuclear Industry Personnel" [39], for initial CNSC certification, which includes:

- Processes for planning, developing, conducting and grading simulator-based certification examinations;

- Examination follow-up activities including processes for dealing with passes, conditional passes, and appeal of examination results; and

- Requirements, criteria and guidelines for administering simulator-based initial certification examinations in an equitable and consistent manner.

As discussed in Section 4.1.2 for Review Task #2, OPG instruction document N-INS-08920-10001, "Requalification Testing of Certified Shift Personnel" [27], provides requirements for requalification tests that OPG Certified Shift Personnel must successfully complete when seeking renewal of certification. The instruction also identifies processes that OPG follows in developing, conducting and grading written and simulator-based requalification tests that demonstrate that Certified Shift Personnel have retained knowledge and skills required to work competently in their assigned positions.

Remedial Training (N-PROC-TR-0013 [40]) and re-take of training is required for trainees not meeting pass criteria for Training and Qualification programs for OPG Nuclear. Remedial training notification requirements for failures that occasionally occur during re-certification of authorized staff are identified in N-INS-08920-10001, "Requalification Testing of Certified Shift Personnel" [27].

As mentioned in the discussion of Review Task #2 (Section 4.1.2), OPG Procedure N-PROC-TR-0008, "Systematic Approach to Training" [23], provides the process used to identify potential training changes. Systematic Approach to Training (SAT) confirms training requirements through training needs analysis; it also designs, develops, implements, and evaluates training. The objective of SAT is to guide the development of performance based training to support job performance requirements, and individual development at OPG Nuclear.

The "Health of Training" reports are used to assess training quality and effectiveness and are reviewed at both the site and Nuclear executive levels. The governance for these reports, and the scope and objectives of the review, are described in the discussion of Review Task #2 (Section 4.1.2).

Conclusion:

The conclusion of this Review Task assessment is that OPG has programs for initial, refresher and upgrade training. OPG also has training programs for operating staff that use simulators, as well as simulator-based examinations. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Training in Safety Culture for Management Staff

Establish that there is training in safety culture, including for management staff, that includes work supervision practices and internal communication practices and expectations.

The Board of Directors and the Chief Nuclear Officer (CNO) take an active role in communicating the importance of safety. This is demonstrated through OPG's Nuclear Safety Policy, N-POL-0001 [41]. The policy states:

> *"Nuclear Safety shall be the overriding priority in all activities performed in support of OPG nuclear facilities. Nuclear Safety shall have clear priority over schedule, cost and production."*

N-CHAR-AS-0002, "Nuclear Management System" [42], gives authority to the nuclear safety processes and defines responsibilities. It specifies that the CNO is accountable for:

> *"The effectiveness of the overall Management System in ensuring our Nuclear facilities are operated and maintained using sound Nuclear safety and defense-in-depth practices to ensure radiological risks to workers, the public, and environment are as low as reasonably achievable, and in keeping with the Nuclear Safety Policy, and the best practices of the international Nuclear community."*

OPG Charter N-CHAR-AS-0002 [42], describes the nuclear quality program, while N-STD-AS-0020, "Nuclear Management Systems Organization" [43], outlines its implementation. Additional guidance is given in N-PROG-OP-0001, "Nuclear Operations" [16], N-PROG-MA-0004, "Conduct of Maintenance" [44], and N-PROG-MP-0007, "Conduct of Engineering" [45]. N-TQD-601-00001, "Leadership and Management Training and Qualification Description" [46], provides qualification requirements for supervisors and managers which includes "Safety Culture for Managers".

Managers ensure that tasks are executed as defined through N-PROG-AS-0002, "Human Performance" [47]. This program establishes a systematic framework for Human Performance management across OPG to achieve higher levels of nuclear and industrial safety, higher unit reliability, and reduced operating costs through event-free operation. This is accomplished through pre-job briefings, post job debriefings, self-checking programs, independent verification, communications, self-assessments, and an observation and coaching program.

OPG Standard N-STD-OP-0012, "Conservative Decision-Making" [48], derives its authority from the Human Performance program and specifically states in Section 1.2.4, "Safety shall remain the number one priority ahead of production or cost."

OPG Program N-PROG-TR-0005 [10] describes the training program for regular staff, contractors, temporary personnel, and other staff assigned to OPG Nuclear. The program also includes the structure and tools for developing and implementing the training required to ensure safe and efficient plant operation.

Overall nuclear safety is emphasized through various forums, ranging from specific reactor safety seminars to reviews of relevant OPEX.

Effective Pre-Job and Post-Job Briefs assist in the safe and efficient planning, preparation and execution of activities that directly or indirectly operate, maintain or modify an OPG generating facility. A formal process is defined in N-PROC-OP-0005, "Pre-Job Briefing and Post-Job Debriefing" [49].

Nuclear Safety is also emphasized through instillation of a questioning attitude in all staff. For tasks with novel content, additional requirements are specified in N-PROC-OP-0001, "Conduct of Infrequently Performed Tests or Evolutions" [50].

The following are a list of procedures that define management expectations in regards to safety:

- N-STD-OP-0036, "Operational Decision-Making", provides principles for effective operational decision making and a systematic approach for the application of these principles enabling operational decisions that support safe and reliable plant operation, both in the near and long term. Conservative decision-making is one of the event-free tools used during operational decision-making;

- The tools for rigorous and prudent approach are all documented in N-PROG-AS-0002, "Human Performance" [47], and in N-STD-AS-0002, "Procedure Use and Adherence" [51]; and

- Detailed guidance on the importance of precise communication and tools for implementation are described in N-STD-OP-0002, "Communications" [52].

Each level of supervision has a generic position qualification supplemented by specific qualifications necessary for the specific position. Expectations on supervisory aspects of a position, and training for those expectations are contained in leadership training courses.

The Leadership and Management Training Program qualification requirements are documented in N-TQD-601-00001, "Leadership and Management Training and Qualification Description" [46]. Appendix A of N-TQD-601-00001 outlines the program elements that each level of supervision must pass to be qualified in their position.

Embedded in each supervisor, manager, and director qualification is the requirement to complete training as follows:

- Safety Culture (all management levels), PEL 65556: Provides training to managers focusing on the accountability of managers to ensure there is a strong and healthy safety culture within their work group [54]. It looks at Safety Culture from three different perspectives: the individual, the manager and the organizational framework. The training is provided to managers to enable them to demonstrate the behaviours and accountabilities of a Nuclear Supervisor in accordance with N-POL-0001, "Nuclear Safety Policy" [41] (as mentioned in N-OVH-65556-00001 R013, "Nuclear Safety Culture for Managers" [55]). This training is a full day in length and is provided to participants in a classroom setting.

- First Level Management Program Parts 1 and Part 2 (all management levels): Both Part 1 and Part 2 courses are provided to all management levels in a classroom setting. Aspects of the training courses highlight OPG's values and behaviours, such as observing for traits of a healthy nuclear safety culture in OPG staff [56].

- Middle Management Program (Department Managers).

These courses contain training on the tools supervisors use to maintain a safe workplace and to reinforce the expected behaviours in the workforce that reflect a strong Safety Culture. For example, the event free tools are explicitly covered. In addition, specific methods of communicating messages from Senior Management to staff are included in management training. Communication methods covered through the training for management include items such as briefing notes from Managers, roll-outs of new or revised procedures and important items of general concern.

Additionally, supervisors and managers participate in the annual Leadership Continuing Training program [46]. The program has two components. The first is the Leadership Skills Continuing Training (QUAL 35544), which is an annual workshop that contains skill refresher training. There are a total of three workshops and one is completed each year; after the third year, the workshop cycles back to the Year 1 workshop. The second component of the annual Leadership Continuing Training program is Significant Operating Experience Report (SOER) 10-2 Leadership Continuing Training (QUAL 32104) [46]. A self-study Computer Assisted Learning (CAL) module is completed each year. Similarly to the leadership skills workshops, there are a total of three modules; one CAL is completed each year for three years and will cycle back and restart at the Year 1 CAL.

Managers may also attend the Nuclear Professional Development Seminar (NPDS) training or Senior Nuclear Plant Manager (SNPM) training, both of which have the following course objectives:

- Enhancing supervisors ability to: identify, analyze and solve leadership issues encountered in nuclear plants; sustain and strengthen job performance; and integrate lessons learned into plans to improve self, staff and the department; and

- Identifying the behaviours and attitudes that demonstrate valuing a positive safety culture.

Training is provided in safety culture traits, practices and expectations as well as the expectations and behaviours that support work supervision practices. This includes communication skills and expectations. However, safety culture is embedded in many processes and cuts across all functions and organizational levels. Safety culture is addressed more broadly in Safety Factor 10 Report; in this Review Task, the focus is on management training in safety culture since management are accountable for ensuring that all staff contribute to a positive safety culture.

Conclusion:

The conclusion of this Review Task assessment is that there is training in safety culture, including for management staff, that includes work supervision practices and internal communication practices and expectations. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Fitness for Duty Guidelines

> *Confirm there are fitness for duty guidelines relating to hours of work, health and substance abuse.*

Section 1.5.2 of N-CHAR-AS-0002, "Nuclear Management System" [42], identifies expectations with respect to Fitness for Duty. It requires that the Fitness for Duty expectations be communicated to all staff through "Human Resources Overview" training and adherence to the Corporate Safety Rules [57] (under Common Safety Rule 1.2).

All supervisors in OPG Nuclear are required to complete a training course on the Continuous Behaviour and Observation Program, N-CMT-62808-00001 [58]. This program trains supervisors to detect people not fit for duty, by developing awareness to recognize and respond to behaviours, including drug and alcohol abuse that may include a risk to the security, safety or health of employees, facilities and the public. It trains supervisors to be aware, through direct observation of changes in the behaviours of their employees, to assess the risk that is posed by these changes and to respond accordingly to the potential risk.

For all OPG Nuclear staff, Nuclear General Employee Training reinforces Fitness for Duty expectations.

With respect to individual employee awareness of fitness for duty, OPG's expectations are well understood. Health and Safety principles are outlined in the Business Code of Conduct and fitness for duty is documented in both the Corporate Safety Rules and the Nuclear Operations & Maintenance Handbook.

Limits to the hours of work for OPG Nuclear employees are identified in Appendix A of N-PROC-HR-0002, "Limits of Hours of Work" [59], which is compliant with the Employment Standards Act (ESA) and the expectations of the CNSC. N-PROC-HR-0002 [59] identifies the process for monitoring and controlling the hours of work for OPG Nuclear employees. OPG Nuclear is required to meet both the regulatory expectations of the CNSC, requirements of the ESA, Ontario and Collective Agreement provisions regarding hours of work. Through N-PROC-HR-0002 [59], the hours of work for OPG Nuclear employees are controlled, monitored, reported, and assessed for compliance to both the legislative requirements, as well as the CNSC expectations. The individual assigning work is made aware of the hours worked by the person receiving the assignment and identifies what limits are applicable to the employee. Ongoing monitoring of hours worked is required to ensure that limits are not exceeded.

Conclusion:

The conclusion of this Review Task assessment is that adequate guidance is in place relating to hours of work, health and substance abuse. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Design for Human-Machine Interfaces

Confirm that the human–machine interface is considered in the design of the control room and other workstations, that analysis of human information requirements and task workload is performed, and that there is linkage to the Probabilistic Safety Assessment, Deterministic Safety Analyses and Hazard Analysis. This review should include a discussion of how guidance such as U.S. NRC NUREG-0700 Revision 2, "Human-System Interface Design Review Guidelines" and NUREG-0711 Revision 2, "Human Factors Engineering Program Review Model" identified in CNSC REGDOC-2.5.2 are relevant to the design of Pickering Units 1,4 and Units 5-8.

Review Task #7 is addressed in the Pickering PSR2 Plant Design Safety Factor report.

4.1.8 Review Task #8: Style and Clarity of Procedures

Confirm the style and clarity of procedures provides an appropriate level of detailed guidance for staff through a review of plant events identifying inadequate procedures as a contributing cause.

OPG Standard N-STD-AS-0014, "Requirements for Technical Procedures" [60], specifies requirements for the structure, minimum content, and format of technical procedures. Compliance with this standard is enforced through the use of approved instructions and templates for preparation of procedures. This standard ensures that the technical procedures developed and used throughout OPG Nuclear facilities:

- Promote safe and efficient operation;
- Reflect industry best practice; and
- Document compliance with regulatory requirements.

This standard takes guidance from industry best practice in developing the instructions and requirements for preparation of technical procedures to minimize human errors. Section 4.3.2 of N-STD-AS-0014 [60] lists a number of developmental references including those that provide guidance on writing styles to address human factors. These are:

- American Institute of Chemical Engineers: Guidelines for Writing Effective Operating and Maintenance Procedures, New York, Center for Chemical Process Safety, 1996.
- ANSI/ANS 3.2 – 1994, Administrative Controls and Quality Assurance for the Operational Phase of Nuclear Power Plants.
- Blake G, Bly RW: The Elements of Technical Writing, New York: Macmillan USA, 1993.

- Campbell JJ, Zimmerman C: Fundamentals of Procedure Writing, Columbia: GP Publishing, Inc., 1988.
- CSA-N286.5-95, Overall Quality Assurance Program Requirements for Nuclear Power Plants, Section 5.2, Maintenance Procedures, 1995.
- CSA-N286.5-95, Overall Quality Assurance Program Requirements for Nuclear Power Plants, Section 4.2.2 Operating Procedures, Subsection 4.2.2.2, 1995.
- CSA-N286.5-95, Overall Quality Assurance Program Requirements for Nuclear Power Plants, Section 4.2.4, Non-Routine and Emergency Operating Procedures, 1995.
- Haramundanis K: The Art of Technical Documentation, Boston: Digital Press, 1998.
- Parker RC: Looking Good in Print: A Guide to Basic Design for Desktop Publishing, Chapel Hill: Ventana Press, 1988.
- Sabin W, Millar W, Sine S, Strashok GW: The Gregg Reference Manual Fourth Canadian Edition, New York: McGraw-Hill Ryerson, 1995.
- Wieringa D, Moore C, Barnes V: Procedure Writing, Principle and Practices, Columbus: Battelle Press, 1998.

The standard provides detailed guidance for style and clarity based on inputs from these developmental documents. Based on these developmental documents, a set of detailed instructions (OPG-MAN-08100-0001, "Template Creation and Maintenance" [61]) has been developed. Once a procedure has been prepared, reviewed and approved, before it is filed in Asset Suite and made available for use, a complete final quality check of the document verifying that the minimum acceptance criteria per OPG-PROC-0178, "Controlled Document Management" [62], is performed.

Availability of the templates, which have been developed based on industry best practices, ensures style and clarity that enhance performance and simplify communication.

Achieving procedural clarity and an appropriate level of detailed guidance in procedures is also ensured through use of the procedure validation process and promotion of a healthy Technical Procedure Action Request (TPAR) process. All new procedures and major revisions to existing procedures are validated either in the simulator or in the field prior to use as per N-PROC-AS-0028 R018 [63]. Per Section 1.5 of N-PROC-AS-0028, the validation process ensures that documents are correct, meet the intended function, and are usable by a qualified individual. Staff are encouraged to provide input to procedures through the TPAR process. Enhancements and improvements identified while using a procedure (OPEX) are captured through submission of a TPAR to revise the procedure in accordance with N-PROC-AS-0028 [63].

In addition to the requirements for technical procedures, OPG Standard OPG-STD-0001, "Requirements for Administrative Guidance Documents" [64], specifies the requirements for administrative governance documents. The standard provides the criteria for selecting the correct document type for a particular use and the standard format for administrative governance documents (e.g., specifying the use of a template to ensure all necessary sections are included). The standard also references OPG Guide OPG-GUID-08130-0001, "Writing Guide for Administrative Governance Documents" [65], which provides recommendations for creating or revising Governance Documents.

To address the Review Task requirement of conducting a "review of plant events that identify inadequate procedures [procedural quality] as a contributing cause," a search through the Pickering Station Condition Record (SCR) database was conducted and a number of SCRs were identified that potentially pointed to clarity and style of procedures as a contributing factor in plant events. In all cases, these issues have since been addressed through evaluation and revision of the relevant procedures.

The Pickering SCR database was queried for procedural quality as a causal factor for events over the 5 year period of 2011 to 2015. Specifically, the following two causal factors were queried: Administrative Procedures and Technical Procedures. These causal factors are applied to identify adverse conditions associated with procedure creation and maintenance processes.

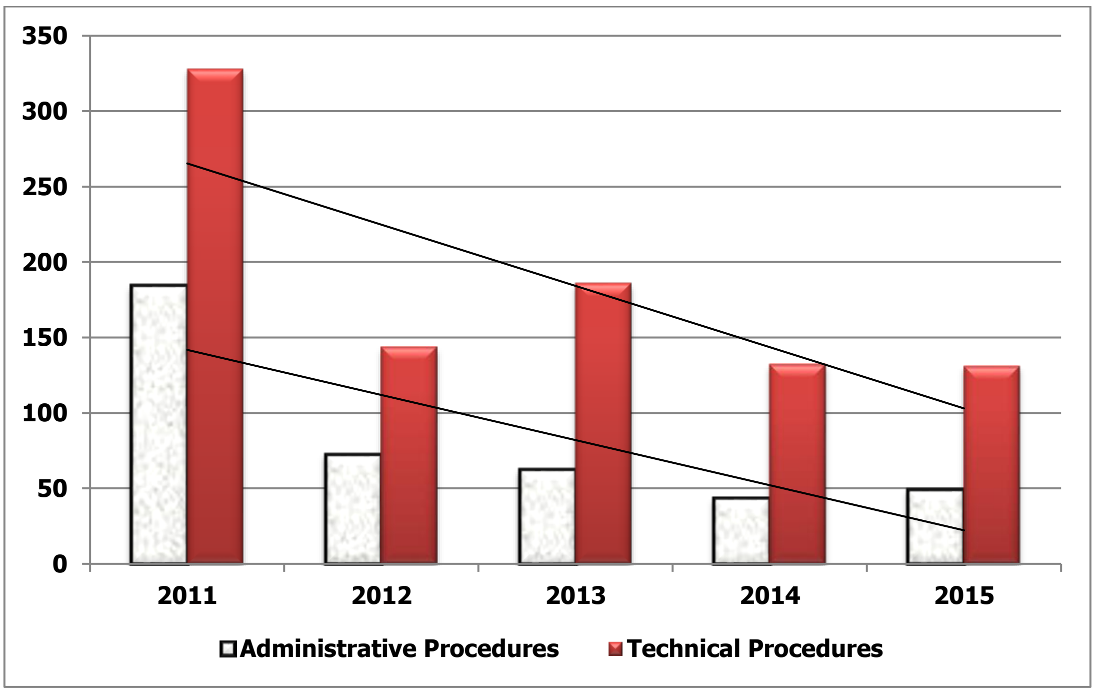
The search yielded a number of SCRs, which were screened to identify SCRs with conditions potentially caused directly or indirectly by clarity issues or lack of detail in procedures, based on the SCR description. Of note, the majority of the conditions in this subset of SCRs were addressed prior to a plant event occurring, through the use of event free tools and the Corrective Action process. As such, this subset was screened further to identify conditions resulting in plant events; this resulted in identification of only 13 SCRs with procedure style and clarity as a potential contributor to plant events (over the 5 year period). A summary of the events, grouped by event type, is presented in the table below.

Plant Event Type	**SCR**
Unexpected System / Component Response	P-2011-12569 P-2013-02471 P-2014-24071 P-2015-09903
Delay in the Completion of Work	P-2011-02619 P-2011-02678 P-2011-11931 P-2011-16400 P-2011-23006
Chemistry Out of Specification	P-2011-12104

Plant Event Type	SCR
Equipment Performance / Impact	P-2013-06430 P-2014-12737
Radiation Protection Performance	P-2011-09359

Most of these procedure issues were attributed to either a lack of sufficient detail, or inconsistencies between various reference documents and procedures. However, as noted earlier, in all cases these issues have since been addressed through evaluation and revision of the relevant procedures.

The results from the SCR database query for SCRs with causal factors relating to procedural quality over the 5 year period 2011 to 2015 are illustrated in the chart below. The trend over this time period demonstrates continuing improvement.



Pickering SCRs with Causal Factors Related to Procedural Quality

Conclusion:

A review of the Pickering SCR database was conducted to identify adverse station conditions potentially caused by procedural clarity and style issues over the past 5 years. Only 13 SCRs were identified where procedural style and clarity issues were potential contributing factors that led to plant events. For each of these SCRs, corrective actions were taken to remedy the situation and close any potential clarity gaps found within OPG procedures. The 5 year trend demonstrates continuing improvement in this area. Therefore, the conclusion of this Review Task assessment is that the style and clarity of procedures provides an appropriate level of detailed guidance for staff, as confirmed through a review of plant events identifying inadequate procedures [procedural quality] as a potential contributing factor. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

Per Section 2.2 of this report, detailed reviews for four L/R/C/Ss with content applicable to Safety Factor 12 are provided in Reference [6]. Associated findings applicable to Safety Factor 12 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 12

L/C/R/S Reviewed	**PSR2 L/R/C/S Review Results for Safety Factor 12**
CNSC G-323 (2007), "Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement"	There are no PSR2 gaps for CNSC G-323 (2007). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-323 (2007).
CNSC G-278 (2003), "Human Factors Verification and Validation Plans"	There are no PSR2 gaps for CNSC G-278 (2003). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-278 (2003).
CNSC G-276 (2003), "Human Factors Engineering Program Plans"	There are no PSR2 gaps for CNSC G-276 (2003). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-276 (2003).
CSA N290.12-14, "Human Factors in Design for Nuclear Power Plants"	There are no PSR2 gaps for CSA N290.12-14. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.12-14.

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program reviewed for Safety Factor 12 is identified in Table 2, and details of the associated effectiveness reviews for the N-PROG are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 12 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 12 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 12.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [11] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 12 report that require discussion in other Safety Factor reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 12 were reviewed for the eight PSR2 Review Tasks in Section 4.1 of this report and resulted in no PSR2 gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 12 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no PSR2 gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 12 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 12), which resulted in no PSR2 gaps.

The review of Safety Factor 12 has confirmed that the various human factors that may affect the safe operation of Pickering NGS have been appropriately addressed.

SOER	Significant Operating Experience Report
TQD	Training Qualification Description
TPAR	Technical Procedure Action Request

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-TR-0005, "Training"

The Training Program is key to improving nuclear station safety, reliability, cost effectiveness and worker competence. The program is used to develop and maintain competent personnel to safely operate, maintain and improve plant performance, to minimize the impact of plant operation on the environment, health and public safety, and to drive human performance improvement.

In general, the Training Program content originated from the following sources:

- Canadian Nuclear Safety Commission objectives and criteria for regulatory evaluations of training, licence conditions and applicable standards;
- World Association of Nuclear Operators;
- United States Department of Energy Training Handbooks and Guides to Good Practices;
- Institute of Nuclear Power Operations; and
- Training procedures used at other nuclear power generating stations.

Nuclear Oversight conducted an audit in April 2012, NO-2012-0005 [B.1.1], of the Training Program for both Pickering and Darlington NGS. The objective of the audit was to confirm that the Training Programs at Ontario Power Generation (OPG) Nuclear are being effectively managed and are in compliance with governing documents. The audit concluded that there were performance improvement opportunities applicable to Pickering NGS in the areas of process inputs for training, sustainability of the long term staffing strategy for non-licensed operator training, some instances of delivery of training by staff prior to full completion of their Trainer qualification designation and governance associated with the Job Coach function.

Four SCRs were initiated to address the above findings (SCR N-2012-02030, N-2012-02027, N-2012-02028 and N-2012-02029), which required corrective actions to be implemented. These SCRs (and the associated Action Requests) have since been closed and the necessary corrective actions were completed to address the underlying issues.

The Nuclear Programs and Training division completed a self-assessment in July 2012, NO12-000415-SA [B.1.2], in order to assess the health of the governance framework for the Training Program for both Pickering and Darlington NGS. This involved a review of related SCRs, governance framework, Asset Suite and revision records. No findings/SCRs were generated as a result of this self-assessment.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 13, *Emergency Planning* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 13 were reviewed for the eleven PSR2 Review Tasks specified in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 13 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 13 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 13).

The results of the review of Safety Factor 13 are discussed in Section 5.0. The review has confirmed that OPG Nuclear has: a) adequate plans, staff, facilities and equipment in place for dealing with emergencies, and b) there are adequate arrangements in place for regular emergency training and exercises, and interaction and coordination with local and national authorities. The review identified two gaps that will need to be addressed further as part of the PSR2 Global Assessment process.

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Emergency Planning Safety Factor 13 is to determine: "(a) whether the operating organization has in place adequate plans, staff, facilities and equipment for dealing with emergencies; and (b) whether the operating organization's arrangements have been adequately coordinated with the arrangements of local and national authorities and are regularly exercised." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 13 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 13 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 13 Review Tasks are:

1) Confirm the full range of accidents and radiation emergencies have been identified and studied.

2) Confirm the appropriate response and mitigation strategies have been developed and have taken account of major changes at site and around the site (industrial, commercial, residential development).

3) Confirm that the station organization includes dedicated Emergency Response personnel on duty at the plant at all times, to handle accidents and emergencies.

4) Assess the adequacy of the training program for emergency response personnel including training, emergency exercises and qualification records.

5) Confirm there is a process for notification of staff that will be brought in to assist in the management of the response in the longer term.

6) Determine that there is a classification of accidents to guide the type of response.

7) Confirm there is a mechanism for notifying and informing relevant off-site organizations such as the police, fire departments, hospitals, ambulance services, regulatory bodies, local authorities, government, public welfare authorities and the news media.

8) Confirm the availability of sufficient communications equipment at the plant and at the off-site Emergency Centre to permit effective communications with Emergency Response Teams, both on and off site.

9) Assess adequacy of the emergency response procedures and training and exercises for all site staff. Confirm that integrated and partial emergency exercises have been conducted to check satisfactory function of the emergency organization and its equipment.

10) Confirm the adequacy of on-site equipment and facilities for emergencies and offsite emergency facilities or locations, including walkdowns of relevant areas on and off the site.

11) Confirm development or existence of a program for Severe Accident Management.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Emergency Planning Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 13 L/R/C/S reviews are high level or incremental in nature. The definitions of High Level Review and Incremental Review are as follows:

- High Level Review: New L/R/C/Ss not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S[3] is provided in Reference [6]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Emergency Planning Safety Factor 13

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N293[3]	Fire Protection for Nuclear Power Plants	N293-12	1, 7, 13	Incremental	N293 addressed as part of Pickering B and Darlington ISRs, as well as PARTS code reviews.

[3] The PSR2 review of CSA N293-12 is in progress. As discussed in Section 4.2, gaps identified from this review will be applicable to the Plant Design Safety Factor, and hence, results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
2	CNSC REGDOC-2.10.1*	Nuclear Emergency Preparedness and Response	2014	13	Incremental	Transition plan in place and gap assessment has been performed by OPG.
Additional L/R/C/Ss						
3	CSA N1600	General Requirements for Nuclear Emergency Management Programs	N1600-14	13	High Level	Not referenced in PROL 48.02/2018. Not reviewed as part of Pickering B or Darlington ISRs.

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 13 is listed in Table 2 below.[4] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Programs Reviewed for Safety Factor 13

Document Number	Document Title
N-PROG-RA-0001 [7]	Consolidated Nuclear Emergency Plan

2.4 Additional Reviews

The PSR2 Safety Factor 13 report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 13):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

[4] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 13 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 13 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [8] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 13 review which need to be addressed in other Safety Factor reports are discussed in Section 4.4 of this report.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Emergency Planning Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 13 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- <u>Compliance</u>: Compliance indicates that either the safety requirement or the intent of the Review Task is met.

- <u>Gap</u>: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[5]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

[5] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 13 L/R/C/S reviews identify Compliances and Gaps as defined below:[6]

- <u>Compliance</u>:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.
    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 13.)

---

6 Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 13.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in

performance. As a result, the broad review scope of program audits focuses on identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [9]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was also performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 13):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 13 (as identified in the Darlington ISR Integrated Implementation Plan [10] and Pickering Units 5-8 Continued Operations Plan [8]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[7]

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2. With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 13 review which need to be addressed in other Safety Factor reports are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 13 Review Tasks.

4.1.1 Review Task #1: Range of Accidents and Radiation Emergencies

Confirm the full range of accidents and radiation emergencies have been identified and studied.

The Consolidated Nuclear Emergency Plan (CNEP) provides a written basis to document concepts, roles, and resources required by OPG Nuclear to implement and maintain its emergency response capability to protect the public, employees, and the environment in the event of a nuclear emergency [7]. The CNEP defines a nuclear emergency as an emergency which poses an actual or potential hazard to public health and property or the environment from ionizing radiation, whose source is a major nuclear installation.

The emergency response capability established in accordance with the CNEP must be sufficiently flexible to be used for a broad range of events both within and beyond the design basis. That is, the full range of accidents and radiation emergencies spans a wide range of events from an impairment of a plant system to the occurrence of a Beyond Design Basis Accident (BDBA) that progresses into a Severe Accident (SA).

The basis for emergency planning is described in Section 1.1 of the CNEP [7]. Developmental references for both on-site and off-site planning are listed in Section 4.2.2 of the CNEP [7]; this list represents the primary source from which the emergency plan is developed. Two of the documents listed in this section are the Pickering NGS 1-4 Station Safety Report, NA44-SR-01320-00002, "PN 1-4 Safety Report: Part 3 – Accident Analysis" [11] and the Pickering NGS 5-8 Station Safety Report, NK30-SR-01320-00003, "PN 5-8 Safety Report: Part 3 – Accident Analysis" [12].

The Pickering NGS 1-4 and Pickering NGS 5-8 Safety Reports, References [11] and [12] respectively, identify and study the full range of accidents and radiation emergencies that are a part of the station design basis. As part of Review Task #3 of the Deterministic Safety Analysis Safety Factor Report, an assessment is performed to determine if the postulated events, event sequences, and event combinations covered by the existing safety analysis are sufficient when compared against those for a modern Nuclear Power Plant (NPP) in accordance with the methodology in CNSC REGDOC-2.4.1, "Deterministic Safety Analysis" [13].

In addition to the analyzed events in the Safety Reports, the ongoing Operating Experience process described in N-PROC-RA-0035, "Operating Experience Process" [14] monitors events around the world to determine if there is any unforeseen event that may have applicability to Pickering NGS. If/when an event is deemed to be applicable, the emergency response process is reviewed to ensure the response to such an event would be adequate. Enhancements to the emergency response would be considered as a part of this process.

The CNEP [7] also recognizes the need to address beyond design basis events, including Design Extension Conditions and SAs. Requirements for OPG's approach to BDBA management are documented in N-STD-MP-0019, "Beyond Design Basis Accident Management" [15], with BDBA strategies implemented through Emergency Mitigating Equipment Guidelines (EMEGs) and Severe Accident Management Guidance (SAMG). A more detailed discussion of the EMEGs and SAMG is provided as part of Review Task #11 (Section 4.1.11).

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place to ensure that the full range of accidents and radiation emergencies have been identified and studied. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Development of Response and Mitigation Strategies

Confirm the appropriate response and mitigation strategies have been developed and have taken account of major changes at site and around the site (industrial, commercial, residential development).

Response and Mitigation Strategies

OPG's emergency response and mitigation strategies are documented in Section 1.2.3 of the CNEP [7]. Response and mitigation strategies consist of a combination of on-site and off-site actions, as dictated by the nature of the emergency.

During the initial emergency phase, Main Control Room (MCR) staff perform the assessment of plant status and where possible, the identification of damage to plant equipment. Appropriate plant procedures are used and MCR staff initiate an immediate operations response to strive towards taking the plant to a safe and stable configuration. These procedures include normal and non-standard operating procedures contained in Operating Manuals and Abnormal Incidents Manual (AIM) procedures. Each of the AIM procedures has specific entry conditions and entry into an AIM procedure is potential entry into the regime of on-site Emergency Response Organization (ERO) implementing procedures. P-MAN-03490-00005, "Index – Emergency Response Manual 5" [16] contains a listing of implementing procedures for various ERO roles.

The MCR team utilizes resources of the on-site Emergency Operations Centre (EOC) to mobilize and deploy the necessary emergency teams. The EOC personnel may, if necessary, mobilize, brief, and deploy Emergency Response Teams to address specific emergencies, such as a fire, medical emergency, or a search and rescue operation. Appropriate off-site support groups (i.e., non-OPG resources) such as fire and/or ambulance may be activated to respond to the site. In addition, the EOC personnel may mobilize and deploy both in-plant and off-site radiation survey teams who shall provide additional data to assess the plant status. If the MCR emergency mitigation strategy requires repair of damaged equipment, then the EOC personnel will assemble, brief, and deploy the appropriate emergency repair teams. MCR staff will seek, as appropriate, consultative, technical, and resource assistance from the Site Management Centre (SMC) who will in turn seek, as appropriate, assistance from the Corporate Emergency Operations Facility (CEOF).

During the response phase, the MCR and SMC staff will, as a continuing action, evaluate the implementation of the emergency mitigation strategy and modify it as necessary.

As per Section 1.3.2 of the CNEP [7], agreements exist with local fire departments for on-site fire-fighting support. Arrangements and procedures also exist for local ambulance service and hospital support for casualties from nuclear sites. These agreements are also documented in Section 1.17.4 of N-PROG-RA-0012, "Fire Protection" [17]. Toronto Hospital Corporation, Western Division has been provincially designated and funded as the radiation trauma centre for Ontario. This includes the capability to deal with contaminated casualties, trauma, and acute radiation syndrome. Rouge Valley Ajax and Pickering Hospital is the primary local hospital designated to receive contaminated casualties from Pickering NGS.

In 2012, a Mutual Aid Agreement between Canada's five major nuclear operators was formalized [18]. The agreement outlines the type of emergency support that may be provided, and the processes involved if a nuclear operator suffers a major emergency and requires assistance. For example, if there is a need for additional Emergency Mitigating Equipment (EME), OPG can contact other Canadian nuclear facilities (i.e., Bruce Power, NB Power, or Canadian Nuclear Laboratories) to ascertain what equipment is available for support [19]. Specific to the use of EME, OPG also has the capability to share some of this equipment between Pickering and Darlington depending on actions required as part of the event response.

Arrangements for support and technical assistance exist within the CANDU Owners Group (COG) and the Institute of Nuclear Power Operations (INPO). INPO operates a 24-hour emergency assistance line and an Emergency Response Centre in Atlanta to provide support to member utilities. As required, INPO will coordinate with the Electric Power Research Institute as part of providing this support. INPO also issues an Emergency Resources Manual with listings of specialized services and equipment and contact phone numbers for all US Nuclear utilities. This manual is available in the CEOF and on-line. Provisions for emergency engineering and technical support are available from Amec Foster Wheeler, CANDU Energy Inc. and Atomic Energy of

Canada Ltd. Similar contracts are made available by COG for securing support from other Canadian nuclear utilities.

As per Section 1.3.3 of the CNEP [7], OPG shall assist the province and designated municipalities in their planning and preparedness for a nuclear emergency, and carry out and assist the province in conducting studies to enhance public safety during a nuclear emergency. As prescribed in the Provincial Nuclear Emergency Response Plan (PNERP) [20], the designated municipalities for Pickering NGS are Durham Region and the City of Toronto. The host municipality for Pickering is the City of Peterborough.

There are external off-site organizations defined in provincial and municipal nuclear emergency plans that OPG interfaces and interacts with during the course of an emergency response. These external organizations are as follows:

1) Office of the Fire Marshal and Emergency Management

    - Provincial Emergency Operations Centre (PEOC)

      The PEOC is located at the Ministry of Community Safety and Correctional Services, Office of the Fire Marshal and Emergency Management, in Toronto and is the provincial facility and organization that directs off-site emergency response operations. OPG provides call-in staff to fill an official liaison officer position in the PEOC Operations Section, some technical positions in the PEOC Scientific Section, and to support environmental radiation monitoring techniques. OPG provides and maintains software codes for dose projection, dedicated telecommunications links, and training and drills as requested to support the PEOC. During the response stage, site shift and management staff make emergency notification to the PEOC as appropriate. A regular flow of technical data and situation updates, including off-site survey data, is provided to the PEOC from the incident site.

2) Ministry of Health and Long Term Care

    In response to a nuclear emergency, the Ministry of Health and Long Term Care activates the Ministry Emergency Operations Centre and implements the Radiation Health Protection Plan in accordance with the PNERP. The Radiation Health Protection Plan is designed to guide health sector planning at both the provincial and local levels across Ontario in order to effectively respond to a nuclear emergency.

    The Ministry of Health and Long Term Care coordinates with the PEOC to provide advice and guidance regarding the implementation of precautionary and protective actions. This includes deciding when to administer potassium iodide (KI) pills for thyroid blocking and ensuring information on the source and type of radiation is communicated to health care facilities in a timely manner. OPG staff located in the PEOC may interact (as required) with Ministry of Health and Long Term Care staff as part of the event response.

3) Durham Region

- Regional EOC

  The Regional EOC is comprised of elected officials, regional department staff (e.g., roads and works, emergency planning, social services), school board staff, police, fire, and medical representatives. The primary responsibility of this organization is to implement the public protective action directives in the locally affected area to protect the public. Only the PEOC provides direction and information on off-site response to the Regional EOC.

  OPG provides a local site representative to fulfill the OPG liaison officer position at the Regional EOC. The liaison officer provides coordination with the site for resources and off-site response activities in the local area. The liaison officer provides interpretation of the significance of radioactivity measurements and technical background information to the regional staff. Official emergency communication with the Regional EOC is through the liaison officer and the SMC.

- Reception Centres and Emergency Worker Centres

  Reception Centres are established to provide, among other functions, a Monitoring and Decontamination Unit (MDU) for evacuees. These centres are under the control and direction of the Regional EOC. OPG Nuclear site organization and call-in personnel staff and equip the MDU function of these centres. MDU staff members are trained to carry out radiation monitoring and decontamination. OPG MDU supervisors maintain communication with the SMC to keep the ERO apprised of the MDU status and any need for further resources.

  Emergency Worker Centres are established during nuclear emergencies to monitor and control radiation exposure of external emergency workers who may be required to enter areas affected by radiation. Similar to Reception Centres, Emergency Worker Centres are under the authority of the Regional EOC. Emergency Worker Centres are staffed by OPG call-in personnel with equivalent qualifications as Reception Centre MDU staff. Communication is regularly maintained between the Emergency Worker Centre OPG supervisors and the SMC and Regional EOC.

4) City of Toronto

- Municipal EOC

  A Municipal EOC is equivalent to a Regional EOC with regards to its role in the emergency response. OPG provides the same level of support to the City of Toronto Municipal EOC as it does to the Durham Region Regional EOC.

- Reception Centres and Emergency Worker Centres

  Reception Centres and Emergency Worker Centres associated with the City of Toronto have the same functionality as corresponding centres for the Durham Region. OPG provides the same level of support to the City of Toronto Reception Centres and Emergency Worker Centres as it does for corresponding centres in the Durham Region.

5) City of Peterborough

   - Reception Centre

     The City of Peterborough Reception Centre has the same functionality as corresponding centres for the Durham Region and the City of Toronto. OPG provides the same level of support to the City of Peterborough Reception Centre as it does for corresponding centres in the Durham Region and the City of Toronto.

6) CNSC

   The CEOF interfaces with the CNSC EOC and its respective staff.

As noted in Section 1.3.4 of the CNEP [7], the PNERP requires Pickering NGS to procure adequate quantities of stable iodine tablets for their Primary Zone population. Other operational responsibilities related to stable iodine tablets are prescribed in the Ministry of Health and Long Term Care's Radiation Health Response Plan. In consultation with the designated municipalities, OPG Emergency Preparedness (EP) Department procures stable iodine tablets and maintains them within expiry dates. Distribution of iodine tablets is the responsibility of the Durham Region and the City of Toronto. Iodine tablets were pre-distributed to the Primary Zone population for Pickering NGS in 2015.

Designated Primary Zone municipalities are also required to establish and maintain a public alerting system in accordance with the PNERP. This requirement is discussed in further detail under Review Task #7.

Changes at Site and Around the Site

To take into account major changes at site and around the site, OPG Approved Roles Document, N-MAN-08131-10000 Sht: S4-0245, "Manager, Emergency Preparedness" [21] provides specific accountability to the Department Manager of EP to interface with the regulator and other external stakeholders as necessary to ensure that the relevant regulatory and licensing requirements are built into the EP program and stakeholder interfaces are effectively managed.

The Department Manager of EP is a member of the Durham Regional Emergency Management Coordinating Committee as well as the Provincial Nuclear Emergency Management Coordinating Committee. These committees meet on a regular basis and review issues that could impact emergency response, including local development which may modify/increase risks.

In addition, OPG's Operating Experience process monitors events around the world to determine if there is any unforeseen event that may have applicability to Pickering NGS. If/when an event is deemed to be applicable, the emergency response process is reviewed to ensure the event can be adequately dealt with.

Appropriateness of Response and Mitigation Strategies

Response and mitigation strategies are developed in accordance with the deterministic safety analysis and with insights from the probabilistic safety assessment. Thus, the appropriateness of these strategies is dependent on the adequacy of the existing safety analysis, which is evaluated in the following Safety Factor reports:

1) Deterministic Safety Analysis

2) Probabilistic Safety Assessment

3) Hazards Analysis

A review of the reports listed above did not identify any PSR2 gaps which are applicable to the Emergency Planning Safety Factor report.

The adequacy of the response and mitigation strategies that have been developed is demonstrated primarily through drills and exercises. On an annual basis, the EP Department assesses the ERO performance to the established objectives identified in N-INS-03490-10002, "Conduct of Emergency Preparedness Drills and Exercises" [22] and reviews all drill and exercise related Station Condition Records (SCRs) and Action Requests (ARs) to monitor status and ensure completeness. These assessments are documented in the EP Drill and Exercise Performance Objectives Reports. Deficiencies found during drills and exercises are documented using the SCR system in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [23]. Corrective Action plans are developed and corrective actions are initiated and tracked to completion.

A review of the latest performance objectives report, N-REP-03490-10038, "2014 Emergency Preparedness Drill and Exercise Performance Objectives Report" [24] indicates that all corrective actions in 2014 were correctly dispositioned and being tracked to completion, if not already completed.

Conclusion:

The conclusion of this Review Task assessment is that response and mitigation strategies have been developed and there is governance in place to monitor the appropriateness of these strategies, accounting for major changes at site and around the site (industrial, commercial, residential development). The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Emergency Response Personnel

> *Confirm that the station organization includes dedicated Emergency Response personnel on duty at the plant at all times, to handle accidents and emergencies.*

Sections 1.6.2 and 2.2.1 of the CNEP [7] specify the requirement for OPG to put an administrative control in place that ensures the shift minimum complement is maintained at all times. N-PROC-RA-0046, "Emergency Response Organization Staffing and Availability" [25] provides an organized method of selecting, staffing, and maintaining the ERO to satisfy the requirements specified in the CNEP. The ERO includes on-shift staff and on-call personnel that are activated to respond to the site and OPG Nuclear emergency response centres. The minimum positions required for the Shift ERO are identified in Figure 4 of the CNEP [7].

Further details of the staffing levels for the duty shift are provided in P-INS-09100-00003, "Pickering Minimum Shift Complement" [26] and P-INS-09260-00008, "Duty Crew Minimum Complement Assurance" [27]. These documents also define responsibilities and processes including confirming on a shift-to-shift basis that the Duty Crew ERO are fully qualified for their assigned roles, as identified in the Training Information Management System. This is confirmed using the Minimum Complement Coordination Program. Use of these tools and processes ensures that the shift minimum complement is met at all times at Pickering NGS.

Conclusion:

The conclusion of this Review Task assessment is that there are administrative controls in place to ensure that dedicated Emergency Response personnel are on duty at the plant at all times, to handle accidents and emergencies. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Adequacy of Emergency Response Training Program

> *Assess the adequacy of the training program for emergency response personnel including training, emergency exercises and qualification records.*

Training and Qualification Records

OPG's ERO training and qualification process is described in Section 1.6.3 of the CNEP [7]. Specifically, the CNEP refers to N-TQD-503-00001, "Nuclear Emergency Response Organization Training and Qualification" [28], which establishes the training and qualification requirements for individuals assigned to the ERO. It is based on the nuclear industry best practice, Systematic Approach to Training, which utilizes a task-based analysis to determine the training requirements and a performance-based analysis to verify effectiveness. The Training Information Management System is used to maintain the training program for OPG Nuclear and is the official database for documenting qualification records associated with personnel assigned to ERO positions.

As per Sections 1.1 and 1.2 of N-TQD-503-00001 [28], personnel assigned to ERO positions are selected based on skills and knowledge they already possess by way of their normal work assignments. Initial training is provided to ensure that ERO personnel have the knowledge and skills needed to independently perform tasks associated with the identified ERO position.

Section 1.5 of N-TQD-503-00001 [28] describes requirements related to continuing training. Continuing training is provided to maintain and enhance knowledge, skills and performance standards required to perform tasks of ERO positions. It also facilitates confirmation that incumbents still possess knowledge and skills required for correct execution of tasks associated with assigned emergency response roles. ERO personnel participate in at least one practical training component every 18 months.

Emergency Exercises

Section 1.6.5.2 of the CNEP [7] refers to N-PROC-RA-0045, "Emergency Preparedness Drills and Exercises" [29], which defines drill and exercise requirements, including activity and frequency requirements.

The EP Drill and Exercise Program provides a means of validating the effectiveness of OPG Nuclear's emergency response capability to ensure the safety of employees, the public, and the environment in the event of a nuclear emergency. The program serves the following purposes:

- Develop and maintain the skills of the ERO.
- Test the effectiveness of emergency plans and procedures, facilities and equipment, and training.
- Demonstrate the adequacy of plans and preparedness to respond to events ranging from minor to severe accidents.

The EP Drill and Exercise Program is comprised of Self Assessed Crew Practices (SACPs), Evaluated Drills, and Evaluated Exercises.

SACPs provide an opportunity for shift crews to develop and maintain their skills, and are planned and executed by the crews, under the direction of the Shift Manager (SM). A SACP should involve participation of:

- EOC including the SM and Emergency Shift Assistant (ESA)[8];
- In-Plant Survey Teams; and
- Off-Site Survey Teams.

SACPs are not identified in the annual drill and exercise schedule; they are scheduled by Operations in consultation with Work Control and are on the station work planning

[8] Per P-INS-03491-00002, the Shift Advisor Technical will perform the role of the ESA [33].

schedule. Minimum frequency requirements for SACPs are specified in N-PROC-RA-0045 [29].

OPG's drill and exercise program is conducted as per N-INS-03490-10002, "Conduct of Emergency Preparedness Drills and Exercises" [22], which describes the overall process, requirements, and guidance for the conduct of nuclear emergency response drills and exercises. It is based on INPO 14-0003 Emergency Drill and Exercise Guidelines [30], with appropriate modifications to reflect specific OPG and regulatory requirements.

As per Section 1.1.1 of N-INS-03490-10002 [22], a drill and exercise schedule is developed annually for each OPG Nuclear site. The approved schedule is provided to the Province, Durham Region, the CNSC, and the City of Toronto. The intent of sharing this schedule is to encourage participation of these key off-site agencies in the drills and exercises. The minimum frequency requirements for drills and exercises are identified in Table 1 of N-PROC-RA-0045 [29].

A drill is an evaluated demonstration by multiple participants of actions taken in response to a simulated emergency. A drill includes interactions between individuals or emergency response facilities that would be expected to occur in an emergency. Performance is evaluated against established objectives and demonstration criteria. A drill may be full-scale, involving testing of a full ERO, or it may be focused on one specific area. A focus-area drill is limited in scope and may involve simulation of facilities or responders. These include a single facility drill, tabletop drills, and mini drills.

Emergency exercises test the adequacy of EP programs and the implementation of emergency measures. This includes an evaluation of the adequacy of the procedures and training of the ERO to respond to an emergency. Emergency exercises simulate emergency events and conditions over a minimum of several hours, in order to test the integrated performance of the EP program.

Nuclear emergency response drills are the most frequently conducted evaluated drills, demonstrating the response capability to a simulated nuclear emergency as identified in the CNEP. Drill scenario development may include a multi-disciplinary team to ensure drill fidelity and realism. An evaluated drill may involve the participation of some of or the entire ERO, and may also include station staff, Provincial and Regional off-site authorities, and/or the CNSC.

Nuclear emergency response exercises involve a full ERO complement and most or all of the station's emergency response facilities. Exercises are conducted at each site once every three years and where practical include participation of Provincial and Regional off-site authorities and the CNSC (subject to their availability). Exercises involve a multi-disciplinary scenario development working group and are run from the station simulators to ensure drill fidelity and realism.

In order to support the successful execution of drills and exercises, a team is established comprised of controllers and evaluators. Controllers are responsible for establishing drill conditions, controlling participant actions, and in certain cases coaching participants. Evaluators are responsible for evaluating participant performance against scenario specific objectives and criteria, and assessing the adequacy of plans, procedures, facilities, and equipment.

Adequacy of Training Program for Emergency Response Personnel

The adequacy of the training program for emergency response personnel is primarily demonstrated through drills and exercises, and supplemented by self-assessments. On an annual basis, the EP Department assesses the ERO performance to the established objectives identified in N-INS-03490-10002, "Conduct of Emergency Preparedness Drills and Exercises" [22] and reviews all drill and exercise related SCRs and ARs to monitor status and ensure completeness. These assessments are documented in the EP Drill and Exercise Performance Objectives Reports. Deficiencies found during drills and exercises are documented using the SCR system in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [23]. Corrective Action plans are developed and corrective actions are initiated and tracked to completion.

A review of the latest performance objectives report, N-REP-03490-10038, "2014 Emergency Preparedness Drill and Exercise Performance Objectives Report" [24] indicates that all corrective actions in 2014 were correctly dispositioned and being tracked to completion, if not already complete.

Conclusion:

There is adequate governance in place to support the execution of relevant activities including training, emergency exercises, and qualification records that are required as part of an adequate training program for emergency response personnel. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Process for Notification of Staff

Confirm there is a process for notification of staff that will be brought in to assist in the management of the response in the longer term.

The ERO is activated by the ESA who is directed by the SM as per P-INS-03491-00001, "Incident Shift Manager" [31]. The process to activate the ERO is outlined in Appendix C of P-INS-03491-00002, "Incident Emergency Shift Assistant" [33].

The ERO activation is initiated using the ERO notification system (MIR3 Intelligent Notification System), which is an automated electronic system. Should the ERO notification system fail, a manual call-out is conducted by SMC responders as specified in Section 2.0 of N-MAN-03491-10000 [34]. The ERO contact information is maintained current in N-MAN-03491-10000 [34].

Staff that requires this sort of notification is referred to as the augmented OPG ERO and is required to assist in the management and the response in the longer term. This is referenced accordingly in Sections 1.2.2 and 2.2 of the CNEP [7]. In accordance with the ERO duty schedule, on-duty ERO staff is divided into three duty teams identified by a colour: Red Team, Green Team, and Blue Team. Each duty team is "on-duty" for a period of two consecutive weeks in a six-week cycle. The duty team that is "on-duty" at the time of the notification would initially respond to the event. However, in the event of a widespread loss of communications or off-site power in Ontario, it is expected that all SMC and CEOF ERO staff (including staff not on duty and in the on-call pool) will immediately report to their facility if it is safe to do so.

Depending on the nature of the event, the ERO may be active for an extended period of time such that it is necessary to relieve staff who was initially called in as part of the initial response. As per Section 2.6 of N-GUID-03491-50010, "Emergency Response Organization Expectations" [35], on receipt of a Real Event notification of abnormal incident or higher, all responders are expected to respond to the call-out (i.e., all on-call staff would respond to the notification, with only staff from the "on-duty" colour team assembling at the appropriate ERO facility), and remain available and fit for duty in order to ensure staffing for subsequent shifts if necessary. Logistics related to co-ordinating a shift change for the ERO, as required, are the responsibility of the Resource Deployment Manager. N-INS-03491-10022, "Resource Deployment Manager" [36], provides direction for the activities required by the Resource Deployment Manager to co-ordinate the shift change, including the identification and notification of ERO staff who will be providing relief.

Depending on the severity of the event, it may be necessary to activate the Crisis Management and Communications Centre (CMCC). The CMCC is an off-site facility whose primary function is to provide corporate leadership and executive level decisions related to any incident requiring CMCC activation until the emergency is mitigated and a recovery strategy is in place. The decision to activate the CMCC is made by the Chief Nuclear Officer in consultation with the Emergency Recovery Director who is located in the CEOF. Once the decision has been made to activate the CMCC, Security personnel will initiate the CMCC notification process in accordance with OPG-PROC-0028, "Crisis Management & Communications Centre Procedure" [37].

Conclusion:

The conclusion of this Review Task assessment is that there exists a process for the notification of staff that will be brought in to assist in the management of the response in the longer term. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Classification of Accidents

Determine that there is a classification of accidents to guide the type of response.

Emergency assessment and classification of accidents are performed as described in Section 1.2.2 of the CNEP [7]. Event classification is performed to determine the extent of the on-site response mobilization and the required notification. The process of notifying and informing government agencies is also outlined in Section 1.2.2 of the CNEP.

As specified in Section 1.2.2.1 of the CNEP [7], the first action is the identification, classification and, if appropriate, declaration of a station emergency. A station emergency is defined as a sudden unexpected occurrence of unusual radiological conditions with the potential for accidental exposure to staff or the public exceeding regulatory limits. A station emergency can also be declared for a non-radiological event requiring protection of on-site personnel and activation of the ERO to deal with the event. Entry into the declaration of a station emergency will arise from a diagnosis in response to a reactor or plant process upset or abnormal condition. Once it is recognized that a threat to plant staff or the public exists, on-site mobilization of the ERO is required. The station emergency tone would be activated to inform staff to assemble and account and to initiate immediate mobilization of the shift ERO, and if appropriate, ERO augmentation.

The Shift Manager is responsible for the initial classification of the event and the required response, as described in Section 1.3 of P-INS-03491-00001, "Incident Shift Manager" [31]. The event is classified based on Appendix A, "Emergency Classification, Categorization, and Notification" of this instruction.

Once the process of emergency classification has been completed, a second process is undertaken to determine the Provincial notification category. The assessment process for off-site categorization is governed by the criteria set by the PNERP [20]. This is translated procedurally into an off-site notification criteria matrix, which has specific entry conditions for each category of notification.

The Shift Manager is also responsible for determining the provincial notification category, as described in Section 1.4 of P-INS-03491-00001, "Incident Shift Manager" [31]. The Provincial notification category is determined based on Appendix B, "Notification Criteria Matrix" of this instruction. Specifically, an event is categorized as a Reportable Event, Abnormal Incident, On-Site Emergency, or General Emergency.

In addition to the initial classification of the event and identification of the Provincial notification category, a provisional International Nuclear Event Scale (INES) rating is prepared by the OPG INES Officer under the direction of the CEOF Technical Support Director as per N-INS-03491-10001, "CEOF Technical Support Director" [32]. Once the provisional INES rating has been approved by the appropriate ERO staff it is provided to the CNSC. The provisional INES rating is under CNSC jurisdiction and is approved and released to external stakeholders by the CNSC INES National Officer.

Conclusion:

The conclusion of this Review Task assessment is that there exists a process to classify accidents to guide the type of response. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Notification of Off-Site Organizations

Confirm there is a mechanism for notifying and informing relevant off-site organizations such as the police, fire departments, hospitals, ambulance services, regulatory bodies, local authorities, government, public welfare authorities and the news media.

Section 1.2.2.5 of the CNEP [7] identifies off-site emergency notifications to external agencies (provincial, municipal, CNSC) as one of the three important notification actions that need to occur in order to ensure an effective emergency response takes place. As specified in Section 1.2.2.2 of the CNEP [7], once the process of emergency classification has been completed, a second process is undertaken to determine the Provincial notification category. The assessment process for off-site categorization is governed by the criteria set by the PNERP. This is translated procedurally into an off-site notification criteria matrix, which has specific entry conditions for each category of notification. Appendix A, "Provincial Notification Categories" of the CNEP [7] contains generic definitions of PNERP notification categories. Appendix B, "Notification Criteria Matrix" of the CNEP [7] contains the Notification Criteria Matrix.

Site-specific derivatives of this matrix are included in site procedures to simplify the determination of notification category (e.g., process failures identified in the plant's AIMs that have been pre-categorized into the Provincial notification categories).

Off-site emergency actions are made following categorization. The time requirement for the plant to notify the Provincial contact point is within 15 minutes after the event has been categorized. This is the provincially set target for notification performance, and a regulatory requirement. The information identified in the official notification form should be confirmed as part of the notification process. The designated municipal or regional contact points also receive the same emergency notification shortly after the Province. Regulatory notification to the CNSC is made after the off-site agency and ERO notifications have been completed. CNSC notification target time is within 15 minutes of ERO activation.

P-INS-03491-00001 [31] provides direction for the SM to respond to an event in accordance with the requirements contained in the CNEP. Step 1.4 of P-INS-03491-00001 [31] prompts the SM to refer to Appendix B, "Notification Criteria Matrix" to determine the applicable PNERP category for the event. Off-site notifications are then initiated per Step 1.5 of P-INS-03491-00001 [31], which prompts the ESA to initiate notifications per P-INS-03491-00002 [33].

The ESA completes off-site notifications within 15 minutes of event categorization per Step 1.3 of P-INS-03491-00002 [33], which includes the Province of Ontario, Durham Region, and the City of Toronto. Per Step 1.5 of P-INS-03491-00002 [33], the ESA will notify the CNSC within 15 minutes of ERO activation. Once notified, these external organizations ensure that other stakeholder groups under their jurisdiction (e.g., ambulance services, public welfare authorities, etc.) receive the appropriate notifications.

OPG has a responsibility to communicate with the public, media, stakeholders and employees during nuclear emergencies as identified in Section 1.2.5 of the CNEP [7]. To facilitate this, OPG has a plan in place and procedures that govern crisis communications response. OPG also supports the Province and municipalities who provide coordinated communications under the jurisdiction of the PNERP.

The CEOF is established as the primary emergency response operational interface for external agencies and authorities (Province's PEOC and CNSC's EOC). This ensures communication demands on the site response organization are kept to a minimum, allowing a focused site response on incident mitigation and nuclear safety. The CEOF executes its mandate by [7]:

- Managing the overall OPG Nuclear response.
- Mobilizing and coordinating corporate resources.
- Ensuring Provincial and external requirements are met.
- Supporting the CMCC response.
    - As discussed in Section 4.1.5, the primary function of the CMCC is to provide corporate leadership, strategic direction, and executive level decisions to any and all incidents requiring CMCC support until the emergency is mitigated and a long-term recovery strategy is in place. The CMCC is an off-site facility that is staffed by 10 representatives from the various OPG Business Units [37].

N-STD-AS-0010, "Nuclear Crisis Communications Standard" [38] governs public communications on behalf of OPG Nuclear in the event of a nuclear emergency and ensures consistent and coordinated public information response. Crisis communications response is implemented by OPG's Corporate Relations and Communications with support from the SMC and/or the CMCC, or with assistance and guidance from ERO personnel.

There are various ERO roles that support communications with key external stakeholders as part of the event response, as outlined below [7]:

1) Municipal EOC/Regional EOC Liaison Officer

   OPG provides a local site representative at each of the activated Municipal EOCs and Regional EOCs to fulfill the OPG liaison officer position. The liaison officer provides coordination with the site for resources and off-site response activities in the local area. Official emergency communications with Municipal EOC/Regional EOC are through the liaison officer and the SMC.

2) Reception Centres and Emergency Worker Centre Supervisors

   OPG Nuclear site organization and call-in personnel staff and equip the MDU function of the Reception Centres. OPG MDU supervisors communicate with the

SMC to keep the ERO apprised of the MDU status and any need for future resources.

Emergency Worker Centres are staffed by OPG call-in personnel with equivalent qualifications as Reception Centre MDU staff. Communication is regularly maintained between the Emergency Worker Centre OPG supervisors and the SMC and Regional EOC.

3) PEOC – OPG Representative

The OPG representative in the PEOC Operations Section may initially report to the CEOF to receive briefing on the details of the incident. Upon activation of the PEOC, this representative will proceed to the PEOC to act as the official OPG representative and liaison.

Activities of the representative at the PEOC include the following:

- Relaying protective action decisions to the CEOF;
- Communicating provincial requests for services and resources; and
- Identifying operational response issues and potential discrepancies for OPG resolution.

4) Emergency Response Manager

The Emergency Response Manager is located in the SMC and has authority over the site ERO once command and control is assumed. Primary duties of the Emergency Response Manager include:

- Ensuring communication of any upgrades of initial notification categories to provincial and municipal contact points during the first four hours or until such time as formally indicated by the provincial authority.
- Ensuring provision of key decision support information (emergency data transmittal) from the site to the provincial authority.
- Providing review and concurrence of media releases and employee bulletins.
- Any other elements identified for the site by the PNERP (e.g., notification of site evacuation, notification of venting, provision of off-site radiological monitoring, staffing commitments at off-site centres).

5) Emergency Recovery Director

The Emergency Recovery Director is located in the CEOF and has authority to oversee the site response and manage the overall OPG nuclear emergency response. The Emergency Recovery Director has principal accountabilities for communications and issue response with the following:

- CNSC – Director General – Directorate of Power Regulation; and
- PEOC – Commander – Command Section.

OPG also supports the Province and municipalities who provide coordinated emergency communications under the jurisdiction of the PNERP. Per Section 1.3.5 of the CNEP [7], OPG provides resources and assistance to the designated Primary Zone municipalities to enable them to establish and maintain a public alerting system as required by the PNERP.

In addition, the PNERP identifies the requirement for a public education program for the area surrounding the nuclear facilities. The program is coordinated by the Office of the Fire Marshal and Emergency Management and includes consultation with the appropriate stakeholders and advisors, including the designated municipalities and nuclear installations. Section 1.3.6 of the CNEP [7] states that the program message shall be consistent with the PNERP and provide adequate information to recipients to enable them to effectively protect themselves during a nuclear emergency. OPG responsibilities are also identified in Section 1.3.6 of the CNEP [7].

Conclusion:

The conclusion of this Review Task assessment is that there are mechanisms in place for notifying and informing relevant off-site organizations such as the police, fire departments, hospitals, ambulance services, regulatory bodies, local authorities, governments, public welfare authorities, and the news media. The intent of Review Task #7 is met and therefore Pickering NGS is compliant.

4.1.8 Review Task #8: Availability of Communications Equipment

Confirm the availability of sufficient communications equipment at the plant and at the off-site Emergency Centre to permit effective communications with Emergency Response Teams, both on and off site.

The available communications equipment within OPG Nuclear's emergency facilities is described in Section 1.5 of the CNEP [7]. Emergency facilities are equipped with the necessary voice communications equipment, including back-up, and other equipment that includes fax machines, personal computers, status boards, area radiation monitoring equipment, radiation survey kits, off-site monitoring vehicles and meteorological monitoring data readout equipment, as appropriate to the facility. Other support facilities have phone communications equipment, including back-up fax machines and radios as appropriate. All OPG Nuclear emergency facilities have the capability to access WebEOC, which is a web-based information management software used by the ERO that allows real-time information posting and multidirectional communication over an Internet connection. WebEOC is provided on a dedicated server backed up by a server maintained physically separate from the main production server [39].

The Pickering site has a variety of emergency communications equipment, including back-up. The Station Public Telephone System is the primary telephone system. Satellite phones are available in the Pickering 1,4 and Pickering 5-8 Shift Manager Offices, the SMC, and the CEOF in the event that all other telecommunication methods become unavailable. Fax machines equipped with Station Public Telephone System and trunk lines are available. The Pickering site has an emergency radio communications system with dedicated frequencies. On-site and off-site field teams are equipped with cell phones and/or portable radios. Base radio stations are available at a number of on-site locations such as the MCR. Off-site field team vehicles are equipped with mobile communication and a back-up system. While the equipment described above is considered to be sufficient, OPG has a Telecommunications Enhancement Project in progress to equip facilities with additional equipment to further enhance telecommunications [40]. The fact that this project remains in progress is not considered to be a PSR2 gap as the objective of the project is to enhance existing telecommunication capabilities as opposed to addressing a deficiency.

OPG emergency response facilities are linked to the PEOC, Municipal EOC, and Regional EOC through landline phones and other systems to allow information transfer. OPG has also established reliable contingency communications systems (e.g., Nuclear Emergency Telephone System).

P-MAN-03490-00002, "Pickering ERO Equipment and Facility Manual" [41] provides requirements and direction for Pickering ERO facilities configuration management and maintenance to ensure readiness, and to provide contingency actions, in accordance with the CNEP. It provides a description of the SMC, EOC, and SM offices including facility set-up, documentation, communications and other equipment and processes dedicated to or specifically set up for the Pickering ERO. N-MAN-03490-10000, "CEOF Equipment and Facility Manual" [42], provides the requirements and direction for CEOF configuration management and maintenance to ensure readiness, and to provide contingency actions, in accordance with the CNEP. OPG-PROC-0028, "Crisis Management & Communications Centre Procedure" [37], provides the framework for the CMCC during the response to incidents that require CMCC activation. This procedure also provides requirements and direction for CMCC configuration management and maintenance to ensure readiness, and to provide contingency actions, in accordance with the CNEP.

N-PROC-RA-0040, "Maintenance and Testing of Emergency Preparedness Facilities and Equipment" [43] defines the process used to monitor, periodically test and maintain the emergency response facilities and equipment to ensure operability 24 hours a day, 7 days a week. This includes testing and facility walk-through frequencies and covers the different types of equipment in the facilities, such as faxes, computers, radiation instruments, communication, meteorological and data transmitting equipment. A complete list of EP facility and inventory check documents is provided in N-LIST-

03490-10028, “Emergency Preparedness Facility and Inventory Check Documents” [44], which includes Pickering, Darlington, and off-site facilities.

The availability of communications equipment within OPG Nuclear’s emergency facilities is managed under the Equipment Important to Emergency Response (EITER) program. EITER includes systems, structures, and components, as well as essential tools and equipment, necessary to implement the CNEP. The overall management process for EITER is documented in N-PROC-RA-0133, “Management of Equipment Important to Emergency Response” [45].

EITER is listed in the following documents according to its location:

- N-INS-03491-10025, “Unavailability of Equipment Important to Emergency Response – Off-Site” [46];

- D-INS-03491-10000, “Unavailability of Equipment Important to Emergency Response – Darlington” [47];

- P-INS-03491-00050, “Unavailability of Equipment Important to Emergency Response – Pickering” [48].

These instructions also contain the required actions (including compensatory measures) that are to be taken if EITER becomes unavailable. The adequacy of the EITER program is discussed in Review Task #10 of this report.

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place to ensure the availability of sufficient communications equipment at the plant and at the off-site Emergency Centres to permit effective communications with Emergency Response Teams, both on and off site. The intent of Review Task #8 is met and therefore Pickering NGS is compliant.

4.1.9 Review Task #9: Adequacy of Emergency Response Procedures

Assess adequacy of the emergency response procedures and training and exercises for all site staff. Confirm that integrated and partial emergency exercises have been conducted to check satisfactory function of the emergency organization and its equipment.

Procedures

The adequacy of emergency response procedures is demonstrated through drills and exercises. The adequacy of the drills and exercises program is discussed in Review Task #4 of this report.

Section 1.6.1 of the CNEP [7] describes the documentation and governance that has been established to implement the CNEP. All EP documents and their control and periodic review are governed by OPG-PROC-0001, "Process Administrative Governance Documents" [49], and N-PROG-AS-0006, "Records and Document Control" [50]. P-MAN-03490-00005, "Index – Emergency Response Manual 5" [16] lists the suite of procedures and instructions for each of the ERO specific positions.

Training

The adequacy of the training program for emergency response personnel is discussed in Review Task #4 of this report.

OPG's ERO training and qualification is described in Section 1.6.3 of the CNEP [7]. The CNEP refers to N-TQD-503-00001, "Nuclear Emergency Response Organization Training and Qualification" [28], which establishes the training and qualification requirements for individuals assigned to the ERO. It is based on the nuclear industry best practice, Systematic Approach to Training, which utilizes a task-based analysis to determine the training requirements and a performance-based analysis to verify effectiveness. In addition, all site staff receive the Nuclear General Employee Training in accordance with N-TQD-501-00001, "Nuclear General Employee Training and Qualification Description" [51]. The Nuclear General Employee Training is delivered to all employees requiring unescorted access to the nuclear facility so they are knowledgeable in the emergency response actions required of them.

Exercises and Drills

The adequacy of the drills and exercises program for site staff is discussed in Review Task #4 of this report.

Section 1.6.5.2 of the CNEP [7] refers to N-PROC-RA-0045, "Emergency Preparedness Drills and Exercises" [29], which defines drill and exercise requirements, including activity and frequency requirements. On an annual basis, the EP Department assesses the ERO performance in drills and exercises to the established objectives identified in N-INS-03490-10002, "Conduct of Emergency Preparedness Drills and Exercises" [22] and reviews all drill and exercise related SCRs and ARs to monitor status and ensure completeness. These assessments are documented in the EP Drill and Exercise Performance Objectives Reports. Deficiencies found during drills and exercises are documented using the SCR system in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [23]. Corrective Action plans are developed and corrective actions are initiated and tracked to completion.

OPG has conducted several integrated and partial emergency exercises to check satisfactory function of the emergency organization and its equipment. The results of each exercise are documented in an after-exercise report that discusses the response performance for various portions of the ERO and identifies strengths, good practices, observations, opportunities for improvement, and findings specific to each aspect of the response. A selection of relevant reports for Pickering NGS is provided below:

- P-REP-03490-00053, Emergency Preparedness Evaluated Drill Report – Pickering Station Emergency Drill (Jan 23 2013) [52];
- P-REP-03490-00052, Emergency Preparedness – Pickering Emergency Mitigating Equipment (EME) Drill Report (February 6 2013) [53];
- P-REP-03490-00054, Emergency Preparedness Evaluated Drill Report – Pickering Station Emergency Drill (July 3 2013) [54];
- P-REP-03490-00055, Emergency Preparedness – Pickering Nuclear DBA/SAMG Report (September 23 2013) [55];
- P-REP-03490-00056, Emergency Preparedness – Pickering Nuclear DBA/SAMG Report (November 1 2013) [56];
- N-REP-03491.23-10041, Emergency Preparedness Exercise Report – Pickering Station Emergency Exercise 15-Oct-2014 [57]; and
- N-REP-03491.23-10042, Emergency Preparedness Exercise Report – Pickering Station Emergency Exercise – 25Nov2015 [58].

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place to ensure the adequacy of the emergency response procedures and training and exercises for all site staff. It has also been confirmed that integrated and partial emergency exercises have been conducted at Pickering NGS to check satisfactory function of the emergency organization and its equipment. The intent of Review Task #9 is met and therefore Pickering NGS is compliant.

4.1.10 Review Task #10: Adequacy of On-Site Equipment and Facilities

Confirm the adequacy of on-site equipment and facilities for emergencies and offsite emergency facilities or locations, including walkdowns of relevant areas on and off the site.

A range of equipment and facilities, located both on-site and off-site, are used to support the overall emergency response. P-MAN-03490-00002, "Pickering ERO Equipment and Facility Manual" [41] provides requirements and direction for Pickering ERO facilities configuration and management to ensure readiness, and to provide contingency actions, in accordance with the CNEP. It provides a description of the SMC, EOC, and SM offices including facility set-up, documentation, communications and other equipment and processes dedicated to or specifically set up for the Pickering ERO. N-MAN-03490-10000, "CEOF Equipment and Facility Manual" [42], provides the requirements and direction for CEOF configuration management and maintenance to ensure readiness, and to provide contingency actions, in accordance with the CNEP.

The availability of the necessary equipment and facilities to implement the CNEP is managed through the EITER program. Section 1.6.6 of the CNEP [7] refers to N-PROC-RA-0133, "Management of Equipment Important to Emergency Response" [45], which provides the overall management process for EITER. This procedure provides a framework to assure that when EITER is removed from service or is in a degraded condition, the correct restoration priority is assigned, compensatory measures are implemented and the equipment is promptly restored to a functional condition. The intent of this procedure is to ensure readiness of equipment and facilities required to implement the emergency plan. The Station Alignment Meeting package includes a Risk Management matrix, which identifies EITER issues. This information is reviewed daily and any EITER issues are flagged to the station operating staff and the station senior management team.

EITER includes systems, structures, and components, as well as essential tools and equipment, necessary to implement the emergency plan as described in the CNEP. EITER also includes EME as it is not managed under any other existing program to identify unavailability, restoration priority, or compensatory actions. EITER is listed in the following documents according to its location:

- N-INS-03491-10025, "Unavailability of Equipment Important to Emergency Response – Off-Site" [46];
- D-INS-03491-10000, "Unavailability of Equipment Important to Emergency Response – Darlington" [47];
- P-INS-03491-00050, "Unavailability of Equipment Important to Emergency Response – Pickering" [48].

These instructions also contain the required actions (including compensatory measures) that are to be taken in the event that EITER becomes unavailable.

It is important to note that the EITER program excludes equipment that is already managed by existing programs. Specific examples are listed below [45]:

1) Personal Protective Equipment (PPE): This equipment is available at Pickering NGS and is managed by plant programs and personal protection training. Further, non-standardized PPE is scenario-dependent and hence will be accessed and used as-required by personnel. This is governed by OPG-PROC-0010, "Health and Safety Management Program" and related governance.

2) Radiation Protection Equipment (Personal): Personal Radiation Protection equipment (e.g., personal dosimetry, radiation clothing, and decontamination supplies) is managed by Radiation Protection procedures and programs under governing document N-PROG-RA-0013, "Radiation Protection". It is readily available at multiple sites and can be easily deployed as required.

3) Fire Protection Equipment: This equipment is managed under N-PROG-RA-0012, "Fire Protection". This program meets the intent of the EITER program; i.e., the Fire Protection equipment that provides an Emergency Response function is

maintained, inspected and tested; impairments are managed by a comprehensive process including compensatory actions.

4) First Aid Equipment: This equipment is managed under N-PROG-RA-0012, "Fire Protection" and implementing standard N-STD-RA-0028, "First Aid". This standard identifies processes, overall requirements, and staff accountabilities to ensure effective First Aid is established and maintained.

5) SAMG Instrumentation and Equipment: The SAMG response uses plant instrumentation from systems that are managed by existing processes so these are not included. EME is included in the EITER program.

6) Supplies including fuel and other consumables: There are pre-established processes for the stocking and resupply of provisions required for emergency management including fuel supplies. Therefore, consumables are not managed as EITER.

Appendix A, "Guidance on Developing Equipment Important to Emergency Response List" of N-PROC-RA-0133 [45], provides guidance that can be used to determine whether new or additional equipment should be added to the EITER program.

N-PROC-RA-0040, "Maintenance and Testing of Emergency Preparedness Facilities and Equipment" [43], outlines the process by which emergency facilities and equipment are inspected, inventoried, operationally checked and tested. This procedure applies only to equipment and facilities used in a radiological emergency that is consistent with the CNEP.

As per Section 1.2 of N-PROC-RA-0040, a list of inventory and equipment checks including frequency is defined in N-LIST-03490-10028, "Emergency Preparedness Facility Inventory and Check Documents" [44]. This list summarizes the various implementing documents that are used to perform maintenance and testing activities for Pickering, Darlington, and off-site equipment and facilities. Walkdowns for individual facilities are performed per the corresponding frequency identified in N-LIST-03490-10028 to confirm adequate equipment is available.

Activities related to the testing and maintenance of EME are documented in N-INS-03600-10002, "Beyond Design Basis Emergency Mitigating Equipment Testing and Maintenance Process" [59]. This document establishes the instructions for testing and maintenance of EME and associated connection points to station systems credited to support BDBA mitigation. It ensures fleet wide consistency and rigour of the process of testing, maintenance, monitoring, and reporting in support of BDBA management. Appendix A, "EME Test and Maintenance" of N-INS-03600-10002 [59], summarizes the various testing and maintenance activities that are performed for EME. N-BDB-03600-00001, "Emergency Mitigating Equipment Inventory" [60] contains a complete listing of EME inventory. N-BDB-03600-00002, "OPG Emergency Mitigating Equipment for Beyond Design Basis Accidents: Technical Basis Document" [61] documents the technical basis for the EME that has been procured by OPG.

The adequacy of EITER is primarily demonstrated through the use of drills and exercises. As per N-PROC-RA-0045, "Emergency Preparedness Drills and Exercises" [29], all major elements of the emergency plan are tested every five years, with a full scale integrated exercise once every three years, per site. Table 1 of N-PROC-RA-0045 specifies the minimum drill and exercise frequency requirements.

A review of the latest performance objectives report, N-REP-03490-10038, "2014 Emergency Preparedness Drill and Exercise Performance Objectives Report" [24] indicates that all corrective actions in 2014 were correctly dispositioned and most of the actions had been completed. Similar findings were obtained from N-REP-03490-10034, "2013 Emergency Preparedness Drill and Exercise Performance Objectives Report" [62].

Pickering recently completed an exercise in November 2015 involving a multi-unit severe accident. The scope of the exercise was developed to demonstrate OPG's response capability to an event which has progressed from a Design Basis Accident (DBA), into a BDBA involving a multi-unit event, with subsequent event progression into a multi-unit severe accident requiring deployment of EME. The results of this exercise have been documented in N-REP-03491.23-10042 R000, "Emergency Preparedness Exercise Report – Pickering Station Emergency Exercise – 25Nov2015" [58]. The majority of ERO instructions utilized and actions taken in response to the simulated events were deemed to be acceptable. There were a number of opportunities for improvement identified, along with corresponding corrective actions. These enhancements do not represent safety significant findings and are therefore not a PSR2 gap.

Conclusion:

The conclusion of this Review Task assessment is that there is governance in place to ensure the adequacy of on-site equipment and facilities for emergencies and offsite emergency facilities, including walkdowns of relevant areas on and off the site. The intent of Review Task #10 is met and therefore Pickering NGS is compliant.

4.1.11 Review Task #11: Severe Accident Management Program

Confirm development or existence of a program for Severe Accident Management.

As per Section 1.2.3.3 of the CNEP [7], N-PROG-MP-0014 "Reactor Safety Program" provides the framework for major aspects of safe operation. These include safety analysis basis and analysis of record, safe operating envelope and beyond design basis accident management.

One element of the Reactor Safety program relates to the management of BDBAs and SAs. In this context, a BDBA refers to a relatively low frequency event sequence that is not included in the plant design basis (due to the low frequency of occurrence) and is not necessarily bounded by the analyses of the station design basis. If the consequences of such events are significant core degradation, these BDBAs are referred to as SAs.

OPG's Severe Accident Management (SAM) Program has been implemented through N-STD-MP-0019, "Beyond Design Basis Accident Management" [15] and is supported in its execution through SAMG and ERO organization procedures. N-STD-MP-0019 was developed using guidance from CNSC G-306, "Severe Accident Management Programs for Nuclear Reactors" [63] and CNSC REGDOC 2.3.2, "Accident Management: Severe Accident Management Programs for Nuclear Reactors" [64].

SAMG is a set of written guidance to implement strategies should a BDBA progress to a SA. The physical processes that govern SA phenomena are complex and, consequently, SAMG cannot be made highly dependent on detailed analyses because of limited understanding of certain SA phenomena and other uncertainties associated with SA causes and progression. However, reasonable strategies for coping with SA progression can be identified and developed using "state of the art" reviews, Probabilistic Safety Assessments, and insights on accident behaviours from accident analyses. SAMG allows flexibility in application and the SAMG document set is referred to as "guidance". SAMG documentation has been approved for use under the NA44-SAM-09013-10000 document series for Pickering 1-4 and the NK30-SAM-09013-10000 document series for Pickering 5-8.

Post-Fukushima, the CNSC assigned a series of Fukushima Action Items to OPG. A subset of these actions related to enhancing the capability of the SAMG program at Pickering NGS. All Fukushima Action Items have been closed for OPG and the CNSC has concluded that OPG has strengthened reactor defence-in-depth and enhanced its emergency response at Pickering NGS in response to lessons learned from the Fukushima nuclear accident [65].

Conclusion:

The conclusion of this Review Task assessment is that there is a Severe Accident Management Program at Pickering NGS. The intent of Review Task #11 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for three L/R/C/Ss with content applicable to Safety Factor 13 are provided in Reference [6]. Associated findings applicable to Safety Factor 13 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 13

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 13
CSA N293-12, "Fire Protection for Nuclear Power Plants"	Gaps identified from the PSR2 incremental review of N293-12 will be applicable to the Plant Design Safety Factor. Results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 13
CNSC REGDOC-2.10.1 (2014), "Nuclear Emergency Preparedness and Response"	There is one PSR2 REGDOC-2.10.1 (2014) gap which relates to Safety Factor 13 (Emergency Planning): 1. OPG has completed a gap analysis for transition to REGDOC-2.10.1 and has developed an action plan to achieve compliance. The transition plan that OPG has committed in order to bring Darlington into compliance with REGDOC-2.10.1 applies across the nuclear fleet and will also bring Pickering into compliance. Updating OPG governance to ensure that the Pickering Evacuation Time Estimate study is maintained and to define how the Potassium Iodide (KI) pill program will be sustained is in progress. As these two actions are not yet complete, this is identified as a PSR2 gap (**Pickering PSR2 Gap SF13-1**).
CSA N1600-14, "General Requirements for Nuclear Emergency Management Programs"	There are no PSR2 gaps for CSA N1600-14. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CSA N1600-14.

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program reviewed for Safety Factor 13 is identified in Table 2, and details of the associated effectiveness reviews for the N-PROG are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 13 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 13 to determine impacts associated with operation of the Pickering Units past 2020.

A review of the Darlington Integrated Improvement Plan (IIP) [10] for gaps that may need to be reassessed in the context of Pickering PSR2 for operation past 2020, identified the following:

- **Gap SF13-2:** Darlington Gap IIP-OI 046 was identified to assess the Emergency Response Projection (ERP) code for potential enhancements to address multi-unit Beyond Design Basis Event scenarios. The action assigned to this gap (AR 28175339, TCD Q1 2017) is also applicable for Pickering NGS and is therefore a gap for Pickering PSR2. ERP is used to assist in decision making for off-site emergency response actions. Specifically, ERP is used to evaluate potential off-site consequences and predict the timing of containment re-pressurization.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [8] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 13 report that require discussion in other Safety Factor reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 13 were reviewed for the eleven PSR2 Review Tasks in Section 4.1 of this report and resulted in no Pickering PSR2 gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 13 were prepared per Sections 4.2 and 4.3, respectively, and resulted in PSR2 Gap SF13-1 below. Per Section 4.2, the PSR2 review of CSA N293-12 is in progress. However, gaps identified in this review will be applicable to the Plant Design Safety Factor, and hence, results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 13 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 13), which resulted in PSR2 Gap SF13-2.

The two gaps identified that will need to be addressed as part of Pickering PSR2 are:

- **Gap SF13-1**: OPG has completed a gap analysis for transition to CNSC REGDOC-2.10.1 and has developed an action plan to achieve compliance. The transition plan that OPG has committed in order to bring Darlington into compliance with REGDOC-2.10.1 applies across the nuclear fleet and will also bring Pickering into compliance. Updating OPG governance to ensure that the Pickering Evacuation Time Estimate study is maintained and to define how the Potassium Iodide (KI) pill program will be sustained is in progress. As these two actions are not yet complete, this is identified as a PSR2 gap.

- **Gap SF13-2**: Darlington Gap IIP-OI 046 was identified to assess the ERP code for potential enhancements to address multi-unit Beyond Design Basis Event scenarios. The action assigned to this gap (AR 28175339, TCD Q1 2017) is also applicable for Pickering NGS and is therefore a gap for Pickering PSR2.

The review of Safety Factor 13 has confirmed that OPG Nuclear has: a) adequate plans, staff, facilities and equipment in place for dealing with emergencies, and b) there are adequate arrangements in place for regular emergency training and exercises, and interaction and coordination with local and national authorities.

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-RA-0001, "Consolidated Nuclear Emergency Plan"

The purpose of the Consolidated Nuclear Emergency Plan (CNEP) is to provide a written basis to document the concepts, roles, and resources required by Ontario Power Generation (OPG) Nuclear to implement and maintain its emergency response capability to protect the public, employees, and the environment in the event of a nuclear emergency. It provides a framework for interaction with external authorities and defines OPG commitments under the Provincial Nuclear Emergency Response Plan (PNERP). The CNEP applies to both the Pickering and Darlington Nuclear facilities.

The CNEP deals with emergency situations that may endanger the safety of on-site staff, the environment, and the public. It also represents a basis for controlling changes and modifications to the OPG Nuclear Emergency Preparedness (EP) program. Provisions of the CNEP apply to any associated potential threat of release of radioactive material (for example, the need for off-site notification, situation updates and confirmation of any radioactive releases). Liquid emission response and transportation of radioactive material emergency response are governed by separate plans.

The Emergency Management department completed a self-assessment, NO13-000443-SA [B.1.1], in November 2013 in order to assess compliance with N-PROG-RA-0001, "Consolidated Nuclear Emergency Plan", including a review of all agreements with offsite authorities. No findings were generated, however a series of recommendations were generated to ensure that the Provincial Nuclear Emergency Response Plan requirements are properly documented. The recommendations were captured under SCRs N-2013-21141, N-2013-21131 and AR 28161879, which have all been completed.

The Emergency Preparedness department completed a self-assessment, NO15-001449-SA [B.1.2], in February 2016 in order to review the requirements of REGDOC-2.10.1, "Nuclear Emergency Preparedness and Response" against N-PROG-RA-0001, to confirm compliance, identify any gaps, and recommend actions to close any identified gaps. The self-assessment was applicable to both Pickering and Darlington NGS and concluded that the CNEP met the majority of the REGDOC-2.10.1 requirements. However, there are additional REGDOC-2.10.1 requirements which need to be incorporated into OPG governance (e.g., an update of the CNEP to reference the planning basis, a listing of agreements with applicable offsite agencies to be referenced in the CNEP, and a validation process to demonstrate compliance with the CNEP and procedures), which may include developing new processes and consulting with the province and industry partners. AR# 28184526 was initiated, which required corrective actions to be implemented in order to address any gaps between the requirements of REGDOC-2.10.1 and N-PROG-RA-0001. This AR is expected to be completed by Q4 2017.

Nuclear Oversight conducted a performance based audit of the Emergency Preparedness program (note, N-PROG-RA-0001 is the program level document for Emergency Preparedness) in April 2013, NO-2013-030 [B.1.3], in order to confirm that the program is being effectively managed and is in compliance with regulatory and OPG governance requirements for both Pickering and Darlington NGS. The audit identified performance improvement opportunities applicable to Pickering NGS related to alignment with standards, readiness of Emergency Preparedness equipment and facilities, and alignment of CNEP with Provincial Implementing Plans.

Three SCRs were initiated to address the above findings (SCRs N-2013-01608, N-2013-01609 and N-2013-01610), which required corrective actions to be implemented. These SCRs have since been closed and the necessary corrective actions were completed to address the underlying issues.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 14, *Radiological Impact on the Environment* is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 14 were reviewed for the seven PSR2 Review Tasks in Section 4.1 of this report. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 14 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Safety Factor 14 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 14).

The results of the review of Safety Factor 14 are discussed in Section 5.0 of this report. The review has confirmed that Pickering NGS has an adequate and effective program for monitoring the radiological impact of the plant on the environment, which ensures that emissions are properly controlled and are as low as reasonably achievable. As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. As discussed in Section 1.0, an effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis will be conducted using recent audit and self-assessment results.

As outlined in IAEA SSG-25 [3], the objective of the review of Safety Factor 14 is to: "determine whether the operating organization has an adequate and effective programme for monitoring the radiological impact of the plant on the environment, which ensures that emissions are properly controlled and are as low as reasonably achievable." REGDOC-2.3.3 [2] requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant."

This report documents the results of the review of Safety Factor 14 for Pickering PSR2. The report is based on the OPG Governance, Programs, data, and material available up to January 15, 2016 which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 14 Review Tasks are defined in Reference [1]. Details of the derivation of these Review Tasks from CNSC REGDOC-2.3.3 and IAEA SSG-25 are shown in Reference [5]. The Safety Factor 14 Review Tasks are:

1) Confirm there are procedures in place to ensure that permitted release limits of radiological substances are not exceeded and, if they are, that appropriate corrective action is taken to minimize the possibility of limits being exceeded in the future.

2) Confirm records of radiological effluent release are maintained in accordance with regulatory requirements.

3) Confirm that a program exists to define the requirements for alarm systems to respond to unplanned effluent releases from on-site facilities.

4) Confirm the environmental data recorded by the station is published and is available on request to the general public.

5) Review the environmental data recorded by the station and compare with the values measured before the plant was put into operation.

6) Confirm there is a process to address changes in the use of land external to the site with respect to the impact on public safety from facility releases.

7) Confirm that the monitoring program is appropriate and sufficiently comprehensive. In particular, confirm that the radiological impact of the plant on the environment is not significant compared with that due to other sources of radiation.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the Radiological Impact on the Environment Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 14 L/R/C/S reviews are high level or incremental in nature. The definitions of High Level Review and Incremental Review are as follows:

- High Level: New L/R/C/Ss not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and,

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in References [6] and [7]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Radiological Impact on the Environment Safety Factor 14

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA[3] N288.1	Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities	N288.1-14	8, 14	Incremental	N288.1 addressed as part of Pickering B and Darlington ISRs.
2	CSA N288.4	Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills	N288.4-10	8, 14	Incremental	N288.4 addressed as part of Pickering B and Darlington ISRs.
3	CNSC REGDOC-2.9.1*	Environmental Protection Policies, Programs and Procedures	2013	8, 14	Incremental	REGDOC-2.9.1 addressed as part of Darlington ISR. S-296 also addressed as part of Pickering B and Darlington ISRs.
Additional L/R/C/Ss						
4	CNSC G-228	Developing and Using Action Levels	2001	8, 14, 15	Incremental	G-228 addressed as part of Pickering B and Darlington ISRs.

[3] CSA – Canadian Standards Association

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
5	CSA N288.6	Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills	N288.6-12	8, 14	Incremental [4]	N288.6 not addressed as part of Pickering B or Darlington ISRs. Implementation Plan and clause-by-clause review have been prepared for Pickering Environmental Monitoring Program compliance with N288.6.
6	CSA N288.5	Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills Facilities	N288.5-11	8, 14	Incremental [4]	N288.5 not addressed as part of Pickering B or Darlington ISRs. OPG has performed a gap analysis and completed all actions in the implementation plan to satisfy mandatory requirements of N288.5.
7	CSA N288.3.4	Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities	N288.3.4-13	8, 14	Incremental [4]	N288.3.4 addressed as part of Darlington ISR, but not addressed as part of Pickering B ISR. OPG has completed a gap analysis and is developing an implementation plan to satisfy mandatory requirements of N288.3.4.
8	CSA N288.7	Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills	N288.7-15	14	High Level	First edition of N288.7 issued in 2015. Not addressed as part of Pickering B or Darlington ISRs. OPG is developing a gap analysis and implementation plan to satisfy mandatory requirements of N288.7.

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

[4] Per Section 3.2.2 of the R02 PSR2 Basis Document [1]: "Table D1 identifies the review type to be applied to each of the Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis. Following further assessment of past work, the review type of a listed modern Law, Regulation, Code or Standard may be changed from Clause-by-Clause or High Level to Incremental." Past assessments of CSA N288.3.4, N288.5 and N288.6 were reviewed and implementation plans with gap assessments were identified. As a result, the Review Type for these three L/R/C/Ss was changed from High Level to Incremental since "… implementation plans exist for many of the codes and standards not addressed in PSR1 and therefore an incremental review will be applied to these documents" [1].

2.3 OPG Program Effectiveness Reviews

The OPG Programs (N-PROGs or OPG-PROGs) reviewed for Safety Factor 14 are listed in Table 2 below.[5] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of each of the N-PROGs or OPG-PROGs in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Programs Reviewed for Safety Factor 14

Document Number	Document Title
N-PROG-OP-0006 [8]	Environmental Management
OPG-PROG-0005 [9]	Environmental Management System

2.4 Additional Reviews

The PSR2 Safety Factor 14 Report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 14):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Safety Factor 14 to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Safety Factor 14 are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan (COP) [10] is provided in a separate PSR2 COP Review Report.

In addition, Fukushima Action Items (FAIs) were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in a separate PSR2 FAI Review Report.

Any PSR2 gaps identified as a result of the Safety Factor 14 review which need to be addressed in other Safety Factor Reports are discussed in Section 4.4 of this report.

---

[5] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Radiological Impact on the Environment Safety Factor.

3.1 Review Tasks

As discussed earlier, the Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]).

For each Safety Factor 14 Review Task identified in Section 2.1, a confirmation of the existence of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) was performed. Compliance against Review Tasks is also assessed by reference to applicable Condition Assessments, safety analyses and operating experience, as required.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.
- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[6]
- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;
- Implications of extending Pickering NGS operation beyond 2020; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;
- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;
- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);
- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

---

6 "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 14 L/R/C/S reviews identify Compliances and Gaps as defined below:[7]

- <u>Compliance</u>:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.
    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 14.)

---

[7] Safety Factor assessments for Review Tasks and L/R/C/S reviews make use of: a) OPG Governance, Programs, Policies and Procedures which support the assessment arguments, b) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC (all related to the Safety Factor under review), as identified in the R04 Pickering LCH [4], c) Identification of previously identified Pickering-specific or programmatic PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and d) Assessments and reviews performed since the PSR1 documents were completed.

- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.
    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 14.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and
- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance. As a result, the broad review scope of program audits focuses on

identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [11]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from review of current OPG Governance, and has used the most recent version of these documents as of the PSR2 freeze date of January 15, 2016.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was also performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 14):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Safety Factor 14 (as identified in the Darlington ISR Integrated Implementation Plan [12] and Pickering Units 5-8 Continued Operations Plan [10]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending operation beyond 2020 (if any).[8]

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in a separate PSR2 FAI Review Report.

---

[8] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

Any PSR2 gaps identified as a result of the Safety Factor 14 review which need to be addressed in other Safety Factor Reports are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 14 Review Tasks. The Review Tasks focus on radiological impacts only. While OPG programs also address non-radiological impacts, they are not within the scope of this Safety Factor.

4.1.1 Review Task #1: Permitted Release Limits

Confirm there are procedures in place to ensure that permitted release limits of radiological substances are not exceeded and, if they are, that appropriate corrective action is taken to minimize the possibility of limits being exceeded in the future.

4.1.1.1 Procedures to Ensure Permitted Release Limits are not Exceeded

P-MAN-03480-00001, "Environmental Emissions Control" [13] provides the Chemistry Laboratory, Operators, Shift Managers and Environment Compliance Section with a summary of the limits and actions required for the control of environmental emissions at Pickering NGS. This document includes routine environmental monitoring of radiological, chemical (non-radiological) and thermal emissions.

Ensuring Radiological CNSC Emission Limits are not Exceeded

Through the Nuclear Safety and Control Act (NSCA) [14], the CNSC stipulates the requirements in Section 10.1 of the Pickering NGS Operating Licence (PROL-48.02/2018, "Nuclear Power Reactor Operating Licence: Pickering Nuclear Generating Station") [15] for the licensee to control and monitor releases of nuclear substances from the nuclear facility. One way in which the releases are controlled and monitored is to ensure that the releases shall not exceed the limits identified in OPG Reports NA44-REP-03482-00001, "Derived Release Limits and Environmental Action Levels for Pickering Nuclear Generating Station A" [16] and NK30-REP-03482-00001, "Derived Release Limits and Environmental Action Levels for Pickering Nuclear Generating Station B" [17].

Section 1.2.4 of N-PROG-OP-0006, "Environmental Management" [8] describes the effluent control program, which establishes controls and limits associated with radiological releases and which ensures releases are only emitted through approved and monitored pathways. Aspects of this program include maintaining radiological emissions to the environment from OPG facilities below the applicable regulatory emission limits (Derived Release Limits (DRLs)), and As Low As Reasonably Achievable (ALARA), taking social and economic factors into account, as described in N-STD-OP-

0042, “Controlling Radiation Exposure of the Public and the Environment to as Low as Reasonably Achievable” [18]. This is achieved through elements such as:

- Management control over work practices
- Personnel qualification and training
- Control of public exposure to radiation, and
- Planning for unusual situations.

OPG also uses Internal Investigation Levels (IILs) to help keep radionuclide levels in effluents low and to provide early warning before reaching an Action Level. Actions taken when IILs or Action Levels are exceeded are discussed in Section 4.1.1.2.

N-STD-OP-0031, “Monitoring of Nuclear and Hazardous Substances in Effluents” [19], establishes minimum standards for the monitoring of nuclear and hazardous substances in airborne and waterborne effluents for Nuclear facilities operating under normal and abnormal operating conditions. This Standard describes the:

- Authority and hierarchical structure of effluent monitoring related documentation
- Fundamental principles and objectives of effluent monitoring
- Conditions that determine when monitoring is required
- Requirements for effluent monitoring programs and equipment.

In addition, N-PROC-MA-0002, “Work Planning” [20], requires that the environmental risk is assessed during work planning. The Station Alignment Meeting package includes a Risk Management matrix, which identifies environmental risk issues. This matrix is reviewed daily, and any changes in environmental risk status are flagged to the station operating staff and the station senior management team.

4.1.1.2 Corrective Action to Minimize the Possibility of Limits Being Exceeded in the Future

Radiological Hazardous Substance Release Non-Compliances

The framework for the control of radioactive effluents includes IILs, which are administrative targets meant to help keep radionuclide levels in effluents low and provide an early warning before reaching an Action Level. In accordance with P-REP-03480-00009, “Internal Investigation Levels and Normal Operating Levels for Radionuclide Releases in Airborne and Liquid Effluents from Pickering Nuclear” [21], exceeding an IIL does not require reporting to the CNSC, as it is an internal limit. When an IIL is exceeded, a Station Condition Record (SCR), in accordance with N-PROC-RA-0022, “Processing Station Condition Records” [22], is raised and, if required, a Corrective Action Plan (CAP) is prepared and executed in accordance with N-PROG-RA-0003, “Corrective Action” [23].

An Action Level is a specific dose of radiation that, if reached, may indicate that corrective actions are required associated with some part of the Radiation Protection Program. There are two types of Action Levels: one for each monitored radionuclide group release category, and one for the combined dose to the public from all radionuclide releases from all facilities on the site.

Section 16.0 of NA44-REP-03482-00001 [16], Section 16.0 of NK30-REP-03482-00001 [17], and Section 14.0 of P-REP-03482-00001, "Derived Release Limits and Environmental Action Levels for Pickering Nuclear Sewage Effluent" [24], define the two types of Action Levels:

- Action Levels for individual radionuclide release groups are designated according to the group represented, i.e., the airborne tritium, noble gas, particulate, iodine or carbon-14 Action Levels and the waterborne HTO, gross beta-gamma, or carbon-14 Action Levels.

- The Combined Dose Action Level represents a control on the total dose impact resulting from the release of all radionuclides on a site (airborne and waterborne). The total dose is not a measurable parameter. Total dose is conservatively calculated from all radionuclide release rate measurements by using DRLs as conversion factors.

In accordance with Section 2.8 of N-INS-03480-10008, "Instruction to Establish Environmental Action Levels for Nuclear Stations" [25], when it is discovered that a radionuclide release group Action Level or a site combined dose Action Level is reached, the following actions are required to take place:

- Notification of Canadian Nuclear Safety Commission
  Notification requirements are detailed in N-PROC-RA-0020, "Preliminary Event Notifications" [26].

- Determination of Cause for Reaching the Action Level
  An SCR is initiated, and the prescribed actions will be followed as outlined in the CNSC Radiation Protection Regulations. An investigation is conducted to determine the cause for reaching the Action Level and a CAP is developed in accordance with N-PROC-RA-0022 [22] and N-PROG-RA-0003 [23]. An SCR would also be initiated if an Action Level was approached.

- Preparation of Action Level Report
  N-PROC-RA-0005, "Written Reporting to Regulatory Agencies" [27], describes the process to be followed when submitting an Action Level Report to the CNSC.

Environmental staff are required to review the Action Levels periodically and when the station DRLs are reviewed, and to review the IILs annually at a minimum, to determine if they need to be revised. The review is based on trends in normal operating levels from quarterly and annual station performance data. As a result of the reviews, any revisions to IILs are documented in site level documents. Any significant changes to operating conditions, radionuclide release monitoring methods or equipment, or other circumstances may result in an earlier review of these levels, with subsequent changes if required. Action Levels are updated based on N-INS-03480-10008 [25]. IILs are documented in P-REP-03480-00009 [21] and updated as per Section 1.7 of N-STD-OP-0031 [19].

Environmental staff are required to perform an ALARA review every five years. ALARA is described in N-STD-OP-0042 [18], which provides specific directions for conducting a station-level review to evaluate the effectiveness of operations in keeping radiation exposures of the public and the environment to ALARA.

<u>Reporting Non-Compliance with Regulatory Release Limits</u>

Section 1.3.3 of N-PROG-OP-0006 [8] identifies OPG initiatives that support reporting requirements in accordance with CNSC regulations.

N-PROC-RA-0005 [27] describes the process nuclear staff follow to submit written event reports regarding a reportable event (in accordance with N-PROC-RA-0020 [26]) required or requested by a regulatory agency, including the CNSC.

N-PROC-RA-0047, "Communications with the Canadian Nuclear Safety Commission" [28], specifies the planning, review, approval, and records required for communications with the CNSC.

4.1.1.3 Conclusion

The assessment of this Review Task confirms that OPG has procedures in place to ensure that permitted release limits of radiological hazardous substances are not exceeded, and if they are, that appropriate mitigating and corrective actions are taken to minimize the possibility of limits being exceeded in the future. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Maintenance of Effluent Release Records

Confirm records of radiological effluent release are maintained in accordance with regulatory requirements.

4.1.2.1 Radiological Effluent Release Records

The CNSC through the NSCA [14] and Section 14 of SOR/2000-204, "Class 1 Nuclear Facilities Regulations" [29], stipulates the requirement in Section 10.1 of the Pickering NGS Operating Licence [15] for the licensee to control and monitor effluents for the release of nuclear substances.

OPG's environmental compliance is described in Section 1.4 of N-PROG-OP-0006 [8]. Section 1.2 of N-PROG-OP-0006 [8] discusses the programs to manage its environmental aspects, and refers to N-STD-OP-0031 [19], which establishes minimum standards for the monitoring and recording of radioactivity in airborne and liquid effluents from OPG facilities operating under normal and abnormal operating conditions.

Section 5.0 of N-STD-OP-0031 [19] states that the results of the effluent monitoring, which include the quantity and concentration of nuclear substances dispersed into the environment, and evaluation of effluent characteristics, shall be kept as permanent records in OPG's record management system.

Station Condition Records

As given in Section 1.4.3 of N-PROG-OP-0006 [8], in the event of non-compliances or potential adverse conditions (which may include unplanned releases and testing and monitoring deficiencies), OPG will record the event using the SCR process in accordance with N-PROC-RA-0022 [22]. In addition, OPG initiates an SCR for an exceedance of an IIL or Action Level for radiological substance releases in accordance with P-REP-03480-00009 [21] and N-INS-03480-10008 [25]. If required, an SCR would be followed up by a CAP.

4.1.2.2 Maintaining Effluent Release Records

Appendix A of N-LIST-00500-10000, "Routine Environment Regulatory Reports/Correspondence" [30] identifies the various regulatory reports required by the CNSC that are generated, including the frequency, applicable file numbers, and the responsible facility.

Section 1.3.5 of N-PROG-OP-0006 [8] describes the OPG programs which facilitate the maintenance of these radiological effluent release records. N-PROG-OP-0006 [8] refers to N-PROG-AS-0006, "Records and Document Control" (superseded by OPG-PROG-0001, "Information Management" [31], see Document Change Request (DCR) 132951 "N-PROG-AS-0006 has been superseded by OPG-PROG-0001 – Update References" [32] for identification of the change to the document), which establishes a series of standards and procedures for management of Nuclear records and documents throughout their life cycle, regardless of media. The program lays out requirements for managed systems of all activities related to records and documents.

Section 4.2 of N-PROC-RA-0022 [22] describes that electronic and paper records of SCRs will be retained as permanent records in accordance with applicable codes and standards.

4.1.2.3 Conclusion

The assessment of this Review Task confirms that OPG has programs in place to ensure records of radiological effluent release are maintained in accordance with regulatory requirements. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Requirements for Alarm Systems

Confirm that a program exists to define the requirements for alarm systems to respond to unplanned effluent releases from on-site facilities.

Section 1.2.4 of N-PROG-OP-0006 [8], specifies that N-STD-OP-0031 [19] establishes minimum standards for the monitoring of radioactivity in airborne and liquid effluents in facilities operating under normal and abnormal operating conditions.

Section 2.4 of N-STD-OP-0031 [19] specifies the requirements for alarm systems. This standard states that alarms may be either physical devices or procedures which are required to alert appropriate staff of monitor/sampler malfunction, loss of sample/test results, or emissions in excess of a set point or target as specified below:

- Performance monitoring

  1) Monitor/sampler inoperative; e.g., loss of power

  2) Sample/test results unavailable; e.g., loss of sample or failure of sample collection system

  3) Cumulative emissions above set point or target

- Control monitoring

  1) Monitoring inoperative; e.g., loss of power

  2) Sample/test results unavailable; e.g., loss of sample or sample collection system failure

  3) Emissions above set point or target

Specific monitoring requirements are described in Sections 2.5 to 2.8 of N-STD-OP-0031 [19], respectively for:

- Airborne Effluents

- Waterborne Effluents, and

- Forebay Influent and Condenser Cooling Water or Outfall Streams.

As per N-STD-OP-0031 [19], OPG facilities are required to have an Emission Monitoring Plan that documents the site's Emission Monitoring Program. P-PLAN-03480-00001, "Pickering Nuclear Radioactive and Hazardous Emissions Monitoring Plan" [33], demonstrates that a comprehensive program for monitoring and controlling effluent releases is in place.

In addition, a summary of the limits and actions required for the control of an environmental release from Pickering NGS is provided in P-MAN-03480-00001 [13].

4.1.3.1 Conclusion

The assessment of this Review Task confirms OPG has programs to define the requirements for alarm systems to respond to unplanned effluent releases from on-site facilities. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Station Environmental Data Publication

Confirm the environmental data recorded by the station is published and is available on request to the general public.

4.1.4.1 Published Radiological Environmental Data

Section 1.3.3 of N-PROG-OP-0006 [8] references N-LIST-00500-10000 [30], which documents the routine regulatory correspondence generated by the Environmental Reporting, Environmental Services and Pickering Operations Support Departments and other departments issuing environmental reports as required. The regulatory agencies involved are the Ontario Ministry of the Environment and Climate Change (MOECC), Statistics Canada, Environment Canada, and the CNSC.

Although not a regulatory requirement, OPG publishes radiological environmental data recorded by the station in the Radiological Environmental Monitoring Program (REMP) and Environmental Emissions data reports, which are available to the public through OPG's corporate website [34].

4.1.4.2 Responding to Public and Non-Regulatory Stakeholder Requests

OPG program N-PROG-OP-0006 [8] makes reference to OPG standard N-STD-AS-0013, "Nuclear Public Information and Disclosure" [35]. This standard documents the process for provision of information to stakeholders and the public regarding activities and operations, including environmental management, as well as the receipt, documentation and response to concerns, complaints, and inquiries received from stakeholders and the public.

Section 1.1.1 of N-STD-AS-0013 [35] states that:

- OPG Nuclear shall develop, maintain and implement an annual public information work plan that supports the commitments of the Public Information Disclosure and Transparency Protocol and is conducted in accordance with the ethical principles of integrity, excellence and citizenship as outlined in the OPG Code of Business Conduct. Plans will be developed taking into consideration:
    - The type of facility and activities being regulated.

- The risks to public health, safety and security, and the environment posed by the facility or activity.

- The level of public interest or concern.

- Communications with stakeholders and the public are conducted in a planned manner by, or in consultation with, appropriate Stakeholder Relations staff.

- Information should be communicated on an ongoing and timely basis, and should be respective of both the public's perception of risk and the level of public interest of station operations, activities, and anticipated effects on the environment and the health and safety of persons.

- Public communications shall be informative, timely, accurate and material information will be disclosed in accordance with applicable legal and regulatory requirements.

Section 1.2 of N-STD-AS-0013 [35] states that:

- Methods of communication include the preferred use of modern electronic means such as internet and social media, where possible, but also include multiple communication vehicles to enhance public understanding and ensure effective reach of all appropriate target audiences. Methods of communication may include the following:

  - Public meetings and briefings
  - Stakeholder meetings and briefings
  - Community engagement and information sharing and consultation
  - Newsletters
  - Information brochures, videos and fact sheets on operations and activities
  - Nuclear divisional and company performance reports and quarterly emissions data reports
  - Posting and communicating reports and regulatory information relating to health, safety and environment
  - Presentations
  - Paid advertising
  - Public tours (limited)
  - Electronic communications and notices

- Community event participation
- Stakeholder notifications
- Media releases
- Public access to information and face-to-face contact
- Websites and social media.

Section 1.7 of N-STD-AS-0013 [35] states that:

- Corporate Stakeholder Relations staff shall receive, document and respond to concerns, complaints, and irregular inquiries, including those related to impacts by the facility on the environment, from stakeholders and the public.

N-STD-AS-0013 [35] also gives direction on public information strategies and products, public information disclosure and transparency period, regulatory and public disclosure of significant events and reports, trained and qualified stakeholder relations staff, public and media opinion, and communication standards.

4.1.4.3 Conclusion

The assessment of this Review Task confirms that OPG has governance in place for ensuring that the environmental data recorded by the station is published and is available on request to the general public. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: Pickering Environmental Data Measurements

Review the environmental data recorded by the station and compare with the values measured before the plant was put into operation.

OPG does not have a program in place to compare current and pre-operational environmental data. The lack of a program to compare current and pre-operational environmental data falls under Gap #357 in the 2007 Pickering B ISR [36]. This gap was evaluated in NK30-CORR-00770-0201414, "Pickering B Integrated Safety Review Gap Evaluations: Environment" [37], where it was concluded that no further action was recommended to address this discrepancy. This is therefore not a PSR2 gap.

Initial environmental effects studies (HSD-TS-90-5, "Pickering NGS-B: Analysis of Pre- and Post-operational Environmental Radiological Data" [38]) were performed over a ten-year period that covered the pre-operational phase (1979-1981), commissioning phase (1982-1985), and the initial operational phase (1986-1988) of Pickering Units 5-8. The results of these studies contributed to the development of the Environmental Monitoring Program (EMP) in effect at Pickering 1&4 and 5-8. Presently, OPG maintains an off-site EMP [39] (REMP until 2013), which includes Pickering NGS, in accordance with N-PROC-OP-0025, "Management of the Environmental Monitoring Programs" [40] and P-REP-03443-00003, "Detailed Design of Environmental

Monitoring Program for Pickering Nuclear Generating Station" [41], as required to meet the environmental protection requirements specified in the Nuclear Power Reactor Operating Licence [15]. The EMP requires that environmental samples obtained by the station be compared to background radiation levels recorded at control monitoring locations in an environment free from the influence of OPG Nuclear facilities. Therefore, for analysis, measurements taken at control monitoring locations serve as baseline pre-operational radiological data. The annual EMP reports include long-term trend plots for select radiological data, including pre-operational data. The 2005 EMP report identified tritium data dating to 1975. The comparison of environmental data from Pickering NGS to environmental data taken at background locations provides an indication of the effects that Pickering NGS operation could have on the environment, and therefore serves the same purpose as a comparison to values measured prior to Pickering NGS operation. The process of comparing environmental data to background levels will not be affected by Pickering NGS operation beyond 2020. Therefore, this is not a PSR2 gap.

4.1.5.1 Conclusion

The information discussed above is an update to the argument used to determine no further action was required to address the fact that OPG does not have a program in place to compare current and pre-operational environmental data. The documentation on which the argument is based has not fundamentally changed since NK30-CORR-00770-0201414 [37] was authored. Therefore, the conclusions of the gap evaluation have not changed and no further action is required as a result of this PSR2 assessment. This resolved PSR1 Pickering ISR issue is therefore not a PSR2 gap. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.1.6 Review Task #6: Use of Land External to Pickering NGS Site

Confirm there is a process to address changes in the use of land external to the site with respect to the impact on public safety from facility releases.

The Pickering NGS Operating Licence [15] states in Licence Condition 1.4 that, the licensee shall control the use and occupation of lands situated within the exclusion zone described in NA44-SR-01320-00001, "Pickering A Safety Report" [42], and NK30-SR-01320-00001, "Pickering B Safety Report – Part 1" [43].

4.1.6.1 Pickering Safety Reports

Land use surrounding the plant is discussed in NA44-SR-01320-00001 [42], and NK30-SR-01320-00001 [43]. Part 1, Section 2 of each of the Pickering Safety Reports discusses the site location and access, surrounding populations, land use, local agriculture, industries, fishing, recreation, and transportation. Per NA44-SR-01320-00001 [42] and NK30-SR-01320-00001 [43], and in accordance with the Pickering NGS LCH [4], it is a requirement to update the Pickering Safety Reports periodically (at least every 5 years as per CNSC REGDOC 3.1.1, "Reporting Requirements for Nuclear

Power Plants” [44]) and subsequently submit them to the CNSC as reference documents.

4.1.6.2 Environmental Monitoring Program

Changes in the use of land external to the site with respect to the impact on public safety from facility releases are addressed in OPG Procedure, N-PROC-OP-0025 [40].

N-PROC-OP-0025 [40] provides direction and accountabilities for design, implementation, and operation of EMPs at OPG nuclear facilities. As stated in Section 1.2 of N-PROC-OP-0025 [40], the EMP shall consider the applicability of the following objectives:

a) Assess the level of risk on human health and safety, and the potential biological effects in the environment of the contaminants and physical stressors of concern arising from the facility;

b) Demonstrate compliance with limits on the concentration and/or intensity of contaminants and physical stressors in the environment or their effect on the environment;

c) To check, independently of effluent monitoring, on the effectiveness of containment and effluent control, and provide public assurance of the effectiveness of containment and effluent control;

d) Verify the predictions made by the Environmental Risk Assessment (ERA), refine models used in the ERA, or reduce the uncertainty in the predictions made by the ERA.

The program design is also structured to satisfy the other EMP objectives as listed in Section 1.2 of N-PROC-OP-0025 [40]. Section 1.5.2 of N-PROC-OP-0025 [40] outlines the design framework in support of radiological dose calculations, which consists of the following design elements:

- Provincial background data
- Site specific survey
- Pathway analysis
- Identification of the contaminants (radionuclides) and pathways of importance.

Site Specific Survey

Site specific surveys allow Environment Operations Support (EOS) to identify the various potential critical groups around each nuclear site and are used for development of the EMPs and site DRLs, and for calculating public collective dose. Site specific survey instructions are documented in N-INS-03481-10000, “Instruction for Performing a Site Specific Survey for Ontario Power Generation Nuclear Sites” [45].

Specific responsibilities of EOS related to Site Specific Surveys as outlined in N-PROC-OP-0025 [40] are as follows:

a) EOS shall conduct a site specific survey for Pickering NGS and its surrounding environment to gather local characteristics, such as:

- Population distribution
- Produce distribution
- Land use patterns by the public around the facility (e.g., farming, industrial areas, well water usage, and recreational usage)
- Dietary patterns (e.g., sources of drinking water, fraction of food intake obtained from local sources)

b) EOS should review the site specific surveys every five years to assess the validity of data and determine if updated surveys are required.

c) EOS should update the site specific surveys when significant changes affecting local characteristics occur, such as land use patterns.

d) EOS should document the results of the updated site specific surveys in individual reports for Pickering and Darlington.

Pathway Analysis

Pathway analysis identifies the significance of each environmental transport pathway for radiological contaminants released by station emissions. Doses shall be calculated by radionuclide and pathway of exposure for each potential critical group using the projected facility emissions for the next five years. Specific responsibilities of EOS related to Pathway Analysis as outlined in N-PROC-OP-0025 [40] are as follows:

a) EOS should conduct a pathway analysis for Pickering NGS every five years. The results of the most recent pathway analyses are documented in the program design review report for Pickering, P-REP-03443-00004, "Pickering Environmental Monitoring Program (EMP) Review" [46].

b) EOS should use the following parameters and models, as applicable, when calculating doses for pathways analyses:

- Pickering NGS Site DRL model, as described in the most recent DRL reports;
- Most recent site-specific survey results;
- Station operational changes and projected five year emissions;
- Previous three to five years of meteorological data;

- Central food intake rates as per CSA N288.1-08, "Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities" [47], and N-INS-03443-00001, "Methodology for Data Analysis and Public Dose Determination for the Environmental Monitoring Program" [48].

Identification of Contaminants and Pathways of Importance

a) Guidelines for determination of significant contaminants and pathways are outlined in Section 7.5 of CSA N288.4-10, "Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills [49] and N-INS-03443-00001 [48].

b) Pathways, radionuclides, and contaminants of concern identified as significant contributors to receptor exposure shall form the basis of the EMP sampling plan. Guidance for determining which sampling locations should be included in the EMPs is provided in Section 7.6 of CSA N288.4-10 [49].

4.1.6.3 Conclusion

The assessment of this Review Task confirms OPG has a process to address changes in the use of land external to the site with respect to the impact on public safety from facility releases. The intent of Review Task #6 is met and therefore Pickering NGS is compliant.

4.1.7 Review Task #7: Monitoring Program Comprehensiveness

Confirm that the monitoring program is appropriate and sufficiently comprehensive. In particular, confirm that the radiological impact of the plant on the environment is not significant compared with that due to other sources of radiation.

4.1.7.1 Monitoring Programs and Assessments

A number of programs and assessments are in place in order to assure adequate provision for the protection of the environment and human health and safety.

Environmental Management System

OPG-PROG-0005, "Environmental Management System" [9] outlines the Environmental Management System (EMS) requirements to implement the requirements of OPG-POL-0021, "Ontario Power Generation Environmental Policy" [50], including monitoring and measurement requirements. As stated in Section 1.3.3 of OPG-PROG-0005 [9], OPG monitors and measures performance against objectives and targets established in business planning through quarterly reporting requirements. Benchmarking is an important tool that is used to assist in setting performance objectives and targets, against which environmental performance is measured. Section 1.5.1 of OPG-PROG-0005 [9] states that, where appropriate, procedures include that monitoring and measurement equipment is calibrated or verified to be functioning properly and that records are retained.

The EMS is registered under the International Organization for Standardization (ISO) 14001 Standard, "Environmental Management Systems – Requirements with Guidance for Use" [51], and thus must be continually improved in accordance with this Standard.

N-PROG-OP-0006 [8] describes the requirements of the OPG EMS that provide the framework for environmental protection within OPG Nuclear, and continual improvement of environmental performance. This program ensures nuclear activities are conducted such that adverse environmental effects are prevented or mitigated.

Section 1.4.1 of N-PROG-OP-0006 [8] states that OPG maintains procedures to regularly measure and monitor its environmental performance. Measurements and observations allow OPG to track progress on meeting objectives and targets, demonstrate compliance with legal and other requirements, and provide data to evaluate operational controls. OPG also maintains procedures to ensure that information collected is valid, including N-PROC-MA-0069, "Control and Calibration of Measuring and Test Equipment" [52], which establishes the process for control and calibration of Measuring and Test Equipment.

Environmental Monitoring Program

N-PROC-OP-0025 [40] provides direction and accountabilities for design, implementation, and operation of EMPs at OPG's nuclear facilities. These programs are required to:

1. Assess potential effects on humans and the environment by nuclear substances.

2. Demonstrate and confirm that radiation doses to members of the public resulting from the operation of OPG nuclear facilities remain below the annual legal limit specified in the current Radiation Protection Regulations under the NSCA [14].

N-PROC-OP-0025 [40] also outlines quality management practices for the operation of the EMP. More information on the contents of N-PROC-OP-0025 [40], including EMP objectives and design elements, are given above in Section 4.1.6.2 of this Safety Factor report.

P-REP-03443-00003 [41] presents the detailed design of the EMP for Pickering NGS, following CSA N288.4-10 [49]. The EMP design addresses site specific objectives covering the aspects of regulatory requirements, risk assessment results, confirmation of effluent control, areas of regulatory interest, stakeholder commitments, environmental model confirmation, and due diligence. The EMP design also includes detailed monitoring design, requirements, and objectives related to Pickering NGS operations. ERA follow-up monitoring is also included.

Section 4.2.1 of P-REP-03443-00003 [41] discusses that public radiation dose should be calculated annually to demonstrate compliance with public dose limits and to demonstrate compliance with the requirement to operate at ALARA.

Presently, Pickering maintains an off-site EMP [39] in accordance with N-PROC-OP-0025 [40] and P-REP-03443-00003 [41], as required to meet the environmental protection requirements specified in the Nuclear Power Reactor Operating Licence [15]. As discussed in Section 1.5.2.1 of N-PROC-OP-0025 [40], radioactivity in the environment is measured near Pickering as well as at provincial background locations to determine the radiological impact on the public resulting from the operation of the station as part of the EMP.

Effluent Monitoring

Section 1.2.4 of N-PROG-OP-0006 [8] states that radiological emissions from OPG Nuclear facilities shall not exceed the DRLs specified in station Nuclear Power Reactor Operating Licences issued by the CNSC.

Section 1.2.4 of N-PROG-OP-0006 [8] makes reference to N-STD-OP-0031 [19], which establishes minimum requirements for the monitoring of nuclear substances in airborne and waterborne effluents from OPG nuclear facilities operating under normal and abnormal operating conditions. This document takes authority from N-PROG-OP-0006 [8].

Section 2.2 of N-STD-OP-0031 [19] discusses effluent monitoring criteria:

- Types of monitoring include performance monitoring and control monitoring.
- The effluent monitoring program of nuclear substances follows a risk-based approach based on the Maximum Probable Emission Rate. The requirement for performance monitoring, control monitoring, and emission reporting is determined based on the ratio of the Maximum Probable Emission Rate to the DRL for each radionuclide or radionuclide group.

Monitoring requirements and requirements for alarm systems for effluents given in N-STD-OP-0031 [19] are discussed above in Section 4.1.3 of this Safety Factor report.

As per N-STD-OP-0031 [19], OPG facilities are required to have an Emission Monitoring Plan that documents the site's Emission Monitoring Program. P-PLAN-03480-00001 [33] outlines the Pickering-specific monitoring requirements for the radiological airborne and liquid effluent pathways in Sections 1 and 2, respectively. This plan also examines compliance of the monitoring program with CSA N288.5-11, "Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills" [53], and therefore demonstrates that a comprehensive program for monitoring effluent releases is in place.

Groundwater Monitoring

Section 1.2.4 of N-PROG-OP-0006 [8] makes reference to N-PROC-OP-0044, "Contaminated Lands and Groundwater Management" [54], which outlines directions and accountabilities for identifying, assessing, and managing contaminated lands within OPG nuclear facilities.

Section 1.2 of N-PROC-OP-0044 [54] includes direction for establishing and managing a Nuclear groundwater monitoring program, including program design, sampling and analysis, quality assurance and quality control, data interpretation, and well inspection and maintenance. The groundwater monitoring program monitors the on-site groundwater quality changes over time.

4.1.7.2 Pickering Radiological Impact on the Environment

Dose to Humans

Environmental samples are collected as part of the EMP to support the public dose calculations. Sample radionuclide concentrations are compared against background concentrations.

As discussed in Section 1.5.2.1 of N-PROC-OP-0025 [40] and Section B.1.4.2.1 of CSA N288.4-10 [49], as part of the EMP, measured data are used together with station emissions data to determine the dose received by members of the public living near the station, known as potential critical groups. The highest estimated potential critical group dose establishes the official public dose for the site.

The dose[9] to the public resulting from Pickering station operations continues to be a very small percentage of the annual legal limit of 1,000 μSv/y. The critical group dose for 2014 was 1.2 μSv [39], which is on the order of 0.1% of the legal limit and is virtually unchanged from the 2013 dose of 1.1 μSv.

The Pickering NGS dose to the critical group for 2014 [39] was equivalent to 0.1% of the estimated background dose to humans around Pickering NGS site of 1,400 μSv/y from naturally-occurring and anthropogenic radiation. The critical group dose has remained at approximately 0.1% of the estimated background dose since 2009 [39].

Dose to Non-human Biota

Dose to non-human biota is not included as part of the EMP. Ecological Risk Assessments, which involve determining the radiological dose to non-human biota, are included as part of the ERA process. As per CSA N288.6-12, "Environmental Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills" [55], the ERA is

[9] In some contexts in the CSA standards and OPG documents, the term "dose" is used interchangeably with "dose rate". The intended meaning of the term is apparent by reference to the units, with "dose/time period" indicating dose rates.

to be reviewed every five years or when major changes occur. This requirement is reflected in Section 1.5.1 of N-PROC-OP-0025 [40].

P-REP-07010-10012, "Environmental Risk Assessment for Pickering Nuclear" [56], was performed in 2014. As part of this assessment, an assessment of the radiological dose received by terrestrial and aquatic biota from air, surface water, and soil was performed. The limiting radionuclides used to represent all radionuclides in this assessment were those emitting gross beta/gamma, including H-3, Cs-134, Cs-137, Co-60, and Ar-41.

Representative doses to biota did not exceed radiological dose benchmarks given in CSA N288.6-12 [55], except for the maximum doses to the Earthworm (8.5 mGy/d) and Red-winged Blackbird (6.35 mGy/d) received on the Pickering NGS site [56]. However, these doses are driven by the maximum tritium concentrations in on-site soil close to the reactor buildings and therefore they are not representative of the dose received by the entire on-site population of Earthworms or by the more mobile Red-winged Blackbird. Off-site biota would also not be exposed to these levels. The mean doses received by these receptors are more representative: 2.37 mGy/d for Earthworms and 1.77 mGy/d for the Red-winged Blackbird [56]. These doses are below the CSA N288.6-12 radiological dose benchmarks [55]. These mean doses represent the highest potential doses received by non-human biota.

A background dose around the Pickering NGS site applicable to terrestrial and aquatic non-human biota was not available in OPG documentation. However, the doses to indicator species in P-REP-07010-10012 [56] encompass both background dose and dose from Pickering NGS site and do not exceed CSA N288.6-12 [55] dose benchmarks. These benchmarks provide a guideline for acceptable dose to non-human biota and hence, the radiological doses from Pickering NGS do not have a significant or adverse effect on non-human biota. This is therefore not a PSR2 gap.

<u>Radionuclide Levels in Environmental and Other Media</u>

In N-REP-03443-10014 [39], concentrations of radionuclides in environmental and other media around the Pickering NGS site, including air, fruits and vegetables, milk, and fish, were found to be higher than levels measured at background monitoring stations, as was expected [39]. Radionuclide levels in drinking water have remained below the OPG target of 100 Bq/L. Emissions have remained at a very small fraction of the DRLs [39].

Although the concentrations measured around Pickering site are higher than background levels, the emissions of radionuclides to the environment from Pickering NGS have remained at a very small fraction of the CSA N288.1-compliant DRLs ([39], [47]), and Pickering NGS meets the terms of its operating licence [15]. The Environmental Risk Assessment is reviewed every five years to ensure up-to-date assessment of the impact of Pickering NGS in terms of risk to biological receptors.

The CNSC has implemented its Independent Environmental Monitoring Program (IEMP) to verify the areas around nuclear facilities are safe. Under this program, the

CNSC measured radionuclide levels in environmental and other media around Pickering site in 2014 and 2015. Media sampled include air particulate, lake water, soil and sediment, grass and wild vegetation, and foodstuffs. Based on the IEMP, the CNSC has confirmed that there are no health impacts around the Pickering NGS facility. The measured values for all samples and for all reported radionuclides represent a fraction of the CNSC reference levels [57].

This is therefore not a PSR2 gap.

4.1.7.3 Conclusion

The assessment of this Review Task confirms OPG has appropriate and comprehensive monitoring programs in place for Pickering NGS.

Review Task #7 states that the radiological impact of the plant on the environment should not be significant compared with that due to other sources of radiation. This was confirmed for human exposure to radiation.

Doses to non-human biota were found to be less than radiological dose benchmarks in the most recent ERA [56] and therefore do not represent an adverse effect to non-human biota. Emissions of radionuclides to the environment from Pickering have remained at a very small fraction of the DRLs, and therefore Pickering NGS meets the terms of its operating licence [15]. The intent of Review Task #7 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for eight L/R/C/Ss with content applicable to Safety Factor 14 are provided in References [6] and [7]. Associated findings applicable to Safety Factor 14 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 14

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 14
CSA N288.1-14, "Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities"	There are no PSR2 gaps for CSA N288.1-14. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.1-14.
CSA N288.4-10, "Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.4-10. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.4-10.

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 14
CNSC REGDOC-2.9.1 (2013), "Environmental Protection Policies, Programs and Procedures"	There are no PSR2 gaps for CNSC REGDOC-2.9.1 (2013). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.9.1 (2013).
CNSC G-228, "Developing and Using Action Levels"	There are no PSR2 gaps for CNSC G-228 (2001). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-228 (2001).
CSA N288.6-12, "Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.6-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.6-12.
CSA N288.5-11, "Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills Facilities"	There are no PSR2 gaps for CSA N288.5-11. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.5-11.
CSA N288.3.4-13, "Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities"	There are no PSR2 gaps for CSA N288.3.4-13. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.3.4-13.
CSA N288.7-15, "Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.7-15. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CSA N288.7-15.

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Programs reviewed for Safety Factor 14 are identified in Table 2 and details of the associated effectiveness reviews for each of the N-PROGs or OPG-PROGs are provided in Appendix B.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 14 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 14 to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 14.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [10] are provided in a separate PSR2 COP Review Report. Findings from the review of Fukushima Action Items are provided in a separate PSR2 FAI Review Report. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 14 Report that require discussion in other Safety Factor Reports.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 14 were reviewed for the seven PSR2 Review Tasks in Section 4.1 of this report and resulted in no Pickering PSR2 gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 14 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no PSR2 gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Safety Factor 14 (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 14), which resulted in no PSR2 gaps.

The review of Safety Factor 14 has confirmed that Pickering NGS has an adequate and effective program for monitoring the radiological impact of the plant on the environment, which ensures that emissions are properly controlled and are as low as reasonably achievable.

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-OP-0006, "Environmental Management"

The Environmental Management Program describes both the requirements of the OPG EMS that provide the framework for environmental protection within OPG Nuclear, as well as Management's approach to ensure compliance with applicable environmental requirements, and conformance with the requirements of the ISO 14001 standard. The Environmental Management Program ensures OPG Nuclear activities are conducted such that adverse environmental effects are prevented or mitigated.

Nuclear Oversight conducted a performance based audit in June 2015, NO-2015-014, Environmental Management [B.1.1], to assess OPG Nuclear compliance with the Environmental Management Program (N-PROG-OP-0006), the ISO 14001 standard and to identify any performance improvement opportunities. The audit identified a number of opportunities for improvement; however, these were associated with conventional emissions and other non-nuclear issues, which are not applicable to this Safety Factor Report.

The Nuclear Programs department completed a self-assessment in July 2012, NO12-000421-SA [B.1.2], in order to assess the health of the Environmental Management governance framework, which is applicable to both Pickering and Darlington NGS. This involved a review of related SCRs, governance framework, Asset Suite and revision records. No actions were generated as a result of the self-assessment.

The Information Management department, Governance and Services section, completed a self-assessment in December 2014, BAS14-001300-SA [B.1.3], in order to assess compliance with N-PROG-OP-0006, Environmental Management. No findings/SCRs were generated from this self-assessment, however it was recommended to initiate a DCR in order to reference certain clauses of CSA N286-12, Management System Requirements for Nuclear Facilities [B.1.4], which has since been completed.

[B.1.4] Canadian Standards Association, CSA N286-12, *Management System Requirements for Nuclear Facilities*, 2012.

B.2 OPG-PROG-0005, "Environmental Management System"

Ontario Power Generation (OPG) has developed an Environmental Management System (EMS) to implement the requirements of OPG-POL-0021, Environmental Policy [B.2.1]. The EMS and the employees that implement it are directed by OPG-POL-0033, OPG Business Model [B.2.2] and bounded by the model's Integrated Control Framework. The EMS builds on the OPG Business Model by providing specific direction on how the Environmental Policy is implemented.

OPG's Environmental Policy includes a commitment to register the EMS under the ISO 14001 Standard. Accordingly, OPG is committed to establish, implement, maintain and continually improve the EMS in accordance with the International Organization for Standardization (ISO) 14001 Standard and use the EMS as a means of describing how the ISO 14001 Standard requirements are fulfilled.

The Chemistry and Environment department completed a self-assessment in February 2014, P14-000425-SA [B.2.3], [B.2.1], in order to evaluate readiness for an EMS Nuclear Oversight audit for Pickering NGS. The scope of the self-assessment included a complete review of the effectiveness of the Pickering NGS EMS and how it conforms to planned arrangements for environmental management including requirements of ISO 14001. It was concluded that the areas of scope identified by the auditor prior to the preparation of the self-assessment were found to be properly addressed and no additional risk areas were identified. Hence, no findings/SCRs were generated.

Nuclear Oversight conducted a performance based audit for selected aspects of the EMS in May 2014, NO-2014-018 [B.2.4], for both Pickering and Darlington NGS. The audit identified nuclear-related performance improvement opportunities applicable to Pickering NGS in the areas of environmental governance implementation and OPG Environmental Aspects database effectiveness (note, 2 additional findings were generated which are associated with conventional emissions and are not applicable to this Safety Factor Report).

Two SCRs were initiated to address the findings (SCRs N-2014-15683 and N-2014-15686) which required corrective actions to be implemented. These SCRs have since been completed and the necessary corrective actions were completed to address the underlying issues.

Revision Summary – For Amec Foster Wheeler Report PS112/RP/018

Rev	Date	Author	Comments
R00	July 29, 2016	B. McLean, R. Jayasundera, J. Cheng	Initial issue for OPG review and comment.
R01	September 23, 2016	B. McLean, R. Jayasundera, J. Cheng	Updated report addressing OPG comments on R00 Report.
R02	October 20, 2016	B. McLean, R. Jayasundera, J. Cheng	Updated Audit and Self-Assessment Reviews and Additional Reviews. This revision was issued as R000 of OPG document P-REP-03680-00019.
R03	February 22, 2017	R. Jayasundera, D. Moule	Updated Sections 2, 3, 4, and Appendix B to provide a level of detail which would be provided in an equivalent PSR1 Safety Factor Review, as Radiation Protection was not previously addressed as a stand alone review in PSR1.
R04	April 11, 2017	R. Jayasundera, D. Moule	Updated to address OPG comments on R03 report. This revision will be issued as R001 of OPG document P-REP-03680-00019.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

Part of PSR2 involves the preparation of Safety Factor reports for each of fifteen major topic areas. Safety Factor reports consist of:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1]. These Review Tasks are derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3, "Periodic Safety Reviews" [2] and International Atomic Energy Agency (IAEA) SSG-25, "Periodic Safety Review for Nuclear Power Plants" [3];[1]

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) as defined in Reference [1]; and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The PSR2 review of Safety Factor 15, *Radiation Protection*, is presented in this report. OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 15 were reviewed for the five PSR2 Review Tasks specified in Section 4.1 of this report. These Review Tasks were derived from CNSC REGDOC-2.3.3 and IAEA SSG-25, and address the broad aspects of Radiation Protection, including reactor design, Radiation Protection equipment and instrumentation, Radiation Protection during nuclear emergencies, improvements of Radiation Protection based on Operating Experience, and ALARA. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 15 were prepared per Sections 4.2 and 4.3, respectively. Per Section 4.4, the PSR2 assessment includes a review of previously identified PSR1 gaps related to Radiation Protection (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering Licence Conditions Handbook [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 15).

The results of the review of Safety Factor 15 are discussed in Section 5.0 of this report. The review has confirmed that Radiation Protection has been adequately accounted for in the design

---

[1] Although Radiation Protection related Review Tasks were addressed in various PSR1 Safety Factors, treatment of Radiation Protection as an independent, stand-alone Safety Factor is a new requirement per CNSC REGDOC-2.3.3 [2] (REGDOC-2.3.3 encompasses all of the PSR Safety Factors recommended by the IAEA in SSG-25 and expands upon it by adding Safety Factor 15, "Radiation Protection"). As a result, the level of detail provided for the Review Tasks in this PSR2 Safety Factor 15 report is equivalent to that which would be provided in a PSR1 Safety Factor review. In addition, RP related requirements will continue to be addressed under other Safety Factors, as required.

and operation of Pickering NGS, that Radiation Protection provisions (including design and equipment) provide adequate protection of persons from the harmful effects of radiation, and that contamination and radiation exposures and doses to persons are monitored and controlled and maintained As Low As Reasonably Achievable (ALARA). As discussed in Section 5.0, the review identified no Pickering PSR2 gaps.

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[2] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5-8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[3] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];
- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and
- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, primarily through review of audit and self-assessment results.

---

2 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

3 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering. An effectiveness review (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis is also conducted in PSR2.

Although Radiation Protection (RP) related Review Tasks were addressed in a number of PSR1 Safety Factor reviews (e.g., Plant Design, Safety Performance), treatment of RP as an independent, stand-alone Safety Factor is a new requirement per CNSC REGDOC-2.3.3 [2] (REGDOC-2.3.3 encompasses all of the PSR Safety Factors recommended by the IAEA in SSG-25 and expands upon it by adding Safety Factor 15, "Radiation Protection"). As a result, the level of detail provided for the Review Tasks in this PSR2 Safety Factor 15 report is equivalent to that which would be provided in a PSR1 Safety Factor review. In addition, RP related requirements continue to be addressed under other Safety Factors, as required.

As discussed in REGDOC-2.3.3:

- *"SSG-25 describes 14 Safety Factors that have been selected on the basis of international experience and are intended to cover all factors important to NPP [Nuclear Power Plant] safety. The scope, tasks and methodologies of these 14 Safety Factors are considered to meet the CNSC's expectations for corresponding Safety Factors 1–14 listed above. The CNSC has included an additional Safety Factor on radiation protection; the licensee should refer to Appendix A for guidance on the scope and tasks for the review of this Safety Factor."*

REGDOC-2.3.3 also requires that: "The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant." Consistent with REGDOC-2.3.3 [2] Appendix A, the objective of the review of Radiation Protection Safety Factor 15 is to confirm that:

- RP has been adequately accounted for in the design and operation of Pickering NGS;

- RP provisions (including design and equipment) provide adequate protection of persons from the harmful effects of radiation; and

- Contamination and radiation exposures and doses to persons are monitored and controlled, and maintained As Low As Reasonably Achievable (ALARA).

This report documents the results of the review of Safety Factor 15 for Pickering PSR2. The review covers all elements of Radiation Protection as applicable to Pickering NGS and as required under REGDOC-2.3.3. The report is based primarily on the OPG Governance, Programs, data and material available up to January 15, 2016, which is the freeze date for PSR2.

2.0 SCOPE OF REVIEW

2.1 Review Task Assessments

The Pickering PSR2 Safety Factor 15 Review Tasks are defined in Reference [1]. Details of the derivation of the Review Tasks from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3] are shown in Reference [5]. The Safety Factor 15 Review Tasks are:

1) Confirm the adequacy of the reactor design features for Radiation Protection.

2) Confirm the adequacy of the Radiation Protection equipment and instrumentation for radiation monitoring.

3) Confirm that adequate provisions are in place to address Radiation Protection of the public and workers during nuclear emergencies.

4) Confirm that the Radiation Protection provisions have been improved as the result of external operating experience.

5) The review will demonstrate that the ALARA principle has been incorporated in any modifications of the reactor design and operational programs and arrangements.

Appendix A (Sections A.3.1 to A.3.4) of REGDOC-2.3.3 [2] is used in the assessment of each Safety Factor 15 Review Task in order to ensure alignment with CNSC guidance relating to the RP Safety Factor. As discussed earlier, although RP related Review Tasks were addressed in various PSR1 Safety Factors, treatment of Radiation Protection as an independent, stand-alone Safety Factor is a new requirement per CNSC REGDOC-2.3.3. Compliance against RP Review Tasks is assessed by reference to applicable OPG programs and procedures, Pickering NGS specific design information, Condition Assessments, safety analyses, operating experience, and additional national and international guidance, to support the RP Review Task responses.

The methodology for the reviews is discussed in Section 3.1. Review Task findings are summarized in Section 4.1 of this Report.

2.2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to the RP Safety Factor are identified in Reference [1] and are listed in Table 1 below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2.

All of the Safety Factor 15 L/R/C/S reviews are high level or incremental in nature. The definitions of High Level Review and Incremental Review are as follows:

- High Level Review: New L/R/C/Ss not referenced in PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

OPG programs and procedures, PSR1 and post-PSR1 assessments, and where applicable, Pickering NGS specific design information (including applicable design requirements), are used to support the L/R/C/S review responses.

The methodology for the reviews is discussed in Section 3.2. A detailed assessment for each L/R/C/S is provided in Reference [6]. Associated findings are summarized in Section 4.2 of this report.

Table 1: L/R/C/Ss Reviewed for Radiation Protection Safety Factor 15

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
1	CNSC G-129	Keeping Radiation Exposures and Doses "As Low As Reasonably Achievable (ALARA)"	2004	8, 15	Incremental	G-129 addressed as part of Pickering B and Darlington ISRs.
2	CNSC G-228	Developing and Using Action Levels	2001	8, 14, 15	Incremental	G-228 addressed as part of Pickering B and Darlington ISRs.
3	SOR/2000-202	The General Nuclear Safety and Control Regulations	Amended in June 2015	10, 15	Incremental	SOR/2000-202 addressed as part of Pickering B and Darlington ISRs.
4	SOR/2000-203	The Radiation Protection Regulations	Amended in June 2015	8, 15	Incremental	SOR/2000-203 addressed as part of Pickering B and Darlington ISRs.
5	CNSC REGDOC-2.2.3	Personnel Certification: Radiation Safety Officers	2014	15	High Level[4]	REGDOC-2.2.3 not addressed as part of Pickering B or Darlington ISRs.

4 There is no Class II nuclear facility or prescribed equipment within the bounds encompassed by the Pickering NGS PROL and there is no requirement to have a Radiation Safety Officer. Hence, a high level review of REGDOC-2.2.3 is not required because REGDOC-2.2.3 is not applicable to Pickering NGS.

2.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program (N-PROG) reviewed for Safety Factor 15 is listed in Table 2 below.[5] The methodology for the effectiveness reviews is discussed in Section 3.3. The assessment results of the N-PROG in Table 2 are provided in Appendix B, and findings are summarized in Section 4.3.

Table 2: OPG Program Reviewed for Safety Factor 15

Document Number	Document Title
N-PROG-RA-0013 [7]	Radiation Protection

In addition to feedback on program effectiveness from audits conducted by Nuclear Oversight, and self-assessments completed by OPG work groups, OPG acquires additional feedback from Station Condition Records, Pre and Post-Job Briefing feedback, RP dose records, and reviews performed through the industry.

2.4 Additional Reviews

The PSR2 Safety Factor 15 Report includes a review of the R04 Pickering Licence Conditions Handbook (LCH) [4] for any impacts of Pickering NGS operation beyond 2020 on the following (all related to Safety Factor 15):

- OPG commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified PSR1 gaps related to Radiation Protection to ascertain the implications of extending Pickering NGS operation beyond 2020. The methodology for these reviews is described in Section 3.4. Any PSR2 gaps identified as a result of programmatic Darlington PSR1 gaps related to Radiation Protection are discussed in Section 4.4 of this report. The review of Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan [8] is provided in Reference [9].

In addition, Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). This review is presented in Reference [10].

Any PSR2 gaps identified as a result of the Safety Factor 15 review that are relevant to other Safety Factors are discussed in Section 4.4 of this report.

---

[5] The list of Nuclear Programs to be assessed for effectiveness for PSR2 was derived from review of current OPG Governance. Although there may be content in Nuclear Programs that is applicable to multiple Safety Factors, N-PROG reviews are only provided in one Safety Factor report and are not duplicated.

3.0 METHODOLOGY

The sub-sections below summarize the methodology used to assess Review Tasks, L/R/C/Ss, and Nuclear Program effectiveness for the Radiation Protection Safety Factor.

3.1 Review Tasks

The Safety Factor Review Tasks are derived from CNSC REGDOC-2.3.3 [2] and IAEA SSG-25 [3], taking into consideration the Review Tasks used in the Pickering B and Darlington ISRs (as derived in [5]). Appendix A of REGDOC-2.3.3 [2] is used in the assessment of each Safety Factor 15 Review Task in order to ensure alignment with CNSC guidance relating to the RP Safety Factor. As discussed earlier, although RP related Review Tasks were addressed in a number of Safety Factors in PSR1, treatment of Radiation Protection as an independent, stand-alone Safety Factor is a new requirement per REGDOC-2.3.3. As a result, the SF15 RP Review Tasks are new for PSR2 and Review Task assessments are written with a level of detail commensurate with a PSR1 review.

For each Safety Factor 15 Review Task identified in Section 2.1, applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) were assessed for compliance. Compliance against Review Tasks is also assessed by reference to applicable Pickering NGS specific design information, Condition Assessments, safety analyses, operating experience, and additional national and international guidance to support the RP Review Tasks responses.

The Review Task assessments identify Compliances and Gaps as defined below:

- Compliance: Compliance indicates that either the safety requirement or the intent of the Review Task is met.

- Gap: A Gap indicates that the intent of the Review Task is not met.

3.2 L/R/C/S Reviews

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in Reference [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis".

PSR2 is focused on the extension of Pickering NGS operations beyond 2020, and will conduct reviews against a baseline of past PSR1 work. As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed as part of PSR1;[6]
- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;
- Implications of extending Pickering NGS operation beyond 2020; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

As described in Reference [1], L/R/C/S review types are clause-by-clause, high level or incremental. Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;
- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;
- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);
- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a

---

[6] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

description of the major changes in the latest revision is provided as discussed below);

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met). There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

L/R/C/S reviews make use of the following information, where applicable: a) OPG Governance, Programs, Policies and Procedures, b) Pickering NGS specific design information (including applicable design requirements), c) Commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC related to the Safety Factor under review, as identified in the R04 Pickering LCH [4], d) Identification of previously identified Pickering-specific or applicable Darlington PSR1 gaps related to the Safety Factor under review and the status of OPG's improvement plan(s) or other dispositions to address these, and e) Assessments and reviews performed since the PSR1 documents were completed.

The Safety Factor 15 L/R/C/S reviews identify Compliances and Gaps as defined below:

- <u>Compliance</u>:

    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.

    - For Clause-by-Clause reviews of modern L/R/C/Ss, Compliance indicates that the safety requirement is met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 15.)

- Gap:

    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.

    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.

    - For Clause-by-Clause reviews of modern L/R/C/Ss, a Gap indicates that the safety requirement is not met. (Note: No Clause-by-Clause reviews were performed as part of Safety Factor 15.)

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;

- "Should" is used to express a recommendation or that which is advised but not required;

- "May" is used to express an option or that which is permissible within the limits of the standard; and

- "Can" is used to express possibility or capability.

3.3 OPG Program Effectiveness Reviews

As discussed earlier, effectiveness reviews (effectiveness at Pickering NGS) of OPG programs used to demonstrate compliance with the PSR2 Assessment Basis were conducted, primarily using recent applicable audit and self-assessment results:

- OPG Nuclear Oversight independent performance-based Program audits (typically performed in 1 to 5 year cycles) and self-assessments. This includes review of associated Station Condition Records and Action Requests to determine the status of any resulting corrective actions; and

- CNSC "Type I" and "Type II" inspections of the effectiveness and performance of OPG programs, where discussed in OPG audits or self-assessments.

There are many audits and self-assessments that are performed to assess the effectiveness of important aspects of each program. A sample of audits and self-assessments has been summarized for each program in order to demonstrate that program effectiveness is being assessed on an ongoing basis. The focus of these reviews was on effectiveness of the programs at Pickering NGS, where specific information is available. Results from these audits and self-assessments will be considered in the Global Assessment process. It is noted that audits and self-assessments are, by their nature, self-critical and are used to drive excellence in performance. As a result, the broad review scope of program audits focuses on

identifying improvement opportunities rather than presenting a balanced picture of program performance.

Program effectiveness is also monitored and addressed through the Fleetview Program Health and Performance Reporting process [11]. This process involves direct oversight by the Chief Nuclear Officer, and includes participation by the Nuclear Executive Committee members. Programs are reviewed, senior oversight is provided, and improvement plans are generated.

In addition to regular feedback on program effectiveness from audits conducted by OPG Nuclear Oversight, and self-assessments completed by OPG work groups, OPG acquires additional feedback from Station Condition Records, Pre and Post-Job Briefing feedback, RP dose records, and reviews performed through industry.

The list of Nuclear Programs to be assessed for each Safety Factor was derived from a review of current OPG Governance.

3.4 Additional Reviews

A review of the R04 Pickering LCH [4] was performed to determine if there are any impacts associated with operation of the Pickering Units past 2020 on the following (all related to Safety Factor 15):

- Commitments previously made to the CNSC;
- Open CNSC action items; and
- Exemptions granted by the CNSC.

The PSR2 assessment includes identification and review of previously identified Pickering-specific or programmatic PSR1 gaps related to Radiation Protection (as identified in the Darlington ISR Integrated Implementation Plan [12] and Pickering Units 5-8 Continued Operations Plan [8]) to ascertain the status of OPG's improvement plan(s) or other dispositions to address these and the implications of extending Pickering NGS operation beyond 2020 (if any).[7] The methodology and review results

[7] PSR2 includes consideration and confirmation that the findings of PSR1 remain valid, as applicable, for the operation period. This includes assessment of PSR1 conclusions against implications resulting from extended operation. In particular, Pickering PSR1 results are applicable to PSR2 if there was a PSR1 gap that is still open, or if a closed PSR1 gap could be affected by extended operation. If so these gaps are carried forward into PSR2 for consideration in the Global Assessment. (When references to PSR1 are made, the source document is identified and the relevant text from that source document is summarized in the context of PSR2.) With respect to the Darlington ISR, much of the evaluation of Safety Factor health is based on programs and practices that apply across OPG's nuclear operations. As a result, Darlington ISR programmatic conclusions are applicable to Pickering PSR2 where Pickering is confirmed to follow the same nuclear programs and practices that were assessed for Darlington. Darlington PSR1 results are applicable to Pickering PSR2 if there are Darlington PSR1 gaps that are found to be relevant to Pickering PSR2.

associated with the Pickering PSR1 gaps previously identified in the Pickering Units 5-8 Continued Operations Plan [8] are provided in Reference [9].

Fukushima Action Items were reviewed to identify implications of extending operation beyond 2020 (if any). The methodology for this review is provided in Reference [10].

Any PSR2 gaps identified as a result of the Safety Factor 15 review that are relevant to other Safety Factors are also discussed.

4.0 REVIEW FINDINGS

4.1 Review Tasks

The sub-sections below provide an assessment of the adequacy of applicable OPG Governance, Programs, Policies and Procedures (as well as Instructions and Guidelines, as applicable) in demonstrating compliance against the Safety Factor 15 Review Tasks. Appendix A of REGDOC-2.3.3 [2] is used in the assessment of each Safety Factor 15 Review Task in order to ensure alignment with CNSC guidance relating to the RP Safety Factor.

4.1.1 Review Task #1: Reactor Design for Radiation Protection

Confirm the adequacy of the reactor design features for Radiation Protection.

REGDOC-2.3.3 [2], Appendix A.3.1, *Review of the reactor design features for radiation protection*, elaborates on this Review Task by stating the following:

"The review should identify all sources of radiation and radiation exposure pathways, with an evaluation of radiation doses that could be received by workers at the facility with consideration of contained and fixed sources, and potential sources of airborne radioactive material. The review should demonstrate that the ALARA principle has been incorporated in the reactor design and operational programs and arrangements, in order to minimize the number and locations of radiation sources and the radiation fields associated with them.

The review should determine that the design and layout of the reactor facility meets CNSC regulatory requirements and expectations for reactor facilities in the area of RP (e.g., REGDOC-2.5.2, Design of Reactor Facilities: Nuclear Power Plants and RD/GD-369, Licence Application Guide: Licence to Construct a Nuclear Power Plant). The review should include RP principles, and how they are incorporated into the reactor design and are of a sufficient depth to demonstrate the following:

- *Suitable provisions have been made in the design and layout of the reactor facility to keep occupational radiation dose below regulatory limits and ALARA, including:*
  - *Classification of areas (zoning) and access control*
  - *Aging of all materials and obsolescence of technology that could impair the radiological safety functions of SSCs [Structures, Systems, and Components]*
  - *Radiological hazard control*
  - *Decontamination of personnel, equipment and structures*
  - *Radiological monitoring (in-plant)*
- *SSCs have been adequately designed so that radiation exposures during all activities are optimized and justified.*

The following subsections address the requirements of this Review Task, as well as Appendix A.3.1 of REGDOC-2.3.3 [2], as noted above. Note that ALARA principles (including an evaluation of the radiation doses that could be received by workers at PNGS) are discussed in this Review Task at a high level and more detailed information is provided in Section 4.1.5 of this report.

RP Program Background

N-PROG-RA-0013, "Radiation Protection" [7], implements a series of standards and procedures for the conduct of activities within Pickering NGS, in order to achieve the following objectives:

1. Controlling occupational and public radiation exposure:

    - Keeping individual doses below regulatory limits;
    - Avoiding unplanned exposures;
    - Keeping individual risk from lifetime radiation exposure to an acceptable level; and
    - Keeping collective doses As Low As Reasonably Achievable (ALARA), social and economic factors taken into account.

2. Preventing the uncontrolled release of contamination or radioactive materials from the nuclear sites through the movement of people and materials.

3. Demonstrating the achievement of 1) and 2) through monitoring.

Figure 1 provides an illustration of the OPGN RP program governance structure [7].

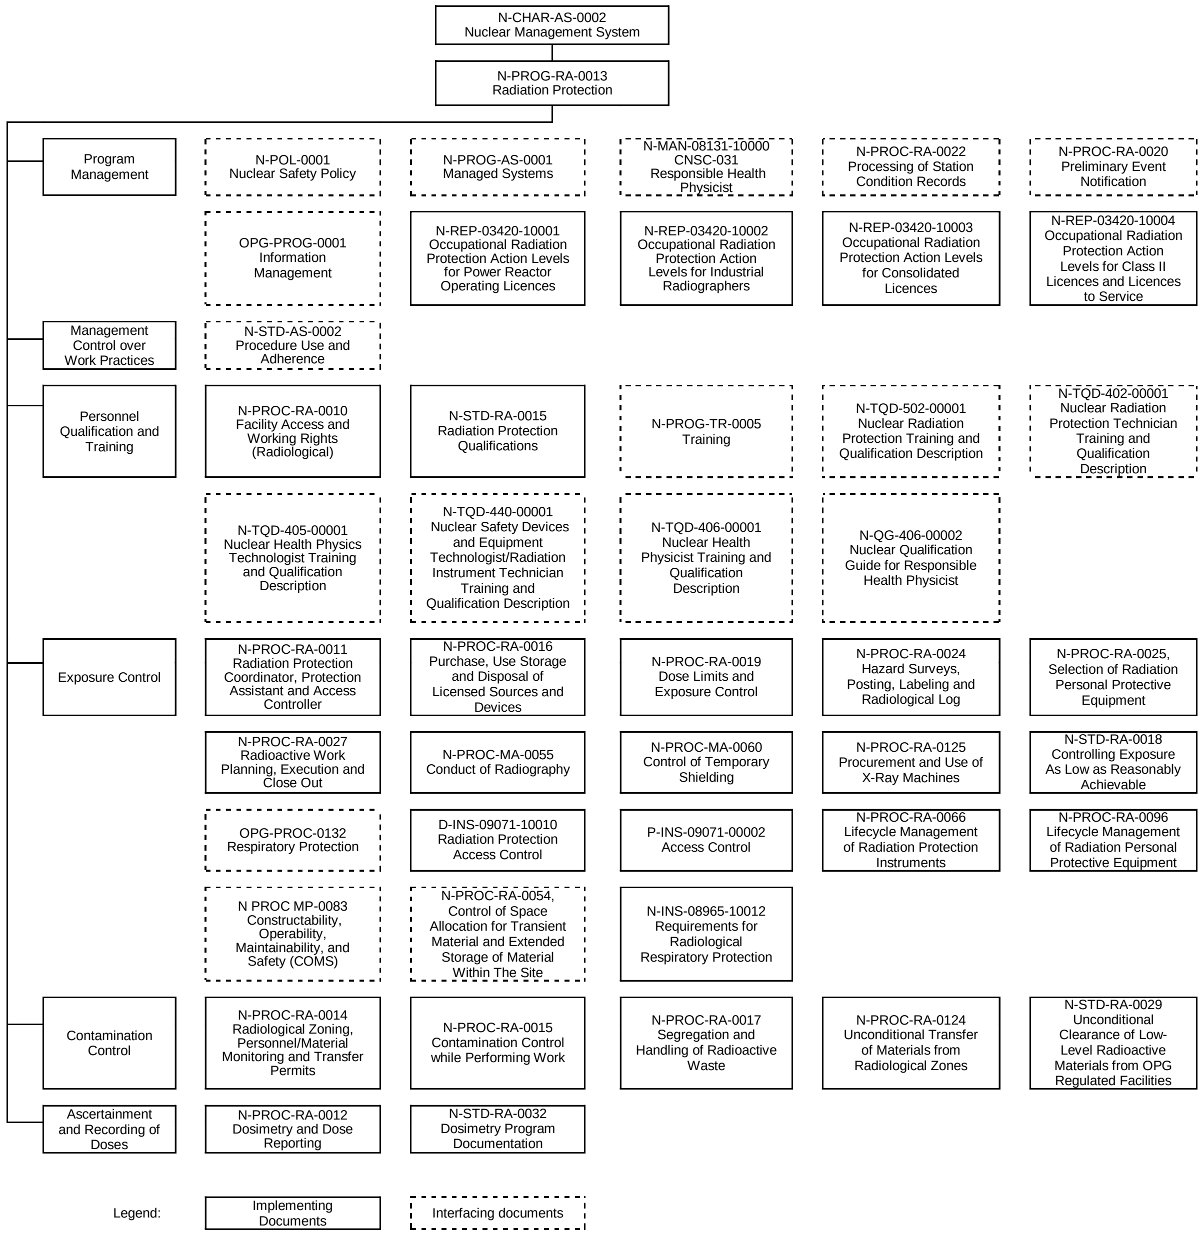

Figure 1 - Outline of Radiation Protection Governance

Per Section 1.5.3 of N-PROG-RA-0013 [7], the initial design of the station was created such that the layout and operation of facility structures, systems, components (SSCs) and processes were consistent with the established RP guidelines and contribute to maintaining occupational radiation exposures ALARA. Per Section 12 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], during the design and early operation of Pickering NGS, a design improvement program for the purpose of occupational radiation exposure reduction during operation and maintenance was undertaken, based on operating experience (OPEX) at Nuclear Power Demonstration (NPD) and Douglas Point. The work program emphasized the importance of system chemistry, equipment maintainability and shielding. In particular, the purification system designs for the Heat Transport System (HTS), the End Shield Cooling System and the Irradiated Fuel Bay were upgraded. Also, HTS components had low cobalt steel alloys specified to reduce the production of Cobalt-60 by activation. Bearing components made of Stellite (which was found to be a significant source of the dissolved cobalt in the HTS system), were removed and replaced with components made of low cobalt alloys.

The current Pickering NGS design includes specific features to ensure radiation exposures during all activities are optimized and justified. This is achieved through the use of radiological zones, area radiation monitoring equipment and the use of shielding to control radiation exposures. The design also includes SSCs which limit the release of radioactivity to the environment, and therefore limit public dose. For example, in areas subject to D_2O leakage, the Reactor Buildings at Pickering NGS have Vapour Recovery Systems [15] to maintain dry atmospheres, which results in the removal of tritium from the Reactor Building atmospheres. The Filtered Air Discharge System (FADS) [16] is a dedicated safety system that can be used in accident situations to keep Containment sub-atmospheric following the depletion of the vacuum reserve in the Vacuum Building, preventing the unfiltered release of radionuclides into the environment that could occur if Containment pressure were above atmospheric pressure. In addition, when needed, the Negative Pressure Containment System at Pickering NGS automatically isolates the Containment volume to limit the release of radioactivity beyond the Containment boundary (known as Box-up) [17].

RP Design for Defence in Depth

As outlined in Part 2 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], there are a number of barriers between radioactive materials and the general public. The barriers in place to prevent radioactivity from escaping to the environment include:

- The UO_2 fuel pellets, which bind the majority of radioactive fission products within a solid matrix;
- The fuel sheath, which contains the fission products not retained in the fuel matrix;
- The Heat Transport System boundary, which contains any leakage from the fuel sheath;
- The Containment structure, which contains any release from the Heat Transport System; and
- The exclusion zone surrounding the facility, which provides for dilution of any release from Containment.

The first three barriers prevent radioactive release accidents. So long as they are intact, very little radioactive material will escape into Containment. Containment and the exclusion zone come into play to mitigate doses when all of the first three barriers are breached (e.g., following a loss of coolant accident with fuel failures).

RP is an important element in all aspects of the design for Defence in Depth. Five levels of Defence in Depth are defined in the IAEA document INSAG-10, "Defence in Depth in Nuclear Safety" [18] (as well as REGDOC-2.5.2 [19]). The 5 levels of Defence in Depth at Pickering NGS can be summarized as follows:

- Level 1 includes the design provisions for protecting staff and the public from radiation during normal operation.
- Level 2 and 3 includes the provisions to support response to anticipated operating occurrences and Design Basis accidents to limit the effect of these events on workers, the public, and the environment.
- Level 4 includes the Beyond Design Basis aspects of the response to mitigate the radiological impact on workers, the public and the environment.
- Level 5 includes the mitigating off-site response including the provisions for Radiation Protection aspects of the off-site Emergency Response.

Note that detailed information regarding Pickering NGS alignment against these five levels is provided in Review Task 4 of Pickering NGS PSR2 Safety Factor 1 Report, "Plant Design" [20].

Radiological Zoning and Access Control

The protected area (inside the inner security fence) of Pickering NGS is divided into radiological zones in order to facilitate contamination control. Per Sections 12.3.4 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], a description of the radiological zones is as follows:

- Zone 1 – This zone contains no radioactive equipment and is normally free of contamination. It includes the administration building, the bridge between the administration and service buildings, the main lobby at the end of the bridge, the lunchroom, and the service wing S-701 office area.
- Zone 2 – This zone contains a minimal amount of radioactive equipment and normally should not have fixed or loose contamination present. This zone includes the Turbine Hall, Turbine Auxiliary Bay, parts of the Reactor Auxiliary Bay, Control Room, non-active shops, stores, showers, locker room, laundry facilities in the service wing, and the service wing extension offices.
- Zone 3 – This zone contains primarily equipment that is associated with radioactive systems. It includes the Reactor Buildings, sections of the Reactor Auxiliary Bay, decontamination centre, active overhaul and fuelling machine maintenance areas, heavy water upgrading building, Irradiated Fuel Bay, and parts of the waste management area in the service wing basement and the east annex and parts of the west annex.

- Unzoned Areas - These are areas within the protected area, but outside the powerhouse, Vacuum Building, or other buildings that are not Zone 1. It includes the roofs of buildings (below the 294’ elevation). Like Zone 1, it normally contains no radioactive sources. It differs from Zone 1 in that radioactive materials may be moved through the area provided that they are adequately shielded and contained. Eating and smoking are prohibited in an unzoned area except in designated areas.

Per Figures 151, 152, 153 and Figure 12-3, 12-4 and 12-5 of the Pickering 1,4 and 5-8 Safety Reports respectively [13], [14], the radiological zoning arrangement diagrams are shown in Figure 2 to Figure 7:

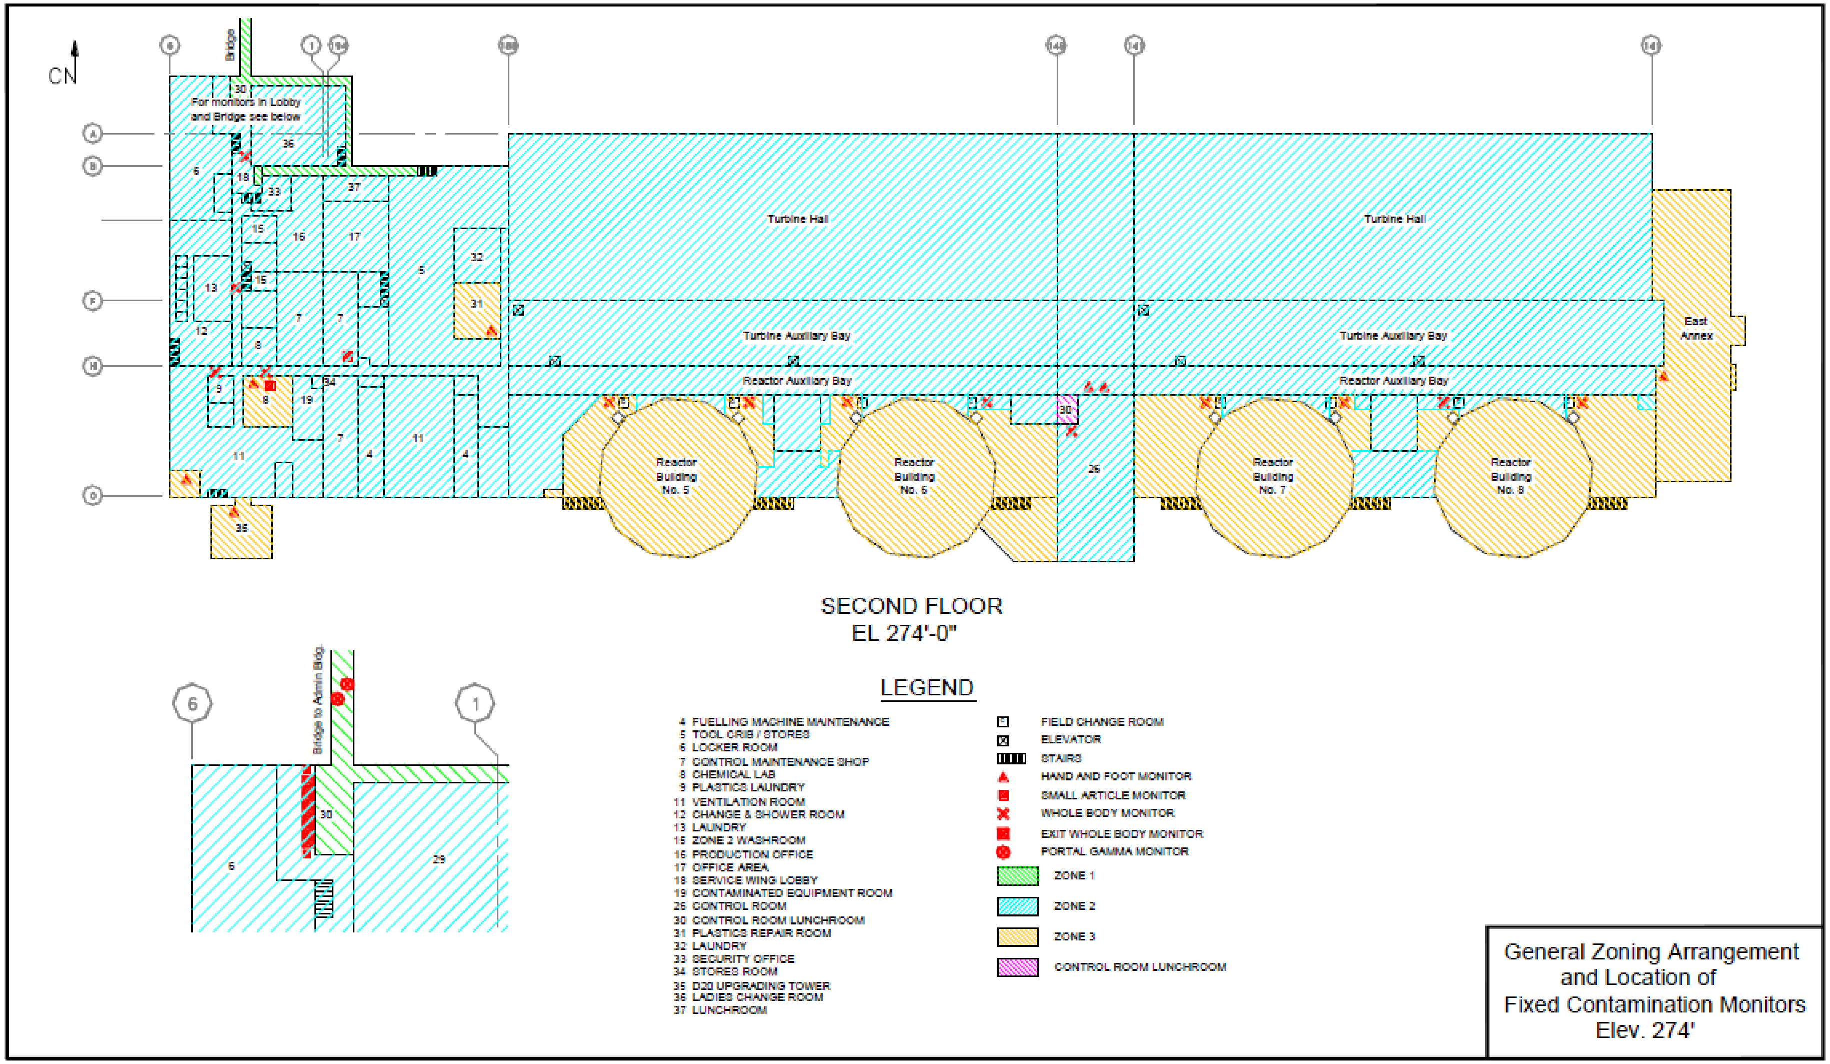

Figure 6 - Pickering 5-8 274' Elevation Zoning Arrangement

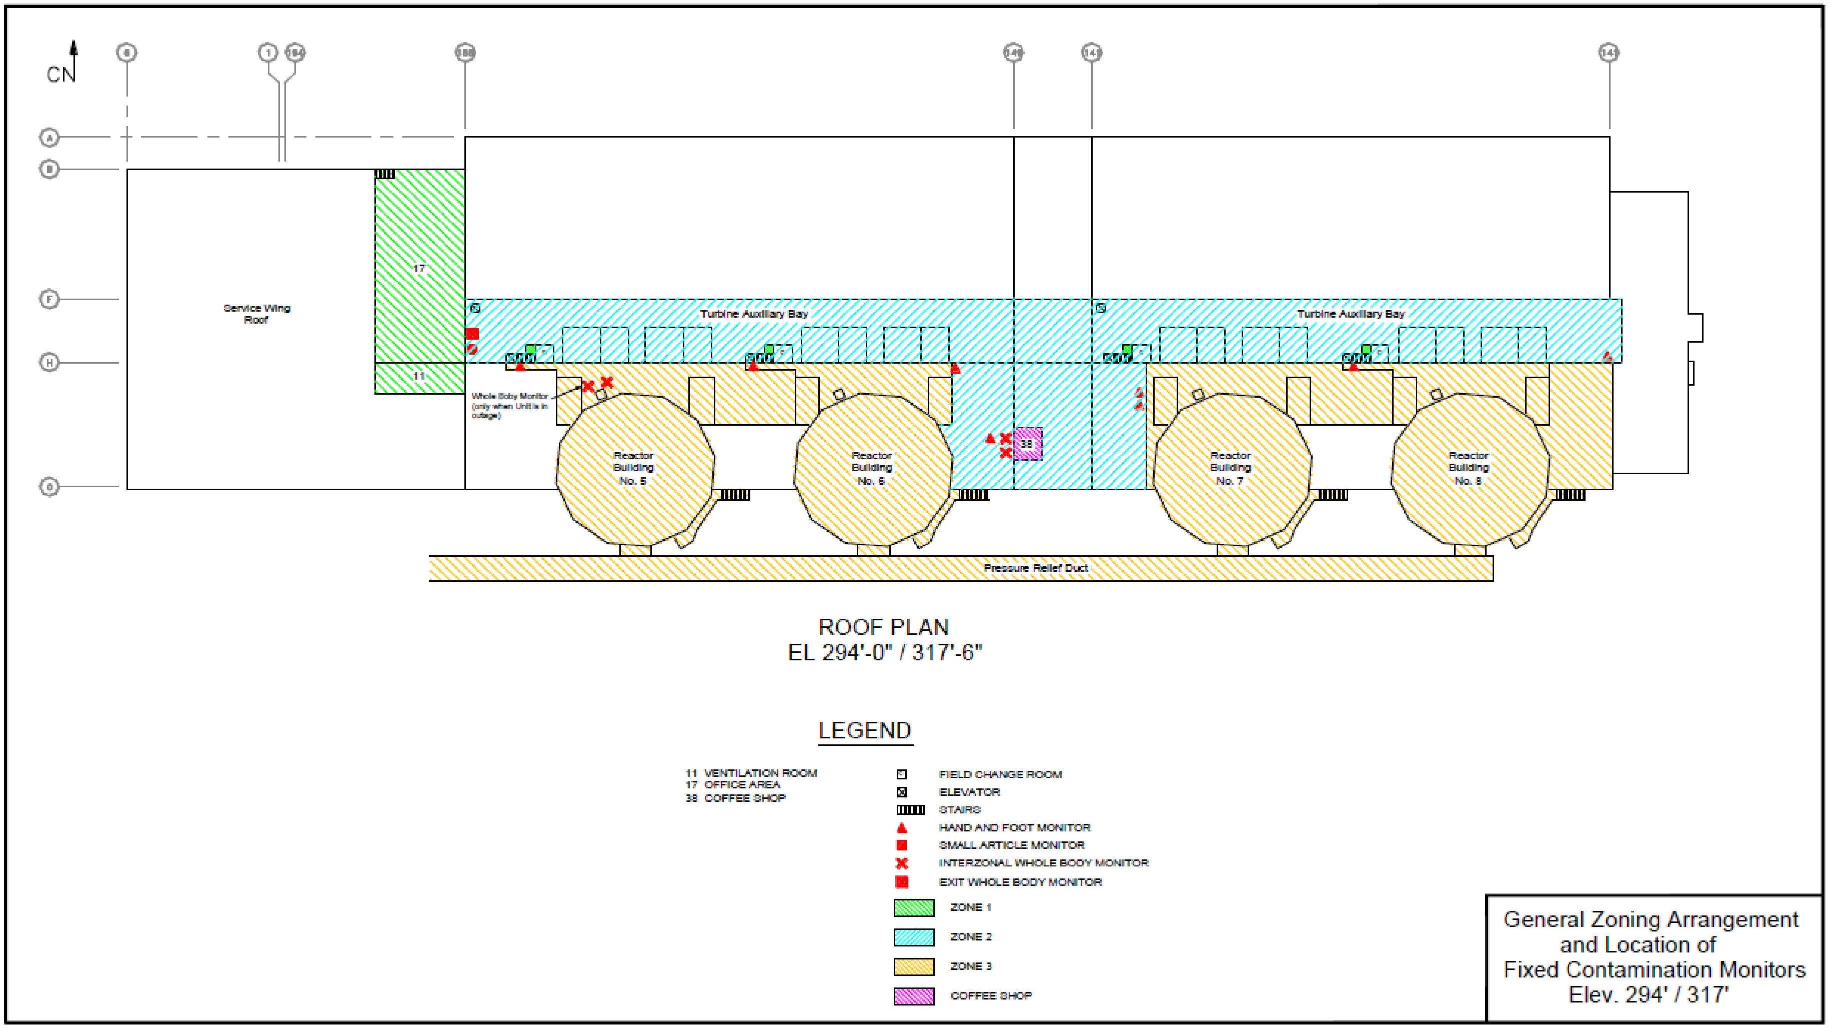

Figure 7 - Pickering 5-8 294′/317′ Elevation Zoning Arrangement

Per Section 12.3.3 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], the Pickering NGS buildings are laid out to assist the management of all sources of radioactivity for the protection of station staff and the public. Operational procedures restrict access to the Reactor Building to qualified staff and to those under escort by qualified staff. Also, permanent signs and procedures warn and instruct staff of any possible danger from radiation. The sources of radiation which give rise to high radiation fields include the reactor (e.g. the fuel and other fixed sources created by activation), the HTS, the moderator system, and the fuelling machines. The source intensity of each is dependent on operating conditions. The Access Control System prevents unauthorized access by staff to areas that contain these high radiation sources. There are two states of reactor operation which require different degrees of access control:

- State 1: Reactor operation below 0.1% full power, which is a power level at which the radiation fields are acceptable for controlled access. During this type of operation, access control doors to areas directly influenced by reactor power may be kept open. Entry to the reactor, HTS, and moderator system areas is by normal procedural controls when the radiation levels are those associated with reactor operation below 0.1% full power.

- State 2: Reactor operation above 0.1% full power is a condition that normally requires all doors that give access to the controlled areas to be locked. Entry to those areas during this type of operation is controlled by specific access control procedures.

The doors to these Access Control Areas are opened with keys that are kept in transfer locks in the Main Control Room. These transfer locks are a part of the key accounting system. A red light on the access control panel is lit whenever a key is removed from its transfer lock in either state of reactor operation. When reactor power is greater than 0.1% and a key is removed from the key accounting system, an alarm advises that the key to an access controlled room has been removed from its transfer lock. Procedures for accessing areas impacted by station operations (including fuelling activities) for Pickering NGS are implemented via P-INS-09071-00002, "Access Control" [21], which defines the Radiation Protection requirements that all individuals must follow when entering Access Control Areas.

<u>Aging of Materials and Obsolescence of Technology that could impair Radiological Safety Functions of SSCs</u>

Maintaining RP design provisions throughout the operating life of Pickering NGS relies on various operations and maintenance programs that proactively account for equipment aging and obsolescence to ensure continued operation within the station's Design Basis and maintenance of doses ALARA.

Aging of SSCs can have RP implications in terms of reduced effectiveness of safety-related systems (e.g., containment), buildup of contamination within systems and components leading to increased dose rates, radiation or corrosive damage to containment systems leading to spills and/or airborne and surface contamination, and degradation of shielding.

Equipment aging is addressed through the Integrated Aging Management (IAM) Program, as specified in N-PROG-MP-0008, "Integrated Aging Management" [22]. The objective of the IAM program is to ensure the condition of critical Nuclear Power Plant (NPP) equipment is understood and that required activities are in place to assure the health of these components and systems while the plant ages. This is accomplished by establishing an integrated set of programs and activities that ensure the performance requirements of all critical station equipment are met on an ongoing basis.

The IAM Program also requires the preparation of Life Cycle Management Plans for Major Components (N-PROG-MA-0025 [23]), and scoping, screening and preparation of required Condition Assessments, to support the monitoring and mitigation of aging related degradation mechanisms. Action plans from the Condition Assessments are managed through the Work Management process and reported as appropriate in System and Component Health Reports. The IAM Program is supported by the Equipment Reliability Program (N-PROG-MA-0026 [24]), which includes a range of procedures and processes to ensure ongoing high levels of reliable performance of components important to nuclear safety, production, and environmental protection at the station.

Surveillance is carried out in accordance with the Component and Equipment Surveillance program (N-PROG-MA-0017 [25]), which describes the elements of a focused surveillance monitoring process, including inspection, maintenance, certification and testing, and is supported by the System Performance Monitoring procedure (N-PROC-MA-0024 [26]). The surveillance monitoring process covers the full range of RP design provisions commensurate with the importance of the equipment to nuclear safety (e.g. Periodic Inspection Programs for the concrete containment as prescribed under applicable CSA standards (CSA N287.7, "In-service examination and testing requirements for containment structures for CANDU nuclear power plants"), and calibration and functionality checks for radiation monitors). Hence, station SSCs supporting RP are routinely monitored, tested and maintained to ensure that any aging effects are not preventing the required level of performance from being sustained.

The IAM program also ensures that changes impacting the condition of plant systems due to aging are monitored and managed such that doses are maintained ALARA over the life of the station. Examples of this include the following:

- The Calandria Vault, Vault Structure Cooling and Shield Tank concrete walls and slabs are inspected for potential deterioration that could lead to reduction in shielding and hence increased dose rates or loss of containment. Any damage discovered as part of the surveillance monitoring process is repaired immediately to ensure shielding and containment integrity.

- Isolation valves are used to close off parts of systems to allow worker access for maintenance activities. These can degrade over time through corrosion, erosion or mechanical fatigue, leading to leakage of radioactive material. This can result in increased doses to workers from external exposure to gamma emitting radionuclides, skin or clothing contamination, and/or inhalation of airborne contamination from evaporation. These valves are tested regularly as part of the safety related system test program, and replaced if not functioning to design requirements.

The overall station SSC surveillance, maintenance and testing programs are discussed in detail in Pickering NGS PSR2 Safety Factor 2 Report, "Actual Condition of Structures, Systems, and Components Important to Safety" [27]. A discussion on the lifecycle management of Radiation Personal Protective Equipment and Radiation Protection instruments at Pickering NGS is provided in Section 4.1.2 of this Safety Factor 15 report.

In order to proactively identify obsolescence issues for SSCs supporting RP before they are encountered through response to equipment failure or other emergent circumstances, N-STD-MA-0024, "Obsolescence Management" [28], defines and implements a sustaining program to manage both proactive and reactive obsolescence issues associated with critical equipment and components. The activities interface with equipment reliability and life-cycle management strategies designed to sustain continued safe and reliable plant operation. The Obsolescence Management program provides direction on managing obsolescence issues pertaining to RP and other critical equipment and components, as defined in N-PROC-MA-0077, "Critical Equipment Identification and P-Categorization" [29]. The replacement of any obsolete or aging SSCs with an impact on RP must comply with the requirements of the Radiation Protection Program and N-STD-MA-0024 [28], such that the replacement item must have demonstrated equivalency and perform the intended design function. Hence, this prevents obsolescence of RP related SSCs from having any adverse impacts on maintaining radiological exposures ALARA.

Note that an evaluation of aging aspects affecting SSCs important to safety, is provided in PSR2 Safety Factor 4 Report, "Aging" [30].

<u>Radiological Hazard Control</u>

Radiation exposure pathways can be through either external exposure (irradiation by sources outside the body from identifiable sources) or internal exposure (irradiation by sources inside the body originating from airborne, surface and liquid contamination). In terms of protection from external radiation, shielding was designed to align with the dose rate targets specified in Table 64 of the Pickering 1,4 and in Table 12-1 of the Pickering 5-8 Safety Reports [13], [14]. The categories of shielding are as follows:

- Primary shield – shielding that attenuates radiation from the reactor.
- Secondary shield – shielding that attenuates radiation from the HT coolant.
- Auxiliary shield – shielding that attenuates radiation from auxiliary systems, such as moderator and fuelling machines.
- Special shield – any shielding not categorized above.

In terms of airborne contamination, per Section 12.3.4.3 and 12.3.6 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], within Zones 2 and 3, airborne contamination is controlled by the adjustment of ventilation flows. Ventilation arrangements are designed such that transfer of atmosphere between different areas, due to a pressure differential, travels from the potentially less to the potentially more contaminated area. Exhaust ducts are provided with damper equipped local exhaust inlets, which can be connected to plastic tent-like structures over and around equipment that is contaminated, to give special ventilation during maintenance. The Breathing Air System supplies flexible hose connection stations throughout the plant where the use of ventilated plastic suits may be required.

The main airborne activity of concern for Pickering NGS is tritium. Release of tritium from the station is kept within limits by containment of heavy water within the HTS and moderator systems where the tritium is produced, by removal of heavy water vapour in the Reactor Building atmosphere (e.g. using Vapour Recovery Dryers), by recovery of any leakage from the heavy water circuits, and by good housekeeping in heavy water management areas. Per Section 11.4.7 of the Darlington Safety Report (Part 2) [31], the Darlington Tritium Removal Facility (TRF) reduces and maintains low tritium levels in OPGN heavy water inventories, including the Pickering NGS Moderator and HTS. By reducing the tritium concentrations in these systems, potential tritium exposures are reduced. The TRF extracts, concentrates, immobilizes and stores the tritium as a metal tritide inside a container vessel. Pickering NGS heavy water is transported to the TRF and returned following tritium extraction. The containers of extracted tritium are stored at Darlington NGS.

Per Section 1.6 of N-PROG-RA-0013 [7], a contamination control area is an area set up with barriers and warning signs to prevent inadvertent access, contain loose or liquid contamination, and prevent spread of contamination. The need to establish contamination control areas is identified during work planning or when a discovered contamination hazard cannot be removed immediately. Contamination control areas may be rubber areas or other containment systems that are clearly marked and bounded.

<u>Decontamination of Personnel, Equipment and Structures</u>

As outlined in the Pickering 1,4 and 5-8 Decontamination System design manuals [32], [33], decontamination facilities are located in various parts of the service wing of Pickering NGS as follows:

- The Active Maintenance Shop provides for the safe disassembly and steam cleaning/manual washing of large machine parts/assemblies and the storage of clean (but still active) parts.

- The Decontamination Centre receives small items from the Reactor Buildings or the service wing and also provides steam cleaning, soaking and manual scrubbing facilities plus shielding and/or ventilated storage for contaminated items which have been decontaminated but still display some fixed activity.

- Laundry facilities are provided for washing and drying items as applicable.

If contamination is detected on material during any monitoring activity, the contaminated surfaces or materials are contained or decontaminated in accordance with N-PROC-RA-0015, "Contamination Control While Performing Work" [34]. This procedure specifies work practices, measures, and techniques used to control radioactive contamination while working with contaminated materials to minimize the spread of contamination to people, equipment, and between work locations.

The focus of N-PROC-RA-0014, "Radiological Zoning, Personnel/Material Monitoring and Transfer Permits" [35] is to prevent the spread of radioactive contamination. The procedure also addresses the required response should contamination be detected on personnel.

Per References [32] and [33], for decontaminating very large pieces of equipment, buidling floors and walls (e.g. structures), manual scrubbing with the use of strong detergents and possibly weak acid solutions may be used. Reduction of exposure to personnel using these methods is accomplished through portable shielding, ventilation exhausts, protective clothing and air masks.

Radiological Monitoring (In-Plant)

Per Section 12.3.2 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], fixed area radiation monitoring is provided to detect the occurrence of radiation hazards and to warn personnel of high radiation fields. An alarm is generated in the Main Control Room on high radiation level and high rate of increase of radiation level. The alarms also annunciate in the monitored area. These monitors are primarily in Access Control Areas. Staff that may be working in the area are warned by a horn and a rotating flasher located near the alarming detector. The flashers and horns continue to operate for the duration of the alarm condition.

Per Section 12.3.4.2 and 12.3.5.1 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], contamination monitors are located throughout the station at inter-zonal boundaries and other points of importance to prevent the spread of contamination by movement of staff and equipment. The monitors are considered semi-portable and may be relocated on either a temporary or a permanent basis to reflect changes in contamination control requirements (e.g. as may be caused by changes in the pattern of work within the station).

Further details on RP equipment and instrumentation for radiation and contamination monitoring are provided in Section 4.1.2.

Design of Plant SSCs for Radiation Protection

SSCs have been designed such that radiation exposure during all activities is minimized and justified, and aligns with CNSC requirements and expectations. For example, CNSC requirements for the design and layout of the reactor facility in the area of RP are outlined in Section 8.13 of CNSC REGDOC-2.5.2 [19], which states:

"The design and layout of the plant shall make suitable provision to minimize exposure and contamination from all sources. This shall include the adequate design of SSCs to:

1. *control access to the plant*
2. *minimize exposure during maintenance and inspection*
3. *provide shielding from direct and scattered radiation*
4. *provide ventilation and filtering to control airborne radioactive materials*
5. *limit the activation of corrosion products by proper specification of materials*
6. *minimize the spread of active material*
7. *monitor radiation levels*
8. *provide suitable decontamination facilities"*

A description of the Pickering NGS RP design provisions has been provided in the preceding subsections. The provisions meet the intent of REGDOC-2.5.2 requirements as follows:

1. Control access to the plant (refer to Radiological Zoning and Access Control subsection);
2. Minimize exposure during maintenance and inspection (refer to Radiological Hazard Control subsection);
3. Provide shielding from direct and scattered radiation (refer to Radiological Hazard Control subsection);
4. Provide ventilation and filtering to control airborne radioactive materials (refer to Radiological Hazard Control subsection);
5. Limit the activation of corrosion products by proper specification of materials (refer to RP Program Background subsection);
6. Minimize the spread of active material (refer to Radiological Hazard Control and Decontamination of Personnel, Equipment and Structures subsections);
7. Monitor radiation levels (refer to Radiological Monitoring subsection); and
8. Provide suitable decontamination facilities (refer to Decontamination of Personnel, Equipment and Structures subsection).

CNSC RD/GD-369, "Licence to Construct a Nuclear Power Plant" [36], provides guidance in terms of the information that should be submitted in support of an application for a licence to construct a NPP. Section 11 of RD/GD-369 [36] outlines the RP related information to be submitted as part of the application. A description of the Pickering NGS RP design provisions and programs is provided in this Safety Factor 15 report. These RP provisions and programs meet the intent of the RD/GD-369 requirements. Alignment with the RD/GD-369 requirements is based on the information provided in this report as follows:

- Application of the ALARA principle (refer to Section 4.1.5);
- Radiation Sources (refer to Radiological Zoning and Access Control subsection in Section 4.1.1);
- Design features for Radiation Protection (refer to Section 4.1.1);
- Radiation Monitoring (refer to Radiological Monitoring subsection in Section 4.1.1); and
- Radiation Protection program (refer to RP Program Background subsection in Section 4.1.1).

In an effort to maintain radiation exposure ALARA, Pickering NGS has continually made improvements to station design, zoning, shielding and RP practices in response to Operating Experience (OPEX) (both internal and external). For Design Basis considerations, the most significant RP improvements arose in response to the accident at Three Mile Island in 1979. Response to this event included the preparation of detailed reviews of plant design and operation following an accident with fuel failures (Pickering NGS reviews are contained in References [37] and [38] respectively). These reviews initiated a number of significant plant improvements including:

- Airlock solid seals (at prescribed locations);
- Shielding around the Pickering 1-4 helium storage tank and Pickering 5-8 Emergency Coolant Injection System piping;
- Improved isolation doors and water collection for the Vacuum Building basement; and
- Improved post-accident isolation of Containment penetrations for D2O Addition/Transfer, Moderator Cover Gas, Reactor Building Vapour Recovery and Leakage Collection.

For Beyond Design Basis Accident (BDBA) considerations, the most significant OPEX is from the 2011 accident at Fukushima Daiichi. Response to this event included the introduction of new portable Emergency Mitigating Equipment (EME) (N-BDB-03600-00002, "OPG Emergency Mitigating Equipment For Beyond Design Basis Accidents: Technical Basis Document" [39]) supported by a detailed Pickering NGS post-accident habitability assessment [40]. The intent of this assessment was to confirm accessibility for existing plant facilities (e.g., Main Control Rooms) and to ensure that new BDBA mitigation provisions (e.g., BDBA monitoring and EME cooling provisions) would be accessible.

Conclusion:

The conclusion of this Review Task assessment is that reactor design features are adequate for Radiation Protection. The intent of Review Task #1 is met and therefore Pickering NGS is compliant.

4.1.2 Review Task #2: Radiation Protection Equipment and Instrumentation

> *Confirm the adequacy of the Radiation Protection equipment, and instrumentation for radiation monitoring.*

REGDOC-2.3.3 [2], Appendix A.3.2, *Review of radiation protection equipment and instrumentation for radiation monitoring*, elaborates on this Review Task by stating the following:

> *"The review of RP equipment and instrumentation for radiation monitoring should demonstrate adequate provisions for monitoring all significant radiation sources, in all activities throughout the lifetime of the reactor facility. These should cover operational states and accident conditions and, as practicable, beyond-design-basis accidents, including severe accidents. The review of the physical condition of RP instrumentation and equipment should be confirmed by walk downs where practicable to verify continued utility and functionality."*

The following subsections address the requirements of this Review Task, as well as Appendix A.3.2 of REGDOC-2.3.3 [2], as noted above.

Radiation Protection Equipment

N-PROG-RA-0013 [7] is the program document that identifies the various procedures and methods for selecting and using equipment that will control occupational dose, preventing uncontrolled release of contamination or radioactive materials, and keeping collective doses ALARA.

N-PROC-RA-0096, "Lifecycle Management of Radiation Personal Protective Equipment" [41] documents the established process followed at OPGN for the lifecycle management of Radiological Personal Protective Equipment (RPPE). This includes the process for the acquisition of approved RPPE, adding new equipment to the approved list and measures for control, maintenance, inspection, and walkdowns of existing supplies. N-EL-03425.01-10000 "Radiation Personal Protective Equipment Approved for Purchase" [42], is the document that tracks the approved RPPE, including radiation area clothing, respiratory protection, and welding apparel.

N-PROC-RA-0025, "Selection of Radiation Personal Protective Equipment" [43] outlines the procedure for the selection of appropriate RPPE, in order to prevent personal contamination and internal uptake and limit the spread of contamination at OPGN facilities. It provides details on the protective clothing and respiratory protection required for anticipated hazards and planned activities. Table 1 of N-PROC-RA-0025 outlines the protective clothing and respiratory protection, which can include basic coveralls, plastic suit ensembles, anti-contamination ensembles, overshoes, rubber gloves, particulate respirators, Ram's horn and hood, and radioiodine respirators [43].

N-PROC-RA-0015, "Contamination Control While Performing Work" [34] specifies the work practices, measures, techniques, and equipment used to control radioactive contamination and minimize the spread of contamination while working. It outlines the requirements for the establishment of contamination control areas, such as:

- Catch Containment (stand-alone),
- Self-Administered Rubber Area,
- Rubber Area,
- Rubber Change Area,
- Contaminated Area, and
- Permanent Rubber Area.

Appendix B of N-PROC-RA-0015 [34] provides the guidelines for decontamination of tools, including use of detergents and cleansers, foaming aerosol cleaners such as Rad Con, and fume hoods. Appendix C provides the guidelines for the decontamination of floor areas, including use of mops, wipes, HEPA filtered vacuum cleaners, and discusses cleaning techniques to systematically remove contamination. Appendix E outlines the guidelines for use of catch containment devices.

OPG-PROC-0132, "Respiratory Protection" [44] establishes the requirements for the selection, care and use of respiratory protection to protect workers against workplace hazardous atmospheres. It includes requirements for the quality of compressed breathing air and compressed breathing air systems.

N-PROC-MA-0060, "Control of Temporary Shielding" [45] outlines processes and controls for requesting, evaluating, approving, installing and removing temporary shielding to protect personnel from radiation, in accordance with the ALARA principle.

<u>Instrumentation for Radiation Monitoring</u>

N-PROC-RA-0066, "Lifecycle Management of Radiation Protection Instruments" [46], establishes procedures for:

- The acquisition of approved RP instrumentation;
- Adding new RP instrumentation to the approved list;
- The maintenance, inspection and calibration of RP instruments;
- Program monitoring, including the creation of performance indicators, as per N-INS-03425.41-10002, "Performance Indicators For Radiation Instruments" [47], and the initiation of corrective actions and SCRs to document adverse trends;

- The evaluation, performance and acceptance testing of new RP instrumentation; and
- The commissioning of fixed RP instruments.

Only approved RP instruments are purchased, as listed in N-EL-03425.42-10000, "List of Radiation Protection Instrumentation Approved for Purchase in OPGN" [48] or N-EL-03425.42-10001, "List of RP Instrumentation for Specialized Use in OPG Nuclear" [49].

N-PROC-RA-0012, "Dosimetry and Dose Reporting" [50] specifies criteria and methods for use of radiation dosimetry and dose control devices. It outlines the required dosimetry needed for entering different radiological zones of the plant, performing radioactive work, or for potential exposure to specific radiation hazards (such as C-14, radioiodine, airborne alpha, tritium oxide, and other airborne particulates). It also outlines proper usage for thermoluminescent dosimeters, electronic personal dosimeters, personal and air samplers. Remote monitoring of dosimetry for staff performing radioactive work can also be performed by RP staff using the Audio-Visual Teledosimetry System. N-INS-03428-10000, "Audio-Visual Teledosimetry System (AVTS) Instructions" [51] outlines the capabilities and instructions for use of the system. These capabilities include video monitoring, live dosimetry monitoring and communication with staff.

N-PROC-RA-0024, "Hazard Surveys, Posting, Labeling, and Radiological Log" [52], describes the requirements for surveying radiation hazards, posting, labeling, and recording hazard details to ensure conditions are tracked and communicated to other workers. Appendix A of N-PROC-RA-0024 [52] outlines the routine survey requirements for all radiological zones, eating and drinking areas, continuous air monitors, tritium air monitors, and workplace monitoring. Appendix B lists the operating instructions for measuring gamma radiation, surface contamination, tritium and airborne contamination, beta and neutron radiation, and for fixed RP instruments. This includes instructions for hand held instrumentation such as gamma survey meters, surface contamination survey meters, passive samplers, tritium survey meters, beta/gamma radiation meters, neutron meters, as well as semi-portable particulate monitors.

Fixed contamination monitoring, using equipment such as hand and foot monitors, small article monitors, fixed survey meters, and whole body contamination monitors, is performed using the directions specified in N-INS-09071-10004, "Use of Fixed Radiation Protection Instruments" [53]. At the point of exit from Zone 2 to Zone 1, sensitive whole body contamination monitors and portal monitors are used to monitor for contamination.

Tritium monitoring is done using various portable instruments or samplers depending on the location, application and sensitivity required [13], [14]. Gaseous diffusion units are normally used to determine tritium concentrations in most areas.

Particulate-in-air monitors can also be set up to monitor and alarm at work sites. In addition to the higher energy emission from more common radionuclides potentially present at the facility, these monitors are sensitive to low energy beta radiation from particulate carbon-14 [13],[14].

Per Section 12.3.2 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], fixed area radiation monitoring is provided by Fixed Area Gamma Monitors[8] (FAGMs) and Semi Portable Area Gamma Monitors to detect the occurrence of radiation hazards and to warn personnel of high radiation fields. As noted in Review Task 1 (Section 4.1.1) in this report, an alarm is generated in the Main Control Room by the FAGMs on high radiation level and high rate of increase of radiation level and a local alarm is sounded (horn and rotating flasher) near the alarming detector. If necessary, area gamma monitoring can be supplemented with Portable Area Gamma Monitors (such as Thermo RMS3 HP270 Probes and Bot AR600 with 713 Probes).

Per Section 12.3.4.2 and 12.3.5.1 of the Pickering 1,4 and 5-8 Safety Reports [13], [14], contamination monitors are located throughout the station at inter-zonal boundaries and other points of importance to prevent the spread of contamination by movement of staff and equipment. The monitors are discussed in additional detail in Review Task 1 (Section 4.1.1) in this report.

Additional dose monitoring capability is provided by the Automated Near Boundary Gamma Monitoring System [54] and the Automated Source Term Gamma Monitoring System [55]. These two systems measure gamma dose rate at various points around the Pickering site. The primary functions supported by these systems are categorization of events and prediction of offsite dose during nuclear emergencies. However, both systems can be used to measure dose rate during normal operation, as they provide continuous data and can be viewed from computers on the Pickering local area network.

Communications equipment is an important part of the RP program. In addition to the headset communications which form part of the AVTS [51], communications between RP personnel and workers in the plant can be performed using the Pickering NGS telephone system, hand held radios, the Public Address System or the Emergency Communications System.

RP Equipment for Emergency Response

RP equipment and instrumentation available for radiation monitoring for nuclear emergencies (including Design Basis, and Beyond Design Basis Accidents) are outlined in N-PROG-RA-0001, "Consolidated Nuclear Emergency Plan" [56]. RPPE is issued to Emergency Response staff during an emergency, as follows:

> *In the event of a nuclear emergency, as appropriate, on-site emergency responders are provided with personal dosimeters and radiation monitoring equipment. Emergency response facilities are equipped with area radiation monitors and airborne samplers. All emergency teams mobilized by the*

[8] A discussion of recent issues related to calibration of FAGMs is included in Appendix B.

Emergency Operation Centre are briefed, prior to deployment, on radiation levels, dosimetry, assigned radiation exposure limits and protective clothing. Airborne hazard breathing protection is specified. KI tablets are available for issue if necessary. Site-specific emergency response implementing procedures contain emergency dose limits, details for radiological protection, and criteria for specifying radiation protection equipment. Personnel are also provided the necessary communication equipment prior to deployment.

The equipment needed for Emergency Response, communications systems, radiation monitoring capabilities, portable Emergency Response RP equipment, and radiation personnel protective equipment, is tracked using N-PROC-RA-0133, "Management of Equipment Important to Emergency Response (EITER)" [57]. This program identifies which equipment is required for the Emergency Response Organization to perform their roles, categorizes the equipment based on importance, redundancy, and whether it is required for Design Basis, or Beyond Design Basis Accidents, and outlines the availability requirements and mitigating actions to be taken should equipment be unavailable. The list of Pickering EITER is identified in P-INS-03491-00050 [58].

Additional Radiation Protection equipment would be available to OPG and Pickering NGS during a nuclear emergency as part of a Mutual Aid Agreement between Bruce Power, OPG, Atomic Energy of Canada Limited, Hydro-Quebec, and New Brunswick Power, as outlined in N-LEGL-03490-0413370 [59]. Annex 1 of the agreement outlines the equipment and expertise that can be supplied by each of the members to the agreement in the event of a nuclear emergency. This includes mobile radiation assessment, radiological survey equipment, shielding structures, dosimetry equipment such as TLDs, as well as health physics personnel to assist.

Additional Radiation Protection of the public during nuclear emergencies is achieved through the design of the plant. These provisions are detailed in Task 1 (Section 4.1.1) in this report.

There are plant systems which are designed to measure or limit radiation releases from the station. The Fixed Gaseous Process Radioactive Effluent Monitoring System (also known as stack monitoring), is used to monitor radioactive emissions from the Pickering NGS ventilation exhaust [60]. The Liquid Effluent Sampling and Monitoring System is used to monitor the liquid effluent stream to Lake Ontario [61].

<u>Calibration and Maintenance Requirements</u>

Section 20 of SOR/2000-207, "Nuclear Substances and Radiation Devices Regulations" [62], requires that all radiation survey meters be calibrated within the 12 month period preceding use. N-INS-09071-10009, "Requirements for the Calibration and Maintenance of Radiation Protection" [63] outlines the OPG maintenance and calibration requirements for RP instruments, which is compliant with Section 20 of the Regulation. N-INS-09071-10009 [63] makes a distinction between portable RP equipment (e.g. handheld survey meters, personal dosimeters, etc.), and fixed and semi portable contamination monitors. Portable RP equipment calibration and testing procedures are also outlined in N-INS-09071-10009, along with the requirements for the frequency of calibration and source checking, which allows for a functional check of the equipment.

The alarm set points and minimum source check frequency for fixed and semi portable monitors are outlined in Appendix A of N-INS-09071-10009. For FAGMs and Semi Portable Area Gamma Monitors, the responsibility for these systems lies with the Operations and Maintenance organizations since these are engineered systems [62]. Walkdowns, calibration, testing, and maintenance of these systems falls under the plant maintenance program, outlined in N-PROG-MA-0004, "Conduct of Maintenance" [64]. System performance monitoring of engineered systems is conducted per N-PROC-MA-0024 [26]. System and equipment walkdowns are conducted by system engineering staff and routine walkdowns are conducted by Operations and RP staff. The performance of these fixed systems is tracked using OPG's quarterly performance indicator reports, as outlined in N-INS-03425.41-10002 [47].

Any real or potential deficiencies identified in calibration or maintenance of RP equipment are filed as SCRs, which are categorized, evaluated and processed in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [65]. Regular audits and self-assessments (which review these SCRs) are undertaken to determine the effectiveness of RP provisions at Pickering NGS. Note that a discussion of SCR trends is included in Appendix B of this document.

Conclusion:

The conclusion of this Review Task assessment is that the RP equipment and instrumentation for radiation monitoring at Pickering NGS are adequate. The intent of Review Task #2 is met and therefore Pickering NGS is compliant.

4.1.3 Review Task #3: Radiation Protection of the Public and Workers During Nuclear Emergencies

Confirm that adequate provisions are in place to address Radiation Protection of the public and workers during nuclear emergencies.

REGDOC-2.3.3 [2], Appendix A.3.3, *Review of radiation protection aspects for nuclear emergencies*, elaborates on this Review Task by stating the following:

> *"The review of RP aspects for nuclear emergencies should demonstrate the effectiveness of RP measures during a nuclear emergency. These measures may be significantly impacted by facility configuration and controls; or for example, the review should consider access controls, habitability controls, communications systems, adequate radiation monitoring capabilities, portable emergency response RP equipment, and radiation personnel protective equipment."*

Provisions to respond to nuclear emergencies constitute primarily Defence in Depth Levels 4 and 5 [17] to mitigate the radiological impact on workers, the public, the environment, and off-site response (the Defence in Depth levels were discussed further in Section 4.1.1). The following subsections address the requirements of this Review Task, as well as Appendix A.3.3 of REGDOC-2.3.3 [2], as noted above.

Nuclear Emergency Planning

A detailed community response to nuclear emergencies is outlined by the "Provincial Nuclear Emergency Response Plan" (PNERP) [66] maintained by the Province of Ontario. Among other things, the PNERP outlines the guidelines concerning provincial issuance of operational directives for various measures implemented in the unlikely event of a nuclear emergency. These include protective actions such as instructions for sheltering and/or evacuation, or operational measures such as ground or aerial monitoring and other measures for the management of off-site consequences and the support and coordination of offsite organizations. For many measures, including sheltering, evacuation, administration of thyroid blocking agents and restrictions placed on the consumption of affected foods and water, the plan further outlines Protective Action Levels, specified in terms of projected radiation doses, as both a lower level (below which the protective measure would not normally be justified) and an upper level (above which the protective measure shall be implemented, unless implementation clearly entails greater risks for the people involved). This graded approach ensures response commensurate with the emergency level.

N-PROG-RA-0001, "Consolidated Nuclear Emergency Plan" [56], defines OPG commitments under the Provincial Nuclear Emergency Response Plan and provides a framework for OPG's interaction with external authorities. More specifically, N-PROG-RA-0001 [56] documents the concepts, roles, and resources required to implement and maintain an Emergency Response capability to protect the public, employees, and the environment in the event of a nuclear emergency. As outlined in the Consolidated Nuclear Emergency Plan, OPG maintains an Emergency Response Organization that would lead the on-site and support the off-site response and recovery during Design Basis and Beyond Design Basis Accidents. Radiation Protection support is provided to the Emergency Response Organization by the following staff [56]:

- The Health Physics Manager at the Site Management Centre is responsible for the following tasks during a nuclear emergency:
    - Collection and transmission of source term and off-site survey data to the Province.
    - Redeployment of Off-Site Survey Teams at Provincial request.
    - On-site exposure control and management, contamination control strategies, and on-site protective action recommendations.
    - On-site dose consequence assessment.
    - Guidance on any radiological casualties, and radiological or hospital support.
    - Radiation Protection services.

- Approval of exposure permits as needed.
- Radiological habitability of Site Management Centre.

The Health Physics Manager has numerous call-in staff for health physics, environmental, and radiation control support, including technical and field staff.

- The Health Physics Director at the Corporate Emergency Operations Facility is responsible for off-site radiological consequence assessment, review and assessment of provincial off-site protective action decisions, and assessment of on-site protective action recommendations. Their counterpart in the Site Management Centre is the Health Physics Manager.

- The In-Plant Survey Team is responsible for hazard surveys, as directed by the In-Plant Co-ordinator, and basic plant damage or abnormal condition recognition.

- The Off-Site Survey Team conduct off-site radiation monitoring and sampling.

- Emergency Response Projection Operators run the Emergency Response Projection computer program to provide off-site impact assessments. They also provide dose projection analysis and explanation in support of the task objectives of the Health Physics Director and Technical Support Director.

- Station staff also support the response at emergency off-site centres that are established as required under the PNERP (discussed further below).

Training and qualification of these Radiation Protection related Emergency Response Organization roles is outlined in N-TQD-503-00001, "Nuclear Emergency Response Organization Training and Qualification Description" [67]. Each Emergency Response Organization member must also participate in Continuing Training as prescribed in station procedures. A summary report of each Emergency Preparedness drill/exercise is prepared. The Radiation Protection Department reviews these reports, and incorporates OPEX and lessons applicable to RP in the quarterly RP Department Performance Improvement Report [68]. Note that additional details on the training and qualification of RP staff are captured in Section 4.1.5.

OPGN procedures for responding to Nuclear Emergencies include Abnormal Incident Manuals, Severe Accident Management Guides, and Emergency Mitigating Equipment Guides. These procedures are outlined further in the PSR2 Safety Factor 13 Report on Emergency Planning [69]. For Design Basis, and Beyond Design Basis Accidents, Radiation Protection elements of Emergency Response are primarily the responsibility of the Health Physics Manager, as discussed above.

As described in Reference [59], additional Radiation Protection equipment, expertise, materials, and other support would be available to OPG and Pickering NGS in the event of a nuclear emergency as part of a Mutual Aid Agreement between Bruce Power, OPG, Atomic Energy of Canada Limited, Hydro-Quebec, and New Brunswick Power.

RP for the Public During Nuclear Emergencies

OPG's role in Radiation Protection of the public during a nuclear emergency is outlined in the Consolidated Nuclear Emergency Plan [56]. This includes the use of various assessment techniques to determine the extent of the on-site radiation impact and to predict the off-site radiation consequence to the public (e.g. radiological source term measurements, meteorological analysis, off-site dose projections, dose assessment verification using off-site survey results and core, fuel and system status assessment techniques). It also includes provisions for public alerting and education, communications to external stakeholders, setup and provision of monitoring and decontamination services at Reception Centres, and the maintenance of an adequate supply of iodine thyroid blocking agents. As detailed in Reference [70], additional proactive efforts, including the pre-distribution of iodine tablets to all residences and businesses within the 10km primary zone of Pickering NGS and an intensive public education campaign on what to do in the very unlikely event of a nuclear emergency, have also been completed by OPG with support from the Region of Durham and City of Toronto. Other operational responsibilities regarding thyroid blocking agents (stocking, distribution and administration) are prescribed by the province's Ministry of Health and Long Term Care as detailed in the PNERP [66].

As discussed in Section 4.1.1 of this report, protection of the public is also achieved through the Defence-in-Depth design measures including station equipment (reactor control and cooling systems) and physical design barriers (Containment), and Emergency Response equipment. The overall response is assisted by the following plant systems, which minimize the release of radioactive material or provide monitoring of radioactive releases to assist with radiation dose control:

- Gaseous Process Radioactive Effluent Monitoring System (stack monitoring),
- Liquid Effluent Sampling and Monitoring System,
- Vapour Recovery System,
- Filtered Air Discharge System, and
- Containment Box Up.

RP for Workers During Nuclear Emergencies

The Radiation Protection of workers during nuclear emergencies is addressed through adherence to OPG's processes and procedures, including the Consolidated Nuclear Emergency Plan [56]. The Consolidated Nuclear Emergency Plan [56] outlines specific provisions for the protection of workers during nuclear emergencies. These include provisions for:

- Increased monitoring and decontamination including the staffing of Emergency Worker Centres and Monitoring and Decontamination Units to provide radiation exposure control and dosimetry for off-site emergency workers;

- Site evacuation of all non-essential staff (instructions for evacuation of non-essential staff are documented in P-INS-03491-00032, "Relocation Dismissal, Evacuation" [71]);

- Issuance of thyroid blocking agent to on-site personnel and OPG emergency workers; and

- In the extremely unlikely event the need arises, provisions for appropriate medical treatment facilities.

RP equipment used for Emergency Response, including radiation monitoring capabilities, portable Emergency Response RP equipment, and radiation personnel protective equipment was discussed in Section 4.1.2 of this report. Communication equipment included as part of Pickering NGS EITER [58] includes radios, site telephone system access for the Emergency Operations Centre, Site Management Centre, and the Shift Managers office, Nuclear Emergency Telephone System, as well as the seismically qualified Emergency Communications System. In addition, the Emergency Telecommunications Enhancement Project is underway as reported in [72], to provide additional emergency communications enhancements in the event of a Beyond Design Basis Accident.

Access and habitability controls for Pickering NGS would be unchanged during nuclear emergencies, and are detailed in P-INS-09071-00002, "Access Controls" [21].

N-PROC-RA-0019, "Dose Limits and Exposure Control" [73] specifies requirements to manage dose within Exposure Control Limits and Administrative Dose Limits to control any worker's dose below CNSC regulatory limits. This document also lists limitations on work when workers are placed on removal, where further radiation exposure of the worker needs to be temporarily limited. Appendix B of N-PROC-RA-0019 [73] outlines emergency circumstances under which these exposures can be exceeded.

N-PROC-RA-0027, "Radioactive Work Planning, Execution and Close Out" [74], outlines the criteria to be used for planning and executing all radioactive work. It states that:

> *In the event the station Shift Manager (SM) declares an emergency, the Radiation Protection (RP) procedures are to be followed to the extent possible/practical, however some discretion is available to the SM to deviate from this procedure to take actions expeditiously to protect workers, the public or the environment. In such an event, the SM shall ensure:*
>
> 1. *ALARA principles continue to be applied when planning emergency actions.*
> 2. *The emergency plan ALARA considerations, including the planned dose estimates, are documented in writing.*
> 3. *A Station Condition Record (SCR) is filed after the event.*

4. *In all cases where this SM discretion is exercised, Radiation Protection Department shall conduct a post-event review to identify lessons learned.*

In the event of a nuclear emergency, briefings for workers would be performed using N-FORM-11073 [75], "Emergency Task Briefing", which is used to identify hazards, PPE, and backout limits for the tasks. Additional guidance for BDBEs is provided by N-GUID-09013-10003 "Radiation Protection – Nuclear Emergency Responders Guide for Beyond Design Basis Events" [76], which includes dosimetry requirements, RPPE, survey equipment and exposure control.

Plant design provisions to minimize worker dose (which are also applicable to nuclear emergencies) are discussed in Section 4.1.1. Specific RP features of the Pickering NGS design include improved post-accident isolation of Containment penetrations for D_2O Addition/Transfer, Moderator Cover Gas, Reactor Building Vapour Recovery and Leakage Collection (which were added in response to the Three Mile Island accident). There has also been an assessment of existing plant facilities (e.g., Main Control Rooms) to ensure that new BDBA mitigation provisions (e.g., BDBA monitoring and Emergency Mitigating Equipment cooling provisions) would be accessible. OPG References [37] and [38] provide additional information explaining how habitability requirements (including Radiation Protection requirements) were addressed when BDBA accident mitigation improvements were made.

Emergency Response for accidents involving radioactive sources other than the reactor core are addressed in two documents. N-INS-04162-10003, "Emergency Response" [77] provides guidelines for emergency situations involving radiography sources and exposure devices. These guidelines are used to develop event-specific response plans appropriate for the conditions present during an emergency. N-STD-RA-0036, "Radioactive Materials, Transportation Emergency Response Plan" [78] identifies the responsibilities of OPG with respect to the response strategy and concepts to enable an effective response to a transportation incident involving an OPG shipment of radioactive material. The plan also identifies the liaison and potential interface with external Emergency Response organizations.

Conclusion:

The conclusion of this Review Task assessment is that adequate provisions are in place to address Radiation Protection of both the public and workers during nuclear emergencies. The intent of Review Task #3 is met and therefore Pickering NGS is compliant.

4.1.4 Review Task #4: Improvement of Radiation Protection Based on Operating Experience

> *Confirm that the Radiation Protection provisions have been improved as the result of external operating experience.*

REGDOC-2.3.3 [2], Appendix A.3.4, *Review of radiation protection related to operating experience*, elaborates on this Review Task by stating the following:

> *"The review of RP-related operating experience (OPEX) should identify OPEX reports from other reactor facilities and relevant national and international experience and research findings. The review should verify that this information has been properly considered in the routine evaluation of OPEX and research developments and that appropriate action has been taken. The review of OPEX should seek to identify good practices and lessons learned elsewhere, and to take advantage of improved knowledge derived from research, in the area of RP."*

OPG ensures Radiation Protection is managed in a manner consistent with regulatory requirements and international standards. This includes identifying Radiation Protection related Operating Experience from other reactor facilities and relevant national and international experience and research findings. OPEX is incorporated into the RP program through Section 1.2.3 of N-PROG-RA-0013 [7], which states that the design and execution of the RP program is subject to ongoing monitoring through mechanisms including, but not limited to:

- External assessments performed by groups such as the CNSC or the World Association of Nuclear Operators (WANO);
- Reviews of industry operating experience;
- Benchmarking of OPG practices with the rest of the nuclear industry; and
- Information obtained from the CANDU Owners Group (COG) and research and development programs.

Events or conditions identified through these mechanisms that indicate real or potential deficiencies are filed as SCRs. At Pickering NGS, the process for documenting external OPEX as SCRs is conducted in accordance with N-PROC-RA-0035, "Operating Experience Process" [79]. This document states that OPEX SCRs for WANO Significant Operating Experience Reports (SOERs), WANO Significant Event Report (SERs), and Level 1 and 2 Institute of Nuclear Power Operations (INPO) Event Report (IERs) be initiated within 5 working days of their communication. SCRs are categorized, given a significance rating, and where warranted, evaluated for corrective actions to be taken to address deficiencies. SCRs are processed in accordance with N-PROC-RA-0022, "Processing Station Condition Records" [65].

The CANDU Owner's Group (COG) CANDU Radiation Protection Peer Group (RPPG), of which OPG is a member, was established to provide industry Radiation Protection management personnel with a forum to identify and address generic issues related to Radiation Protection within CANDU nuclear power plants and related facilities and organizations. The working group provides an environment for promoting awareness of issues and for developing common response strategies. COG also maintains a database of OPEX gathered from the CANDU reactors around the world, as well as major industry groups such as WANO, INPO, Electric Power Research Institute (EPRI), etc. This OPEX is screened at weekly meetings, which are attended by OPG staff. COG also co-ordinates CANDU specific research and development as well as joint projects between OPG and other utilities.

The Radiation Protection department creates a quarterly Performance Improvement report [68]. The reports document industry Operating Experience, such as INPO and WANO event reports, as well as OPEX from within OPG itself. RP related SCRs generated within the quarter are reviewed to determine what OPEX or lessons learned are applicable. Outstanding actions related to SCRs are also listed. The reports also track external evaluations of RP adequacy and effectiveness, such as assessments from the IAEA, WANO Peer Reviews, and other industry assessments that provide Operating Experience and industry best practices to OPG. The opportunities for improvement in these assessments are noted and described, and subsequent action items are listed and tracked for completion.

In addition to the response to the major OPEX events discussed earlier in this report (e.g., Fukushima/Three Mile Island), some examples of good practices and lessons learned from elsewhere that OPG has identified using the SCR process and the COG OPEX screening process include:

- P-2015-02695, "OPEX SCR - INPO ICES #313040 Shepherd Calibrator Interlock Failure". OPG received OPEX from INPO identifying a possible defect in the Shepherd Model 89 box calibrators employed at Pickering for the calibration of fixed radiation detection instruments. This led to the practice of opening the device housing to inspect the solenoids during routine inspection.

- N-2010-00632, "OPEX- Alpha Contamination found During Refurbishing at Bruce Power (Bruce SCR 28184910, BC 04533)". A COG screening meeting identified this OPEX from Bruce Power. The HEPA vacuum system and tooling used at Bruce A was insufficient to prevent higher than expected alpha contamination during work on the heat transport piping during refurbishment of Unit 2. As a result of this OPEX, OPG reviewed and revised the radioactive work planning process for alpha hazards, monitoring, engineering controls, protective equipment and administrative controls.

- N-2009-07252, "OPEX-SCR: V.C. Summer - WBC Did Not Find I-125 Seeds, INPO OE30151 - COG Record 45921, 14DEC09". COG identified applicable OPEX from the V.C. Summer Station where a whole body counter did not detect that a contractor receiving radiation treatment had I-125 seeds implanted in his body, which triggered an exit monitor when the contractor attempted to leave the station. As a result of this, OPG reassessed procedures to specify that sodium iodide detectors with limited shielding could be used in similar situations to locate, identify and assess the radioactivity.

- As an example of improved Radiation Protection provisions from external OPEX, Section 7.2 of P-CORR-00531-03719, "Application for Renewal of Pickering Nuclear Generating Station Power Reactor Operating Licence" [80] notes reductions in dose due to improvements in the management of scaffolding tasks based on industry OPEX.
- A COG Radiation Protection Workshop was held in Toronto in August 2016. Lessons learned and observations are documented in the Benchmarking Report P16-001981-SA, titled "2016 CANDU Owners Group Radiation Protection Workshop Benchmarking Report".

When making engineering changes, the Radiation Protection program N-PROG-RA-0013 [7] mandates that "engineers maintain or improve upon designs that reduce occupational exposures". RP staff review engineering changes to provide input for achieving these goals in accordance with N-PROC-MP-0083, "Constructability, Operability, Maintainability, and Safety (COMS)" [81]. External OPEX is included in these reviews by means of N-PROC-MP-0090, "Modification Process" [82], which mandates that appropriate OPEX be used to understand technical issues and provide the best possible input for making operational decisions during the detailed design phase of a Design Engineering Change. This is, in part, documented in Section 3.1 of each modification's N-FORM-10959 "Design Scoping Checklist" [83], which specifies the following OPEX reviews:

- SCRs in accordance with N-PROC-RA-0022 [65];
- Outside industry experience to decide on vendors for service or materials;
- WANO, EPRI, INPO and COG web-sites for relevant information; and
- An as-needed discussion with the OPEX Single Point Of Contact.

Additional information on how OPG receives, assesses, incorporates, and implements OPEX and research findings was included as part of the PSR2 Safety Factor 9 Report, "Use of Experience from Other Nuclear Power Plants and Research Findings" [84].

Conclusion:

The conclusion of this Review Task assessment is that Radiation Protection provisions have been improved as the result of external operating experience. The intent of Review Task #4 is met and therefore Pickering NGS is compliant.

4.1.5 Review Task #5: ALARA Principle in Reactor Design and Operational Programs

The review will demonstrate that the ALARA principle has been incorporated in any modifications of the reactor design and operational programs and arrangements.

Per REGDDOC-2.3.3 [2], Appendix A.3.1, *Review of the reactor design features for radiation protection,* demonstration of the incorporation of the ALARA principle in the reactor design and operational programs and arrangements is required. Section 4.1.1 of this report, identifies ALARA principles at Pickering NGS at a high level, while the following subsections provide more detailed information regarding the application of ALARA in reactor design and operational programs.

<u>ALARA Principle for Design Modifications</u>

N-PROG-RA-0013 [7] mandates that when making engineering changes, engineers maintain or improve upon designs that reduce occupational exposures throughout the lifecycle of the facility. At Pickering NGS, this process is implemented through N-STD-RA-0018, "Controlling Exposure as Low as Reasonably Achievable" [85]. Specifically, Section 1.6.2 "Plant Modifications" states that:

> *(a) ALARA principles are to be applied to any changes to facility design.*
>
> *(b) Station Engineering ensures proposed changes to radiological systems are reviewed by Facility RP Department in accordance with N-PROG-MP-0001, Engineering Change Control, and N-PROC-MP-0083, Constructability, Operability, Maintainability, and Safety (COMS).*
>
> *(c) Facility RP Department shall review all proposed changes to facility design which may affect radiation exposure. Even though the proposed change may not explicitly involve radiation exposure, an ALARA review may uncover additional improvements, which may lead to dose reduction.*

RP staff are required to review engineering changes to provide input for achieving the goal of reducing occupational exposure in accordance with N-PROC-MP-0083, "Constructability, Operability, Maintainability, and Safety (COMS)" [81]. N-PROC-MP-0083 [81] mandates a graded approach to address Radiation Protection / ALARA aspects depending on the potential radiological risk of a modification as identified for the particular modification on N-FORM-10958, "Modification Outline" [86].

The control of public and environmental exposure to radiation in accordance with the ALARA principle is similarly documented in N-STD-OP-0042, "Controlling Radiation Exposure to the Public and the Environment to As Low As Reasonably Achievable" [87], which mandates that each engineering modification with the potential to impact the environment be reviewed by Environment Operations Support using N-FORM-

10422, “Environmental Impact Worksheet” [88], as per N-PROC-MP-0090, “Modification Process” [82].

Additional ALARA provisions may be applied as appropriate during maintenance or inspection activities e.g. through the use of temporary radiation shielding. This would be prescribed during the planning of radioactive work. N-PROC-MA-0060, “Control of Temporary Shielding” [45] outlines the processes and controls for requesting, evaluating, approving, installing and removing temporary shielding.

Note that in addition to engineering changes which impact radiation exposure, RP staff review changes to the use of space in radiological zones in accordance with N-PROC-RA-0054, “Control of Space Allocation for Transient Material and Extended Storage of Material within the Site” [89]. This procedure prescribes the administrative requirements regarding control of space allocation, transient materials, extended storage of material, and re-locatable structures.

<u>ALARA for Operational Programs and Arrangements</u>

The RP program as described in N-PROG-RA-0013 [7], has an important objective in keeping collective doses ALARA. The design and execution of the RP program is subject to ongoing monitoring through mechanisms including, but not limited to:

- Worker identified issues or opportunities to improve in the design or implementation of the RP program;
- RP program self-assessments;
- Independent audits;
- Review of exceptional dosimetry and dose control device measurement results;
- External assessments performed by groups such as the CNSC or WANO;
- Reviews of industry operating experience;
- Benchmarking of OPG practices with the rest of the nuclear industry; and
- Review of COG and other research and development programs.

To ensure radiation doses that could be received by workers at Pickering NGS are ALARA, N-PROG-RA-0013 [7] states that individual worker doses, including those for contractors and visitors, are managed to Exposure Control Levels (ECLs) that are below administrative control levels that are in turn below the regulatory limits. The ECLs may only be increased with line manager’s approval up to the Administrative Dose Limits (ADLs). Increasing allowable doses above ADLs requires a higher level of management approval. N-PROC-RA-0019, “Dose Limits and Exposure Control” [73] specifies requirements to manage dose within ECLs and ADLs to control any worker’s dose below CNSC regulatory limits and lists limitations on work when workers are placed on removal, where further radiation exposure of the worker needs to be temporarily limited. Appendix B of N-PROC-RA-0019 [73] outlines emergency circumstances under which these exposures can be exceeded.

Collective dose performance targets for each facility are established annually by station management and take into account the reductions achievable through the application of ALARA techniques. As work is planned in more detail, collective dose projections are reviewed and actions taken to ensure dose is ALARA. N-STD-RA-0018, "Controlling Exposure as Low as Reasonably Achievable" [85] describes elements of a managed system for use at OPG Nuclear facilities to keep and demonstrate that occupational collective dose is ALARA, social and economic factors taken into account. Specifically, this standard:

- Requires ALARA committees be created to ensure high level participation of senior management;
- Requires estimating collective dose for general facility operations and outages;
- Requires continuous monitoring of the effectiveness of ALARA measures; and
- Defines responsibilities for setting performance objectives.

N-PROC-RA-0027, "Radioactive Work Planning, Execution and Close Out" [74], specifies the processes that are to be used for planning and executing all radioactive work to ensure doses are kept ALARA and unplanned exposures are avoided. For example, all radioactive work must be executed in accordance with conditions and constraints specified on an ALARA Section approved Radiation Exposure Permit (REP), appropriate for the task being performed. If the REP identifies that Electronic Personal Dosimeter dose rate alarms are anticipated, methods for limiting the number and duration of alarms are incorporated into the task evaluation. Also, per Section 1.4.2 of Reference [85], a radiation hazard information system is readily available to facilitate personnel job planning, job safety analysis, pre-job briefing, dose estimating and dose rate trending. The system consists of a database containing both current and historical radiological data and has the ability to search for information by location. Data provided by the database include results from measured external dose rates, airborne radiation hazards and surface contamination. This system is one element of the Radiation Information System, which is a suite of computer applications containing personnel dose and qualification status, dose management information, radiation hazard information, software to issue Electronic Personal Dosimeters and a tool to prepare REPs.

Per N-PROC-MA-0013, "Planned Outage Management" [90], Radiation Protection plans are prepared and in place to support outage scope and scheduled activities. Based on the projected source term and approved outage work scope along with the detailed ALARA reviews completed, RP staff is required to establish the final dose estimates for the outage. These estimates provide the basis to specifically challenge opportunities to reduce the dose impact of specific work efforts or projects.

N-STD-OP-0042, “Controlling Radiation Exposure to the Public and the Environment to As Low As Reasonably Achievable” [87], establishes requirements for OPGN facilities to keep radiological exposures and doses to the public and the environment ALARA (PE-ALARA). The PE-ALARA process is an ALARA approach that is factored into aspects of the design, operation and maintenance of the station, such that minimizing the release of radioactivity to the environment is considered. Timely identification and mitigation of increases in emissions are the cornerstone of the PE-ALARA process. Note that PSR2 Safety Factor 14 Report, “Radiological Impact on the Environment” [91], provides an evaluation of the program for monitoring the radiological impact of the plant on the environment, which ensures the emissions are properly controlled and are ALARA.

Furthermore, as a condition of the Dosimetry Service Licence, OPG prepares Annual Compliance Reports to assess the regulatory and program requirements to measure and record occupational exposure. The Annual Compliance Reports submitted to the CNSC in the last three years [92], [93], [94] (which also include independent reviews of SCRs) did not identify any dosimetry licence violations or unplanned RP-related event reports related to Pickering NGS.

<u>Application of ALARA</u>

Initiatives to drive improvements to the ALARA program are documented in the Site ALARA Strategy, which is updated as warranted to reflect the results of self-assessments, benchmarking, corrective action plans and industry best practices. The comprehensive strategy includes the following key aspects to improve performance [80].

- Source Term Characterization and Mitigation:

  Comprehensive surveys are performed during planned outages and during operation to characterize the radiological condition and source term of each unit, enabling the development of current ALARA plans and effective dose reduction initiatives for jobs. If radiological ‘hot spots’ are identified, ALARA staff determine the benefit of removal of the hot spot versus other dose reduction methods. If warranted, the removal of the hot spot is managed via the station work management program.

- Source Term Reduction:

  Industry best practices are implemented to reduce source term and accordingly the dose to workers. For example, a reduction in process fluid filtration pore size will improve the removal of insoluble radionuclides, which in turn will reduce general dose rates and hot spots. Pickering maintains an aggressive strategy to reduce internal dose to workers through heavy water de-tritiation. Heavy water with low tritium concentration is transferred from storage to all running units during operation. During planned maintenance outages, bulk Moderator water transfers are executed, decreasing the tritium concentrations. Other internal dose reduction initiatives include better

Vapour Recovery Dryer maintenance, more effective use of supplemental Vapour Recovery Dryers, and improvements in leak management. As a result, dose to workers performing maintenance is effectively managed.

- Innovative Shielding:

  The application of temporary shielding has proven effective in reducing dose rates where the source could not be eliminated. Innovative uses of shielding, including custom designed shielding (e.g. in-boiler head applications and improved reactor face applications) and enhancements to support structures to decrease installation time (e.g. for boiler drains), have been implemented by the Radiation Protection Department.

  As part of the long range ALARA Strategy, a reactor face shielding cabinet has been developed for use in outages, which will considerably reduce dose to inspection personnel.

- Remote Monitoring and Instrumentation for Dose Control:

  Remote monitoring and teledosimetry is a key component of the ALARA program. The installation of remote monitoring equipment has improved radioactive work planning and reduced dose to workers. Remotely operated cameras have been used to perform visual inspections and monitoring of inaccessible areas in support of plant Operations and Maintenance activities. Remotely operated robotic equipment has been used very successfully to significantly reduce dose to workers in elevated dose-rate environments. This includes the performance of detailed radiation surveys; removal, manipulation and shielding of high dose rate components; and non-destructive examinations in 'hard to access' locations.

Additional improvements are also noted in OPG Correspondence P-CORR-03680-0612567 [95] as follows:

- Establishing dose goals for radioactive work to improve individual and station dose performance;

- Use of robotics to perform tasks in radioactive work areas, reducing radiation exposure and therefore dose to workers;

- Use of dynamic learning activities to provide workers an opportunity to practice Radiation Protection fundamentals in a simulated radioactive work environment using remotely controlled radiofrequency technology;

- Implementation of remote reading radiation detection instrumentation and real time data transmission to facilitate improved job planning and awareness of current radiological conditions;

- Implementation of a gamma ray imaging spectrometer to perform enhanced radiation surveys and to identify areas with elevated dose rates, enabling more effective shielding to reduce dose to workers; and

- Improved Vapour Recovery Dryer performance.

Training Provisions and Qualifications

Per N-PROG-RA-0013 [7], all personnel working at a nuclear site are assigned an RP qualification level based on successful completion of training, which is maintained through periodic retraining and testing. Maintenance of the qualification is also contingent on ongoing demonstrated ability to perform appropriately at the qualification level. Training is in sufficient detail that workers can carry out their obligations as specified in the CNSC regulations.

The requirements for achieving and maintaining qualification levels are stated in N-STD-RA-0015, "Radiation Protection Qualifications" [96] and N-TQD-502-00001, "Nuclear Radiation Protection Training and Qualification Description". As outlined in References [96] and [97], the RP training and qualification process is a five level system as follows:

- Red – Assigned to workers who do not have any formal RP training or whose previous qualification has expired or been terminated.

- Orange 1 – Basic RP training that permits unescorted access to all zones, but not to radioactive work areas unless under the protection of a person holding a Yellow or Green qualification.

- Orange 2 – Builds on Orange 1 qualification and provides an additional working right of using the contamination meter.

- Yellow – Personnel who routinely perform radioactive work and possess the advanced knowledge to protect oneself and provide direct protection for up to two lesser-qualified people from radiation and radioactive contamination.

- Green – Personnel who routinely provide indirect Radiation Protection for others or direct Radiation Protection for more than two others.

Qualified trainers, using approved training packages designed to meet approved training objectives, deliver RP training. RP training is delivered in accordance with N-PROG-TR-0005, "Training" [98], which provides the structure, processes and tools for defining, developing, implementing, documenting, assessing and improving the training required to ensure staff have the appropriate knowledge, skill and attitudes for safe and efficient operation.

Key positions in the RP program organizations are given additional Radiation Protection related training to become qualified to perform in their specialized positions within the program. As described in Section 1.4.2.5 of N-PROG-RA-0013, the specialized Radiation Protection training and qualifications are described in the following documents [7]:

- N-QG-406-00002, Nuclear Qualification Guide for Responsible Health Physicist;
- N-TQD-402-00001, Nuclear Radiation Protection Technician Training and Qualification Description;
- N-TQD-405-00001, Nuclear Health Physics Technologist Training and Qualification Description;
- N-TQD-406-00001, Nuclear Health Physicist Training and Qualification Description
- N-TQD-440-00001, Nuclear Safety Devices and Equipment Technologist/Radiation Instrument Technician Training and Qualification Description.

Conclusion:

The conclusion of this Review Task assessment is that ALARA principles have been incorporated into both modifications of the reactor design and into operational programs and arrangements. The intent of Review Task #5 is met and therefore Pickering NGS is compliant.

4.2 L/R/C/S Reviews

As per Section 2.2 of this report, detailed reviews for five L/R/C/Ss with content applicable to Safety Factor 15 are provided in Reference [6]. Incremental Reviews against the L/R/C/Ss were conducted using the methodology explained in Section 3.2 of this report. Through the reviews conducted, alignment of programs, procedures, and practices in place at Pickering NGS relative to the L/R/C/Ss related to Radiation Protection identified in the assessment basis in [1] was evaluated. Associated findings applicable to Safety Factor 15 are summarized in Table 3 below.

Table 3: PSR2 L/R/C/S Review Results for Safety Factor 15

L/C/R/S Reviewed	PSR2 L/R/C/S Review Results for Safety Factor 15
CNSC G-129 (2004), "Keeping Radiation Exposures and Doses As Low As Reasonably Achievable (ALARA)"	There are no PSR2 gaps for CNSC G-129 Revision 1 (2004). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-129 Revision 1 (2004).
CNSC G-228 (2001), "Developing and Using Action Levels"	There are no PSR2 gaps for CNSC G-228 (2001). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-228 (2001).
SOR/2000-202 (Amended June 2015), "General Nuclear Safety and Control Regulations"	There are no PSR2 gaps for the General Nuclear Safety and Controls Regulations (Amended June 2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the General Nuclear Safety and Controls Regulations (Amended June 2015).
SOR/2000-203 (Amended June 2015), "Radiation Protection Regulations"	There are no PSR2 gaps for the Radiation Protection Regulations (Amended June 2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the Radiation Protection Regulations (Amended June 2015).
CNSC REGDOC-2.2.3 (2014), "Personnel Certification: Radiation Safety Officers"	There is no Class II nuclear facility or prescribed equipment within the bounds encompassed by the Pickering NGS PROL and there is no requirement to have a Radiation Safety Officer. Hence, a review of REGDOC-2.2.3 is not required because REGDOC-2.2.3 is not applicable to Pickering NGS.

It is also noted that there are no PSR2 gaps for CNSC RD-204 (2008), "Certification of Persons Working at Nuclear Power Plants", which addresses training and qualification requirements for Health Physicists. RD-204 was reviewed under Safety Factor 10 (Organization, the Management System and Safety Culture) as part of OPG Report P-REP-03680-00021 R000, "Pickering NGS PSR2 Law, Regulation, Code and Standard Reviews Associated with Safety Factors 8, 10, 12, 13, and 14" [99].

4.3 OPG Program Effectiveness Reviews

The OPG Nuclear Program reviewed for the Radiation Protection Safety Factor is identified in Table 2, and details of the associated effectiveness reviews for this N-PROG are provided in Appendix B.

Additional supporting program reviews are documented in the associated Safety Factor Reports as cross-referenced in the Review Task sections of this report.

The audits, self-assessments, SCR reviews, and work management lessons learned processes as well as the safety performance and results achieved, demonstrate that the programs and processes supporting Radiation Protection are effective, and that continual learning is employed to address issues as they arise.

4.4 Additional Review Findings

As discussed in Section 3.4, the PSR2 Safety Factor 15 assessment also included a review of commitments previously made to the CNSC, open CNSC action items, and exemptions granted by the CNSC, as identified in the R04 Pickering LCH [4], to determine if there are any impacts associated with the operation of the Pickering Units past 2020. The review also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Radiation Protection to determine impacts associated with operation of the Pickering Units past 2020. This assessment did not identify any gaps for Safety Factor 15.

Findings from the review of previously identified PSR1 gaps in the Pickering Units 5-8 Continued Operations Plan [8] are provided in Reference [9]. Findings from the review of Fukushima Action Items are provided in Reference [10]. Results from the Continued Operations Plan and Fukushima Action Items reviews will be considered in the Global Assessment process.

There were no PSR2 gaps identified in this Safety Factor 15 report that require additional consideration under other Safety Factors.

5.0 RESULTS AND CONCLUSIONS

OPG Governance, Programs, Policies, Procedures, Instructions and Guidelines related to Safety Factor 15 were reviewed for the five PSR2 Review Tasks in Section 4.1 of this report. These Review Tasks were derived from CNSC REGDOC-2.3.3 and IAEA SSG-25, and address all aspects of Radiation Protection, including reactor design, Radiation Protection equipment and instrumentation, Radiation Protection during nuclear emergencies, improvements of Radiation Protection based on Operating Experience, and ALARA. The Review Task assessments resulted in no PSR2 gaps. L/R/C/S and OPG Nuclear Program effectiveness reviews for Safety Factor 15 were prepared per Sections 4.2 and 4.3, respectively, and resulted in no PSR2 Gaps. Per Section 4.4, this report also included identification and review of previously identified programmatic Darlington PSR1 gaps related to Radiation Protection (to ascertain the implications of extending Pickering NGS operation beyond 2020), as well as a review of the R04 Pickering LCH [4] for any impacts of Pickering NGS operation beyond 2020 on: a) OPG commitments previously made to the CNSC, b) open CNSC action items, and c) exemptions granted by the CNSC (all related to Safety Factor 15), which resulted in no PSR2 gaps.

The review of Safety Factor 15 has confirmed that Radiation Protection has been adequately accounted for in the design and operation of Pickering NGS, that Radiation Protection provisions (including design and equipment) provide adequate protection of persons from the harmful effects of radiation, and that contamination and radiation exposures and doses to persons are monitored and controlled and maintained ALARA.

Appendix A: Nomenclature

ADL	Administrative Dose Limit
ALARA	As Low As Reasonably Achievable
AVTS	Audio-Visual Teledosimetry System
BDBA	Beyond Design Basis Accident
CANDU	CANada Deuterium Uranium
CNSC	Canadian Nuclear Safety Commission
COG	CANDU Owners Group
COMS	Constructability, Operability, Maintainability, and Safety
ECL	Exposure Control Level
EITER	Equipment Important to Emergency Response
EME	Emergency Mitigating Equipment
EPRI	Electric Power Research Institute
FADS	Filtered Air Discharge System
FAGM	Fixed Area Gamma Monitor
IAEA	International Atomic Energy Agency
IAM	Integrated Aging Management
IER	INPO Event Report
INPO	Institute of Nuclear Power Operations
ISR	Integrated Safety Review
LCH	Licence Conditions Handbook
L/R/C/S	Laws, Regulations, Codes and Standards
NEW	Nuclear Energy Worker
NGS	Nuclear Generating Station
N-PROG	Nuclear Program
NPP	Nuclear Power Plant
OPEX	Operating Experience
OPG	Ontario Power Generation
OPGN	Ontario Power Generation Nuclear
PARTS	Pickering A Return to Service
PNERP	Provincial Nuclear Emergency Response Plan
PE-ALARA	Public and Environment ALARA

PROL	Power Reactor Operating Licence
PSR	Periodic Safety Review
PSR1	Periodic Safety Review 1 (earlier OPG PSR work and other associated assessments)
PSR2	Periodic Safety Review 2 (subsequent PSR per CNSC REGDOC-2.3.3)
REP	Radiation Exposure Permit
RPPE	Radiological Personal Protective Equipment
RP	Radiation Protection
SCR	Station Condition Record
SER	Significant Event Report
SM	Shift Manager
SOER	Significant Operating Experience Report
SSC	Structures, Systems, and Components
WANO	World Association of Nuclear Operators

Appendix B: OPG Program Effectiveness Review Results

B.1 N-PROG-RA-0013, "Radiation Protection"

The Radiation Protection Program implements a series of standards and procedures for the conduct of activities within nuclear sites and with radioactive materials. The objectives of the Radiation Protection Program include the following:

a) Controlling occupational and public exposure:

   - Keeping individual doses below regulatory limits;
   - Avoiding unplanned exposures; and
   - Keeping collective doses ALARA, social and economic factors taken into account.

b) Preventing the uncontrolled release of contamination or radioactive materials from the nuclear sites through the movement of people and materials.

c) Demonstrating the achievement of a) and b) through monitoring.

The Health Physics department completed a self-assessment in June 2016, NO16-000655-SA [B.1.1], in order to assess the effectiveness of contamination control methods at Pickering NGS. The self-assessment concluded that there were opportunities for improvement in the areas of contamination surveys, zonal boundary definition, and standards for radioactive material storage areas. AR# 28188262 was initiated, identifying actions that have since been completed to address the identified improvements.

The Health Physics department completed a self-assessment in May 2015, NO15-000885-SA [B.1.2], in order to assess Radiation Protection Program compliance and effectiveness for Pickering and Darlington NGS as well as the Western Waste Management Facility. It was concluded that improvements have been made to the Radiation Protection Program and identified some opportunities for improvement in the areas of radiation hazard signage, postings and worker practices. AR# 28177826 was initiated, identifying actions that have since been completed to address the identified improvements.

Nuclear Oversight conducted a performance based audit of the Radiation Protection Program in July 2015, NO-2015-010 [B.1.3], for both Pickering and Darlington NGS, to determine whether requirements defined in governance are being effectively implemented. The audit identified performance improvement opportunities applicable to Pickering NGS in the areas of staff practices, calibration and labelling of Radiation Protection instruments, rubber area management, and hazard postings.

Five SCRs were initiated (P-2015-15739, P-2015-15785, N-2015-15791, N-2015-15729 and P-2015-15775). All corrective actions were completed to address the findings. An effectiveness review will be completed in Q2 2017 (AR# 28180495).

A CNSC Type II inspection on radiological hazard control was conducted in October 2015 for Pickering NGS [B.1.4]. CNSC staff concluded that there were no non-compliances with the Nuclear Safety and Control Act, applicable regulations, licence conditions, codes or standards. One Action Notice was generated due to a non-compliance with N-STD-AS-0002, "Procedure Use and Adherence", by not consistently adhering to approved procedures and practices as they pertain to the maintenance of emergency showers. OPG provided CNSC staff with a corresponding action plan and all actions associated with the corrective action plan have been completed to the satisfaction of the CNSC [B.1.5], [B.1.6].

There were instances identified where FAGMs were not re-calibrated if the FAGM passed a function test, resulting in the 12 month re-calibration period not being met. SCRs were initiated and this issue is being tracked and addressed under OPG's Corrective Action Program. Corrective actions have been completed to address the underlying issues (including updated predefined maintenance requirements to ensure calibration checks are performed at the required frequency, and the provision of additional spare instruments and parts). An effectiveness review of the FAGM calibration compliance plan will be undertaken per the requirements of the Corrective Action Program. OPG will also continue to address CNSC requirements in this area [B.1.7] under its regulatory program.

Regulatory Oversight Report for Canadian Nuclear Power Plants

As documented in the 2015 Regulatory Oversight Report for Canadian Nuclear Power Plants [B.1.8], the CNSC concluded that Radiation Protection and control measures at Pickering NGS met or exceeded all applicable performance objectives and regulatory requirements, kept doses to workers within both the one and five year regulatory limits, and maintained the estimated annual dose to the public to less than 1% of the regulatory limit of 1 mSv, well below the stated annual natural background level (of 1.8 mSv). The report assigned a Fully Satisfactory rating to Pickering NGS, comparing it favourably to industry-wide performance.

The Regulatory Oversight Report also stated that CNSC staff have verified that Pickering's five-year ALARA plan includes dose-reduction initiatives based on a review of operational experience, including an initiative to reduce overall collective radiation exposure. Compliance activities conducted by CNSC staff verified that ALARA is implemented into work planning and dose monitoring and control processes.

CNSC Performance Indicators

Pickering NGS Radiation Protection performance is tracked by the CNSC through the issuance of a quarterly Safety Performance Indicators Report. The Safety Performance Indicators include collective radiation exposure, personnel contamination events, unplanned dose, loose contamination events, as well as summaries of Emergency Response Organization drills completed. Over the first 3 quarters of 2016 [B.1.9], [B.1.10], [B.1.11], OPG doses to workers have been maintained within both the one and five year regulatory limits.

2016 Trending Analysis

Pickering NGS complies with the regulatory requirements to measure and record doses received by workers at Pickering NGS. Routine compliance verification activities indicate that performance in the area of worker dose control at Pickering is highly effective. No worker or member of the public received a radiation dose in excess of the regulatory dose limits or action levels established in the Pickering Radiation Protection program. Per P-CORR-03680-0634906 [B.1.12], collective radiation exposure for Pickering NGS over the period 2013-2016 reflects the extensive maintenance programs and modifications executed, particularly during planned maintenance outages to improve operations. The average collective radiation exposure and collective internal radiation exposure over the years 2014-2016 were reduced by 113.4 rem/year and 6.7 rem/year respectively compared to the period 2009-2012 (note that 2013 was excluded from this comparison since only 2 major planned outages were executed in 2013 and all other years had 3 major planned outages). Collective radiation exposure targets are established based on the anticipated outage and maintenance schedule for the year, hence the targets may vary from year to year (e.g., a larger amount of reactor / fuel channel maintenance and inspection work may result in higher anticipated personnel collective radiation exposure for that year and thus a higher target.). The figure below demonstrates that Pickering NGS collective radiation exposure was within target in each of the past 4 years.

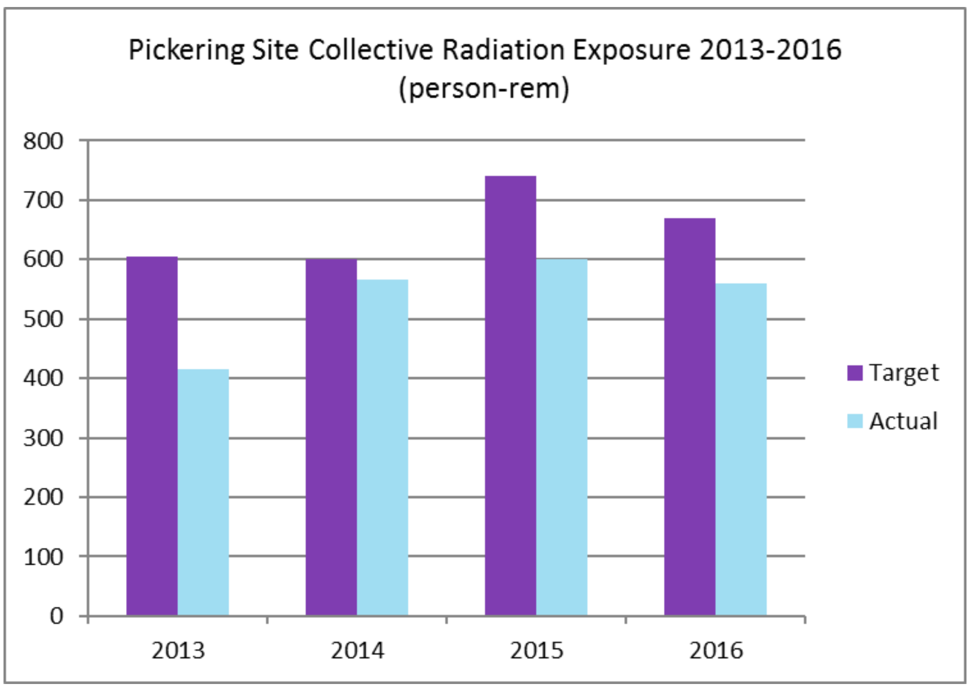

Figure 8 - Pickering Site Collective Radiation Exposure 2013-2016

In terms of SCR trending, per the Q4 2016 Radiation Protection Department Performance Improvement Report [B.1.13], from Q4 2015 to Q4 2016, SCR event based code analysis identified the following top three SCR contributors:

- Radiation Instrumentation - Major contributor identified as missing or lost gamma meters. Availability of the meters remains adequate.

- Dosimetry - The largest contributor was TLDs missing from the badge rack or lost TLD badges during work completion.

- Radiation Dose Control (Internal) - Major contributor identified as elevated tritium causing worker back-outs or delays.

In all cases, actions have been taken to address the trends.

Environmental Management Program

Per N-REP-03443-10015, "2015 Results of Environmental Monitoring Programs" [B.1.14], to ensure Pickering NGS activities are conducted in a manner that minimizes any adverse impact on the public and the environment, an Environmental Management Program has been established (consistent with CNSC requirements). For 2015, Pickering NGS radiological emissions for all radionuclides remained under 1% of their licensed Derived Release Limits.

R00	April 29, 2016	D. Vecchiarelli, A. Johnstone	Initial issue for OPG review and comment.
R01	May 26, 2016	A. Johnstone, S. Harvey	Updated report addressing OPG comments on R00 Report.
R02	July 13, 2016	A. Johnstone, S. Harvey	Updated report addressing OPG comments on R01 Report.

EXECUTIVE SUMMARY

OPG is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering beyond 2020. The current PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews (ISRs) and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS. Fifteen Safety Factors will be assessed as part of the PSR. The objective of Safety Factor review reports is to document assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss), as well as PSR Review Tasks (as identified in the PSR2 Basis Document [1], and derived in Reference [2] based on CNSC REGDOC-2.3.3, *Periodic Safety Reviews* [3] and IAEA SSG-25, *Periodic Safety Review for Nuclear Power Plants* [4]), to confirm that the design, condition and operation of Pickering Unit 1,4, Unit 5-8, and common systems will support continued safe operation for the period of PSR2.

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant, and that are applicable to the PSR2 scope. The identification and selection criteria are defined in the PSR2 Basis Document [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the PSR2 Assessment Basis. This Report provides the compliance reviews of L/R/C/Ss that are required to address PSR Safety Factors 2 (Actual Condition of SSCs), 3 (Equipment Qualification) and 4 (Aging). There is also some overlap with Safety Factor 1 (Plant Design) for a number of L/R/C/Ss considered, as per Table 1 in Section 2.0 of this Report.

The summary of findings is as follows:

- CSA N290.13-05, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants": No gaps.
- CSA N285.4-14, "Periodic Inspection of CANDU Nuclear Power Plant Components": There are six gaps associated with Safety Factor 4.
- CSA N285.5-13, "Periodic Inspection of CANDU Nuclear Power Plant Containment Components": There are two gaps associated with Safety Factor 4.
- CSA N287.7-08, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants": There are three gaps associated with Safety Factor 4.
- CNSC RD/GD-210, "Maintenance Programs for Nuclear Power Plants": No gaps.
- CNSC RD/GD-98, "Reliability Programs for Nuclear Power Plants": No gaps.

- CNSC REGDOC-2.6.3, "Aging Management": There are two gaps associated with Safety Factor 4.
- CSA N287.2-08, "Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants": No gaps.
- CSA N289.1-08, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants": No gaps.
- CSA N289.2-10, "Ground Motion Determination for Seismic Qualification of Nuclear Power Plants": No gaps.
- CSA N289.3-10, "Design Procedures for Seismic Qualification of Nuclear Power Plants": There is one gap associated with Safety Factor 3.
- CSA N289.4-12, "Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components": There is one gap associated with Safety Factor 3.
- CSA N289.5-12, "Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities": There is one gap associated with Safety Factor 3.
- CSA N285.8-15, "Technical Requirements for In-Service Evaluation of Zirconium Alloy Pressure Tubes in CANDU Reactors": There is one gap associated with Safety Factor 4.

Details of the assessment can be found in Table 2 and Appendix B of this report.

TABLE OF CONTENTS

1.0 INTRODUCTION

OPG is performing a Periodic Safety Review (PSR) in support of the evaluation of extended operation of the Pickering NGS units, beyond the year 2020, which is in accordance with the recent announcement by the government of the Province of Ontario.

The current PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews (ISRs) and other associated assessments (termed here "PSR1"). Specifically, PSR1 consists of:

- The Pickering B ISR, performed in support of refurbishment and continued operation of Pickering Units 5-8;
- Pickering 1, 4 integrated safety assessments performed during the Pickering A Return to Service (PARTS) work, in support of approval to restart Units 1 and 4; and
- The Darlington ISR, performed in support of refurbishment and continued operation of the Darlington units (programmatic parts applicable to Pickering).

PSR2 must satisfy the requirements in CNSC REGDOC-2.3.3, *Periodic Safety Reviews* [3], which in turn refers to International Atomic Energy Agency's (IAEA) Safety Guide No. SSG-25, *Periodic Safety Review for Nuclear Power Plants* [4]. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

The process to identify the modern Laws, Regulations, Codes and Standards (L/R/C/Ss) that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant, and that are applicable to the PSR2 scope. The identification and selection criteria are defined in the PSR2 Basis Document [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the PSR2 Assessment Basis. The PSR2 Basis Document also identifies the modern version and date of the L/R/C/S and the type of review that will be completed in PSR2. The types of review are explained in Section 2.0 below.

This Report provides the compliance review of L/R/C/Ss that are required to address PSR Safety Factors 2 (Actual Condition of SSCs), 3 (Equipment Qualification) and 4 (Aging). The objectives of the reviews of these Safety Factors is as follows [1]:

- The objective of the review of Safety Factor 2 is to determine the actual condition of SSCs important to safety and so to consider whether they are capable and adequate to meet design requirements, throughout the period of

PSR2[1]. In addition, the review should verify that the condition of SSCs important to safety is properly documented, as well as reviewing the ongoing maintenance, surveillance and in-service inspection programmes, as applicable;

- The objective of the review of Safety Factor 3 is to determine whether plant equipment important to safety has been properly qualified (including for environmental conditions) and whether this qualification is being maintained through an adequate programme of maintenance, inspection and testing that provides confidence in the availability of safety functions throughout the period of PSR2; and

- The objective of the review of Safety Factor 4 is to determine whether aging aspects affecting SSCs important to safety are being effectively managed and whether an effective aging management program is in place so that all required safety functions will be available throughout the period of PSR2.

There is also overlap with Safety Factor 1 (Plant Design) for a number of L/R/C/Ss considered, as outlined in Table 1 in Section 2.0 below.

[1] Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC by June 30, 2017 as required by the current Power Reactor Operating Licence.

2.0 REVIEW SCOPE AND METHODOLOGY

PSR2 is focused on the extension of Pickering NGS operations beyond 2020. Thus, it is important that the methodology for PSR2 be focused on addressing aspects of the review that are likely to have material impact in terms of identifying enhancements that will be reasonable and practicable to implement during the remaining commercial life of the plant. PSR2 will conduct reviews against a baseline of the PSR1 work. It is important to note that OPG conducts regular reviews of new and revised Codes and Standards, so a large amount of information is already available to assist in the Safety Factor compliance reviews. In OPG letter W.M. Elliott to P.A Webster and M. Santini, "Design Codes and Standards Effective Dates for OPG Nuclear Fleet" [5], OPG stated:

> *"...OPG commits to completing a code-over-code review (i.e., review of changes) of subsequent editions, addendum and/or updates of the Codes and Standards listed in [Attachment 1 of the referenced document]. Key emerging issues due to major changes in the codes will be addressed immediately, or as agreed with the CNSC on a case-by-case basis. Otherwise, OPG will confirm in a letter to the CNSC that these reviews have been completed and there are no significant technical issues..."*

As a result, many of the updated codes and standards issued since PSR1 have already had gap assessments performed, to varying degrees of detail, which will be utilized and cited in Pickering PSR2.

As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information, rather than repeating the activities of previous reviews. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Therefore, clause-by-clause reviews of the majority of applicable L/R/C/Ss have already been completed and there is little value in repeating that process. If clause-by-clause reviews were to be undertaken in PSR2, a major portion of the review effort would be consumed by repackaging existing information that remains largely applicable and, therefore, is not contributing to the identification of new insights and enhancements. A more constructive approach has therefore been applied that maximizes the value and usefulness of the work by focusing attention where it is most beneficial, i.e., on identifying new issues. Since this assessment is a subsequent PSR, the focus is on identifying safety significant differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed;[2]
- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier L/R/C/S assessment;
- Implications of extending Pickering NGS operation beyond 2020; and
- Safety significant differences between Pickering Units 1,4 and Units 5-8.

In most cases PSR2 L/R/C/S reviews will be incremental in nature and performed by topic or subject matter for revised requirements. The rationale for this is that new or updated requirements that need to be included in PSR2 are predominantly replacements for other L/R/C/S that were previously assessed.

To align with the goals of a subsequent PSR, the following three tiers of reviews are applied for PSR2:

- <u>Clause-by-Clause review</u>: New L/R/C/Ss referenced in Pickering PROL 48.02/2018 (listed in Appendix C of the Licence Conditions Handbook) will be subjected to a clause-by-clause type review. In a clause-by-clause review, conformance with individual clauses is demonstrated by supporting evidence stating whether the requirements stipulated in the requirement document are met;
- <u>High Level review</u>: New L/R/C/Ss not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the Law, Regulation, Code or Standard is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and
- <u>Incremental review</u>: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

[2] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

Table 1 identifies the review type to be applied to each of the L/R/C/Ss in the PSR2 Assessment Basis that are applicable to Safety Factors 2, 3 and 4. Compliance assessments for each L/R/C/S are provided in Appendix B, and Results and Conclusions are summarized in Section 3.0.

Table 1: Applicable L/R/C/Ss for Pickering PSR2 Safety Factors 2, 3 and 4

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N290.13	Environmental Qualification of Equipment for CANDU Nuclear Power Plants	N290.13-05	3, 4	Incremental	N290.13 addressed as part of Pickering B and Darlington ISRs
2	CSA N285.4	Periodic Inspection of CANDU Nuclear Power Plant Components	N285.4-14	1, 2, 4	Incremental	N285.4 addressed as part of Pickering B and Darlington ISRs
3	CSA N285.5	Periodic Inspection of CANDU Nuclear Power Plant Containment Components	N285.5-13	1, 2, 3, 4	Incremental	N285.5 addressed as part of Pickering B and Darlington ISRs
4	CSA N287.7	In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.7-08	2, 3, 4	Incremental	N287.7 addressed as part of Pickering B and Darlington ISRs
5	CNSC RD/GD-210*	Maintenance Programs for Nuclear Power Plants	2012	3, 4	Incremental	S-210 and RD/GD-210 addressed as part of Darlington ISR
6	CNSC RD/GD-98	Reliability Programs for Nuclear Power Plants	2012	3, 4	Incremental	RD/GD-98 addressed as part of Darlington ISR and S-98 as part of Pickering B ISR
7	CNSC REGDOC-2.6.3*	Aging Management	2014	3, 4	Incremental	Transition plan in place and gap assessment between RD-334 and OPG Nuclear Integrated Aging Management governance has been performed
Additional L/R/C/Ss						
8	CSA N287.2	Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants	N287.2-08	1, 2, 3, 4	Incremental	N287.2 addressed as part of Pickering B and Darlington ISRs and PARTS

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
9	CSA N289.1	General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants	N289.1-08	1, 3	Incremental	N289.1 addressed as part of Pickering B and Darlington ISRs
10	CSA N289.2	Ground Motion Determination for Seismic Qualification of Nuclear Power Plants	N289.2-10	1, 3	Incremental	N289.2 addressed as part of Pickering B and Darlington ISRs
11	CSA N289.3	Design Procedures for Seismic Qualification of Nuclear Power Plants	N289.3-10	1, 3	Incremental	N289.3 addressed as part of Pickering B and Darlington ISRs
12	CSA N289.4	Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components	N289.4-12	1, 3	Incremental	N289.4 addressed as part of Pickering B and Darlington ISRs
13	CSA N289.5	Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities	N289.5-12	1, 3	Incremental	N289.5 addressed as part of Pickering B and Darlington ISRs
14	CSA N285.8	Technical Requirements for In-Service Evaluation of Zirconium Alloy Pressure Tubes in CANDU Reactors	N285.8-15	2, 4	Incremental	N285.8 addressed as part of Pickering B and Darlington ISRs

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

L/R/C/Ss in the PSR2 Assessment Basis generally receive incremental reviews since PSR2 is an update of previous ISR assessments and clause-by-clause or high level reviews for the majority of the L/R/C/S in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous ISRs but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this Report include an assessment of the intent of recent changes to the L/R/C/Ss identified in Table 1 on a topic or subject-matter basis where there is potential to impact nuclear safety. The Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

The Safety Factor 2, 3 and 4 L/R/C/S reviews will identify Compliances and Gaps as defined below:

- <u>Compliance</u>: Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.

- <u>Gap</u>: Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.

The assessments documented in this Report assume that use of the word "shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard, "should" is used to express a recommendation or that which is advised but not required, "may" is used to express an option or that which is permissible within the limits of the standard, and "can" is used to express possibility or capability.

3.0 RESULTS AND CONCLUSIONS

The results of the PSR2 compliance assessments of the fourteen L/R/C/Ss listed in Table 1 are summarized in Table 2 below. Additional background information and details regarding the gaps listed in Table 2 are provided in Appendix B of this report.

Table 2: PSR2 L/R/C/S Compliance Assessment Results for Safety Factors 2, 3 and 4

L/R/C/S Reviewed	PSR2 Compliance Assessment
N290.13-05, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants"	There are no PSR2 gaps for N290.13-05. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N290.13-05.
N285.4-14, "Periodic Inspection of CANDU Nuclear Power Plant Components"	There are six PSR2 CSA N285.4 gaps which all relate to Safety Factor 4. The first five of these N285.4 gaps are applicable to compliance with N285.4-09 including Updates 1 and 2. The sixth N285.4 gap is applicable to compliance with N285.4-14. 1. N285.4 PIP Governance references N285.4-05, not N285.4-09 including Updates 1 and 2. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2. 2. There has been a significant change in the wording of clause 4.2.7 in CSA N285.4-09 including Updates 1 and 2. I-PROC-AS-0009, "Inspection Qualification of Non-Destructive Examination Processes" does not identify the authorized inspector as a qualifying authority as directed by clause 4.2.7. Instead it establishes the CANDU Inspection Qualification Bureau (CIQB) as the organization that would approve procedures and personnel. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2. 3. New erosion and corrosion inspection requirements in N285.4-09 including Updates 1 and 2 are not reflected in current PIP governance. NK38-REP-03680-10137 R000 states that: "It should be noted specifically that [this ISR Issue] is likely to have a major impact on piping PIPs because sub-clauses 7.4.7.X in CSA N285.4-09 including UPD1 and UPD2 include substantive changes. Under the new standard erosion and corrosion inspection exemptions can no longer be justified on the basis of [sic] that conditions are determined to be non-erosive and non-corrosive." This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2. 4. Extended life inspection schedules in N285.4-09 including Updates 1 and 2 are not reflected in PIP governance. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

L/R/C/S Reviewed	PSR2 Compliance Assessment
	5. An assessment of the prior operating non-conforming state, as required by N285.4-09 including Updates 1 and 2, is required when dispositioning inspection results. This requirement has not been included in the feeder PIP plan. This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2. 6. There is a PSR2 gap for Pickering NGS against N285.4-14 to address: o Revised requirements for pressure tube volumetric and dimensional inspection (Clause 12.2), pressure tube hydrogen equivalent determination (Clause 12.3) and pressure tube material property testing (Clause 12.4); o Clause 12.5 which specifies minimum annulus spacer surveillance examination and testing requirements; o Selection criteria for identifying candidate tube for pressure tube surveillance examination and testing (Annex E) to include selection criteria for annulus spacer surveillance examination and testing; and o Clause 7.4.8 which specifies requirements for inspection of Environmentally Assisted Cracking, and Clauses 7.5.1/7.5.2 which specify requirements for inspection of identical components.
N285.5-13, "Periodic Inspection of CANDU Nuclear Power Plant Containment Components"	There are two PSR2 CSA N285.5 gaps which both relate to Safety Factor 4: 1. There were a number of concessions granted from the CNSC for compliance with N285.5-M90 that will need to be reconciled for Pickering for the period of PSR2: (Since these gaps are all concession-related and associated with N285.5-M90, they are tracked under a single PSR2 gap.) o The Pickering B ISR gap associated with N285.5-M90 clause 4.5.1 is closed. However, the disposition of the gap refers to OPG receiving a concession from the CNSC on the inspection of components deemed to be inaccessible. A similar (updated) concession may be required for Pickering operation past 2020. Therefore, this is a gap for PSR2. o The Darlington ISR disposition of the gaps for N285.5-M90 clauses 8.4.2.1 and 8.4.2.2 refer to OPG receiving a concession from the CNSC that insulation will not be removed in the absence of visible damage to a component, and only "light weight" access covers will be removed. The Darlington ISR states: "This is a concession from the regulator which is not assured in the case of a refurbished plant. As such, this represents a gap". By the same logic it will need to be reconciled for Pickering for the period of PSR2 (life extension past 2020). o The Darlington ISR disposition of the gap for N285.5-M90 for clause 8.5.2.2 refers to an exception of the numerical rules of this clause for reasons of practicality, and that a concession was received from the

L/R/C/S Reviewed	PSR2 Compliance Assessment
	CNSC. The Darlington ISR stated "… it is categorized as a Gap, because a concession from the CNSC is not assured for a refurbished plant.". By the same logic it will need to be reconciled for Pickering for the period of PSR2. o Per the Darlington ISR disposition of the gap for N285.5-M90 clause 8.6.3, although CNSC acceptance was obtained, there is still a non-compliance with a portion of the clause related to the timing of inspections which is noted as needing to be reconciled for a refurbished station. The Darlington ISR stated "This represents a gap that will need to be reconciled with the regulator for a refurbished station." By the same logic it will need to be reconciled for Pickering for the period of PSR2. 2. The changes in N285.5-13 relative to N285.5-08 that are applicable to Fiberglass Reinforced Plastic material that is used at Pickering NGS have only been assessed for fitness for service to 2024 in the Pickering Continued Operations Plan. These changes related to aging management (monitoring and test programs) for FRP materials. As a result, additional assessment is required for Pickering to address FRP aging management at Pickering for operation to 2028, and to confirm the current program aligns with N285.5-13 clauses 8.2, 8.3.3, 8.3.4 and A.6.1.2. (Note: This gap only exists if Pickering NGS intends to operate past 2024.)
N287.7-08, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	There are three PSR2 CSA N287.7 gaps which all relate to Safety Factor 4: 1. N287.7-08 clause 7.11.2 Table 1 involving non-compliance with accuracy and repeatability requirements for dewpoint temperature was a gap for Darlington. No evidence can be found that this has been addressed for Pickering NGS. This is therefore a gap for Pickering PSR2. 2. OPG initiated a Regulatory Management action to provide the CNSC with the latest Dow Corning 995 material test report in response to an Action Notice raised in the CNSC Type II Inspection. The work is currently in progress. Therefore, this is a gap for Pickering PSR2. 3. Actions #31, #32, and #33 from the Pickering Units 5-8 Continued Operations Plan are related to N287.7 and although complete, need to be re-assessed for Pickering operation past 2020. (IIP Action #31 involved submission of Periodic Inspection Plans and Life Cycle Management Plans for a number of safety-significant civil structures. IIP Action #32 involved submission of Aging Management Plans for concrete containment structures to the CNSC for acceptance. IIP Action #33 involved revising the Reactor Building Periodic Inspection Plan and submitting to the CNSC for acceptance.)
CNSC RD/GD-210, "Maintenance Programs for Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD/GD-210. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-210.

L/R/C/S Reviewed	PSR2 Compliance Assessment
CNSC RD/GD-98, "Reliability Programs for Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD/GD-98. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-98.
CNSC REGDOC-2.6.3, "Aging Management"	There are two PSR2 REGDOC-2.6.3 gaps which both relate to Safety Factor 4: 1. OPG is not compliant with N-PROC-MP-0060 Aging Management Process, Section 1.7 for "not reviewing and updating the Component Condition Assessments[3] within the review cycle of the component, and when new information or feedback from the program was received." OPG has since revised these CAs, which are now valid until 2020. OPG has stated they will develop an implementation plan to prevent reoccurrence of: a) not reviewing and revising the CAs within the review cycle, and b) not updating the CAs when pertinent new information becomes available. OPG stated they will provide an update and a target implementation date on this action to the CNSC by October 30, 2016. This is a gap for Pickering PSR2. 2. OPG is not compliant with N-PROC-MA-0077, "Critical Equipment Identification and Categorization", Section 1.2 because "the Reactor Safety (RS) category code and rationale for critical components was not always accurate or consistently applied in the CCAs[3]." OPG has stated they have since completed a review and update of the RS category code and rationale for a portion of the components to become fully compliant with N-PROC-MA-0077. However, OPG has stated that a review of the CAs will be conducted to ensure consistency with the revised Reactor Safety codes and that an update will be provided to the CNSC by October 30, 2016. This is a gap for Pickering PSR2.
N287.2-08, "Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N287.2-08. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N287.2-08.
N289.1-08, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants"	There are no PSR2 gaps for CSA N289.1-08. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N289.1-08.
N289.2-10, "Ground Motion Determination for	There are no PSR2 gaps for CSA N289.2-10. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N289.2-10.

[3] The terminology currently used is Condition Assessment (CA) instead of Component Condition Assessment (CCA).

L/R/C/S Reviewed	PSR2 Compliance Assessment
Seismic Qualification of Nuclear Power Plants”	
N289.3-10, “Design Procedures for Seismic Qualification of Nuclear Power Plants”	There is one PSR2 gap for Pickering NGS compliance with N289.3-10 which is applicable to Safety Factor 3: 1. Clause 4.4.4.5 of CSA N289.3-10 states: “The power spectral density (PSD) function of each time-history shall be calculated and shown to not have any significant gaps in energy over the frequency intervals outlined in Table 2….” The calculation of PSD is not addressed in the Pickering A or B PRA Based SMAs. The Pickering NGS A PRA Seismic Guide and the OPG PRA Guide do not identify any requirements for PSD. Also, evidence in the form of a calculation for time histories which represent the design ground motion was not found (which is a precursor for the PSD calculation). The lack of evidence of calculated time histories was also identified as a gap in the Darlington ISR (ISR Issues #D352 and #D617 - Documented evidence in the form of a calculation to show that the generated time history correctly represents the design ground response spectrum within the prescribed requirements has not been provided). The closure reference for #D352 and #D617 makes use of the detailed assessment performed in NK38-REP-03680-10224 R000 which is specific to Darlington. A similar assessment for Pickering NGS could not be found. As a result, there is a gap for PSR2 to provide similar evidence to show that: a) the generated time history used within seismic analyses of safety-related systems correctly represents the design ground response spectrum for the Pickering site in compliance with N289.3-10, and b) the PSD function of each time-history has been calculated and shown to not have any significant gaps in energy over the frequency intervals.
N289.4-12, “Testing Procedures for Seismic Qualification of Nuclear Power Plants Structures, Systems, and Components”	There is one PSR2 gap for Pickering NGS compliance with N289.4-12 which is applicable to Safety Factor 3: 1. Station-specific documents (including the Darlington seismic design guide, Darlington Reports and Darlington-specific technical specifications for seismic qualification) were used as the basis for compliance in the clause-by-clause Darlington code refresh review for clauses 4.2.1, 4.2.2.2, 4.2.3.1, 4.2.5, 4.3.2, 5.2.2.2.5, 5.7, 5.8.1, 5.8.1.2, 7.2.1, 7.7.1, 7.7.4 and 8.2. Pickering-specific seismic design guides, reports and technical specifications that are equivalent to those used to demonstrate Darlington compliance with the changes made in CSA N289.4-12 were identified. However, a detailed review to confirm that the Pickering-specific documents fully comply with the requirements of the clauses listed above is needed. As a result, this is a PSR2 gap.
N289.5-12, “Seismic Instrumentation Requirements for Nuclear Power Plants and Nuclear Facilities”	There is one PSR2 gap for Pickering NGS compliance with N289.5-12 which is applicable to Safety Factor 3: 1. Darlington ISR Issues #D622, D623 and D624 require no further action for Darlington as they were either classified as Acceptable Deviations or were closed. However, the issues are identified as a PSR2 gap for the following

L/R/C/S Reviewed	PSR2 Compliance Assessment
	reasons: (Note: These gaps are closely related and are therefore identified as a single PSR2 gap.) ○ Darlington ISR Issue #624 refers to specific Darlington instrumentation in order to classify the gaps as Acceptable Deviations. It must be demonstrated that Pickering seismic instruments have the same capabilities as the Darlington instruments (fleet-wide or Pickering-specific standards that would ensure that the Pickering seismic instruments have the same capabilities as the Darlington instruments could not be found). Therefore, this is identified as a gap for PSR2. ○ Darlington ISR Issue #D622 was deemed to be of low safety significance. The same rationale may apply at Pickering, but first it must be demonstrated that Pickering has the same set up of seismic instruments as Unit 0 at Darlington. Therefore, this is identified as a gap for PSR2. ○ Darlington ISR Issue #D623 was deemed to be of low safety significance. The same rationale may apply at Pickering, but first it must be demonstrated that similar accelerometers are used at Pickering, and that their locations are not affected by strong ambient vibration. Therefore, this is identified as a gap for PSR2.
N285.8-15, "Technical Requirements for In-Service Evaluation of Zirconium Alloy Pressure Tubes in CANDU Reactors"	There is one PSR2 gap for Pickering NGS compliance with N285.8-15 which is applicable to Safety Factor 4: 1. For the Pickering B ISR, no clause-by-clause review of the Standard was conducted on the basis that the pressure tubes will be replaced during the refurbishment outage for Pickering Units 5-8, and the condition of these components is well understood and managed through their own specific, detailed life cycle plans and fitness-for-service criteria. However, in November 2015, OPG issued Plan N-REP-31100-10061 R002 for Pickering NGS compliance with pressure tube in-service evaluation requirements in CSA N285.8-15. OPG had submitted a previous compliance plan for the long term use of the 2010 edition of CSA N285.8 and this compliance plan was accepted by the CNSC. The compliance plan was revised to document OPG's compliance to the 2015 edition of CSA N285.8. Since OPG has committed to fulfillment of the commitments in N-REP-31100-10061 R002, successful fulfillment by OPG of the commitments in the compliance plan is required for Pickering operation past 2020. This is therefore a gap for Pickering PSR2. In particular, the significant changes to CSA N285.8-15 per the CSA Impact Statement will need to be reflected in Pickering procedures, including: ○ Implementation of statistically based fatigue crack initiation evaluation curves for axial flaws (Clauses D.4.2, D.4.3, and D.3.6);

L/R/C/S Reviewed	PSR2 Compliance Assessment
	○ Implementation of closed-form engineering relation for threshold peak stress for Delayed Hydride Cracking (DHC) initiation (Clauses D.5 and 5.4.3.4); ○ Implementation of statistically based threshold relation for peak stress for crack initiation due to hydrided region overloads (Clause D.5); ○ Implementation of new fracture toughness models for axial through-wall flaws (Clause D.13.2); and ○ Implementation of Methods 1 and 2 Probabilistic Leak-Before-Break (Clauses 3.1, 7.3 and 7.4).

APPENDIX B: L/R/C/S REVIEWS FOR SAFETY FACTORS 2, 3 AND 4

B.1 CSA N290.13-05, "Environmental Qualification of Equipment for CANDU Nuclear Power Plants"

B.1.1 Background

The following paraphrased from the Preface of CSA N290.13-05 (R2015) [B.1-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *The requirements for environmental qualification (EQ) of safety-related equipment in CANDU nuclear power plants are specified in the CSA N290 series of Standards. General quality assurance requirements for the life cycle of these plants are specified in the CSA N286 series of Standards. Standard N290.13-05 is supplemental to these two series of Standards.*
>
> *CSA N290.13 has been written as a general Standard for the establishment and maintenance of an environmental qualification program for safety-related equipment in the CANDU nuclear power plants that are within its scope. It provides generic requirements and methods for such qualification...*
>
> *Safety-related equipment that must be environmentally qualified has to meet functional safety requirements throughout its installed life. This requires a program of quality assurance, design qualification, production, transportation, storage, installation, maintenance, periodic testing, and surveillance. This Standard provides guidelines for the establishment of an ongoing program. Although it focuses on the qualification process, it also provides requirements for maintaining qualification once it has been established.*

All of CSA N290.13-05 (R2015) is directly relevant to Safety Factor 3 (Equipment Qualification). CSA N290.13-05 (R2015) also addresses the effects of aging on equipment required to mitigate the effects of a Design Basis Accident. The following clauses apply to Safety Factor 4 (Aging):

- Clause 6 - Preserving environmental qualification.
- Annex A - Arrhenius methodology in predicting material aging.

Compliance with CSA N290.13-05 including Update 1 (R2010) [B.1-2] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.1-3]. The current version of the Standard, N290.13-05 (R2015) [B.1-1] is a reaffirmation of the update introduced in 2009 [B.1-2] without any content changes.

The Impact Statement [B.1-4] for CSA N290.13-05 including Update 1 [B.1-2] provides a "Summary of significant changes from the previous edition" which identifies four changes to the Standard which are discussed in Section B.1.2 below and are not safety significant. In addition to findings resulting from review of the CSA N290.13-05 including Update 1 Impact Statement, the results of PSR1 N290.13 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.1.2.

As identified in [B.1-5], the Pickering PSR2 review of CSA N290.13-05 (R2015) is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.1.2 Compliance Assessment for Pickering PSR2

B.1.2.1 Application of PSR1 Reviews

The versions of N290.13 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

A clause-by-clause review of the Pickering B Environmental Qualification program against the CSA N290.13-05 [B.1-6] version of the Standard was documented in NK30-REP-03680-00003 R000 [B.1-7]. Two Acceptable Deviations (ADs) were identified which resulted from differences in the wording used in applicable EQ Program documentation. The intent of the wording was concluded to be the same in both circumstances. These ADs were considered acceptable as they have no adverse impact on the Environmental Qualification program or on plant safety. As a result, NK30-REP-03680-00003 R000 concluded that the Pickering NGS B Environmental Qualification program complies with each clause of CSA N290.13-05 [B.1-6]. None of the ADs are impacted by Pickering operation past 2020, so there are no PSR2 gaps which result from the Pickering B ISR.

Pickering Units 1,4

No code review was performed for Pickering Units 1,4 against CSA N290.13. Also, no subsequent code reviews or code refresh reviews against the updated versions of N290.13 (i.e., [B.1-1] or [B.1-2]) were performed for either Pickering NGS A or B. However, Section 6.3 of the R04 Pickering Licence Conditions Handbook [B.1-3] states:

> *As per the agreement reached in CNSC letter dated June 22, 2012 (e-Doc 3947068) a number of design-related codes and standards, associated effective dates and conditions were established, including application of CSA N290.13-05. OPG is to provide the CNSC with the code-over-code reviews conducted for any subsequent editions, addendums and/or updates of the CSA N290.13-05 and Update No.1, with OPG's assessment of the changes and their significance upon completion of the review and assessment of significance. OPG is to submit such assessments on an annual basis. Refer to Appendix G, for additional details.*

Further, Section 5.3 of the Pickering PROL Application P-CORR-00531-03719 R000 [B.1-8] states:

> *OPG has in place an Environmental Qualification (EQ) Program, including the governing documents that systematically identify the equipment to be qualified, the environmental conditions to be used for qualification, the method(s) of qualification, and the documentation to ensure that the qualification is complete and can be maintained for the remaining life of the plant. The OPG EQ Program is compliant with the Canadian Standard Association CSA N290.13-05 as per the governing program document N-PROG-RA-0006, Environmental Qualification. All required systems, equipment, components, protective barriers, and structures were qualified to perform their safety functions under the environmental conditions defined by the Pickering design-basis accidents.*
>
> *The overall condition of the current EQ program at Pickering is acceptable. This assessment is based on weighted indicators that are consistent with industry-best practices.*

Since compliance with CSA N290.13-05 including Update 1 (R2010) is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.1-3], and this is confirmed by review of the Pickering PROL Application, Pickering Units 1,4 (and Units 5-8) are also in compliance with N290.13-05 including Update 1 [B.1-2]. Further, assessments have been performed for Darlington which are programmatically applicable to Pickering, and which are used below to demonstrate Pickering NGS compliance with CSA N290.13-05 (R2015) [B.1-1].

Darlington NGS

The Darlington ISR performed assessments against two versions of CSA N290.13:

1) The original code review for the Darlington ISR, as documented in OPG Report NK38-REP-03680-10093 R000 [B.1-9], was performed against CSA N290.13-05 [B.1-6]. NK38-REP-03680-10093 R000 identified 8 gaps with the requirements in CSA N290.13-05 (February 2005) [B.1-6]. However, Appendix B of NK38-REP-03680-10093 R000 identified that OPG has completed a project to ensure program governance compliance with N290.13-05, including Update 1 [B.1-2], and that consequently those 8 gaps had been resolved as of the date that NK38-REP-03680-10093 R000 was issued in September 2011.

2) Following the issue of CSA N290.13-05 including Update 1 [B.1-2], a code refresh review was conducted and documented in OPG Report NK38-REP-03680-10154 R000 [B.1-10]. NK38-REP-03680-10154 R000 [B.1-10] identified that the changes to CSA N290.13-05 including Update 1 (R2010) [B.1-2] had no impact on the program governance compliance assessment and that as a result, OPG Nuclear governance continues to be compliant with the revised requirements of CSA N290.13-05 including Update 1 [B.1-2].

Therefore, there are no outstanding gaps for Darlington compliance with CSA N290.13-05 including Update 1 [B.1-2]. Since the current version of the Standard, N290.13-05 (R2015) [B.1-1] is a reaffirmation of the update introduced in 2009 [B.1-2] without any content changes, Darlington also complies with [B.1-1]. Further, as discussed in Section B.1.2.2 below, since all N290.13-05 requirements are programmatic (i.e., apply across OPG's Nuclear fleet operations), Pickering NGS (Units 1,4 and Units 5-8) also fully complies with N290.13-05 (R2015) [B.1-1].

B.1.2.2 Application of Post-PSR1 Reviews

As discussed above, CSA N290.13 was updated in 2009. The changes relative to CSA-N290.13-05 [B.1-6] included minor changes, mostly for clarification purposes. Information about the changes to the Standard can be found in the CSA N290.13-05 Impact Statement [B.1-4] for Update 1 [B.1-2]. The changes in Update 1 are primarily editorial in nature and do not trigger any new requirements. The only content-related change, which does not trigger new requirements and is not safety significant, is a revision to Clause 4.6, "Documentation of EQ Requirements". The revision adds the option of providing a reference source for the required equipment attributes instead of providing the necessary information as part of the mandatory list of equipment (revised text is underlined):

Based upon the identification of EQ requirements, a list of equipment shall be prepared. The list shall contain the following attributes for each piece of equipment or shall reference the source of such information:

(a) equipment identification (e.g., make, model number, manufacturer, stock identification, plant system, installed location, and relevant interfaces);

(b) safety function;

(c) applicable design basis accident;

(d) mission times; and

(e) normal and accident service conditions.

Since the current version of the Standard, N290.13-05 (R2015) [B.1-1] is a reaffirmation of the update introduced in 2009 [B.1-2], Darlington is compliant with the latest version of the Standard (N290.13-05 (R2015)).

With respect to Pickering, in 2015 OPG authorized an independent external assessment of the Environmental Qualification program at both Pickering and Darlington NGSs to ensure they were functioning acceptably as indicated in the current health reports. This assessment was documented in N-REP-03651-0564226 [B.1-11]. With specific reference to OPG's EQ governance, N-REP-03651-0564226 states the following in Section 4.1, "Program Governance":

> *Given that OPG's EQ program governance is written at the "N" level rather than at station specific level, the EQ program governance findings for the DNGS EQ program are equally valid for the PNGS EQ program.*

Therefore, since Darlington is compliant with the latest version of the Standard, and since all N290.13-05 requirements are programmatic (i.e., apply across OPG's Nuclear fleet operations), the EQ program at Pickering NGS (Units 1,4 and Units 5-8) also fully complies with N290.13-05 (R2015).[4]

Further, given that there are no technical differences between N290.13-05 including Update 1 and N290.13-05 (R2015), evidence that the requirements of the current version of N290.13

[4] N-REP-03651-0564226 [B.1-11] concluded that there has been a significant improvement in the Environmental Qualification Program at OPG. The Conclusions section of the report (Section 6) identified that findings from internal and external assessments have been resolved, but that some process improvements, if implemented, would further improve management oversight capability, while enhancing the sustainability of the EQ program. The improvement opportunities do not relate to compliance with the requirements stipulated in CSA N290.13 and are addressed separately in the Safety Factor Report for Equipment Qualification.

(N290.13-05 (R2015)) are being applied at OPG is provided by demonstrating that N290.13-05 including Update 1 are being applied in the following OPG governance:

1) OPG Engineering Standard N-STQ-03651-10013 R003, "Qualification Methods" [B.1-12], which provides:

   … guidelines on the qualification methods to be used in establishing environmental qualification (EQ). This standard is applicable to all electrical and mechanical equipment requiring environmental qualification.

   According to CSA Standard N290.13-05 and Update No. 1, fully sequential type testing is the preferred method of qualification, however, operating experience, analysis, ongoing qualification or a combination of these methods may be used. This standard provides guidance on the use of all these methods at Ontario Power Generation (OPG).

2) N-PROG-RA-0006 R008, "Environmental Qualification" [B.1-13], the Nuclear Program OPG uses, which states in Section 1.1.1 that the technical basis for the program is CSA Standard N290.13-05 including Update 1.

B.1.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for N290.13-05 (R2015) [B.1-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N290.13-05 (R2015).

B.2 CSA N285.4-14, "Periodic Inspection of CANDU Nuclear Power Plant Components"

B.2.1 Background

The following paraphrased from the Preface of CSA N285.4-14 [B.2-1] provides an overview of the purpose of this Standard and the requirements expressed therein:

> *This Standard defines requirements for the periodic inspection of pressure retaining systems, components, and supports that form part of a CANDU nuclear power plant. Periodic inspection is considered to include the fluid boundary portions of components and piping, including their supports that comprise:*
>
> *a) systems containing fluid that directly transports heat from nuclear fuel;*
> *b) systems essential for the safe shutdown of the reactor or the safe cooling of the fuel, or both, in the event of a process system failure; and*
> *c) other systems or components whose failure could jeopardize the integrity of the systems described in Item a) or b), or both.*
>
> *In addition, for components exposed to conditions beyond the known experience base, and where such components constitute part of a vital system, the components may be considered suitable for inclusion in the periodic inspection program, as supplementary inspections.*
>
> *This Standard addresses:*
>
> *a) failure aspects;*
> *b) classification of areas subject to inspection;*
> *c) provision for access;*
> *d) inspection techniques and procedures;*
> *e) personnel qualifications;*
> *f) frequency of inspection;*
> *g) responsibilities;*
> *h) documentation;*
> *i) records;*
> *j) evaluation of inspection results;*
> *k) dispositioning; and*
> *l) repair, replacement, and modification requirements.*

N285.4-14 is relevant to Safety Factor 2 (Actual Condition of SSCs). As stated in OPG Report NK30-REP-03680-00001 R000 [B.2-2], even though N285.4 applies to periodic inspection rather than to the design of the plant, there are elements of this Standard that have implications on plant design, and therefore N285.4 is also considered to be relevant to Safety Factor 1 (Plant Design). A number of clauses in N285.4-14 are also relevant to Safety Factor 4 (Aging), namely:

- Clause 7.4.7.3: Determination of wall-thinning susceptibility (specifically clauses 7.4.7.3.1, 7.4.7.3.3, and 7.4.7.3.4);
- Clause 7.4.7.4: Inspection requirements;
- Clause 7.4.7.5: Inspection area (specifically clauses 7.4.7.5.1, 7.4.7.5.2, and 7.4.7.5.3);
- Clause 8.2.1: Acceptance criteria - General;
- Clause 8.2.5: Dimensional inspection;
- Clause 12.4: Material property testing;
- Clause 12.5: Material surveillance of fuel channel annulus spacers;
- Clause 14.4.1.1: General (this clause documents the general requirements for the metallurgical examination of Steam Generator tubes); and
- Annex E: Guidance on the selection of pressure tubes for material property testing and spacer surveillance.

Compliance with CSA N285.4-05 [B.2-3] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.2-4]. The current revision of the Standard, N285.4-14 [B.2-1], is the sixth edition of N285.4 which supersedes the previous editions, published in 2009, 2005, 1994, 1983, and 1978.

In the more recent versions of the Standard, revisions have ranged from editorial to the addition of supplementary information as well as the addition of new requirements. The CSA N285.4-14 Impact Statement [B.2-5] provides a "Summary of significant changes from the previous edition" which identifies six primary changes to the Standard which are discussed in Section B.2.2 below. In addition to findings resulting from review of the CSA N285.4-14 Impact Statement, the results of PSR1 N285.4 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.2.2.

As identified in Reference [B.2-6], the Pickering PSR2 review of CSA N285.4-14 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.2.2 Compliance Assessment for Pickering PSR2

B.2.2.1 Application of PSR1 Reviews

The versions of N285.4 subject to previous ISR reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

The Pickering B ISR was performed using the N285.4-94 [B.2-7] and N285.4-05 [B.2-3] versions of the Standard. The Pickering B ISR review based on N285.4-05 [B.2-3], being the most recent (as well as the version referenced in current Pickering NGS PROL 48.02/2018) is discussed further with respect to the Pickering code reviews conducted for Safety Factors 1 and 2. OPG Report NK30-REP-03680-00001 R000 [B.2-2] documented a clause-by-clause review of N285.4-05 for Safety Factor 1 and concluded the following:

> *The existing CSA N285.4-05 inspection program documents were reviewed to determine the degree to which the program at PNGS B complies with the requirements of CSA N285.4-05. These program documents include a "Compliance Matrix" which specifically indicates the areas where the current program does not fully comply with the requirements of the standard. …the only area of non-compliance with the standard that is a design issue is for clause 3.7.1 [which specifies that the design and arrangement of components and piping shall provide for clearances adequate to permit all inspections]. OPG's planned resolution to this problem, stated in the previous section, has been accepted by the CNSC. Accordingly, CPUS recommend that OPG refrain from making design changes to the plant for the sole purpose of providing access to piping and components to facilitate future periodic inspections. The necessary design changes and work to rearrange equipment and*

piping would incur unnecessary costs and expose plant personnel to unnecessary radiation hazards.

OPG Report NK30-REP-03680-00002 R000 [B.2-8] documented a clause-by-clause review of N285.4-05 [B.2-3] Clauses 3 through 11 for Safety Factor 2. With respect to the non-compliance for Clause 3.7.1 of N285.4-05 identified in the code review for Safety Factor 1, Appendix D of NK30-REP-03680-00002 R000 [B.2-8] included the following update:

> *OPG provided clarification as per NK30-CORR-00531-04566 [Ref 2]. OPG agreed to include more details about evaluation and substitution criteria for inaccessible / partially accessible locations in the next revision of N-ED-03641.2-10000.*
>
> *NK30-PIP-03641.2-00001/00002/00003/00004 (for Units 5/6/7/8) Appendix E, "CAN/CSA-N285.4-05 Compliance Matrix" item 1 states: "Where there is limited access for inspection of a selected piping weld or component, the inspection will be completed to the extent possible and credit will be taken for full inspection of that component."*

Per Reference [B.2-9], OPG's planned resolution to this problem was accepted by the CNSC and this gap is now closed. This gap is not impacted by operation past 2020 and therefore there is no related gap for Pickering PSR2.

Section 3.1.9 of NK30-REP-03680-00002 R000 documented the findings from the code review for Clauses 3 through 11 as follows:

> *(a) Compliance Review of CSA N285.4*
>
> *… only Clauses 3 through 11 of this standard were included in this review. A tabularized detailed clause-by-clause summary of the results of the review is documented in Table 1 in Appendix D.*
>
> *Discrepancies: There were no "Discrepancies" identified.*
>
> *Acceptable Deviations: Compliance against 9 clauses were identified as Acceptable deviations.*

The nine Acceptable Deviations (ADs) identified in NK30-REP-03680-00002 R000 are not safety significant. Further, the ADs are not impacted by Pickering operation past 2020 and are therefore not addressed further in the context of Pickering PSR2. Therefore, there are no PSR2 applicable gaps resulting from the Pickering B ISR review.

Pickering Units 1,4

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N285.4-94 [B.2-7]. As outlined in NA44-CORR-00531-00381 R000 [B.2-10], OPG did not perform a code review of the Standard on the basis that it "Pertains mostly to Operations aspects, or other aspects not having a direct or immediate effect on installed design features". However, NA44-CORR-00531-00381 R000 states that "Condition 5.2 of the Power Reactor Operating Licence requires OPG to inspect and perform material surveillance according [to] the technical requirements in CSA Standard N285.4-94…. Completion of the associated PIP is included as Regulatory Commitments in the scope of the Pickering A Return to Service project." Further, Section 6.1.3, "Periodic Inspection Program - Nuclear Plant and Containment Components Inspections" of the Pickering PROL Renewal Application [B.2-11] states:

> *The main objective of the periodic inspection programs is to ensure [OPG] satisfy the following Canadian Standards Association CAN/CSA Standards: CSA-N285.4-05, Periodic Inspection of CANDU Nuclear Power Plant Components.*
>
> *… The CSA N285.4 program consists of approximately 300-600 inspection items for each of the six operating units. Each scheduled item is normally inspected once within each 10-year cycle. Inspected components include: piping and vessel welds, pumps, valves, pipe and component supports, heat exchangers, and mechanical couplings.*

Section 6.2 of [B.2-11], "Major Components Life Cycle Management", states:

> *The Major Components program has implemented Periodic Inspection Program (PIP) plans for SG, FC and feeders, according to CSA Standard N285.4. The Program will continue to be executed until the end of commercial life with change expected primarily in the asset preservation category of work.*

Since N285.4-05 [B.2-3] is a licence requirement for Pickering NGS per Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.2-4], and compliance is confirmed in the Pickering PROL Renewal Application [B.2-11], Pickering Units 1,4 (and Units 5-8) are in compliance with N285.4-05. Further, there are no gaps that result from the Pickering B ISR as discussed above. The results of Darlington ISR reviews for the latest editions of the Standard, and their applicability to Pickering, are discussed below.

Darlington NGS

The Darlington ISR was performed using N285.4-05 including Update No. 1 (June 2007) [B.2-12] and N285.4-09 including Updates No. 1 (January 2010) and No. 2 (June 2011) [B.2-13]. These reviews are documented in Reports NK38-REP-03680-10057 R000 [B.2-14] and NK38-REP-03680-10137 R000 [B.2-15] respectively. Various gaps for Darlington were identified and documented in NK38-REP-03680-10057 R000 and NK38-REP-03680-10137 R000. Of these Darlington Reports, only NK38-REP-03680-10137 R000 (N285.4-09 assessment) was reviewed in detail for PSR2 since N285.4-05 was already assessed as part of the Pickering B ISR and Pickering B is in compliance with N285.4-05 as discussed above.

The clauses in N285.4 are primarily programmatic from the perspective of the specified requirements, while recognizing that required records and reports, including PIPs, are specific to each station. Therefore, the Darlington ISR N285.4 conclusions above are largely applicable to Pickering PSR2.

As described in NK38-REP-03680-10137 R000, the changes made in CSA N285.4-09 including Updates 1 and 2 [B.2-13] relative to N285.4-05 [B.2-12] included changes to 102 clauses. NK38-REP-03680-10137 R000 identified that changes to 35 of those clauses were editorial leaving the changes to the remaining 67 clauses which were reviewed in more detail within the report. Those 67 changes resulted in the identification of 43 Darlington ISR Gaps relative to the requirements of N285.4-09 which were then grouped under 8 areas (ISR Issues) where "OPG's governance for Darlington compliance with the requirements of CSA N285.4 will need to be updated in order to comply with the requirements of CSA N285.4-09 Update 2". The 8 Darlington ISR Issues identified in NK38-REP-03680-10137 R000 are applicable to Pickering (since they are either programmatic or relate to PIP updates (which also apply to Pickering)) and are therefore addressed below:

- **PSR2 N285.4 Gap #1**: OPG PIP Governance references N285.4-05, not N285.4-09 including Updates 1 and 2. This (programmatic) Darlington ISR gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **PSR2 N285.4 Gap #2**: There has been a significant change in the wording of clause 4.2.7 in CSA N285.4-09 including Updates 1 and 2. I-PROC-AS-0009, "Inspection Qualification of Non-Destructive Examination Processes" does not identify the authorized inspector as a qualifying authority as directed by clause 4.2.7. Instead it establishes the CANDU Inspection Qualification Bureau (CIQB) as the organization that would approve procedures and personnel. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **PSR2 N285.4 Gap #3**: New erosion and corrosion inspection requirements in N285.4-09 including Updates 1 and 2 are not reflected in current PIP governance. NK38-REP-03680-10137 R000 states that: "It should be noted specifically that [this ISR Issue] is likely to have a major impact on piping PIPs because sub-clauses 7.4.7.X in CSA N285.4-09 including UPD1 and UPD2 include substantive changes. Under the new standard erosion and corrosion inspection exemptions can no longer be justified on the basis of [sic] that conditions are determined to be non-erosive and non-corrosive." This Darlington PIP gap will also need to be addressed in the

Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **PSR2 N285.4 Gap #4**: Extended life inspection schedules in N285.4-09 including Updates 1 and 2 are not reflected in PIP governance. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- **PSR2 N285.4 Gap #5**: An assessment of the prior operating non-conforming state, as required by N285.4-09 including Updates 1 and 2, is required when dispositioning inspection results. This requirement has not been included in the feeder PIP plan. This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2.

- The Darlington ISR identified that OPG Governance does not ensure that qualifications of examination personnel are included within inspection reports as required by clause 12.4.4.6 of N285.4-09 including Updates 1 and 2, and was therefore identified as a gap. However, clause 11.3.2.1 of N285.4-09 including Updates 1 and 2 already requires that qualifications of examination personnel be included in inspection reports, and clause 11.3.2.1 had not changed relative to N285.4-05 [B.2-12]. Further, Section 6.5 of the Pickering Units 1,4 and 5-8 Fuel Channel PIP plans ([B.2-16], [B.2-17], [B.2-18], [B.2-19], [B.2-20] and [B.2-21]) state:

  > *…Beyond this specific reporting requirement, test records and the issuance of reports shall comply with [N285.4] Clause 11.*

  As a result, this is not a PSR2 gap.

- The Darlington ISR identified that although the Darlington PIP recognizes feeder cracking as an OPEX issue, it does not establish a default classification of "high" for feeders as would be required under clause 7.1.3.3 (a) of CSA N285.4-09 including Updates 1 and 2. This gap was deemed as an Acceptable Deviation in the Darlington ISR with the following resolution [B.2-22]:

  > *The fact that Piping and Component PIPs do not classify feeders as having high fatigue factor is an "acceptable deviation" that has no safety significance. Feeders are now being inspected under Feeder PIPs… in accordance with the requirements of N285.4. The feeder inspections in these PIP plans recognize and account for the feeder cracking OPEX at other CANDU sites and supersede those in the Piping and Component PIP plans...No further action is required.*

  A similar resolution can be applied to Pickering as separate Feeder Pipe PIP plans have been issued and accepted by CNSC in P-CORR-00531-04492 R000 [B.2-23] for Pickering Units 1,4 and 5-8. Feeder inspections will be removed from the Piping and Component PIP plans in their next revision as communicated to the CNSC in N-CORR-

00531-06833 R000 [B.2-24]. The Unit 5-8 Feeder Pipe PIP plans recognize feeder cracking OPEX at other CANDU sites (i.e., weld cracking at Gentilly 2). While OPEX at Gentilly 2 is not mentioned in the Unit 1,4 Feeder Pipe PIP plans, weld cracking inspections are included in the inspection program. Therefore, although the feeders are not classified as having a high fatigue factor in Piping and Component PIP plans, this is not a gap for Pickering PSR2.

- CSA N285.4-09 including Updates 1 and 2 requires that stresses, including thermal expansion stresses, are included in evaluations. Although secondary stresses may have been included in the PIPs this is not explicit. The PIPs will need to ensure that secondary stresses, including thermal expansion stresses, are evaluated for all components. This was therefore identified as a Darlington PIP gap in NK38-REP-03680-10137 R000. However, N-REP-03641-10003 R000 [B.2-28] discussed later, which addresses the most recent version of N285.4-14, states that there is "No Impact" given that "This sub-clause was added to the 2009 edition of CSA N285.4 Standard in order to provide further clarification only and it does not introduce new requirement." Therefore, this is not a gap for Pickering PSR2.

NK38-REP-03680-10137 R000 goes on to state: "This change from N285.4-05 UPD1 will introduce a significant change to the PIPs for piping when the operating license is amended to require compliance with CSA N285.4-09 including UPD1 and UPD2."

The 8 Darlington ISR Issues were subsequently rolled-up into three Darlington IIP [B.2-25] gaps, namely IIP-OI 044, IIP-OI 049 and IIP-OI 050, which call for the update of Darlington PIPs and the qualification of inspection procedures for specific components to address the requirements of the 2014 edition of N285.4 [B.2-1]. These three Darlington IIP gaps, which have a completion date of 2019, are [B.2-25]: 1) IIP-OI 044: "Perform compliance activities to meet CSA N285.4 including appropriate assessments and PIP updates." , 2) IIP-OI 049: "The jurisdictional boundary between ASME III and the building structure defined for Darlington NGS does not meet the current requirements of ASME Section III.", and 3) IIP-OI 050: "Periodic inspection procedures for volumetric inspections of pressure tubes are to be documented and proven capable of yielding results to a sensitivity that is appropriate for the system or components being inspected. All inspection procedures used in periodic inspections need to be qualified. Inspection procedures applied to pressure tube inspections are to be qualified by the CANDU Inspection Qualification Bureau (CIQB)." These Darlington IIP gaps are not identified as gaps for PSR2 (the 8 ISR Issues above are instead) since the Darlington GAR/IIP may have used Darlington-specific rationale for these "roll-ups" which are not applicable to Pickering NGS.

Nevertheless, there is a gap for Pickering NGS compliance with N285.4-14. As discussed under Section B.2.2.2 below, OPG Letter N-CORR-00531-06613 R000 [B.2-26], "OPG Transition Plan to 2014 Edition of CSA Standard N285.4 - Periodic Inspection of CANDU

Nuclear Power Plant Components" states that "OPG intends to transition only Darlington NGS to the 2014 edition of CSA Standard N285.4" and that "Pickering NGS will remain compliant with the 2005 Edition of CSA N285.4 and Update No. 1 until the planned end of commercial operation in 2020" (at the time of the communication to the CNSC, OPG was planning to end commercial operation of Pickering NGS in 2019).

Regulatory Management Action Request #28168380 was submitted in September 2014 to address OPG's N285.4-14 Transition Plan for Darlington which is tasked with addressing the IIP gaps listed above (for Darlington only). Since OPG intends to transition Darlington NGS to comply with N285.4-14 by 2019, a similar transition plan may also be required for Pickering NGS for operation past 2020. There are PSR2 gaps for Pickering NGS compliance with the 2014 edition of N285.4. This is discussed further under Section B.2.2.2 below.

B.2.2.2 Application of Post-PSR1 Reviews

Following the Darlington ISR reviews, additional compliance assessments were completed for the N285.4-14 [B.2-1], first in July 2015 for Clauses 12 through 14 (in N-REP-03641-10002 R000 [B.2-27]) and then in November 2015 for Clauses 1 through 11 (in N-REP-03641-10003 R000 [B.2-28]). Although these N285.4-14 reviews were completed specifically for Darlington, the dispositions are programmatic in nature (affecting OPG Nuclear Program documentation and Governance) or impacting identical station-specific documents for both Darlington and Pickering (i.e., the PIPs). Therefore, these reviews are applicable to Pickering NGS.

The compliance assessment of Clauses 1 through 11 [B.2-28] included a gap analysis between N285.4-14 and N285.4-05 including Update No. 1 [B.2-12] to identify, for Clauses 1 through 11, all changes between these two editions of the standard and the impact of the changes on Darlington's N285.4 Periodic Inspection Program. With respect to the Darlington ISR gaps identified earlier in OPG Reports NK38-REP-03680-10057 R000 [B.2-14] and NK38-REP-03680-10137 R000 [B.2-15], N-REP-03641-10003 R000 [B.2-28] states:

> *Although some of the compliance gaps have since been resolved and are no longer considered compliance gaps relative to N285.4-14, other compliance gaps identified relative to the earlier editions of N285.4 remain relative to N285.4-14.*

The compliance assessment of Clauses 1 through 11 [B.2-28] concluded:

> *The existing Darlington N285.4 PIP documentation complies with the 2005 edition of the Standard, but as the 2014 edition not only includes changes to some of the existing requirements (e.g. revised sample sizes for the inspection of identical components, adjusted inspection intervals) it also introduces new requirements (e.g. the need to identify locations for potential pipe wall thinning and to incorporate the inspection of those locations in the PIP Plans, and PIP documents). All the PIP Plans, program*

documentation and governance and PIP-related documents and procedures (e.g. inspection procedures) need to be reviewed and revised to reflect the new or revised requirements of N285.4-14, which range from straightforward reference updates to extensive revision.

The compliance assessment of Clauses 12 through 14 [B.2-27] documents the findings of the gap analysis between N285.4-14 [B.2-1] and N285.4-05 including Update No. 1 [B.2-12], and also addresses CNSC comments raised in the Code Refresh Review of N285.4-09 Update No. 2 for the Darlington ISR [B.2-15]. In general, the review found that various Darlington PIP documents will need to be updated to reflect updated requirements in N285.4-14. Similar to OPG Letter N-CORR-00531-06613 R000 [B.2-26], the compliance assessment of Clauses 12 through 14 [B.2-27] stated that OPG intends to transition Darlington NGS to N285.4-14 by 2019, and that Pickering NGS will remain compliant with the CSA N285.4-05 and Update No. 1 until the planned end of commercial operation (assumed at the time to be 2019).

As discussed earlier, the CSA N285.4-14 Impact Statement [B.2-5] identifies six primary changes from the previous edition of the Standard which provides additional insight about the potential impact of changes in N285.4-14. A summary of each change, as well as a brief assessment of safety significance, is addressed below:

- N285.4-14 Impact Statement Change #1 [B.2-5]: "Clarified inspection ultrasonic scan requirements to remove ambiguous language. Provided guidance for use of phased array ultrasonic inspection methodology. Provides direction for inspection staff. Changes made to Clauses 2.2, 4.2, 4.3, 8.2.1, and 8.2.4; update of Figure 3. Impact: - Clarified inspection ultrasonic scan requirements to remove ambiguous language. - Provided guidance for use of phased array ultrasonic inspection methodology. - Changes made to Clauses 2.2, 4.2, 4.3, 8.2.1, and 8.2.4; update of Figure 3."

  These changes are for clarification and guidance only (to remove ambiguity) and are not safety significant. Therefore, there is no gap for Pickering PSR2.

- N285.4-14 Impact Statement Change #2 [B.2-5]: "Updated Figure A-1 to reflect current practices in defining inspection requirements. Provides direction to staff setting periodic inspection programs. Impact: Provides increased clarity in non-mandatory annex that provides an overview of the philosophy."

  These changes are for increased clarity of a non-mandatory Annex only and are not safety significant. Therefore, there is no gap for Pickering PSR2.

- N285.4-14 Impact Statement Change #3 [B.2-5]: "Updated minimum requirements for SG tube surveillance examination and testing (Clause 14.4.1 and new Annex H). Possible update to industry best practices. Impact: - Modified Clause 14.4.1, added new Annex H. - Permits use of Integrated Material Surveillance Program (IMSP) to minimize number of SG tube removals. - Allows licensee to request exemption from SG tube removals if can demonstrate, via a technical justification, that active SG tubing degradation is known, stable, predictable and managed by SG LCMP actions over next surveillance interval (Regulatory acceptance is required for an IMSP or exemption; Rules for IMSP preparation or exemption request are clearly defined)."

N-PROG-MA-0025 R002, "Major Components" [B.2-29] points to N-PLAN-33110-10009 R006, "Steam Generators Life Cycle Management Plan" [B.2-30], which states the following in Section 1.10:

> *CSA N285.4 Clause 14 [N-PLAN-33110-10009] requires periodic removal of SG tubes for material surveillance (every six years without an integrated plan). In 2011, OPG performed a review of the potential for changes to the Clause 14 material surveillance requirements and initiated dialogue with the CSA N285B Technical Committee (TC) regarding the next version of CSA N285.4 to be issued in 2014. OPG authored a position paper on this subject [N-PLAN-33110-10009]. Options were developed in the paper for possible modification to Clause 14 N285.4 tube removal requirements. The OPG position paper was distributed to external stakeholders in Q1 2012 [N-PLAN-33110-10009]. In 2012, OPG led a CSA N285B TC task team that produced a modification to Clause 14 and a new informative annex to allow a licensee to prepare and request regulatory acceptance of an exemption from the requirement for a surveillance tube removal provided certain conditions are satisfied. These modifications were included in the draft 2014 CSA N285.4 standard that underwent public review in 2013 and have been approved by CSA N285B TC for inclusion in the standard.*
>
> *Periodic removal of SG tubes remains as the default requirement in the 2014 CSA N285.4 standard until such time as a licensee has prepared, submitted and obtained CNSC approval of an exemption from the tube removal requirements. OPG prepared a technical justification and requested CNSC acceptance of an exemption from CSA N285.4-05 requirements for steam generator surveillance tube removal, for the Periodic Inspection Program (PIP) interval of 2009-2015, during 2015 Unit 5 and Unit 6 planned maintenance outages [N-PLAN-33110-10009]. CNSC accepted OPG's request for exemption of tube removal if the following conditions were met [N-PLAN-33110-10009]: 1. Inspection results of planned 2015 outages of Unit 5 and Unit 6 will unquestionably validate current technical justification and fully satisfy the requirements from the Annex H of CSA N285.4-14 and OPG proposed criteria. 2. In case that the 2015 inspection results deviate from the criteria defined in Annex H of CSA N285.4-14 , OPG will follow guidance of current CSA N285.4-05 and perform tube removal. Assessment of the P5, 2015 steam generator inspection results confirmed that OPG's technical justification remains valid and satisfies CNSC's condition #1 described above. PIP primary side tube removal in one SG was deleted*

from the approved P1551 outage scope of work per the scope change #2 [N-PLAN-33110-10009]. P6 steam generator inspection results will be assessed following P1561.

Further, N-REP-03641-10002 R000 [B.2-27] assessed this clause for Darlington and concluded: "Compliant. Impact - None unless exemption is pursued. If exemption is desired follow Clause 14.4.1.3 and Annex H". Based on the above, OPG is aware of, and has been interfacing with the CNSC to satisfactorily account for this new requirement. As a result, there is no gap for Pickering PSR2.

- N285.4-14 Impact Statement Change #4 [B.2-5]: "Revised requirements for pressure tube volumetric and dimensional inspection (Clause 12.2), pressure tube hydrogen equivalent determination (Clause 12.3) and pressure tube material property testing (Clause 12.4). Updates also made to associated Annexes. Updated to include industry best practices and incorporate lessons learned from reactor which have operated one full life cycle. Impact: Revised requirements for pressure tube inspections, [Heq] measurements and material property testing. - Based on good Operating Experience, and lessons learned for FCLM project. - 20% reduction in total inspections and number of inspection outages in first 30 years of operation. - Clarified volumetric inspection requirements, eliminating potential compliance gaps."

  N-PROC-MA-025 R002, "Major Components" [B.2-29], points to N-PLAN-01060-10002 R016, "Fuel Channel Life-Cycle Management Plan" [B.2-31], which states: "In this procedure wherever reference is made to Clause 12 and sub-clauses, the reference is to the edition of CSA N285.4 in the station specific Power Reactor Operating License" which is N285.4-05, not N285.4-14. As discussed earlier, N-REP-03641-10002 R000 [B.2-27] reviewed these N285.4-14 clauses and determined that various Darlington PIP documents will need to be updated to reflect updated requirements in N285.4-14. There is a PSR2 gap (i.e., PIP updates required) for Pickering NGS compliance with N285.4-14 Clauses 12.2, 12.3 and 12.4. Compliance requirements for alignment with N285.4-14 are identified under **PSR2 N285.4 Gap #6.**

- N285.4-14 Impact Statement Change #5 [B.2-5]: "Added new Clause 12.5 specifying minimum annulus spacer surveillance examination and testing requirements. Addresses OPEX item on material property degradation of annulus spacers (garter springs). Impact: - Spacer surveillance requirements added (new Clause 12.5). - Requirements modeled on PT material property testing (Clause 12.4)."

  N-REP-03641-10002 R000 [B.2-27] reviewed this clause and determined that "requirements will need to be incorporated into DNGS PIP plans and associated documentation in transition to 2014 Edition of standard." There is a PSR2 gap (i.e., PIP updates required) for Pickering NGS compliance with N285.4-14 Clause 12.5. As discussed above, compliance requirements for alignment with N285.4-14 are identified under **PSR2 N285.4 Gap #6**.

- N285.4-14 Impact Statement Change #6 [B.2-5]: "Updated selection criteria for identifying candidate tube for pressure tube surveillance examination and testing (Annex E) to include address [sic] selection criteria for annulus spacer surveillance examination and testing. Possible update to industry best practices. Impact: Modified Annex E (channel selection requirements for material surveillance) to include requirements for spacer surveillance. - Can be integrated with tube removals for pressure tube material property testing to minimize impacts."

  This is an update with respect to aligning with industry best practices, and similar to the previous two Impact Statement changes, PIP documents will need to be updated to reflect updated requirements in N285.4-14. As discussed above, compliance requirements for alignment with N285.4-14 are identified under **PSR2 N285.4 Gap #6**.

It is noted that the CSA N285.4-14 Impact Statement [B.2-5] does not identify clauses 7.4.8 (which relates to new requirements for inspection for Environmentally Assisted Cracking), or clauses 7.5.1/7.5.2 (which relate to new requirements for Inspection of identical components), as being a significant change from the previous edition of the Standard. However, N-REP-03641-10003 R000 [B.2-28] states:

> *Inspection for Environmentally Assisted Cracking (EAC): As the aforementioned, Clause 7.4.8 introduces new requirement to assess the potential for EAC to be present in all N285.4 PIP systems or components, and then determine its extent, the sample size, inspection intervals, inspection methods and procedures , reporting and acceptance criteria. As above, if a potential for EAC is identified as credible degradation. This information then needs to be incorporated in the N285.4 program.*
>
> *Inspection of identical components: According to Clauses 7.5.1 and 7.5.2, the minimum number of identical components/areas/welds to be inspected for each identical unit has been changed. Not only has the Figure 1 graph been replaced by Table 2 for specifying the sample size, but the sampling population in Table 2 is different and typically calls for a smaller number of identical components to be inspected. Consequently the PIP Plans and PIP documents are to be adjusted accordingly.*

Therefore, PIP documents will need to be updated to reflect updated requirements in N285.4-14. As discussed above, compliance requirements for alignment with N285.4-14 are identified under **PSR2 N285.4 Gap #6**.

In addition to the above N285.4 PSR2 gaps, in May 2015 the CNSC communicated a concern in CNSC Letter P-CORR-00531-04474 R000 [B.2-32] about OPG's use of N285.4 with respect to credit taken for inaugural inspections. Reference [B.2-32] states:

… inaugural inspections, performed to establish a baseline prior to SSCs going into service, cannot replace or be credited for the periodic inspections required to verify degradation of SSCs after going into service.

… CNSC staff request that OPG stops using inaugural inspections to fulfill the periodic inspections program requirements. Future periodic inspection reports will be monitored to verify that OPG is complying with CNSC's request.

There is no commitment or open action from OPG related to this CNSC request and compliance will be monitored by the CNSC as indicated above. Therefore, this is not a gap for PSR2.

B.2.3 Compliance Summary for Pickering PSR2

There are six PSR2 CSA N285.4 gaps which all relate to Safety Factor 4. The first five of these N285.4 gaps are applicable to compliance with N285.4-09 including Updates 1 and 2 [B.2-13]. The sixth N285.4 gap is applicable to compliance with N285.4-14 [B.2-1].

1. N285.4 PIP Governance references N285.4-05, not N285.4-09 including Updates 1 and 2. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

2. There has been a significant change in the wording of clause 4.2.7 in CSA N285.4-09 including Updates 1 and 2. I-PROC-AS-0009, "Inspection Qualification of Non-Destructive Examination Processes" does not identify the authorized inspector as a qualifying authority as directed by clause 4.2.7. Instead it establishes the CANDU Inspection Qualification Bureau (CIQB) as the organization that would approve procedures and personnel. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

3. New erosion and corrosion inspection requirements in N285.4-09 including Updates 1 and 2 are not reflected in current PIP governance. NK38-REP-03680-10137 R000 states that: "It should be noted specifically that [this ISR Issue] is likely to have a major impact on piping PIPs because sub-clauses 7.4.7.X in CSA N285.4-09 including UPD1 and UPD2 include substantive changes. Under the new standard erosion and corrosion inspection exemptions can no longer be justified on the basis of [sic] that conditions are determined to be non-erosive and non-corrosive." This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2.

4. Extended life inspection schedules in N285.4-09 including Updates 1 and 2 are not reflected in PIP governance. This (programmatic) Darlington gap is a PSR2 gap against N285.4-09 including Updates 1 and 2.

5. An assessment of the prior operating non-conforming state, as required by N285.4-09 including Updates 1 and 2, is required when dispositioning inspection results. This requirement has not been included in the feeder PIP plan. This Darlington PIP gap will also need to be addressed in the Pickering PIPs. Therefore, this is a PSR2 gap against N285.4-09 including Updates 1 and 2.

6. There is a PSR2 gap for Pickering NGS against N285.4-14 to address:

    - Revised requirements for pressure tube volumetric and dimensional inspection (Clause 12.2), pressure tube hydrogen equivalent determination (Clause 12.3) and pressure tube material property testing (Clause 12.4);

    - Clause 12.5 which specifies minimum annulus spacer surveillance examination and testing requirements;

    - Selection criteria for identifying candidate tube for pressure tube surveillance examination and testing (Annex E) to include selection criteria for annulus spacer surveillance examination and testing; and

    - Clause 7.4.8 which specifies requirements for inspection of Environmentally Assisted Cracking, and Clauses 7.5.1/7.5.2 which specify requirements for inspection of identical components.

B.3 CSA N285.5-13, "Periodic Inspection of CANDU Nuclear Power Plant Containment Components"

B.3.1 Background

The following paraphrased from the Preface of CSA N285.5-13 [B.3-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *This Standard defines requirements for the periodic inspection of containment system components, including containment pressure suppression systems, in CANDU nuclear power plants.*
>
> *This Standard specifies requirements for*
>
> a) *inspection;*
> b) *accessibility;*
> c) *inspection methods and procedures;*
> d) *personnel qualifications;*
> e) *inspection criteria;*
> f) *inspection program development;*
> g) *inspection frequency;*
> h) *evaluation of inspection results;*
> i) *disposition of defects;*
> j) *repairs;*
> k) *documentation; and*
> l) *records.*

N285.5-13 is relevant to Safety Factor 2 (Actual Condition of SSCs). As stated in OPG Report NK30-REP-03680-00001 R000 [B.3-2], even though N285.5 applies to periodic inspection rather than to the design of the plant, there are elements of the Standard that have implications on plant design, and therefore N285.5 is also considered relevant to Safety Factor 1 (Plant Design). A number of clauses in N285.5-13 are also relevant to Safety Factor 3 (Equipment Qualification) and Safety Factor 4 (Aging), including:

- Clause 5.2: Inspection methods (specifically Clauses 5.2.3, 5.2.4, and 5.2.5);
- Clause 8.2: Plastic materials;
- Clause 8.3: Assessment and determination of inspection methods (specifically Clauses 8.3.1.3, 8.3.2.1, 8.3.3.1, and 8.3.4); and

- Annex A: Periodic inspection, material property monitoring, and test programs for Fibreglass Reinforced Plastic (FRP) containment components.

Compliance with CSA N285.5-08 including Update 1 [B.3-3] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Section 7.1 and Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.3-4]. The current revision of the Standard is N285.5-13 [B.3-1]. This is the fourth edition of CSA N285.5, and it supersedes the previous editions, published in 2008, 1990, and 1988.

The CSA N285.5-13 Impact Statement [B.3-5] provides a "Summary of Significant Changes from the Previous Edition" which identifies two primary changes to the Standard which are discussed in Section B.3.2 below. In addition to findings resulting from review of the CSA N285.4-14 Impact Statement, the results of PSR1 N285.5 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.3.2.

As identified in Reference [B.3-6], the Pickering PSR2 review of CSA N285.5-13 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.3.2 Compliance Assessment for Pickering PSR2

B.3.2.1 Application of PSR1 Reviews

The versions of N285.5 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

For Pickering B ISR Safety Factors 1 and 2, a clause-by-clause review against N285.5-M90 (R2000) [B.3-7] was performed. The reviews were documented in reports NK30-REP-03680-00001 R000 [B.3-2] and NK30-REP-03680-00002 R000 [B.3-8], respectively.

Report NK30-REP-03680-00001 R000 [B.3-2] concluded the following for Safety Factor 1:

The existing CSA N285.5-M90 inspection program documents were reviewed to determine the degree to which the program at PNGS B complies with the requirements of CSA N285.5-M90… only one area of non-compliance with the program is a design issue and that is for clause 4.5.1. OPG's planned resolution to this problem, stated in the previous section has been accepted by the CNSC.

The gap associated with clause 4.5.1 is closed. However, as discussed under the Darlington review below, the disposition of the gap for clause 4.5.1 refers to OPG receiving a concession from the CNSC on the inspection of components deemed to be inaccessible. A similar (updated) concession may be required for Pickering operation past 2020. This is therefore identified as **PSR2 CSA N285.5 Gap #1.**

NK30-REP-03680-00002 R000 [B.3-8] identified a number of Acceptable Deviations (ADs) for Clauses 4.5.1, 8.4.2.1, 8.4.2.2, 8.5.2.2, 8.6.3, 8.6.5, and 8.6.6. (Note: These ADs were also identified for Darlington and are discussed further in the "Darlington NGS" review subsection below. As discussed there, although compliance against these clauses were deemed to be ADs during the Pickering B ISR, further consideration in the context of PSR2 (Pickering operation past 2020) has led to these being reclassified as a PSR2 gap relating to ongoing CSA N285.5 concessions). In addition, ADs were identified in NK30-REP-03680-00002 R000 [B.3-8] for:

- Clause 4.1.2 (a) which describes requirements prefaced by "should" rather than "shall" but notes that all requirements must be performed unless an exception is granted by the CNSC. This is not a safety significant gap in the context of Pickering PSR2.

- Clause 4.5.2 which defines requirements for clearances to permit access for inspections. "PIP requirements identified in NK30-PIP-03642.2-00001 and P-PIP-03642.2-00001 have been accepted by CNSC" [B.3-8].

- Clause 5.3 (b) which requires that procedures that deviate from requirements must be submitted to the regulatory authority for approval. "Deviation from the standard is identified in NK30-PIP-03642.2-00001 and P-PIP-03642.2-00001 and has been approved by CNSC" [B.3-8].

- Clauses 6.1.2.1 through 6.1.2.5 which address authorized inspectors who are not part of OPG.

- Clause 7.1.1 which notes that requirements for inaugural inspections were not performed in some cases since components have been in service since 1970 and inaugural inspections were not required. This deviation has been accepted by the CNSC [B.3-8].

- Clause 8.6.1 which requires that a complete periodic inspection be made within a 5 year period commencing one year after the reactor unit achieves first criticality. This deviation has been accepted by the CNSC [B.3-8].

Given the above, these six ADs do not result in gaps for Pickering PSR2.

<u>Pickering Units 1,4</u>

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N285.5-M90 (R2000) [B.3-7]. Per NA44-CORR-00531-00381 R000 [B.3-9] OPG did not perform a code review of the Standard on the basis that it "Pertains mostly to Operations aspects, or other aspects not having a direct or immediate effect on installed design features". However, NA44-CORR-00531-00381 states that "Condition 5.2 of the Power Reactor Operating Licence requires OPG to inspect and perform material surveillance according [to] the technical requirements in CSA Standard N285.4-94 and N285.5-M90. Completion of the associated Periodic Inspection Program (PIP) is included as Regulatory Commitments in the scope of the Pickering A Return to Service project." Further, Section 6.1.3, "Periodic Inspection Program - Nuclear Plant and Containment Components Inspections", of the Pickering PROL Renewal Application [B.3-10] states:

> *The main objective of the periodic inspection programs is to ensure [OPG] satisfy the following Canadian Standards Association CAN/CSA Standards: … CSA-N285.5-M90, Periodic Inspection of CANDU Nuclear Power Plant Containment Components.*
>
> *The CSA N285.5 program consists of approximately 1000 inspection items for Unit 0 and 200-600 inspection items for each of the six operating units. Each item is normally inspected once within each 10-year cycle. Inspected components include: containment penetration seal welds, pipe supports, piping/ducting, valves, containment dampers and other components.*
>
> *The CSA N285.5-08 compliance project is on target and will be completed in December 2012 in accordance with the transition plan accepted by the CNSC.*

Since CSA N285.5-08 [B.3-3] is a licence requirement for Pickering NGS per Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.3-4], and compliance is confirmed in the Pickering PROL Renewal Application [B.3-10], Pickering Units 1,4 (and Units 5-8) are currently in compliance with N285.5-08 [B.3-3]. The results of Darlington ISR reviews for the latest versions of the Standard, and their applicability to Pickering, are discussed below.

Darlington NGS

The Darlington ISR review of N285.5 was initially performed using version N285.5-M90 (R2005) [B.3-11] which was documented in OPG Report NK38-REP-03680-10058 R000 [B.3-12]:

> *The review found that Darlington NGS Governance is compliant with most of the clauses in CSA N285.5, with the exception of ten that have been categorized as gaps. The gaps are to clauses in which Darlington NGS has obtained regulatory acceptance…*

The clauses in N285.5 are primarily programmatic from the perspective of the specified requirements, while recognizing that required records and reports, including PIPs, are specific to each station. Therefore, the Darlington ISR N285.5 conclusions above are largely applicable to Pickering PSR2.

The clauses of N285.5-M90 (R2005) identified as having gaps in the Darlington ISR were 4.5.1, 8.4.2.1, 8.4.2.2, 8.4.5.2, 8.4.5.4, 8.5.2.2, 8.6.2, 8.6.3, 8.6.5 and 8.6.6. These clauses are assessed below in the context of Pickering operation past 2020:

- The disposition of the gap for clause 4.5.1 refers to OPG receiving a concession from the CNSC on the inspection of components deemed to be inaccessible (Item 1 for Clause 4.5.1). However, the Darlington ISR states: "… it remains a gap in Darlington governance as there is no assurance that a similar concession would be forthcoming in a refurbished plant". By the same logic it will need to be reconciled for Pickering for the period of PSR2 (life extension past 2020). As discussed under the Pickering B ISR review above, this was already identified as **PSR2 CSA N285.5 Gap #1**.

- The disposition of the gaps for clauses 8.4.2.1 and 8.4.2.2 refer to OPG receiving a concession from the CNSC that insulation will not be removed in the absence of visible damage to a component, and only "light weight" access covers will be removed. The Darlington ISR states: "This is a concession from the regulator which is not assured in the case of a refurbished plant. As such, this represents a gap". By the same logic it will need to be reconciled for Pickering for the period of PSR2. Since this gap is concession-related and associated with N285.5-M90 (similar to the gap above), it will also be tracked under **PSR2 CSA N285.5 Gap #1**.

- The disposition of the gap for clause 8.5.2.2 refers to Item 4 in Appendix F of Reference [B.3-13], which declares an exception of the numerical rules of this clause for reasons of practicality, and that a concession was received from the CNSC. The Darlington ISR states: "… it is categorized as a Gap, because a concession from the CNSC is not assured for a refurbished plant." By the same logic it will need to be reconciled for Pickering for the period of PSR2. Since this gap is concession-related and associated with N285.5-M90, it will also be tracked under **PSR2 CSA N285.5 Gap #1**.

- For clause 8.6.3, although CNSC acceptance was obtained, there is still a non-compliance with a portion of the clause related to the timing of inspections which is noted as needing to be reconciled for a refurbished station. The Darlington ISR states: "This represents a gap that will need to be reconciled with the regulator for a refurbished station." By the same logic it will need to be reconciled for Pickering for the period of PSR2. Since this gap is concession-related and associated with N285.5-M90, it will also be tracked under **PSR2 CSA N285.5 Gap #1**.

For clause 8.6.6, since the Darlington governance defines commencement (for the inspection program) as one year after first net power and or criticality, it does not comply with the requirement in the Standard, which defines commencement as when first criticality is achieved. However, N-PROC-MA-0064 [B.3-15], "Administrative Requirements For The Periodic Inspection Of Nuclear Power Plant Containment Components", was revised subseqent to the Darlington ISR and does not define the commencement of the inspection program as one year after first net power or criticality. Therefore, there is no PSR2 gap.

The disposition of the gap for Clause 8.6.2 refers to the Darlington VBO frequency being on a 12-year interval with the approval of the CNSC, which is a deviation from the 10-year requirement in N285.5-M90. The compliance discussion noted that this represents a gap that will need to be reconciled for a refurbished station. However, N285.5-13 has since updated clause 8.6.2 such that a 12-year interval is permitted. This is not a gap for Pickering PSR2 because the Pickering VBO is on a 10-year interval (i.e., on more frequent intervals than required).

The Gap related to clause 8.4.5.2 is closed and is not impacted by Pickering operation past 2020. Finally, the remaining two gaps in N285.5-M90 (R2005) for clauses 8.4.5.4, and 8.6.5 are classified as ADs per the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.3-14] and are not identified as being at risk by refurbishment (life extension), so they are not relevant in the context of PSR2.

Following the original code review for the Darlington ISR, a code refresh review was conducted based on the current revision of the Standard N285.5-13 [B.3-1] which was documented in OPG Report NK38-REP-03680-10138 R000 [B.3-16]. A clause-by-clause comparison of all clauses in N285.5-13 [B.3-1] relative to CSA N285.5-M90 (R2005) [B.3-11] was performed for the code refresh review. Three of the four changes in N285.5-13 relative to N285.5-08 are not applicable to Darlington since they were related to aging management (monitoring and test programs) for Fibreglass Reinforced Plastic (FRP) materials, which has been assessed at Pickering as part of Reference [B.3-17] for operation to 2024. As a result, additional assessment is required to address FRP aging management at Pickering for operation to 2028, and to confirm the current program aligns with N285.5-13 clauses 8.2, 8.3.3, 8.3.4 and A.6.1.2. This is therefore identified as **PSR2 CSA N285.5 Gap #2** (Note: This gap only exists if Pickering NGS intends to operate past 2024).

There were significant changes (approximately 40) in N285.5-08 relative to N285.5-M90 (R2005). However, the current Pickering NGS program is compliant to N285.5-08 as discussed earlier.

The code refresh review report concluded the following (paraphrased) [B.3-16]:

1. *Darlington is in compliance with the changed requirements in CSA N285.5-13. However, the OPG Nuclear governance and the PIP plan must be updated to reference the 2013 version of the standard. This can be done upon licence renewal once the 2013 N285.5 is included in the PROL.*

2. *There are no changes between CSA N285.5-08, Update 1 and N285.5-13 which are applicable to Darlington. Compliance with the N285.5-05, update 1 standard is based on:*

   (i) specific sections in NK38-PIP-03642.2-10001 R002 [B.3-18] and N-PROC-MA-0064 R005 [B.3-15], and

   (ii) Section 1.1.3 of OPG governance document, N-PROC-MA-0064 R005 [B.3-15] which states 'all inspections, examinations or testing required to ensure acceptability of containment components, shall be performed in accordance with the edition of CAN/CSA-N285.5 stated in the operating license.'

The above conclusions from NK38-REP-03680-10138 R000 were recorded for tracking purposes as Darlington ISR Issue #D564, and assigned Gap #02192 per the Nuclear Refurbishment Issue Resolution Form - Darlington [B.3-19]:

> *The review of the changed clauses in the code refresh review report [R1] concludes that Darlington is in compliance with the changed requirements in CSA N285.5-13. However, applicable OPG Nuclear governance and PIP plans do not make reference to CSA N285.5-13; hence Darlington is considered to be administratively non-compliant i.e. Darlington has been determined to be compliant with all of applicable clauses of N285.5-13, however, this edition of the N285.5 standard is not referenced in OPG governance documents and PIP plans.*

There are no gaps against N285.5-13 per the Darlington IIP Report NK38-REP-03680-10185 R002 [B.3-20]. The Darlington CSA N285.5-13 ISR conclusions above are largely applicable to Pickering PSR2 with the exception of clauses related to Fiberglass Reinforced Plastic which were not applicable to Darlington but are applicable to Pickering as discussed above. This is discussed further below.

B.3.2.2 Application of Post-PSR1 Reviews

Per the CSA N285.5-13 Impact Statement [B.3-5], the following is a summary of the significant changes from the previous edition of the Standard:

- N285.5-13 Impact Statement Change #1 [B.3-5]: New Annex A to identify the inspection and material testing requirements for Fibreglass Reinforced Plastic components added. The outlined requirements in Annex A "provide consistent framework for industry to perform periodic inspection, measurements material testing, and acceptance criteria for FRP."

- N285.5-13 Impact Statement Change #2 [B.3-5]: Update Standard for structure, content, clarity and alignment with other CSA N285 Standards. In particular, "New clause 4.6.3 added to adopt similar requirements in CSA N285.4-09."

As discussed under Section B.3.2.1 above, the changes in N285.5-13 relative to N285.5-08 that are applicable to FRP material that is used at Pickering NGS (but was not relevant to Darlington) have only been assessed for fitness for service to 2024 [B.3-17], so additional assessment is required in the context of Pickering PSR2 for operation to 2028. This was identified earlier as **PSR2 CSA N285.5 Gap #2**.

With respect to new clause 4.6.3, it states: "In cases when this Standard is being applied to an existing plant or to an existing periodic inspection program written to an earlier edition of CSA N285.5, the updated program documents shall identify: a) the requirements in this Standard that cannot be practically implemented; and b) measures taken to compensate for the requirements that cannot be practically implemented." This is not safety significant in the context of PSR2.

B.3.3 Compliance Summary for Pickering PSR2

There are two PSR2 CSA N285.5 gaps which both relate to Safety Factor 4:

1. There were a number of concessions granted from the CNSC for compliance with N285.5-M90 that will need to be reconciled for Pickering for the period of PSR2. Since these gaps are all concession-related and associated with N285.5-M90, they are tracked under a single PSR2 gap:

    - The Pickering B ISR gap associated with N285.5-M90 clause 4.5.1 is closed. However, the disposition of the gap refers to OPG receiving a concession from the CNSC on the inspection of components deemed to be inaccessible. A similar (updated) concession may be required for Pickering operation past 2020. Therefore, this is a gap for PSR2.

- The Darlington ISR disposition of the gaps for N285.5-M90 clauses 8.4.2.1 and 8.4.2.2 refer to OPG receiving a concession from the CNSC that insulation will not be removed in the absence of visible damage to a component, and only "light weight" access covers will be removed. The Darlington ISR states: "This is a concession from the regulator which is not assured in the case of a refurbished plant. As such, this represents a gap". By the same logic it will need to be reconciled for Pickering for the period of PSR2 (life extension past 2020).

- The Darlington ISR disposition of the gap for N285.5-M90 for clause 8.5.2.2 refers to an exception of the numerical rules of this clause for reasons of practicality, and that a concession was received from the CNSC. The Darlington ISR stated "… it is categorized as a Gap, because a concession from the CNSC is not assured for a refurbished plant.". By the same logic it will need to be reconciled for Pickering for the period of PSR2.

- Per the Darlington ISR disposition of the gap for N285.5-M90 clause 8.6.3, although CNSC acceptance was obtained, there is still a non-compliance with a portion of the clause related to the timing of inspections which is noted as needing to be reconciled for a refurbished station. The Darlington ISR stated "This represents a gap that will need to be reconciled with the regulator for a refurbished station." By the same logic it will need to be reconciled for Pickering for the period of PSR2.

2. The changes in N285.5-13 relative to N285.5-08 that are applicable to Fiberglass Reinforced Plastic material that is used at Pickering NGS have only been assessed for fitness for service to 2024 in Reference [B.3-17]. These changes related to aging management (monitoring and test programs) for FRP materials. As a result, additional assessment is required for Pickering to address FRP aging management at Pickering for operation to 2028, and to confirm the current program aligns with N285.5-13 clauses 8.2, 8.3.3, 8.3.4 and A.6.1.2. (Note: This gap only exists if Pickering NGS intends to operate past 2024.)

B.4 CSA N287.7-08 including Update No. 1, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"

B.4.1 Background

The following paraphrased from the Preface of CSA N287.7-08 (including Update No. 1) (R2013) [B.4-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *This Standard provides requirements for in-service examinations and positive pressure leakage-rate testing of concrete containment structures of a containment system that are designated as class containment components.*

N287.7-08 is relevant to Safety Factor 2 (Actual Condition of SSCs). N287.7-08 is also applicable to Safety Factor 3 (Equipment Qualification) and Safety Factor 4 (Aging) since CNSC web site [B.4-2] identifies the Standard as being relevant to the Safety Control Area for "Fitness for Service".

Compliance with CSA N287.7-08 [B.4-3] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.4-4]. The current revision of the Standard is N287.7-08 (including Update No. 1) (R2013) [B.4-1]. This is the fourth edition of CSA N287.7 which supersedes the previous editions, published in 1996, 1980, and 1976. In the more recent versions of the Standard, the changes have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements. An Impact Statement was not prepared by the CSA for N287.7-08. However, the results of PSR1 N287.7 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.4.2.

As identified in Reference [B.4-5], the Pickering PSR2 review of CSA N287.7-08 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.4.2 Compliance Assessment for Pickering PSR2

B.4.2.1 Application of PSR1 Reviews

The versions of N287.7 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

The Pickering B ISR review of N287.7 was performed for Safety Factor 2, comprising a clause-by-clause review against N287.7-96 (R2005) [B.4-6]. The review was documented in OPG Report NK30-REP-03680-00002 R000 [B.4-7]. This report also included a review of environmentally qualified components, seismic qualification status of SSCs and aging management of critical components. Appendix D, Table 3 of NK30-REP-03680-00002 R000 documents the following findings: 103 clauses in direct compliance, Clause 4.5.1 is an Acceptable Deviation (AD) and 10 clauses with gaps (i.e., Clauses 3.1(c), 4.2, 5.1.3(c), 5.1.4, 5.2.4, 5.3.1, 5.3.3, 6.13.2, 8(j), and 8(k)).

SCR N-2008-01932 [B.4-8] was generated to track the documentation changes which were required to ensure compliance with N287.7-96 (R2005) [B.4-6]. The SCR assignment (Action Request assignment 28086700-01) to update N-PROC-MA-0066, "Administrative Requirements for In-Service Examination and Testing for Concrete Containment Structures" [B.4-9] to be fully compliant with CSA N287.7-M96 was completed in February 9, 2009 and also included a review of N287.7-M96 compliance for Pickering A. SCR N-2008-01932 [B.4-8] noted the following actions initiated to resolve the gaps associated with N287.7-M96 (R2005) [B.4-6]:

> *Nuclear Generation Division (NGD) focus has been on whether or not Pickering B is compliant with CSA Standard N287.7-M96. Revising NK30-PIP-03643.2-0001 will ensure that this document will cover the CSA Standard N287.7-M96 requirements. However, a preliminary review of other documentation associated with N287.7-M96 found that minor revisions were required in some of the other related documentation. These are listed below:*
>
> 1. *NK30-CTP-21100-00001 RB Pressure Test Prerequisites (IPTE)*
> 2. *NK30-CTP-21100-00002 Reactor Building Pressure Test (IPTE)*
> 3. *NK30-CTP-21100-00003 RB Pressure Test Post-requisites (IPTE)*
> 4. *P-REP-34200-10003 Vacuum Building and Pressure Relief Duct Inspection Requirements*

5. *N-PROC-MA-0066, Administrative Requirements for In-Service Examination and Testing for Concrete Containment Structures*

6. *N-PROC-MA-0052, Flaw Dispositioning.*

Some of the CSA N287.7-M96 clauses to be considered during documentation revision are clauses 3.1 (c), 4.2, 5.2.4 and 5.3.3.

The SCR associated with these gaps is closed, and is not impacted by Pickering operation past 2020. Based on the above, there are no gaps for Pickering PSR2 that relate to the Pickering B ISR clause-by-clause review of N287.7-96 (R2005).

<u>Pickering Units 1,4</u>

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N287.7-96 (R2000) [B.4-10]. Per NA44-CORR-00531-00381 R000 [B.4-11], OPG did not perform a code review of the Standard on the basis that it "Pertains mostly to Operations aspects, or other aspects not having a direct or immediate effect on installed design features". However, Section 6.1.3, "Periodic Inspection Program - Nuclear Plant and Containment Components Inspections", of the Pickering PROL Renewal Application [B.4-12] states:

> *The main objective of the periodic inspection programs is to ensure [OPG] satisfy the following Canadian Standards Association CAN/CSA Standards: … CSA-N287.7-96 or -08, In-service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants.*
>
> *The CSA N287.7 program addresses inspection and testing of concrete containment structures. Separate PIP Plans have been created and submitted to the CNSC for the vacuum building and Pressure Relief Duct (PRD), the reactor buildings, and the vacuum building post-tensioning system. The PIP Plans identify the Civil Containment Structures and components to be inspected, describe relevant mechanisms potentially affecting these components, identify inspection methods and acceptance criteria, and define the reporting requirements. Access and other supporting functions required to perform the inspections are also provided.*
>
> *Inspections/testing of Vacuum Building (VB) and PRD containment structures were performed during the 2010 Vacuum Building Outage. Inspection activities involved concrete components, vacuum building joint sealant, vacuum building roof seal and pressure relief duct joint seals. There were only minor findings from the 2010 VBO inspections, with repairs completed or findings assessed as acceptable by the Plant Design Department. In addition, vacuum building in-leakage testing was performed during the 2010 VBO and results were acceptable. The Pickering VB and PRD PIP Plan, NA44-PIP-03643.2-00002 R000 (written to N287.7-96), is currently being adhered to.*

Inspections/testing of Units 1 and Unit 4 Reactor Buildings (RBs) were performed during 2010 (P1011) and 2009 (P941) planned outages, respectively. Inspections/testing of the Units 5-8 Reactor Buildings (RBs) were performed during the period of 2008-2011. Minor follow-up activities for repair and monitoring were undertaken as detailed in the submitted inspection reports.

Inspections/testing of the Vacuum Building post-tensioned rods (PTRs) were performed in 2010. CNSC AI 2010-4-18 tracks open Action Notices related to the post-tensioning system PIP plan, NA44-PIP-03643.2-00003 R000 (written to N287.7-08).

OPG revised its Aging Management Plan (AMP) N-PLAN-01060-10004 R002 [B.4-13], which establishes, implements, and improves OPG's aging management strategy for containment structures built under CSA N287 series of standards. The AMP notes that OPG's aging management governance, along with nuclear procedure N-PROC-MA-0066 [B.4-9], ensure that the Pickering PIPs are compliant with CSA N287.7. Based on the above, Pickering Units 1,4 and Units 5-8 PIPs are currently in compliance with either N287.7-96 [B.4-6] or N287.7-08 [B.4-3]. There are no gaps for Pickering that result from the past Pickering B ISR review of N287.7-96, as discussed above. Further, as discussed earlier, CSA N287.7-08 [B.4-3] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.4-3]. The CNSC has accepted the Pickering 1,4 and Pickering Units 5-8 PIPs with respect to the Compliance Verification Criteria related to N287.7-08 per the Pickering NGS Licence Conditions Handbook [B.4-4], which states:

CNSC staff have accepted the Pickering NGS-A and B PIP documents (e-Doc 4452432).

The results of Darlington ISR reviews and their applicability to Pickering (including compliance against N287.7-08) are discussed below, since Darlington ISR programmatic conclusions are applicable to Pickering PSR2.

Darlington NGS

The Darlington ISR was performed against N287.7-08 [B.4-3] and is documented in OPG Report NK38-REP-03680-10061 R000 [B.4-14] which states that this version of the Standard was a non-PROL code at the time:

CAN/CSA N287.7-08, "In-Service Examination and Testing Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants" [R-6] is a Non-PROL code and the use of the term "Compliant" in the Compliance Categorization is therefore to be read as being the same as the term "Indirect Compliance".

The findings from the Darlington ISR code review were:

... that eight clauses in CSA N287.7-08 are not applicable to Darlington and also Darlington is non-compliant with three other clauses of CSA N287.7-08. It is noted that N287.7-08 is a fairly recent revision with some new clauses, and that OPG has informed the CNSC that it will update its governance so that it is in full compliance with the new standard. Other gaps have already received CNSC approval, but are noted as gaps since there is no assurance that a similar concession from the CNSC would be forthcoming for a refurbished plant.

Four of the eight clauses that are not applicable to Darlington are also not applicable to Pickering:

- Clause 6.1.8.1 is not applicable to Darlington because the Emergency Water Storage Tank (EWST), which forms part of the Dousing System, is drained for inspection. The same is true for Pickering, i.e., the Dousing Tank is drained for inspection, therefore this is not a gap for PSR2.

- Clause 6.2.4 is not applicable at Darlington because test beams are not used. The same is true for Pickering, therefore this is not a gap for PSR2.

- Clause 7.6.2 is not applicable to Darlington because Darlington uses the absolute method using the mass plot analysis technique for leakage-rate testing (per clause 7.6.1). The same is true for Pickering, therefore this is not a gap for PSR2.

- Clause 7.12.3 is not applicable to Darlington because Darlington does not use two independent systems to validate the leakage test results. The same is true for Pickering, therefore this is not a gap for PSR2.

The remaining four of the eight clauses that are not applicable to Darlington are Clauses 6.2.1, 6.2.2, 6.2.3 and Clause 7.4. However, clauses 6.2.1, 6.2.2 and 6.2.3 need to be assessed for Pickering due to design differences as discussed below:

- N287.7-08 Clause 6.2.1 requires that: "Pre-stressing systems used as principal reinforcement in concrete containment structures shall be subject to an integrity evaluation for conformance to the design specifications to determine the effects of certain time-related factors, such as: (a) shrinkage and creep of the concrete; (b) stress relaxation; and (c) deterioration." Clause 6.2.2 requires: "In addition to the requirements of Clause 6.1, the consequences of full or partial loss of pre-stress shall be considered." Clause 6.2.3 requires: "Where instrumented monitoring is used to verify the integrity of the pre-stressing system, a monitoring program that is specific to the application shall be developed (see Annex F)."

  Clauses 6.2.1, 6.2.2 and 6.2.3 are not applicable to Darlington because the concrete pre-stressing systems are not used as the principle reinforcement in concrete structures.

Although the Reactor Buildings at Pickering do not have a pre-stressing system, the Vacuum Building does. However, the pre-stressing system in the Vacuum Building at Pickering is not used as principal reinforcement, and therefore Clause 6.2 of N287.7-08 is not applicable. Section 7.0 of NA44-PIP-03643.2-00003 R002, "Pickering Nuclear GS – Vacuum Building Post Tensioning Rods Periodic Inspection Program" [B.4-15] states:

> *Both vertical and horizontal PTRs [post-tensioning rods] in the VB [Vacuum Building] structure ring girder are not principal reinforcement of the VB concrete containment structure and are therefore not subject to an integrity evaluation in accordance with the clause 6.2 of CSA/CAN N287.7.*

NA44-PIP-03643.2-00003 R002 was prepared in accordance with CSA N287.7-08 [B.4-16] and was accepted by the CNSC on July 16, 2014 [B.4-17]. Therefore, there is no gap for PSR2.

With respect to N287.7-08 Clause 7.4, this allows omission of positive Vacuum Building pressure testing if certain conditions are met. It is not applicable to Darlington because the Darlington Vacuum Structure leakage test is performed at positive pressure, as required in Regulatory Document R-7, "Requirements for Containment Systems for CANDU Nuclear Power Plants". Positive pressure testing is not possible at Pickering so the conditions listed (sub clauses a-g) must all be met. As discussed earlier, the 1996 version of the Standard (which did not include clause 7.4, which covers topics such as visual inspection, confirmation of lack of known defects, in-leakage measurements, and testability of access hatches) was assessed for the Pickering B ISR. However, compliance with N287.7-08-related VB pressure testing requirements is addressed by NA44-REP-25100-00009 R000, "Pickering NGS Vaccum Building In-Service Leaakge Rate Test Requirements in Accordance with CSA N287.7-08" [B.4-18] which was developed in accordance with N287.7-08 and has been accepted by the CNSC. Therefore, this is not a gap for PSR2.

The three clauses of N287.7-08 [B.4-3] identified as having gaps in the Darlington ISR were clauses 6.1.8.2, 6.1.4, and 7.13. Clause 6.1.8.2 requires that remotely operated underwater vehicle and/or divers with imaging equipment be used to provide images of the wet side of the containment structure. This was regarded as a Darlington gap since underwater inspections will be required in the reception bay. Darlington is in the process of updating governance to comply. This gap is not applicable to Pickering since the Pickering IFBs do not interface with containment structures unlike the reception bay at Darlington.

Although OPG received concession approval from the CNSC, clauses 6.1.4 and 7.13 were listed as Darlington gaps because there is no assurance that a similar concession from the CNSC would be forthcoming for a refurbished plant. Clause 6.1.4 addresses in-service examination by means of visual inspection of accessible areas inside and outside the containment structure. However, there is no provision in Darlington governance to set requirements for invasive testing or analytical methods, as this was not a requirement in N287.7-96 (R2005) [B.4-6]. As discussed below, the code refresh review based on the current revision of the Standard N287.7-08 (R2013) [B.4-1] documented that Darlington has become compliant with Clause 6.1.4. Pickering is also compliant with Clause 6.1.4 as "visual inspections of accessible areas inside and outside the containment structure" are performed, thereby meeting the requirements of the clause.

Clause 7.13 addresses the requirement for deformation of the containment structure to be monitored during pressurization and depressurization to ensure the elastic behaviour of the containment structure. Deformation is checked and measurements are taken if present (buckling, misalignment). However, the Pickering positive pressure test plan does not specify measurements for deformation to confirm elastic behaviour of the containment structure. Pickering's periodic inspection plans (NK30-PIP-03643.2-00001 R003 [B.4-19], NA44-PIP-03643.2-00001 R002 [B.4-20], and NA44-PIP-03643.2-00002 R002 [B.4-21]) state:

> *Where movement, deformation, misalignment, abrasion, etc, not meeting criteria described in Tables 1 to 4 [of the PIP], are found on the concrete or steel structures, pertinent dimensional measurements should be taken and recorded.*

The PIPs do not appear to specify requirements for on-going measurements which would facilitate monitoring of deformation during the pressurization cycle to ensure the elastic behaviour of the containment structure. However, Clause 7.13 of CSA N287.7-08 describing deformation monitoring is a non-mandatory requirement as indicated by the use of the word "should" in the requirement. Clause 7.13 refers to Annex F for more information and this is a non-mandatory annex. Furthermore, Annex F has not been imposed as a mandatory requirement, as per license requirements. As such, this clause is not applicable and this is not a gap for PSR2.

The disposition above is based on the DNGS Nuclear Refurbishment Issue Resolution Form for Issue D011 (NK38-REP-00770-0417579 R002 [B.4-22]) which states:

> *Clause 7.13 of CSA-N287.7-08 describing deformation is a non-mandatory requirement as indicated by the use of the word should in the requirement. Clause 7.13 refers to Annex F for more information and this is a non-mandatory annex. Annex F applies to a station with permanent instrumentation installed for evaluating containment deformation, which is not the case at DNGS. Further this Annex F has not been imposed as a mandatory requirement, as per licence requirements. Because clause 7.13 is non-mandatory and because the DNGS design does not include the means to measure containment deformation, this clause is not applicable. No further action is required.*

Following the original code review for the Darlington ISR, a clause-by-clause code refresh against the current revision of the Standard N287.7-08 including Update 1 (R2013) [B.4-1] was conducted in OPG Report NK38-REP-03680-10145 R000 [B.4-23] which stated the following:

There was only one change made in Update 1 2010 (R2013). The revision made was to the resolution of dry bulb temperature (Clause 7.11.2, Table 1). Darlington has demonstrated compliance with this clause in an assessment completed in May 2013. The same assessment identified non-compliance with accuracy and repeatability requirements for dewpoint temperature. Therefore, this is identified as a gap. Actions are being taken to procure new hygrometer probes that will meet the requirements of Clause 7.11.2 Table 1 in CSA N287.7-08 Update 1 2010 (R2013).

The gaps identified in the last code review report have been addressed and the Periodic Inspection Programs (PIPs) updated accordingly. The PIPs and the OPG Nuclear governance must be updated to reference Update 1 2010 (R2013) version of the standard. This can be done upon licence renewal once Update 1 2010 (R2013) is included in the PROL.

The assessment which Darlington used to demonstrate compliance with the dry bulb temperature issue [B.4-23] also addressed Pickering (the assessment states that the current temperature elements used for leakage rate testing meet the required resolution of 0.06°C in CSA N287.7-08 Update 1), and therefore this is not a PSR2 gap. However, the same assessment identified non-compliances for Pickering for the repeatability of the existing pressure transmitters and accuracy of the existing moisture transmitters, as discussed below.

On February 11, 2016 and March 14, 2016, OPG submitted concession requests [B.4-25] [B.4-26] to the CNSC for deviation from Clause 7.11.2, Table 1 requirements of CSA N287.7-08 for the use of existing pressure and moisture transmitters during the 2016 Pickering Unit 4 and Unit 8 containment leak rate tests. The repeatability of the existing station pressure transmitters and accuracy of the existing station moisture transmitters have specifications which differ from the CSA requirements identified in Clause 7.11.2, Table 1 of N287.7-08. The CNSC accepted the above concession requests on February 15, 2016 and April 4, 2016 respectively [B.4-27][B.4-28].

OPG requested a clarification from the CSA committee on the repeatability value in Table 1 of N287.7-08 for future exemptions for the use of the existing pressure transmitters. Based on the CSA response, the CNSC may determine a path forward for the CSA standard and future concession requests by licensees [B.4-29]. An update on the pending response from the CSA could not be found. Until CSA clarification is received and a path forward is directed by the CNSC, CNSC consent will continue to be required in the future to exempt the repeatability requirements in Clause 7.11.2, Table 1 of N287.7-08. Since OPG must also continue to request exemption from the accuracy requirements for the existing moisture transmitters for future containment leak rate tests, compliance with Clause 7.11.2 Table 1 in CSA N287.7-08 has not been addressed for Pickering NGS and is therefore **PSR2 CSA N287.7 Gap #1**. Note that the gap against N287.7-08 (R2013) identified in the code refresh review report [B.4-23] is listed in the Darlington IIP report NK38-REP-03680-10185 R002 [B.4-30] as completed per Darlington IIP gap IIP-OI-065 [B.4-31].

As discussed above, the code refresh review report states that the gap for clause 6.1.4 noted in the NK38-REP-03680-10061-R000 [B.4-14] has been addressed:

> *Periodic Inspection Programs documents for RB, Unit 0 and VB containment structures … have been revised to include provisions for non-destructive testing, invasive testing and analytical methods. These can be found in Sections 5.6.2, 5.6.3 and 5.6.4 in each of the PIPs. Therefore, Darlington is compliant with this clause.*

As discussed above, Pickering is compliant with Clause 6.1.4 as "visual inspections of accessible areas inside and outside the containment structure" are performed, thereby meeting the requirements of the clause.

B.4.2.2 Application of Post-PSR1 Reviews

In September 2009, OPG issued report N-REP-21000-10000 [B.4-32] documenting a clause-by-clause review identifying differences between the 1996 [B.4-6] and 2008 [B.4-3] versions of CSA N287.7, as well as differences between N287.7-08 and existing PIP documents for both Pickering and Darlington concrete containment structures. The following recommendations were made to incorporate changes identified in N287.7-08 into existing PIPs and governance on the administrative program:

> *Revisions to the existing Pickering and Darlington PIPs are required for compliance to CSA N287.7-08.*
>
> *Governance document N-PROC-MA-0066 and the technical specification for the inspection of post-tensioning for the Darlington Vacuum Building will have to be reviewed for compliance with CSA N287.7-08 and updated to comply with CSA N287.7-08.*

As discussed in Section B.4.2.1, the Pickering PROL Renewal Application [B.4-12] states that the Pickering PIPs are currently in compliance with either N287.7-96 [B.4-6] or N287.7-08 [B.4-3]. There are no gaps for Pickering that result from the past Pickering B ISR review of N287.7-96. Further, as discussed earlier, CSA N287.7-08 [B.4-3] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.4-3]. The CNSC has accepted the Pickering 1,4 and Pickering Units 5-8 PIPs with respect to the Compliance Verification Criteria related to N287.7-08 per the Pickering NGS Licence Conditions Handbook [B.4-4], which states:

> *CNSC staff have accepted the Pickering NGS-A and B PIP documents (e-Doc 4452432).*

Therefore, the N-REP-21000-10000 [B.4-32] recommendation to revise "the existing Pickering and Darlington PIPs are required for compliance to CSA N287.7-08" is not a gap for Pickering PSR2.

Compliance against the current version of the standard (N287.7-08 including Update 1 (R2013) [B.4-1]), and its applicability to Pickering, was discussed earlier.

In 2013, the CNSC conducted a Type II Inspection on the implementation of the Pickering Units 5-8 PIPs for N287. 7 [B.4-33]. Two relevant Action Notices (ANs) were raised by the CNSC and subsequently closed [B.4-34] (hence, AN2 and AN4 are not gaps):

1. AN2: ensure PIP documents make reference to the correct and up to date documents and meet the recording requirements of OPG procedures in order to become compliant with N-STD-MA-0021 sub-section 1.2.7 (b) 1.

2. AN4: ensure alignment of record reviewer qualification level with station document requirements in order to become compliant with N-STD-MA-0021 sub-section 1.4.

Also, per NK30-CORR-00531-07118 R000 [B.4-35], OPG initiated a Regulatory Management action to provide the CNSC with the latest Dow Corning 995 material test report in response to AN3 raised in the CNSC Type II Inspection [B.4-34] noted above. AN3 concerns the Dow Corning sealant repair material used in the Unit 6, Embedded Part 12679 repair. The work is currently in progress at the Kinectrics laboratories, and OPG plans to submit this to the CNSC by June 30, 2016 (i.e., the action is still in progress). Therefore, this is identified as **PSR2 CSA N287.7 Gap #2**.

In 2011, the CNSC conducted a Type II Inspection on CSA N287.7 PIPs for Concrete Containment Structure Inspections and Leakage Rate Tests and raised six Action Notices for OPG [B.4-36]. OPG responded to the CNSC that "these items have been reviewed and deemed minor in terms of risk to safety and represent opportunities for improvement" [B.4-37]. Therefore, this is not a gap for Pickering PSR2.

Finally, the Action List from the Pickering Units 5-8 Continued Operations Plan [B.4-38] identifies three actions related to N287.7: Appendix A Actions #31, #32, and #33. IIP Action #31 involved submission of Periodic Inspection Plans and Life Cycle Management Plans for a number of safety-significant civil structures. IIP Action #32 involved submission of Aging Management Plans for concrete containment structures to the CNSC for acceptance. IIP Action #33 involved revising the Reactor Building Periodic Inspection Plan and submitting to the CNSC for acceptance. All three of these actions have been closed; however, they only address fitness for service "to end of mission time" (which will need to be extended for Pickering operation past 2020) or older (non-current) versions of CSA N287.7. Therefore, they will need to be re-addressed for Pickering operation past 2020. This is identified as **PSR2 CSA N287.7 Gap #3**.

B.4.3 Compliance Summary for Pickering PSR2

There are three PSR2 CSA N287.7 gaps which all relate to Safety Factor 4:

1. N287.7-08 clause 7.11.2 Table 1 involving non-compliance with accuracy and repeatability requirements for dewpoint temperature was a gap for Darlington. No evidence can be found that this has been addressed for Pickering NGS. This is therefore a gap for Pickering PSR2.

2. OPG initiated a Regulatory Management action to provide the CNSC with the latest Dow Corning 995 material test report in response to an Action Notice raised in the CNSC Type II Inspection. The work is currently in progress. Therefore, this is a gap for Pickering PSR2.

3. Actions #31, #32, and #33 from the Pickering Units 5-8 Continued Operations Plan are related to N287.7. (IIP Action #31 involved submission of Periodic Inspection Plans and Life Cycle Management Plans for a number of safety-significant civil structures. IIP Action #32 involved submission of Aging Management Plans for concrete containment structures to the CNSC for acceptance. IIP Action #33 involved revising the Reactor Building Periodic Inspection Plan and submitting to the CNSC for acceptance.) All three of these actions have been closed; however, they only address fitness for service "to end of mission time" (which will need to be extended for Pickering operation past 2020) or older (non-current) versions of CSA N287.7. Therefore, the actions will need to be re-addressed for Pickering operation past 2020 and this is a PSR2 gap.

B.5 CNSC RD/GD-210, "Maintenance Programs for Nuclear Power Plants"

B.5.1 Background

The following paraphrased from the Preface of CNSC RD/GD-210 [B.5-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *Effective maintenance is essential for the safe operation of a nuclear power plant. The range of maintenance activities includes monitoring, surveillance, inspection, testing, assessment, calibration, service, overhaul, repair and replacement of parts. The scope of the maintenance program covers all structures, systems or components (SSCs) within the bounds of the nuclear power plant.*
>
> *Regulatory document RD/GD-210 sets out the requirements of the CNSC with regard to maintenance programs for nuclear power plants (NPPs). A nuclear power plant maintenance program consists of policies, processes and procedures that provide direction for maintaining SSCs of the plant.*

RD/GD-210 is relevant to Safety Factor 3 (Equipment Qualification) and Safety Factor 4 (Aging).

Compliance with CNSC Regulatory Standard S-210, "Maintenance Programs for Nuclear Power Plants" [B.5-2] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.2 of the R04 Pickering Licence Conditions Handbook [B.5-3]. The current revision of the document, which supersedes S-210, is RD/GD-210 (November 2012) [B.5-1]. RD/GD-210 reaffirms the existing requirements found in S-210, and adds information and guidance on how these requirements may be met. These guidelines provide additional information licensees may use in developing a Maintenance Program.

The results of PSR1 S-210 and RD/GD-210 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.5.2. As identified in Reference [B.5-4], the Pickering PSR2 review of RD/GD-210 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.5.2 Compliance Assessment for Pickering PSR2

B.5.2.1 Application of PSR1 Reviews

The versions of RD/GD-210 or S-210 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

A review of S-210 was not included as part of the Pickering B ISR. However, as discussed below, the Darlington ISR prepared a clause-by-clause review against the current revision of RD/GD-210, the findings of which are programmatically applicable to Pickering NGS.

Darlington NGS

The Darlington ISR was originally performed against S-210 [B.5-2], comprising a clause-by-clause review documented in OPG Report NK38-REP-03680-10006 R000 [B.5-5]. The Section 4.0 conclusions of NK38-REP-03680-10006 R000 identified one gap:

> *The Clause by Clause Review of the CNSC S-210 document showed that the governing documents adequately addressed most sections of the code. Due to outstanding SCR actions on Time Based preventative maintenance, it was determined that one area is non-compliant and a gap exists for section 5.3.1.*

Appendix B of NK38-REP-03680-10006 R000 lists the ISR gaps that have been reclassified or added and addresses the impact of these changes. In the case of the gap against Section 5.3.1 noted above, it was reclassified as "Compliant" with SCRs related to the gap closed and all actions completed per the supporting rationale and references provided in Appendix B of the report. Thus, the Darlington ISR demonstrated OPG governance and practices are compliant with S-210 [B.5-2].

Following the original code review for the Darlington ISR, a clause-by-clause code refresh review against the current revision of RD/GD-210 (2012) [B.5-1] was conducted and documented in OPG Report NK38-REP-03680-10164 R000 [B.5-6]. NK38-REP-03680-10164 R000 concluded the following regarding compliance with RD/GD-210:

- *The Clause by Clause Review of the CNSC RD/GD-210 (November 2012) document showed that the governing documents adequately addressed all sections of the code.*
- *Documents were found to be current and appropriately posted.*

NK38-REP-03680-10164 R000 also confirmed that SCRs related to the gap from the review of Darlington against CNSC S-210 have been closed and all actions completed.

The clauses in RD/GD-210 are programmatic from the perspective of the specified requirements while recognizing that maintenance programs are specific to each station. Therefore, the Darlington ISR conclusions are applicable to Pickering PSR2.

B.5.2.2 Application of Post-PSR1 Reviews

In 2015, the CNSC conducted a Type II Compliance Inspection on maintenance work execution at Pickering NGS [B.5-7]. The CNSC concluded:

> *Based on the scope of the field inspections conducted February 23-27, 2015, CNSC staff concludes that the licensee met the regulatory requirements of RD/GD-210 that were within the scope of the inspection. It did not however meet requirements of one of its documents that address completing SATM [Space Allocation for Transient Material] permit applications during work package development or work planning process.*

The Action Notice (AN) raised by the CNSC under Action Item 2015-48-6450 does impact OPG's compliance with RD/GD-210 as the AN concerns an OPG compliance with its own governance related to space allocation for transient material:

> *In order for Ontario Power Generation to become compliant with N-INS-09070-10001 R002, CNSC staff request Ontario Power Generation to develop and implement a corrective action plan to ensure that when required, work is performed with a SATM permit.*

Reference [B.5-8] contains OPG's response to the AN, which states that the finding in the AN was previously identified by OPG during an internal Nuclear Audit (NO-2014-017). To address their audit finding, OPG initiated SCR P-2014-30948, "Space Allocation and Transient Material (SATM) non-compliances", and subsequent Corrective Action Plan (CAP) and Assignment Actions (per Action Request # 28174181). OPG's response in Reference [B.5-8] states that this existing CAP addresses the issue in the AN. In Reference [B.5-9] the CNSC staff agreed with OPG's CAP which covers the concern expressed in the AN, but stated that "CNSC staff will wait for the completion of the CAP before closing AN1". Action Request # 28174181 was subsequently completed on February 11, 2016. Therefore, there is no gap for Pickering PSR2. In addition, operation of Pickering NGS past 2020 does not impact compliance with this AN.

Since Pickering A Return to Service [B.5-10] preceded the advent of the Regulatory Standard S-210 [B.5-2], no code review of the Standard was performed in support of the Pickering A Restart. However, the past ISR conclusions are applicable for Pickering NGS as a whole.

B.5.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CNSC RD/GD-210 (2012) [B.5-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-210 (2012).

B.6 CNSC RD/GD-98, "Reliability Programs for Nuclear Power Plants"

B.6.1 Background

The following paraphrased from Section 1, "Introduction", of CNSC Regulatory Document RD/GD-98 (2012) [B.6-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *A reliability program assures that the systems important to safety shall meet their defined design, and performance criteria at acceptable levels of reliability throughout the lifetime of the facility. Regulatory document RD/GD-98 sets out the requirements and guidance of the CNSC for the development and implementation of a reliability program, including reliability assessment, modelling, evaluation, and monitoring.*

RD/GD-98 is applicable to Safety Factor 3 (Equipment Qualification) and Safety Factor 4 (Aging) since CNSC web site [B.6-2] identifies the Regulatory Document as being relevant to the Safety Control Area for "Fitness for Service".

Compliance with RD/GD-98 is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.2 of the R04 Pickering Licence Conditions Handbook [B.6-3]. The current revision of the Regulatory Document is RD/GD-98 (2012) [B.6-1]. RD/GD-98 captures the existing requirements previously found in CNSC Regulatory Standard S-98 (Revision 1), "Reliability Programs for Nuclear Power Plants" [B.6-4]. As per Darlington ISR code refresh review report NK38-REP-03680-10167 R000 [B.6-5], there are no changes to the mandatory requirements of RD/GD-98 (2012) relative to S-98 (Revision 1). The non-mandatory changes made in RD/GD-98 (2012) relative to S-98 (Revision 1) consist of a new section on guidelines. These guidelines provide additional information licensees may use in developing a Reliability Program.

The results of PSR1 S-98 and RD/GD-98 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.6.2. As identified in Reference [B.6-6], the Pickering PSR2 review of RD/GD-98 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.6.2 Compliance Assessment for Pickering PSR2

B.6.2.1 Application of PSR1 Reviews

The versions of RD/GD-98 or S-98 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

<u>Pickering Units 5-8</u>

The Pickering B ISR performed a clause-by-clause review of S-98 (Revision 1) [B.6-4]. The review was documented in report NK30-REP-03680-00005 R000 [B.6-7] and concluded:

> *Recognizing that at a high level S-98 has been established and OPG is currently complying with the standard, there still remain details with respect to methods and guidance that are being further developed. This was noted in Reference [R-44], where further improvements were deemed desirable, but were not considered compliance issues. However, for this reason, both the CNSC and the industry are developing 'guide' type documents that will provide more guidance with respect to acceptable approaches for complying with S-98. It is noted in Reference [R-46], that the COG working group is recommending that further guidance be developed in the following areas…Hence, this review finds that Pickering B is in Direct Compliance with all clauses of S-98.*

Based on the above, there are no PSR2 gaps relating to Pickering B ISR compliance with S-98 (Revision 1) [B.6-4].

<u>Pickering Units 1-4</u>

For Pickering A Return to Service, the active version of the Regulatory Document at the time was as an Atomic Energy Control Board (AECB) Consultative Document, C-98 [B.6-8]. Per NA44-CORR-00531-00381 R000 [B.6-9], OPG did not perform a code review of the Standard on the basis that it "Pertains mostly to Design Support Analysis". However, given the programmatic applicability as discussed under the Darlington review below, a review specifically for Pickering A is not required. Furthermore, the Pickering B ISR conclusions are applicable to all of Pickering NGS.

Section 4.6, "Risk and Reliability Program" of the Pickering PROL Renewal Application [B.6-10] notes that implementation standard N-STD-RA-0033, "Reliability Monitoring and Reporting of Systems Important to Safety" [B.6-11] has been created to provide direction on carrying out reliability program activities at the station consistent with Regulatory Standard S-98, which was the predecessor of RD/GD-98. As stated below for the Darlington ISR, there are no changes to the mandatory requirements of CNSC RD/GD-98 (R2012) relative to S-98 Revision 1. Therefore, OPG Nuclear governance remains compliant with CNSC RD/GD-98 (R2012) and N-STD-RA-0033 is consistent with RD/GD-98.

Furthermore, the Pickering Licence Conditions Handbook [B.6-3] notes OPG's required compliance with RD/GD-98 and the CNSC's associated yearly review of the Pickering annual reliability reports [B.6-12] [B.6-13]:

> *CNSC Regulatory Document RD/GD-98, "Reliability Programs for Nuclear Power Plants", has recently been issued and replaces S-98 in the regulatory framework. Requirements set out in the newly issued document remain unchanged from those established in S-98.*
>
> *OPG's key governing documents for the reliability program are listed in the written notification table below. OPG has developed the lists of systems important to safety for both Pickering NGS-A and Pickering NGS-B as required by RD/GD-98 (using a methodology developed by COG). The systems important to safety, along with their unavailability target, are documented in NA44-REP-03611-00004 "Pickering A Systems Important to Safety" and NK30-REP-03611-00024 "Pickering B Systems Important to Safety", respectively.*
>
> *CNSC staff will review the annual report on risk and reliability required by REGDOC 3.1.1 to ensure the performance of systems important to safety meet their reliability requirements. See section 4.3 for version control of REGDOC 3.1.1.*

Darlington NGS

The Darlington ISR was originally performed using S-98 (Revision 1) [B.6-4], comprising a clause-by-clause review documented in OPG Report NK38-REP-03680-10005 R000 [B.6-14]. Section 4.0, "Conclusions of Darlington ISR code review report", identified three gaps:

> *… three gaps in Darlington's reliability program activities. It should be noted that these gaps are not directly related to plant design; they are related to reporting and performance characterization. Two of these gaps are the result of differences between the technical methodology specified in the OPG Governance and the requirements of the CNSC standard, while the third gap is a failure in a specific instance of practice to adhere to the requirements of the OPG procedures.*

Appendix B of NK38-REP-03680-10005 R000 lists the ISR gaps that were reclassified or added and addresses the impact of these changes on the code review report. In the case of the three gaps noted above, all three were reclassified as "Compliant" with supporting rationale and references. Thus, the Darlington ISR demonstrated OPG governance and practices were compliant with S-98 (Revision 1) [B.6-4].

Following the original code review for the Darlington ISR, a clause-by-clause code refresh review against the current revision of RD/GD-98 (2012) [B.6-1] was conducted and documented in OPG Report NK38-REP-03680-10167 R000 [B.6-5]. NK38-REP-03680-10167 R000 concluded that OPG is compliant with RD/GD-98 (2012):

> *There are no changes to the mandatory requirements of CNSC RD/GD-98 (R2012) relative to S-98 Revision 01-2005. Therefore, OPG Nuclear governance remains compliant with CNSC RD/GD-98 (R2012).*

The clauses in RD/GD-98 (2012) are programmatic from the perspective of the specified requirements while recognizing that reliability monitoring and reporting documented in Annual Reliability Reports (e.g., [B.6-12], [B.6-13], [B.6-15]) are specific to each station. Therefore, the Darlington ISR conclusions are applicable to Pickering NGS and no PSR2 gaps result from the Darlington ISR reviews.

B.6.2.2 Application of Post-PSR1 Reviews

In 2014, the CNSC conducted a Type II Compliance Inspection of the reliability program at Pickering NGS [B.6-16]. One relevant Action Notice (AN) was raised by the CNSC under Action Item 2015-48-5864 to ensure that all component failures were identified. OPG responded [B.6-17] to the CNSC that OPG procedures already exist at Pickering that address the AN, that is P-INS-03611-00001 R000, "Pickering Reliability Instruction" [B.6-18], and P-GUID-03611-00004 R000, "Fault Data Monitoring and Recording" [B.6-19] (which is a supporting guide to P-INS-03611-00001). OPG's response to the CNSC concluded [B.6-17]:

> *With respect to the monitoring of the performance of components, OPG procedures P-INS-03611-00001 and P-GUID-03611-00004 are in alignment with Section 3.6.3.2 of Regulatory Document RD/GD-98, "Reliability Programs for Nuclear Power Plants" which states:*
>
> *"The performance or condition of all components of SIS should be monitored. This monitoring of component reliability should include: ... Assessment and recording of every failure of a component that could affect the reliability of the whole system to which it belongs, as soon as practicable after the failure has been discovered."*
>
> *In summary, OPG complies with OPG procedures with respect to the identification and recording of component failures for the Systems Important to Safety. Therefore, OPG has determined that no corrective action plan is required.*

Based on the above, OPG requested closure of the Action Item 2015-48-5864, which the CNSC accepted per P-CORR-00531-04615 R000 [B.6-20]:

Canadian Nuclear Safety Commission (CNSC) staff have completed their review of Ontario Power Generation (OPG) Inc.'s response [1] to CNSC Action Item 2015-48-5864 and find it satisfactory. Action Item 2015-48-5864 is therefore closed."

Pickering operation past 2020 does not impact the above mentioned compliance with RD/GD-98.

B.6.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CNSC RD/GD-98 (2012) [B.6-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with RD/GD-98 (2012).

B.7 CNSC REGDOC-2.6.3, "Aging Management"

B.7.1 Background

The following provides a brief overview of the purpose of CNSC REGDOC-2.6.3, "Aging Management" [B.7-1] and the requirements expressed therein:

> *REGDOC-2.6.3 sets out requirements and guidance for the appropriate and proactive management of aging throughout the different phases of a power reactor facility's lifecycle. This document provides a framework within which codes and standards can be applied so that physical aging and obsolescence of structures, systems and components important to safety are effectively managed.*

REGDOC-2.6.3 replaces RD-334, "Aging Management for Nuclear Power Plants" [B.7-2], which was published in June 2011. As per CNSC news release "CNSC publishes REGDOC-2.6.3, Aging Management" [B.7-3]:

> *REGDOC-2.6.3 does not contain new regulatory requirements. Some requirements in RD-334 have transitioned to guidance as appropriate. New guidance has been added to supplement the requirements, including some information related to lessons learned from Fukushima, providing licensees and applicants with information on how the requirements may be met.*

All of REGDOC-2.6.3 is directly relevant to Safety Factor 4 (Aging). A number of clauses in REGDOC-2.6.3 also require consideration of aging effects in the specifications for equipment qualification which are applicable to Safety Factor 3 (Equipment Qualification).

Although compliance with REGDOC-2.6.3 is not currently a licence requirement for Pickering NGS, compliance with RD-334 is as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.7-4]. In the 2014 Regulatory Oversight Report for Canadian Nuclear Power Plants [B.7-5] the CNSC state:

> *All operating NPPs are reviewing and updating their processes and programs in accordance with the updated regulatory document [REGDOC-2.6.3]. All operating NPPs have component-specific aging management programs, also known as lifecycle management programs, for the major primary heat transport components of their CANDU reactors (feeders, pressure tubes and steam generators) and for concrete containment structures and BOP safety-related civil structures. CNSC staff conducted onsite inspections in accordance with the compliance verification program to confirm the licensees' implementation of their aging management programs.*

The results of PSR1 RD-334 and REGDOC-2.6.3 reviews performed since PSR1 have been assessed for applicability to PSR2 in Section B.7.2 below. As identified in Reference [B.7-6], the

Pickering PSR2 review of REGDOC-2.6.3 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.7.2 Compliance Assessment for Pickering PSR2

B.7.2.1 Application of PSR1 Reviews

Neither CNSC RD-334 nor REGDOC-2.6.3 were reviewed as part of the Darlington or Pickering B ISRs, or as part of Pickering A Return to Service. However, as discussed under Section B.7.2.2 below, a review of RD-334 has been performed since PSR1 which is applicable to both Darlington and Pickering (due to the programmatic nature of the requirements) as well as REGDOC-2.6.3 (since requirements have not changed from RD-334 to REGDOC-2.6.3).

B.7.2.2 Application of Post-PSR1 Reviews

In order to facilitate the implementation of RD-334 at OPG, the Engineering Programs Integration department performed a gap assessment between the RD-334 and OPG Nuclear Integrated Aging Management (IAM) governance in 2012. The methodology and the results of the gap assessment are documented in N-REP-01060-10012 R000 [B.7-7], with Table 1 of the document providing the RD-334 gap assessment results in the format of a clause-by-clause review. The gap assessment found that OPG Nuclear IAM governance is aligned with the aging management requirements of RD-334 given that both documents were written based on the IAEA Safety Guide NS-G-2.12 "Aging Management for Nuclear Power Plants" [B.7-8]. IAM governance and its interfacing programs were found to cover all requirements of RD-334 except the following:

- Extended Shutdown: The requirements for "Extended Shutdown" (i.e., reactor shutdown lasting for a period exceeding one year, excluding shutdowns for regular maintenance outages) are provided in the RD-334. At the time of the gap assessment, IAM governance did not specify requirements for extended shutdowns. Document Change Request (DCR) 116405 was placed against N-PROG-MP-0008, "Integrated Aging Management", and N-PROC-MP-0060, "Aging Management Process", to incorporate the required changes. Both documents have since been updated accordingly and this gap is therefore closed.

- Decommissioning: Although a corporate level decommissioning charter was in place and a fleet wide decommissioning governance has since been developed, OPG IAM governance did not address Decommissioning at the time of the gap assessment. Decommissioning is now planned and executed as a part of the OPG corporate level governance using W-PROG-WM-0003, "Decommissioning Program". Further, IAM governance now recognize decommissioning program level documents and list them in the N-PROG-MP-0008 interfacing programs. Therefore, this gap is now closed.

- Mutual link to Design Management: RD-334 prescribes design-related requirements: N-PROG-MP-0009, "Design Management" was in compliance with the RD-334 design related requirements by being in compliance with the current codes and standards. However, the terms aging management, aging, and degradation mechanisms were not explicitly mentioned in the N-PROG-MP-0009 or other implementing Design Management documents. DCR 116024 was put in place to address the Design Management program interface with the IAM program, and to readily demonstrate the mutual link between both programs. N-PROG-MP-0009 has since been updated accordingly and this gap is therefore closed.

Per N-REP-01060-10012 R000 [B.7-7], the Major Component Engineering department also reviewed RD-334 requirements versus the Major Components governance, i.e., N-PROG-MA-0025, "Major Components", N-PROC-MA-0100, "Major Components Life Cycle Management Plan", and the supporting Technical Basis documents. The review did not identify any additional gaps. Based on the above, there are no outstanding gaps related to compliance with RD-334 based on the findings of Reference [B.7-7].

Reference [B.7-9] summarizes the findings of a CNSC inspection carried out on the IAM program at Pickering NGS from July 20 to 24, 2015. OPG's response to each finding is provided in Reference [B.7-10] as summarized below:

- Finding #1: "OPG is not compliant with Power Reactor Operating Licence 48.01/2018 Licence Condition 7.1 because the governance N-PROG-MP-0008 Integrated Aging Management Program does not refer to the current regulatory requirement, RD-334 Aging Management, identified in the Licence and Licence Conditions Handbook." OPG has since revised N-PROG-MP-0008 Section 1.3.3 and N-PROC-MP-0060 Section 1.0 which now include the reference to RD-334. Therefore, this gap is now closed.

- Finding #2: "OPG is not compliant with RD-334 Section 4.7 (REGDOC-2.6.3 Section 4.7) because their governance N-PROG-MP-0008 Integrated Aging Management does not refer to a specific program for management of technological obsolescence." OPG has since revised N-PROG-MP-0008 Section 1.6.10 and N-PROC-MP-0060 Section 4.3.1 which now include the reference to N-STD-MA-0024," Obsolescence Management" for the management of technological obsolescence. Therefore, this gap is now closed.

- Finding #3: "OPG is not compliant with RD-334 Section 3.5 (REGDOC-2.6.3 Section 3.5) because the governance N-PROG-MP-0008 Integrated Aging Management does not address decommissioning." As discussed earlier, OPG has revised N-PROG-MP-0008, Section 1.3.4 which now covers decommissioning and extended shutdowns. Therefore, this gap is now closed.

- Finding #4: "OPG is not compliant with RD-334 Section 4.6 (REGDOC-2.6.3 Section 4.6) because the governance N-PROG-MP-0008 does not specifically address the nine attributes for effective aging management." OPG stated they believe that the nine attributes for effective aging are addressed through the combination of the OPG programs and processes, such as Condition Assessments, Station Condition Records and corrective action programs, Self-Assessments, System Health Reports / Component Health Reports and inspection, testing, monitoring and maintenance programs and strategies. However, Reference [B.7-10] states that OPG is in the process of initiating a formal review and documenting the relationship between the nine attributes for effective aging management and the existing OPG aging management programs and processes. Per Reference [B.7-11], the action is now complete and no further updates are planned. Therefore, there is no gap for PSR2. (Note: There is no Finding #5 specified in Reference [B.7-10].)

- Finding #6: "OPG is not compliant with N-PROC-MP-0060 Aging Management Process, Section 1.7 for not reviewing and updating the Component Condition Assessments (CCAs)[5]: within the review cycle of the component, and when new information or feedback from the program was received." OPG has reviewed the extent of condition of not reviewing and revising the CAs within the review cycle and found that 432 CAs were overdue for revision. OPG has since revised these CAs, which are now valid until 2020. Further, OPG is updating CAs to address potential operation past 2020 as part of Pickering PSR2. OPG has stated they will develop an implementation plan to prevent reoccurrence of: a) not reviewing and revising the CAs within the review cycle, and b) not updating the CAs when pertinent new information becomes available. OPG stated they will provide an update and a target implementation date on this action to the CNSC by October 30, 2016. Therefore, this is an open gap (**PSR2 CNSC REGDOC-2.6.3 Gap #1**).

- Finding #7: "OPG is not compliant with N-PROC-MA-0077, "Critical Equipment Identification and Categorization", Section 1.2 because the Reactor Safety (RS) category code and rationale for critical components was not always accurate or consistently applied in the CCAs." OPG has stated that they have since completed a review and update of the RS category code and rationale for a portion of the

---

[5] The terminology currently used is Condition Assessment (CA) instead of Component Condition Assessment (CCA).

components to become fully compliant with N-PROC-MA0077, "Critical Equipment Identification and Categorization". All components previously coded as RS1, RS2 or RS3 have been updated with the correct RS code. Components coded as RS4 or N/A have been updated with the correct RS code. Any components that were ranked RS1 per the Fussell-Vesely or Risk Achievement Work criteria were also updated for Pickering Units 1,4 and 5-8. Further, to ensure that RS codes remain accurate the normal update process will be used after any future revisions of Probabilistic Safety Assessments, Operational Safety Requirements or N-PROC-MA-0077. This will ensure that RS codes remain accurate and consistent. OPG has stated that a review of the CAs will be conducted to ensure consistency with the revised RS codes and an update will be provided to the CNSC by October 30, 2016. Therefore, this is an open gap (**PSR2 CNSC REGDOC-2.6.3 Gap #2**).

- Finding #8: "OPG is not compliant with N-INS-01071-10000 System Health Reporting for not ensuring AM [Aging Management] actions identified in the HX [Heat Exchanger] Component Health Reports (CHRs) dashboard were captured in the PHTS [Primary Heat Transport System] System Health Reports (SHR)." OPG performed a self-assessment (P15-000853) and found that the majority of SHRs are in compliance with the requirements specified in Section 1.9.1 of N-INS-01 07110000, "System Health Reporting" and actions are addressed in the Aging Management section of SHRs. However, there were found to be instances when the SHR does not show AM related actions from CHRs. Station Condition Record SCR-P-2015-11922 was initiated to document the findings and the two recommendations identified to address the findings from this self-assessment. As identified in the recommendations, OPG has completed a roll out of a briefing card regarding the expectations that CHRs Aging Management related information is to be included in SHRs and DCR #0000131304 has been approved to enhance N-INS-01071-10000 to include relevant information from Condition Assessments on Aging Management related actions in the SHRs. This action is complete and no further updates are planned. Therefore, this gap is now closed.

With respect to demonstrating compliance specifically with REGDOC-2.6.3, this was first addressed in 2014 per NK38-REP-09701-0523075 [B.7-12] where "Appendix C Terms of Reference - Aging Management Program Integration with Reliability Program", which states:

Two phases are proposed to integrate aging management into the ongoing plant operation, these are:

Phase I Assessment

a. Conduct a gap analysis for the requirements of Draft REGDOC-2.6.3 against the maintenance, engineering components, and system health and reliability programs.

b. *Review the gaps against OPG benchmarking results performed in 2010 and the GALL report to ensure that there is a comprehensive list of gaps.*

c. *Perform a cost evaluation between enhancing the existing programs to close the gaps versus maintaining the Component Condition Assessments as a means of meeting REGDOC-2.6.3. Alternately, consider changes to CCAs based on the gap closure analysis.*

d. *Recommend a path forward based on the business case study*

Phase II Implementation

Implement recommendations from phase I

Stakeholders identified at the time were from Refurbishment Engineering, Darlington and Pickering NGS. The team was "lead by Engineering Program Integration with members from Refurbishment Engineering, Darlington Aging Management and Pickering Engineering". The outcome of the Stakeholder review team assessment was an "Approved Implementation Plan and schedule for implementation" for REGDOC-2.6.3 which is discussed in Reference [B.7-13]. Attachment 1 of [B.7-13] provides details of all the required steps of the Implementation Plan and associated milestones, namely:

- Conducting a detailed gap analysis between REGDOC-2.6.3 and OPG governance, documents, practices, and procedures.
- Preparing a White Paper summary for the affected governance, procedures, documents and practices.
- Conducting process mapping exercise with stakeholders to identify process gaps with future governance structure per white paper summary.
- Validating process maps with stakeholders and draft Change Management Plan.
- Ensuring review and acceptance of the Change Management Plan by stakeholders, i.e., Program and Process owners.
- Revising affected governance to begin implementation of the Change Management Plan.

OPG stated in [B.7-13] that the target completion date for the REGDOC-2.6.3 implementation plan is July 15, 2017. A Regulatory Management Action Request (REGM) has been entered to track this item. After implementation, [B.7-13] states that an annual effectiveness review will be performed for two consecutive years on the revised processes and procedures to ensure they execute as intended, and are sustaining. A REGM has also been entered to track these items with a final completion date of December 3, 2019.

Since [B.7-3] states that REGDOC-2.6.3 does not contain any new regulatory requirements in comparison to RD-334 (some requirements in RD-334 have transitioned to guidance as appropriate, and new guidance has been added to supplement the requirements), there are not expected to be any additional safety significant findings that will result from the above mentioned detailed gap assessment of REGDOC-2.6.3 that were not already identified above during past gap assessments and CNSC inspections of RD-334 compliance.

B.7.3 Compliance Summary for Pickering PSR2

Reference [B.7-9] summarizes the findings of a CNSC inspection carried out on the IAM program at Pickering NGS from July 20 to 24, 2015. OPG has two remaining Gaps to close as a result of the CNSC inspection that are applicable to Pickering PSR2 [B.7-10]. Both of these gaps relate to Safety Factor 4:

1. OPG is not compliant with N-PROC-MP-0060 Aging Management Process, Section 1.7 for "not reviewing and updating the Component Condition Assessments[6] within the review cycle of the component, and when new information or feedback from the program was received." OPG has since revised these CAs, which are now valid until 2020. OPG has stated they will develop an implementation plan to prevent reoccurrence of: a) not reviewing and revising the CAs within the review cycle, and b) not updating the CAs when pertinent new information becomes available. OPG stated they will provide an update and a target implementation date on this action to the CNSC by October 30, 2016. This is a gap for Pickering PSR2.

2. OPG is not compliant with N-PROC-MA-0077, "Critical Equipment Identification and Categorization", Section 1.2 because "the Reactor Safety (RS) category code and rationale for critical components was not always accurate or consistently applied in the CCAs." OPG has stated they have since completed a review and update of the RS category code and rationale for a portion of the components to become fully compliant with N-PROC-MA-0077. However, OPG has stated that a review of the CAs will be conducted to ensure consistency with the revised Reactor Safety codes and that an update will be provided to the CNSC by October 30, 2016. This is a gap for Pickering PSR2.

B.8 CSA N287.2-08, "Material Requirements for Concrete Containment Structures for CANDU Nuclear Power Plants"

B.8.1 Background

The following paraphrased from the Preface of CSA N287.2-08 (R2013) [B.8-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *The N287 standards were initiated in response to the recognition by the utilities and industries concerned with nuclear structures in Canada of a need for consistent standards for the design, construction, and testing of concrete containment structures for CANDU nuclear power plants.*
>
> *CSA N287.2 provides the requirements for materials used in concrete containment structures of containment systems designed as class containment components, parts, and appurtenances in CANDU nuclear power plants. Together with the other CSA N287 Standards, it provides the requirements for concrete containment structures for CANDU nuclear power plants.*

All of N287.2-08 is directly relevant to Safety Factor 2 (Actual Condition of SSCs), and potentially applicable to Safety Factor 3 (Equipment Qualification) and Safety Factor 4 (Aging) since CNSC web site [B.8-2] lists the Standard as being relevant to the Safety Control Areas on "Fitness for Service" and "Physical Design". On this basis, N287.2-08 is deemed applicable to Safety Factors 1, 2, 3 and 4.

CSA N287.2 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.8-3] as "Guidance and Criteria". The current revision of the Standard is N287.2-08 (R2013) [B.8-1]. This is the fifth edition of CSA N287.2 which supersedes the previous editions, published in 1991, 1982, 1977, and 1976. Changes since the last version of the Standard in 1991 have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements. An Impact Statement was not prepared by the CSA for N287.2-08.

The results of PSR1 N287.2 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.8.2 below. As identified in Reference [B.8-4], the Pickering PSR2 review of CSA N287.2-08 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.8.2 Compliance Assessment for Pickering PSR2

B.8.2.1 Application of PSR1 Reviews

The versions of N287.2 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering

Pickering Units 5-8

OPG Report NK30-REP-03680-00001 R000 [B.8-5] documents a clause-by-clause review against CSA N287.2-M91 (R2003) [B.8-6]. The findings of the review were:

> *The compliance evaluation of the CSA N287.2-M91 Standard has determined that it does not introduce any new requirements that impact the design basis of the CCSs [Concrete Containment Structures].*
>
> *Reviewing the various material standards referenced in CSA N287.2 to identify and assess changes introduced since the PNGS B CCSs were design and built is not considered worthwhile.*

The context for these findings is that Pickering NGS B was designed to National Building Code 1970 requirements, and though N287.2-M91 (R2003) [B.8-6] introduced new requirements none impact the design basis of the Concrete Containment Structures. For the 18 N287.2-M91 clauses that make reference to additional material standards as listed below, NK30-REP-03680-00001 R000 recommended that the new material standards be categorized as Acceptable Deviations (ADs) (by crediting in-service inspections and the aging management program during life extension with the ability to detect and monitor any safety significant aging mechanism and to provide assurance of continued fitness for service of the Concrete Containment Structures):

> *a) 4.1 General Requirements (Concrete Materials).*
>
> *b) 4.2 Materials for Concrete.*
>
> *c) 4.2.3.1 General Aggregates.*
>
> *d) 4.2.3.2 High Density Aggregates.*
>
> *e) 4.2.4 Admixtures.*
>
> *f) 4.2.5.1 Supplementary Cementing Materials.*

g) 4.3.1 Cement.

h) 4.3.3 Aggregates.

i) 5.1 General, Non prestressed Reinforcements.

j) 5.6.1 Rebar Weld Splicing.

k) 7.1.1 Nonmetallic Liner Systems.

l) 7.2 Compatibility of Nonmetallic Liner Systems.

m) 8.1.1 General, Studs & Metallic Embedded Parts.

n) 8.1.2 Anchorage Systems.

o) 8.2 Material Selection (metallic).

p) 9.1 Welding Materials.

q) 10.1.1 Organic Materials.

r) 11.1 General, Anchorage Systems.

As a result, NK30-REP-03680-00001 R000 [B.8-5] made the following recommendations:

> *It is recommended that an assessment of the N287.7 Periodic Inspection Program for Concrete Components and the NPC system In-service Inspection and Test program be carried out to determine whether they provide adequate assurance of continued fitness for service of the CCSs.*
>
> *It is not recommended that OPG carry out a review of the material standards referenced in CSA N287.2 to identify and assess changes introduced since the PNGS B CCSs were designed and built. There appears to be little of value to be gained from performing such a review.*

The Pickering B ISR actions were incorporated into the Pickering B IIP (see Appendix A of the Pickering Units 5-8 Continued Operation Plan NK30-PLAN-00531-00001 R005 [B.8-7]). IIP Action #31 resulted in submission of PIPs and Life Cycle Management Plans (LCMPs) for the safety-significant civil structures that are under the scope of N291-08, but not covered by N287.7. IIP Action #32 resulted in submission of Aging Management plans for the CCSs to the CNSC for review. Although both actions are complete, they will need to be considered in the context of Pickering operation past 2020 and are therefore identified as gaps for Pickering PSR2. However, these gaps are already identified under the review for CSA N287.7-08 in Section B.4 of this Report and are therefore are not addressed further here.

Pickering Units 1,4

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N287.2-M91 (R1998) [B.8-8]. Per NA44-CORR-00531-00381 R000 [B.8-9], OPG identified N287.2-M91 as a code to be reviewed on the basis that it has "Direct and Immediate Effect on Installed Design Features". The code review was documented in OPG Report 44RS-00531-ASD-001-Revision 4 [B.8-10] and the findings were similar to those for Pickering B discussed above:

> *Based on the present study and the evaluation of documents, it is concluded that the design of Pickering 'A' containment structure meets the intent of the current CSA standards. As the design was done years ago utilizing NBC 1965, it is not possible to meet every aspect of newly developed codes. However after a review of the requirements in old and new codes and project specific documents it can be concluded that the changes and additions that have occurred in new codes do not have impact on the performance of the containment structure, namely the pressure retaining capability and leak tightness.*

Based on above, there are no PSR2 gaps which result from past Pickering N287.2 reviews.

Darlington NGS

The Darlington ISR was performed using version N287.2-08 [B.8-11] (equivalent to the latest version N287.2-08 [B.8-1], which was simply reaffirmed in 2013) and documented in report NK38-REP-03680-10035 R000 [B.8-12]. NK38-REP-03680-10035 R000 notes that this version of the Standard underwent a clause-by-clause (non-PROL) intent review.

The conclusions of the Darlington ISR code review of N287.2-08 were:

> *Based on the results of the review of the Darlington NGS concrete containment structures against CSA Standard N287.2-08, it is concluded that the Darlington NGS concrete containment structures are compliant, except for the gaps identified in Appendix C.*
>
> *The identified gaps are related to new requirements for seismic qualification tests, static tensile tests and static shear tests for mass produced embedded anchors and repair materials for concrete and grout.*

The clauses in N287.2-08 (R2013) are programmatic from the perspective of the specified requirements, while recognizing that design programs are specific to each station. Therefore, the programmatic Darlington ISR conclusions are applicable to Pickering PSR2 as discussed below.

The gaps arising from the Darlington ISR are related to new code requirements for seismic qualification tests, static tensile tests and static shear tests for mass produced embedded anchors and repair materials for concrete and grout. A number of the gaps identified for clauses of N287.2-08 were closed in either Appendix B of NK38-REP-03680-10035 R000 [B.8-12] (i.e., clause 5.4) or OPG Report NK38-REP-03680-10035-ADD-001 R000 [B.8-13] (e.g., clauses 12.2.3 to 12.2.6, inclusive), which documents the CNSC staff comments and OPG responses related to NK38-REP-03680-10035 R000. The unclosed gaps (e.g., clauses 12.3.2.1 to 12.3.2.4, inclusive) are part of Darlington ISR Issue #D014, as recorded in the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.8-14]. Issue #D014 was assessed to be an Acceptable Deviation (AD) for Darlington [B.8-14] based on the following logic:

> *DNGS Concrete Containment Structures were designed and constructed in accordance with the CAN/CSA-N287 Standards of the day, and although the gaps indicate that they did not include the prescriptive specifications for, and testing of, the materials used in concrete anchors according to CAN/CSAN287.2-08 and CAN/CSA-N287.3-93, the anchor manufacturers did meet testing requirements at that time. The Periodic Inspection of the concrete structures and routine leakage tests of the containment envelope verify that there is no significant deterioration in the integrity of the Concrete Containment Structures. No further action required.*

The above AD rationale also applies to Pickering NGS. The Darlington AD compliance statement for Issue #D014 points to Darlington-specific documentation (NK38-CORR-00531-14185, "Darlington NGS - Qualified Concrete Expansion Anchors" [B.8-15]) for evidence that post-installed mechanical anchors qualified for use at OPG are compliant to the revised CSA N287.2-08 testing requirements. N-GUID-20000-10000 R001, "Guide for Design of Post Installed Anchors for Safety Related, Seismically Qualified Systems and Components" [B.8-16], which is applicable to Pickering NGS, states:

> *Post-installed anchors do not have predictable pullout capacities, and are therefore required to be tested for reliability and simulated seismic events. Anchors not meeting the material and test requirements of CSA N287.2 are not qualified and should not be used in safety related systems, structures or components (located inside or outside containment). New anchors should be qualified by analysis and design as per current standards.*

There is therefore no gap for Pickering PSR2.

B.8.2.2 Application of Post-PSR1 Reviews

No post-PSR1 reviews were performed as the latest version was assessed for the Darlington ISR (which is programmatically applicable to Pickering NGS).

B.8.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CSA N287.2-08 (R2013) [B.8-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N287.2-08 (R2013).

B.9 CSA N289.1-08, "General Requirements for Seismic Design and Qualification of CANDU Nuclear Power Plants"

B.9.1 Background

The following, paraphrased from the Preface of CSA N289.1-08 (R2013) including Update 1 [B.9-1], provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *The CSA N289 series specifies means for the seismic qualification of those nuclear power plant structures, systems, and components necessary for safe shutdown, fuel cooling, the containment of potential releases of radioactive material, and the monitoring and control of essential safety-related functions in the event of an earthquake.*
>
> *CSA N289.1 has been restructured to act as an introduction to the CSA N289 series and to supplement the Standards in this series with current seismic qualification concepts and methodologies. The standard sets forth the general requirements for seismic design and qualification of CANDU nuclear power plants.*

All of N289.1-08 is directly relevant to Safety Factor 1 (Plant Design) since CNSC web site [B.9-2] identifies the Standard as being relevant to the Safety Control Area on "Physical Design". This Standard also addresses seismic qualification of SSCs and is therefore related to Safety Factor 3 (Equipment Qualification).

CSA N289.1 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.9-3] as "Guidance and Criteria". The current revision of the Standard is N289.1-08 (R2013) including Update 1 [B.9-1]. It supersedes the previous edition, published in 1980. Changes since the last version of the Standard in 1980 have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements.

The CSA N289.1-08 Impact Statement for N289.1-08 (R2013) including Update 1 [B.9-4] provides a "Summary of significant changes from the previous edition" which identifies several changes to the Standard as described in Section B.9.2 below. The results of PSR1 N289.1 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.9.2.

As identified in [B.9-5], the Pickering PSR2 review of CSA N289.1-08 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.9.2 Compliance Assessment for Pickering PSR2

The versions of N289.1 subject to previous reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

B.9.2.1 Application of PSR1 Reviews

Pickering NGS

Pickering Units 5-8

OPG Reports NK30-REP-03680-00001 R000 [B.9-6] and NK30-REP-03680-00005 R000 [B.9-7] document code reviews of CSA version N289.1-80 (R2008) [B.9-8] for the Plant Design and Safety Analysis Safety Factors, respectively. The review documented in NK30-REP-03680-00001 R000 [B.9-6] is a clause-by-clause review that used the following approach:

> *Station specific documents that identify seismic requirements for Safe Operating Envelope (SOE) system designs were used to perform the assessment. It was decided to include the safety report and the design requirements documents listed, because these documents provide more detail and were prepared much more recently than the design guide.*

The findings and conclusions of the review were [B.9-6]:

> *The documents … that describe the seismic requirements for the design of the Pickering B SOE systems were evaluated against the Standard CAN3-N289.1-80 and were found to comply with all the design requirements specified therein. On the assumption that the documents referenced accurately describe the seismic designs of the relevant systems in the plant, it is concluded that these systems are compliant with the Standard.*

The review documented in NK30-REP-03680-00005 R000 [B.9-7] assessed N289.1-80 (R2008) against the three Safety Factors related to the Safety Analysis subject area (i.e., Deterministic Safety Analysis, Probabilistic Safety Analysis, and Hazard Analysis):

- *The extent to which the plant conforms to modern high-level safety goals and requirements,*

- *The extent to which the licensing basis remains valid in terms of meeting the current regulatory requirements,*

- *The effectiveness of the arrangements that are in place to maintain plant safety for long-term operation.*

The findings and conclusions of the review were [B.9-7]:

> *This standard requires that the plant be designed and constructed to ensure that the effects of an earthquake do not result in unacceptable radiation exposure to the public. In terms of Safety Analysis, this standard has limited applicability. However, per Clause 4.1, it is ultimately the seismic success path that specifies the credited Systems, Structures and Components (SSCs) for a seismic event and the level of qualification required.*
>
> *Once the success path is established, the level of qualification for SSCs credited with mitigating consequence of a Design Basis Earthquake (DBE) or the Site Design Earthquake (SDE) is identified (the SDE being specific to the post-LOCA [Loss of Coolant Accident] mission).*
>
> *These credits are further subdivided into functional requirements for a seismic event to perform:*
>
> - *During an earthquake,*
> - *During or after an earthquake, and*
> - *After an earthquake.*
>
> *The above requirements have all been adopted in the Pickering B Seismic Design Guide for seismic qualification as DBE(a) and DBE(b).*
>
> *Clause 1.2 of the standard identifies that any SSCs that are not seismically qualified must be built to at least the requirements of the National Building Code (NBC).*

Based on the above, no PSR2 gaps are identified based on the Pickering B ISR assessments.

<u>Pickering Units 1,4</u>

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N289.1-80 (R1998) [B.9-9]. Per NA44-CORR-00531-00381 R000 [B.9-10], "Pickering A was not reviewed against CSA CAN3-N289.1-80, because completion of the Seismic Margin Assessment makes such a review unnecessary." As noted in the Pickering PROL Renewal Application [B.9-11], for Pickering A the common containment structures were designed to exceed the National Building Code 1965 seismic design provisions and were subsequently confirmed analytically to meet seismic design requirements. No PSR2 gaps are identified based on the Pickering A Return to Service assessments.

Darlington NGS

The clauses in N289.1-08 are primarily programmatic from the perspective of the specified requirements, while recognizing that Seismic Qualified Equipment Lists are specific to each station. Therefore, the Darlington ISR conclusions are primarily applicable to Pickering PSR2 as discussed below.

The Darlington ISR was performed using two different versions of N289.1:

1) The first review used version N289.1-80 (R2008) [B.9-8] and is documented in OPG Report NK38-REP-03680-10039 R000 [B.9-12] which notes that this version of the Standard underwent a clause-by-clause (non-PROL) intent review. The review found there were no material differences between the version re-affirmed in 2008 and the previous version from 1980.

   The conclusions of the Darlington ISR code review of N289.1-80 (R2008) were [B.9-12]:

   > *In this safety review, six clauses are considered as blank as they do not have any requirements for compliance. The rest of the clauses, except one, are found to be either directly compliant or at least meet the intent of the respective clauses of the given Standard [6]. Details of the review are presented in Appendix C of this report.*
   >
   > *This review identified one gap with regard to Clause 5.1. This clause is concerned with the responsibilities of the Owner of the nuclear power plant with regard to compliance with the CAN CSA N289 series of seismic codes.*

   The gap identified for Clause 5.1 of N289.1-80 (R2008) was closed in Appendix B of the code review report [B.9-12] for N289.1-80 (R2008) (December 1980). However, OPG Report NK38-REP-03680-10039-ADD-01 R000 [B.9-13], which documents the CNSC staff comments and OPG responses related to the N289.1-80 (R2008) code review report [B.9-12], introduced new gaps on some clauses that were previously identified as compliant. The affected clauses were 4.1, 4.1(b), 5.2.53, 5.3.10, and 6.1, to which gaps were assigned due to a lack of a consolidated Seismic Qualified Equipment List:

   > *ISR Gaps will be raised against relevant clauses to assess the adequacy of existing list(s) and to assess the need for a consolidated list.*

This Darlington ISR gap and its applicability in the context of PSR2 are addressed in the discussion of the second code review below.

2) The second code review for the Darlington ISR used version N289.1-08 [B.9-14] and is documented in OPG Report NK38-REP-03680-10110 R000 [B.9-15]. This version of the Standard underwent a clause-by-clause (non-PROL) intent review, and considered the Plant Design and Deterministic Safety Analysis Safety Factors. The code review identified a few changes and new methods/terminologies that had been incorporated in N289.1-08. The conclusions of the Darlington ISR code review of N289.1-08 were [B.9-15]:

   This review identified gaps against the intent of eight clauses viz. 5.2.5.1, 5.3.2, 6.1, 6.5.6.1, 6.5.6.2.2, 6.5.6.4, 6.5.7.3 and 6.6. Either Darlington NGS does not meet requirement/s for compliance or no documentary evidence for compliance could be found for these clauses. The definition of design basis earthquake (DBE) has been changed in the latest Standard in the more conservative direction [1]. DBE is now defined at a minimum of 1 x 10^{-4} probability per year thus requiring a higher earthquake level.

   The Darlington ISR gaps identified above were assigned to the following Darlington ISR Issues in the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.9-16]:

ISR Issue #	Gap	Clause
D063	01525	5.2.5.1
	01526	5.3.2
	01527	6.1
	01532	6.6
D281	01528	6.5.6.1
	01529	6.5.6.2.2
	01530	6.5.6.4
	01531	6.5.7.3

   Based on a review of the existing OPG governance, no further action was required to address the gaps in Darlington ISR Issue #D281, and so they were reclassified as Acceptable Deviations (ADs) per Appendix M of the Darlington Final ISR Report [B.9-16].

   The gaps in Darlington ISR Issue #D063 were reclassified as closed, with the justification provided in Appendix E of the Darlington Final ISR Report Addendum 002 Report NK38-REP-03680-10104-ADD-002 R000 [B.9-17]. In the case of Gap #01525, which was declared against Clause 5.2.5.1 of CSA N289.1 which requires "A seismic classification list shall be created and shall define the seismic category and earthquake level for each SSC", the gap was addressed as follows [B.9-17]:

OPG is currently developing a seismic classification list to meet the criteria in CSA N289.1-8. This Gap #01525 is reassigned to a new Issue D345, which is created as a result of the CNSC comment during the review of the ISR. The Issue D345 has been resolved separately in accordance with the ISR Gap resolution process. The creation of the List will be tracked to completion in the IIP under Issue D345.

As stated above, Gap #01525 was reassigned to a new Issue #D345, which will track the creation of a Seismic Qualified Equipment List for Darlington. OPG is currently developing a Seismic Qualified Equipment List to meet the criteria in CSA N289.1-08 for Darlington.

The impact on Pickering of the Darlington ISR gaps related to CSA N289.1-08 relate to the need for a consolidated Seismic Qualified Equipment List. Seismic Probabilistic Risk Assessments (SPRAs) have been completed for Pickering A and B ([B.9-18], [B.9-19]) in which the Seismic Equipment List for each Station was prepared. The Seismic Equipment Lists identify the SSCs required for the seismic success path and meet the intent of the seismic classification list requirement. Therefore, this is not a gap for Pickering PSR2.

In November 2014, a study documented in OPG Report NK38-REP-03680-10197 R001 [B.9-20] examined the aggregate effects of ADs that are related to the seismic, pressure boundary, or accident management programs. The purpose of this study was to determine whether there are aggregate effects of these ADs. This report concluded there were no aggregate effects from ADs associated with the seismic, pressure boundary or accident management barriers and, therefore, no impacts on public safety. The ADs related to N289.1-08 (September 2008) [B.9-14] listed above for the Darlington ISR Issue #D281 were part of the study. There are no implications for Pickering PSR2.

No PSR2 gaps are identified based on the Darlington ISR assessments.

B.9.2.2 Application of Post-PSR1 Reviews

Per the CSA N289.1-08 Impact Statement [B.9-4] for N289.1-08 (R2013) including Update 1 [B.9-1], the following is a summary of the significant changes from the previous edition of the Standard:

- Incorporation of lessons from Fukushima in the body of the standard, further detailed in a new annex on Readiness for Beyond Design Basis seismic events. The impact is updated guidance for Beyond Design Basis seismic event evaluation and requirement for readiness for such events (for example periodic hazard evaluation minimum 10 year cycle, suggested margins for BDB over design basis). The standard requires consideration of seismic-induced multiple hazard interactions such as fire, flooding, blasts, tsunami, seiche and power blackout.

- Incorporation of Design Extension Conditions (DECs) as a subset of Beyond Design Basis events. This change clarifies checking/review level earthquake as a Design Extension Condition.

- Annex C on Evaluation for Beyond Design Basis events updated to incorporate current technology. This change aligns with the current technology, regulatory requirements and international practice (i.e. peer review, irradiated fuel storage bay evaluation, scaling of in-structure response spectra, etc.).

- Seismic Instrumentation and automatic shutdown addressed via reference to the updated CSA N289.5 standard. This change improves the usefulness of seismic monitoring records for post-earthquake evaluation, with respect to a decision to shut down the plant and future engineering designs.

- Incorporated current references to the extent possible. This change reflects the state-of-the-art technology via updated and international references.

These five changes were all assessed during the clause-by-clause review of N289.1-08 (R2013) [B.9-21] discussed below. As discussed below two issues were identified as a result of the clause-by-clause assessment. The other CSA code changes were not safety significant for Pickering.

OPG has committed to submitting to the CNSC annual "Code-over-Code" reviews to identify significant technical changes to the requirements of the set of engineering design-related code and standard effective dates, as agreed with the CNSC. The Code-over-Code reviews for 2014 included a review [B.9-21] of the latest version of CSA N289.1-08 (R2013) including Update 1 [B.9-1]. For this version of the Standard there were two significant issues that were identified related to Clauses 5.3.11 and 5.4.3. OPG raised internal Action Request (AR) # 28168507-09 to address the impact of these issues on OPG facilities by December 2015. This AR is now complete. Clauses 5.3.11 and 5.4.3 have an impact on Safety Factor 3 (Equipment Qualification) as demonstrated by the requirements set forth in these clauses to assess the performance of SSCs [B.9-21]:

- *Clause 5.3.11 Readiness for beyond design basis seismic event: Each facility shall have a periodic evaluation to demonstrate readiness to cope with the potential consequences of a beyond design basis seismic event.*

  The Standard specifies, as a minimum, the evaluation will be carried out once every 10 years. This is considered to be potentially at risk for a refurbished plant and also at risk for Pickering life extension to 2028. However, both Pickering Units 1,4 and Pickering Units 5-8 have completed Seismic Probabilistic Risk Assessments (SPRAs) (reports NA44-REP-03611-00022 R000 [B.9-18] and NK30-REP-03611-00013 R001 [B.9-19], respectively) that meet the intent of Clause 5.3.11. Hence, this is not a gap for Pickering PSR2.

- *Clause 5.4.3 Seismic capacity evaluation: Seismic capacity evaluation of existing nuclear power plant SSCs shall be performed in accordance with the methods specified in Clause 5.3, as applicable.*

  There is no PSR2 gap for Clause 5.4.3 since Darlington and Pickering meet the requirements by recently having issued the SPRAs; the documented Pickering assessments are identified below.

The seismic qualification methodologies specified in this Standard are probabilistic in nature "in order to more rigorously quantify the engineering capacity of the safety-related SSCs with respect to the seismic demand at the plant site." Clause 5.4.1.1 indicates that Seismic Margin Assessment and SPRA methodologies have been developed to establish the seismic margin of nuclear power plant SSCs relative to the seismic hazard at a plant site. Both Pickering Units 1,4 and Pickering Units 5-8 have completed SPRAs (reports NA44-REP-03611-00022 R000 [B.9-18] and NK30-REP-03611-00013 R001 [B.9-19], respectively) that meet the requirements of the Standard.

No PSR2 gaps are identified based on the post-PSR1 assessments.

B.9.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CSA N289.1-08 (R2013) [B.9-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N289.1-08 (R2013).

B.10 CSA N289.2-10, "Ground Motion Determination for Seismic Qualification of CANDU Nuclear Power Plants"

B.10.1 Background

The following paraphrased from the Preface of CSA N289.2-10 (R2015) [B.10-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *For nuclear power plants, investigation is required to obtain the seismological and geological information necessary to determine the seismic ground motion that will be used in seismic qualification of safety-related plant structures and systems, and the potential for seismically induced phenomena that can have a direct or indirect effect on plant safety or operation.*
>
> *CSA N289.2 sets requirements on how to determine the appropriate seismic ground motion parameters for a particular site.*

N289.2-10 is directly relevant to Safety Factor 1 (Plant Design) since CNSC web site [B.10-2] identifies the Standard as being relevant to the Safety Control Area on "Physical Design". However, as stated above, the primary purpose of this Standard is to describe the "investigations required to obtain the seismological and geological information necessary to determine the seismic ground motion that will be used in seismic qualification of safety-related plant structures and systems." The Standard is also applicable to Safety Factor 3 (Equipment Qualification).

CSA N289.2 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.10-3] as "Guidance and Criteria". The current revision of the Standard is N289.2-10 (R2015) [B.10-1]. It supersedes the previous edition, published in 1981. Changes since the last version of the Standard in 1981 have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements.

The Impact Statement for CSA N289.2-10 [B.10-4] provides a "Summary of significant changes from the previous edition" which identifies several primary changes to the Standard described in Section B.10.2 below. In addition to findings resulting from review of the CSA N289.2-10 Impact Statement, the results of PSR1 CSA N289.2 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.10.2.

As identified in Reference [B.10-5], the Pickering PSR2 review of CSA N289.2-10 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.10.2 Compliance Assessment for Pickering PSR2

The versions of N289.2 subject to previous reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

B.10.2.1 Application of PSR1 Reviews

Pickering NGS

Pickering Units 5-8

OPG Report NK30-REP-03680-00005 R000 [B.10-6] documents the review of CSA N289.2-M81 (R2003) [B.10-7] for the Safety Analysis Safety Factor. The review documented in NK30-REP-03680-00005 R000 [B.10-6] assessed the Standard against the three Safety Factors related to the Safety Analysis subject area (i.e., Deterministic Safety Analysis, Probabilistic Safety Analysis, and Hazard Analysis) for:

- *The extent to which the plant conforms to modern high-level safety goals and requirements,*

- *The extent to which the licensing basis remains valid in terms of meeting the current regulatory requirements,*

- *The effectiveness of the arrangements that are in place to maintain plant safety for long-term operation.*

With respect to the applicability of N289.2-M81 (R2003) [B.10-7] to the Safety Analysis Safety Factor, the code review report [B.10-6] states:

> *In terms of Safety Analysis, N289.2 does not specify any specific requirements relating to the seismic success path. It is focused on a systematic approach to identify the seismic hazard, and as such, there are no specific clauses relating to Safety Analysis. The remainder of this standard is applicable to Siting.*

However, as stated in Section B.10.1, the Standard has limited applicability to Safety Factor 1, as only Clause 4.4.1.4 refers to this Safety Factor:

The effects of applicable seismically induced phenomena shall be mitigated by siting, layout, and design of the nuclear power plant structures, systems, and components.

The compliance review in the code review report [B.10-6] states the level of compliance with N289.2-M81 (R2003) [B.10-7] is an Acceptable Deviation (AD):

In terms of Safety Analysis, N289.2 does not specify any specific requirements relating to the seismic success path. It is focused on a systematic approach to identify the seismic hazard. And as such, there are no specific clauses relating to Safety Analysis. However, it is recognized that the magnitude and frequency of the spectra impacts on the qualification of the Systems, Structures, and Components and that if their required qualification were to change, the success path may need to change. There is no evidence of any additional information or insight in terms of quantification of the seismic hazard that would invalidate Pickering B's safety case for seismic events. Notwithstanding, the fact that there remains some ongoing activities in terms of establishing seismic hazard uncertainties results in the level of compliance being an Acceptable Deviation.

Follow-up on the status of the aforementioned ongoing activities was required to confirm the level of compliance being an AD. NK30-REP-03680-00005 R000 [B.10-6] includes the following explanation:

OPG has investigated, as part of the Seismic Hazard Resolution Project (SHRP), three sources of seismic hazard uncertainty; a) Rouge River faults, b) accuracy of historical seismicity data, and c) adequacy of regional seismic monitoring. The first two hazard uncertainties were eliminated by the SHRP. Recent regional seismic monitoring enhancements (e.g., POLARIS Project, which will add a further 23 seismometers to the Southern Ontario monitoring program) support resolution of the third.

The Pickering B Integrated Implementation Plan NK30-PLAN-03680-00002 R000 [B.10-8] also has Action I03 to complete the PRA-based seismic margin assessment for Pickering B. Seismic Probabilistic Risk Assessments (SPRAs) have been issued for both Pickering Units 1,4 (OPG Report NA44-REP-03611-00022 R000 [B.10-9]) and Pickering Units 5-8 (OPG Report NK30-REP-03611-00013 R001 [B.10-10]). While Action I03 is one of the actions to close the gaps identified in codes and standards with respect to the PRA, it is applicable here to support the compliance being an AD. Thus, there is no gap related to Gap #407 for Pickering PSR2. No PSR2 gaps are identified based on the Pickering B ISR.

<u>Pickering Units 1,4</u>

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N289.2-M81 (R1998) [B.10-11]. Per NA44-CORR-00531-00381 R000 [B.10-12], this version of the Standard "Pertains mostly to design support analysis" and states that "Recent completion of the Seismic Margin Assessment makes review of this CSA Standard not necessary". As noted in the Pickering PROL Renewal Application [B.10-13], for Pickering A the common containment structures were designed to exceed the National Building Code 1965 seismic design provisions and were subsequently confirmed analytically to meet seismic design requirements. No PSR2 gaps are identified based on the Pickering A Return to Service assessments.

Darlington NGS

The Darlington ISR was originally performed against N289.2-M81 (R2008) [B.10-14] and is documented in OPG Report NK38-REP-03680-10040 R000 [B.10-15] which notes that this version of the Standard underwent a clause-by-clause (non-PROL) high-level intent review.

The clauses in N289.2 are primarily programmatic from the perspective of the specified requirements, while recognizing, for example, that Soil-Structure Interaction is specific to each station. Therefore, significant portions of the Darlington ISR assessment are applicable to Pickering as discussed below.

NK38-REP-03680-10040 R000 identified the following gaps [B.10-15]:

1. *Clause 3.2.1.1: Historical earthquake data*

   This clause requires that all the relevant sources are used to obtain as much historical and current seismic data as can be available for determining the site seismicity. Data to the present day has not been included. Therefore, this is a gap in compliance.

2. *Clause 3.2.1.2: Re-evaluation of earthquake history*

   This clause requires that the state-of -the art information is utilized in re-evaluation of the seismic parameters. In keeping with the recent development in seismic methodology… recently (2008) a Probabilistic Seismic Hazard Analysis (PSHA) has been performed at Darlington site. However, the earthquake parameters have not been re-evaluated on the basis of current methods of earthquake analysis.

3. *Clause 3.2.1.3: Use of instrumental seismology in assessing the earthquake parameters*

   This clause specifies the requirement for assessing the completeness and reliability of the historical recorded and qualitative data. The more recent seismological data from seismograph stations are not included in the assessment of the earthquake parameters; therefore this constitutes a gap in compliance.

4. *Clause 3.2.1.4: Detailed earthquake history of the DNGS site*

   This clause specifies detailed requirement for documenting the earthquake history of the region and required conservatism in making judgement based on qualitative *information. Since the time of construction of Darlington, 30 years of seismic data has not been included in the seismic risk analyses; therefore, this constitutes a gap.*

All of these clauses pertain to the incorporation of recent earthquake data into re-evaluating the earthquake parameters for DNGS.

The Darlington ISR gaps identified above were assigned to the following Darlington ISR Issue in the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.10-16]:

ISR Issue #	Gap	Clause
D074	00800	3.2.1.1
	00801	3.2.1.2
	00802	3.2.1.3
	00803	3.2.1.4

For Gaps #00800, #00801, #00802, and #00803, the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.10-16] also provided a proposed resolution for compliance:

The combination of the original seismic design and the current seismic monitoring practice provides high confidence that DNGS can withstand a seismic event and that the seismic activity in the region is within the design basis assumptions. The Seismic Probabilistic Risk Assessment will use the latest analysis methods and seismic data to assess the risk to the station from a seismic event and confirm the adequacy of DNGS to withstand an earthquake, or suggest possible design modifications in order to ensure the proper level of safety is maintained. Periodic updates to the seismic hazard have also been included in governance to ensure continuity.

Management action AR# 28127916 has been raised to track the Darlington Risk Assessment (DARA) project to completion in order to confirm that it satisfactorily resolved Issue D074.

Gaps #00800, #00801, #00802, and #00803 were reclassified as closed in Appendix E of the Darlington Final ISR Report Addendum 002 report NK38-REP-03680-10104-ADD-002 R000 [B.10-17] based on the existence of the Darlington Probabilistic Seismic Hazard Assessment (PSHA) and Darlington Seismic Probabilistic Risk Assessment (SPRA) which address the identified gaps. There is no gap for Pickering PSR2 since SPRAs have recently been issued for Pickering Units 1,4 and Pickering Units 5-8.

OPG Report NK38-REP-03680-10040-ADD-001 R000 [B.10-18] documents the CNSC staff comments and OPG responses related to the N289.2-M81 (R2008) code review report [B.10-15]. The report notes that OPG agreed to an action "to assign compliance with clause 4.2.1.1 as an ISR Gap". The action addresses CNSC comments on clause 4.2.1.1 (i.e., that Soil

Structure Interactions (SSIs) effects in terms of analysis approaches for the evaluation of site response analysis for the free-field case were not explicitly considered). This is related to ISR Issue #D415, Gap #01674 on clause 4.2.1.1 of N289.2-M81 (R2008), which was reclassified as an Acceptable Deviation in Appendix F of NK38-REP-03680-10104-ADD-001 R000 [B.10-19] since "despite the gap, the SPRA confirms that the DNGS buildings are sound enough to meet the intent of the clause." As discussed earlier, SPRAs have also been issued for both Pickering Units 1,4 (OPG Report NA44-REP-03611-00022 R000 [B.10-9]) and Pickering Units 5-8 (OPG Report NK30-REP-03611-00013 R001 [B.10-10]). Further, NA44-REP-02004-0119 R000, "Seismic Soil-Structure Interaction Analysis of Pickering NGS A Reactor Building" [B.10-20], documents the Soil Structure Interactions analysis for the Seismic Margin Assessment of Pickering A Reactor Building components. NK30-REP-21001-00002 R000, "Reactor Building Seismic Analysis" [B.10-21], documents the Pickering B Reactor Building seismic analysis, which includes Soil Structure Interactions effects. Therefore, there is no gap for Pickering PSR2 relating to Soil Structure Interactions effects.

Following the original code review for the Darlington ISR, a code refresh review based on version N289.2-10 [B.10-22] was conducted and documented in OPG Report NK38-REP-03680-10150 R000 [B.10-23]. The code refresh review comprised a clause-by-clause review of all changes in N289.2-10 (May 2010) [B.10-22] relative to N289.2-M81 (R2008) [B.10-14]. The review of the changed clauses did not identify any gaps relative to the requirements of N289.2-10 (May 2010) [B.10-22]. Furthermore, the gaps listed above on Clauses 3.2.1.3 and 3.2.1.4 of N289.2-M81 (R2008) [B.10-14] were reclassified as "Indirect Compliance". (Note that Clauses 3.2.1.3 and 3.2.1.4 of N289.2-M81 (R2008) [B.10-14] are similar to Clauses 4.2.1.3 and 4.2.1.4, respectively, of N289.2-10 [B.10-22] that was assessed in the code refresh review.) The code refresh review of the changed clauses in this code concluded the following:

> *The review confirms OPG Nuclear governance is in compliance with the requirements of CSA N289.2-10 relative to CSA N289.2 M81 (R2008).*

In November 2014, a study documented in OPG Report NK38-REP-03680-10197 R001 [B.10-24] examined the aggregate effects of ADs that are related to the seismic, pressure boundary, or accident management programs. The purpose of this study was to determine whether there are aggregate effects of these ADs. This report concluded there were no aggregate effects from ADs associated with the seismic, pressure boundary or accident management barriers and, therefore, no impacts on public safety. In the case of the ADs related to N289.2-M81 (R2008) [B.10-14] under Issue Resolution Form (IRF) #D415, they were excluded from the aggregation assessment for the following reason:

> *The gaps were raised in response to CNSC comments about whether Soil Structure Interaction effects had been adequately considered the DNGS seismic analysis. The rationale for considering these gaps as an AD is that the DNGS Site Probabilistic Seismic Hazard Assessment [R-62] confirms that DNGS conforms to CNSC S-294 [R-63] and to*

various international guides on seismic PRA, and that the results are considered acceptable. Consequently these gaps are considered to have no impact on the seismic resistance of qualified structures.

The combined safety significance category of the AD is 4.

This AD is therefore excluded from further review in this aggregation assessment.

As discussed earlier, the clauses in N289.2-10 are primarily programmatic from the perspective of the specified requirements, while recognizing, for example, that Soil-Structure Interaction is specific to each station.

B.10.2.2 Application of Post-PSR1 Reviews

The Impact Statement for CSA N289.2-10 [B.10-4] provides the following summary of the significant changes from the previous edition of the Standard:

- The term CANDU was removed from the title to be more technology neutral;

- Seismic hazard assessment procedures are updated and detailed to reflect international practices;

- The requirement to specify the Design Basis Seismic Ground Motion has been removed. The Standard instead provides seismic hazard estimates for a range of ground motion parameters, a range of probabilities, and a range of confidence intervals. The impact is: improves usage of the results, since various design requirements in N289.3 can use different outputs from a single application of N289.2. Removal of explicit reference to nuclear design parameters means N289.2 could be used for the seismic hazard assessment of non-nuclear facilities;

- Volcanism and surface faulting are added considerations. This change reflects current international practice and extends applicability to the standard within Canada and worldwide;

- The required site, site vicinity, and regional investigations are updated. This change reflects current international practice;

- Scenario earthquakes are added. This change provides a set of "earthquakes" representative of the probabilistic seismic hazard results that may be useful as check/review level earthquakes;

- Requires a full treatment of uncertainty in the evaluation of seismic hazard. This change reflects current seismic hazard assessment practice;

- Explicit clause on documentation is added to reflect the current regulatory requirements; and
- An Annex keyed to the Standard's clauses together with a flowchart has been added. This provides additional guidance and imposes understanding of the standard and its procedures.

The latest changes incorporated into CSA N289.2-10 were part of the clause-by-clause code refresh review [B.10-23] using N289.2-10 (May 2010) [B.10-22] since the R2015 version [B.10-1] introduced no additional changes (i.e., the Darlington clause-by-clause code refresh review using the CSA N289.2-10 (May 2010) version is the latest version of the standard to be assessed). No gaps were found as discussed above.

OPG has committed to submitting to the CNSC annual Code-over-Code reviews to identify significant technical changes to the requirements of the set of engineering design-related code and standard effective dates, as agreed with the CNSC. The code-over-code review methodology documents [B.10-25] and [B.10-26] list Standard N289.2-10 (R2015) [B.10-1], signifying that future versions of the Standard will be included in subsequent Code-over-Code reviews. A Code-over-Code review for CSA N289.2-10 (R2015) relative to CSA N289.2-10 (May 2010) has not been prepared as it is not required (i.e., there are no changes to address).

Further, OPG Nuclear Standard N-STD-MP-0025 R001 [B.10-27] sets forth the general integrated approach to seismic requirements for the applicable SSCs within OPG's nuclear facilities. The approach and framework for OPG activities related to the general requirements for seismic design and qualification of OPG nuclear facilities are in accordance with the CSA N289 series of standards.

B.10.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CSA N289.2-10 (R2015) [B.10-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N289.2-10 (R2015).

B.11 CSA N289.3-10, "Design Procedures for Seismic Qualification of CANDU Nuclear Power Plants"

B.11.1 Background

The following paraphrased from the Preface of CSA N289.3-10 (Update No. 2; November 2015) [B.11-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *Nuclear power plants are required to be designed and seismically qualified in a manner using analytical techniques that meet a quality and standard commensurate with the safety principles necessary to comply with the Canadian nuclear safety philosophy.*
>
> *CSA N289.3 provides design requirements and methods, specifies the requirements, criteria and methods of analysis for the following:*
>
> - *Determining the design response spectra and ground motion time-histories to be used in the analysis;*
> - *Establishing design criteria for SSCs, and supports that require seismic qualification; and*
> - *Performing seismic analyses, including the effects of the soil-structure-interaction.*

N289.3-10 is directly relevant to Safety Factor 1 (Plant Design) since the CNSC web site [B.11-2] identifies the Standard as being relevant to the Safety Control Area on "Physical Design". Also, since this Standard addresses seismic qualification of SSCs it is related to Safety Factor 3 (Equipment Qualification).

CSA N289.3 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.11-3] as "Guidance and Criteria". The current revision of the Standard is N289.3-10 (Update No. 2; November 2015) [B.11-1]. It supersedes the previous edition, published in 1981. Changes since the last version of the Standard in 1981 have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements.

The CSA N289.3-10 (Update No. 2; November 2015) Impact Statement [B.11-4] provides a "Summary of significant changes from the previous edition" which identifies several primary changes to the Standard described in Section B.11.2.2 below. In addition to findings resulting from review of the CSA N289.3-10 Impact Statement, the results of PSR1 N289.3 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.11.2.

As identified in Reference [B.11-5], the Pickering PSR2 review of CSA N289.3-10 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.11.2 Compliance Assessment for Pickering PSR2

The versions of CSA N289.3 subject to previous reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

B.11.2.1 Application of PSR1 Reviews

Pickering NGS

Pickering Units 5-8

OPG Report NK30-REP-03680-00001 R000 [B.11-6] documents the code review of CSA N289.3-M81 (R2003) [B.11-7] for the Plant Design Safety Factor. The review of the Plant Design Safety Factor identified two types of gaps:

- *Gaps stemming from new Design Code requirements.*
- *Gaps related Documentation issues.*

  The ISR Plant Design safety factor review concludes that the design of the Pickering NGS-B was initially robust and continues to be that way. In addition, programs for maintaining the design integrity of the Station have been adequately implemented.

The gaps identified were against Clauses 4.7.1, 4.7.2, 4.7.3 (Gap #64, "no evidence that factor of safety applied consistently") and 5.13.2 (Gap #65, "number of cycles for fatigue analysis not in compliance"). Action Plans for these gaps are identified in the Pickering B Integrated Implementation Plan NK30-PLAN-03680-00002 R000 [B.11-8]:

- Gap #64 - Overturning and Sliding Stability Factor of Safety-not less than 1.25 used in calculations:

  Action: I01 Perform a review of the relevant seismic analysis reports regarding seismic overturning and sliding stability and document the level of compliance of *structures with CSA N289.3-M81, Clause 4.7.1 to 4.7.3. If seismic reports are not available, perform required calculations to demonstrate compliance.*

- Gap #65 - Required Minimum Number of Seismic Cycles-15/25:

  Action: I02 Review the relevant seismic analysis reports regarding number of cycles for a fatigue analysis and document compliance with CSA N289.3-M81, Clause 5.13.2, and revise OPG Design Guide, DG-30-68000-2, "Pickering G.S. 'B' Seismic Qualification of Safety Related Systems", R02, December 1979, Section 6.4 to document the requirements of CSA N289.3-M81 clause 5.13.2.

The Pickering Continued Operations Plan (NK30-PLAN-00531-00001 R005 [B.11-9]) states: "I01 and I02 - 112013: Refer to Appendix B of R001 of the Pickering Consolidated End of life Action Log (CAL), P-LIST-09314-00001, for completion notes and additional action details. This action is complete." Therefore, Gaps #64 and 65 are now closed. Further, these gaps are not impacted by Pickering operation past 2020.

Thus, for the Pickering B ISR, gaps were identified, but these were deemed not safety significant as they stem from new design code requirements or were related to documentation issues. Furthermore, the design of Pickering B was initially robust and continues to be that way. In addition, programs for maintaining the design integrity of the Station have been adequately implemented.

<u>Pickering Units 1,4</u>

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N289.3-M81 (R1998) [B.11-10]. Per NA44-CORR-00531-00381 R000 [B.11-11] this version of the Standard "Pertains mostly to design support analysis" and states "Recent completion of the Seismic Margin Assessment makes review of this CSA Standard not necessary". As noted in the Pickering PROL Renewal Application [B.11-12], for Pickering A the common containment structures were designed to exceed the National Building Code 1965 seismic design provisions and were subsequently confirmed analytically to meet seismic design requirements.

Darlington NGS

The Darlington ISR was performed using two different versions of the Standard as discussed below. The clauses in N289.3 are primarily programmatic from the perspective of the specified requirements, while recognizing, for example, that seismic hazard models are specific to each station. Therefore, significant portions of the Darlington ISR assessments are applicable to Pickering.

1) The first review used version N289.3-M81 (R2008) [B.11-13] and is documented in report NK38-REP-03680-10008 R000 [B.11-14], which notes that this version of the Standard underwent a clause-by-clause (non-PROL) intent review. The review identified the following gap:

   Clause 5.10: This clause pertains to account for torsional effects on unsymmetric components. No documentary evidence of compliance with this clause could be found.

   During the initial ISR Gap resolution process, it was determined that the gap with clause 5.10 could not be reclassified as compliant. Therefore, the ISR Gap remained as per the code review report [B.11-14] for N289.3-M81 (R2008). Gap 00174 was declared against Clause 5.10 of CAN/CSA-N289.3-M81 which requires that for unsymmetrical systems torsional effects be included.

   Gap 00174 was assigned to the following Darlington ISR Issue in the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.11-15]:

ISR Issue #	Gap	Clause
D063	00174	5.10

   The Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.11-15] provided a proposed resolution for compliance:

   The completion of this Seismic Probabilistic Risk Assessment will provide compliance with CNSC S-294 and is consistent with CAN/CSA-N289.1-08 methods. The Seismic Probabilistic Risk Assessment will confirm the adequacy of the DNGS design to withstand an earthquake, or suggest possible design modifications in order to ensure the proper level of safety is maintained.

   Management action AR# 28127914 has been raised to track the Darlington Risk Assessment project to completion in order to confirm that it satisfactorily resolved Issue D063.

   AR# 28127914 is complete as of December 15, 2012. In the case of Pickering, SPRAs have been issued for both Pickering Units 1,4 (OPG Report NA44-REP-03611-00022 R000 [B.11-16]) and Pickering Units 5-8 (OPG Report NK30-REP-03611-00013 R001 [B.11-17]), so this Darlington ISR gap is not applicable for PSR2.

2) The second code review for the Darlington ISR used version N289.3-10 (Update No. 1; August 2012) [B.11-18] and is documented in report NK38-REP-03680-10151 R000 [B.11-19]. This version of the Standard underwent a clause-by-clause (non-PROL) intent review, and considered two Safety Factors: Plant Design and Equipment Qualification. The

conclusions of the Darlington ISR code review of N289.3-10 (Update No. 1; August 2012) were:

> *Darlington NGS is in compliance with all of the clauses except for the following:*
>
> *Clauses 4.4.1, 4.4.2, 4.4.3, 4.4.4.1 to 4.4.4.6, 5.3.3, 5.3.4, 5.3.5, 5.6.1, 5.6.3, 5.6.4, 6.5.2.2, 6.7.1, 6.10.1, 6.10.2, and 6.10.3.*

Appendix D of NK38-REP-03680-10151 R000 [B.11-19] indicates that the Darlington ISR Issues covering the above gaps are #D352, #D617, #D415, #D618, #D414, and #D063.

Report NK38-REP-03680-10008-ADD-001 R000 [B.11-20] documents the CNSC staff comments and OPG responses related to the N289.3-M81 (R2008) [B.11-13] code review report [B.11-14]. The report identified a number of news gaps for Clauses 3.43, 4.2, 5.2.2.1, 5.7.1, and 5.11, and a "General" gap *against the CSA N289.3 code review report to address the CNSC concerns with the systems and structures that were considered in the report*.

Report NK38-REP-03680-10104-ADD-001 R000 [B.11-21], which documents the CNSC staff comments and OPG responses related to the Darlington Final ISR Report [B.11-15], addressed CNSC comments on N289.3-M81 (R2008) and provided the following updates to existing Darlington ISR Issues:

- #D352 - Resolution: OPG to check the time histories used in seismic analyses of safety-related System, Structure and Components against original and recent versions of the code. An assessment is required to determine whether time histories meet code requirements.
- #D414 – This gap related to seismic time histories, was reclassified as an Acceptable Deviation per Appendix F.
- #D415 - This gap to Soil-Structure Interactions, was reclassified as an Acceptable Deviation per Appendix F.

Both #D414 and #D415 were reclassified as ADs by pointing to the Darlington SPRA as evidence of indirect compliance. As discussed earlier, SPRAs have been issued for both Pickering Units 1,4 (OPG Report NA44-REP-03611-00022 R000 [B.11-16]) and Pickering Units 5-8 (OPG Report NK30-REP-03611-00013 R001 [B.11-17]). Therefore, there is no gap for Pickering PSR2 relating to Soil Structure Interactions effects.

The resolution of Darlington ISR Issue #D352 was completed and documented in report NK38-REP-03680-10224 R000 [B.11-22] which states the following:

A series of calculations were performed on the set of seismic time-histories provided by OPG that was used in the design of DNGS to demonstrate compliance with Clause 3.4.3 of CSA N289.3-M81 and with the requirements of Clauses 4.4.4.3 and 4.4.4.4 of CSA N289.3-10. Calculations were performed to: (a) digitize the tri-partite Darlington Ground Response Spectrum, (b) convert the time history text file into a format that can be used as input to ANSYS, using the ANSYS APDL command language, and, (c) perform ANSYS transient analyses to generate the required 5 % response. The results indicate that the seismic time history files are compliant with Clause 3.4.3 of CSA N289.3-M81 and Clauses 4.4.4.3 and 4.4.4.4 of CSA N289.3-10.

The Darlington NGS Integrated Implementation Plan report NK38-REP-03680-10185 R002 [B.11-23] also documents closure of Darlington ISR Issue #D352 under IIP-OI-052, which also includes related ISR Issue #D617 (Seismic Time History Requirements). The closure reference for #D352 and #D617 makes use of the detailed assessment performed in NK38-REP-03680-10224 R000 which is specific to Darlington. A similar assessment for Pickering NGS could not be found. As a result, there is an associated gap for PSR2 to provide similar evidence to show that the generated time history used within seismic analyses of safety-related systems correctly represents the design ground response spectrum for the Pickering site in compliance with N289.3-10 (**PSR2 CSA N289.3 Gap #1**).

The Darlington IIP report [B.11-23] also notes that ISR Issue #D618 (Soil Liquefaction Potential) under IIP-OI-071 remains as a code gap, with the following Action Plan tracked by Action Request 28175301-01 for completion by 2019:

Review the available information to verify that the liquefaction potential for fill materials in the Protected Area related to safety related systems and structures is low. Otherwise, complete a liquefaction assessment study.

It needs to be demonstrated that a similar gap does not exist for Pickering due to the plant-specific nature of the gap. This investigation is discussed in section B.11.2.2 and the conclusion is that there is no PSR2 gap.

Gap #00174 in Darlington ISR Issue #D063 was reclassified as closed, with the justification provided in Appendix E of the Darlington Final ISR Report Addendum 002 report NK38-REP-03680-10104-ADD-002 R000 [B.11-24]. The rationale included evidence that the original design considered torsional effects based on application of AECL seismic design guidance, DG-91-01040-1-39113. Whether this argument applies to Pickering is not pertinent because the issue is resolved by the completed Pickering Seismic Probabilistic Risk Assessments (SPRAs) listed later in this paragraph. Also, in accordance with Clause 5.4 of CSA N289.1-08, an acceptable method of re-evaluating existing Nuclear Plants for seismic considerations is SPRA, for which the issued SPRA for Darlington (report NK38-REP-03611-10051 [B.11-25] confirms that the original design and seismic qualification of Darlington provide an adequate level of Safety from the earthquake hazard at the DNGS site. In the case of Pickering, SPRAs have been issued for both Pickering Units 1,4 (OPG Report NA44-REP-03611-00022 R000 [B.11-16]) and Pickering Units 5-8 (OPG Report NK30-REP-03611-00013 R001 [B.11-17]), so this Darlington ISR gap is not applicable for Pickering.

Appendix E of the Darlington Final ISR Report Addendum 002 report NK38-REP-03680-10104-ADD-002 R000 [B.11-24] also documented a new Darlington ISR Issue #D500 (Gap #02128):

Gap 02128: The gap addresses the CNSC concerns with the adequacy of the N289.3-M81 code review report [R-1], specifically the lack of a listing of systems and structures that were considered in the report.

Gap #02128 was addressed and closed by the provision of a list of systems and structures proposed for inclusion in the code refresh review report. This list was documented in NK38-CORR-03680-0486309 R000 [B.11-26], which states:

This letter provides a list of systems and structures proposed for inclusion within the scope of the CSA N289.3-10, "Design Procedures for Seismic Qualification of Nuclear Power Plants", including Update No. 1 (2012) Code Refresh Report.

As discussed above, SPRAs have been completed for Pickering U1,4 and 5-8 ([B.11-16], [B.11-17]) in which the Seismic Equipment List for each Station was prepared. The Seismic Equipment Lists identify the SSCs required for the seismic success path and meet the intent of the seismic classification list requirement. Therefore, this is not a gap for PSR2.

In November 2014, a study documented in OPG Report NK38-REP-03680-10197 R001 [B.11-27] examined the aggregate effects of ADs that are related to the seismic, pressure boundary, or accident management programs. The purpose of this study was to determine whether there are aggregate effects of these ADs. This report concluded there were no aggregate effects from ADs associated with the seismic, pressure boundary or accident management barriers and, therefore, no impacts on public safety. The ADs related to N289.3-M81 (R2008) [B.11-13] listed above for Darlington ISR Issue #D281 were part of the study.

B.11.2.2 Application of Post-PSR1 Reviews

The CSA N289.3-10 (Update No. 2; November 2015) Impact Statement [B.11-4] provides a summary of the significant changes from the previous edition of the Standard which are noted in the following table. Since these changes to the code were not assessed in the latest code update review described in the previous section, each change is assessed below.

#	CSA "Summary of Significant Changes from Previous Edition"	Assessment of Safety Significance of Changes
1	Incorporation of requirements for addressing differences between Standard-shape ground spectra and Uniform Hazard Spectra (esp. at high frequency) to reflect current seismological information and technology. This change provides an enhanced level of safety by addressing potential impact of high frequency seismic input.	Clause 4.3.2 of CSA N289.3-10 specifies requirements for addressing the differences between Standard-shape ground spectra and Uniform Hazard Spectra (especially at high frequency). This is addressed below. <u>Pickering Units 1,4</u> Per "Pickering NGS-A PRA-Based Seismic Margin Assessment" [B.11-16], the Uniform Hazard response spectrum (UHRS) defines the review level earthquake (the review level earthquake is a very low probability (less than 10^{-4} per year) seismic ground motion derived from assessment of seismic hazard at the Pickering site) and forms the basis of the in-structure response needed in estimating the seismic demand on equipment. The UHRS represents the acceleration at the specified probability of occurrence at all response frequencies. Per the definition above, the UHRS reflects all the expected response frequencies (which includes high frequency). The high frequency content for UHRS is further supported by the PNGS-A PRA Guide-Seismic [B.11-28], which identifies the Uniform Hazard Spectra as possessing high frequency responses (i.e., section 2.3.3 "…..due to the high frequency content of the Uniform Hazard Spectra".). Therefore, since the UHRS (which shows high frequency content) forms the basis of the in-structure response needed in estimating the seismic demand on equipment, the ground response spectra in the Pickering A PRA based SMA, reflect the expected high frequency content of the seismic ground motions. No PSR2 gap exists against the requirements of the Clause. <u>Pickering Units 5-8</u> Applying similar logic used for Pickering A above, per "Pickering NGS B PRA based SMA" [B.11-17]: *"The RLE selected for this PRA based SMA is the 10, 000 year return 84th percentile UHRS updated in 2011."* The OPG PRA Seismic Guide (N-GUID-03611-10001 [B.11-29]) which provides guidance for the Pickering B PRA based SME, identifies the UHRS as containing high frequency" (i.e. Section 2.3.3.1, "….since the UHS shows significant high frequency contents at frequencies over 10Hz….". Therefore, since the UHRS (which shows high frequency content) forms the basis of the in-structure response needed in estimating the seismic demand on equipment,

#	CSA "Summary of Significant Changes from Previous Edition"	Assessment of Safety Significance of Changes
		the ground response spectra in the Pickering B PRA based SMA reflects the expected high frequency content of the seismic ground motions. No PSR2 gap exists against the requirements of the Clause.
2	Incorporation of more detailed requirements for Power Spectral Density and its use. This change clarified requirements that are consistent with signal processing terminology.	Clause 4.4.4.5 of CSA N289.3-10 states: "*The power spectral density (PSD) function of each time-history shall be calculated and shown to not have any significant gaps in energy over the frequency intervals outlined in Table 2…."* The calculation of PSD is not addressed in the Pickering A PRA Based SMA [B.11-16] or the Pickering B PRA Based SMA [B.11-17]. Also, the Pickering NGS A PRA Seismic Guide [B.11-28] and the OPG PRA Guide [B.11-29] do not identify any requirements for PSD. Also, evidence in the form of a calculation for time histories which represent the design ground motion was not found (which is a precursor for the PSD calculation). The lack of evidence of calculated time histories was also identified as a gap in the Darlington ISR (*#D352 and #D617 – Documented evidence in the form of a calculation to show that the generated time history correctly represents the design ground response spectrum within the prescribed requirements has not been provided).* This is therefore a gap for PSR2 (identified earlier as **PSR2 CSA N289.3 Gap #1**).
3	Improvement of requirements for soil liquefaction to articulate the requirements for the Design Basis level. This change articulated requirements for liquefaction at Design Basis earthquake levels.	Clause 5.6.1 of CSA N289.3-10 states: "*Adverse effects of soil liquefaction at a nuclear power plant site shall be precluded at the DBE level".* The adverse effects of soil liquefaction are not addressed in the Pickering A PRA Based SMA [B.11-16] or the Pickering B PRA Based SMA [B.11-17]. Also, the Pickering NGS A PRA Seismic Guide [B.11-28] and the OPG PRA Guide [B.11-29] do not identify any requirements for soil liquefaction. However, as identified in NK30-CORR-00531-04876, "Pickering NGS-B – Integrated Safety Review (ISR) – CNSC Review of Acceptable Deviations and Discrepancies for the Plant Design Safety Factor Report" [B.11-30], it indicates that the potential for liquefaction of the subsurface materials at Pickering B site does not have to

#	CSA "Summary of Significant Changes from Previous Edition"	Assessment of Safety Significance of Changes
		be evaluated since the plant is located in an area of flat geologically stable ground and a seismic ground motion assessment was performed (Section 2.3 of Part 1 of the Pickering A Safety Report was referenced). This gap assessment was subsequently accepted by the CNSC. In addition, Section 1.0 of Geotechnical Report 74148, "Pickering Generating Station B Interim Report Preliminary Engineering Phase Geotechnical Evaluation of Site Features" [B.11-31] states the following regarding the Pickering B site: "the potential of liquefaction occurring on this site is considered to be remote and of minor importance since the reactors and turbines will be founded on piles to bedrock". Since Pickering A and B share common site geology as reflected in Section 2.3, Part 1 of the Pickering A and B Safety Report, the above arguments are also applicable for Pickering A (i.e., soil liquefaction is not applicable for Pickering A as well). Additionally, Section 2.4.5 of the Pickering NGS B Design Manual, "Seismic Route" (NK30-DM-21002-10001 [B.11-32]) states, "Pickering DBE seismic ground acceleration levels are insufficient to induce soil liquefaction or other vibration-related disturbances…..". Hence, soil liquefaction at the DBE level can be precluded for both Pickering A and B. No PSR2 gap exists against the requirements of the Clause.
4	Incorporation of improved requirements reflective of currently applicable codes and their use in SSCs' design and specifically in the design of supports and anchorage. This change adds requirements that allow for use of Canadian steel code (CSA S16) to design supports.	The inclusion of CSA S16 appears in CSA N289.3-10 Clauses 7.3.4(d), 7.4.3.1, 7.4.3.3 and 7.4.3.4. The text in the "impact of changes" column as well as the Clauses themselves, indicates that CSA S16 requirements are now allowed for use as required (i.e., does not impose more restrictive requirements), due to the improvement in the code itself. Examples exist in which compliance with these requirements have been met: • Seismic analysis of 7132-HX501, -HX502 support frame (NA44-CALC-71320-10001 [B.11-33]), in which a code check against CSA S16 was performed (section 5.0) • Unit 7 Boiler Blow Down Pipe Civil Pipe Supports Miscellaneous Steel (NK30-CALC-21459-00005 [B.11-

#	CSA "Summary of Significant Changes from Previous Edition"	Assessment of Safety Significance of Changes
		34]), states in the Conclusion section that all analysis, modifications and new designs meet the current code S16-09. Hence, the incorporation of improved applicable codes (i.e. CSA S16) in the design of supports and anchorage has been applied for both Pickering A and B. No PSR2 gap exists against the requirements of the Clause.
5	Incorporation of provisions that allow for extension to the highest frequency of interest from the current 33Hz in the standard to values corresponding to input from modern seismic hazard studies. This change extends the frequency range to be consistent with current input from seismic hazard assessments.	The text in the "impact of changes" column, indicates that the highest frequency of interest is no longer limited to 33Hz, but rather should reflect the current input from the seismic hazard assessment which may be greater than 33Hz. Although this value is typically 33Hz for standard shaped spectra (as indicated in Table 2 of CSA N289.3-10), higher values can be used depending on the values used in the seismic hazard study. The 33Hz value has not been used as a limit in the Pickering seismic assessments. No PSR2 gap exists against the requirements of the Clause.
6	Clarification of the requirements for consideration of seismic fatigue. This change increases clarity of provisions for seismic fatigue.	CSA N289.3-10 Clause 7.3.3.1 states: "*Seismic fatigue analysis of ASME Class 1 components (vessels, pumps, valves and piping) shall not be required when the range of primary plus secondary stresses due to the seismic load alone (inertia plus anchor movement) is limited to 3 Sm (the design stress intensity) or equivalent.* Seismic fatigue analysis has been carried out as per the requirements of the Clause. For example: • Per 44RS-60350-AR-004, "Pickering A Return to Service - Seismic Analysis of Instrument Panel" [B.11-35], section 7.8 states "*seismic fatigue evaluation is not required since the range of stress due to seismic loads alone is less than 3 Sm*" • Per NK30-REP-33319-00001, "Pickering B PHT 3331 Feed Circuit Nuclear Class 1 Pipe Stress Analysis Report" [B.11-36], Section 6.2 states "*in the event some components exceed the 3 Sm limit (for seismic primary plus secondary stress range), then a less conservative detailed fatigue analysis for these components may be conducted*".

#	CSA "Summary of Significant Changes from Previous Edition"	Assessment of Safety Significance of Changes
		• Per NK30-REP-71389-0094106, "Stress Report – Pickering NGS B Emergency Water System" [B.11-37], section 6.2 states, *"in the event some components exceed the 3 Sm limit (for seismic primary plus secondary stress range), then a less conservative detailed fatigue analysis for these components may be conducted".* Hence, there is evidence that seismic fatigue analysis was carried out as per the requirements of this Clause for Pickering A and B. No PSR2 gap exists against the requirements of the Clause.

B.11.3 Compliance Summary for Pickering PSR2

There is one PSR2 gap for Pickering NGS compliance with N289.3-10 which is applicable to Safety Factor 3:

1. Clause 4.4.4.5 of CSA N289.3-10 states: "The power spectral density (PSD) function of each time-history shall be calculated and shown to not have any significant gaps in energy over the frequency intervals outlined in Table 2…." The calculation of PSD is not addressed in the Pickering A or B PRA Based SMAs. The Pickering NGS A PRA Seismic Guide and the OPG PRA Guide do not identify any requirements for PSD. Also, evidence in the form of a calculation for time histories which represent the design ground motion was not found (which is a precursor for the PSD calculation). The lack of evidence of calculated time histories was also identified as a gap in the Darlington ISR (ISR Issues #D352 and #D617 – Documented evidence in the form of a calculation to show that the generated time history correctly represents the design ground response spectrum within the prescribed requirements has not been provided). The closure reference for #D352 and #D617 makes use of the detailed assessment performed in NK38-REP-03680-10224 R000 which is specific to Darlington. A similar assessment for Pickering NGS could not be found. As a result, there is a gap for PSR2 to provide similar evidence to show that: a) the generated time history used within seismic analyses of safety-related systems correctly represents the design ground response spectrum for the Pickering site in compliance with N289.3-10, and b) the PSD function of each time-history has been calculated and shown to not have any significant gaps in energy over the frequency intervals.

B.12 CSA N289.4-12, "Testing Procedures for Seismic Qualification of CANDU Nuclear Power Plants"

B.12.1 Background

The following paraphrased from the Preface of CSA N289.4-12 [B.12-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *The purpose of CSA N289.4 is to provide a basis for the development of specifications for seismic qualification by testing, and to aid purchasers, suppliers, and testing laboratories in selecting the appropriate test method(s) for performing acceptable seismic qualification tests that meet a quality and standard commensurate with the safety principles necessary to comply with the Canadian nuclear safety philosophy.*
>
> *CSA N289.4 provides the design requirements and methods for seismic qualification of specific components and systems by testing methods.*

N289.4-12 is directly relevant to Safety Factor 1 (Plant Design) since the CNSC web site [B.12-2] identifies the Standard as being relevant to the Safety Control Area on "Physical Design". Also, as this Standard addresses seismic qualification of SSCs, it applicable to Safety Factor 3 (Equipment Qualification).

CSA N289.4 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.12-3] as "Guidance and Criteria". The current revision of the Standard is N289.4-12. It supersedes the previous edition, published in 1986. Changes since the last version of the Standard in 1986 have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements.

The CSA N289.4-12 Impact Statement [B.12-4] provides a "Summary of significant changes from the previous edition" which identifies several primary changes to the Standard described in Section B.12.2 below. In addition to findings resulting from review of the CSA N289.4-12 Impact Statement, the results of PSR1 N289.4 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.12.2.

As identified in Reference [B.12-5], the Pickering PSR2 review of CSA N289.4-12 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.12.2 Compliance Assessment for Pickering PSR2

The versions of N289.4 subject to previous reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

B.12.2.1 Application of PSR1 Reviews

Pickering NGS

Pickering Units 5-8

OPG Report NK30-REP-03680-00003 R000 [B.12-6] documents the code review of CSA N289.4-M86 (R2003) [B.12-7] for the Equipment Qualification Safety Factor. The code review report findings were:

> *The review report concluded that Equipment qualification measures to assure safe operation under accident and earthquake environmental conditions and normal operational conditions have been adequately implemented. The various programs, procedures and controls that establish and maintain these measures conform to the requirements of CSA standards and are consistent with the recommendations of international guides.*

Therefore, there are no PSR2 gaps identified based on the Pickering B ISR.

Pickering Units 1,4

For Pickering A Return to Service, the active version of the Standard at the time was CSA-N289.4-M86 (R1998) [B.12-8]. Per NA44-CORR-00531-00381 R000 [B.12-9], this version of the Standard "Pertains mostly to design support analysis" and it is stated that "Recent completion of the Seismic Margin Assessment makes review of this CSA Standard not necessary". As noted in the Pickering PROL Renewal Application [B.12-10], for Pickering A the common containment structures were designed to exceed the National Building Code 1965 seismic design provisions and were subsequently confirmed analytically to meet seismic design requirements. No PSR2 gaps are identified based on the Pickering A Return to Service assessments.

Darlington NGS

The Darlington ISR was performed using N289.4-M86 (R2008) [B.12-11] and is documented in OPG Report NK38-REP-03680-10009 R000 [B.12-12], which notes that this version of the Standard underwent a clause-by-clause (non-PROL) intent review.

The clauses in N289.4 are largely programmatic from the perspective of the specified requirements. Therefore, the Darlington ISR conclusions are applicable to Pickering PSR2 as discussed below.

NK38-REP-03680-10009 R000 found Darlington NGS is in compliance with all of the clauses of N289.4-M86 (R2008) except the following clause identified as a gap (paraphrased) [B.12-12]:

> *Clause 4.1.4: Multi-axis and Multi-frequency Coupling.*
>
> *The multiplication factor for uni-axial testing in the sine sweep test is 1.2, which is lower than the 1.4 specified in CAN/CSA-N289.4-M86. No documentation was found justifying the lower multiplication factor.*

The gap identified for Clause 4.1.4 was assigned as Gap #00175 under Darlington ISR Issue #D063 in the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.12-13]:

ISR Issue #	Gap	Clause
D063	00175	4.1.4

For Gap #00175, the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.12-13] also provided a proposed resolution for compliance:

> *The completion of this Seismic Probabilistic Risk Assessment will provide compliance with CNSC S-294 and is consistent with CAN/CSA-N289.1-08 methods. The Seismic Probabilistic Risk Assessment will confirm the adequacy of the DNGS design to withstand an earthquake, or suggest possible design modifications in order to ensure the proper level of safety is maintained.*
>
> *Management action AR# 28127914 has been raised to track the Darlington Risk Assessment project to completion in order to confirm that it satisfactorily resolved Issue D063.*

Gap #00175 was reclassified as closed with the completion of the Darlington Seismic Probabilistic Risk Assessment (SPRA), which also closed Management action AR# 28127914. Closure of Gap #00175 is documented with the following justification provided in Appendix E of the Darlington Final ISR Report Addendum 002 report NK38-REP-03680-10104-ADD-002 R000 [B.12-14]:

> *In accordance with Clause 5.4 of CSA N289.1-08, an acceptable method of re-evaluating existing Nuclear Plants for seismic considerations is SPRA. SPRA is also an acceptable method of seismic qualification per Clause 5.3.9. The recently issued SPRA, NK38-REP-03611-10051, confirms that the original design and seismic qualification of DNGS provides an adequate level of Safety from the earthquake hazard at the DNGS site.*

Regardless of this change in multiplication factor, the original testing has produced an adequate design and continuing qualification has been confirmed via SPRA.

With closure of Gap #00175 for Darlington supported by its SPRA, there is also no gap for Pickering PSR2 since both Pickering Units 1,4 and Pickering Units 5-8 have recently issued SPRAs.

Following the original code review for the Darlington ISR, a code refresh review based on the latest version of the Standard N289.4-12 [B.12-1] was conducted and documented in OPG Report NK38-REP-03680-10152 R000 [B.12-15]. The code refresh review comprised a clause-by-clause review of all changes in N289.4-12 relative to N289.4-M86 (R2008) [B.12-11]. NK38-REP-03680-10152 R000 concluded the following [B.12-15]:

The review confirms OPG Nuclear governance is in compliance with the changes in the requirements of CSA-N289.4 -12 [R-1] relative to CAN3-N289.4-M86 [R-2] with the exception of one ISR Gap.

The gap identified in NK38-REP-03680-10152 R000 [B.12-15] was assigned as Gap #02041 under Darlington ISR Issue #D427, as indicated below. The scope of this ISR Issue relates to the requirement to account for aging degradation effects that may impair seismic functionality in seismic qualification by testing.

ISR Issue #	Gap	Clause
D427	02041	4.2.6

Darlington ISR Issue #D427 was reclassified as an Acceptable Deviation (AD) in report NK38-REP-03680-0477236 R000 [B.12-16] based on the following rationale:

A review of OPG governance on Integrated Aging Management [R-6] is in place and effective. OPG's commitment [R-8] to using the most current published standard for Testing procedures for seismic qualification of nuclear power plant structures, systems, and components [R-2] will ensure that clause 4.2.6 will be followed. This demonstrates the intent of Clause 4.2.6 of N289.4-12 will be met and concludes that this ISR Issue can be considered an acceptable deviation with no further action required.

The Darlington code refresh demonstrated compliance with Clause 4.2.6 of CSA N289.4-12 using fleet-wide, OPG Nuclear governance documents (including Integrated Aging Management) which are applicable to Pickering. Consequently there is no PSR2 gap related to Clause 4.2.6.

Station-specific documents (including the Darlington seismic design guide, Darlington Reports and Darlington-specific technical specifications for seismic qualification) were used as the basis for compliance in the clause-by-clause Darlington code refresh review for clauses 4.2.1, 4.2.2.2, 4.2.3.1, 4.2.5, 4.3.2, 5.2.2.2.5, 5.7, 5.8.1, 5.8.1.2, 7.2.1, 7.7.1, 7.7.4 and 8.2. Pickering-specific seismic design guides, reports and technical specifications that are equivalent to those used to demonstrate Darlington compliance with the changes made in CSA N289.4-12 were identified. However, a detailed review to confirm that the Pickering-specific documents fully comply with the requirements of the clauses listed above is needed. As a result, this is a PSR2 gap **(PSR2 CSA N289.4-12 Gap #1)**."

In November 2014, a study documented in OPG Report NK38-REP-03680-10197 R001 [B.12-17] examined the aggregate effects of ADs that are related to the seismic, pressure boundary, or accident management programs. The purpose of this study was to determine whether there are aggregate effects of these ADs. This report concluded there were no aggregate effects from ADs associated with the seismic, pressure boundary or accident management barriers and, therefore, no impacts on public safety. The AD related to N289.4-12 [B.12-1] listed above for Darlington ISR Issue #D427 was part of the study.

B.12.2.2 Application of Post-PSR1 Reviews

The CSA N289.4-12 Impact Statement [B.12-4] provides a summary of the significant changes from the previous edition of the Standard:

- The scope has been broadened to have the standard apply to nuclear power plant structure systems and component irrespective of plant design type (technology neutral). This is reflected in the changed title of the standard. This change accommodates non CANDU designs;

- By reference to CSA N289.1-08 and providing detailed guidance in annexes to this standard, qualification by similarity, experience and industry test database has been acknowledged in the standard as being acceptable when justified. This change incorporates the current Canadian and international practice to permit seismic qualification by similarity, experience and industry test database as being acceptable methods. This may result in minimal cost and better use of resources;

- For the SSCs requiring functionality demonstration, preference of qualification by shake testing is emphasized. This change is aligned with recent regulatory documents (e.g. RD-337) and with current international industry practice;

- While retaining the acceptability of seismic testing using single frequency and uni- and bi-axial testing as in the old edition, the new edition emphasises preference for multi-axis random motion that more closely simulates the earthquake motion. This change reflects current industry practice for using multi-axis random motion test methodology that more closely simulates the earthquake motion;

- In recognition of possible high frequency contents in a site-specific ground motion response spectrum (GMRS), the cut-off frequency in testing of equipment that is sensitive to high frequency effects is extended to above 33Hz. This change reflects the recent understanding of the earthquake characteristics in central/eastern North America. The testing requirements and test simulations are required to incorporate high frequency effects;

- The Standard provides more detailed guidance solicited from industry experience to better align and harmonize with the international practices in qualification by seismic testing. This change provides clarity in implementation and streamlined compliance with regulator expectations;

- More detailed requirements for preparation of a test specification, test plan and documentation of a test report have been included in the Standard. The impact of this change is that improved quality of documentation will facilitate engineering work; and

- Additional guidance has been added to the Standard in the annexes on qualification by similarity, qualification by experience database, qualification of valves, qualification of dampers, isolators and dynamic restraints and qualification of cabinet mounted equipment. This change makes the standard more user-friendly.

The Darlington ISR code refresh review based on N289.4-12 discussed earlier addresses these latest changes. The applicability of that work to Pickering was demonstrated in many cases. However, a PSR2 gap was identified to confirm Pickering-specific documents are compliant with 13 clauses that had used Darlington-specific documents as the basis of compliance. The PSR2 gap is identified in Section B.12.2.1.

OPG has committed to submitting to the CNSC annual Code-over-Code reviews to identify significant technical changes to the requirements of the set of engineering design-related code and standard effective dates, as agreed with the CNSC. The code-over-code review methodology documents [B.12-18] and [B.12-19] list Standard N289.4-12 [B.12-1], signifying that future versions of the Standard will be included in subsequent Code-over-Code reviews. A Code-over-Code review of CSA N289.4-12 relative to a more recent version has not been prepared because CSA N289.4-12 is the latest version.

Further, OPG Nuclear Standard N-STD-MP-0025 R001 [B.12-20] sets forth the general integrated approach to seismic requirements for the applicable SSCs within OPG's nuclear facilities. The approach and framework for OPG activities related to the general requirements for seismic design and qualification of OPG nuclear facilities are in accordance with the CSA N289 series of standards.

No additional PSR2 gaps are identified based on the post PSR1 assessments.

B.12.3 Compliance Summary for Pickering PSR2

There is one PSR2 gap for Pickering NGS compliance with CSA N289.4-12 which is applicable to Safety Factor 3:

1. Station-specific documents (including the Darlington seismic design guide, Darlington Reports and Darlington-specific technical specifications for seismic qualification) were used as the basis for compliance in the clause-by-clause Darlington code refresh review for clauses 4.2.1, 4.2.2.2, 4.2.3.1, 4.2.5, 4.3.2, 5.2.2.2.5, 5.7, 5.8.1, 5.8.1.2, 7.2.1, 7.7.1, 7.7.4 and 8.2. Pickering-specific seismic design guides, reports and technical specifications that are equivalent to those used to demonstrate Darlington compliance with the changes made in CSA N289.4-12 were identified. However, a detailed review to confirm that the Pickering-specific documents fully comply with the requirements of the clauses listed above is needed. As a result, this is a PSR2 gap.

B.13 CSA N289.5-12, "Seismic Instrumentation Requirements for CANDU Nuclear Power Plants"

B.13.1 Background

The following paraphrased from the Preface of CSA N289.5-12 [B.13-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *The purpose of CSA N289.5 is to aid nuclear facilities owners in the determination of the extent and nature of instrumentation to be installed. It is also intended to aid owners and equipment suppliers by specifying instrumentation commensurate with Canadian nuclear safety principles.*
>
> *CSA N289.5 provides a basis for specifying requirements for seismic instrumentation to monitor site-specific seismic responses.*

N289.5-12 is directly relevant to Safety Factor 1 (Plant Design) since CNSC web site [B.13-2] identifies the Standard as being relevant to the Safety Control Area on "Physical Design". Also, since this Standard addresses seismic qualification of SSCs, it is applicable to Safety Factor 3 (Equipment Qualification).

CSA N289.5 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.13-3] as "Guidance and Criteria". The current revision of the Standard is N289.5-12 [B.13-1]. It supersedes the previous edition, published in 1991. Changes since the last version of the Standard in 1991 have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements.

The CSA Impact Statement for N289.5-12 [B.13-4] provides a "Summary of significant changes from the previous edition" which identifies several primary changes to the Standard described in Section B.13.2.2 below. In addition to findings resulting from review of the CSA N289.5-12 Impact Statement, the results of PSR1 N289.5 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.13.2.1.

As identified in Reference [B.13-5], the Pickering PSR2 review of CSA N289.5-12 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.13.2 Compliance Assessment for Pickering PSR2

The versions of N289.5 subject to previous reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

B.13.2.1 Application of PSR1 Reviews

Pickering NGS

Pickering Units 5-8

OPG Report NK30-REP-03680-00001 R000 [B.13-6] documents the code review of CSA version N289.5-M91 (R2003) [B.13-7] for the Plant Design Safety Factor. The code review report findings were:

> *The design of the Seismic Monitoring System was evaluated against the Standard CSA N289.5-91 on a clause by clause basis. The Seismic Monitoring System was found to comply with the requirements of the Standard. The one exception to the Seismic Monitoring System is that the system Components are becoming obsolete and the system is experiencing maintainability issues (References 9, 10, 11 and 12). Pickering Engineering is currently reviewing this matter and will be identifying a path forward strategy.*

Appendix B of the Pickering B Integrated Implementation Plan NK30-PLAN-03680-00002 R000 [B.13-8] describes the improvement action G09-01 established to resolve the seismic monitoring equipment upgrade gap. The improvement plan is documented under ISR Issue G9 - Seismic Monitoring System:

> *A Seismic Monitoring System Replacement project was initiated to improve the reliability of the current seismic monitoring system and to address the findings from the CNSC Type 2 inspection of this system. The project scope is to complete the design, procurement, installation, staff training, and testing to upgrade the Seismic Monitoring System to meet the intent of CSA Standard N289.5-M91. The detailed design of the Seismic Monitoring System upgrade is currently in progress and is expected to be completed by March 2012.*

The Pickering Continued Operations Plan (NK30-PLAN-00531-00001 R005 [B.13-9]) states:

> *2014: This action is complete. The new seismic monitoring system was installed, commissioned, and placed in service as documented in P-REP-61150-00002, 'Available For Service Report PN Seismic Monitoring System Replacement Project*

(Syscom Instruments) Project 13·49129 Unit 018', MASTER EC: 111865, DESIGN ECS: 113888, 116978, 113887, 117638. This work was completed by December 6, 2013.

Therefore, there are no PSR2 gaps which result from the Pickering B ISR.

<u>Pickering Units 1,4</u>

For Pickering A Return to Service, the active version of the Standard at the time was CSA N289.5-M91 (R1998) (January 1991) [B.13-10]. Per NA44-CORR-00531-00381 R000 [B.13-11], for this version of the Standard "Pickering A was not reviewed against CSA CAN3-N289.5-M91, because seismic instrumentation has been installed at Pickering site and, therefore, such a review was unnecessary". As noted in the Pickering PROL Renewal Application [B.13-12], for Pickering A the common containment structures were designed to exceed the National Building Code 1965 seismic design provisions and were subsequently confirmed analytically to meet seismic design requirements. No PSR2 gaps are identified based on Pickering A Return to Service assessments.

Darlington NGS

The Darlington ISR was performed using N289.5-M91 (R2008) [B.13-13] and is documented in report NK38-REP-03680-10041 R000 [B.13-14], which notes that this version of the Standard underwent a clause-by-clause (non-PROL) intent review.

The clauses in N289.5 are primarily programmatic from the perspective of the specified requirements. Therefore, significant portions of the Darlington ISR assessment are applicable to Pickering as discussed below.

NK38-REP-03680-10041 R000 found that Darlington NGS is in compliance with all of the clauses of N289.5-M91 (R2008) except the following clauses identified as a gap [B.13-14]:

The review finds that Darlington, for the most part, complies with the standard. However, one gap has been identified. This relates to surveillance Clauses 6.2.2 and 6.2.5 where no evidence of on-power testing or regular scheduled surveillance of the system could be identified in OPG's electronic systems. Commissioning tests were performed and results are available and a Control Maintenance Procedure for testing exists. However, no Preventative Maintenance IDs were identified and no evidence of regular testing could be located.

During the initial ISR Gap resolution process, it was determined that the gap listed above could not be reclassified as compliant. Therefore, the ISR Gap remained for N289.5-M91 as identified in NK38-REP-03680-10041 R000 [B.13-14].

The Darlington ISR gap identified above was assigned to the following Darlington ISR Issue in the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.13-15]:

ISR Issue #	Gap	Clause
D064	00701	6.2.2
	00702	6.2.5

Darlington ISR Issue #D064 is defined as:

> *The gaps in this Issue indicated that on-power testing and routine inspection and recalibration of the entire Seismic Monitoring System was not being done. No scheduled testing or Predefined Maintenance Identifications were identified for the system to demonstrate conformance with the testing requirements.*

Appendix M of the Darlington Final ISR Report NK38-REP-03680-10104 R000 [B.13-15] documents that this Issue has been reclassified as an Acceptable Deviation (AD):

> *Station Condition Record D-2010-11677 was raised following the in-depth scrutiny of the Seismic Monitoring System and addresses this issue. It indicates that immediate action was taken to institute regular weekly walkdowns by the System Responsible Engineer to confirm the status of the Seismic Monitoring System.*
>
> *In addition, Change Request # 2010-00593 has been entered into the Preventive Maintenance Living Program and submitted to set up routine maintenance activities, in accordance with the vendor manual recommendations. By establishing weekly walkdowns, scheduled testing and routine maintenance activities, the Seismic Monitoring System is expected to perform as per design.*
>
> *No further action required. ISR Issue reclassified as an Acceptable Deviation.*

This Darlington ISR gap is potentially applicable to Pickering and was therefore investigated to confirm that seismic instrumentation tests are listed in the Pickering PMIDs. These PMIDs are complete for Pickering NGS per P-REP-61150-00002, "Available for Service Report PN Seismic Monitoring System Replacement Project (Syscom Instruments) Project 13·49129 Unit 018" [B.13-16]. Therefore, this is not a gap for PSR2.

Following the original code review for the Darlington ISR, a code refresh review based on the latest version N289.5-12 [B.13-1] was conducted and documented in OPG Report NK38-REP-03680-10153 R000 [B.13-17]. The code refresh review comprised a clause-by-clause review of all changes in N289.5-12 relative to N289.5-M91 (R2008) [B.13-13]. NK38-REP-03680-10153 R000 found the following:

The changes in the requirements are minor and reflect improvements for clarity or for formatting purposes. The review of the changed clauses in this code review report also confirms that OPG Nuclear governance is in compliance with the requirements of CSA-N289.5 -12 [R-1].

In summary, the review did not identify any additional gaps relative to the requirements of CSA-N289.5-12 [R-1].

OPG Report NK38-REP-03680-10153-ADD-001 R000 [B.13-18] documents the results of a review of Darlington NGS governance regarding seismic qualification against only Clause 5 of N289.5-12 [B.13-1] in response to comments from the CNSC related to the code refresh review report [B.13-17]. The CNSC comment is summarized as follows from OPG Report NK38-REP-00770-0517256 R001 [B.13-19]:

The code refresh report for CSA N289.5-12 did not include a review of Section 5 of the code. Section 5 is titled 'New nuclear power plants and on-site nuclear facilities' and although it would not normally be applicable to an existing station, it is a requirement of the review of modern codes and standards for the Darlington Integrated Safety Review. The code refresh report for CSA N289.5-12 should have included a review of Section 5 of that standard.

NK38-REP-03680-10153-ADD-001 R000 [B.13-18] identified the following gaps against Clause 5 of N289.5-12:

- *Clause 5.1.5: Recording devices installed at Darlington are triggered and not continuous; therefore the intent of this clause is not met.*
- *Clauses 5.2.3.1.2, 5.2.3.2.3 (a) and (c): The intent of these code requirements regarding the number of seismic monitoring system sensors is not met.*
- *Clause 5.2.3.1.9: It could not be confirmed if all accelerometers are free from any strong ambient vibration and/or what measures were taken to ensure that strong ambient vibrations do not preclude recording of earthquake data, therefore the intent of this clause is not met.*
- *Clauses 5.2.3.2.3 (b): There is no remote display and annunciation functions for each reactor unit in the MCR [Main Control Room]. Only the U0 [Unit 0] panel in the MCR has seismic system annunciations available, therefore the intent of this clause is not met.*

The gaps against Clause 5 of N289.5-12 [B.13-18] were closed or reclassified as Acceptable Deviations (ADs) per the following reports:

Issue	Gap	Clause	Status	Reference
D621	02327	5.1.5	Acceptable Deviation	NK38-REP-00770-0528825 R000 [B.13-20]
D622	02328	5.2.3.2.3	Acceptable Deviation	NK38-REP-00770-0528826 R000 [B.13-21]
D623	02329	5.2.3.1.9	Closed	NK38-REP-00770-0528827 R000 [B.13-22]
D624	02330	5.2.3.1.2	Acceptable Deviation	NK38-REP-00770-0528828 R000 [B.13-23]
	02331	5.2.3.2.3 (a)		
	02332	5.2.3.2.3 (b)		

The above gaps against Clause 5 of N289.5-12 [B.13-1] require no further action for Darlington. However, three of these are identified as a PSR2 gap (**PSR2 CSA N289.5 Gap #1**) for the following reasons: (Note: These gaps are closely related and are therefore identified as a single PSR2 gap).

- Darlington ISR Issue D621 refers to specific seismic instrumentation recording device trigger settings for Darlington instrumentation and then classifies the gap as an Acceptable Deviation. Reference [B.13-24] states that the initial setting parameters for the Pickering seismic monitoring system for recording seismic motion (per Master EC 111865 discussed under the Pickering Units 5-8 review section above) were determined to meet the requirements of N289.5-12. Therefore, this is not a gap for PSR2.

- Darlington ISR Issue D622 was deemed to be of low safety significance. The same rationale may apply at Pickering. However, it must first be demonstrated that Pickering has the same set-up of seismic instruments as Unit 0 at Darlington. Therefore, this is a gap for PSR2.

- Darlington ISR Issue D623 was deemed to be of low safety significance. The same rationale may apply at Pickering. However, it must first be demonstrated that similar accelerometers are used at Pickering, and that their locations are not affected by strong ambient vibration. Therefore, this is a gap for Pickering PSR2.

- Darlington ISR Issue D624 refers to specific Darlington instrumentation. It must be demonstrated that Pickering seismic instruments have the same capabilities as the Darlington instruments (fleet-wide or Pickering-specific standards that would ensure that the Pickering seismic instruments have the same capabilities as the Darlington instruments could not be found). Therefore, this is identified as a gap for PSR2.

In November 2014, a study documented in report NK38-REP-03680-10197 R001 [B.13-25] examined the aggregate effects of ADs that are related to the seismic, pressure boundary, or accident management programs. The purpose of this study was to determine whether there are aggregate effects of these ADs. This report concluded there were no aggregate effects from ADs associated with the seismic, pressure boundary or accident management barriers and, therefore, no impacts on public safety. The ADs related to N289.5-M91 (R2008) [B.13-13] (under ISR Issue #D064) and N289.5-12 [B.13-1] (under Issues #D621 to #D624) listed above were not part of the study. Reference [B.13-25] states the following for the exclusion of the ADs under ISR Issue #D064 per report NK38-REP-00770-0421410 R001 [B.13-26]:

> *… there is no potential for this AD to aggregate into a significant impact with another AD related to seismic design because the SMS plays no role in dynamically influencing any seismic safety barriers. It serves primarily to indicate the occurrence of low-level seismic motions, and to record response levels in 9 locations of the station. The recorded dynamic response measurements aid in evaluating the condition of SSCs after seismic events that are less intense than the Design Basis Earthquake level, to establish viability of continued operation.*
>
> *With the implementation of surveillance and maintenance measures, the gaps are no longer present so there is no potential for aggregation.*
>
> *This AD is therefore excluded from further review in this aggregation assessment.*

B.13.2.2 Application of Post-PSR1 Reviews

The CSA Impact Statement for N289.5-12 [B.13-4] provides a summary of the significant changes from the previous edition of the Standard:

- Scope changes from addressing only CANDU nuclear power plants to addressing a range of nuclear facilities including nuclear power plants; small reactors; enriched fuel processing, fuel fabrication, and storage facilities; and high- and intermediate-level radioactive waste storage facilities;
- Seismic instrumentation is now mandatory for nuclear power plants and some other nuclear facilities;
- Seismic instrumentation is not considered a safety related system;
- The minimum requirement for instrumentation is now one instrument at the free field, even in low seismic areas;
- Requires that the instrumentation system operate for the life of the facility including maintenance periods;
- Requires continuous recording devices, as opposed to triggered devices;
- Updates the requirements for the sensor characteristics based on current technology;

- Updates the requirements for the seismic instrumentation system characteristics based on current technology;
- Provides detailed guidance on the number and location of sensors, including multi-unit cases; and
- Additional guidance for design, installation, maintenance, testing, and record keeping.

The Darlington ISR code refresh review based on N289.5-12 discussed earlier addresses these latest changes. Furthermore, the applicability of that work to Pickering was demonstrated. **PSR2 CSA N289.5 Gap #1** resulted from that assessment.

OPG has committed to submitting to the CNSC annual Code-over-Code reviews to identify significant technical changes to the requirements of the set of engineering design-related code and standard effective dates, as agreed with the CNSC. The code-over-code methodology documents [B.13-27] and [B.13-28] list Standard N289.5-12 [B.13-1], signifying that future versions of the Standard will be included in subsequent code-over-code reviews. A Code-over-Code review of CSA N289.5-12 relative to a more recent version has not been prepared because CSA N289.5-12 is the latest version.

Further, OPG Nuclear Standard N-STD-MP-0025 R001 [B.13-29] sets forth the general integrated approach to seismic requirements for the applicable SSCs within OPG's nuclear facilities. The approach and framework for OPG activities related to the general requirements for seismic design and qualification of OPG nuclear facilities are in accordance with the CSA N289 series of standards.

B.13.3 Compliance Summary for Pickering PSR2

There is one PSR2 gap for Pickering NGS compliance with N289.5-12 which is applicable to Safety Factor 3:

1. Darlington ISR Issues #D622, D623 and D624 require no further action for Darlington as they were either classified as Acceptable Deviations or were closed. However, they are identified as a PSR2 gap for the following reasons: (Note: These gaps are closely related and are therefore identified as a single PSR2 gap).

   - Darlington ISR Issue #624 refers to specific Darlington instrumentation in order to classify the gaps as Acceptable Deviations. It must be demonstrated that Pickering seismic instruments have the same capabilities as the Darlington instruments (fleet-wide or Pickering-specific standards that would ensure that the Pickering seismic instruments have the same capabilities as the Darlington instruments could not be found). Therefore, this is identified as a gap for PSR2.

- o Darlington ISR Issue #D622 was deemed to be of low safety significance. The same rationale may apply at Pickering. However, it must first be demonstrated that Pickering has the same set up of seismic instruments as Unit 0 at Darlington. Therefore, this is identified as a gap for PSR2.
- o Darlington ISR Issue #D623 was deemed to be of low safety significance. The same rationale may apply at Pickering. However, it must first be demonstrated that similar accelerometers are used at Pickering, and that their locations are not affected by strong ambient vibration. Therefore, this is identified as a gap for PSR2.

B.14 CSA N285.8-15, "Technical Requirements for In-Service Evaluation of Zirconium Alloy Pressure Tubes in CANDU Reactors"

B.14.1 Background

The following paraphrased from the Preface of CSA N285.8-15 [B.14-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *CSA N285.8 is one of a series of CSA N285 Standards that provide consistent rules for the design, fabrication, installation, inspection, and assessment of pressure-retaining systems and components in CANDU nuclear power plants.*
>
> *The purpose of CSA N285.8 is to ensure structural integrity of cold-worked Zr-2.5 wt% Nb alloy pressure tubes in operating CANDU reactor. CSA N285.8 specifies mandatory technical requirements and non-mandatory evaluation procedures for fitness-for-service assessments. The main body contains the mandatory rules and acceptance criteria for in-service evaluation of zirconium alloy pressure tubes in CANDU reactors. The annexes contain the non-mandatory evaluation procedures, material properties and derived quantities, and a form for providing notification of the evaluation to the authority having jurisdiction.*

N285.8-15 is applicable to zirconium alloy pressure tubes in CANDU reactors, and is relevant to Safety Factor 2 (Actual Condition of SSCs) and Safety Factor 4 (Aging).

CSA N285.8-15 is identified in Appendix E.1 of the R04 Pickering Licence Conditions Handbook [B.14-2] as "Guidance and Criteria". However, Section 7.1 "Programs to ensure Fitness for Service and In-Service Inspection" of the LCH [B.14-2] states: "Where N285.4 refers to N285.8, OPG shall comply with N285.8-10". As discussed in Section B.2, compliance with CSA N285.4 is a licensing requirement and therefore any N285.8-10 call-ups are in practice license requirements.

The current revision of the Standard is N285.8-15 [B.14-1]. This is the third edition of CSA N285.8. It supersedes the previous editions, published in 2010 and 2005. Changes since the 2005 version of the Standard have ranged from editorial, to the addition of supplementary information as well as the addition of new requirements.

The CSA N285.8-15 Impact Statement [B.14-3] provides a "Summary of significant changes from the previous edition" which identifies five primary changes to the Standard which are discussed in Section B.14.2 below. In addition to findings resulting from review of the CSA N285.4-14 Impact Statement, the results of PSR1 N285.8 reviews (Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section B.14.2.

As identified in [B.14-4], the Pickering PSR2 review of CSA N285.8-15 is an Incremental Review. As discussed in Section 2.0 of this Report, PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.14.2 Compliance Assessment for Pickering PSR2

B.14.2.1 Application of PSR1 Reviews

The versions of N285.8 subject to previous reviews conducted for Darlington and Pickering, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

OPG Reports NK30-REP-03680-00001 R000 [B.14-5] and NK30-REP-03680-00002 R000 [B.14-6] document the Pickering B ISR Safety Factor 1 and 2 reviews, respectively, of CSA N285.8-05 [B.14-7]. With respect to the Plant Design Safety Factor, NK30-REP-03680-00001 R000 [B.14-5] concluded that:

> *CSA Standard N285.8-05 does not directly address HT pressure tube design requirements.*
>
> *PNGS B reactors' HT pressure tubes will be replaced during the life extension outage if OPG proceeds with the life extension.*
>
> *Accordingly, a clause by clause review of the CSA Standard N285.8-05 is not required.*

NK30-REP-03680-00001 R000 [B.14-5] recommended the following:

> *OPG should take the opportunity to use current codes and standard when preparing specifications for HT pressure tubes replacement.*

With respect to the Actual Condition of SSCs Safety Factor, NK30-REP-03680-00002 R000 [B.14-6] stated in the Scope section that a review against N285.8-05 for the pressure tubes was unnecessary based on the following rationale:

The fuel channels, pressure tubes, calandria tubes, feeders and steam generators will be replaced during the refurbishment outage for Pickering NGS-B. The condition of these components is well understood and managed through their own specific, detailed life cycle plans and fitness-for-service criteria. As such, an assessment of the current condition of these components is unnecessary and is not included in this report. Since CSA N285.8-05 is only applicable to fuel channels and Clauses 12, 13 and 14 of CSA N285.4-05 only apply to fuel channels, feeders and steam generators, respectively, these are not included in the scope of the review documented in this report. Life Cycle Plans for these components are routinely submitted to the CNSC.

The design basis of the components to be replaced will be reviewed in accordance with N-PROG-MP-0001, "Engineering Change Control" [R-10], as part of the process to prepare detailed procurement specifications for these components. Current expectations are that, at minimum, the materials and/or material properties of these components will differ from components currently installed at Pickering NGS-B. As per N-PROG-MP-0001, the requirements of the versions of codes and standards applicable to Pickering NGS-B at the time will be applied during these design reviews. This includes the codes and standards applicable to maintaining the condition of these components.

Based on the above, no PSR2 gaps are identified based on the Pickering B ISR.

<u>Pickering Units 1,4</u>

Since Pickering A Return to Service [B.14-8] preceded the first edition of N285.8 that was issued in June 2005, no code review of the Standard was performed in support of the Pickering A Restart. However, the results of Darlington ISR N285.8 reviews are assessed for applicability to Pickering NGS below. Further, Section 7.1 "Programs to ensure Fitness for Service and In-Service Inspection" of the Pickering LCH [B.14-2] states:

CNSC staff have accepted the Pickering NGS-A and the Pickering-B NGS PIP documents… With respect to N285.4-05 clause 12.2.5.1.3, CNSC staff have accepted (e-Doc 4280370 and e-Doc 4523259) OPG's revised compliance plan N-REP-31100-10061 R001 (N-CORR00531-06244, e-Doc 4180866 & N-CORR-00531-06522, e-Doc 4447955) for the use of CSA standard N285.8-10 Update 2 "In-Service Evaluation of Zirconium Alloy Pressure Tubes", as the evaluation method used for the fitness-for-service assessment of the Fuel Channels in Pickering A and B units. See Recommendations and Guidance (section "CSA N285.4-05, Clause 12") for more information on how CNSC will be reviewing the probabilistic assessments.

CNSC has accepted (e-Doc 4272552 & 4369355) the OPG proposed "Approach to Fitness for Service Assessment for Pressure Tubes" described in OPG submission N-CORR-00531-06304 (e-Doc 4250561), subject to the conditions described in CNSC letter e-Doc 4369355. With respect to N285.4-05 clause 12.4.4.2, CNSC staff have accepted (e-Doc

3895468) OPG's procedural updates and technical justifications for pressure tube material testing submitted in e-Doc 3848127, N-CORR-00531-05488.

The compliance plan and submissions discussed in the Pickering LCH [B.14-2] are addressed in Section B.14.2.2 below. No PSR2 gaps are identified based on the Pickering A Return to Service.

Darlington NGS

The Darlington ISR was originally performed using version N285.8-05 including Update No. 1 (May 2007) [B.14-9] and documented in OPG Report NK38-REP-03680-10059 R000 [B.14-10], which notes that this version of the Standard underwent a clause-by-clause (non-PROL) review.

The conclusions of the Darlington ISR code review were:

> *A Clause-by-Clause review of CSA N285.8-05 "Technical requirements for in-service evaluation of zirconium alloy pressure tubes in CANDU reactors" (updated May 2007) has been performed in this report. It was found that Darlington Nuclear Generating Station is compliant with all clauses of CSA N285.8-05 except for Clause 6, which has been identified as a gap.*

The gap identified for Clause 6 of N285.8-05 including Update No. 1 (May 2007) was closed in Appendix B of NK38-REP-03680-10059 R000 [B.14-10] as follows:

> *As required by the Darlington NGS Nuclear Power Reactor Operating licence, PROL-13.00/2013 [R-1], Darlington NGS performs pressure tube Periodic Inspections in accordance with the technical requirements provided in CAN/CSA-N285.4 "Periodic inspection of CANDU nuclear power plant components" [R-2].*
>
> *Clause 12 of CAN/CSA-N285.4-09 [R-2] requires that when the results of pressure tube inspection do not satisfy the acceptance criteria, the licensee shall evaluate the inspection results to determine the acceptability for continued operation as per CAN/CSA-N285.8 [R-3]. Currently at Darlington NGS, the pressure tube to calandria tube gap margins are maintained and have not required invoking Clause 6 of the CAN/CSA-N285.8-05 [R-3] standard.*
>
> *However, if gap margins are challenged, then the requirements of Clause 6 of CAN/CSA-N285.8-05 [R-3] would be used for evaluation of pressure tube to calandria tube contact as required by CAN/CSA-N285.4 "Periodic inspection of CANDU nuclear power plant components" [R-2].*
>
> *This issue has therefore been re-categorized as "Closed" and no further action is required.*

However, OPG Report NK38-REP-03680-10059-ADD-001 R000 [B.14-11], which documents the CNSC staff comments and OPG responses related to the N285.8-05 including Update No. 1 code review report [B.14-10], introduced new gaps on some clauses that were previously identified as compliant. The affected clauses were 7.3.3.1, 7.3.3.2, and 7.3.3.3, which were treated collectively as a Gap for inclusion in the gap resolution and issue prioritization process. This remaining gap relates to predicting time to Pressure Tube (PT) - Calandria Tube (CT) contact, using the as-installed locations of tight-fitting annulus spacers in Darlington Fuel Channels (FCs). OPG agreed to treat it as a gap for Clauses 7.3.3.1 through 7.3.3.3 inclusive. This gap is applicable to Pickering NGS. However, OPG has issued a plan for compliance with pressure tube in-service evaluation requirements in N285.8-15 [B.14-1] that addresses this gap as outlined in Section B.14.2.2 below.

A clause-by-clause (non-PROL) code refresh review based on version N285.8-10 [B.14-12] was performed for the Darlington ISR and is documented in report NK38-REP-03680-10140 R000 [B.14-13]. The assessment considered N-PROC-MA-0044 "Fuel Channel Life Cycle Management" [B.14-14], with lower-level disposition processes as directed by N-PROC-MA-0052 "Flaw Dispositioning" [B.14-15]. Future activities to ensure continued compliance are planned and guided by N-PLAN-01060-10002 "Fuel Channel Aging and Life Cycle Management Strategy and Plan" [B.14-16].

The code refresh review determined that only 10 mandatory clauses had revisions compared to version N285.8-05 including Update No. 1 (May 2007). Three are minor non-intent changes, such as the renumbering and reordering of clauses and four were found to be "intent" changes. In addition, Clauses 8.3, 8.4, and 8.5 were found to have technical revisions and also are "intent" changes. For the "intent" changes, Darlington was found to be in compliance both with the four clauses and with Clauses 8.3, 8.4, and 8.5. The conclusions of the code refresh review report [B.14-13] were:

> *Although four clauses in CSA N285.8-10 [R-1] were found to contain "intent" changes in the code review, DNGS was found to be in compliance both with the four clauses and also with three other clauses (8.3, 8.4.and 8.5), which had technical changes.*
>
> *Therefore, no ISR Gaps relative to CSA N285.8 – 10 [R-1] were identified in OPG's governance of the DNGS Pressure Tubes.*

To the extent that the Darlington ISR identified that OPG Nuclear fleet documents are compliant, this conclusion is applicable to Pickering NGS as well. However, since the assessment of Darlington compliance relied in part on Darlington specific analysis reports and component dispositions, a similar assessment is required for Pickering. As discussed in Section B.14.2.2 below, OPG has issued a detailed plan for compliance [B.14-17] with pressure tube in-service evaluation requirements in N285.8-15 [B.14-1] that will address this gap.

B.14.2.2 Application of Post-PSR1 Reviews

The CSA N285.8-15 Impact Statement [B.14-3] provides a summary of the significant changes from the previous edition of the Standard as follows:

- Implementation of statistically based fatigue crack initiation evaluation curves for axial flaws (Clauses D.4.2, D.4.3, and D.3.6): "This change will allow evaluation of fatigue crack initiation in probabilistic core assessments of flaws."
- Implementation of closed-form engineering relation for threshold peak stress for Delayed Hydride Cracking (DHC) initiation (Clauses D.5 and 5.4.3.4): "This change will provide closed-form engineering equations for evaluation of delayed hydride cracking (DHC) for use in probabilistic core assessments of flaws."
- Implementation of statistically based threshold relation for peak stress for crack initiation due to hydrided region overloads (Clause D.5): "This change will allow evaluation of crack initiation due to hydrided region overloads in probabilistic core assessments of flaws."
- Implementation of new fracture toughness models for axial through-wall flaws (Clause D.13.2): "This change will allow predictions of fracture toughness of pressure tubes with low to high levels of hydrogen equivalent concentration."
- Implementation of Methods 1 and 2 Probabilistic Leak-Before-Break (Clauses 3.1, 7.3 and 7.4): "This change will provide specific requirements on performing probabilistic leak-before-break analysis."

Compliance with the above changes has not yet been demonstrated for either Darlington or Pickering. As discussed earlier, the latest clause-by-clause review performed for N285.8 was based on version N285.8-10 [B.14-12] as documented in NK38-REP-03680-10140 R000 [B.14-13], and the above changes to the latest version of the Standard (N285.8-15 [B.14-1]) were therefore not addressed. However, in November 2015 OPG issued Plan N-REP-31100-10061 R002 [B.14-17] for compliance with pressure tube in-service evaluation requirements in N285.8-15 [B.14-1] and submitted the compliance plan to the CNSC for acceptance [B.14-18]. OPG has submitted a previous revision compliance plan for the long term use of the 2010 edition of N285.8 [B.14-19] and this compliance plan was accepted by the CNSC [B.14-20]. The compliance plan was revised to document OPG's compliance to the latest 2015 edition of CSA N285.8 in Reference [B.14-17]:

> *OPG had been using in-service evaluation procedures in the 2010 Edition of CSA Standard N285.8. The 2015 Edition of CSA N285.8 contains updates and improvements for in-service evaluation procedures based on the experience obtained from the use of*

the 2010 Edition as well as recent inspection and R&D results. OPG plans to continue using CSA N285.8 on a long-term basis.

This document outlines OPG's plan for compliance with pressure tube in-service evaluation requirements in CSA N285.8-15, and summarizes OPG's commitments for supporting activities for long-term use of CSA N285.8-15. Submission of this revised CSA N285.8 Compliance Plan is being tracked under CNSC Action Item 2014-OPG-4862.

As identified in N-REP-31100-10061 R002, the purpose of the N285.8-15 compliance plan is to:

- Confirm OPG's continued intention to use CSA N285.8 on a long-term basis;
- Define the evaluation methodology for disposition of pressure tube flaws;
- Define the evaluation methodology for disposition of pressure tube to calandria tube contact;
- Establish a protocol for submission of the future probabilistic core assessment updates; and
- Summarize OPG's commitments for supporting activities for the long-term use of CSA N285.8-15.

Table 2 of N-REP-31100-10061 R002 lists the supporting activities and OPG commitments for long-term use of CSA N285.8. The timeline for submission of the compliance plan was agreed to by the CNSC in Reference [B.14-21]. Table 1 of N-REP-31100-10061 R002 lists the schedule for updating the core assessments for Pickering 1,4 (May 31, 2016) and Pickering Units 5-8 (December 15, 2016). The core assessments for Pickering Units 1,4 were recently submitted to the CNSC in References [B.14-22] and [B.14-23]. Since OPG has committed to fulfilment of the commitments in N-REP-31100-10061 R002 [B.14-17], completion of the above-mentioned Pickering Units 5-8 action is required for Pickering NGS operation past 2020. This is therefore a gap for Pickering PSR2 (**PSR2 CSA N285.8-15 Gap #1**).

B.14.3 Compliance Summary for Pickering PSR2

There is one PSR2 gap for Pickering NGS compliance with N285.8-15 which is applicable to Safety Factor 4:

1. For the Pickering B ISR, no clause-by-clause review of the Standard was conducted on the basis that the pressure tubes will be replaced during the refurbishment outage for Pickering Units 5-8, and the condition of these components is well understood and managed through their own specific, detailed life cycle plans and fitness-for-service criteria. However, in November 2015, OPG issued Plan N-REP-31100-10061 R002 for Pickering NGS compliance with pressure tube in-service evaluation requirements in

CSA N285.8-15 [B.14-1]. OPG had submitted a previous compliance plan for the long term use of the 2010 edition of CSA N285.8 and this compliance plan was accepted by the CNSC. The compliance plan was revised to document OPG's compliance to the 2015 edition of CSA N285.8. Since OPG has committed to fulfillment of the commitments in N-REP-31100-10061 R002, successful fulfillment by OPG of the commitments in the compliance plan is required for Pickering operation past 2020. This is therefore a gap for PSR2. In particular, the significant changes to CSA N285.8-15 per the CSA Impact Statement will need to be reflected in Pickering procedures, including:

- Implementation of statistically based fatigue crack initiation evaluation curves for axial flaws (Clauses D.4.2, D.4.3, and D.3.6);
- Implementation of closed-form engineering relation for threshold peak stress for Delayed Hydride Cracking (DHC) initiation (Clauses D.5 and 5.4.3.4);
- Implementation of statistically based threshold relation for peak stress for crack initiation due to hydrided region overloads (Clause D.5);
- Implementation of new fracture toughness models for axial through-wall flaws (Clause D.13.2); and
- Implementation of Methods 1 and 2 Probabilistic Leak-Before-Break (Clauses 3.1, 7.3 and 7.4).

Dear Mr. Ruffolo,

Re: Pickering PSR2 Law, Regulation, Code and Standard Reviews Associated with Safety Factors 9, 11, and 15

Please find in Attachment A of this letter the reviews of 6 Laws, Regulations, Codes and Standards (L/R/C/Ss) which form part of the Pickering Periodic Safety Review 2 (PSR2) Assessment Basis [1]. Table 1 of this letter identifies the L/R/C/S that were assessed, as well as the modern version and date of each L/R/C/S and the type of review that was completed.

If there are any questions on the attached reviews, please do not hesitate to contact me to discuss.

Sincerely,

SEAN DONNELLY FOR:
Andrew Johnstone

Attachment A: PSR2 L/R/C/S Reviews

The applicable Laws, Regulations, Codes and Standards relevant to PSR2 are listed in the PSR2 Basis Document [A-1]. Table 1 identifies the L/R/C/S addressed in this letter, as well as the modern version and date of each L/R/C/S considered and the type of review performed.

All of the PSR2 reviews are high level or incremental in nature. The definitions of High Level Review and Incremental Review are as follows:

- High Level Review: New L/R/C/Ss not referenced in Pickering Power Reactor Operating License (PROL) 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met; and

- Incremental Review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

The PSR2 incremental reviews in this letter include an assessment of the intent of recent changes to the L/R/C/Ss on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;

- Pertinent background information about the current revision of the L/R/C/S that is being considered;

- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;

- A description of which version(s) of the L/R/C/S were assessed for Periodic Safety Review 1 (PSR1)[1] (i.e., Darlington ISR (for programmatic content), Pickering B ISR and PARTS code reviews);

---

[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5-8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR. These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [A-1].

- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);

- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;

- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and

- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of Pickering NGS compliance with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

The L/R/C/S reviews identify Compliances and Gaps as defined below:

- <u>Compliance</u>:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.
- <u>Gap</u>:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.

A.1 CSA N286-12, “Management System Requirements for Nuclear Facilities”

A.1.1 Background

The following text paraphrased from CSA N286-12 [A.1-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *CSA N286 provides overall direction to management to develop and implement sound management practices and controls, while the other CSA N-Series provide technical requirements and guidance that support the management system. This edition of the standard expands beyond nuclear power plants to include nuclear facilities.*
>
> *CSA N286 identifies management system requirements for Uranium mines and mills, Uranium processing and fuel manufacturing facilities, high energy reactors, research and isotope processing facilities, and radioactive waste management facilities. It integrates the requirements from management system standards for health, safety, environment, security, economics, and quality and is based on the following 12 principles:*
>
> 1. *Safety is the paramount consideration guiding decisions and actions.*
> 2. *The business is defined, planned, and controlled.*
> 3. *The organization is defined and understood.*
> 4. *Resources are managed.*
> 5. *Communication is effective.*
> 6. *Information is managed.*
> 7. *Work is managed.*
> 8. *Problems are identified and resolved.*
> 9. *Changes are controlled.*
> 10. *Assessments are performed.*
> 11. *Experience is sought, shared, and used.*
> 12. *The management system is continually improved.*

Sections 4 and 7 of CSA N286-12 are directly relevant to Safety Factors 10 (Organization, Management System and Culture) and 11 (Procedures). Various clauses of Sections 4 and 7 are also applicable to Safety Factors 5 and 6 (Probabilistic and Deterministic Safety Analysis) and 9 (Use of OPEX). Sections 0 to 3 are introductory. Sections 5, 6 and 8 are specific to other types of facilities and not relevant to PSR2. Section 9 is related to Waste Management, which is not in the scope of PSR2.

Compliance with CSA N286-05 (including Update No. 1) [A.1-2] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Section 2.1 of the R04 Pickering Licence Conditions Handbook (LCH) [A.1-3]. N286-12 is the second edition of this standard which supersedes the previous edition published in 2005 under the title "Management System Requirements for Nuclear Power Plants" [A.1-4], and its Updates No. 1 [A.1-2] and No. 2 [A.1-5]. The 2005 version of N286 superseded the 1992 version of N286.0 [A.1-6] and accompanying standards N286.1 to N286.6 [A.1-7] to [A.1-12].

The CSA Impact Statement notification of the 2012 edition of CSA N286 [A.1-13] provides a "Summary of Significant Changes from the Previous Edition" which identifies four primary changes to the Standard which are discussed in Section A.1.2 below. In addition to findings resulting from review of the CSA N286-12 Impact Statement, the results of PSR1 CSA N286 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have also been assessed for applicability to PSR2 in Section A.1.2.

As identified in Reference [A.1-14], the Pickering PSR2 review of CSA N286-12 is an Incremental Review. PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

A.1.2 Compliance Assessment for Pickering PSR2

A.1.2.1 Application of PSR1 Reviews

The versions of N286 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

For the Pickering B ISR, different versions of N286 were assessed for the Plant Design, Safety Analysis, Safety Performance, Management System and Radiation Protection Safety Factors [A.1-15][A.1-16][A.1-17][A.1-18][A.1-19] as these reports were produced from 2007-2009. The N286 versions reviewed included the versions associated with the Pickering PROL at the time, CSA N286.0-92 [A.1-6] and the associated N286 series standards (References [A.1-7] to [A.1-12]), as well as CSA N286-05 [A.1-4] (both with and without Update No. 1 [A.1-2]). A clause-by-clause review of the applicable clauses of N286-05 (including Update No. 1) [A.1-2] was also performed for the Pickering B ISR by the OPG Performance Improvement & Nuclear Oversight (PINO) group to confirm that OPG Governance adequately addressed the requirements defined in the standard [A.1-20]. In all of these reviews, no compliance gaps were identified.

N-LIST-08130-10023, "CSA N286-05 to OPGN Governance Cross Matrix" [A.1-21] was also prepared in 2009 and last updated in 2012. This list is a controlled document cited in the current (R04) Pickering License Conditions Handbook [A.1-3]. Direct compliance with all applicable clauses of N286-05 was shown.

Pickering Units 1,4

A review of CSA N286 was not performed as part of the Pickering A Return to Service assessments on the basis that it "pertains mostly to quality assurance aspects" [A.1-22]. However, compliance with the N286-05 including Update No. 1 [A.1-2] is a license requirement for Pickering NGS per Section 2.1 of the Pickering License Condition Handbook [A.1-3]. Furthermore, Section 1.0 of Attachment 3 of the Pickering PROL Application P-CORR-00531-03719 R000 states [A.1-23]:

> *The OPG Management System is the framework which establishes the process and programs required to ensure that OPG and Pickering achieves its safety objectives and continuously monitors its performance against these objectives.*
>
> *The OPGN document N-CHAR-AS-0002 Nuclear Management System and referenced supporting documents establish the quality program. The Charter establishes the expectations regarding implementation of the nuclear management system.*
>
> *This Charter and reference documents fulfill the requirements of Canadian Standard Association (CSA) N285 and N286-05 standards, International Organization for Standardization (ISO) 14000 series of standards and American Society of Mechanical Engineers (ASME) NCA 4000. The Charter and the supporting documents identified in N-LIST-08130-10023, CSA N286-05 to OPGN Governance Cross Matrix, demonstrate compliance with CSA N286-05.*
>
> *…In addition nuclear oversight is proactively assessing changes to the CSA N286-05 standard upon release of the next revision to this standard and its impact to the nuclear management system.*
>
> *… Nuclear Organization Standard, N-STD-AS-0020, Nuclear Organization, describes the organization and responsibilities of OPG in support of its Management System and (CSA) N286-05, Management system requirements for nuclear power plants.*

Since compliance with N286-05 (including Update No. 1) [A.1-2] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018), and this is confirmed by review of the Pickering PROL Application, Pickering Units 1,4 and 5-8 are in compliance with N286-05 (including Update No. 1). Further, assessments have been performed for Darlington which are programmatically applicable to Pickering, and which are used to demonstrate Pickering NGS compliance with the latest version of the Standard, as discussed below.

Darlington NGS

The Darlington ISR was originally performed using N286-05 (including Update No. 1) [A.1-2]. The review is documented in Reference [A.1-24] and concluded: "The review did not identify any ISR Gaps and found that Darlington NGS was compliant with CAN/CSA N286-05" [A.1-24].

A Code Refresh Review of the most recent version of the Standard, CSA N286-12 [A.1-1], was also performed for the Darlington ISR in NK38-REP-03680-10142-R000 [A.1-25]. This review concluded:

> *CSA N286-12 has been expanded and the scope broadened to include other nuclear facilities, i.e. uranium mines, mills, processing, fuel facilities and high energy reactor facilities. The overall requirements remain the same in principle but have been generalized to provide specific guiding principles applicable to many types of facilities and operation(s). The review of the updated clauses in this code refresh review report concludes that the Darlington station is in compliance with the updated requirements in CSA N286-12.*

The only recommendation resulting from the code-refresh review was administrative, i.e., "that the 2012 version of N286 be reflected in future updates of the OPG governing documents" [A.1-25].

Since compliance against CSA N286-12 is based on Governance, Programs and Procedures that apply across OPG's Nuclear operations, the Darlington ISR conclusions are applicable to Pickering PSR2.

A.1.2.2 Application of Post-PSR1 Reviews

The CSA Impact Statement notification of the 2012 edition of CSA N286 identifies the following changes from the previous edition (paraphrased) [A.1-13]:

1. *The scope of N286 is expanded to include all class 1 nuclear facilities and uranium mines and mills licensed by the Canadian Nuclear Safety Commission.*

2. *N286-12 was written with full knowledge of the strategy of nuclear power plant operators to move away from performing modification and refurbishment work in-house and contracting the work to Engineer, Procurement and Construction (EPC) suppliers. The wording of N286-12 was modified in many places to eliminate commonly used NPP operations jargon and to not repeat requirements in the licensed control areas that are adequately addressed by license and law (such as radiation protection and security). This makes the majority of N286-12 easier to apply to suppliers than N286-05.*

3. *Annex G was eliminated because it was not being used.*

4. *The standard explicitly integrates the requirements for management systems for health, safety, environment, security, economics and quality.*

5. *The standard addresses the direction from the Nuclear Standards Strategic Steering Committee to be technology neutral, internationally harmonized and reflect best*

industry practices: The standard is technology neutral, and is harmonized with IAEA – GS-R-3 and various international standards (i.e., ISO & OHSAS). The Standard explicitly states requirements for safety culture and includes a principle that "safety is the paramount consideration guiding decisions and actions."

As discussed in Section A.1.2.1 above, the most recent version of the Standard, CSA N286-12 [A.1-1], was assessed for the Darlington ISR (per NK38-REP-03680-10142 R000 [A.1-25]) and there were no gaps. That review is applicable to Pickering NGS. NK38-REP-03680-10142 R000 explicitly addressed the Impact Statement changes identified above, and therefore no additional assessment is required as part of PSR2.

Further, although there is no specific assessment against N286-12 for Pickering, N-LIST-08130-10025, "CSA N286-12 to OPGN Governance Cross-Matrix" [A.1-26] was produced in August 2015 to demonstrate OPG Nuclear fleet compliance with CSA N286-12. Similar to the controlled list prepared for N286-05 (N-LIST-08130-10023 [A.1-21]), this document contains a clause-by-clause listing of CSA N286-12 with cross-references to corresponding OPG governance documents. As shown by this compliance matrix, there are no gaps with respect to the applicable clauses of the CSA N286-12.

A.1.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CSA N286-12 [A.1-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with N286-12.

A.2 CNSC G-129 (2004), "Keeping Radiation Exposures and Doses 'As Low As Reasonably Achievable (ALARA)'"

A.2.1 Background

The following paraphrased from the purpose and scope of CNSC G-129 Revision 1 (2004) [A.2-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *CNSC G-129 describes measures that regulated persons can take for the purpose of keeping the amount of exposure to radon progeny and the effective doses and equivalent doses received by and committed to persons as low as reasonable achievable, social, and economic factors being taken into account (ALARA).*

The standard is applicable in its entirety to Safety Factor 15 (Radiation Protection). Parts of Section 7 related to Operational Review (7.3.2), Documentation (7.5.1) and Radiological Performance Targets (7.5.2), as well as the parts of Section 8 related to Analysis and Rationale Required for Substantiation (8.2 (3), (4), (5) and (6)) are related to Safety Factor 8 (Safety Performance).

CNSC G-129 is identified in Appendix E.2 of the R04 Pickering Licence Conditions Handbook [A.2-2] as "Guidance or Criteria". As indicated in Section 8.1 of the LCH [A.2-2], G-129 is recommended for guidance in "developing, implementing and maintaining a radiation protection program to ensure that exposures will be ALARA".

CNSC G-129 revision 1 [A.2-1] is the second edition of this Regulatory Guide and supersedes the previous edition published in September 1997 under the title "Guidelines on How to Meet the Requirement to Keep All Exposures as Low as Reasonably Achievable" [A.2-3]. The results of PSR1 G-129 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section A.2.2.

As identified in Reference [A.2-4], the Pickering PSR2 review of CNSC G-129 (2004) is an Incremental Review. PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

A.2.2 Compliance Assessment for Pickering PSR2

A.2.2.1 Application of PSR1 Reviews

The versions of G-129 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

Revision 1 of G-129 [A.2-1] was reviewed as part of the Pickering B ISR, with the findings related to the Safety Performance Safety Factor presented in Reference [A.2-6] and with respect to the Radiation Protection Safety Factor presented in Reference [A.2-7]. Based on the review of the implementing program N-PROG-RA-0013 "Radiation Protection" and related OPG standards and procedures, it was concluded that "the overall OPG process for implementing a radiation protection program that keeps radiation exposure and doses ALARA, aligns with the intent of the process described in G-129 Rev. 01" [A.2-6]. No gaps were identified in either review.

Pickering Units 1,4

As part of the code review for Pickering A Return to Service, review of G-129 [A.2-3] was excluded from review on the basis that it "pertains mostly to operations aspect, or other aspects not having a direct or immediate effect on installed design features" [A.2-5]. However, the Pickering B ISR reviewed the latest version of G-129 and the conclusions of that work are applicable across the OPG Nuclear fleet (based on reference to Nuclear Programs such as N-PROG-RA-0013 "Radiation Protection"), including Pickering NGS (Units 1,4 and Units 5-8). Further, an assessment was also performed for Darlington which is programmatically applicable to Pickering, as discussed below.

Darlington NGS

Revision 1 of G-129 [A.2-1] was reviewed as part of the Darlington ISR. Similar to the Pickering B ISR review, it was concluded that "the Darlington Nuclear Generating Station is currently in compliance with CNSC Regulatory Guide G-129 Rev. 1" [A.2-8] based on the existence of suitable OPG Governance, Programs and Procedures. The findings were substantiated through the CNSC staff comments appended to the code review wherein the CNSC concurred with the "Compliant" conclusion based on the high level intent review combined with additional clarification provided in the comment dispositions [A.2-9].

Since compliance against CNSC G-129 is based on Governance, Programs and Procedures that apply across OPG's Nuclear operations, the Darlington ISR conclusions are applicable to Pickering PSR2.

Based on the above, OPG compliance with CNSC G-129 Revision 1 has been demonstrated through past assessments performed for the Pickering B and Darlington ISRs.

A.2.2.2 Application of Post PSR1 Reviews

The version of G-129 assessed in the Pickering B and Darlington ISRs is the most recent version of this guidance document. No additional code reviews have been performed as none were required.

A.2.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CNSC G-129 Revision 1 [A.2-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-129 Revision 1.

[A.2-9] OPG Report, NK38-REP-03680-10052-ADD-001 R000, *Addendum to the CNSC G-129 Code Review Report for Darlington ISR*, January 2014.

A.3 CNSC G-228 (2001), "Developing and Using Action Levels"

A.3.1 Background

The following paraphrased from the purpose and scope of CNSC G-228 (2001) [A.3-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The purpose of CNSC G-228 is to help applicants for Canadian Nuclear Safety Commission (CNSC) licences develop action levels in accordance with paragraph 3(1)(f) on the General Nuclear Safety and Controls Regulations (SOR/2000-202) and Section 6 of the Radiation Protection Regulations (SOR/2000-203).*

CNSC G-228 describes how the licence applicant can develop action levels that provide for the radiation protection of workers and the public during the conduct of activities licensed by the CNSC. G-228 is applicable for Safety Factors 8 (Safety Performance), 14 (Radiological Impact on the Environment) and 15 (Radiation Protection).

CNSC G-228 is identified in Appendix E.2 of the R04 Pickering Licence Conditions Handbook [A.3-2] as "Guidance or Criteria". As indicated in Section 8.1 and 10.2 of the LCH, G-228 "provides the licensees guidance for developing action levels in accordance with the General Nuclear Safety and Control Regulations and Section 6 of the Radiation Protection Regulations" [A.3-2]. CNSC G-228 (2001) is the first edition of this Regulatory Guide. The results of PSR1 G-228 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section A.3.2.

As identified in Reference [A.3-3], the Pickering PSR2 review of CNSC G-228 (2001) is an Incremental Review. PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

A.3.2 Compliance Assessment for Pickering PSR2

A.3.2.1 Application of PSR1 Reviews

The versions of G-228 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

For the Pickering B ISR, Sections 5 and 7 of the latest version of G-228 [A.3-1] were reviewed for the Safety Performance and Radiation Protection Safety Factors as documented in References [A.3-4] and [A.3-5]. These reviews concluded that:

> *The overall OPG process for developing and using action levels aligns with the intent of the process described in G-228. Therefore, Pickering B is judged to be in compliance with the intent of CNSC regulatory guide G-228.*

There is no evidence of a Pickering B ISR review of Section 6 which covers the development, use, revision and monitoring of Action Levels (ALs). However, as discussed further below, Pickering NGS compliance is demonstrated through statements made in the Pickering LCH [A.3-2]. Further, the Darlington ISR review of G-228 covers the full content of G-228 and the conclusions are programmatically applicable to Pickering NGS, as discussed below.

As discussed earlier, compliance with G-228 is not a license requirement for Pickering NGS. However, the document is referenced in the Pickering LCH as a guide to developing action levels. The LCH further states that "the licensee should conduct a documented review and, if necessary, revise the ALs specified above at least once per licence period in order to validate their effectiveness. The results of such reviews should be provided to CNSC staff" [A.3-2]. Pickering NGS adherence with the Environmental Action Limit requirements of G-228 is also confirmed through the following statement in Section 10.2 of the LCH:

> *OPG's EALs (Environmental Action Limits) are documented in the reports NA44-REP-03482-00001 "Derived Release Limits and Environmental Action Levels for Pickering Nuclear Generating Station A", NK30-REP-03482-00001 "Derived Release Limits and Environmental Action Levels for Pickering Nuclear Generating Station B", and P-REP-03482-00001 "Derived Release Limits and Environmental Action Levels for Pickering Nuclear Sewage Effluent", which are consistent with CNSC expectations set out in G-228.*

Pickering Units 1,4

No review was performed for Pickering Units 1,4 against any version of G-228. However, as discussed above, the Pickering B ISR reviewed the latest version of G-228 and the conclusions of that work are applicable to both Pickering Units 1,4 and Units 5-8. An assessment was also performed for Darlington which is programmatically applicable to Pickering, as discussed below.

Darlington NGS

The latest version of G-228 [A.3-1] (the same version reviewed for the Pickering B ISR) was reviewed as part of the Darlington ISR as documented in NK38-REP-03680-10053 [A.3-6]. NK38-REP-03680-10053 assessed Darlington compliance with G-228 by reference to two OPG reports: N-REP-03480-10003 R001, "Environmental Action Levels for Ontario Power Generation Nuclear Generating Stations" [A.3-7], and N-REP-03420-10001 R000, "Occupational Radiation Protection Action Levels for Power Reactor Operating Licences" [A.3-8]. Two observations were made:

1. N-REP-03420-10001 R000, which defines the OPG occupational action levels for inclusion in all OPG Power Reactor Operating Licence submissions, does not include procedures for revising occupational Action Levels [A.3-6].

2. A discrepancy between the reporting time in the as then current procedure in N-REP-03420-10001 and the Darlington Power Reactor Operating Licence [A.3-9] was found wherein the OPG report required notification to the CNSC within 7 days of becoming aware of reaching an Action Level, whereas references in the PROL required notification within three calendar days. This discrepancy was noted by the Health Physics Department and the Darlington PROL reporting requirements took precedence while N-REP-03420-10001 was revised to remove the discrepancy.

NK38-REP-03680-10053 [A.3-6] concluded that neither finding was a compliance gap with CNSC G-228 from a high level intent perspective and stated that "based on a programmatic high-level intent review, Darlington NGS is currently in compliance with CNSC G-228". This is supported by the appended CNSC staff comments [A.3-10]. The reporting time requirement was removed from the subsequent revision of N-REP-03420-10001. In addition, the discrepancy is no longer applicable to Darlington (and is not applicable to Pickering NGS) as the current versions of the Pickering and Darlington PROLs (Condition 8.1) require notification within seven days.

Based on the above, OPG compliance with CNSC G-228 [A.3-1] is demonstrated through the ISR assessments performed for both Pickering B and Darlington, as documented in References [A.3-4] to [A.3-10]. Since compliance against CNSC G-228 is based on Governance, Programs and Procedures that apply across OPG's Nuclear operations, the Darlington ISR conclusions are applicable to Pickering PSR2.

A.3.2.2 Application of Post PSR1 Reviews

The version of CNSC G-228 assessed in the Pickering B and Darlington ISRs is the most recent version of this guidance document. No additional code reviews have been performed as none were required.

A.3.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for CNSC G-228 [A.3-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-228.

A.4 SOR/2000-202, "General Nuclear Safety and Control Regulations" (Amended in June 2015)

A.4.1 Background

The following outline of the General Nuclear Safety and Control Regulations (Amended in June 2015) [A.4-1], paraphrased from the CNSC List of Regulations Website [A.4-2], provides a brief overview of the purpose of the regulation and the information expressed therein:

> *The purpose of the General Nuclear Safety and Control Regulations is to provide general regulations with respect to licence applications and renewals, exemptions, obligations of licensees, prescribed nuclear facilities and equipment and information, contamination, record-keeping, and inspections.*

The General Nuclear Safety and Control Regulations are relevant to Safety Factor 10 (Organization, Management System and Safety Culture) and Safety Factor 15 (Radiation Protection). The General Nuclear Safety and Control Regulations were last amended in June, 2015. The changes made in 2015 include the following [A.4-3]:

1. An update to the referenced Packaging and Transport of Nuclear Substances Regulations, 2015 [A.4-4] with respect to General License Application Requirements (Section 3);

2. Changes to the exemption criteria for naturally occurring nuclear substances (Section 10); and

3. The definition of Prescribed Equipment (Section 20 (a)) with reference to the updated Packaging and Transport of Nuclear Substances Regulations, 2015 [A.4-4].

Other amendments that have been included as previous consolidated versions of the regulations were published and can be found on the Government of Canada Justice Laws Website [A.4-3].

Per Section 2.1 of the R04 Pickering Licence Conditions Handbook [A.4-5]:

> *Paragraphs 3(1)(k) and 15(a) and (b) of the General Nuclear Safety and Control Regulations require that a licence application contain information related to the organizational management structure and responsibilities… An adequately established and implemented management system provides CNSC staff confidence and evidence that the legal basis under which the Commission made its decision and had issued a licence, pursuant the Nuclear Safety and Control Act, remains valid.*

The results of PSR1 General Nuclear Safety and Control Regulations reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section A.4.2. As identified in Reference [A.4-6], the Pickering PSR2 review of the General Nuclear Safety and Control Regulations (Amended in June 2015) is an Incremental Review. PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

A.4.2 Compliance Assessment for Pickering PSR2

A.4.2.1 Application of PSR1 Reviews

The versions of the General Nuclear Safety and Control Regulations (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

The Pickering B ISR included a review of Radiation Protection in OPG Report NK30-REP-03680-00012 R001 [A.4-7]. That review included a clause-by-clause review of the SOR/2000-202 sections that are relevant to Radiation Protection. OPG was in compliance with all clauses.

Pickering Units 1,4

The General Nuclear Safety and Control Regulations were not reviewed as part of the Pickering A RTS assessments.

Section 2.1 of the R04 Pickering Licence Conditions Handbook [A.4-5] states:

> *Paragraphs 3(1)(k) and 15(a) and (b) of the General Nuclear Safety and Control Regulations require that a licence application contain information related to the organizational management structure and responsibilities…*
>
> *Safe and reliable operation requires a commitment and adherence to a set of management system principles and, consistent with those principles, the establishment and implementation of processes that achieve the expected results. The CNSC measures the activities carried out at a nuclear power plant throughout its life cycle against the CSA N286-05 standard, which contains requirements for a management system.*
>
> *A management system brings together in a planned and integrated manner the processes necessary to satisfy requirements and to carry out licensed activity in a safe manner. Management system requirements provide direction to management to develop and implement management practices and controls. The elements of a management system include areas such as organization structure and culture, resources, equipment, and information. Requirements in applicable codes and standards are addressed in the processes comprising the management system. Finally, the management system must satisfy the requirements set out in the NSCA, regulations made pursuant to the NSCA, the licence and the measures necessary to ensure that safety is of paramount consideration in implementation of the management system.*

An adequately established and implemented management system provides CNSC staff confidence and evidence that the legal basis under which the Commission made its decision and had issued a licence, pursuant the Nuclear Safety and Control Act, remains valid.

A compliance review against CSA N286 is assessed as part of PSR2, per Reference [A.4-6].

The Pickering NGS PROL Renewal Application [A.4-8] states:

Table 1 is included for convenience, to assist in locating specific information within the application corresponding to the requirements of the Nuclear Safety and Control Act and applicable Regulations.

Table 1 of [A.4-8] demonstrates where in the PROL application the applicable clauses of the General Nuclear Safety and Control Regulations are addressed. The PROL was issued in part on the basis of the PROL application, which demonstrates that the regulatory requirements have been achieved to the satisfaction of the regulator.

There are no PSR2 gaps.

Darlington NGS

An assessment of compliance with the General Nuclear Safety and Control Regulations (May 2000) was performed for the Darlington ISR in OPG Report NK38-REP-03680-10055 R000 [A.4-9]. The review is applicable to Pickering since the program requirements specified for Darlington are fleet-wide programs. No gaps were identified.

A.4.2.2 Application of Post-PSR1 Reviews

Subsequent to the 2012 Pickering Licence Renewal application [A.4-8], the General Nuclear Safety and Control Regulations were amended in 2015 [A.4-1]. The changes made in 2015 include the following:

1. An update to the referenced Packaging and Transport of Nuclear Substances Regulations, 2015 [A.4-4] with respect to General License Application Requirements (Section 3);

2. Changes to the exemption criteria for naturally occurring nuclear substances (Section 10); and

3. The definition of Prescribed Equipment (Section 20 (a)) with reference to the updated Packaging and Transport of Nuclear Substances Regulations, 2015 [A.4-4].

These amendments have no impact on nuclear safety. Further, the two amendments related to Packaging and Transportation are not part of the scope of PSR2 as described in the PSR2 Basis Document Appendix D [A.4-6].

There are no PSR2 gaps.

A.4.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for the General Nuclear Safety and Control Regulations (Amended in June 2015) [A.4-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the General Nuclear Safety and Control Regulations (Amended in June 2015).

A.5 SOR/2000-203, "Radiation Protection Regulations" (Amended in June 2015)

A.5.1 Background

The following outline of the Radiation Protection Regulations [A.5-1], paraphrased from the CNSC website [A.5-2], provides a brief overview of the purpose of the regulation and the information expressed therein:

> *The purpose of the regulation is to define the "as low as reasonably achievable" (ALARA) principle and regulations for radiation dose limits, action limits, and requirements for labeling and signage, and reports.*

The Radiation Protection Regulations are relevant to Safety Factors 8 (Safety Performance) and 15 (Radiation Protection). The Radiation Protection Regulations were last amended in June, 2015. Sections that have been amended include a citation to the amending Act or regulation. The changes made in 2015 include an update to the referenced Packaging and Transport of Nuclear Substances Regulations, 2015 [A.5-3] with respect to Labelling of Containers and Devices (Section 20, subsection 2). Other amendments from September 2007 have been included as previous consolidated versions of the regulations were published and can be found on the Government of Canada Justice Laws Website [A.5-4].

Per Section 8 of the R04 Pickering Licence Conditions Handbook [A.5-5]: "The Safety and Control Area 'Radiation Protection' covers the implementation of a radiation protection program in accordance with the *Radiation Protection Regulations*. This program must ensure that contamination and radiation doses received are monitored and controlled."

The results of PSR1 Radiation Protection Regulations reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section A.5.2. As identified in Reference [A.5-6], the Pickering PSR2 review of the Radiation Protection Regulations (Amended in June 2015) is an Incremental Review. PSR2 Incremental Review includes an assessment of the intent of recent changes to the L/R/C/S on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

A.5.2 Compliance Assessment for Pickering PSR2

A.5.2.1 Application of PSR1 Reviews

The versions of the Radiation Protection Regulations (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

The Pickering B ISR included a review of Radiation Protection in OPG Report NK30-REP-03680-00012 R001 [A.5-7]. That review included a clause-by-clause review of the SOR/2000-203 (May 2000) sections that are relevant to Radiation Protection. OPG was in compliance with all clauses with the exception of the following two clauses, which were classed as acceptable deviations:

> *(1) SOR/2000-203 Clause 20 (1) (a): A container or device that contains a radioactive nuclear substance must be labeled with the words, "RAYONNEMENT – DANGER – RADIATION".*
>
> *(2) SOR/2000-203 Clause 21 (1): Hazard warning signs must contain the words, "RAYONNEMENT – DANGER – RADIATION".*

OPG container, device and hazard warning labels and signage at Pickering are not in compliance with the wording required in the Radiation Protection Regulations. Pickering labels and signage do not contain the words *"RAYONNEMENT – DANGER – RADIATION".* These signage wording differences were considered to be acceptable following the 2009 Pickering B ISR [A.5-7]. However as noted below, Darlington has committed to amending signage to align with the wording in the Radiation Protection Regulations which included actions for aligning Pickering U1,4 and U5-8 signage with the regulatory requirements [A.5-8]. All actions associated with the Regulatory Management Action # 28101238 open to track the commitment have been completed, as reported to the CNSC in status update N-CORR-00531-06042, "Radiation Labelling and Posting" [A.5-9]. As such, there are no outstanding gaps from the Pickering B ISR that are applicable to Pickering PSR2.

Pickering Units 1,4

The Radiation Protection Regulations were not part of the Pickering A Return to Service assessments. However, the Pickering NGS PROL Renewal Application [A.5-10] states:

> *Table 1 is included for convenience, to assist in locating specific information within the application corresponding to the requirements of the Nuclear Safety and Control Act and applicable Regulations.*

Table 1 of [A.5-10] demonstrates where in the PROL application the applicable clauses of the Radiation Protection Regulations are addressed. The PROL was issued in part on the basis of the PROL application, which demonstrates that the regulatory requirements have been achieved to the satisfaction of the regulator.

Therefore, there is no PSR2 gap.

Darlington NGS

A clause-by-clause review of the Radiation Protection Regulations (Amended September 2007)[2] was performed during the Darlington ISR in OPG Report NK38-REP-03680-10056 R000 [A.5-11]. Darlington was determined to be in compliance with the exception of gaps related to signage. The following is quoted from reference [A.5-11]:

1. *Clause 20 of SOR/2000-203 states "… No person shall possess a container or device that contains a radioactive nuclear substance unless the container or device is labelled with (a) the radiation warning symbol set out in Schedule 3 and the words "RAYONNEMENT - DANGER - RADIATION"; …"*

   Requirements for labelling of containers or devices are detailed in Section 1.4 of the OPG procedure N-PROC-RA-0024 R014, "Hazard Surveys, Posting, Labelling and Radiological Log."

   The labels referred to (OPG form N-FORM-10076 R003, "Radioactive Material Tag" and OPG form N-FORM-10017 R0001, "Licensed Radioisotope Source Inventory Control Label") indicate the appropriate radiation hazards. However, they do not currently have the words RAYONNEMENT - DANGER - RADIATION" as specified in Schedule 3 of SOR/2000-203.

2. *Clause 21 of SOR/2000-203 states "Every licensee shall post and keep posted, at the boundary of and at every point of access to an area, room or enclosure, a durable and legible sign that bears the radiation warning symbol set out in Schedule 3 and the words "RAYONNEMENT-DANGER-RADIATION", if;*

   (a) there is a radioactive nuclear substance in a quantity greater than 100 times its exemption quantity in the area, room or enclosure; or

   (b) there is a reasonable probability that a person in the area, room or enclosure will be exposed to an effective dose rate greater than 25 µSv/h."

   Requirements for posting of signs at boundaries and points of access are detailed in Section 1.3 of the OPG procedure N-PROC-RA-0024 R014, "Hazard Surveys, Posting, Labelling and Radiological Log". The signs used by OPG indicate the appropriate radiation hazards. However, the words "RAYONNEMENT-DANGER-RADIATION" are not currently specified as a requirement.

3. *Also in relation to clause 21, specifically sub-clause (a), Airborne and loose surface contamination levels are included; however relation to exemption quantities for radioactive nuclear substances is not specified.*

In the Darlington ISR Report [A.5-13], Issue D157 was assigned to the label and signage gaps (i.e. the fact that Darlington labels and signage do not include the words *"RAYONNEMENT-DANGER-RADIATION"* as required by the Radiation Protection Regulations). The gaps were

---

[2] The clause-by-clause review states that SOR/2000-203 (May 2000) was reviewed. Although the latest amendment date of the regulations is not specified in the code review report, the reviewed clauses include the amendments from September 2007 [A.5-12].

addressed with OPG actions to update the Darlington Radiation signs and labels, and the associated procedures. The ISR issue was reclassified as an Acceptable Deviation. Regulatory Management Action # 28101238 was opened to track actions committed to in OPG Letter N-CORR-00531-04586, "Radiation Labelling and Posting" [A.5-8]. The AR included actions for aligning Pickering U1,4 and U5-8 labels to comply with the Radiation Protection Regulations. All actions to align the Pickering and Darlington labelling with the regulatory requirements have been completed, as reported to the CNSC in the status update N-CORR-00531-06042, "Radiation Labelling and Posting" [A.5-9]. Furthermore, the Darlington ISR gap related to Clause 21, sub-clause (a) was assigned to Issue D275, which was classified as Closed since the requirements were met by Section 1.6.2 of N-PROC-RA-0016, per the Darlington Final ISR Report [A.5-13]. As such, there are no outstanding gaps from the Darlington ISR that are applicable to Pickering PSR2.

Since compliance against SOR/2000-203 (Amended September 2007) is based on Governance, Programs and Procedures that apply across OPG's Nuclear operations, the Darlington ISR conclusions are applicable to Pickering PSR2.

A.5.2.2 Application of Post-PSR1 Reviews

Subsequent to the Darlington ISR review of SOR/2000-203 (Amended September 2007), a change was made in 2015 to update the referenced Packaging and Transport of Nuclear Substances Regulations [A.5-3] in Section 20, subsection 2 of SOR/2000-203, which relates to Labelling of Containers and Devices. This Amendment is not safety significant. Further, Packaging and Transportation are not part of PSR2 scope as described in PSR2 Basis Document Appendix D [A.5-6]. Therefore, there is no PSR2 gap.

A.5.3 Compliance Summary for Pickering PSR2

There are no PSR2 gaps for the Radiation Protection Regulations (Amended June 2015) [A.5-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the Radiation Protection Regulations (Amended June 2015).

A.6 CNSC REGDOC-2.2.3 (2014), "Personnel Certification: Radiation Safety Officers"

A.6.1 Background

The following paraphrased from the purpose and scope of CNSC REGDOC-2.2.3 (2014) [A.6-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *REGDOC-2.2.3 sets out guidance to assist applicants in completing an application for certification as a Radiation Safety Officer (RSO) pursuant to the Class II Nuclear Facilities and Prescribed Equipment Regulations.*
>
> *REGDOC-2.2.3 is based on the Nuclear Safety and Control Act (NSCA) and its regulations, which are administered by the CNSC. The document provides detailed information about the completion of an application and the process for the RSO certification. The document explains what is needed in an application form, in order to assess if the applicant has the qualifications necessary to be certified as a RSO. The information submitted will also help the CNSC plan and conduct the certification examination. Any information which is submitted may subsequently be referred to in the RSO certificate. It then becomes a requirement of the certificate, and is thus legally binding.*

REGDOC-2.2.3 is relevant to Safety Factor 15 (Radiation Protection). REGDOC-2.2.3 is not discussed in the R04 Pickering Licence Conditions Handbook [A.6-2]. As discussed in Sections A.6.2 and A.6.3 below, there is no Class II nuclear facility or prescribed equipment at Pickering NGS.

As identified in Reference [A.6-3], the Pickering PSR2 review of CNSC REGDOC-2.2.3 (2014) is a High Level review. For a PSR2 High Level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the intent of the safety requirement is met.
- <u>Gap</u>: A Gap indicates that the intent of the safety requirement is not met.

A.6.2 Compliance Assessment for Pickering PSR2

A.6.2.1 Application of PSR1 Reviews

Pickering NGS

There was no PSR1 compliance review done for Pickering NGS against REGDOC-2.2.3. Compliance with REGDOC-2.2.3 is only applicable if the facility operator has a Class II nuclear facility or prescribed equipment licence. There are no such licences issued for any Class II activities at the Pickering site.

Darlington NGS

There was no PSR1 compliance review done for Darlington ISR against REGDOC-2.2.3.

A.6.2.2 Application of the Post-PSR1 Reviews

Compliance with REGDOC-2.2.3 is a licence condition for operators of Class II facilities. OPG has one such facility located in the Common Service Area of the Darlington Plant [A.6-4]. Per REGDOC-2.2.3, if an individual has the responsibilities and authorization to be a Responsible Health Physicist (RHP) for a facility, the individual may also be authorized as a RSO per section 1.3 of [A.6-1]:

> *In accordance with section 15.12 of the Class II Nuclear Facilities and Prescribed Equipment Regulations, a licensee does not need to appoint a RSO for a Class II facility if a person who has duties equivalent to that of a RSO has been designated and that person is certified under subsection 9(2) of the Class I Nuclear Facilities Regulations.*

In addition to the above designation of RSOs, the appendix of Reference [A.6-4] identifies the documents in support of the licence. The primary reference relating to the Class II facility operation is [A.6-5]. The RSO accountabilities and responsibilities are detailed in Section 1.2.1 of [A.6-5] with further details provided in [A.6-6].

A.6.3 Compliance Assessment Summary for Pickering PSR2

There is no Class II nuclear facility or prescribed equipment at Pickering NGS and there is no requirement to have a Radiation Safety Officer. Hence, a high level review of REGDOC-2.2.3 is not required because REGDOC-2.2.3 is not applicable to Pickering PSR2.

Revision Summary – For Amec Foster Wheeler Report PS112/RP/011

Rev	Date	Author	Comments
R00	December 12, 2016	Amec Foster Wheeler Staff	Initial issue of report addressing OPG comments on Law, Regulation, Code and Standard reviews.

EXECUTIVE SUMMARY

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020. The PSR (referred to as "PSR2") is a subsequent PSR building on the review basis of earlier OPG Integrated Safety Reviews and other associated assessments. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant, and that are applicable to the PSR2 scope. The identification and selection criteria are detailed in the PSR2 Basis Document [1]. The result of the identification and selection process was a set of modern L/R/C/Ss that became part of the "PSR2 Assessment Basis". This report provides the reviews of L/R/C/Ss that are required to address PSR2 Safety Factors 8 (Safety Performance), 10 (Organization, Management System, and Safety Culture), 12 (Human Factors), 13 (Emergency Planning), and 14 (Radiological Impact on the Environment). As noted in Section 2.0, reviews of several L/R/C/Ss applicable to Safety Factors 8, 10 and 14 were provided in Reference [4] and findings from these reviews are not duplicated in this report. There is also some overlap with other Safety Factors for a number of L/R/C/Ss considered, as outlined in Table 1 in Section 2.0 of this report.

The summary of findings documented in Appendix B of this report is as follows:

- CSA N290.15-10, "Requirements for the Safe Operating Envelope of Nuclear Power Plants": No gaps.

- CSA N286.7-16, "Quality Assurance of Analytical, Scientific and Design Computer Programs": No gaps.

- CSA N288.1-14, "Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities": No gaps.

- CSA N288.4-10, “Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills”: No gaps.

- CSA N293-12, “Fire Protection for Nuclear Power Plants”: Results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report.

- CNSC RD-204 (2008), “Certification of Persons Working at Nuclear Power Plants”: No gaps.

- CNSC REGDOC-3.1.1 (2014), “Reporting Requirements for Nuclear Power Plants”: No gaps.

- CNSC REGDOC-2.9.1 (2013), “Environmental Protection Policies, Programs and Procedures”: No gaps.

- CNSC REGDOC-2.10.1 (2014), “Nuclear Emergency Preparedness and Response”: There is one gap associated with Safety Factor 13.

- CNSC G-323 (2007), “Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement”: No gaps.

- CNSC G-278 (2003), “Human Factors Verification and Validation Plans”: No gaps.

- CNSC G-276 (2003), “Human Factors Engineering Program Plans”: No gaps.

- S.C. 1997, C.9 (Amended in February 2015), “Nuclear Safety and Control Act”: No gaps.

- CSA N1600-14, “General Requirements for Nuclear Emergency Management Programs”: No gaps.

- CSA N288.6-12, “Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills”: No gaps.

- CSA N288.5-11, “Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills”: No gaps.

- CNSC REGDOC-2.2.2 (2014), “Personnel Training”: No gaps.

- CNSC REGDOC-2.3.2 (2015), “Accident Management, Version 2”: There are no gaps associated with Safety Factors 8, 10, 12, 13 and 14. However, there is one gap associated with Safety Factor 1.

- CNSC REGDOC-2.3.3 (2015), “Periodic Safety Reviews”: No gaps.

- CSA N286.7.1-09, “Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants”: An assessment of N286.7.1-09 was not performed. Relevant guidance from N286.7.1-09 has been amalgamated into CSA N286.7-16, which was reviewed for PSR2.

- CSA N290.12-14, “Human Factors in Design for Nuclear Power Plants”: No gaps.
- CSA N288.3.4-13, “Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities”: No gaps.
- CSA N288.7-15, “Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills”: No gaps.

Details of the reviews can be found in Table 2 and Appendix B of this report.

TABLE OF CONTENTS

Page

LIST OF TABLES

1.0 INTRODUCTION

Ontario Power Generation (OPG) is performing a Periodic Safety Review (PSR) to support the possibility of continued operation of Pickering Nuclear Generating Station (NGS) beyond 2020.[1] A comprehensive Integrated Safety Review (ISR) was completed for Pickering Units 5 through 8 in 2009 in support of refurbishment and continued operation. Pickering Units 1,4 integrated safety assessments were also performed for Pickering A Return to Service (PARTS) in support of approval to restart Units 1 and 4. In addition to these Pickering-specific studies, the 2013 Darlington ISR performed extensive code and standard reviews that were updated in relation to the versions that were assessed in the 2009 Pickering B ISR.[2] These previous ISRs are considered to constitute the first PSR completed for Pickering (referred to as "PSR1"). The current PSR (referred to as "PSR2") is a subsequent PSR building on the basis of earlier OPG integrated safety assessments through review of the various studies, assessments and licence renewals performed since PSR1. The PSR2 scope and methodology are described in the Pickering PSR2 Basis Document [1].

PSR2 will support and complement the licence renewal application for Pickering NGS going forward. Fifteen Safety Factors will be assessed as part of the PSR. The purpose of Safety Factor reviews is to confirm that the design, condition and operation of Pickering Units 1,4 and 5-8 (as well as common systems) will support continued safe operation for the period of PSR2 by:

- Assessing compliance against "Review Tasks" identified in the PSR2 Basis Document [1], which were derived from Canadian Nuclear Safety Commission (CNSC) REGDOC-2.3.3 [2] and International Atomic Energy Agency (IAEA) SSG-25 [3];

- Documenting assessments against applicable modern Laws, Regulations, Codes and Standards (L/R/C/Ss) (as defined in Reference [1]); and

- Reviewing the effectiveness of applicable OPG Nuclear Programs that support the above assessments, through review of audit and self-assessment results.

The process to identify the modern L/R/C/Ss that are applicable to the PSR2 Assessment Basis involved first creating a broad list from multiple sources (potential candidate L/R/C/Ss) and then filtering it to identify those that are most significant, and

---

1 Currently, Pickering Units 5-8 are approved to operate to 247,000 Effective Full Power Hours. This operation limit is expected to be reached on some units in 2020. For the purposes of PSR2, OPG assumes operation of Pickering NGS for up to eight additional years, from 2020 until 2028. OPG will make a decision regarding the permanent shut down dates for the six reactors following the performance of a technical evaluation that will include PSR2, and will communicate it to the CNSC as required by the current Power Reactor Operating Licence (PROL).

2 Much of the compliance assessment and evaluation of Safety Factor health for the Darlington ISR is based on programs and practices that apply across OPG's nuclear operations. As a result, where Pickering is confirmed to follow the same nuclear programs and practices as were assessed for Darlington, the Darlington ISR programmatic conclusions are applicable to Pickering.

that are applicable to the PSR2 scope. The identification and selection criteria are detailed in the PSR2 Basis Document [1]. The result of the identification and selection process was a set of modern Laws, Regulations, Codes and Standards that became part of the "PSR2 Assessment Basis". The PSR2 Basis Document also identifies the modern version and date of the L/R/C/S and the type of review that will be completed in PSR2. The types of review are explained in Section 2.0 below.

This report provides the reviews of L/R/C/Ss with content applicable to Safety Factors 8 (Safety Performance), 10 (Organization, Management System and Safety Culture), 12 (Human Factors), 13 (Emergency Planning), and 14 (Radiological Impact on the Environment). As noted in Section 2.0, reviews of several L/R/C/Ss applicable to Safety Factors 8, 10 and 14 were provided in Reference [4] and findings from these reviews are not duplicated in this report. There is also some overlap with other Safety Factors for a number of L/R/C/Ss considered, as outlined in Table 1 in Section 2.0 of this report.

As outlined in IAEA SSG-25 [3], the objectives of these Safety Factor reviews are as follows:

- The objective of the review of Safety Factor 8 is to determine whether the plant's safety performance indicators and records of operating experience, including the evaluation of root causes of plant events, indicate any need for safety improvements.

- The objective of the review of Safety Factor 10 is to determine whether the organization, management system, and safety culture are adequate and effective for ensuring the safe operation of the plant.

- The objective of the review of Safety Factor 12 is to evaluate the various human factors that may affect the safe operation of the nuclear power plant and to seek to identify improvements that are reasonable and practicable.

- The objective of the review of Safety Factor 13 is to determine: (a) whether the operating organization has in place adequate plans, staff, facilities and equipment for dealing with emergencies; and (b) whether the operating organization's arrangements have been adequately coordinated with the arrangements of local and national authorities and are regularly exercised.

- The objective of the review of Safety Factor 14 is to determine whether the operating organization has an adequate and effective programme for monitoring the radiological impact of the plant on the environment, which ensures that emissions are properly controlled and are as low as reasonably achievable.

2.0 REVIEW SCOPE AND METHODOLOGY

PSR2 is focused on the extension of Pickering NGS operations beyond 2020. Thus, it is important that the methodology for PSR2 be focused on addressing aspects of the review that are likely to have material impact in terms of identifying enhancements that will be reasonable and practicable to implement during the remaining commercial life of the plant. PSR2 conducts reviews against a baseline of the PSR1 work. It is important to note that OPG conducts regular reviews of new and revised Codes and Standards, so a large amount of information is already available to assist in the Safety Factor reviews. In OPG letter N-CORR-00531-05661, W.M. Elliott to P.A Webster and M. Santini, "Design Codes and Standards Effective Dates for OPG Nuclear Fleet" [5], OPG stated:

> *OPG commits to completing a code-over-code review (i.e., review of changes) of subsequent editions, addendum and/or updates of the Codes and Standards listed in Attachment 1* [of the referenced document]*. Key emerging issues due to major changes in the codes will be addressed immediately, or as agreed with the CNSC on a case-by-case basis. Otherwise, OPG will confirm in a letter to the CNSC that these reviews have been completed and there are no significant technical issues...*

As a result, many of the updated codes and standards issued since PSR1 have already had gap assessments performed, to varying degrees of detail, which are utilized and cited in the present Pickering PSR2.

As a subsequent PSR, PSR2 focuses on changes in requirements, plant conditions, operating experience and new information. Since PSR2 is an update of previous ISRs, it incorporates reviews of L/R/C/Ss that have occurred as new versions have been issued. Therefore, clause-by-clause reviews of the majority of applicable L/R/C/Ss have already been completed and there is little value in repeating that process. If clause-by-clause reviews were to be undertaken in PSR2, a major portion of the review effort would be consumed by repackaging existing information that remains largely applicable and, therefore, is not contributing to the identification of new insights and enhancements. A more constructive approach is therefore applied that maximizes the value and usefulness of the work by focusing attention where it is most beneficial, i.e., on identifying new issues. The primary objective for this work, which is to identify safety significant enhancements that may be implemented during the limited remaining life of the station, is achieved using this process and is expected to result in the same (safety significant) Global Issues being identified as would result from a clause-by-clause assessment.

Since this assessment is a subsequent PSR, the focus is on identifying differences between what was previously assessed and what is now different within the current Pickering PSR2 Assessment Basis. In general, these differences relate to:

- More recent (new or revised) L/R/C/S versions than what was previously assessed;[3]

- Safety significant differences between Pickering and Darlington, if the Darlington ISR is the basis for the earlier assessment;

- Implications of extending Pickering NGS operation beyond 2020; and

- Safety significant differences between Pickering Units 1,4 and Units 5-8.

In most cases L/R/C/S reviews are incremental in nature and performed by topic or subject matter for revised requirements. The rationale for this is that new or updated requirements that need to be included in PSR2 are predominantly replacements for other L/R/C/S that were previously assessed, and specify requirements that can be readily mapped to existing OPG programs.

To align with the goals of a subsequent PSR, the following three tiers of reviews are applied for PSR2:

- Clause-by-Clause review: New L/R/C/S referenced in Pickering PROL 48.02/2018 (listed in Appendix C of the Licence Conditions Handbook) will be subjected to a clause-by-clause type review. In a clause-by-clause review, conformance with individual clauses is demonstrated by supporting evidence stating whether the requirements stipulated in the requirement document are met;

- High Level review: New L/R/C/S not referenced in Pickering PROL 48.02/2018 but which are in the PSR2 Assessment Basis will be subject to a high level review. In a high level review, the degree of conformance with clauses or groups of clauses in the L/R/C/S is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document are met; and

- Incremental review: For L/R/C/Ss that have been reviewed in PSR1 but have had revisions since the last review, a topical review will be performed of the changes.

Most of the L/R/C/Ss in the PSR2 Assessment Basis receive incremental reviews since PSR2 is an update of previous PSR1 assessments and clause-by-clause or high level reviews for the majority of the L/R/C/Ss in the PSR2 Assessment Basis have already been completed. Implementation plans (including gap analyses or code-over-code reviews) also exist for the latest editions of many L/R/C/Ss. As a result, an

[3] "New" refers to a code or standard that was not previously considered in the context of earlier assessments. "Revised" refers to an updated version of a code or standard that was previously considered in the context of earlier assessments. Where a document has a new number/type, but addresses the same topic from the same organization, it is a "revised", not "new", document (e.g., if a REGDOC replaces a CNSC G or RD document).

incremental review is also used in circumstances where a L/R/C/S in the PSR2 Assessment Basis was not assessed in previous PSR1 reviews but an implementation plan currently exists for compliance.

The PSR2 incremental reviews in this report include an assessment of the intent of recent changes to the L/R/C/Ss identified in Table 1 on a topic or subject-matter basis where there is potential to impact nuclear safety. Incremental reviews provide:

- A summary of the purpose of the L/R/C/S;
- Pertinent background information about the current revision of the L/R/C/S that is being considered;
- Identification of which Safety Factor(s) are applicable to the current revision of the L/R/C/S;
- A description of which version(s) of the L/R/C/S were assessed for PSR1 (i.e., Darlington ISR (where applicable), Pickering B ISR and PARTS code reviews);
- Identification of whether the current version of the L/R/C/S is an update of a previous version of the L/R/C/S that was assessed in PSR1 (and if so, a description of the major changes in the latest revision is provided as discussed below);
- An assessment of the applicability of PSR1 assessment findings (gaps and conclusions), including the implications of extending Pickering NGS operation beyond 2020 if any;
- An assessment of the applicability of assessment findings that address more recent (post-PSR1) editions of the L/R/C/S, including any implementation or transition plans that are already committed to by OPG; and
- Where PSR1 and post-PSR1 assessments are not sufficient to address changes in the latest edition of the L/R/C/S, an assessment of the changes from the previously assessed edition of the L/R/C/S (including identification of any safety significant PSR2 gaps which result).

High Level reviews provide the same information as above, where applicable, in a similar format. However, given that High Level L/R/C/Ss generally have not received past assessment during PSR1, the Incremental review content is augmented by a high level, section-by-section assessment of the degree of conformance of Pickering NGS with the L/R/C/S (demonstrating, with supporting evidence, whether the intent of the requirements stipulated in the document are met).

There are currently no L/R/C/S clause-by-clause reviews identified in the PSR2 Assessment Basis.

The Safety Factor 8, 10, 12, 13 and 14 L/R/C/S reviews identify Compliances and Gaps as defined below:

- Compliance:
    - Where an Incremental review has been performed, Compliance indicates that the change in the safety requirement, per the topical review, is met.
    - Where a High Level review has been performed, Compliance indicates that the intent of the safety requirement is met.
- Gap:
    - Where an Incremental review has been performed, a Gap indicates that the change in the safety requirement, per the topical review, is not met.
    - Where a High Level review has been performed, a Gap indicates that the intent of the safety requirement is not met.

The reviews assume that use of the word:

- "Shall" is used in an L/R/C/S to express a requirement, i.e., a provision that the licensee is obliged to satisfy in order to comply with the standard;
- "Should" is used to express a recommendation or that which is advised but not required;
- "May" is used to express an option or that which is permissible within the limits of the standard; and
- "Can" is used to express possibility or capability.

Table 1 identifies the L/R/C/Ss in the PSR2 Assessment Basis that are applicable to Safety Factors 8, 10, 12, 13, and 14, with several exceptions discussed below. Table 1 also identifies the modern version and date of each L/R/C/S to be considered, the Safety Factor(s) to which each document is applicable, and the type of review that will be completed in PSR2. Reviews for each L/R/C/S are provided in Appendix B, and results are summarized in Section 3.0.

Several L/R/C/Ss applicable to Safety Factors 8, 10 and 14 are excluded from Table 1 below. Specifically:

- CNSC G-129, "Keeping Radiation Exposures and Doses 'As Low As Reasonably Achievable (ALARA)'", and SOR/2000-203, "Radiation Protection Regulations", which are applicable to Safety Factor 8.

- CNSC G-228, “Developing and Using Action Levels”, which is applicable to Safety Factors 8 and 14.

- CSA N286-12, “Management System Requirements for Nuclear Facilities” and SOR/2000-202, “General Nuclear Safety and Control Regulations”, which are applicable to Safety Factor 10.

The reviews for the above L/R/C/Ss are provided in Reference [4] and findings are not duplicated in this report.

Table 1: Applicable L/R/C/Ss for Pickering PSR2 Safety Factors 8, 10, 12, 13, and 14

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
L/R/C/Ss Referenced in Pickering NGS PROL 48.02/2018						
1	CSA N290.15	Requirements for the Safe Operating Envelope of Nuclear Power Plants	N290.15-10	8	Incremental	N290.15 not addressed as part of Pickering B or Darlington ISRs, but gap analysis has been performed against OPG Governance and N290.15.
2	CSA N286.7	Quality Assurance Of Analytical, Scientific And Design Computer Programs	N286.7-16	1, 5, 6, 7, 10	Incremental	N286.7 addressed as part of Pickering B and Darlington ISRs.
3	CSA N288.1	Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities	N288.1-14	8, 14	Incremental	N288.1 addressed as part of Pickering B and Darlington ISRs.
4	CSA N288.4	Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills	N288.4-10	8, 14	Incremental	N288.4 addressed as part of Pickering B and Darlington ISRs.
5	CSA N293 [4]	Fire Protection for Nuclear Power Plants	N293-12	1, 7, 13	Incremental	N293 addressed as part of Pickering B and Darlington ISRs, as well as PARTS code reviews.

[4] The PSR2 review of CSA N293-12 is in progress. Gaps identified from this review will be applicable to the Plant Design Safety Factor, and hence, results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
6	CNSC RD-204	Certification of Persons Working at Nuclear Power Plants	2008	10	Incremental	RD-204 addressed as part of Darlington ISR.
7	CNSC REGDOC-3.1.1	Reporting Requirements for Nuclear Power Plants	2014	10	Incremental	CNSC S-99 (precursor to REGDOC-3.1.1) addressed as part of Pickering B and Darlington ISRs.
8	CNSC REGDOC-2.9.1*	Environmental Protection Policies, Programs and Procedures	2013	8, 14	Incremental	REGDOC-2.9.1 addressed as part of Darlington ISR. S-296 also addressed as part of Pickering B and Darlington ISRs.
9	CNSC REGDOC-2.10.1*	Nuclear Emergency Preparedness and Response	2014	13	Incremental	Transition plan in place and gap assessment has been performed by OPG.
Additional L/R/C/Ss						
10	CNSC G-323	Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement	2007	10, 12	Incremental	G-323 addressed as part of Darlington ISR.
11	CNSC G-278	Human Factors Verification and Validation Plans	2003	1, 12	Incremental	G-278 addressed as part of Pickering B and Darlington ISRs.
12	CNSC G-276	Human Factors Engineering Program Plans	2003	1, 12	Incremental	G-276 addressed as part of Pickering B and Darlington ISRs.
13	S.C. 1997, C.9	Nuclear Safety and Control Act (NSCA) and its associated Regulations	Amended in February 2015	10	Incremental	S.C. 1997, C.9 addressed as part of Darlington ISR.
14	CSA N1600	General Requirements for Nuclear Emergency Management Programs	N1600-14	13	High Level	Not referenced in PROL 48.02/2018. Not reviewed as part of Pickering B or Darlington ISRs.

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
15	CSA N288.6	Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills	N288.6-12	8, 14	Incremental [5]	N288.6 not addressed as part of Pickering B or Darlington ISRs. Implementation Plan and clause-by-clause review have been prepared for Pickering Environmental Monitoring Program compliance with N288.6.
16	CSA N288.5	Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills	N288.5-11	8, 14	Incremental [5]	N288.5 not addressed as part of Pickering B or Darlington ISRs. OPG has performed a gap analysis and completed all actions in the implementation plan to satisfy mandatory requirements of N288.5.
17	CNSC REGDOC-2.2.2	Personnel Training	2014	10	Incremental	REGDOC-2.2.2 not addressed as part of Pickering B or Darlington ISRs. Transition Plan and gap analysis has been prepared for REGDOC-2.2.2.
18	CNSC REGDOC-2.3.2	Accident Management, Version 2	2015	1, 5, 6, 7, 8, 10	Incremental	REGDOC-2.3.2 addressed as part of Darlington ISR.
19	CNSC REGDOC-2.3.3	Periodic Safety Reviews	2015	8	High Level	REGDOC-2.3.3 not addressed as part of Pickering B or Darlington ISRs. New PSR methodology.

[5] Per Section 3.2.2 of the R02 PSR2 Basis Document [1]: "Table D1 identifies the review type to be applied to each of the Laws, Regulations, Codes and Standards in the PSR2 Assessment Basis. Following further assessment of past work, the review type of a listed modern Law, Regulation, Code or Standard may be changed from Clause-by-Clause or High Level to Incremental." Past assessments of CSA N288.3.4, N288.5 and N288.6 were reviewed and implementation plans with gap assessments were identified. As a result, the Review Type for these three L/R/C/Ss was changed from High Level to Incremental since "… implementation plans exist for many of the codes and standards not addressed in PSR1 and therefore an incremental review will be applied to these documents" [1].

#	Document Number	Document Title	Modern Version for PSR2	Applicable Safety Factors	Type of Review	Review Type Basis
20	CSA N286.7.1	Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants	N286.7.1-09	1, 5, 6, 7, 10	N/A [6]	N286.7.1 not addressed as part of Pickering B or Darlington ISRs.
21	CSA N290.12	Human Factors in Design for Nuclear Power Plants	N290.12-14	1, 12	Incremental [7]	N290.12 not addressed as part of Pickering B or Darlington ISRs. OPG has completed a gap analysis against mandatory requirements of N290.12.
22	CSA N288.3.4	Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities	N288.3.4-13	8, 14	Incremental [5]	N288.3.4 addressed as part of Darlington ISR, but not addressed as part of Pickering B ISR. OPG has completed a gap analysis and is developing an implementation plan to satisfy mandatory requirements of N288.3.4.
23	CSA N288.7	Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills	N288.7-15	14	High Level	First edition of N288.7 issued in 2015. Not addressed as part of Pickering B or Darlington ISRs. OPG is developing a gap analysis and implementation plan to satisfy mandatory requirements of N288.7.

* Superseding documents to those currently in Pickering NGS PROL 48.02/2018.

[6] The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [6]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

[7] Per CNSC's request in P-CORR-03680-0607223 R000, "Pickering PSR2 – Change to Review Type for CSA N290.12" [7], the Review Type for CSA N290.12-14 was changed from High Level to Incremental.

3.0 RESULTS AND CONCLUSIONS

The results of the PSR2 reviews of the L/R/C/Ss listed in Table 1 are summarized in Table 2 below. Additional background information and details regarding the gaps listed in Table 2 are provided in Appendix B of this report.

Table 2: PSR2 L/R/C/S Review Results for Safety Factors 8, 10, 12, 13 and 14

Appendix Section #	L/R/C/S Reviewed	L/R/C/S Review Results
B.1	CSA N290.15-10, "Requirements for the Safe Operating Envelope of Nuclear Power Plants"	There are no PSR2 gaps for CSA N290.15-10 (R2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.15-10 (R2015).
B.2	CSA N286.7-16, "Quality Assurance Of Analytical, Scientific And Design Computer Programs"	There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.
B.3	CSA N288.1-14, "Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities"	There are no PSR2 gaps for CSA N288.1-14. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.1-14.
B.4	CSA N288.4-10, "Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.4-10. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.4-10.
B.5	CSA N293-12, "Fire Protection for Nuclear Power Plants"	The PSR2 review of CSA N293-12 is in progress. Gaps identified from this review will be applicable to the Plant Design Safety Factor, and hence, results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report.
B.6	CNSC RD-204 (2008), "Certification of Persons Working at Nuclear Power Plants"	There are no PSR2 gaps for CNSC RD-204 (2008). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC RD-204 (2008).
B.7	CNSC REGDOC-3.1.1 (2014), "Reporting Requirements for Nuclear Power Plants"	There are no PSR2 gaps for CNSC REGDOC-3.1.1 (2014). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-3.1.1 (2014).
B.8	CNSC REGDOC-2.9.1 (2013), "Environmental Protection Policies, Programs and Procedures"	There are no PSR2 gaps for CNSC REGDOC-2.9.1 (2013). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.9.1 (2013).

Appendix Section #	L/R/C/S Reviewed	L/R/C/S Review Results
B.9	CNSC REGDOC-2.10.1 (2014), "Nuclear Emergency Preparedness and Response"	There is one PSR2 REGDOC-2.10.1 (2014) gap which relates to Safety Factor 13 (Emergency Planning): 1. OPG has completed a gap analysis for transition to REGDOC-2.10.1 and has developed an action plan to achieve compliance. The transition plan that OPG has committed in order to bring Darlington into compliance with REGDOC-2.10.1 applies across the nuclear fleet and will also bring Pickering into compliance. Updating OPG governance to ensure that the Pickering Evacuation Time Estimate study is maintained and to define how the Potassium Iodide (KI) pill program will be sustained is in progress. As these two actions are not yet complete, this is identified as a PSR2 gap.
B.10	CNSC G-323 (2007), "Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement"	There are no PSR2 gaps for CNSC G-323 (2007). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-323 (2007).
B.11	CNSC G-278 (2003), "Human Factors Verification and Validation Plans"	There are no PSR2 gaps for CNSC G-278 (2003). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-278 (2003).
B.12	CNSC G-276 (2003), "Human Factors Engineering Program Plans"	There are no PSR2 gaps for CNSC G-276 (2003). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-276 (2003).
B.13	S.C. 1997, C.9 (Amended in February 2015), "Nuclear Safety and Control Act"	There are no PSR2 gaps for the Nuclear Safety and Control Act (Amended 2015). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the NSCA (Amended 2015).
B.14	CSA N1600-14, "General Requirements for Nuclear Emergency Management Programs"	There are no PSR2 gaps for CSA N1600-14. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CSA N1600-14.
B.15	CSA N288.6-12, "Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.6-12. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.6-12.

Appendix Section #	L/R/C/S Reviewed	L/R/C/S Review Results
B.16	CSA N288.5-11, "Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.5-11. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.5-11.
B.17	CNSC REGDOC-2.2.2 (2014), "Personnel Training"	There are no PSR2 gaps for CNSC REGDOC-2.2.2 (2014). Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.2.2 (2014).
B.18	CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"	There is one PSR2 CNSC REGDOC-2.3.2 (2015) gap which relates to Safety Factor 1 (Plant Design): 1. Full provision of Complementary Design Features for containment integrity as required by Clause 4.2.1 of REGDOC-2.3.2 will be addressed with the completion of Phase 2 Emergency Mitigating Equipment. This work is currently scheduled to be fully implemented by the end of 2017. Since this work is still in progress, it is identified as a PSR2 gap.
B.19	CNSC REGDOC-2.3.3 (2015), "Periodic Safety Reviews"	There are no PSR2 gaps for CNSC REGDOC-2.3.3 (2015). Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.3.3 (2015).
B.20	CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"	The N286.7.1 guide has been amalgamated into the new (-16) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [6]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.
B.21	CSA N290.12-14, "Human Factors in Design for Nuclear Power Plants"	There are no PSR2 gaps for CSA N290.12-14. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.12-14.
B.22	CSA N288.3.4-13, "Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities"	There are no PSR2 gaps for CSA N288.3.4-13. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.3.4-13.
B.23	CSA N288.7-15, "Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills"	There are no PSR2 gaps for CSA N288.7-15. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CSA N288.7-15.

Appendix B: L/R/C/S Reviews for Safety Factors 8, 10, 12, 13 and 14

B.1 CSA N290.15-10, "Requirements for the Safe Operating Envelope of Nuclear Power Plants"

B.1.1 Background

The following, paraphrased from CSA N290.15-10 (R2015) [B.1-1], provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The licensing of a nuclear power plant requires a safety evaluation to demonstrate its safe operation. In the safety evaluation, the limits and conditions associated with the safety requirements form the safe operating envelope (SOE) and the operator is responsible to demonstrate compliance.*
>
> *CSA N290.15 provides the requirements for the definition, implementation, and maintenance of the safe operating envelope at nuclear power plants.*

All of CSA N290.15-10 (R2015) is directly relevant to Safety Factor 8 (Safety Performance).

Compliance with CSA N290.15-10 (R2015) is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.1-2]. The current version of the Standard, N290.15-10 (R2015) is a reaffirmation of the initial standard introduced in 2010 without any changes.

CSA N290.15-10 is the first edition of this standard. The related impact statement and publication note [B.1-3] identifies the following significant features of the standard:

1. *The SOE, as expressed in terms of the limits and conditions which govern plant operation in compliance with the safety analysis are clearly, completely, and consistently defined, and fully reflected in the documentation that governs plant operation;*

2. *The SOE, and the basis for its derivation, are contained in a set of documentation that can be readily referenced by users requiring an understanding of the basis for safe plant operation;*

3. *A compliance framework has been established that avoids plant operation outside of the SOE, ensures timely detection of plant operation outside of the SOE, and specifies appropriate and timely corrective actions to restore plant operation to within the SOE; and*

4. *The SOE is maintained up to date within the context of other processes.*

The results of PSR1 CSA N290.15 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.1.2. As identified in Reference [B.1-4], the Pickering PSR2 review of CSA N290.15-10 is an Incremental review.

PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.1.2 Compliance Assessment for Pickering PSR2

B.1.2.1 Application of PSR1 Reviews

Pickering and Darlington NGS

The first edition of this standard was issued in August 2010 after the completion of the code reviews for the Pickering B ISR and Pickering A Return to Service. Further, this standard was not identified as requiring consideration as part of the Darlington ISR. Therefore, no code review was performed for Pickering or Darlington NGS against CSA N290.15. However, the content of CSA N290.15 was extracted, with only minor changes, from the SOE Principles & Guidelines (P&G) document that the Canadian nuclear industry had prepared previously through the CANDU Owners Group (COG) [B.1-5]. The COG SOE P&G document basically described the SOE program that OPG had developed and was in the process of implementing at the time, as part of an Integrated Improvement Project initiated in the late 1990's. As such, when CSA N290.15-10 was issued for industry use, the expectation was that OPG would already be in compliance with its requirements.

The status of implementation of N290.15-10 is discussed further in Section B.1.2.2 below.

B.1.2.2 Application of Post-PSR1 Reviews

Subsequent to the issuance of CSA N290.15-10, the CNSC conducted a pilot Type 1 inspection of the OPG SOE program at Pickering Units 1,4 in 2011. As stated in Reference [B.1-6], the purpose of this inspection was to assess the implementation of the Safe Operating Envelope as defined by CSA standard N290.15-10. In preparation for this inspection, OPG performed a detailed review and assessment of all the SOE governing documents to ensure that the SOE documents meet the CSA N290.15 requirements. As summarized in Reference [B.1-7]:

> *The results show that the majority of the documented instructions clearly present the definition, implementation and maintenance of the SOE; consistent with the CSA N290.15 Standard. However, three potential gaps were identified during the process:*
>
> *(1) Criterion 9 of the CSA N290.15 states that the SOE shall be supported by a compliance framework that ensures training for affected SOE users and developers. However, authorized staff training is not considered to be part of the SOE as per N-ST-08131.02-10000.*

(2) As per N-INS-08131.02-10009, any major discrepancies between SOE and existing station-licensing documentation are dealt with by the discrepancy management process via the SOE Discrepancy Database and the SOE Implementation Gap Matrix. NSATD should establish and maintain both the database and the gap matrix to ensure all SOE discrepancies identified by SOE project staff are documented. However, neither of the database or the gap matrix has been established by NSATD.

(3) The SOE Compliance Table provides references to station operating documentation (SOD) for Required Actions and Action Times to ensure timely detection of instances of operation outside of the defined SOE. Pickering A has instructions on preparation of the OSR and IUC, but has no guidelines on preparing the Compliance Tables. This is a gap identified as non-compliance to CSA N290.15, Criterion 9. In the interim we have made reference to the Pickering B instruction, "NK30-INS-08131-00001".

The results of the CNSC Type I Inspection [B.1-8] were generally favourable, though the CNSC did identify five recommendations for consideration by OPG, in order to comply with CSA N290.15-10, before it was introduced into the Pickering A licence:

Recommendation 2011-SOE-PA-R-01: *CNSC recommends that OPG update its governing documents for SOE to ensure compliance with CSA N290.15-10.*

Recommendation 2011-SOE-PA-R-02: *CNSC recommends that OPG complete development of the SOE. Also, OPG should continue adequate maintenance of the SOE documentation through the existing processes.*

Recommendation 2011-SOE-PA-R-03: *CNSC staff recommends that OPG strengthen the adherence to the procedures and processes in place to develop and maintain adequately the SOE. CNSC staff also recommends that OPG staff be made aware of the importance of the SOE while the limits and conditions are being developed and maintained. Finally, CNSC staff recommends that OPG perform a complete review of the SOE limits and conditions while performing the next revision of the SOE documents.*

Recommendation 2011-SOE-PA-R-04: *CNSC staff recommends that OPG assess the completeness of the SOE limits and conditions for all systems. CNSC staff also recommends that OPG ensure that the SOE limits and conditions are stated in a manner that is useful by the operator. Finally, CNSC staff recommends that OPG clarify the interfaces between the systems to improve the horizontal linkage. This task should be performed while doing the next revision of the documentation.*

Recommendation 2011-SOE-PA-R-05: *CNSC recommends that OPG develop adequate training sessions for the affected users and developers of the SOE.*

As part of the process to complete implementation of the SOE program at Pickering and Darlington NGS, an OPG Nuclear standard was created and issued for implementation in 2012 [B.1-9]. This standard states the objectives of the OPG program and, in particular, states that these objectives will be achieved by meeting the intent of all of the SOE requirements specified in Section 4.0 of CSA N290.15-10. The OPG standard goes on to describe the OPG SOE program in detail and the manner in which it will be managed. The implementation date for all aspects of the standard was established as the end of 2012, with the exception of training for SOE users and developers, for which implementation was expected by the end of 2013.

In OPG's application for renewal of the Pickering NGS PROL in 2012 [B.1-10], issuance of the OPG Nuclear Standard for SOE was cited and it was indicated that completion of the SOE documentation for all SOE systems was expected by the end of 2012 for both Pickering Units 1,4 and Pickering Units 5-8. In addition, a transition plan for demonstrating compliance with CSA N290.15-10 was presented that addressed each of the gaps identified in Reference [B.1-7], all of which are programmatic in nature and applicable to all OPG Nuclear stations. Specifically:

1. *Review of existing SOE classroom training to determine whether an update is necessary (in progress).*

2. *The SOE Discrepancy Management instruction was made obsolete. SOE discrepancies are now managed by Station Condition Records (SCR) and Action Tracking database (complete).*

3. *Nuclear level instruction for preparation of SOE Compliance Tables was issued in Passport (complete).* ([B.1-11])

4. *N-STI-03602-10000, SOE Instrument Uncertainty and Allowable Value Calculations, has been updated to clarify that OSR documents, Compliance Tables and station operating documents need to be updated as required when an IUC has been updated (complete).*

Items 2 and 3 above eliminated the second and third gaps that had been identified in the OPG self-assessment [B.1-7]. With respect to the first gap identified in Reference [B.1-7], the following was committed to the CNSC in Reference [B.1-10]:

> *An action (tracked under CRC 2011-08) has been taken to provide SOE training for all SOE users and developers (i.e., Engineering, Operations and Maintenance) as per requirements in CSA N290.15. The action is expected to be completed by end of 2013.*

In addition it was noted in Reference [B.1-10] that a formal response to the findings of the CNSC Type I Inspection of the SOE implementation at Pickering A, including a corrective action plan, was committed for the end of 2012, with the expectation that all actions would be completed and/or implemented by the end of 2013.

OPG's response to the CNSC's Type I Inspection findings for Pickering A [B.1-12] outlined the actions and documentation updates undertaken to address the CNSC recommendations. The only CNSC recommendation left outstanding at the time was Recommendation 2011-SOE-PA-R-05 on the adequacy of SOE training for OPG staff. This finding relates to the same gap that OPG had identified previously in its self-assessment, and is covered by the corresponding regulatory commitment mentioned above in [B.1-10].

OPG communicated to the CNSC at the end of 2013 [B.1-13] that the one outstanding action to address SOE training requirements (as committed previously in [B.1-10] and [B.1-12]) had been completed and requested that the Pickering Licence Conditions Handbook be updated accordingly.

As part of the "Regulatory Oversight Report for Canadian Nuclear Power Plants" for the year 2014 [B.1-14], the CNSC stated:

> *All licensees are required to establish a safe operating envelope (SOE) program according to the requirements of N290.15-10, Requirements for the Safe Operating Envelope of Nuclear Power Plants. To date, Bruce Power, OPG and NB Power have completed the development and the baseline implementation of their SOEs, and continued to make improvements to their SOE programs. Program compliance assessments are being conducted through CNSC compliance monitoring activities, and CNSC staff were satisfied with the results from monitoring activities in 2014.*

Specific to Pickering, Reference [B.1-14] concluded that:

> *OPG's implementation of the safe operating envelope (SOE) ensured that the Pickering reactors operated in their analyzed states, thereby ensuring adequate safety at all times. The SOE implementation level was satisfactory at Pickering in 2014 and in compliance with N290.15, Requirements for the Safe Operating Envelope of Nuclear Power Plants.*

In Reference [B.1-15], the CNSC provided feedback in relation to industry responses to their earlier comments on COG report COG-02-901 [B.1-16]. This report outlined how the Canadian utilities had applied CSA N290.15-10 for the purpose of identifying which systems were included in the SOE program at each station. The expectation communicated by the CNSC in Reference [B.1-15] was that their remaining issues would be addressed by making changes to CSA N290.15. In 2016, an amendment to N290.15 was issued [B.1-17] which incorporated the clarifications requested by the CNSC. CNSC staff were part of the team that drafted the amendment, and provided concurrence that the changes made adequately met the CNSC's expectations. This latest code amendment was issued past the Freeze Date (January 15, 2016) for PSR2 and is therefore not reviewed in this assessment.

The above demonstrates that OPG and Pickering NGS have been assessed to now be fully compliant with CSA N290.15-10 (R2015) [B.1-1]. This standard is programmatic in nature and the status of OPG's compliance is not impacted by continued operation of Pickering NGS beyond 2020. Hence, there are no PSR2 gaps for CSA N290.15.

B.1.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N290.15-10 (R2015) [B.1-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.15-10 (R2015).

B.2 CSA N286.7-16, "Quality Assurance of Analytical, Scientific and Design Computer Programs"

B.2.1 Background

The following paraphrased from CSA N286.7-16 [B.2-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The Canadian nuclear industry has recognized the need to establish rigorous and effective requirements for application of quality assurance process to computer programs. This standard identifies the quality assurance requirements to support the management system for high energy reactor facilities where analytical tools are utilized in the life cycle of nuclear facilities.*
>
> *CSA Standard N286.7 specifies the requirements for the quality assurance program applicable to the design, development, maintenance, modification, acquisition, and use of analytical, scientific and design computer programs that are used in high energy reactor applications.*

Compliance with CSA N286.7-99 (R2007) [B.2-2] is currently a licensing requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.2-3].

CSA N286.7-16 is the third edition of this standard, and supersedes previous editions published in 1999 and 1994. The CSA Group Impact Statement relating to the publication of this edition [B.2-4] provides the following summary of the changes from the previous edition (paraphrased):

1. *The scope has been expanded* [8] *and now includes: In-house developed computer programs, Third-party computer programs, Legacy computer programs, Programmed applications.*

2. *The N286.7.1 guide* [B.2-5] *has been amalgamated into the new edition of the N286.7 Standard and is no longer being maintained.*

3. *To provide the user with a clear breakdown of the requirements, they are divided into two parts: (a) Design, development and maintenance of software; and (b) Acquisition, qualification, control and use of software.*

4. *Overlap with CSA N286-12 has been removed. The new edition does not address qualification of staff or procurement requirements already covered by CSA N286-12.*

5. *Requirements were brought up-to-date with consideration of current technology.*

---

[8] The scope was expanded to address programmed applications and third-party computer programs. In-house developed computer programs and legacy computer programs were previously addressed in the 1999 edition.

CSA N286.7 is relevant to Safety Factors 1 (Plant Design), 5 (Deterministic Safety Analysis), 6 (Probabilistic Safety Assessment), 7 (Hazard Analysis), and 10 (Organization, the Management System, and Safety Culture). The current version of the code is CSA N286.7-16, which was issued in January, 2016. The previous version of the code, CSA N286.7-99 which was reaffirmed in 2004 and in 2007, was the subject of reviews performed as part of PSR1 (Pickering B and Darlington Integrated Safety Reviews (ISRs)). The version of the code identified in the current license for Pickering [B.2-3] is CSA N286.7-99 (R2007) [B.2-2].

The results of PSR1 N286.7 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.2.2. As identified in Reference [B.2-6], the Pickering PSR2 review of CSA N286.7-16 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.
- <u>Gap</u>: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.2.2 Compliance Review History

B.2.2.1 Application of PSR1 Reviews

The versions of N286.7 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

<u>Pickering Units 5-8</u>

OPG first implemented its software Quality Assurance programs for Nuclear Safety Analysis based on the requirements of CSA Standard N286.7-94. The version of the Standard reviewed as part of the Pickering B ISR was CSA N286.7-99, which was reaffirmed in 2003. A high level review of CSA N286.7-99 (R2003) [B.2-7] was performed as part of the Pickering B ISR for the Deterministic, Probabilistic Safety Analysis and Hazard Analysis Safety Factors in OPG Report NK30-REP-03680-00005 R000 [B.2-8]. It was confirmed through the review that OPG's governance and assessment processes adequately addressed each clause of the standard. The review concluded that Pickering B was in direct compliance with CSA N286.7-99 (R2003) [B.2-7].

OPG Report NK30-REP-03680-00001 R000 [B.2-9] documents the results of the Pickering B ISR based on the Plant Design Safety Factor. No gaps were identified.

The reviews performed as part of the Pickering B ISR did not identify any gaps against CSA N286.7-99. Hence, there are no PSR2 gaps which result from the Pickering B ISR.

Pickering Units 1,4

CSA N286.7 was not included in the list of codes and standards reviewed as part of Pickering A Return to Service. As noted in Reference [B.2-10], CSA N286.7-94 was not reviewed on the basis that it "pertains mostly to design support analysis" and it "pertains mostly to quality assurance aspects".

The subsequent review of CSA N286.7-99 against OPG software governance that was performed as part of the Pickering B ISR [B.2-8] identified no gaps. Since the review was performed against relevant OPG Governance, the conclusions of Reference [B.2-8] are equally applicable to Pickering Units 1,4 and Units 5-8.

Darlington NGS

A clause-by-clause review of OPG software governance was performed against CSA N286.7-99 March 1999 (R2007) [B.2-2] as part of the Darlington ISR. The results of this review are documented in References [B.2-11] and [B.2-12]. The review was conducted by comparing the requirements of the Standard against OPG software governance.

Reference [B.2-11] identified that all requirements of CSA N286.7-99 (R2007) were reflected in the OPG software governance with the exception of one gap. CSA N286.7-99 calls for an explanation of nomenclature and conventions appearing in the Problem Definition Document. At the time that the Darlington ISR review of CSA N286.7-99 was performed, the relevant OPG software governance did not specify this content requirement. This was identified as a licensing basis gap and Station Condition Record (SCR) #D-2010-11439 was raised against this issue. Applicable software governance was subsequently updated as part of Action Request (AR) # 28112428 assignment 01 and hence this gap no longer exists against CSA N286.7-99 (R2007). These requirements are identified in Table 2 of N-PROC-MP-0095 R002, "Qualification of Scientific, Engineering, and Safety Analysis Software" [B.2-13].

Reference [B.2-12] identified a second gap related to specification of library functions as part of the Design Description for Grade 1 software. At the time that the Darlington ISR review of CSA N286.7-99 was performed, the relevant OPG software governance did not specify this content requirement. This was identified as a gap and SCR #D-2012-12366 was raised against this issue. The current revision of N-PROC-MP-0095 [B.2-13] incorporates this requirement and hence this gap no longer exists against CSA N286.7-99.

As noted above, actions have been taken to address the two gaps against CSA N286.7-99 with OPG software governance identified as part of the Darlington ISR. The results of those actions are also applicable to Pickering. Hence, there are no PSR2 gaps which result from the Darlington ISR.

B.2.2.2 Application of Post-PSR1 Reviews

As discussed in Section B.2.1, CSA N286.7 was updated in January 2016 to CSA N286.7-16. The major changes relative to CSA N286.7-99 as documented in the CSA Impact Statement [B.2-4] are as follows:

1. The scope has been expanded [8] and now includes: in-house developed computer programs, third-party computer programs, legacy computer programs, Programmed applications.

2. The N286.7.1 guide [B.2-5] has now been amalgamated into the new edition of N286.7 Standard.

CNSC staff completed a review of OPG's Safety Analysis Program implementation in December, 2015. The results of the review are documented in Reference [B.2-14]. The review was intended to confirm CNSC staff's understanding of the effective implementation of OPG's Safety Analysis Program using the generic requirements of CSA N286-12, "Management System Requirements for Nuclear Facilities." The review covered the programmatic elements of the management of deterministic and probabilistic safety analysis as required by the Pickering and Darlington Licence Conditions Handbooks. This work was a high-level review of the Safety Analysis Program with a focus on the managed processes and interfaces of safety analysis activities and potential identification of gaps with REGDOC-2.4.1 and REGDOC-2.4.2. The CNSC review identified the following observation with regard to OPG's software governance and compliance to N286.7-16:

> *Note that the term "relaxation of requirements" has been removed from the recent version of N286.7-16. This new edition replaces N286.7-99 and its companion guidance document CSA N286.7.1-09. The OPG procedures in which the term "relaxation of requirements" is used (e.g., N-PROC-MP-0097 R003* ["Grading of Scientific Engineering and Safety Analysis Software"]*) should include a warning or otherwise make it clear that a relaxation of requirements is not applicable in performing a deterministic safety analysis updated as part of the scope of the REGDOC-2.4.1 implementation plan.*

This observation was identified as an area of improvement, not a safety significant finding, and has been addressed in the recent revisions of N-PROC-MP-0095, "Qualification of Scientific, Engineering, and Safety Analysis Software" [B.2-13], N-PROC-MP-0097, "Grading of Scientific, Engineering and Safety Analysis Software" [B.2-15], and N-STD-MP-0008, "Development, Qualification and Use of Scientific, Engineering, and Safety Analysis Software" [B.2-16]. Therefore, there is no gap for Pickering PSR2.

As part of a self assessment (NO16-001985-SA) conducted by the Design Engineering department, a clause-by-clause gap assessment of CSA N286.7-16 was performed against OPG governance in September 2016 [B.2-17]. The review identified two gaps relating to specific requirements from N286.7-16 that were not explicitly mentioned in the governance:

- N-STD-MP-0008, "Development, Qualification and Use of Scientific, Engineering, and Safety Analysis Software" [B.2-16], Section 1.7.1, Verification, does not discuss embedded models as required by Clause 8.2 (h) (ii); and

- N-PROC-MP-0095, "Qualification of Scientific, Engineering and Safety Analysis" [B.2-13], Section A.2.0, Design and Development Tasks – Requirements Specification, does not explicitly include a requirement for the computer program version number as required by Clause 13.2.2 (a).

These gaps were addressed in the latest revision of N-STD-MP-0008 [B.2-16] and N-PROC-MP-0095 [B.2-13]. Therefore, there are no gaps for Pickering PSR2.

B.2.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N286.7-16. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N286.7-16.

B.3 CSA N288.1-14, "Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities"

B.3.1 Background

The following paraphrased from the preface and introduction of CSA N288.1-14 [B.3-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The derived release limit* [DRL] *for a given radionuclide is the release rate that would cause an individual of the most highly exposed group to receive and be committed to a dose equal to the regulatory annual dose limit due to release of the radionuclide to air or surface water during normal operation of a nuclear facility over the period of a calendar year. The DRL is derived using mathematical equations that describe the transfer of radioactive materials through the environment to humans. It takes into account all exposure pathways, including external exposure from immersion in contaminated air and water, external exposure to contaminated soil and beaches, and internal exposure from inhalation and ingestion of radioactivity.*
>
> *CSA N288.1 provides guidelines for calculating derived released limits for radioactive material in airborne and liquid effluents for normal operation of nuclear facilities. It is intended to apply primarily to CANDU nuclear power stations in Canada.*

CSA N288.1-14 [B.3-1] is relevant to Safety Factor 8 (Safety Performance) and Safety Factor 14 (Radiological Impact on the Environment).

Compliance with CSA N288.1 (R2008) [B.3-2] is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook (LCH) [B.3-3].

CSA N288.1-14 is the third edition of this standard, and supersedes the previous editions published in 2008 and 1987. The CSA Impact Statement for Final Publication [B.3-4] of the 2014 edition of CSA N288 provides a "Summary of Significant Changes" which are discussed in Section B.3.2.2 below.

The results of PSR1 CSA N288.1 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.3.2. As identified in Reference [B.3-5], the Pickering PSR2 review of CSA N288.1-14 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.3.2 Compliance Assessment for Pickering PSR2

B.3.2.1 Application of PSR1 Reviews

The versions of N288.1 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

For the Pickering B ISR in 2007 as part of the Environment Safety Factor [B.3-6] an intent review against the 1987 (CSA N288.1-M87) version of the code was conducted. The review confirmed that OPG programs and procedures were aligned with the practices in the standard.

Pickering Units 1,4

CSA N288.1 was not reviewed as part of Pickering A Return to Service because it was concluded that it "Pertains mostly to design support analysis" [B.3-7].

Section 10.1 of the R04 Pickering LCH [B.3-3] states:

> *The licensee shall establish the DRLs in accordance with CSA standard N288.1. The releases of nuclear substances to the environment from the Pickering NGS nuclear facility shall not exceed the DRLs listed below and the sum of all fractional DRL releases must remain less than unity.*
>
> *If any of the individual radionuclide DRLs are exceeded, or the sum of fractional DRL releases exceeds unity, it indicates that OPG is in non-compliance with the public dose limit of 1mSv/year as per the CNSC Radiation Protection Regulations.*

Further, Section 9.4 of the Pickering PROL Application P-CORR-00531-03719 R000 [B.3-8] states:

> *… changes were made to dose modeling parameters from the 2009 implementation of CSA N288.1-08, Guidelines for Calculating Derived Release Limits for Radioactive Material in Airborne and Liquid Effluents for Normal Operation of Nuclear Facilities.*

Since compliance with CSA N288.1 (R2008) is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering LCH [B.3-3], and this is confirmed by review of the Pickering PROL Application [B.3-8], Pickering Units 1,4 (and Units 5-8) are also in compliance with N288.1 (R2008). Further, the Darlington ISR review of CSA N288.1 is also programmatically applicable to Pickering NGS, as discussed below.

Darlington NGS

The Darlington ISR conducted a high level intent review against CSA N288.1-M87 in 2011 per Reference [B.3-9]. One gap was initially identified relating to Clause 6.10. This gap was subsequently closed based on the justification provided in Appendix B of the referenced report.

Subsequent to this review, a code refresh review was performed in 2014 [B.3-10] against the 2008 update version of the code. A high level summary of the review follows:

> *The documents used in the review were based on the mapping of OPG Nuclear governance to CSA N288.1-2008 U2011 [R-1]. As the OPG governance is constantly revised, the documents reviewed were current as of January 10, 2013, and posted in Asset Suite. The changes in the requirements from CSA N288.1 M87 [R-2] are substantial. The review of all applicable clauses in this code review report confirms that OPG Nuclear governance is in compliance with the requirements of CSA N288.1-2008 [R-1].*
>
> *The majority of the assessment is a comparison with the COG report COG-06-3090 R2 [R-7], which outlines the methodology for calculating the permissible upper limit (the Derived Release Limit, DRL) for COG-member nuclear facilities. The methodology is used as input to compute Derived Release Limits per OPG Report, NK38-REP-03482-10001 [R-8].*

The review concluded that Darlington was in compliance with CSA N288.1-2008 U2011 and no gaps were identified. Since the Darlington review assessed compliance against the common OPG governance, its conclusions are considered to also be applicable to Pickering NGS.

B.3.2.2 Application of Post-PSR1 Reviews

CSA N288.1-14 is the third edition of this standard, and supersedes the previous editions published in 2008 and 1987. The CSA Impact Statement for CSA N288.1-14 identifies the following major changes (paraphrased) [B.3-4]:

> *This New Edition offers improved direction on the applicability of the Guideline.*
>
> *This New Edition contains updates to the following:*
>
> *a) Energy expenditures and dietary intake rates for humans;*
>
> *b) Half-lives, gamma energies, and photon yields for all radionuclides;*
>
> *c) Values for many parameters based largely on a new International Atomic Energy Agency (IAEA) handbook of parameter values (IAEA, 2010);*
>
> *d) Wind direction and precipitation data for use in the wet deposition model; and*
>
> *e) Specific activity model for tritium in animals;*

This New Edition includes the introduction of a model for wild waterfowl as an additional source of human exposure through ingestion, and the extension of the C-14 specific activity model to cover plant to animal transfer.

The R04 Pickering LCH references CSA N288.1-2008, which has an effective date of September 1, 2013. The current Pickering A and B "Derived Release Limit" reports [B.3-11] and [B.3-12] respectively, were issued in 2011. These were updates to the 2003 (R00) version of the DRL report to reflect: "…changes from the recommended calculations, transfer parameter values and exposure factors found in the Guidance for the Calculation of Derived Release Limits (OPG-2002) on which R001 of this report was based."

The Executive Summary of the Pickering B DRL report [B.3-12] states the following:

Upon receipt of the approval and license amendment from the Canadian Nuclear Safety Commission (CNSC), these limits will be implemented and will supersede the 2006 PNGS-B DRLs [R-1].

A routine review of PNGS-B DRLs in 2008 [R-2] indicated an update was required to:

- *Update methodology, pathway models, transfer factors, representative age groups, and dosimetry to conform to the recently updated Canadian Standards Association (CSA) N288.1-08 standard for the calculation of DRLs [R-3].*
- *Incorporate changes in the locations and characteristics of nearby members of the public as identified by the review of the Pickering Site Specific Survey [R-4] [R-5].*

DRL calculations were performed with version 5.4.0 of EcoMetrix's IMPACT software, which accurately represents the models contained in the CSA N288.1-08 standard. The software has undergone verification and validation according to OPG's Software Governance and meets the requirements of CSA Standard N286.7 [R-6]. This report and the DRL calculations were also independently verified by EcoMetrix Inc [R-7]…

The same Executive Summary is also included in the Pickering A DRL report.

As identified in the CSA Impact Statement [B.3-4] discussed above, the 2014 version of the standard introduces additional changes beyond those reflected in the 2008 standard. The "2015 Results of Environmental Monitoring Programs" [B.3-13], Section 6 identifies that:

Recommendations from these studies will be incorporated into the EMPs [Environmental Monitoring Programs] *following the revision of the station DRLs which will take place in 2016 and incorporation of N288.1-14 into the public dose calculations.*

In addition to this, there is an ongoing COG program that is refining modelling and tools to align with the new 2014 version of the Standard [B.3-14].

The above demonstrates that OPG and Pickering are fully compliant with the 2008 version of CSA N288.1, and are actively working towards implementing the 2014 version of CSA N288.1-14. Although the COG initiative is still in progress, the changes in CSA N288.1-14 are not expected to impact the physical plant design or safe operation of Pickering since: a) Pickering is compliant with the 2008 version reference in the LCH, and b) the incremental changes to the code largely reflect refinements in methodology. Therefore, there is no gap for Pickering PSR2.

B.3.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N288.1-14 [B.3-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.1-14.

B.4 CSA N288.4-10, “Environmental Monitoring Program at Class I Nuclear Facilities and Uranium Mines and Mills”

B.4.1 Background

The following, paraphrased from the preface and introduction of CSA N288.4-10 (R2015) [B.4-1], provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *CSA N288.4 purpose is to protect the environment in conformance with the regulations under the Nuclear Safety and Control Act. This is done through the monitoring of radioactive and non-radioactive contaminants, physical stressors, potential biological effects, and pathways for both human and non-human biota.*
>
> *CSA N288.4 provides the requirements for the design and operation of environmental monitoring programs (EMPs) for Class I nuclear facilities and uranium mines and mills. This standard provides guidance and requirements on general objectives of an EMP, criteria for establishing and revising an EMP, design of an EMP, sampling and analytical procedures, interpretation of data, quality assurance and quality control, reporting and review, staff qualifications and training.*

CSA N288.4-10 is applicable to Safety Factor 8 (Safety Performance) and Safety Factor 14 (Radiological Impact on the Environment).

Compliance with CSA N288.4-10 is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.1 of the R04 Pickering Licence Conditions Handbook [B.4-2].

CSA N288.4-10, which was reaffirmed in 2015, is the second edition of this standard, and supersedes the first edition published in 1990 under the title “Guidelines for Radiological Monitoring of the Environment” [B.4-3]. The results of PSR1 CSA N288.4 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.4.2. As identified in Reference [B.4-4], the Pickering PSR2 review of CSA N288.4-10 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.
- <u>Gap</u>: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.4.2 Compliance Assessment for Pickering PSR2

B.4.2.1 Application of PSR1 Reviews

The versions of N288.4 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

A high level intent review was done against CSA N288.4-M90 [B.4-3] for Pickering B in 2007 [B.4-5], which identified the following:

> *Ontario Power Generation Pickering B-NGS Environmental monitoring program N-PROC-OP-0025, "Management of the Off-Site Radiological Environmental Monitoring Program at Ontario Power Generation", presents these quantitative methods in Section 1.4 Field Sampling, Section 1.5 Laboratory Analysis and Section 1.6 Review and Analysis of Data. It also discusses the QA standards recommended by N288.4-M90.*
>
> *N-STD-OP-0031, "Monitoring of Radioactivity in Effluents", further outlines the QA standards and reviews which are done in the effluent monitoring program.*

The review concluded that Pickering B and OPG Nuclear Programs documented in [B.4-6] and [B.4-7][9] were "Indirectly Compliant" with N288.4-M90.

Pickering Units 1,4

CSA N288.4 was not assessed as part of Pickering A Return to Service given it, "Pertains mostly to Operations aspects, or other aspects not having a direct or immediate effect on installed design features" [B.4-8]. However, compliance with N288.4-10 is a licence requirement for Pickering NGS per Section 10.1 of the R04 Pickering Licence Conditions Handbook [B.4-2]. Further, assessments have been performed for Darlington which are programmatically applicable to Pickering NGS, as discussed below.

Darlington NGS

As part of the Darlington ISR, a high level review against all relevant clauses of N288.4-M90 (R2008) [B.4-9] was conducted in 2009. The review concluded that:

> *The intents of all relevant clauses of CAN/CSA-N288.4-M90 (Reference 6) were met by Ontario Power Generation's Darlington Nuclear Generating Station as demonstrated in Management of the Off-site Radiological Environmental Monitoring Program at OPG Nuclear Site N-PROC-OP-0025 R06, Operating Standards for the Ontario Power*

---

[9] Note, N-STD-OP-0031, "Monitoring of Nuclear and Hazardous Substances in Effluents" was formerly titled "Monitoring of Radioactivity in Effluents".

Generation Radiological Environmental Monitoring Program N-REP-03480-10001-R01 and associated documentation.

No gaps were identified in this review.

In addition, a Code Refresh review was conducted for Darlington in 2014 against the 2010 version of the standard [B.4-10]. CSA N288.4-10 [B.4-1], was the second edition of this standard, and superseded the 1990 version [B.4-3]. A synopsis and summary of the major changes to the standard are provided below [B.4-11]:

1. *The standard applies to all Class I nuclear facilities and uranium mines and mills (the previous version was only intended for CANDU nuclear power plants).*
2. *The standard addresses monitoring for the protection of both human and non-human biota (the previous version only addressed protection of humans).*
3. *Monitoring of nuclear substances, hazardous substances and physical stressors such as habitat loss and entrainment|impingement of aquatic organisms is addressed (the previous version only addressed monitoring of nuclear substances).*
4. *This standard requires a stricter adherence to a risk-based approach to the development of an Environmental Monitoring Program. This approach assumes that an Environmental Risk Assessment of the nuclear facility is available.*
5. *The standard requires that a systematic, informed planning process be followed during the development of an Environmental Monitoring Program.*
6. *Both Pathways Monitoring and Biological Effects Monitoring are addressed (the previous version only addressed Pathways Monitoring).*
7. *The standard requires a more formal periodic review of the need for, and adequacy of the Environmental Monitoring Program, which may result in either the addition of new program elements or the deletion of existing program elements.*
8. *Additional informative material, including examples of the application of the standard to hypothetical facilities, has been included to provide guidance to the user.*

These changes substantially increase the scope of the program; the number of facilities that fall within the scope of the standard; the number and types of potential effects that must be considered when developing a monitoring program and the types of monitoring that may be included in the program. The changes make the Standard consistent with current regulatory requirements, international guidance and accepted practice.

A summary of the review from [B.4-10] is provided below:

The changes made in the revised edition as CSA standard N288.4-2010, "Environmental Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills", relative to CSA standard N288.4-M90 (R2008), are substantial. It was changed from "requirements for radiological monitoring" to "requirements for monitoring of all environmental parameters, radiological and non-radiological." Due to *the extent of the changes, the entire CSA N288.4-2010 document has been assessed on a clause-by-clause basis, but comments are given generically at a High Level, as defined by N-PROC-LE-0005.*

This High Level review has determined that OPG Nuclear governance is in compliance with the requirements of CSA N288.4-2010. The review did not identify any gaps relative to its intent. The monitoring programs (existing and planned) comply with the intent of the Standard. The changes being implemented are not considered as gaps at the high level, but as improvements or supplements to the existing programs.

Since the Darlington review assessed compliance based on governance that applies across OPG's nuclear operations, the Darlington ISR conclusions are applicable to Pickering and Pickering PSR2.

B.4.2.2 Application of Post PSR1 Reviews

A gap analysis specific to Pickering Environmental programs against the 2010 version of the standard was completed in 2011 [B.4-12]. A summary of the gaps with either mandatory or recommended actions is included in Appendix B of Reference [B.4-12]. In support of the Pickering licence renewal application [B.4-13], a new/revised procedure for managing Environmental Monitoring Programs [B.4-14] was provided. As a follow-up to this, in November 2014, the CNSC requested a detailed implementation plan for both N288.4-10 and N288.5-11 [B.4-15] for both Darlington and Pickering, and specifically requested more information on supplemental studies. In January 2015 OPG communicated to the CNSC that all issues with respect to N288.4-10 implementation were complete [B.4-16] and only the supplementary studies in Attachment 1 of Reference [B.4-16] remained to be completed. These remaining studies are considered to be on-going monitoring programs under N288.4-10 and are not considered to be gaps for PSR2.

The 2015 version of N288.4 is a simple reaffirmation of the 2010 version of the standard. Hence, there are no changes incremental to the review already conducted for the 2010 version discussed in the section above.

B.4.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N288.4-10 [B.4-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.4-10.

B.5 CSA N293-12, "Fire Protection for Nuclear Power Plants"

The PSR2 review of CSA N293-12 is in progress. Gaps identified from this review will be applicable to the Plant Design Safety Factor, and hence, results are presented in the Pickering NGS PSR2 Plant Design Safety Factor Report.

B.6 CNSC RD-204 (2008), "Certification of Persons Working at Nuclear Power Plants"

B.6.1 Background

The following paraphrased from the purpose and scope of CNSC RD-204 [B.6-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *CNSC RD-204 purpose is to ensure that persons seeking a certification or renewal of a certification by the CNSC for a position referred to in the licence of a nuclear power plant are qualified to carry out the duties of that position in accordance with the Nuclear Safety and Control Act.*
>
> *CNSC RD-204 sets requirements on the programs and processes to train and examine persons seeking or renewing a certification, training and requalification tests that certified persons seeking a renewal of certifications must have completed, and the qualification required of persons seeking a certification.*

CNSC RD-204 is applicable to Safety Factor 10 (Organization, the Management System and Safety Culture).

Compliance with CNSC RD-204 is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.2 of the R04 Pickering Licence Conditions Handbook [B.6-2]. According to licence condition 3.3: "The license shall implement and maintain a training program that includes certification training, examinations and tests for positions requiring certified personnel in accordance with CNSC Regulatory Document RD-204, *Certification of Persons Working at Nuclear Power Plants*" [B.6-2]. The licence condition also specifies which positions require certified personnel. CNSC RD-204 (2008) is the first edition of this Regulatory Document.

The results of PSR1 RD-204 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington ISRs), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.6.2. As identified in Reference [B.6-3], the Pickering PSR2 review of CNSC RD-204 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.6.2 Compliance Assessment for Pickering PSR2

B.6.2.1 Application of PSR1 Reviews

The versions of RD-204 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

A review of RD-204 was not included as part of the Pickering B ISR or Pickering A Return to Service. As discussed below, the Darlington ISR prepared a clause-by-clause review against the current revision of RD-204, the findings of which are programmatically applicable to Pickering NGS.

Although no code review was performed for Pickering Units 1,4 or Units 5-8, compliance with RD-204 (2008) [B.6-1] is a licence requirement for Pickering NGS per Section 3.3 of the Pickering LCH [B.6-2]. Further, Section 2.3 of Attachment 3 of the Pickering PROL Renewal Application [B.6-4] states the following:

> *The ANO* [Authorized Nuclear Operator] *and CRSS* [Control Room Shift Supervisor] *training programs are based on a Systematic Approach to Training as required by RD-204. Recent improvements include development and implementation of revised On-the-Job Training Programs. Considerable work has been completed for the most recent CRSS Supplemental program by updating all the mentor guides and the development and implementation of a three day leadership workshop.*

Section 2.6 of Attachment 3 of the Pickering PROL Renewal Application states [B.6-4]:

> *For certified and security staff, Regulatory Documents RD-204 and RD-363 also outline specific fitness for duty requirements that are complied with by OPG.*

Darlington NGS

RD-204 (2008) [B.6-1] was reviewed as part of the Darlington ISR as documented in OPG Report NK38-REP-03680-10095 R000 [B.6-5]. The clause-by-clause review concluded that OPG governance meets the requirements of the Regulatory Document with the exception of 8 gaps (01489, 01498, 01504, 01505, 01509, 01510, 01514, and 01523). These were assigned to three issues in the Darlington Final ISR Report, NK38-REP-03680-10104 R000 [B.6-6] as outlined in the table below:

Issue	Gaps	Status
D272: "Reinstatement of a Person to the Duties of a Position Following Absence or Removal from Those Duties" *There is no documented process in place to reinstate a person who has been absent or removed from shift duties.*	01489 01498	Acceptable Deviation

Issue	Gaps	Status
D273: "Maintaining Qualification During Temporary Assignment to Other Positions" *There is no documented procedure identifying specific requirements for performing minimum shift duties during temporary assignment.*	01504 01505 01509 01510	Closed
D274: "Recertification Requirements after Decertification" *There is no documented process for re-certifying a person who has been decertified.*	01514 01523	Acceptable Deviation

The review noted that these gaps do not represent non-conformances with the Operating Licence since the review confirmed that there is governance in place at OPG Darlington consistent with the requirements of RD-204 for persons in the position of performing shift duties [B.6-5]. The above assessment is programmatically applicable to Pickering NGS.

Following the initial code review, issue D273 was closed with the issuance of D-GUID-09110-10004 [B.6-7] which was shown to meet the requirements of Clause 14 of CNSC RD-204 [B.6-1]. Subsequently, N-GUID-09110-10000, "Certification Requirements for Certified Staff on Rotation" [B.6-8] was issued. This OPG Nuclear document is identical in content to the Darlington Guide and applies to Pickering NGS.

The Darlington NGS final ISR Report summarized D272 as follows [B.6-6]:

> *This Issue is composed of Gaps # 01489 and 01498, which are both against sub-clauses of Clause 13 of CNSC RD-204 which defines requirements for reinstatement of a person to the duties of a position following absence or removal from those duties. In the Code Review Report, NK38-REP-03680-10095, it is concluded that since a documented process to reinstate certified shift staff who have been absent or removed from shift duties does not exist, all clauses related to reinstatement are identified as gaps.*

The justification for the classification of Acceptable Deviation for issue D272 was supported through the submission of additional documents to support the application to amend the Pickering and Darlington Power Reactor Operating Licences to implement RD-204. A list of the OPG implementing documents for RD-204 was provided to the CNSC in Reference [B.6-9]. These included N-TQD-103-00001 R007 "Nuclear Certified Shift Personnel Continuing Training and Qualification Description", N-INS-08920-100001 R003 "Requalification Testing of Certified Shift Personnel", N-INS-08920-10003 R002 "Independence And Security for Initial Certification Examinations and Requalification Testing of Certified Shift Personnel", and N-PROC-RA-0005 "Written Reporting to Regulatory Agency" (which calls up N-FORM-10824 R001 "Report on Performance and Status of Certified Personnel"). One reporting criterion in N-FORM-10824 requires the date of reinstatement to duties and any remedial actions taken prior to reinstatement be reported to the CNSC. These requirements demonstrate that the gap is addressed.

Issue D274 is related to the recertification of an individual who has been decertified and: "The gaps in this Issue point to there being no documented procedure at OPG for re-certifying a person who has been decertified" [B.6-6]. The justification for the classification of Acceptable Deviation for Issue D274 from the Final Darlington NGS ISR Report is as follows:

> *The reason OPG does not have governance for recertification of staff after decertification is that it is considered that a business need for such a procedure does not exist. Without a defined process for certification following decertification, individuals could become recertified after meeting the same requirements that are prescribed for initial certification, which are documented in the following three documents: N-TQD-101-00001 R005, "Authorized Nuclear Operator Initial Training and Qualification Description", N-TQD-102-00001 R007, "Nuclear Shift Manager/Control Room Shift Supervisor Initial Training and Qualification Description", or N-TQD-105-00001 R001, "Darlington Unit 0 Control Room Operator (CRO) Initial Training and Qualification Description".*
>
> *Alternatively, in absence of a defined process within OPG governance, OPG could, on a case-by-case basis, rely directly on the requirements of CNSC RD-204 Clause 34.*

Both D272 and D274 issues and the justifications as Acceptable Deviations are applicable to Pickering NGS given the programmatic nature of the gaps and their resolutions. These Acceptable Deviations are not impacted by operation beyond 2020. These issues are therefore not PSR2 gaps.

In summary, three issues related to CNSC RD-204 were identified as part of the Darlington ISR. Of these three, one (D273) was closed with the development of documentation (which was also produced for Pickering NGS), and the other two (D272 and D274) were Acceptable Deviations with justifications which are programmatically applicable to Pickering. There are therefore no PSR2 gaps.

B.6.2.2 Application of Post-PSR1 Reviews

OPG Compliance with RD-204 (2008) is demonstrated through the Pickering NGS PROL Application [B.6-4] and through the Darlington ISR review of RD-204 which is programmatically applicable to Pickering NGS. There have been no revisions to CNSC RD-204 since first issuance in 2008, and no other reviews have been performed as none were required.

B.6.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC RD-204 (2008) [B.6-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC RD-204 (2008).

B.7 CNSC REGDOC-3.1.1 (2014), "Reporting Requirements for Nuclear Power Plants"

B.7.1 Background

The following paraphrased from the preface and introduction of CNSC REGDOC-3.1.1 (2014) [B.7-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *Nuclear power plants are required to report to the CNSC using event reports for situations or events of higher safety significance and that may require short-term action by the CNSC, and to submit routine scheduled reports on various topics that are required for longer-term compliance monitoring. Nuclear power plants are also required to provide notification of certain normal business activities and to file specific records with the CNSC in accordance with the Nuclear Safety and Control Act.*
>
> *Regulatory document REGDOC-3.1.1 sets out the timing and information that nuclear power plant licensees are required to report to the CNSC to support the conditions of applicable power reactor operating licences. REGDOC-3.1.1 presents the types of reports, their frequency and the applicable timeframe for reporting. It also contains guidance, explanatory information, forms and templates to assist users in meeting reporting requirements.*

REGDOC-3.1.1 (2014) is applicable to Safety Factor 10 (Organization, the Management System and Safety Culture).

Compliance with REGDOC-3.1.1 [B.7-1] is currently a licensing requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.2 of the R04 Pickering Licence Conditions Handbook [B.7-2]. Licence Condition 4.3 states: "the licensee shall notify and report in accordance with CNSC Regulatory Document REGDOC 3.1.1 *Reporting Requirements for Nuclear Power Plants"* [B.7-2].

REGDOC-3.1.1 is the result of the consolidation of two draft documents, RD-99.1, "Reporting Requirements for Operating Nuclear Power Plants" [B.7-3] and GD-99.1, "Guide to the Reporting Requirements for Operating Nuclear Power Plants" [B.7-4]. It also supersedes CNSC S-99, "Reporting Requirements for Operating Nuclear Power Plants" [B.7-5] which was published in 2003. It includes updates to the reporting requirements, including the Safety Performance Indicators.

The results of PSR1 S-99 and REGDOC-3.1.1 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.7.2. As identified in Reference [B.7-6], the Pickering PSR2 review of CNSC REGDOC-3.1.1 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.7.2 Compliance Assessment for Pickering PSR2

B.7.2.1 Application of PSR1 Reviews

The versions of REGDOC-3.1.1 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

A clause by clause review of CNSC S-99 [B.7-5] is documented in the OPG Report NK30-REP-03680-00006 R002 [B.7-7] for the Safety Performance Safety Factor, which demonstrated compliance with all relevant clauses of S-99.

The Environmental Program compliance with CNSC S-99 was assessed in OPG Report NK30-REP-03680-00010 R000 [B.7-8] for the Environment Safety Factor, wherein the OPG environmental procedures and standards which document the S-99 reporting requirements are documented. The report concluded that OPG complies with the intent of CNSC S-99.

S-99 was also reviewed with respect to the safeguards program in NK30-REP-03680-00011, "Pickering NGS-B Integrated Safety Review - Safeguards" [B.7-9]. The document states that "Pickering NGS-B has submitted the required safeguards reports to the CNSC and thereby is in compliance with Articles 59-69 and 74 of IAEA INFCIRC/164, S-99, AECB1049 and the safeguards requirement #13 of the PROL."

Based on the Pickering B ISR reviews, no PSR2 gaps were identified with respect to S-99 [B.7-5], which was the precursor to REGDOC-3.1.1 [B.7-1].

Pickering Units 1,4

Both S-99 [B.7-5] and REGDOC-3.1.1 [B.7-1] were issued subsequent to Pickering A Return to Service. AECB Regulatory Document R-99, "Reporting Requirement for Operating Nuclear Power Facilities", which preceded S-99, was omitted from review on the basis that it "pertains mostly to Operations aspects, or other aspects not having a direct or immediate effect on installed design features" [B.7-10]. However, the Pickering B ISR reviewed S-99 and the conclusions of that work are applicable across the OPG Nuclear fleet, including Pickering Units 1,4 and Units 5-8. Further, the Darlington ISR review of S-99 is programmatically applicable to Pickering as discussed below.

Darlington NGS

A clause-by-clause review of S-99 [B.7-5] was performed as part of the Darlington ISR, as documented in NK38-REP-03680-10045 R000 [B.7-11]. The report concluded that "OPG has implemented governance, programs and procedures to ensure compliance with the requirements of S-99. No gaps or major findings were found". Given that S-99 compliance is addressed by Governance, Program, Policies and Procedures that apply across OPG's Nuclear fleet, the results of the programmatic review are applicable to Pickering NGS. No PSR2 gaps are identified from the Darlington ISR review of S-99.

B.7.2.2 Application of Post-PSR1 Reviews

Compliance with CNSC REGDOC-3.1.1 is a license requirement per Pickering PROL 48.02/2018. The request from OPG to the CNSC for a licence amendment included a Transition Plan for REGDOC-3.1.1 which indicates that "Starting January 1, 2015, Pickering Nuclear will be in compliance with the requirements of Regulatory Document 3.1.1" [B.7-12]. Attachment 3 of [B.7-12] provides the details of the Transition Plan.

The CNSC Record of Proceedings for the Application to Amend Reporting Requirements in Power Reactor Operating Licence [B.7-13] describes the changes in REGDOC-3.1.1 [B.7-1] relative to S-99 [B.7-5] as follows:

> *REGDOC-3.1.1, which supersedes S-99, provides a modernized set of reporting requirements for NPPs, including an improved set of safety performance indicators. The included requirements and guidance would enable CNSC staff to effectively oversee NPP operations, while eliminating unnecessary or duplicate reporting.*

The CNSC Record of Proceedings also notes that several requirements introduced by REGDOC-3.1.1 were previously introduced as licence conditions in the PROL pending revision of S-99. Therefore some new requirements introduced by REGDOC-3.1.1 were already addressed at Pickering NGS through previous licence conditions. For Pickering, referencing REGDOC-3.1.1 as a licensing requirement included the removal of the following licence condition [B.7-2] related to reporting requirements now covered in REGDOC-3.1.1:

> *The licensee shall report any apparent non-compliance of applicable law at the federal, provincial or municipal level that pertains to the activities licensed under this licence;*

This represents a change in REGDOC-3.1.1 relative to S-99, but no change in the PROL reporting requirements for OPG since the new requirement was previously addressed through licence conditions.

Compliance with REGDOC-3.1.1 is further ensured through use of Action Requests to track scheduled submission requirements of REGDOC-3.1.1 compliance reports (e.g., effluent/emission reports, quarterly performance indicators, R&D annual reporting).

Based on the Transition Plan for REGDOC-3.1.1 [B.7-12] (which was accepted by the CNSC [B.7-2]), as well as ongoing compliance reports and compliance initiatives as discussed above, it is concluded that there are no PSR2 gaps for Pickering NGS compliance with REGDOC-3.1.1.

B.7.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC REGDOC-3.1.1 (2014) [B.7-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-3.1.1 (2014).

B.8 CNSC REGDOC-2.9.1 (2013), "Environmental Protection Policies, Programs and Procedures"

B.8.1 Background

The following paraphrased from the preface and introduction of CNSC REGDOC-2.9.1 [B.8-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *Environmental protection policies, programs, and procedures are an important component of the overall requirement for licensees to make adequate provision for protection of the environment. Licensees also have specific obligations to take all reasonable precautions to protect the environment and to control the releases of nuclear and hazardous substances. The respective regulations require submission of environmental protection policies and procedures at Class I nuclear facilities and submission of environmental protection policies and programs at uranium mines and mills.*
>
> *The purpose is to help assure that licensees implement adequate environmental protection policies, programs and procedures, other than for licences to abandon, at Class I nuclear facilities and uranium mines and mills, in accordance with the Nuclear Safety and Control Act (NSCA) and regulations.*
>
> *This document sets out the environmental protection policies, programs and procedures that licensees shall implement at Class I nuclear facilities and uranium mines and mills, when required by the applicable licence or other legally enforceable instrument.*

REGDOC-2.9.1 is directly relevant to Safety Factor 14 (Radiological Impact on the Environment). A number of clauses also relate to Safety Factor 8 (Safety Performance).

Although compliance with REGDOC-2.9.1 is not a licensing requirement, compliance with CNSC Regulatory Standard S-296 "Environmental Protection Policies, Programs and Procedures at Class I Nuclear Facilities and Uranium Mines and Mills" is currently a licence requirement for Pickering NGS (per PROL 48.02/2018) as indicated in Appendix C.2 of the R04 Pickering Licence Conditions Handbook [B.8-2]. REGDOC-2.9.1 supersedes S-296 [B.8-3] and combines the information from associated Regulatory Guide G-296, "Developing Environmental Protection Policies, Programs and Procedures at Class I Nuclear Facilities and Uranium Mines and Mills" [B.8-4].

On November 30, 2015, a revised Draft of REGDOC-2.9.1 was posted for an additional round of consultation [B.8-5]. Consultation closed on March 29, 2016, which is past the PSR2 freeze date. As a result, the 2013 version of REGDOC-2.9.1 [B.8-1] is reviewed as part of PSR2.

The results of PSR1 S-296 and CNSC REGDOC-2.9.1 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.8.2. As identified in Reference [B.8-6], the Pickering PSR2 review of CNSC REGDOC-2.9.1 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code and Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.8.2 Compliance Assessment for Pickering PSR2

B.8.2.1 Application of PSR1 Reviews

The versions of REGDOC-2.9.1 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

CNSC S-296 [B.8-3] was reviewed as part of the Pickering B ISR, as documented in Environment Safety Factor Report NK30-REP-03680-00010 R000, "Pickering NGS-B Integrated Safety Review – Environment" [B.8-7]. The review included a clause by clause review of ISO 14001:2004, "Environmental Management Systems - Requirements with Guidance for Use" [B.8-8], taking into account the provisions stipulated in S-296 [B.8-3] and G-296 [B.8-4], in order to ensure compliance with ISO 14001:2004 and CNSC S-296. The review concluded that the OPG Environmental Management program, described in N-PROG-OP-0006 "Environmental Management" [B.8-9] is in compliance with the requirements and recommendations of S-296. There were no associated gaps. Since compliance is demonstrated based on Governance, Programs, Procedures and Practices that apply across OPG's Nuclear operations, this conclusion is applicable to all of Pickering NGS (Units 1,4 and Units 5-8).

Pickering Units 1,4

No review was performed for Pickering Units 1,4 against any version of REGDOC-2.9.1 [B.8-1] or CNSC S-296 [B.8-3]. However, Section 9.0 of Attachment 3 of the Pickering PROL Renewal Application [B.8-10] states:

> *The Environmental Program (N-PROG-OP-0006) and its supporting governing documents establish provisions for protection of the environment at OPG's nuclear facilities and continual improvement of environmental performance. This program provides Nuclear with a systems approach to managing environmental aspects in accordance with the elements of ISO 14001 Environmental Management Systems standard and the CNSC Standard S-296: Environmental Protection, Policies, Programs and Procedures at Class 1 Nuclear Facilities and Uranium Mines and Mills.*

Holding ISO 14001 (Environmental Management System) certification provides assurance that an environment policy is in place, compliance to legislation is effective, objectives are established, programs are in place to meet these objectives, and performance reviews against these objectives are conducted periodically to ensure overall continuous improvement.

Darlington NGS

Clause-by-clause reviews were performed for the Darlington ISR for both S-296 [B.8-3] and G-296 [B.8-4] with respect to the Radiological and Non-Radiological Impact on the Environment Safety Factor, as documented in References [B.8-11] and [B.8-12], respectively. The reviews examined OPG's Environmental Management System (EMS) as documented in N-PROG-OP-0006 "Environmental Management" [B.8-9]. The reviews did not identify any gaps and found that Darlington NGS was compliant with both CNSC S-296 [B.8-3] and CNSC G-296 [B.8-4]. Since compliance is demonstrated based on Governance, Programs, Procedures and Practices that apply across OPG's Nuclear operations, this conclusion is applicable to Pickering NGS (Units 1,4 and Units 5-8).

A high level intent review of REGDOC-2.9.1 was performed for Darlington, in the context of the Safety Factor for Radiological and Non-Radiological Impact on the Environment, as documented in OPG Report NK38-REP-03680-10208 R000 [B.8-13]. The review concluded that Darlington is in compliance with CNSC Regulatory Document REGDOC-2.9.1 and that no gaps were identified during the review. While the review is largely programmatic, several Darlington-specific documents were used in the assessment. One example is in measuring compliance with clause 3.2 of REGDOC-2.9.1 "EMS Scope". The review indicated that "Darlington has conducted an ecological risk assessment which concluded that radiological risks to non-human biota were not significant" [B.8-13]. This is not a gap for PSR2 since: a) similar ecological risk assessments have been performed for Pickering (e.g., References [B.8-14] and [B.8-15]), and b) the clause in question has not changed from CNSC G-296 [B.8-4], and as such, the previously assessed intent compliance for Pickering B [B.8-7] remains applicable. The same conclusion is applicable to the other Darlington-specific document examples that were used in the assessment (which relate to spill prevention, emergency preparedness, and environmental protection), since similar assessments have been performed for Pickering NGS and there have been no safety significant changes to any of the related clauses.

Section B.8.2.2 below discusses compliance for any clauses of CNSC S-296 that have changed in REGDOC-2.9.1.

B.8.2.2 Application of Post-PSR1 Reviews

The CNSC document history for REGDOC-2.9.1 [B.8-5] indicates that REGDOC-2.9.1 supersedes S-296 [B.8-3] and G-296 [B.8-4]. A comparison of REGDOC-2.9.1 (2013) to its predecessors reveals the following changes:

1. In the list of Relevant Regulations in Section 1.3 of REGDOC-2.9.1 [B.8-1], the following statement is incremental from the parallel clause 3.3 of S-296 [B.8-3]: "Other acts and regulations also apply to projects, to support environmental protection policies,

programs and procedures (refer to the References Section for details)." References added include:

a. *Migratory Birds Convention Act,* Ottawa, 1994.

b. *Fisheries Act*, Ottawa, 1985.

c. *CSA Group, Environmental Management Systems - General Guidelines on Principles, Systems and Support Techniques (Adopted ISO 14004:2004, second edition, 2004-11-15)*, CAN/CSA-ISO 14004-04 (R2009), Toronto, 2004.

d. Health Canada, Guidance documents related to Federal Contaminated Risk Assessment in Canada, Ottawa, 2010.

These changes are not safety significant and there is therefore no PSR2 gap.

2. The definition of 'licensing basis' was added to REGDOC-2.9.1, and used in the Preface to this standard. This change is not safety significant and does not result in a PSR2 gap.

Since REGDOC-2.9.1 (2013) [B.8-1] does not contain any new regulatory requirements in comparison to S-296 [B.8-3] or G-296 [B.8-4], Pickering NGS compliance is demonstrated through the original Pickering B ISR reviews [B.8-7] of S-296 [B.8-3] and G-296 [B.8-4]. This is further supported by the Darlington review in B.8.2.1 described above, where the review confirmed that there were no material changes from CNSC G-296 to REGDOC-2.9.1 and the programmatic requirements and conclusions are also applicable to Pickering.

B.8.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC REGDOC-2.9.1 (2013) [B.8-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.9.1 (2013).

B.9 CNSC REGDOC-2.10.1 (2014), "Nuclear Emergency Preparedness and Response"

B.9.1 Background

The following paraphrase from the preface and introduction of CNSC REGDOC-2.10.1 [B.9-1], provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *Prevention of nuclear emergencies at Canadian nuclear facilities is the responsibility of the licensees. The CNSC regulates the Canadian nuclear industry in order to prevent unreasonable risk to the environment, the health and safety of persons, and national security. Mitigation of nuclear emergencies aims at ensuring that equipment, such as hydrogen recombiners, or procedures, such as emergency operating procedures, are put in place before a nuclear emergency to reduce the potential magnitude or impact of the hazard*
>
> *REGDOC-2.10.1 sets out the emergency preparedness requirements and guidance of the CNSC related to the development of emergency measures for licensees and licence applicants of Class I nuclear facilities and uranium mines and mills.*
>
> *REGDOC-2.10.1 lists and discusses the requirements and guidance that licence applicants and licensees shall implement and consider in the design of their emergency preparedness program (EP program)…*
>
> *For existing facilities: The requirements contained in this document do not apply unless they have been included, in whole or in part, in the licence or licensing basis.*

REGDOC-2.10.1 (2014) is directly relevant to Safety Factor 13 (Emergency Planning).

REGDOC-2.10.1 (2014) is the first version of this REGDOC and supersedes:

- G-225, "Emergency Planning at Class I Nuclear Facilities and Uranium Mines and Mills" (2001) [B.9-2].
- RD-353, "Testing the Implementation of Emergency Measures" [B.9-3].

Compliance with REGDOC-2.10.1 is not currently a licence requirement for Pickering NGS (in accordance with PROL 48.02/2018) per the R04 Pickering Licence Conditions Handbook (LCH) [B.9-4]. However, RD-353 (2008) is a licence requirement as indicated in Appendix C2 of the R04 Pickering LCH [B.9-4].

It is noted that "REGDOC-2.10.1, 'Nuclear Emergency Preparedness and Response,' version 2 was published in February 2016. While there will be no impact on any REGDOC-2.10.1 requirements and guidance, this update aligns with version 2 of REGDOC-2.3.2, '*Accident Management*'– which had been created to clarify requirements" [B.9-5]. Since Version 2 was issued after the PSR2 freeze date, the 2014 version has been assessed as part of PSR2.

According to Reference [B.9-6], "The new regulatory documents address lessons learned from the Fukushima nuclear accident and incorporate international post-Fukushima best practices and guidance for use by current and future Canadian licensees."

As identified in Reference [B.9-7], the Pickering PSR2 review of REGDOC-2.10.1 (2014) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.9.2 Compliance Assessment for Pickering PSR2

B.9.2.1 Application of PSR1 Reviews

The versions of REGDOC-2.10.1 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

The first edition of REGDOC-2.10.1 was issued in October 2014 after the completion of the Pickering B ISR. Therefore, no code review was performed for Pickering Units 5-8 against REGDOC-2.10.1.

CNSC G-225 [B.9-2] was reviewed as part of the Pickering B ISR, as documented in [B.9-8]. The review included a clause by clause review of CNSC G-225 in relation to the then current OPG Emergency Response Program [B.9-9] and its relevant implementing documentation. As documented in [B.9-8], the OPG program was found to be in direct compliance with all requirements, with only one exception. Gap 13-037 was raised against Clause 5.8 of G-225 associated with the Filtered Air Discharge System (FADS). Specifically, it was noted that there was an outstanding CNSC Action Item (AR# 28071493 – AI# 2006-8-02) related to Post-Accident Radiological Monitoring System (PARMS) iodine sampling not being consistent with design accuracy requirements, in terms of iodine activity measurement. In [B.9-10] (Gap 13-037 in Appendix F), OPG outlined a series of actions that were accepted by the CNSC in order to bring this issue to resolution. OPG also undertook that, upon completion of these actions, a determination would be made as to the validity of the resolution beyond the current design life of the station. The actions completed by OPG are documented in [B.9-11] in which closure of the Action Item was requested on the grounds that further action to address this issue was not feasible, and not necessary since it would be of limited value. The CNSC agreed and closed Action Item 2006-8-02 [B.9-12] and in so doing, stated that no further work is required. The technical basis for closure of this Action Item is not related to the design life of the station, hence, this resolution is considered applicable for extended operation of the Pickering station beyond 2020.

Although there is not a one-to-one correspondence, the subject matter of Clause 5.8 of CNSC G-225 maps generally to the content of Clauses 2.2.6 and 2.3.2 of REGDOC-2.10.1. As such, the previously identified gap relating to CNSC AI# 2006-08-02 is considered to be relevant in the context of REGDOC-2.10.1, as well as its resolution. Therefore, this does not represent a PSR2 gap.

No code review was performed for Pickering Units 5-8 against CNSC RD-353.

Pickering Units 1,4

The first edition of REGDOC-2.10.1 was issued in October 2014 after the completion of the Pickering A Return-to-Service. Therefore, no code review was performed for Pickering Units 1,4 against REGDOC-2.10.1.

No code review was performed for Pickering Units 1,4 against CNSC G-225. However, in the review done for Pickering Units 5-8 [B.9-8], compliance was assessed based on Governance, Programs, Procedures and Practices that apply either across OPG's Nuclear operations or for the Pickering site. Hence, the conclusions are applicable to all of Pickering NGS (Units 1,4 and Units 5-8). This includes the identified gap and its resolution relating to the FADS, which is a shared system between Pickering Units 1,4 and Units 5-8.

No code review was performed for Pickering Units 1,4 against CNSC RD-353.

Darlington NGS

The first edition of REGDOC-2.10.1 was issued in October 2014 after the completion of the code reviews for the Darlington ISR. Therefore, no code review was performed for Darlington against REGDOC-2.10.1.

CNSC G-225 [B.9-2] was reviewed as part of the Darlington ISR, as documented in [B.9-13] and [B.9-14]. The review included a high level review of CNSC G-225 in relation to the then current OPG Emergency Response Program [B.9-15] and its relevant implementing documentation. As documented in [B.9-14], the OPG program was found to comply with all requirements, with only one exception. Similar to the Pickering B ISR, the gap was related to Clause 5.8 of CNSC G-225 (iodine activity measurement). In the final Darlington ISR report [B.9-16], this was identified as ISR Issue D067. The proposed resolution was to monitor work under the outstanding CNSC AI# 2006-8-02 and to assess if the resolution is sufficient for refurbishment. As noted in [B.9-16], this Action Item is common for both Pickering and Darlington stations. Hence, the resolution of this issue as discussed above for Pickering Units 5-8 is applicable to Darlington. As such, ISR Issue D067 was reclassified as an Acceptable Deviation [B.9-17].

No code review was performed for Darlington against CNSC RD-353.

B.9.2.2 Application of Post PSR1 Reviews

As part of the 2012 PROL renewal application for Pickering [B.9-18], a report on the Nuclear Emergency Plan was presented, in which OPG stated the conclusion that:

> *Pickering NGS is in full compliance with CNSC RD-353, Testing and Implementation of Emergency Measures.*

This, in combination with the discussion of CNSC G-225 in the preceding section, provides confirmation that for Pickering, there are no gaps in relation to the CNSC documents that have now been superseded by REGDOC-2.10.1.

As part of the most recent PROL renewal application process for Darlington [B.9-19], OPG provided a detailed status report with respect to their Emergency Management Program, which included the following commitment:

> *OPG will submit a transition plan for compliance with REGDOC-2.10.1 to CNSC staff by September 30, 2015, and will be fully compliant by December 31, 2018.*

The transition plan was subsequently provided to the CNSC in [B.9-20], in which OPG stated that a gap analysis (documented in [B.9-21]) had been conducted to identify the required steps to transition to REGDOC-2.10.1. All requirements for which no gaps were identified are either generically applicable to the OPG emergency response program or, if station-specific aspects exist, these are met for both Pickering and Darlington. For the gaps identified, the specific actions to implement the transition plan are summarized in the table below. Regulatory Management Action Request AR # 28184526 was initiated to track completion of the transition plan by Q3 2017.

No.	REGDOC-2.10.1 Clause	OPG Action
1	2.1 (2)	OPG is undertaking to compile the applicable documentation of the planning basis considerations and to incorporate into EP governance in order to demonstrate full compliance
2	2.2.3 (5)	OPG is undertaking to review and develop a process for real time access to offsite monitoring data for the offsite authority and the CNSC
3	2.2.3 (7) (8)	OPG is undertaking to identify and revise applicable procedures such that the CNSC is included with the offsite authority in being provided this information
4	2.2.4 (2)	OPG is undertaking to formally compile existing agreements and reference in the emergency plan

No.	REGDOC-2.10.1 Clause	OPG Action
5	2.2.4 (additional requirement 2)	OPG is undertaking to update the Darlington Evacuation Time Estimate study. Subsequent to the target completion date, OPG will revise its governance to include the requirement to maintain the evacuation time estimates as required.
6	2.2.6 (11)	OPG is undertaking to formally compile existing arrangements and reference in EP governance
7	2.2.9 (2) (3)	Although changes to the emergency plan already follow a formal process to ensure continued effectiveness, OPG is undertaking to develop and document a validation process to demonstrate compliance with this requirement. OPG proposes to work with the CNSC to ensure that the applicable Emergency Response plans and procedures are reflected in the LCH.
8	2.3.4 (1) to (8)	OPG is in the process of stocking and distributing Potassium Iodide (KI) pills to meet this requirement by the end of 2015. OPG is undertaking to document associated processes, including lessons learned resulting from the stocking and distribution of KI pills.

Actions 1, 2, 3, 4, 6 and 7 relate entirely to Governance, Programs, Procedures and Practices that apply across OPG's nuclear operations. Once these actions are completed for the Darlington transition plan, Pickering will also be in compliance with these clauses of REGDOC-2.10.1 since the programs apply to both stations. Action 1 is to produce documentation that compiles material that already exists in other documents. Actions 2 and 3 relate to enhancing processes to share information with the CNSC during an accident. Actions 4, 6 and 7 are to produce documentation that describes arrangements or processes that OPG already follows. The absence of the above would not affect the manner in which OPG would manage the response to an emergency and is not safety significant. Therefore, the open status of these actions does not result in a PSR2 gap.

Actions 5 and 8 are safety significant and contain elements that are station-specific and apply to Pickering. In relation to Action 5, the Pickering Evacuation Time Estimate study has been updated as documented in [B.9-22] and made available to the public [B.9-23]. Updating OPG governance to ensure that the Pickering Evacuation Time Estimate study is maintained up to date is in progress. With respect to Action 8 dealing with public distribution of KI pills, in Section 2.3.3 of [B.9-24] the CNSC made note of actions underway at the time by OPG that would address this action for Pickering. Section 1.7 of the Licence Conditions Handbook for Pickering [B.9-4] also outlines the CNSC's expectations for the completion of these actions. The distribution of KI pills and associated public information providing instructions on their proper use was completed in 2015 for the primary distribution zone around the Pickering station. Details of the program are publically available in [B.9-25]. Updating OPG governance to define how the KI pill program will be sustained is in progress. The need to complete Actions 5 and 8 from the transition plan in [B.9-20], as they relate to Pickering and taking into account Pickering life extension, is identified as **PSR2 REGDOC-2.10.1 Gap #1.**

Note that REGDOC-2.10.1 is programmatic in nature and, except for the items noted under **PSR2 REGDOC-2.10.1 Gap #1**, the status of OPG's compliance with it is not impacted by the possibility of continued operation of Pickering beyond 2020.

B.9.3 Compliance Assessment Summary for Pickering PSR2

There is one PSR2 REGDOC-2.10.1 gap which relates to Safety Factor 13 (Emergency Planning):

1. OPG has completed a gap analysis for transition to REGDOC-2.10.1 and has developed an action plan to achieve compliance. The transition plan that OPG has committed in order to bring Darlington into compliance with REGDOC-2.10.1 applies across the nuclear fleet and will also bring Pickering into compliance. Updating OPG governance to ensure that the Pickering Evacuation Time Estimate study is maintained and to define how the Potassium Iodide (KI) pill program will be sustained is in progress. As these two actions are not yet complete, this is identified as a PSR2 gap.

B.10 CNSC G-323 (2007), "Ensuring the Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement"

B.10.1 Background

The following paraphrased from the purpose and scope of CNSC G-323 (2007) [B.10-1] provides a brief overview of the purpose of this Standard and the requirements expressed therein:

> *Adequate staffing levels are required to respond to the most resource-intensive conditions under all operating states, including normal operations, anticipated operational occurrences, design basis accidents, and emergencies. The purpose of CNSC G-323 is to assist Class I nuclear facility licensees and applicants for a Class I nuclear facility licence to demonstrate to the CNSC that they will ensure the presence of a sufficient number of qualified workers to carry on the licensed activity safely.*
>
> *CNSC G-323 sets out information related to the staffing of a Class I nuclear facility that should typically be included in an application for the issuance, renewal, amendment, or replacement of a licence to operate a facility. The guide sets out the key factors that CNSC staff will take into account when assessing whether the licensee has made, or the application will make, adequate provision for ensuring the presence of a sufficient number of qualified staff.*

CNSC G-323 is relevant to Safety Factor 10 (Organization, Management System and Culture) and Safety Factor 12 (Human Factors).

CNSC G-323 is identified in Appendix E.2 of the R04 Pickering Licence Conditions Handbook (LCH) [B.10-2] as "Guidance or Criteria". As indicated in Sections 3.1 and 3.2 of the LCH, G-278 provides the recommended approach for defining the minimum shift complement and sets out the key factors that CNSC staff will take into account when assessing whether there are adequate provisions for ensuring the presence of a sufficient number of qualified staff. G-323 (2007) is the first edition of this Regulatory Guide.

The results of PSR1 G-323 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.10.2. As identified in Reference [B.10-3], the Pickering PSR2 review of CNSC G-323 (2007) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.
- <u>Gap</u>: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.10.2 Compliance Assessment for Pickering PSR2

B.10.2.1 Application of PSR1 Reviews

The versions of G-323 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

G-323 was not reviewed as part of the Pickering B ISR. G-323 was also not reviewed for Pickering 1,4 Return to Service. As discussed below, Pickering NGS compliance with G-323 has been demonstrated through completion of a clause-by-clause review performed for the Darlington ISR review of G-323, the findings of which are programmatically applicable to Pickering NGS. Further, Pickering NGS compliance demonstration includes submission to, and acceptance by, the CNSC of P-INS-09100-00003, "Pickering Minimum Shift Complement" [B.10-4] as discussed below.

Darlington NGS

G-323 (2007) [B.10-1], which is the latest version of the Regulatory Guide, was reviewed as part of the Darlington ISR and documented in OPG Reports NK38-REP-03680-10094 R000 [B.10-5] and NK38-REP-03680-10094-ADD-001 R000 [B.10-6]. This clause-by-clause review against G-323 showed that OPG governing documents adequately address the intent of the majority of the clauses in the Regulatory Guide. Four gaps were identified which were assigned to Darlington ISR Issue D270 [B.10-7] and tracked under Action Request (AR) 28112704. The gaps are as follows:

1. *Clause 5.1.1 of CNSC Guide G-323 expects that the minimum staff complement is determined by the licensee through a systematic analysis, and the most resource-intensive condition for each operation state should be analyzed. Gap 01355 indicates that there is no explicit requirement in OPG governance requiring systematic analysis to determine minimum shift complement.*

2. *Clause 5.1.2 of CNSC Guide G-323 identifies the requirement of validating minimum staff requirement under all operating states including normal operation, Anticipated Operational Occurrences, Design Basis Accidents, and / or emergencies. Gap 01356 indicates that Manual N-MAN-06700-10001 R000 "Human Factors Validation Planning and Methods" does not provide details of the inputs required for validation such as operating states, range of scenarios or the objectives of the validation such as those identified in CNSC G-323.*

3. *Clause 5.1.2.1 of CNSC Guide G-323 identifies validation scenarios that should include the most resource-intensive events that could affect more than one unit, such as seismic events, loss of off-site power, steam line or feeder water line breaks. Gap 01357 indicates that Manual N-MAN-06700-10001 R000 does not provide details of the inputs required for validation such as operating states, range of scenarios or the objectives of the validation such as those identified in CNSC G-323.*

4. *Clause 5.1.2.2 of CNSC Guide G-323 specifies that the validation exercises should demonstrate that relevant procedures can be implemented in a timely manner, there is effective and timely response to Anticipated Operational Occurrences, Design Basis Accidents and emergencies, the facility can be effectively monitored, controlled and stabilized, there is effective communication and coordination, workers are able to maintain awareness of facility conditions, the physical and mental workload of minimum staff complement is achievable and all safety–critical human actions are achievable. Gap 01358 indicates that Manual N-MAN-06700-10001 R000 does not provide details of the inputs required for validation such as operating states, range of scenarios or the objectives of the validation such as those identified in CNSC G-323.*

Since the identified gaps relate to OPG governance, they are applicable to PSR2. Darlington ISR Issue D270 summarizes the gaps above as follows [B.10-7]:

> *The code requires the nuclear facility to use systematic analysis to determine minimum staff complement and validate minimum staff complement under all operating states. Reviews indicate that the current OPG governance does not have requirements for systematic analysis to determine minimum shift complement and that validation of minimum shift complement does not consider required inputs such as all operating states, the range of scenarios or the objectives to be achieved.*

AR # 28112704 was opened to address issue D270. Initiative Plan MA-08, "Days Based Maintenance", was developed to address requirements specified in G-323 at Darlington and at Pickering NGS and thus to address issue D270. Following completion of the actions associated with development of the validation plan, and submission of the minimum shift complement basis document to the CNSC, the issue was assigned an Acceptable Deviation on the basis that the minimum shift complement as specified in D-PROC-OP-0009 R008 "Station Shift Complement" [B.10-8], and D-INS-09260-10001 R002 "Duty Crew Minimum Complement Assurance" [B.10-9] were accepted by the CNSC.

As the Days Based Maintenance Initiative included Pickering, AR # 28112704 also included actions related to the preparation, verification and validation of the Pickering minimum shift complement document [B.10-4]. This AR has been closed with all items completed. Changes in the minimum shift complement as a result of these actions are identified in OPG letter to the CNSC, P-CORR-00531-03710 "Pickering A and B Request for Licence Amendments – Minimum Shift Complement" [B.10-10], wherein it is noted that: "The validation methodology has been documented and validation exercises have been observed by CNSC Staff."

B.10.2.2 Application of Post-PSR1 Reviews

Action Items 2004-4-09 and 2004-8-10 had been previously raised in 2004 to track OPG's progress in analyzing the minimum shift complement required for Pickering NGS. Closure of these action items was requested in OPG Letter P-CORR-00531-03585 [B.10-11], wherein the analysis in accordance with G-323 was submitted through an earlier revision (R005) of P-INS-09100-00003, "Pickering Minimum Shift Complement" [B.10-4]. The analysis methodology, analysis and validation reports for the minimum shift complement are listed as references in this document. As per the response from the CNSC [B.10-12]:

CNSC staff agrees with the process used to conduct the systematic analysis and integrated validation of the minimum shift complement at Pickering NGS.

P-INS-09100-00003 [B.10-4] is now referenced in Section 3.2 of the Pickering LCH [B.10-2] as the reference for compliance verification. Therefore, there is no gap for Pickering PSR2.

As discussed above, compliance with CNSC G-323 (2007) is demonstrated through the CNSC's acceptance of the process used to conduct the systematic analysis and integrated validation of the minimum shift complement at Pickering NGS [B.10-12]. There have been no revisions to CNSC G-323 since first issuance in 2007, and no other reviews performed since the Darlington ISR review as none were required. There are no gaps for Pickering NGS compliance with CNSC G-323.

B.10.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC G-323 (2007) [B.10-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-323 (2007).

B.11 CNSC G-278 (2003), "Human Factors Verification and Validation Plans"

B.11.1 Background

The following paraphrased from the purpose and scope of CNSC G-278 (2003) [B.11-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The purpose of CNSC G-278 is to assist licensees and licence applicants in planning for human factors verification and validation activities. Such activities help satisfy certain regulatory requirements by demonstrating that licensees and applicants have made adequate provision for the protection of the environment and the health and safety of persons.*
>
> *CNSC G-278 describes the elements of effective human factors verification and validation planning for Class I nuclear facilities and uranium mines and mills. A suggested format for documenting these elements is presented in the guide as a Human Factors Validation and Verification Plan. However, equivalent documentation that meets the objectives and intent of the guide is also acceptable.*

CNSC G-278 (2003) is applicable to Safety Factor 1 (Plant Design) and Safety Factor 12 (Human Factors).

CNSC G-278 is identified in Appendix E.2 of the R04 Pickering Licence Conditions Handbook (LCH) [B.11-2] as "Guidance or Criteria". As indicated in Sections 3.1 and 3.2 of the LCH, G-278 provides additional recommendations and guidance for the development of human performance programs, for verification and validation of the minimum shift complement, and for considering human factors in design programs. CNSC G-278 (2003) is the first edition of this Regulatory Guide.

The results of PSR1 G-278 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.11.2. As identified in Reference [B.11-3], the Pickering PSR2 review of CNSC G-278 (2003) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard (L/R/C/S) on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.11.2 Compliance Assessment for Pickering PSR2

B.11.2.1 Application of PSR1 Reviews

The versions of G-278 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

A clause-by-clause review of CNSC G-278 (2003) [B.11-1] was performed for the Pickering B ISR. The results are documented in OPG Report NK30-REP-03680-00014 R000 [B.11-4] as an Addendum to the Management Safety Factor Report (which included Human Factors-related L/R/C/S reviews and Review Tasks), wherein indirect compliance with the majority of clauses was determined.

Two clauses were assessed as Acceptable Deviations on the basis of the technical assessment. The Acceptable Deviation findings are as follows:

1. Compliance with Section 6.3 and its subsections was assigned an Acceptable Deviation based on the exception for simple modifications where it was assessed that explicitly documenting each validation element is not judged necessary. Where appropriate, these elements are addressed in either a Human Factors Engineering Program Plan or a separate Verification & Validation plan, as recommended in COG-92-444, COG-92-445 and NUREG-0711.

2. When using the Human Factors (HF) Worksheet, HF Validation includes completion of two questions in Section 6: HF Validation. Sources of information used to complete this section are documented on the worksheet. Given that the HF Worksheet is used for simple straightforward modifications, the elements used in the validation process are limited to a recommended set of activities.

These Acceptable Deviations are not impacted by Pickering NGS operation beyond 2020. Further, an assessment of G-278 (2003) was also performed for the Darlington ISR, the findings of which are programmatically applicable to Pickering NGS, as discussed below.

Pickering Units 1,4

No code review was performed for Pickering Units 1,4 against any version of G-278. However, as discussed above, the Pickering B ISR reviewed the latest (and only) version of G-278 and the conclusions of that work are applicable across the OPG Nuclear fleet, including Pickering NGS (Units 1,4 and Units 5-8). Further, the Darlington ISR review of G-278 is also programmatically applicable to Pickering NGS, as discussed below.

Darlington NGS

CNSC G-278 (2003) [B.11-1] (the same version as used for the Pickering B ISR) was reviewed as part of the Darlington ISR and documented in Reference [B.11-5]. The review, which is programmatically applicable across OPG's Nuclear fleet and to Pickering NGS, did not identify any gaps and found that Darlington NGS was compliant with CNSC G-278 (2003) [B.11-1]. In reference to the Acceptable Deviation conclusions for Section 6.3 of G-278 as determined in the Pickering B ISR review [B.11-4], the review conducted for Darlington [B.11-5] states: "The content of the verification and validation activities in the worksheet addresses the requirements for verification and validation as stated in G-278. However, the verification and validation activities required during completion of the Human Factors Worksheet do not need to be completed by a qualified Human Factors Specialist as the worksheet is completed for minor or uncomplicated modifications where HF Specialist input is not required." The Darlington ISR Report concluded that based on a high-level intent review, OPG's Engineering Change Control process (and related HF engineering processes) comply with the intent of G-278. Since compliance against CNSC G-278 is based on Governance, Programs and Procedures that apply across OPG's Nuclear operations, the Darlington ISR conclusions are applicable to Pickering PSR2.

B.11.2.2 Application of Post-PSR1 Reviews

The version of CNSC G-278 assessed in the Pickering B and Darlington ISRs is the most recent version of this guidance document. No additional code reviews have been performed as none were required.

B.11.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC G-278 (2003) [B.11-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-278 (2003).

B.12 CNSC G-276 (2003), "Human Factors Engineering Program Plans"

B.12.1 Background

The following paraphrased from the purpose and scope of CNSC G-276 (2003) [B.12-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The purpose of CNSC G-276 is to assist licensees and licence applicants in developing human factors engineering program planning documentation that demonstrates how human factors considerations are incorporated into activities licensed by the CNSC. Such considerations help satisfy certain regulatory requirements by demonstrating that licensees and applicants have made adequate provision for health, safety and protection of the environment.*
>
> *CNSC G-276 describes the elements of effective human factors engineering program planning documentation for Class I nuclear facilities and uranium mines and mills. A suggested documentation format is presented in the guide as a Human Factors Engineering Program Plan. However, equivalent documentation that meets the objectives and intent of the guide is also acceptable.*

CNSC G-276 is applicable to Safety Factor 1 (Plant Design) and Safety Factor 12 (Human Factors).

CNSC G-276 is identified in Appendix E.2 of the R04 Pickering Licence Conditions Handbook (LCH) [B.12-2] as "Guidance or Criteria". As indicated in Section 3.1, and Section 6.1 of the LCH, G-276 provides additional guidance for considering human factors in design programs, and for the preparation of human performance programs [B.12-2]. CNSC G-276 (2003) is the first edition of this Regulatory Guide.

The results of PSR1 G-276 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.12.2. As identified in Reference [B.12-3], the Pickering PSR2 review of CNSC G-276 (2003) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.12.2 Compliance Assessment for Pickering PSR2

B.12.2.1 Application of PSR1 Reviews

The versions of G-276 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

A clause-by-clause review of CNSC G-276 (2003) [B.12-1] was performed for the Pickering B ISR Management System Safety Factor, as discussed in OPG Report NK30-REP-03680-00008 [B.12-4]. The results of the review are documented in an Addendum to the Management System Safety Factor Report [B.12-5], wherein indirect compliance with each applicable clause was demonstrated through the Human Factors Engineering screening process within the Engineering Change Control process, and the subsequent preparation of Human Factors Engineering Program Plans and Human Factors Worksheets. The assessment concluded that compliance has been demonstrated with the intent of the code based on the high level intent review. No gaps were identified.

Pickering Units 1,4

No review was performed for Pickering Units 1,4 against G-276. However, as discussed above, the Pickering B ISR reviewed the latest (and only) version of G-276 and the conclusions of that work are applicable across the OPG Nuclear fleet, including Pickering Units 1,4 and Units 5-8. Further, the Darlington ISR review of G-276 is also programmatically applicable to Pickering NGS, as discussed below.

Darlington NGS

CNSC G-276 [B.12-1] (the same version used for the Pickering B ISR) was reviewed as part of the Darlington ISR and documented in Reference [B.12-6]. The review concluded that "based on a programmatic, high-level intent review, OPG's engineering change control process and related Human Factors Engineering processes comply with the intent of G-276". No gaps were identified and Darlington NGS was found to be compliant with CNSC G-276 (2003).

Since compliance against CNSC G-276 is based on Governance, Programs and Procedures that apply across OPG's Nuclear operations, the Darlington ISR conclusions are applicable to Pickering PSR2.

B.12.2.2 Application of Post PSR1 Reviews

The version of CNSC G-276 assessed in the Pickering B and Darlington ISRs is the most recent version of this guidance document. No additional code reviews have been performed as none were required.

B.12.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC G-276 (2003) [B.12-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC G-276 (2003).

B.13 S.C. 1997, C.9 (Amended in February 2015), "Nuclear Safety and Control Act"

B.13.1 Background

The following paraphrased from the Nuclear Safety and Control Act (NSCA) (Amended 2015) [B.13-1] provides a brief overview of the purpose of this Act and the information expressed therein:

> *The purpose of the act is to provide for the limitation of the risks to national security, the health and safety of persons and the environment that are associated with the development, production and use of nuclear energy and the production, possession and use of nuclear substances, prescribed equipment and prescribed information. In addition, the act is to provide for the implementation in Canada of measures to which Canada has agreed respecting international control of the development, production and use of nuclear energy, including the non-proliferation of nuclear weapons and nuclear explosive devices.*
>
> *The act does this by establishing the Canadian Nuclear Safety Commission (CNSC) and defines its objectives, members, employees, power, record and reporting requirements, offences, punishments, and penalties.*

The NSCA is relevant to Safety Factor 10 (Organization, Management System and Safety Culture). The NSCA was last amended on February 26, 2015. Sections that have been amended include a citation to the amending Act or regulation. Consolidation of the amendments was published in April 2016, which includes some amendments not in force. Section 80 of the Act was amended by S.C. 2015 c. 3, s.136 [B.13-2] to reference the 1996 AECB Cost Recovery Fees Regulations instead of the 1994 Regulations. Other amendments have been included as previous consolidated versions are published, and can be found on the Government of Canada Justice Laws Website [B.13-3].

Per Section 2.1 of the R04 Pickering Licence Conditions Handbook (LCH) [B.13-4]:

> *Paragraphs 3(1)(k) and 15(a) and (b) of the General Nuclear Safety and Control Regulations require that a licence application contain information related to the organizational management structure and responsibilities… An adequately established and implemented management system provides CNSC staff confidence and evidence that the legal basis under which the Commission made its decision and had issued a licence, pursuant the Nuclear Safety and Control Act, remains valid.*

The results of PSR1 NSCA reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.13.2. As identified in the Pickering PSR2 Basis Document [B.13-5], the Pickering PSR2 review of the NSCA (Amended in February 2015) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.13.2 Compliance Assessment for Pickering PSR2

B.13.2.1 Application of PSR1 Reviews

The versions of the NSCA (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

NSCA was not assessed in the Pickering B ISR.

Pickering Units 1,4

NSCA was not part of the Pickering A Return to Service assessments.

The Pickering LCH [B.13-4] confirms that the NSCA is the basis for the granting of the PROL. For example the LCH states:

> *An adequately established and implemented management system provides CNSC staff confidence and evidence that the legal basis under which the Commission made its decision and had issued a licence, pursuant the Nuclear Safety and Control Act, remains valid…*

The Pickering PROL Renewal Application [B.13-6] states:

> *Table 1 is included for convenience, to assist in locating specific information within the application corresponding to the requirements of the Nuclear Safety and Control Act and applicable Regulations."*

Table 1 of [B.13-6] demonstrates how compliance with regulations under the NSCA is achieved, and there are no PSR2 gaps. Further, the Darlington ISR review of the NSCA is programmatically applicable to Pickering NGS and is discussed further below.

Darlington NGS

A clause-by-clause review of the NSCA (1997) was performed for Darlington ISR in NK38-REP-03680-10089 R000 [B.13-7]. The majority of the Act is applicable only to the CNSC. The parts that are applicable to OPG were addressed with reference to fleet-wide documents. The findings were that OPG has implemented Governance, Programs and Procedures to ensure compliance with the requirements of the NSCA. The report did not identify any gaps. This conclusion is also applicable to Pickering and is not affected by operation past 2020.

A subsequent Darlington ISR Code Refresh clause-by-clause review of the 2014 Amendment of the NSCA was performed in OPG Report NK38-REP-03680-10216 R000 [B.13-8]. No gaps were found in this review. The compliance assessment refers to fleet-wide licences and programs with the exception of the compliance discussion on Section 30 which refers to Darlington correspondence to explain how OPG is committed to providing timely access to CNSC inspectors to enable them to perform their duties under the NSCA. Similar programs are in place at Pickering NGS. A search was performed of the Station Condition Records issued since 2009 to identify any issues with inspector access. None were found. As a result, there are no PSR2 gaps.

B.13.2.2 Application of Post-PSR1 Reviews

Subsequent to the 2012 Licence Renewal application [B.13-6], the NSCA was amended in 2015 [B.13-1]. The only change made to the NSCA is described in Miscellaneous Statute Law Amendment Act, 2014 (S.C. 2015, c. 3) clause 136 [B.13-2] as follows:

> *Section 80 of the* Nuclear Safety and Control Act *is replaced by the following:*
>
> *80. A licence that is issued pursuant to regulations made under paragraph 9(b) of the Atomic Energy Control Act and that is in force immediately before the commencement day is deemed to have been issued under section 24 of this Act and to be in force for the remainder of the period for which it was issued under the Atomic Energy Control Act and any fees paid or payable under the AECB Cost Recovery Fees Regulations, 1996 in respect of such a licence are deemed to be paid or payable, as the case may be, under this Act.*

This amendment has no impact on nuclear safety and is not applicable in the context of PSR2. There is no PSR2 gap.

B.13.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for the Nuclear Safety and Control Act (Amended 2015) [B.13-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with the NSCA (Amended 2015).

B.14 CSA N1600-14, "General Requirements for Nuclear Emergency Management Programs"

B.14.1 Background

The following paraphrased from the purpose and scope of CSA N1600-14 [B.14-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The purpose of CSA N1600-14 is to establish criteria for the emergency management programs of on- and off-site organizations to address nuclear emergencies at Canadian reactor facilities.*
>
> *CSA N1600-14 provides requirements for a comprehensive nuclear emergency management program (NEMP) embracing the Emergency Management (EM) components (prevention/mitigation, preparedness, response, and recovery) in keeping with international EM practice, with a predominant focus on preparedness, response, and recovery. It establishes the elements of a continuous improvement process to develop, implement, maintain, and evaluate the EM functions of nuclear facilities and their surrounding communities.*

CSA N1600-14 is directly relevant to Safety Factor 13 (Emergency Planning). However, it is worth noting that CSA N1600 is intended to cover all aspects of emergency management, which includes requirements that do not apply to utility organizations (for example, the management of off-site response). For the purpose of the PSR2 review, only requirements that apply to OPG require assessment.

Compliance with CSA N1600-14 is not a licence requirement for Pickering NGS (per PROL 48.02/2018) and it is not referenced in the Pickering Licence Conditions Handbook [B.14-2].

CSA N1600-14 is the first edition of this standard, published in May 2014. The impact statement [B.14-3] for N1600-14 highlights the significant features of the standard as follows:

1. *This new Canadian Standard outlines the requirements for on-site and off-site emergency management programs to address nuclear emergencies at nuclear power plants (NPPs).*

2. *This Standard does not apply to nuclear emergencies at Class IB nuclear facilities, Class II nuclear facilities, and mines and mills; however, this Standard may provide guidance to nuclear facilities other than NPPs. The operators of these facilities may, together with the authority having jurisdiction, determine the applicability and suitability of the guidance provided by this Standard.*

3. *This Standard provides the unique requirements to develop, implement, evaluate, maintain, and continuously improve a nuclear emergency management program (NEMP) and reflects the Five Pillars/Components of Emergency Management (prevention, mitigation, preparedness, response, and recovery) in keeping with international emergency management practice.*

4. *Although this Standard reflects the Five Pillars/Components of Emergency Management, the predominant focus is on the preparedness for, the response to, and the recovery from a nuclear emergency at a NPP.*

5. *This Standard includes requirements pertaining to: i) planning basis, ii) communications, iii) program management, iv) nuclear emergency response plans, v) nuclear emergency recovery plans, vi) training, facilities and equipment maintenance, vii) public awareness and education, viii) exercises, ix) program evaluation, audit, and review, and x) management review.*

As identified in Reference [B.14-4], the Pickering PSR2 review of CSA N1600-14 is a High Level Review. For a PSR2 High Level Review, the degree of conformance with clauses or groups of clauses in the Law, Regulation, Code or Standard (L/R/C/S) is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the intent of the safety requirement is met.
- Gap: A Gap indicates that the intent of the safety requirement is not met.

B.14.2 Compliance Assessment for Pickering PSR2

B.14.2.1 Application of PSR1 Reviews

Pickering NGS

The first edition of CSA N1600 was issued in May 2014 after the completion of the Pickering B Integrated Safety Review (ISR) and Pickering A Return-to-Service. Therefore, no code reviews were performed for Pickering Units 5-8 or Units 1,4 against CSA N1600.

Darlington NGS

The first edition of CSA N1600 was issued in May 2014 after the completion of the code reviews for the Darlington ISR. Therefore, no code review was performed for Darlington against CSA N1600.

B.14.2.2 Application of Post PSR1 Reviews

A compliance review against CSA N1600-14 [B.14-1] was not undertaken as part of previous PSR1 reviews and the following High Level assessment has been completed. In the review below, the degree of conformance with clauses or groups of clauses in the standard is assessed for Pickering NGS by reference to supporting evidence stating whether the intent of the requirements stipulated in the standard is met.

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
0 Introduction	This clause provides introductory background information and does not specify requirements. Assessment not required.	N/A
1 Scope	This clause defines the scope of N1600 and does not specify requirements. Assessment not required.	N/A
2 Reference publications	This clause identifies references used in N1600 and does not specify requirements. Assessment not required.	N/A
3 Definitions	This clause defines terms used in N1600 and does not specify requirements. Assessment not required.	N/A
4 Nuclear Emergency Management Program (NEMP)		
4.1 General	This clause contains sub-clauses specifying requirements related to the following subject areas: • NEMP overview • NEMP elements • Integration • Alternatives <u>Assessment</u> Clause 4.1 of N1600 establishes high level requirements for a NEMP that are further elaborated on in subsequent Clauses 4.2 to 4.10. These high level requirements are addressed by the content of N-PROG-RA-0001, "Consolidated Nuclear Emergency Plan" (CNEP) [B.14-5] and the various implementing documents that it references, which collectively define OPG's NEMP. The CNEP is integrated with OPG's overall governance framework, and receives its authority from N-CHAR-AS-0002, "Nuclear Management System" [B.14-6]. Integration in the form of collaboration and coordination with other stakeholders and external organizations occurs primarily through the conduct of drills and exercises (refer to discussion for Clause 4.10 of N1600).	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	Clause 4.1 of N1600 makes reference to event prevention and mitigation as being elements of the NEMP, but acknowledges that these are not addressed in N1600 (they are covered by other codes and standards). OPG also addresses these as part of other programs, which are outside of the NEMP. Hence, this is not a PSR2 gap. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.1 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4.2 Planning basis	This clause contains sub-clauses specifying requirements related to the following subject areas: • Hazards identification • Risk assessment • Impact analysis • NPP planning basis requirements • Off-site planning basis requirements • Review frequency <u>Assessment</u> The emergency response planning basis is discussed in Section 1.1 of the CNEP, N-PROG-RA-0001 [B.14-5]. The need is specified to consider the range of Design Basis Accidents that could reasonably be postulated to occur (as identified, described and analyzed in the station's Safety Report). As well, potentially more severe Beyond Design Basis Accidents need to be considered, as reflected in new governance that OPG has established subsequent to the Fukushima accident, such as N-STD-MP-0019, "Beyond Design Basis Accident Management" [B.14-7]. Consideration is also given to events caused by conditions external to the site and initiating events that are non-nuclear in nature. This ensures that the full spectrum of potential hazards is considered. Clause 4.2.2 of N1600 specifies the requirement to perform a risk assessment to determine the potential impact of hazards. Requirements applicable to performing risk assessments are addressed in the Pickering PSR2 Safety Factor 6 Report – Probabilistic Safety Assessment (PSA). Impact analysis deals with the need to identify and ensure the availability of functions that are critical to supporting the emergency response. This requirement is addressed by N-PROC-RA-0133, "Management of	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	Equipment Important to Emergency Response" [B.14-8] (refer to the discussion for Clause 4.8 of N1600). Clause 4.2.5 relating to off-site planning requirements is specifically addressed to outside organizations (i.e., not OPG). Clause 4.2.6 of N1600 sets requirements for the emergency response planning basis to be documented (in accordance with the organization's document management process) and reviewed at least every five years. The planning basis is well understood; it is derived from sources such as the station's Safety Report and PSA. As part of the OPG transition plan for CNSC REGDOC-2.10.1 [B.14-9], an action is in progress to compile the planning basis references for incorporation into the CNEP, which is subject to an annual review frequency. This is a documentation issue that does not affect the manner in which OPG would manage the response to an emergency and is not safety significant. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.2 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4.3 Communication	This clause contains sub-clauses specifying requirements related to the following subject areas: • Communication needs analysis • Process for external communication • Data and information needs for effective communication • Data and information transmittal requirements for NPPs • Communications plan establishment • Communications plan scope • Communication procedures • Testing of communication systems <u>Assessment</u> Requirements for external communication are specified throughout the CNEP, N-PROG-RA-0001 [B.14-5]. Specific details with respect to how communications are managed during a nuclear emergency are provided in:	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	• OPG-PROC-0028, "Crisis Management and Communications Centre (CMCC) Procedure" [B.14-10] • OPG-PROC-0112, "Corporate Relations and Communications Emergency Preparedness and Response Procedure" [B.14-11] • N-STD-AS-0010, "Nuclear Crisis Communications Standard" [B.14-12] Collectively and in conjunction with other implementing governing documents under the CNEP (e.g., Clause 4.8 discussion covers testing of communications equipment), these address the requirements specified in Clause 4.3 of N1600, with one exception. Clause 4.3.2 of N1600 requires that the approach to managing emergency communications be based on performing a communications needs analysis. The need for this is not specified in the OPG governing documents. However, post-Fukushima, OPG embarked on an Emergency Telecommunications Enhancement project for Pickering as documented in [B.14-13], [B.14-14] and [B.14-15]. Communications needs have been clearly defined for Pickering in [B.14-14] and used as the basis for assessing the adequacy of emergency communications at Pickering. Furthermore, communication protocols have been tested on several occasions over the years in exercises and drills involving external organizations, and will continue to be evaluated as part of future exercises. Considering the above, the absence of reference to a communications needs analysis in the governance is not safety significant, hence, this is not a PSR2 gap. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.3 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4.4 Program management	This clause contains sub-clauses specifying requirements related to the following subject areas: • Planning cycle for the NEMP • Leadership and commitment • Program coordination • NEMP review committee • NEMP administration • Review of the NEMP • Financial management	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	• NEMP maintenance <u>Assessment</u> Planning, development, implementation and maintenance of the emergency management program are established as specified in the CNEP, N-PROG-RA-0001 [B.14-5]. Requirements with respect to leadership and commitment, program coordination, program administration, program maintenance and financial management are addressed as part of the roles and accountabilities specified in Section 2.0 of the CNEP. Clause 4.4.4 of N1600 specifies the requirement for a NEMP review committee to provide guidance and advice on the organization's NEMP. Each site has an Emergency Response Oversight Committee that encompasses and addresses any issues identified with the CNEP. Performance measures are addressed in Section 1.6.5 of the CNEP as well as N-GUID-03491-10008, "Emergency Preparedness Performance Measure System" [B.14-16]. Mutual aid agreements are addressed in Section 1.3 of the CNEP as well as in N-LEGL-03490-0413370 [B.14-17] documenting the arrangements between OPG, Bruce Power, AECL and New Brunswick Power, and N-GUID-03490-10001, "Mutual Aid Agreement Implementation" [B.14-18]. Documentation requirements are specified in Section 1.6.1 of the CNEP. Control and periodic review of Emergency Preparedness documents are governed by OPG-STD-0001, "Requirements for Administrative Governance Documents" [B.14-19] and OPG-PROC-0001, "Process Administrative Governance Documents" [B.14-20]. Records and documentation are managed in accordance with OPG-PROG-0001, "Information Management" [B.14-21] and OPG-PROC-0019, "Records and Document Management" [B.14-22]. Processes to ensure ongoing review and maintenance of the program are specified in Section 1.6.5 of the CNEP including monitoring of performance measures, drills and exercises, self-assessment, independent assessment, use of the corrective action program and OPEX. Validation of the program and changes to the program are not explicitly addressed in the CNEP, however, this is adequately covered by the range and frequency of drills conducted regularly per Table 1 in N-PROC-RA-0045, "Emergency Preparedness Drills and Exercises" [B.14-23]. Drills and exercises serve as validation of the program, therefore, this is not a PSR2 gap.	

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	Clause 4.4.1.3 of N1600 specifies a five year planning cycle for the NMEP. This is considered to be redundant to the five year review cycle for the planning basis that is specified in Clause 4.2.6 of N1600. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.4 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4.5 Nuclear emergency response plan	This clause contains sub-clauses specifying requirements related to the following subject areas: • Nuclear emergency response plan development • Response organization requirements • Nuclear emergency categorization and notification • Emergency assessment • Protective actions • Interface and support between response organizations • Emergency personnel protection • Critical facilities • Communication, information flow and public alerting systems • Continuity of nuclear emergency response operations • Deviation from the nuclear emergency response plan • Validation of the nuclear emergency response plan and procedures • Nuclear emergency response plan maintenance Assessment The OPG NEMP, as specified in the CNEP, N-PROG-RA-0001 [B.14-5] and its suite of implementing documents possesses the high level characteristics recommended in Clause 4.5.1 of N1600. The OPG NEMP as defined in these documents also meets the plan development requirements specified in Clause 4.5.2 of N1600. Clause 4.5.2.5 requires that information about the plan be readily accessible to the public. A summary of the NEMP to the extent it is relevant to the public is readily available on OPG's Emergency Preparedness website [B.14-24]. Requirements with respect to the Emergency Response Organization (ERO) responsible for managing an event at an OPG station are specified in Section 2.2 of the CNEP.	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	This includes roles and accountabilities for all identified positions within the ERO. This is further supported by a set of procedures that provide detailed execution instructions for all key ERO roles (e.g., N-INS-03491-10000, "CEOF Emergency Response Director" [B.14-25]). Staffing quorum requirements are also specified for each ERO facility to declare itself operational. The command and control structure is defined in Section 1.2.1 of the CNEP and further reinforced by the role-specific instruction documents that elaborate on interface requirements between roles, thereby ensuring an integrated response effort. Requirements are also specified within the CNEP for the identification, deployment and managing of required support resources. Processes governing activation of the ERO are defined, including reporting time requirements for key positions. Further details with respect to how ERO staffing is managed, including availability and notification provisions are specified in N-PROC-RA-0046, "Emergency Response Organization Staffing and Availability" [B.14-26]. Minimum staffing requirements in terms of on-site staff required to perform all essential event mitigation and response duties following limiting design basis accidents are defined for the station per P-INS-09100-0003, "Pickering Minimum Shift Complement" [B.14-27]. Provisions are also made for the possibility that emergency response may be extended over a period of time (i.e., over multiple shifts). As a result of actions taken subsequent to the Fukushima event, procedures and guidelines have been developed and implemented that also assure that emergency response to a multi-unit event is supported. Validation exercises have been performed to confirm this. Nuclear emergency categorization and notification requirements are defined in Section 1.2.2 of the CNEP. Requirements for emergency assessment, in particular the need to predict and monitor radiological conditions both on-site and off-site are addressed in the CNEP. This includes the designation of specific ERO roles to perform these functions in Section 2.2 of the CNEP. This is further supported by implementing procedures such as N-STD-RA-0004, "Emergency Off-Site Radiological Monitoring Process for Airborne Releases of Radioactive Materials" [B.14-28] and N-STD-RA-0005, "Emergency Dose Projection Process" [B.14-29]. Clause 4.5.6 of N1600 deals with off-site protective actions that are primarily the responsibility of the Province of Ontario. The CNEP addresses these considerations, to the extent required for OPG to support the identification	

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	and implementation of protective actions (e.g., communication requirements, provision of dose projections). Clause 4.5.6.3.2 of N1600 deals with public evacuation time estimates. The Pickering Evacuation Time Estimates report has been recently updated [B.14-30] and is available to the public [B.14-31]. OPG governance is in the process of being updated to ensure that the report is maintained up to date on an as required basis. Clause 4.5.6.3.3 of N1600 deals with the distribution of iodine thyroid blocking agents (i.e., potassium iodide (KI) pills). The distribution of KI pills, including instructions on their proper use, was completed by OPG prior to the end of 2015 for the primary distribution zone around the Pickering station. Details regarding this program are available to the public [B.14-32]. OPG governance is in the process of being updated to sustain this program going forward. Completion of these actions to update governance for Evacuation Time Estimates and KI pills has been committed to the CNSC as part of the OPG transition plan to achieve compliance with CNSC REGDOC-2.10.1. As such, this is documented as a gap in the PSR2 REGDOC-2.10.1 assessment (PSR2 REGDOC-2.10.1 Gap#1) and is not identified as a gap for CSA N1600. N-STD-RA-0043, "Nuclear Recovery Planning" [B.14-33] addresses the need for communications with organizations outside of OPG but does not explicitly mention inter-organizational coordination. However, Table 2 of the standard identifies required interfaces with external stakeholders and assigns responsibilities within OPG for managing each of these. This is sufficient to meet the intent of the requirement. Mutual aid agreements are discussed as part of the discussion for Clause 4.6 of N1600. Clause 4.5.7.5 of N1600 provides requirements with respect to venting containment. The CNEP outlines how the potential need for containment venting is managed in accordance with these requirements, including the associated expectations for notification, consultation and approval authority. Instructions for physically implementing venting strategies are embedded in station emergency operating procedures. The CNEP and its implementing documents, in addition to station operating procedures, address the requirements for emergency personnel protection, including the provision and use of Personal Protective Equipment (PPE). Required equipment and facilities to support the emergency response are addressed in the CNEP, and managed in accordance with OPG's Equipment Important To Emergency Response (EITER) program (refer to discussion for Section 4.8 of N1600). Potential threats to	

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	habitability are considered, and alternate facility locations are specified to allow essential emergency response functions to be performed in the event that primary facility locations are unavailable or uninhabitable. Requirements for communication are specified throughout the CNEP (refer to discussion for Clause 4.3 of N1600). Continuity of emergency response operations and the potential need to authorize deviations from plan are addressed in the CNEP. Validation of the program and changes to the program are not explicitly addressed in the CNEP, however, this is adequately covered by the range and frequency of drills conducted regularly per Table 1 in N-PROC-RA-0045, "Emergency Preparedness Drills and Exercises" [B.14-23]. Clause 4.5.13.3 of N1600 requires that the Authority Having Jurisdiction (AHJ) be notified of changes to the NEMP and that validation results be submitted to the AHJ at least 30 days prior to implementation. This is not addressed in OPG's governing documents, however, this is not safety significant so it is not a PSR2 gap. Documentation requirements and maintenance of the emergency management program are addressed as part of the discussion for Clause 4.4 of N1600. Clause 4.5.8.4 of N1600 requires that the types and quantities of PPE be identified and provided that would allow the station's emergency response to be self-sufficient (i.e., without outside assistance) for the first 72 hours following an event. This 72 hour window is consistent with provisions OPG has implemented following the Fukushima event to address Beyond Design Basis Accidents. As documented in [B.14-34], guidance has been implemented to ensure that adequate supplies are identified and maintained on-site for the station to be self-sufficient for 72 hours following an accident. In particular, [B.14-35] itemizes the radiation protection PPE supplies and their quantities for Pickering and Darlington to be self-sufficient for at least 72 hours, which meets the intent of the requirements. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.5 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4.6 Nuclear emergency recovery plan	This clause contains sub-clauses specifying requirements related to the following subject areas:	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	• Nuclear emergency response plan development • Transition from response to recovery • Plan implementation authority • Technical resource needs • Scope of the nuclear emergency recovery plan • Recovery organizational requirements • Other resource requirements • Communications and information flow • Continuity of nuclear emergency recovery plan operations • Deviation from the nuclear emergency recovery plan • Nuclear emergency recovery plan accessibility • Validation of the nuclear emergency recovery plan and procedures • Nuclear emergency recovery plan maintenance <u>Assessment</u> Requirements related to emergency recovery are specified in Section 1.2.7 of the CNEP, N-PROG-RA-0001 [B.14-5]. N-STD-RA-0043, "Nuclear Recovery Planning" [B.14-33] specifies in more detail the processes by which OPG manages the emergency recovery phase. N-STD-RA-0043 [B.14-33] stipulates that the recovery effort by the utility will be managed as if it were a project and that a Recovery Project Organization (RPO) will be established to execute the project. N-STD-RA-0043 [B.14-33] cites N1600-14 as a Bases reference and has been developed taking into consideration the requirements in Clause 4.6 of N1600 that are applicable to NPPs. Consideration is given to the potential need to develop special procedures and business processes and to perform damage assessments, recognizing that the available recovery options will depend on the extent of damage. The potential need for recovery activities to commence while some emergency response activities are still ongoing is acknowledged, and roles and accountabilities are defined to manage the transition to emergency recovery. Mutual aid agreements are addressed in Section 1.3 of the CNEP as well as in N-LEGL-03490-0413370 [B.14-17] documenting the arrangements between OPG, Bruce Power, AECL and New Brunswick Power, and N-GUID-03490-10001, "Mutual Aid Agreement Implementation" [B.14-18]. Clause 4.6.1 of N1600 specifies the need to develop supporting procedures, but recognizes that detailed	

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	procedures likely cannot be prepared until after the event has occurred, since they will depend on the extent of damage to the plant. This is acceptable since strategies and a basic framework have been put in place prior, including roles and responsibilities and expectations related to other organizations. These are covered in N-STD-RA-0043 [B.14-33]. Furthermore, by specifying that the recovery effort will be managed as a project, it is implicit that the RPO will recognize the need to create the procedures it will require to perform its functions, based on the known conditions at the time. Table 1 in N-STD-RA-0043 provides a list of project execution documents the RPO may need to generate. The transition from emergency response to emergency recovery is addressed in Sections 1.2.6 and 1.2.7 of the CNEP [B.14-5] and Sections 1.3.4 and 1.4.4 of N-STD-RA-0043 [B.14-33]. N-STD-RA-0043 addresses plan implementation, scope of the plan, resource needs, organizational requirements, communication requirements and continuity of operations. The potential need to authorize and manage deviations from plan is addressed in Sections 1.2.1 and 1.5, and is implicit in establishing a project organization to manage the recovery effort, with roles and accountabilities as specified in Section 2.0. Public accessibility of the recovery plan is not applicable to OPG, since this requirement is written relative to off-site requirements that are outside of OPG's responsibility to manage. Clause 4.6.12 of N1600 specifies requirements to perform and document validation of the recovery plan and changes to the plan. Clause 4.6.13 of N1600 specifies requirements to review the recovery plan at least every five years and to maintain it. The recovery plan has been validated through stakeholder review including the Fukushima project for Beyond Design Basis Accidents and the review cycle for N-STD-RA-0043 aligns with the five year timeframe specified. This meets the intent of the requirements. Clause 4.6.12 of N1600 also contains a requirement to submit validation results to the Authority Having Jurisdiction, however, this is not safety significant, and is not a PSR2 gap. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.6 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
4.7 Training	This clause contains sub-clauses specifying requirements related to the following subject areas: • Levels of training • Training requirements • Competencies • Training design • Systematic approach to training • Frequency and scope • Qualification maintenance • On-site and off-site emergency response • Record retention <u>Assessment</u> Training requirements are specified in Section 1.6.3 of the CNEP, N-PROG-RA-0001 [B.14-5]. Specific details, including the training requirements for all ERO roles, are provided in N-TQD-503-00001, "Nuclear Emergency Response Organization Training and Qualification Description" [B.14-36]. Per N-LIST-08920-10001, "Trained Performance Areas" [B.14-37], ERO roles are among those designated as being governed by N-PROG-TR-0005, "Training" [B.14-38]. This requires that training be analyzed (to identify required competencies and training requirements), designed, developed, implemented and evaluated in accordance with a Systematic Approach to Training (SAT), details of which are specified in N-PROC-TR-0008, "Systematic Approach to Training" [B.14-39]. Training documentation is maintained in accordance with N-PROC-TR-0012, "Records and Documentation" [B.14-40]. Detailed training and qualification information for individuals is managed using the Training Information Management System (TIMS), in accordance with N-PROC-TR-0041, "TIMS II Administration" [B.14-41]. This includes identification of requalification requirements and expiry dates for affected qualifications. Clause 4.7.9.1 of N1600 could be interpreted as specifying a requirement to support the emergency response training needs of emergency response agencies external to OPG. Sections 1.3.3.1 and 2.1.7.3 of the CNEP recognize this and OPG does provide training for emergency workers outside of OPG. Clause 4.7.9.2 of N1600 specifies a requirement to submit training program information to the Authority Having Jurisdiction at least 30 days prior to implementation. This is not addressed in	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	the OPG governing documents, however, this is not safety significant, and is not a PSR2 gap. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.7 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4.8 Facilities and equipment maintenance	This clause contains sub-clauses specifying requirements related to the following subject areas: • Working condition assurance • Functionality inspection and tests • System testing • Gaps and limitations • Corrective action plans <u>Assessment</u> Requirements for the testing and maintenance of emergency facilities and equipment are specified in Sections 1.6.4 and 1.6.6 of the CNEP, N-PROG-RA-0001 [B.14-5]. OPG has implemented an EITER program that addresses all facilities and equipment that are essential for performing ERO functions following an actual emergency, as documented in N-PROC-RA-0133, "Management of Equipment Important to Emergency Response" [B.14-8]. Details with respect to testing and maintenance requirements are contained in N-PROC-RA-0040, "Maintenance and Testing of Emergency Preparedness Facilities and Equipment" [B.14-42]. This procedure refers to N-LIST-03490-10028, "Emergency Preparedness Facility Inventory and Check Documents" [B.14-43] that provides a listing of affected equipment, including required checks and frequencies. References are also made to other equipment-specific checks, such as for radiation protection instruments or emergency response vehicles. In the event that any EITER components are found to be unavailable to meet their performance requirements, required actions are specified in P-INS-03491-00050, "Unavailability of Emergency Important to Emergency Response – Pickering" [B.14-44] and N-INS-03491-10025, "Unavailability of Emergency Important to Emergency Response – Off-Site" [B.14-45]. Additional specific information related to the capability and operation of ERO equipment and facilities at Pickering is provided in P-MAN-	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	03490-00002, "Pickering ERO Equipment and Facility Manual" [B.14-46], including information for dealing with contingencies during an actual event (e.g., loss of power). On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.8 of CSA N1600-14. Since this applies across OPG Nuclear, and covers equipment and facilities that are specific to Pickering, this conclusion is applicable to the Pickering station.	
4.9 Public awareness and education	This clause contains sub-clauses specifying requirements related to the following subject areas: • Program requirements • Capabilities • Accountability <u>Assessment</u> Requirements for public education related to the possibility of a nuclear emergency at an OPG nuclear power plant are outlined in Section 1.3.6 of the CNEP, N-PROG-RA-0001 [B.14-5]. This is primarily the responsibility of the Province of Ontario and Section 1.3.6 contains sufficient high level information to describe the role OPG plays to support this. Extensive information regarding the OPG emergency management program is made available to the public through OPG's Emergency Preparedness website [B.14-24]. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.9 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	Compliant
4.10 Exercises	This clause contains sub-clauses specifying requirements related to the following subject areas: • Exercise program • Exercise schedule • Exercise design • Exercise facilitator qualifications • Exercise preparation • Exercise conduct • Post-exercise activities	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	• Exercise evaluation <u>Assessment</u> Section 1.6.5.2 of the CNEP, N-PROG-RA-0001 [B.14-5] specifies the requirements for drills and exercises. Specific details governing the performance of drills and exercises are outlined in N-PROC-RA-0045, "Emergency Preparedness Drills and Exercises" [B.14-23], and N-INS-03490-10002, "Conduct of Emergency Preparedness Drills and Exercises" [B.14-47]. Collectively, these documents lay out OPG's exercise program and comply with the requirements contained in Clause 4.10 of N1600-14. This includes identification of the types of drills and exercises required, their required frequency, and the detailed specification of performance objectives and evaluation criteria. Detailed requirements and instructions are provided for the design, preparation and conduct of drills and exercises. Details are also provided for post-exercise activities including debriefings, evaluation to identify areas for improvement and documentation (e.g., drill reports). Exercise controller and evaluator qualifications are addressed in N-TQD-503-00001, "Nuclear Emergency Response Organization Training and Qualification Description" [B.14-36]. Clause 4.10.2.3 specifies that a multi-jurisdictional operations-based exercise be conducted at least once every five years. This requirement is not specified in the OPG governing documents, although in practice exercises of this nature are conducted periodically. The frequency with which such exercises are conducted is not safety significant, so this is not a PSR2 gap. Clause 4.10.6.4 states that exercise controllers and evaluators should be separate individuals. This is generally not the case for on-site OPG exercises and is not specified in OPG governing documents. However, this is not safety significant, so this is not a PSR2 gap. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 4.10 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
5 Response	This clause contains sub-clauses specifying requirements related to the following subject areas: • Activation of the nuclear emergency response plan • Inter-organizational emergency response coordination • Assessment of the response needs	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	• Deviation from the nuclear emergency response plan • Termination of the emergency response phase • Response evaluation <u>Assessment</u> The CNEP, N-PROG-RA-0001 [B.14-5] and its suite of implementing documents specify the processes by which OPG manages the emergency response phase. The program addresses both activation and termination of the Emergency Response Organization, which manages the utility response to the event. Inter-organizational coordination is addressed extensively in Section 1.3. Assessment of response needs is not applicable to OPG, since this is written relative to off-site needs that are outside of OPG's responsibility to manage (aside from external communication which is dealt with extensively in the program). The potential need to authorize and manage deviations from plan is not addressed explicitly, but is implicit in the roles and accountabilities as specified in Section 2.0. Evaluation for the purpose of determining the root cause of the event and to identify actions to prevent recurrence is addressed in Section 1.2.7. Evaluation of response effectiveness is not specified in the standard, however, this is addressed per normal OPG Nuclear processes including: • N-PROG-RA-0003, "Corrective Action" [B.14-48] • N-PROG-RA-0010, "Independent Assessment" [B.14-49] • N-PROG-RA-0097, "Self-Assessment and Benchmarking" [B.14-50]. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 5 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
6 Recovery	This clause contains sub-clauses specifying requirements related to the following subject areas: • Activation of the nuclear emergency recovery plan • Inter-organizational emergency recovery coordination • Assessment of the recovery needs • Deviation from the nuclear emergency recovery plan • Termination of the recovery operation	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
	• Recovery evaluation <u>Assessment</u> Requirements related to emergency recovery are specified in Section 1.2.7 of the CNEP, N-PROG-RA-0001 [B.14-5]. N-STD-RA-0043, "Nuclear Recovery Planning" [B.14-33] specifies in more detail the processes by which OPG manages the emergency recovery phase. N-STD-RA-0043 stipulates that the recovery effort by the utility will be managed as if it were a project and that a Recovery Project Organization (RPO) will be established to execute the project. Activation and termination of the RPO are outlined in Section 1.4.4 of N-STD-RA-0043. The standard addresses the need for communications with organizations outside of OPG but does not explicitly mention inter-organizational coordination. However, Table 2 of the standard identifies required interfaces with external stakeholders and assigns responsibilities within OPG for managing each of these. This meets the intent of the requirement. Assessment of recovery needs is not applicable to OPG, since this is written relative to off-site needs that are outside of OPG's responsibility to manage (aside from external communication which is dealt with extensively in the standard). The potential need to authorize and manage deviations from plan is addressed in Sections 1.2.1 and 1.5, and is implicit in establishing a project organization to manage the recovery effort, with roles and accountabilities as specified in Section 2.0. Evaluation of recovery effectiveness is not specified in the standard, however, this is addressed per normal OPG Nuclear processes including: • N-PROG-RA-0003, "Corrective Action" [B.14-48] • N-PROG-RA-0010, "Independent Assessment" [B.14-49] • N-PROG-RA-0097, "Self-Assessment and Benchmarking" [B.14-50]. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 6 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
7 NEMP evaluation, audit and review	This clause contains sub-clauses specifying requirements related to the following subject areas: • NEMP evaluation • NEMP audit • NEMP review <u>Assessment</u> Section 2.1 of the CNEP, N-PROG-RA-0001 [B.14-5] specifies senior management roles and accountabilities related to the program, including specific role assignments for conducting program assessments, measuring and reporting on the effectiveness of the program, and identifying and implementing corrective actions. Requirements to ensure the ongoing health of the program are specified in Section 1.6.5 of the CNEP including monitoring of performance measures, drills and exercises, self-assessment, independent assessment, use of the corrective action program and OPEX. These are managed per normal OPG Nuclear processes, including: • N-PROG-RA-0003, "Corrective Action" [B.14-48] • N-PROG-RA-0010, "Independent Assessment" [B.14-49] • N-PROG-RA-0097, "Self-Assessment and Benchmarking" [B.14-50]. Clause 7.1.1 of N1600 specifies the requirement for a NEMP review committee to provide guidance and advice on the organization's NEMP. Membership needs to include those responsible for managing the NEMP, and others with emergency management expertise, and organizational knowledge with the ability to identify needed resources. The roles identified in Section 2.1 of the CNEP encompass all of the above, including the need for senior managers to provide strategic and programmatic direction. Each site has an Emergency Response Oversight Committee that encompasses and addresses any issues identified with the CNEP. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 7 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	Compliant

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
8 Management oversight	This clause contains sub-clauses specifying requirements related to the following subject areas: • Senior management oversight • Continual improvement <u>Assessment</u> Section 2.1 of the CNEP, N-PROG-RA-0001 [B.14-5] specifies senior management roles and accountabilities related to the program, including specific role assignments for oversight, corrective action and the use of OPEX. Each site has an Emergency Response Oversight Committee that encompasses and addresses any issues identified with the CNEP. Requirements to ensure continual improvement of the program are specified in Section 1.6.5 of the CNEP including monitoring of performance measures, drills and exercises, self-assessment, independent assessment, use of the corrective action program and OPEX. These are managed per normal OPG Nuclear processes, including: • N-PROG-RA-0003, "Corrective Action" [B.14-48] • N-PROG-RA-0010, "Independent Assessment" [B.14-49] • N-PROG-RA-0097, "Self-Assessment and Benchmarking" [B.14-50]. On this basis, the OPG Nuclear emergency management program meets the intent of the requirements specified in Clause 8 of CSA N1600-14. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	Compliant
Annex A (informative) Introduction figures	This annex is non-mandatory and provides additional explanation for information contained in Clause 0, Introduction of N-1600. It does not specify requirements. Assessment not required.	N/A
Annex B (informative) Nuclear emergency management program overview	This annex is non-mandatory and illustrates the relationship between the various legislation, plans and organizations involved in emergency response. It does not specify requirements. Assessment not required.	N/A

CSA N1600-14 Clause	PSR2 Review	Compliant or Gap
Annex C (informative) Conversion equivalence table	This annex provides information for converting between units of radiation measurement and does not specify requirements. Assessment not required.	N/A

Although no previous reviews have been documented against CSA N1600, several reviews have been performed as part of PSR2 in relation to other L/R/C/S related to emergency management that are potentially relevant to the subject matter of CSA N1600-14. The following codes were reviewed as part of the Pickering PSR2.

Code or Standard Number	Code or Standard Title
CNSC G-323 (2007)	Ensuring Presence of Sufficiently Qualified Staff at Class I Nuclear Facilities-Minimum Shift Complement
CSA N288.2-14	Guidelines for calculating Radiological Consequences to the public from a release of airborne radioactive material for Nuclear Reactor Accidents
CNSC REGDOC-2.3.2 (2015)	Accident Management, Version 2
CNSC REGDOC-2.10.1 (2014)	Nuclear Emergency Preparedness and Response

Note that CSA N1600-14 is programmatic in nature and, as such, the status of OPG's compliance with it is not impacted by the possibility of continued operation of Pickering beyond 2020.

B.14.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N1600-14 [B.14-1]. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CSA N1600-14.

B.15 CSA N288.6-12, "Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills"

B.15.1 Background

The following paraphrased from the purpose and scope of CSA N288.6-12 [B.15-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *Environmental risk assessment (ERA) of nuclear facilities is a systematic process used to identify, quantify, and characterize the risk posed by contaminants and physical stressors in the environment on biological receptors, including the magnitude and extent of the potential effects associated with a facility.*
>
> *CSA N288.6-12 addresses the design, implementation, and management of an environmental risk assessment program that incorporates best practices used in Canada and internationally.*

CSA N288.6 is relevant to Safety Factors 8 (Safety Performance) and 14 (Radiological Impact on the Environment). N288.6 is not identified in Appendix C of the R04 Licence Conditions Handbook [B.15-2], meaning it is not in Pickering PROL 48.02/2018. CSA N288.6-12 is the first edition of this standard.

As identified in Reference [B.15-3], the Pickering PSR2 review of CSA N288.6-12 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.15.2 Compliance Assessment for Pickering PSR2

B.15.2.1 Application of PSR1 Reviews

There have not been any previous PSR1 compliance reviews relating to N288.6.

Section 5 of the R04 Pickering License Conditions Handbook [B.15-2] states:

> *Environmental Risk Assessment (ERA) should be conducted in accordance with CSA standard N288.6-12 "Environment Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills". The ERA provides the basis for the environmental monitoring program (CSA standard N288.4) and also the effluent monitoring program (CSA standard N288.5) (see section 10.1 for more details regarding these standards). The ERA should be updated periodically with the results from the environmental and effluent monitoring programs in order to confirm the effectiveness of proposed mitigation measures…*

CSA standard N288.6-12 "Environmental risk assessments at Class I nuclear facilities and uranium mines and mills", published in June 2012, specifies the need for an ERA. The results of ERA provide the basis for monitoring programs in accordance with CSA Standards such as N288.4 and N288.5, including Radiological Environmental Monitoring Programs (REMP) and Fish Impingement Monitoring Program. The ERA should be periodically updated with the results of monitoring to confirm the effectiveness of proposed mitigation measures.

B.15.2.2 Application of Post-PSR1 Reviews

A clause-by-clause review and gap analysis against CSA N288.6-12 was prepared on behalf of OPG Nuclear in 2012 and issued in 2014 [B.15-4]. Table 6.1 of [B.15-4] summarizes the review findings and recommended actions to eliminate the identified gaps. Appendix A of [B.15-4] provides the clause-by-clause review of N288.6. OPG subsequently completed and issued an Environmental Risk Assessment in January 2014 [B.15-5] which addressed the gaps identified in [B.15-4].

The 2015 OPG environmental monitoring programs results were reported to the CNSC in [B.15-6]. Relating to the Environmental Risk Assessment, the reference states:

> *The PN* [Pickering Nuclear] *ERA was updated in 2013 in accordance with the requirements of CSA N288.6-12, Environmental Risk Assessments at Class I Nuclear Facilities and Uranium Mines and Mills [R-9]. The results indicate that PN station operation does not present any radiological or physical stressor risks to human or non-human biota, however hydrazine in lake water was identified as a potential human health risk due to uncertainty in the lake water concentrations used in the assessment [R-10]. To clarify this potential risk, a supplementary study was conducted in 2014 which confirmed that there is no risk of human health or ecological effects from hydrazine in Lake Ontario near the PN facility [R-18].*

OPG has conducted a clause-by-clause review CSA N288.6-12 and has completed gap resolution for Pickering resulting in a revised ERA compliant with N288.6-12. Hence, there are no PSR2 gaps relating to CSA N288.6-12 compliance.

B.15.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N288.6-12 [B.15-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.6-12.

B.15.4 References

B.16 CSA N288.5-11, "Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills"

B.16.1 Background

The following paraphrased from the purpose and scope of CSA N288.5-11 [B.16-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *Nuclear facilities or licensed activities can release hazardous or nuclear substances to the surrounding environment. Various federal and provincial/territorial regulations require licensees to monitor and report on the characteristics of airborne and waterborne effluents (e.g., the quantity and concentration of nuclear and hazardous substances that are emitted to the environment).*
>
> *CSA N288.5-11 addresses the design, implementation, and management of an effluent monitoring program that meets legal and business requirements and incorporates current best practices and technologies used internationally.*

CSA N288.5 is relevant to Safety Factor 8 (Safety Performance) and Safety Factor 14 (Radiological Impact on the Environment). N288.5 is not identified in Appendix C of the R04 Licence Conditions Handbook [B.16-2], meaning it is not in Pickering PROL 48.02/2018. N288.5-11 is the first edition of this standard.

As identified in Reference [B.16-3], the Pickering PSR2 review of CSA N288.5-11 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.16.2 Compliance Assessment for Pickering PSR2

B.16.2.1 Application of PSR1 Reviews

There have not been any previous PSR1 compliance reviews relating to N288.5.

Section 10 of the R04 Pickering License Conditions Handbook [B.16-2] states:

> *CSA standard N288.5-11: "Effluent Monitoring Programs at Class I Nuclear Facilities and Uranium Mines and Mills" addresses the design, implementation, and management of an effluent monitoring program that meets legal and business requirements and incorporates current best practices and technologies used internationally.*

Implementation Strategy: As described in OPG letter N-CORR-00531-06608 (e-Doc 4463626), OPG has completed a gap analysis and developed a preliminary implementation plan to satisfy mandatory requirements of CSA N288.5. OPG will complete implementation of CSA N288.5 mandatory requirements by December 31, 2015. After implementation is achieved, compliance with N288.5 will be measured against OPG program documents.

This Implementation Plan is discussed further below.

B.16.2.2 Application of the Post-PSR1 Reviews

A clause-by-clause review and gap analysis against CSA N288.5-11 was performed for OPG Nuclear (OPGN) including Darlington and Pickering in 2012 [B.16-4]. A summary of the gap analysis results is provided below:

In general, the OPGN effluent monitoring program meets the requirements of the CSA N288.5-11; a number of gaps were identified. A number of gaps are administrative in nature as many of the requirements of CSA N288.5-11 are already performed at sites but they are not documented in the OPGN's effluent monitoring program documents, e.g., STD 31. The identified gaps are summarized as follows; certain aspects of the gaps require further assessment by each site:

1. *Assessment is required to ensure (a) monitoring is performed at the point of release or before dilution occurs, and (b) samples are representative (for permanent and alternative samplers).*
2. *Ensure an Environmental Risk Assessment (ERA) for each nuclear site is up to date. The results of the ERA shall be used to determine substances that need to be monitored.*
3. *Specify performance or acceptance criteria for each effluent stream. Acceptance or performance criteria may include limits on the results of quality control (QC) measurements (e.g., background, blank, or spike samples), sample availability (e.g., number of samples collected, percentage unavailability of continuous monitors), measurement performance (e.g., detection limits), treatment of uncertainties, statistical significance, etc.*
4. *(a) Conduct initial characterization for all effluent streams, and (b) verify the effluent stream characterizations periodically.*
5. *Document justifications or rationales when estimation is used instead of direct measurement.*
6. *Assess if the sampling locations are appropriate to the monitoring objectives and the characteristics of the effluent stream.*
7. *Re-evaluate the estimated airborne emissions annually and/or following any changes that may significantly alter emissions.*

8. *Develop a toxicity management plan for each site.*

9. *Include the requirement to use isokinetic sampling in the effluent monitoring program.*

10. *Determine uncertainty of the reported emissions.*

11. *Include the requirement of routine performance testing of the sample collection system in the effluent monitoring program (this test is currently in place only for radioactive airborne effluents).*

12. *Review the need for, and adequacy of, the effluent monitoring program for each site (a) after any change that has the potential to alter the nature or quantity of the effluent (b) following any update or revision of the ERA for the facility, and (c) every five years after the last review.*

13. *(a) Re-assess the frequency of QA* [quality assurance]*/QC activities, and (b) ensure QC/QA programs are defined for hazardous substances monitoring.*

14. *Annually, review the performance of the effluent monitoring program and the selection of the monitored effluent streams.*

The results of this gap analysis show that the elements of CSA N288.5-11 and OPGN effluent monitoring program are largely equivalent, however, CSA N288.5-11 is more stringent in several areas such as annual review of the program, effluent characterization, interpretation of data, uncertainty of data, quality assurance and quality control, documentation, and reporting.

To address the identified gaps, a three phase Implementation Plan was developed and documented in [B.16-5]. Table 1 of [B.16-5] assigned Asset Suite Action Tracking Assignment Numbers to the gaps under Action Request (AR) #28154791. All Assignments under this AR have subsequently been completed.

As part of the implementation, revised versions of the OPG nuclear standard [B.16-6] and the Pickering site specific emissions monitoring plan [B.16-7] were issued. OPG subsequently notified the CNSC that it was in compliance with CSA N288.5-11 in January 2016 [B.16-8].

It is concluded that there are no PSR2 gaps relating to Pickering NGS compliance with CSA N288.5-11 based on the previously conducted clause-by-clause review.

B.16.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N288.5-11 [B.16-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.5-11.

B.17 CNSC REGDOC-2.2.2 (2014), "Personnel Training"

B.17.1 Background

The following paraphrase from the introduction and purpose of CNSC REGDOC-2.2.2 (2014) [B.17-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The purpose of training in the nuclear industry is to ensure that workers are competent and qualified to perform the duties of their position. As required by the General Nuclear Safety and Control Regulations, workers shall be trained to carry on the licensed activity.*
>
> *REGDOC-2.2.2 sets out requirements and guidance for the analysis, design, development, implementation, evaluation, documentation and management of training at nuclear facilities within Canada, including the essential principles and elements of an effective training system.*

CNSC REGDOC-2.2.2 (2014) is directly relevant to Safety Factor 10 (Organization, Management System and Safety Culture).

CNSC REGDOC-2.2.2 (2014) is the first edition of this regulation. The publication notice for the 2014 publication of REGDOC-2.2.2 identifies the following key features [B.17-2]:

1. *The requirement and guidance align with IAEA recommendations on the use of Systematic Approach to Training (SAT) methodology, which is the nuclear industry standard for training development.*

2. *The document formalized the CNSC's existing oversight program for training in nuclear facilities, and provides the basis for assessing the acceptability of licensee training programs.*

Compliance with CNSC REGDOC-2.2.2 (2014) is not a licence requirement for Pickering NGS (per PROL 48.02/2018) and it is not referenced in the R04 Pickering Licence Conditions Handbook (LCH) [B.17-3]. However, the CNSC advised of the following in Reference [B.17-4]:

> *REGDOC-2.2.2, Personnel Training, which was published in August 2014, sets out the CNSC requirements for licensees regarding the development and implementation of a training system. REGDOC-2.2.2 also provides guidance on how these requirements should be met. REGDOC-2.2.2 has not yet been added to the licensing basis of the NPPs. However, each licensee will be expected to conduct a gap analysis of existing practices against REGDOC-2.2.2, and the estimated timeframe for implementation is between 2016 and 2018. At present, licensees continue to meet the SAT requirements as specified in RD-204, Certification of Persons Working at Nuclear Power Plants.*

As part of the recent license renewal process for Darlington NGS ([B.17-5]), the CNSC also noted the following:

> *REGDOC-2.2.2 does not represent a fundamental change to OPG's current training programs. OPG will perform a gap analysis by March 2017 and will take the appropriate actions to ensure that its training system meets the requirements set out in the regulatory document as per OPG's transition plan which will follow after the gap analysis is complete.*

As discussed below in Section B.17.2.2, OPG has completed this assessment with no gaps identified. Since OPG's training governance applies across OPG's nuclear operations, the results are also applicable for the Pickering station.

While REGDOC-2.2.2 may be new, it is important to recognize that the training of personnel is a critical and well-established aspect of the OPG Nuclear program. Of particular relevance is CNSC Regulatory Document RD-204 [B.17-6], for which compliance is a licensing requirement for Pickering as specified in Section 3.3 of Reference [B.17-3]. RD-204 specifies requirements that ensure personnel are sufficiently qualified to perform the duties associated with specific positions for which CNSC certification is required. This includes specification of the type of training required for applicable positions associated with nuclear power plant operation. Although RD-204 does not provide detailed requirements with respect to how training is to be managed, Section 4.3 of [B.17-6] states:

> *The licensee shall establish and implement the initial and continuing training programs specified in Part II and Part III of this regulatory document in accordance with the principles of a systematic approach to training.*

CNSC REGDOC-2.2.2 is complementary to RD-204 in that it specifies requirements for the analysis, design, development, implementation, evaluation, documentation and management of training for staff performing licensed activities, including guidance for the application of SAT principles.

As identified in Reference [B.17-7], the Pickering PSR2 review of REGDOC-2.2.2 (2014) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- <u>Compliance:</u> Compliance indicates that the change in the safety requirement, per the topical review, is met.

- <u>Gap</u>: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.17.2 Compliance Assessment for Pickering PSR2

B.17.2.1 Application of PSR1 Reviews

The versions of REGDOC-2.2.2 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

The first edition of REGDOC-2.2.2 was issued in August 2014 after the completion of the Pickering B Integrated Safety Review (ISR) and Pickering A Return-to-Service. Therefore, no code reviews were performed for Pickering Units 5-8 or Units 1,4 against REGDOC-2.2.2.

Darlington NGS

The first edition of REGDOC-2.2.2 was issued in August 2014 after the completion of the code reviews for the Darlington ISR. Therefore, no code review was performed for Darlington against REGDOC-2.2.2.

As part of the Darlington ISR, a code review was performed against RD-204 (2008) as documented in Reference [B.17-8]. Only three issues were identified, none of which are pertinent to the content of REGDOC-2.2.2.

B.17.2.2 Application of Post PSR1 Reviews

As discussed above, a review of CNSC REGDOC-2.2.2 was not undertaken as part of the Pickering or Darlington PSR1 reviews, as the document did not exist at the time.

As noted in Section B.17.1 above, REGDOC-2.2.2 provides more specific requirements with respect to training in relation to the more general requirements contained in RD-204 [B.17-6]. A PSR2 code review of RD-204 (2008) has been performed, which identified no gaps and concluded that Pickering is in compliance with RD-204 (2008).

OPG has completed a gap assessment of CNSC REGDOC 2.2.2 (2014), relative to the OPG Nuclear training governance, as documented in [B.17-9]. The assessment maps each of the requirements in CNSC REGDOC-2.2.2 (2014) to the corresponding sections of applicable OPG governing documents and in so doing, demonstrates that the OPG Nuclear Training Program is fully compliant. No gaps are identified.

As part of this PSR2 assessment, the following summary table has been prepared that provides additional information describing the degree of conformance with the clauses of CNSC REGDOC-2.2.2 (2014) [B.17-1] and supports the conclusion of [B.17-9] that there are no gaps and that the OPG Nuclear Training Program is fully compliant.

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
1. Introduction	This Section provides background information with respect to the purpose, scope and other relevant legislation. It does not provide specific requirements, but it does state the following high level requirements per the "General Nuclear Safety and Control Regulations" (paraphrased): • Workers shall be trained to carry on the licensed activity. • Every licensee shall ensure the presence of a sufficient number of qualified workers to carry on the licensed activity safely. • Every licensee shall train the workers to carry on the licensed activity. In addition, the regulatory document is identified as applying to workers in positions where the consequence of human error poses a risk to the environment, the health and safety of persons, or the security of the nuclear facilities and of nuclear substances, and states: • The licensees shall define these positions in their training governing documents. <u>Assessment</u> N-PROG-TR-0005, "Training" [B.17-10] describes the OPG Nuclear Training Program. Section 1 clearly states the OPG direction that training is used to develop and maintain competent personnel to safely operate, maintain and improve plant performance, to minimize the impact of plant operation on environment, health and public safety, and to drive human performance improvements in a cost-effective manner. N-PROG-TR-0005 and the extensive suite of performance references that support it clearly demonstrate OPG's commitment to ensuring effective training of all workers engaged in performing licensed activities such that the intent of the high level requirements embodied in the first three bullets noted above is fully met. Since these apply across OPG Nuclear, this conclusion is applicable to the Pickering station. N-PROG-TR-0005 is specified as being applicable to staff in roles that are identified in N-LIST-08920-10001, "Trained Performance Areas" [B.17-11]. Table 1 in N-LIST-08920-10001 provides a comprehensive listing of all OPG Nuclear positions to which N-PROG-TR-0005 applies and identifies the Training and Qualification Description (TQD) document that has been prepared for each position. In addition to including positions that are	Compliant

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	directly involved in nuclear power plant Operations and Maintenance, the list includes staff in roles such as: • Emergency Response • Fleet Support Services (e.g., Chemistry Lab, Radiation Protection, Engineering, Environment, Supply Chain, Conventional Safety, Work Protection) • Fire Protection • Health Physics • Inspections • Leadership and Management • Trainer • Security • Waste Management • Audit Personnel Also identified is a TQD for Nuclear General Employee, which applies to all staff in OPG Nuclear. N-LIST-08920-10001 further distinguishes staff who belong to Major Technical Performance Areas that are deemed to have sufficient importance to require a higher level of oversight. This includes staff in Fleet Operations (i.e., Authorized Nuclear Operator, Shift Manager/Control Room Shift Supervisor, Nuclear Certified Personnel, Control Room Operator and Nuclear Operator) as well as staff in other safety-related roles (i.e., Chemistry Lab Technician, Radiation Protection Technician, Engineering, Trainer, and Maintenance). Even for staff who are not in roles identified in N-LIST-08920-10001, N-PROG-TR-0005 specifies that their training still comply with essential elements of the OPG nuclear training program, including: N-PROC-TR-0007, "On-the-Job Training, On-the-Job Evaluation, and Practical Evaluation Process" [B.17-12], N-PROC-TR-0008, "Systematic Approach to Training" [B.17-13], N-PROC-TR-0012, "Records and Documentation" [B.17-14], N-PROC-TR-0041, "TIMS II Administration" [B.17-15] and N-PROC-TR-0044, "Training Demand, Scheduling, and Cancellation Process" [B.17-16]. The positions identified in N-LIST-08920-10001 are comprehensive in terms of identifying workers in roles for which the consequence of human error may pose risks impacting on the environment, health and safety, and security. This fully meets the intent of the fourth bullet noted above. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
2. Principles	This Section states that a licensee's training system adhere to the following fundamental principles: • Performance-oriented: All instruction that is subject to this regulatory document shall focus on essential knowledge, skills and safety-related attributes required to meet job requirements and nuclear-safety-specific needs throughout the lifecycle of the facility. • Systematically developed: Training shall be defined, produced and maintained through an iterative and interactive series of steps, leading from the identification of a training requirement to the confirmation that the requirement has been satisfied. <u>Assessment</u> N-PROG-TR-0005, Training [B.17-10] describes the OPG Nuclear Training Program. With respect to the second principle noted above, Section 1.1.7 explicitly states the expectation that a systematic approach be used for the analysis, design, development, implementation and evaluation of training. N-PROC-TR-0008, Systematic Approach to Training [B.17-13] is cited as a performance reference, and it describes in detail the systematic approach to training that is followed in OPG Nuclear. With respect to the first principle noted above, Sections 1.1 through 1.7 of N-PROC-TR-0008 provide detailed instructions for the analysis, design, development, implementation and evaluation of training. This includes steps (e.g., training needs analysis, job and task analysis, development of terminal and enabling learning objectives, trainee performance evaluation) to ensure that essential knowledge and skills to perform each job are being identified, trained and confirmed to be learned. OPG's training governance does not make explicit reference to the concept of "safety-related attributes" as defined in REGDOC-2.2.2. However, this is considered to be implicitly addressed by OPG's implementation of programs and processes such as N-PROG-AS-0002 (Human Performance) [B.17-17], N-STD-OP-0002 (Procedure Use and Adherence) [B.17-18] and N-STD-OP-0012 (Conservative Decision-Making) [B.17-19] in conjunction with specific instructions for training development as stated in N-PROC-TR-0008, such as: • Section 1.3.2 indicating that Job and Task Analysis include consideration of "performance expectations", "attitudes", "consequences of inadequate performance" and "personnel and personal safety issues".	Compliant

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	• Section 1.4 indicating that training should be designed to "develop required attitudes" and "reinforce conduct and performance expectations". • Section 1.5.3.1 indicating that Lesson Plans address "key management expectations for such concepts as personal safety, procedure use and adherence, radiation safety and conservative decision-making". With respect to training needs over the life cycle of the facility, it is noted that OPG's training program is focused on the operational phase of its plants and specific reference is not made to other phases such as Construction or Decommissioning. However, REGDOC-2.2.2 is clearly stated as being applicable to licensed activities, which in the context of PSR2 applies only to Pickering as an operating nuclear power plant. On this basis, the OPG Nuclear training program fully meets the intent of the two principles noted above. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
3. Training Systems for Nuclear Facilities	This Section states the following high level requirements : • *Licensees shall ensure workers who carry on licensed activities are qualified to do the work assigned to them through the use of a training system to systematically analyze, design, develop, implement evaluate, document and manage new training and the revision of existing training, including continuing training.* • *It [the training system] shall be used whether the training is defined, designed, developed, implemented, evaluated, recorded and managed internally by licensees or externally through vendors or contractors.* This Section goes on to state the following specific requirements that licensees shall: *1. Identify all performance requirements of a job or duty area relating to licensed activities by conducting a job analysis to determine all of the tasks involved.* *2. Define and document the necessary general worker training, initial job training and continuing training requirements for workers, based on a task analysis of the knowledge and skills required to perform each task and the safety-related attributes required to perform their duties.*	Compliant

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	3. *Ensure that appropriate training is designed, developed and implemented to meet the qualification requirements.* 4. *Ensure that trainers meet and maintain documented qualification requirements, particularly in the areas of subject matter expertise and instructional skills.* 5. *Ensure that formal evaluations are used to confirm and document that all trained workers are qualified to perform their duties.* 6. *Implement a training change-management process that will systematically analyze procedural and equipment changes, changes in job descriptions, and operating experience feedback (including facility and industry-wide events), in order to identify changes to the tasks and task lists and to assess potential training implications leading to training modifications.* 7. *Ensure continuing training is provided to workers as deemed necessary through the job and task analyses processes, and that it includes updates to training programs stemming from the change-management process as identified through the training needs analysis process.* 8. *Evaluate training regularly and incorporate the results of the evaluations into a training improvement process.* 9. *Ensure that workers' records in support of training and qualifications are established and maintained.* 10. *Ensure that workers have a level of training related to nuclear safety corresponding to the duties of their position and employment, including but not limited to radiation safety, fire safety, onsite emergency arrangements and conventional health and safety.* <u>Assessment</u> For the first high level requirement noted above, refer to the assessment discussion for Sections 1, 2 and 5 of REGDOC-2.2.2. For the second high level requirement noted above, N-PROC-TR-0002, "Control of Vendor-Supplied Training" [B.17-20] specifies the processes by which training developed or delivered by organizations external to OPG is managed to ensure that the requirements of the OPG Nuclear training program (as specified in N-PROG-TR-0005, "Training" [B.17-10]) are met.	

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	For the ten specific requirements noted above, all aspects are explicitly covered as part of the processes OPG follows for the analysis, design, development, implementation and evaluation of training, as specified in N-PROC-TR-0008, "Systematic Approach to Training" [B.17-13]. Specifically: 1. Compliance with this requirement is demonstrated in Sections 1.2 and 1.3 of N-PROC-TR-0008 and other governing documents such as N-PROC-TR-0021, "Training and Qualification Description Development and Approval Process" [B.17-26]. 2. Compliance with this requirement is demonstrated in Sections 1.2 and 1.3 of N-PROC-TR-0008 and other governing documents such as N-PROC-TR-0021, "Training and Qualification Description Development and Approval Process" [B.17-26]. 3. Compliance with this requirement is demonstrated in Sections 1.4, 1.5 and 1.6 of N-PROC-TR-0008 and other governing documents such as N-STD-TR-0001, "Conduct of Training" [B.17-25]. 4. Compliance with this requirement is demonstrated in Sections 1.2, 1.5.4, 1.6.2 and 1.7.1.3 of N-PROC-TR-0008 and other governing documents such as N-TQD-602-00001, "Nuclear Trainer Training and Qualification Description" [B.17-21] and N-STD-TR-0001, "Conduct of Training" [B.17-25]. 5. Compliance with this requirement is demonstrated in Sections 1.4, 1.5 and 1.6 of N-PROC-TR-0008 and other governing documents such as N-STD-TR-0001, "Conduct of Training" [B.17-25], N-PROC-TR-0007, "On-the-Job Training, On-the-Job Evaluation and Practical Evaluation Process" [B.17-12] and N-PROC-TR-0018, "Examination Security, Development, Approval and Implementation" [B.17-27]. 6. Compliance with this requirement is demonstrated in Sections 1.1 (particularly sub-sections 1.1.1.2, 1.1.1.3 and 1.1.1.4), 1.4.3, 1.5.5 and 1.7.1.4 of N-PROC-TR-0008 and other governing documents such as N-INS-08920-10037, "Training Change Control" [B.17-22]. 7. Compliance with this requirement is demonstrated in Section 1.3.2 of N-PROC-TR-0008 and other governing documents such as N-INS-08920-10021, "Continuing and Requalification Training – Curriculum Development and Implementation Process" [B.17-23] and N-PROC-TR-0021, "Training	

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	and Qualification Description Development and Approval Process" [B.17-26]. 8. Compliance with this requirement is demonstrated in Sections 1.6.4, 1.6.7 and 1.7.1 of N-PROC-TR-0008 and other governing documents such as N-STD-TR-0001," Conduct of Training" [B.17-25] and N-INS-08920-10017, "Training Committees"[B.17-28]. 9. Compliance with this requirement is demonstrated in N-PROC-TR-0012," Records and Documentation" [B.17-14], N-PROC-TR-0041, "TIMS II Administration" [B.17-15] and other governing documents such as N-STD-TR-0001, "Conduct of Training" [B.17-25]. 10. Compliance with this requirement is demonstrated throughout N-PROC-TR-0008, as well as N-LIST-08920-10001, "Trained Performance Areas" [B.17-11], N-PROC-TR-0021, "Training and Qualification Description Development and Approval Process" [B.17-26] and N-STD-TR-0001, "Conduct of Training" [B.17-25]. On this basis, the OPG Nuclear training program fully meets the intent of the requirements specified in Section 3 of REGDOC-2.2.2. Since this applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
4. Records Management for a Training System	This Section states the following specific requirements (paraphrased): • Licensees shall develop and manage documentation related to all phases of their training including analysis, design, development, implementation and evaluation. • Licensees shall maintain records on the training and qualification of all workers and these records shall: o be managed and controlled, o have immediate, unencumbered and ready access by workers' supervisors and managers, o include all qualifications and certifications granted by or relied upon by the licensee, and o include expiration dates for time-sensitive qualifications and certifications, and all requalification or recertification requirements.	Compliant

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	<u>Assessment</u> N-PROG-TR-0005, Training [B.17-10] describes the OPG Nuclear Training Program. Sections 1.17.1 and 1.17.2 explicitly state the expectations with respect to training records and documentation, and the Training Information Management System (TIMS). N-PROC-TR-0012, "Records and Documentation" [B.17-14] is cited as a performance reference, and it provides direction for completing, processing and maintaining training documents and records in OPG Nuclear. Two types of training records are recognized: • Training support materials (i.e., documents generated through the analysis, design, development, implementation and evaluation of training in accordance with N-PROC-TR-0008 [B.17-13]); and • Individual Training Records (ITRs) (i.e., documented evidence of a person's completion of training requirements). With respect to training support materials, Table 1 in Section 1.6.2 of N-PROC-TR-0012 identifies the documents that are considered to be essential records, and which of these are to be managed as Controlled Documents in accordance with OPG-PROC-0179, "Nuclear Quality Assurance Records" [B.17-24]. ITRs are maintained in TIMS for all staff in OPG Nuclear, in accordance with N-PROC-TR-0041, "TIMS II Administration" [B.17-15], which is also cited as a performance reference in N-PROC-TR-0012. N-PROC-TR-0041 describes the processes by which ITRs are managed and controlled using TIMS. An individual's TIMS information identifies all qualifications and certifications that they possess, including requalification requirements and expiration dates. Per Section 1.8 of N-PROC-TR-0012, ready access to an individual's ITRs is provided to the individual, their First Line Manager and Direct Line Manager, as well as others having a business need to access this information (e.g., training staff). Control and processing of documentation related to examination materials is managed in accordance with N-PROC-TR-0018, "Examination Security, Development, Approval and Implementation" [B.17-27]. The above demonstrates that the OPG training program fully meets the intent of Section 4 of REGDOC-2.2.2 and	

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	since it applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	
5. Guidance of the Systematic Approach to Training	This Section provides guidance only and describes the phases and recommended content of a training program that is developed in accordance with SAT principles. Five phases of a SAT-based program are outlined as follows: 1. Analysis, containing details related to: • Training needs analysis. • Job and task analysis. • Learning objectives (specifically terminal learning objectives). • Target audience analysis. 2. Design, containing details related to: • Trainee characteristics. • Instructional program design. • Enabling objectives. • Learning assessment plan. • Instruction strategies. • On-the-job training. • Training development plan. 3. Development, containing details related to: • Procurement/production of training materials. • Assessment tests. • Conduct of trials (pilot courses). 4. Implementation, containing details related to instructor preparation and the actual delivery of training. 5. Evaluation, containing details related to assessing the effectiveness and efficiency of training, as well as change management. <u>Assessment</u> N-PROG-TR-0005, "Training" [B.17-10] describes the OPG Nuclear Training Program. Section 1.1.7 explicitly states the expectation that a systematic approach be used for the analysis, design, development, implementation and evaluation of training. N-PROC-TR-0008, "Systematic	Compliant

CNSC REGDOC-2.2.2 Section	PSR2 Review	Compliant or Gap
	Approach to Training" [B.17-13] is cited as a performance reference, and it describes the systematic approach to training that is followed in OPG Nuclear. The structure of N-PROC-TR-0008 is fully aligned with the five SAT phases defined in Section 5 of REGDOC-2.2.2. Detailed instructions for each phase are provided which address all aspects of the guidance contained in Section 5 of REGDOC-2.2.2. Implementation of N-PROC-TR-0008 is supported in part by other aspects of the OPG Nuclear Training Program, including: N-LIST-08920-10001, "Trained Performance Areas" [B.17-11], N-PROC-TR-0007, "On-the-Job Training, On-the-Job Evaluation and Practical Evaluation Process" [B.17-12] and N-PROC-TR-0002, "Control of Vendor-Supplied Training" [B.17-20]. N-PROC-TR-0008 fully meets the intent of Section 5 of REGDOC-2.2.2 and since it applies across OPG Nuclear, this conclusion is applicable to the Pickering station.	

Note that REGDOC-2.2.2 is programmatic in nature and, as such, the status of OPG's compliance with it is not impacted by the possibility of continued operation of Pickering beyond 2020.

B.17.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC REGDOC-2.2.2 (2014) [B.17-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.2.2 (2014).

B.18 CNSC REGDOC-2.3.2 (2015), "Accident Management, Version 2"

B.18.1 Background

The following paraphrased from the purpose and scope of CNSC REGDOC-2.3.2 Version 2 (2015) [B.18-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *REGDOC-2.3.2 sets out the requirements and guidance of the Canadian Nuclear Safety Commission (CNSC) for the development, implementation and validation of accident management programs for reactor facilities.*
>
> *Accident management is a commitment to the defence-in-depth approach and is an important component in the licensee's overall capabilities to ensure the risks from nuclear reactors remain low. Defence in depth is applied to all organizational, behavioural, and design-related safety and security activities to ensure they are subject to overlapping provisions. It is important for licensees to implement and maintain operational procedures, guidelines and adequate capabilities to deal with abnormal situations and accidents, including severe accidents. REGDOC 2.3.2 specifies safety principles, high-level requirements and supporting guidelines that allow licensees to develop, implement, and evaluate an integrated accident management program, which includes components that address severe accident management.*

REGDOC-2.3.2 Version 2 (2015) is applicable to Safety Factors 1 (Plant Design), 5 (Deterministic Safety Analysis), 6 (Probabilistic Safety Assessment), 7 (Hazard Analysis), 8 (Safety Performance), and 10 (Organization, the Management System and Safety Culture).

Compliance with REGDOC-2.3.2 Version 2 (2015) is not currently a licence requirement for Pickering NGS (in accordance with PROL 48.02/2018) per the R04 Pickering Licence Conditions Handbook [B.18-2].

REGDOC-2.3.2 Version 2 (2015) supersedes:

- REGDOC-2.3.2, "Accident Management (October 2014)" – Issued for Comment [B.18-3]
- REGDOC-2.3.2, "Severe Accident Management Programs for Nuclear Reactors" (September 2013) [B.18-4]
- G-306, "Severe Accident Management Programs for Nuclear Reactors" (2006) [B.18-5]

The updated version reflects lessons learned from the Fukushima nuclear event of March 2011, and addresses findings from the CNSC Fukushima Task Force Report [B.18-6].

The results of PSR1 REGDOC-2.3.2 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.18.2. As identified in Reference [B.18-7], the Pickering PSR2 review of CNSC REGDOC-2.3.2 (2015) is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.18.2 Compliance Assessment for Pickering PSR2

B.18.2.1 Application of PSR1 Reviews

The versions of REGDOC-2.3.2 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

REGDOC-2.3.2 was not issued at the time the Pickering B ISR was performed. As part of the ISR, a high level intent review of a predecessor CNSC document G-306 was performed and documented in [B.18-8]. This review identified several gaps relating to Severe Accident Management Guidelines (SAMG) implementation and an Action Tracking request (AR #28064164) was created to address the gaps and was subsequently closed.

However, developments relating to the Fukushima event, Beyond Design Basis Accident (BDBA) response, SAMG and the issuance of REGDOC 2.3.2 Version 2, have superseded significant elements of the assessment performed for Pickering B.

Pickering Units 1,4

Neither REGDOC-2.3.2 nor G-306 were available when the Pickering A safety assessment was conducted and no standards relating to BDBA or Severe Accident Management requirements were addressed as part of Return-to Service.

Darlington NGS

For the Darlington ISR a clause-by-clause review against G-306 was performed in 2011 [B.18-9]. This review identified several gaps that were subsequently tracked to completion under an Action Request. Subsequently, a Code Refresh review of Darlington against the first version of REGDOC 2.3.2 [B.18-4] was conducted in February 2014 [B.18-10]. The major findings from the review were:

- *DNGS does not currently fully meet the intent of CNSC REGDOC-2.3.2.*

- *All clauses which were determined not to meet the full intent of the clause have a defined, on-going work scope for which compliance is expected upon completion of the work scope.*

- *It is expected that Darlington will meet the full intent of CNSC REGDOC-2.3.2 by the end of 2015, coinciding with the completion of OPG's SAMG Implementation Plan.*

The REGDOC-2.3.2 review identified 5 gaps related to:

- #02193 performance of instrumentation
- #02194 instrument and equipment survivability
- #02195 availability and accuracy of instrumentation
- #02196 drills and training for multi-unit events
- #02197 SAM validations of reviews not complete

All gaps were assigned a safety significance level of 4 and grouped under ISR Issue #D565 [B.18-11] to be addressed via ongoing work under AR #28153869. This review and the resultant gaps and Issue are generic/programmatic for OPG, and are hence fully applicable to Pickering. However, as detailed in the section below, all gaps have subsequently been addressed.

B.18.2.2 Application of Post PSR1 Reviews

The scope and structure of REGDOC-2.3.2 (October 2014) [B.18-3] and Version 2 (September 2015) [B.18-1] have significantly changed from the previous version (2013) [B.18-4]. Whereas the 2013 version of the document specifically dealt with Severe Accident Management Programs, the new version is broader in terms of an overall Accident Management (AM) program, which encompasses Anticipated Operational Occurrences (AOOs), Design Basis Accidents (DBAs) and BDBAs including Design Extension Conditions (DECs)[10] and Severe Accidents (SAs). Other significant changes relate to:

1. Providing guidance for an integrated AM framework (Section 2.0)
2. Documenting the AM framework as it relates to the levels of defense-in-depth (Section 3.1)
3. Recognition of the application of BDBA Emergency Mitigating Equipment (EME) and EME Procedures (throughout document)

---

[10] DECs are a subset of BDBAs that are considered in the design process of the facility in accordance with best-estimate methodology to keep releases of radioactive material within acceptable limits. DECs could include severe accident conditions.

4. Identification and treatment of cliff-edge effects (Section 4.2.1)

5. The concept of Design Extension Conditions (DECs) and Complementary Design Features (CDFs) (Section 4.3.1)

6. CDFs for prevention of core melt at high pressure and hydrogen detonation (Section 4.3.1) and direct containment heating form corium (Section 4.2.1)

7. Consideration and treatment of extreme external hazards (Section 4.2.1) and incremental requirements on the plant and resources (Section 4.3.3)

8. Human interactions, including environmental conditions and timing of actions (Section 4.3.1)

9. Multi-unit failures and Irradiated Fuel Bay (IFB) failures (Section 4.2.5)

10. More specific details relating to suitability of instrumentation and equipment for accident mitigation (Section 4.3.1 and Section 4.3.2)

11. Assessment of external resources (Section 6.3)

The overriding objective of the REGDOC relates to ensuring the licensees have developed a comprehensive AM program. AOOs are generally upsets rather than accidents and are addressed by responding to the failure or condition in accordance with event based procedures (i.e., response to alarms, Operating Manuals, Abnormal Incidents Manuals (AIMs)). They are generally mitigated by process system action and human action and do not require AM activities beyond those of the normal plant Operations complement. For DBAs, Pickering has a fully mature AM program for all internal and external accidents. These events are fully assessed in the Safety Reports, risk assessments and supplementary assessments. Operating documents by way of AIMs have long been established to address DBAs, and in some cases BDBAs, where coincidental random or consequential failures have occurred. This framework has long been part of the licencing basis for Pickering and addresses all elements of AM, including:

- Identification and analysis of upsets and accidents in the Safety Report
- Established procedures to deal with upsets and accidents
- Validation and verification of procedures
- Qualification and availability of equipment and systems
- Training and qualification of staff to exercise response, including use of the simulator
- Assurance of resources (minimum shift complement), and response capability
- Interfaces with the Emergency Management organization

BDBA response, where Event Based response may not have been successful, or where multiple failures have occurred would be addressed via Symptom Based response, largely contained in the Critical Safety Parameter Monitoring (CSPM) procedures including Restoration Procedures. These Restoration Procedures were designed to restore critical parameters to within an acceptable range. Both the Event and Symptom Based procedures would result in accident unit(s) being in a controlled state with a long term heat sink, radioactive releases controlled and containment integrity maintained.

Hence, OPG Pickering is fully compliant with the Design Basis AM requirements in REGDOC-2.3.2, Version 2 (2015).

However, developments relating to a more structured response and AM framework for BDBA response are more recent, and have been significantly influenced by the Fukushima event in 2011. Therefore, this Incremental review is focused on the changes between the 2013 and 2015 version of the REGDOC as they pertain to BDBA AM and the lessons learned from Fukushima.

OPG undertook a significant initiative relating to obtaining insight into accident progression and accident management following the Fukushima event. As a result OPG has implemented several improvements relating to defence-in-depth and emergency response. In all, there were thirty-six issues/topics identified in Fukushima Action Items (FAIs) that were assessed and addressed. A summary of each of these FAIs and corresponding references is included in [B.18-12]. All of these FAIs have been closed, with one outstanding action relating to Emergency Response Prediction code improvements. This has been identified as a PSR2 gap in the PSR2 Safety Factor 13 report [B.18-13]. In addition to and in parallel with the FAI work, OPG as part of an industry initiative, participated in a project to enhance the overall SAMG to incorporate lessons learned from Fukushima and other industry insights/developments (COG-JP-4426). This project produced a series of topical reports relating to:

- Instrumentation and Equipment Survivability
- Multi-unit events
- Shutdown and Low Power states
- In-Vessel retention
- Habitability
- Containment Integrity
- Irradiated Fuel Bays
- Fukushima Lessons Learned
- Impact Assessment of Operating Experience (OPEX) on SAMG Documentation

Information, insights and recommendations from these generic reports were used to update OPG and Pickering specific documentation as part of the FAI process and BDBA (including SAMG) management program.

The significant changes identified in REGDOC-2.3.2, Version 2 (2015) are grouped under topical subheadings and assessed for Pickering under those headings below:

Accident Management Framework and Levels of Defense

OPG's AM framework for BDBAs, which is applicable to Pickering, is outlined in [B.18-14]. Appendix A of [B.18-14] illustrates the defense-in-depth as it relates to accident barriers. It details the interfaces between the design basis and beyond design basis response. Reference [B.18-20] summarizes the technical basis for the BDBA accident response while [B.18-15] details the transition from DBA into BDBA and the AM process once into BDBA response. BDBA accident response is either entered from Symptom Based procedures (CSPM) or certain Event Based procedures. Severe Accident Management response and SAMG entry occurs if SAMG entry conditions are met during the execution of the BDBA response (e.g., while executing EME Guidelines).

Therefore, OPG Pickering has an AM framework that is in compliance with REGDOC-2.3.2, Version 2 (2015), and there are no gaps relating to the first three incremental changes identified above, specifically:

1. *Providing guidance relating to an integrated AM framework (Section 2.0)*
2. *Documenting the Accident Management framework as it relates to the levels of defence-in-depth (Section 3.1)*
3. *Recognition of the application of BDBA Emergency Mitigating Equipment (EME) and EME Procedures (throughout document)*

Identification and Treatment of Cliff-Edge Effects

4. *Identification and treatment of cliff-edge effects (Section 4.2.1)*

Cliff-edge effects were implicitly addressed as part of the review of external hazards at Pickering for capability to manage external events [B.18-16].

Additionally, work done for instrument and equipment survivability explicitly considered the margin to confirm that incremental changes in conditions would not result in a step change in consequences. No specific instances were identified.

Potential cliff-edge effects were evaluated as part of the FAIs process [B.18-12]. The applicable FAIs are:

- FAI 1.1.1 – bleed condenser relief capacity
- FAI 1.2.1 – shield tank/calandria vault relief
- FAI 1.3.1 – adequacy of protection of containment integrity

These FAIs were completed and subsequently closed as detailed in [B.18-19]. It is therefore concluded that OPG Pickering has an AM framework that is in compliance with REGDOC-2.3.2, Version 2 (2015), and there are no gaps relating to the introduction of the requirement relating to cliff-edge effects.

<u>Design Extension Conditions and Complementary Design Features</u>

5. *The concept of Design Extension Conditions (DECs) and Complementary Design Features (CDFs) (Section 4.3.1)*

6. *CDFs for prevention of core melt at high pressure and hydrogen detonation (Section 4.3.1) and direct containment heating form corium (Section 4.2.1)*

CDFs are those modifications or features that are specifically provided to address DECs and are defined in [B.18-21]. Phase 1 EME is a CDF, which includes power, water and procedures, and has been fully implemented. Further detail relating to these CDFs is provided in [B.18-22] and [B.18-23]. These features provide additional capabilities for heat sinks (fuel cooling) and monitoring for BDBAs. In addition, Passive Autocatalytic Recombiners (PARs) have been installed in all Pickering units for BDBA hydrogen mitigation and this issue has been closed under FAI 1.4.1. EME Guidelines have been developed for the deployment, connection and operation of EME in the event it is required for a BDBA.

However, Clause 4.2.1 of REGDOC-2.3.2 states:

> *Challenges that are not considered in the reactor design envelope, but could threaten the integrity of the containment should be practically eliminated;*

Full provision of CDFs for containment integrity for BDBAs, as required by REGDOC-2.3.2, will be addressed with the completion of Phase 2 EME. As discussed in [B.18-24], Phase 2 EME will provide a longer term supply of AC power to restore cooling provisions (e.g., Reactor Building Air Conditioning Units) and the Filtered Air Discharge System for containment venting. Phase 2 EME is currently scheduled to be fully implemented by the end of 2017 [B.18-25]. Since this work is still in progress, it is identified as **<u>PSR2 REGDOC-2.3.2 Version 2 (2015) Gap #1</u>**.

<u>Treatment of External Hazards and Human Interactions</u>

7. *Consideration and treatment of extreme external hazards (Section 4.2.1) and incremental requirements on plant and resources (Section 4.3.3)*

8. *Human interactions, including environmental conditions and timing of actions (Section 4.3.1)*

External hazards have been addressed in [B.18-16] and as part of the DEC review discussed above. Hence, the incremental implication of this change is specific to the issues of resources and timing. The timing and resources for response to BDBA external events as evaluated in [B.18-26] and [B.18-27] provide an overall summary of EME deployment timing. The EME deployment action time Safety Limits for Pickering 1,4 and Pickering 5-8 are summarized in Tables A.2 of [B.18-22] and [B.18-23] respectively.

In addition to the above references, adequacy of timing and resources are evaluated in the emergency preparedness exercises and simulations. Reference [B.18-28] provides the details of

SAMG validation activities involving drills and exercises and provides a high level summary of the Human Factors evaluations conducted. This report was produced to support closure of FAI 3.1.4.

It is recognized that BDBA response to multi-unit events including irradiated fuel bay failures would pose additional challenges to resources. Depending on the nature of the BDBA external event and uncertainty relating to affected units and collateral damage (impeding on and off site access), station resources could be significantly challenged and off-site support delayed. For these reasons a BDBA decision making framework has been established to prioritize use and deployment of available resources [B.18-15]. Additionally, for a BDBA multi-unit event, if any unit progresses into a severe accident, there is a prioritization framework built into SAMG to protect containment integrity as the highest priority.

Therefore sufficient focus and assessment has been given to BDBA response in terms of evaluating the event timing and adequacy of resources. There are no gaps related to resourcing for BDBAs.

Multi-unit Events and Irradiated Fuel Bay Failures

9. *Multi-unit failures and Irradiated Fuel Bay (IFB) failures (Section 4.2.5)*

The BDBA and SAMG response has been upgraded to address response to multi-unit events and fuel bay failures. Actions relating to these events have been addressed as part of [B.18-12], specifically:

FAI 1.3.1 – adequacy of means to protect containment

FAI 3.1.2 – plans and schedule for addressing multi-unit events in SAMG

FAI 3.1.2 – plans and schedule for addressing IFB events

FAI 3.2.1 – modelling of multi-unit events

FAI 1.9.1 – habitability of control facilities (including multi-unit events)

FAI 4.2.1 – exercise improvement program (including multi-unit events)

All of the above FAIs have been completed and are closed. BDBA response (including SAMG) has been upgraded to address both multi-unit failures and IFB events and there are no gaps relating to treatment of these failures.

Instrumentation and Equipment Survivability

10. *More specific details relating to suitability of instrumentation and equipment for accident mitigation (Section 4.3.1 and Section 4.3.2)*

Instrumentation and equipment (I&E) survivability has been addressed for Pickering as part of the FAI process [B.18-12], under FAI 1.8.1. This FAI was specific to providing a plan and schedule to address I&E survivability, and has been closed per [B.18-12], which states:

OPG has prepared specific methodology to be used for the OPG stations and the assessments for Pickering and Darlington are now complete. Reference 2 summarizes the findings and details are available in References 3-6.

The assessment has demonstrated that there is reasonable assurance that sufficient equipment and instrumentation will be available to facilitate operator actions at both Pickering and Darlington under a wide range of BDBA conditions, and hence no further actions are required.

OPG has conducted both instrument and equipment survivability assessments for Pickering Units 1,4 and Pickering Units 5-8 [B.18-17] and [B.18-18]. These assessments focused on 'high value' I&E for BDBA including SAs. The assessment concluded that there is sufficient I&E with a Reasonable Level of Confidence of Survivability for harsh conditions, such that the stations can establish and maintain a stable shut down state.

There are no PSR2 gaps relating to BDBA I&E survivability for Pickering.

<u>External Resources</u>

11. Assessment of external resources (Section 6.3)

A confirmatory assessment of external resource protocols was conducted as part of the FAI process. Issues pertaining to external interfaces were addressed under:

FAI 5.2.1 - Identify the external support and resources that may be required during an emergency.

FAI 5.2.2 - Identify the external support and resource agreements that have been formalized and documented.

FAI 5.2.3 - Confirm if any undocumented arrangements can be formalized.

These FAIs were completed and closed per [B.18-19]. The "OPGN Emergency Preparedness Response to CNSC FAI 5.2.1, 5.2.2 and 5.2.3" report, N-REP-03490-10023 [B.18-29], identifies a list of existing external support agreements, which includes the Mutual Aid Agreement (MAA), N-LEGL-03490-0413370 [B.18-30]. The MAA identifies comprehensive support and resources available from four other major Canadian nuclear operators, implemented on November 30, 2012. An internal implementation document, N-GUID-03490-10001, "Mutual Aid Agreement Implementation" [B.18-31], outlines the process of how OPG will implement emergency support under the MAA. Direction to consult this guide is incorporated into the relevant Emergency Response Organization instructions. Both N-REP-03490-10023 [B.18-29] and the MAA [B.18-30] include a list of potential external support and resources that may be required in an emergency.

In addition to the agency agreements detailed above, the REGDOC also specifically identifies agreements relating to the procurement of resources in Section 6.3. These are not generally addressed under the AM framework, but rather they are addressed by the emergency organization under the Consolidated Nuclear Emergency Plan and the role of the Resource Deployment Manager [B.18-32]. The Resource Deployment Manager instruction, N-INS-03491-

10022 [B.18-33], as well as the Emergency Response Manager instruction, N-INS-03491-10015 [B.18-34] and the Corporate Emergency Operations Facility Emergency Recovery Director instruction, N-INS-03491-10000 [B.18-35], now include references to N-GUID-09013-10002, "Supply Chain Support – Nuclear Emergency Responders Guideline" [B.18-36]. This guideline identifies consumables and supplies for Operations and documents the strategic just-in-time sourcing that may be anticipated following a significant emergency. Therefore, Pickering is compliant with the requirements for external resources.

B.18.3 Compliance Assessment Summary for Pickering PSR2

There is one PSR2 CNSC REGDOC-2.3.2 (2015) gap which relates to Safety Factor 1 (Plant Design):

1. Full provision of Complementary Design Features for containment integrity as required by Clause 4.2.1 of REGDOC-2.3.2 will be addressed with the completion of Phase 2 Emergency Mitigating Equipment. This work is currently scheduled to be fully implemented by the end of 2017 [B.18-25]. Since this work is still in progress, it is identified as a PSR2 gap.

B.19 CNSC REGDOC-2.3.3 (2015), "Periodic Safety Reviews"

B.19.1 Background

The following paraphrased from the Purpose and Scope of CNSC REGDOC-2.3.3 (2015) [B.19-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *REGDOC-2.3.3 sets out the CNSC's requirements for the conduct of a periodic safety review (PSR). A PSR is a comprehensive evaluation of the design, condition and operation of a nuclear power plant (NPP, plant). It is an effective way to obtain an overall view of plant safety and the quality of the safety documentation, and to determine reasonable and practical improvements to ensure safety until the next PSR or, where appropriate, until the end of commercial operation.*
>
> *PSRs have been effective in achieving improvements in safety. Adopting PSRs in support of licence renewal will ensure the continued improvement of NPP safety. Past experience with life-extension projects gives the CNSC and the Canadian nuclear industry a large degree of familiarity with the PSR process. As such, the application of a PSR in Canada represents an evolution of a current practice, as opposed to the adoption of a new one.*

All of CNSC REGDOC-2.3.3 (2015) is directly relevant to Safety Factor 8 (Safety Performance).

Compliance with REGDOC-2.3.3 is not currently a licence requirement for Pickering NGS (in accordance with PROL 48.02/2018) per the R04 Pickering Licence Conditions Handbook (LCH) [B.19-2]. REGDOC-2.3.3 superseded RD-360, "Life Extension of Nuclear Power Plants" [B.19-3] (also later referred to as "Life Management of Nuclear Power Plants", and "Long-Term Operation Management for Nuclear Power Plants").

Per Section 16.2 of the Pickering Licence Conditions Handbook [B.19-2]:

> *OPG conducted, between 2006 and 2009, an environmental assessment (EA) and an Integrated Safety Review (ISR) in anticipation of refurbishing Pickering B. In February 2010, OPG announced that Pickering B will not be refurbished, but would continue to operate for another decade (i.e. until 2020). Because RD-360, "Life Extension of Nuclear Power Plants" issued in February 2008 did not cover the aspect of continued operations, CNSC staff developed and established regulatory expectations for continued operation beyond the assumed design life of Pickering B, which were formally communicated to OPG on May 12, 2010 (e-Doc 3546506). From mid-2010 to mid-2012, two draft revisions were produced, the latest document published for public consultation is RD/GD-360 version 2 (July 2012), "Long-Term Operation Management for Nuclear Power Plants". On August 1, 2012, CNSC staff communicated a formal regulatory position and directions to OPG regarding the regulatory framework applicable to the End-of-Life approach for Pickering, to ensure regulatory stability and predictability (e-Doc 3973315).*
>
> *The continued operations plan (COP) is an integrated improvement plan to close issues identified in the EA and ISR for Pickering B, which contains the actions required to support the technical basis for operating the Pickering B units to the end of 2020.*

The sustainable operations plan (SOP) describes the arrangements and activities required to demonstrate that safe and reliable operation of Pickering will be maintained and sustained, for each of the fourteen safety and control areas (SCAs), for the period of operation up to until each reactor unit is permanently shutdown. This licence condition provides the regulatory requirement to implement and maintain the COP and SOP ensuring safe operation of Pickering, and request OPG to provide an end date by which the Pickering units will be shutdown.

The results of previous REGDOC-2.3.3 (2015) reviews have been assessed for applicability to PSR2 in Section B.19.2. As identified in Reference [B.19-4], the Pickering PSR2 review of CNSC REGDOC-2.3.3 is a High Level review. For a PSR2 High Level review, the degree of conformance with clauses or groups of clauses in the Law, Regulation, Code or Standard (L/R/C/S) is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the intent of the safety requirement is met.
- Gap: A Gap indicates that the intent of the safety requirement is not met.

B.19.2 Compliance Assessment for Pickering PSR2

B.19.2.1 Application of PSR1 Reviews

The versions of REGDOC-2.3.3 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering and Darlington NGSs

The Pickering B and Darlington Integrated Safety Reviews (ISRs) were performed to meet draft CNSC Regulatory Document RD-360, "Life Extension of Nuclear Power Plants" [B.19-3], which established the CNSC's approach and requirements relating to Life Extension of Nuclear Power Plants (NPPs). In accordance with RD-360, specific guidance for performing the ISR review was identified in IAEA NS-G-2.10, "Periodic Safety Review of Nuclear Power Plants - Safety Guide" [B.19-5]. The IAEA Safety Guide was designed to deal specifically with the ISR of existing NPPs.

PSR2 is a subsequent PSR as defined in REGDOC-2.3.3 [B.19-1] and IAEA SSG-25 [B.19-6]. PSR2 is an update of the Pickering B ISR completed in 2009, the Darlington ISR completed in 2013 and integrated safety assessments performed for Pickering A Return to Service in 2000. The Pickering PSR must satisfy the requirements of CNSC REGDOC-2.3.3 [B.19-1], which supersedes RD-360. REGDOC-2.3.3, in turn, refers to IAEA document SSG-25 [B.19-6], which supersedes NS-G-2.10. Since REGDOC-2.3.3 and IAEA SSG-25 did not exist at the time that the previous Darlington and Pickering B ISRs were performed, they introduce potential additional requirements for PSR2. Neither document was reviewed as part of PSR1. REGDOC-2.3.3 or its predecessors were not assessed as part of the Pickering A Return to Service.

Both IAEA NS-G-2.10 and SSG-25 are consistent in that they recommend 14 PSR Safety Factors to facilitate the review. CNSC REGDOC-2.3.3 encompasses all of the PSR Safety Factors recommended by the IAEA in SSG-25 and expands upon it by adding Safety Factor 15, Radiation Protection. As discussed in REGDOC-2.3.3 [B.19-1]:

> *The PSR approach is outlined in SSG-25. The complex process of conducting a PSR can be facilitated by subdividing it into tasks that are identified as safety factors. These safety factors are intended to cover all aspects that are important to the safety of an operating nuclear power plant. The terms "safety factor" and "safety factor reports" are an adoption of the SSG-25 terms, with the addition of a safety factor for radiation protection…*
>
> *SSG-25 describes 14 safety factors that have been selected on the basis of international experience and are intended to cover all factors important to NPP safety. The scope, tasks and methodologies of these 14 safety factors are considered to meet the CNSC's expectations for corresponding safety factors 1–14 listed above. The CNSC has included an additional safety factor on radiation protection; the licensee should refer to Appendix A for guidance on the scope and tasks for the review of this safety factor.*

SSG-25 Section 5 contains review element guidance for Safety Factors 1 to 14. For Safety Factor 15, review elements are identified in Appendix A of REGDOC-2.3.3. A clause-by-clause review of Section 5 of SSG-25 (which identifies Review Tasks for PSR Safety Factors 1 to 14) is addressed in Reference [B.19-7].

PSR2 is a subsequent PSR as defined in REGDOC-2.3.3 and is an update of the ISRs that were completed for Pickering B in 2009 and Darlington in 2013. A high level review of REGDOC-2.3.3 is provided in Section B.19.2.2 below.

B.19.2.2 Application of Post-PSR1 Reviews

As discussed above, a review of CNSC REGDOC-2.3.3 was not undertaken as part of the Pickering B or Darlington ISRs as the document did not exist at the time.

OPG provided comments on a draft version of REGDOC-2.3.3 [B.19-8] and in doing so, a comprehensive review was performed to compare the ISR baseline processes and documents against the requirements specified in REGDOC-2.3.3. The review concluded that OPG's existing processes and programs can be credited with the implementation of recommended enhancements in order to meet REGDOC-2.3.3, and that the recommended enhancements can be easily integrated into the existing processes.

A compliance review against REGDOC-2.3.3 was not undertaken as part of previous PSR1 reviews and the following High Level assessment has been completed. In the review below, the degree of conformance with clauses or groups of clauses in the L/R/C/S is assessed for Pickering NGS by reference to supporting evidence stating whether the intent of the requirements stipulated in the L/R/C/S is met. The focus of the review is on PSR2. PSR2 is being conducted in accordance with the PSR2 Basis Document [B.19-4], which was accepted by the CNSC [B.19-9].

REDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
1. Introduction	There are no requirements specified. The introduction describes the purpose of REGDOC-2.3.3 and the purpose of a PSR.	Compliant
1.1 Purpose	There are no requirements specified. Sets context.	Compliant
1.2 Scope	There are no requirements specified. Sets applicability to nuclear power plants and other nuclear facilities.	Compliant
1.3 Relevant Regulations	There are no unique requirements specified. Sets the legal context for the REGDOC-2.3.3. Specified regulations are addressed separately.	Compliant
1.4 National and international standards	Establishes context. Identifies the alignment with IAEA SSG-25. Section 5 of SSG-25 is assessed in [B.19-7].	Compliant
2. General Requirements The licensee shall conduct a PSR in accordance with this regulatory document for the period until the next PSR or, if applicable, until the end of commercial operation of the plant. The PSR shall be conducted in four phases:	REGDOC-2.3.3 is the basis for PSR2 as documented in the PSR2 Basis Document [B.19-4]. The period addressed by PSR2 covers to the next license renewal period expected to be in 2028 which aligns with the period until the next PSR or encompasses the end of commercial operation of the plant. Section 2.2 of the PSR2 Basis Document identifies the four phases of the PSR process as identified in REGDOC-2.3.3 clause 2.	Compliant
Guidance The guidance describes the PSR objectives, the use of Safety Factors, and the scope of PSR Basis Document. The use of the Global Assessment Report and Integrated Implementation Plan are briefly described. Documentation to be submitted to CNSC is identified. The 10 year interval for the performance of PSRs is discussed. The expectation of less effort on a second PSR is explained. The fact that a PSR complements other regulatory activities is explained.	The PSR2 Basis Document identifies the use of Safety Factors, Global Assessment Report (GAR) and Integrated Implementation Plan (IIP) as identified in REGDOC-2.3.3. The scope of the PSR2 Basis Document is consistent with the guidance. The PSR2 Basis Document is consistent with REGDOC-2.3.3 requirements for CNSC submissions. The second PSR is aligned with the expected licence renewal period of 10 years, which is at the recommended 10 year interval. The use of previous PSR information (referred to as PSR1) is described in the PSR2 Basis Document. This guidance about the PSR2 being complementary to other regulatory activities establishes context only.	Compliant

REDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
3. Periodic Safety Review Basis Document The required elements of the PSR basis document are:		Compliant
1. statement of current licensing basis, including exemptions and acceptable deviations (also described in section 3.1)	Addressed in PSR2 Basis Document [B.19-4] Section 1.4.	
2. statement of the proposed operating strategy of the facility (also described in section 3.2)	Addressed in PSR2 Basis Document [B.19-4] Section 1.2.	
3. description of scope of the PSR (also described in section 3.3)	Addressed in PSR2 Basis Document [B.19-4] Section 2.	
4. description of the methodology for the performance of the PSR, including the period for which the PSR is valid	The methodology is addressed in PSR2 Basis Document [B.19-4] Section 3. The period for which the PSR is valid is described in Sections 1.2, and 2.4.	
5. statement of applicable modern codes, standards and practices	Addressed in PSR2 Basis Document [B.19-4] Appendix D, Table D1.	
6. description of the methodology for the identification, dispositioning and tracking of gaps	The definition of a gap is specified in the PSR2 Basis Document [B.19-4] Section 3.2.3. The handling of gaps during the Global Assessment is described in PSR2 Basis Document [B.19-4] Sections 3.3.2 and 3.3.3. The tracking of implementation of initiatives is discussed in PSR2 Basis Document [B.19-4] Sections 3.4.1 and 3.4.2.	
7. description of the methodology for the global assessment	Addressed in PSR2 Basis Document [B.19-4] Section 3.3 and subsections.	
8. PSR governance	Addressed in PSR2 Basis Document [B.19-4] Section 4.0.	
Guidance		Compliant
Fifteen Safety Factors are listed.	The PSR2 Basis Document applies the 15 Safety Factors listed in REGDOC-2.3.3.	
The use of SSG-25 for the first 14 Safety Factors is described. The 15th safety factor is described in Appendix A.	SSG-25 is the basis for Safety Factor 1-14 Review Tasks as described in PSR2 Basis Document [B.19-4] Section 2.6.1.2. Review Tasks for Safety Factor 15 are derived directly from REGDOC-2.3.3 Appendix A as described in PSR2 Basis Document Section 2.6.1.2.	
Use of earlier PSR conclusions in a subsequent PSR is discussed.	Addressed in PSR2 Basis Document [B.19-4] Section 2.4 and Appendix A.	

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
3.1 Current Licensing Basis 3.2 Proposed Operating Strategy for the Nuclear Power Plant 3.3 Scope of the Periodic Safety Review	Compliance with Sections 3.1 to 3.3 of REGDOC-2.3.3 is addressed by the compliance discussion above for Section 3.	Compliant
3.4 Methodology for the performance of the periodic safety review. The requirements include specifying a methodology for conducting assessments to confirm that the plant will continue to meet its licensing basis until the end of commercial operation, conducting assessments against applicable modern codes, standards and practices, conducting a global assessment and identifying corrective actions and safety improvements. The guidance identifies IAEA SSG-25 as defining an appropriate approach. The use of appropriate internal documents based on a freeze date is recommended.	The PSR2 Basis Document was developed to address requirements defined in IAEA SSG-25 as outlined in the PSR2 Basis Document [B.19-4] Section 2.4. The PSR2 methodology is specified in Section 3 of the PSR2 Basis Document [B.19-4] and addresses all of the aspects identified in REGDOC-2.3.3 Section 3.4 as noted in PSR2 Basis Document Sections: - 3.2, Safety Factor Reviews. - 3.3, Global Assessment. - 3.4, Integrated Implementation Plan. A PSR2 freeze date is specified in Section 2.4 of the PSR2 Basis Document [B.19-4]. The period for PSR2 validity is defined in Section 2.4.	Compliant
3.5 Applicable modern codes, standards and practices The requirement is to list applicable codes, standards, and practices to be used in the PSR along with selection criteria, PSR cut-off date, and definition of review type. The guidance identifies that codes, standard and practices should be selected taking into consideration CNSC's regulatory documents and international experience. Documents listed in the license and regulatory documents should be considered. Clause by clause reviews are recommended for new versions of codes and standards and those referenced in the PROL or LCH. Guidance is provided on the type	The methodology and selection criteria used to select codes and standards are defined in the PSR2 Basis Document [B.19-4] Section 2.6.2 and Appendix D. Multiple sources were used including the Pickering PROL, Pickering LCH, and CNSC web sites. The resulting list is provided in Appendix D Table D1. A freeze date (which functions as a cut-off date) is specified in Section 2.4 of the PSR2 Basis Document [B.19-4]. The review type is defined for each code and standard in Table D1 based on a methodology outlined in Section 3.2.2 of the PSR2 Basis Document [B.19-4]. Clause-by-clause reviews are applied to new codes or standards listed in the Pickering PROL or LCH. High Level and Incremental reviews (as defined by the licensee) are also defined with criteria for their application.	Compliant

REDGOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
of review and allows the licensee to propose review types.		
Guidance Expectations for the selection of modern codes and standards are specified. This includes establishing a list before any work is carried out. Selection criteria for Codes and Standards are recommended. Mandatory clauses are to be reviewed. Sub-tier referenced sections are also to be reviewed. New code versions referenced in the LCH should have a clause-by-clause review.	A list of codes and standards is identified in the PSR2 Basis Document Table D1. PSR2 was started on the basis of the Revision 0 of the PSR2 Basis Document and was amended to include changes that were incorporated into Revisions 1 and 2. The extensive basis for the selection of Codes and Standards, including use of the Pickering PROL and LCH, is documented in the PSR2 Basis Document [B.19-4] Appendix D.1.0. The PSR2 Basis Document [B.19-4] states: - Section 3.2.2: *As a subsequent PSR, PSR2 will focus on changes in requirements, plant conditions, operating experience and new information, rather than repeating the activities of previous reviews. Since PSR2 is an update of previous ISRs, it will incorporate reviews of Laws, Regulations, Codes and Standards that have occurred as new versions have been issued. Therefore, clause-by-clause reviews of the majority of applicable Laws, Regulations, Codes and Standards have already been completed and there is little value in repeating that process…* *New Laws, Regulations, Codes and Standards referenced in Pickering PROL 48.02/2018 (listed in Appendix C of the Licence Conditions Handbook) will be subjected to a clause-by-clause type review.* - Section D.1.0, bullet 3.2: *If a sub-tier Code or Standard is called up or cited as mandatory by a PROL Law, Regulation, Code or Standard (or a more recent version of a PROL Law, Regulation, Code or Standard as identified in Step 3.1), and either the sub-tier Code or Standard was not already assessed as part of PSR1 or the sub-tier Code or Standard has been updated since PSR1, then the applicable parts of the sub-tier Code or Standard are included in the PSR2 Assessment Basis if they are determined to be safety significant.*	Compliant

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
3.6 Methodology for the identification, dispositioning and tracking of gaps The licensee shall describe the process and methodology for identifying, categorizing, prioritizing and dispositioning gaps. The licensee shall state what decision-making process will be used to evaluate and decide on the various alternatives to disposition the gaps. To the extent practicable, the licensee shall resolve identified gaps with respect to applicable modern codes, standards and practices. The licensee shall use established processes to resolve identified gaps with the current licensing basis. The licensee shall track dispositioning and resolution of all gaps identified during the PSR through to their resolution.	The PSR2 Basis Document [B.19-4] Section 3.3.3 defines the consolidation of strengths and gaps from the 15 Safety Factor Reports, the definition of Global Issues, and the development of resolutions. The PSR2 Basis Document [B.19-4] Section 3.3.3 describes the use of a risk informed decision making process considering the overall safety significance of Global Issues. The PSR2 Basis Document [B.19-4] Section 3.3.3 identifies that the Global Issues will be tabularized, tracking sources of the issues, to facilitate further review and assessment. The PSR2 Basis Document [B.19-4] Section 3.3.3 describes the process to resolve identified global issues and gaps. Section 3.4.2 describes the implementation of tracking and reporting, and the change management process. .	Compliant
Guidance Findings are to be identified as strengths and gaps. The rationale is to be provided. Gaps are to be prioritized according to safety significance, considering deterministic and probabilistic safety analysis and engineering judgement.	The PSR2 Basis Document [B.19-4] Section 3.2.3 describes the criteria for compliances and gaps with respect to the review elements in the PSR2 Assessment Basis. Section 3.3.3 outlines how the Strengths and Gaps from the 15 individual Safety Factor Reports will be consolidated and grouped by topic area to support the Global Assessment. With the assembly of Global Issues and Strengths, and considering the recommendations from the Component Condition Assessments, the aggregate impact of the Global Issues will be assessed. The PSR2 Basis Document [B.19-4] Section 3.3.3 outlines the use of deterministic criteria (PSR2 Basis Document Appendix E) and probabilistic criteria (PSR2 Basis Document Appendix F).	Compliant

REDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
The overall priority of a gap should inform the course of action to be taken to establish its recommended disposition. The licensee should establish and maintain a database of all gaps identified during the PSR.	The PSR2 Basis Document [B.19-4] Section 3.3.3 outlines how the Safety Significance level will consider deterministic and probabilistic safety analysis impact, as appropriate. The assignment of Safety Significance values for prioritization was derived based on OPG experience and takes into account the priority values from the OPG guidelines for evaluating and prioritizing Safety Report Issues, the COG Benefit-Cost Analysis processes, and the OPG Station Condition Record categorization process. Safety Significance will be derived primarily through the thresholds defined in PSR2 Basis Document Appendix E Table E1 and per the risk assessment criteria in Appendix F. The PSR2 Basis Document [B.19-4] Section 3.3.3 also outlines how the resolution of global issues and gaps (i.e., "course of action" per the SSG-25 Guidance wording) is dependent on the significance level. The PSR2 Basis Document Section [B.19-4] 3.3.3 identifies that the Global Issues will be tabularized, tracking sources of the issues, to facilitate further review and assessment.	
3.7 Methodology for the global assessment The methodology for performing the global assessment shall be described in the PSR basis document. The methodology shall address and include: 1. results of the safety factor reviews, in particular, the findings (both gaps and strengths) of NPP design and operation 2. the interdependencies between gaps and the significance of their aggregate effects 3. recommended corrective actions and safety improvements to address individual and consolidated gaps	The methodology for performing the Global Assessment is described in Section 3 of the PSR2 Basis Document [B.19-4]. As noted in Section 3.3.3 of the PSR2 Basis Document [B.19-4]: *the Strengths and Gaps from the 15 individual Safety Factor Reports will be consolidated and grouped by topic area to support the Global Assessment*. *The consolidation of Gaps into Global Issues will provide a means to assemble Gaps of a common nature, facilitating the assessment of safety impact and identifying and assessing practical and effective resolutions… The aggregate impact of the Global Issues will be assessed.* *Resolution options will be developed and assessed using risk informed decision making techniques.*	Compliant

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
4. the extent to which the safety requirements of defence in depth are fulfilled 5. an estimate of global risk associated with facility operation with any unresolved gaps The results from the global assessment shall be documented in the global assessment report.	*An important element of the development of proposed recommendations will be to assess the overall defence-in-depth and aggregate impact of the residual Global Issues / Acceptable Deviations. After evaluating a range of resolutions for Global Issues, and determining a recommended resolution to be selected, the impact on defence-in-depth, considering both deterministic and probabilistic elements, will be evaluated to assess the aggregate impact on overall safety.* *As a final step in the assessment process, the team will assess the overall acceptability of operation of the plant over the period considered in PSR2. This will entail a review of the results of the Safety Factor Reviews, a consideration of enhancements planned (both newly identified in PSR2 and from other station plans), and a consideration of plant performance and initiatives underway.* As noted in PSR2 Basis Document [B.19-4] Section 3.3.4, the results of the Global Assessment will be documented in the Global Assessment Report, presenting the results, assessing the overall defence-in-depth of the plant, and documenting the conclusions, corrective actions, and enhancements to be considered.	
Guidance The guidance elaborates on the requirements listed above.	Addressed in the compliance assessment above concerning clause 3.7.	Compliant
3.8 Periodic safety review governance In the PSR basis document, the licensee shall establish, and describe governance for the conduct of the PSR.	The governance for the conduct of the PSR is described in PSR2 Basis Document [B.19-4] Section 4.	Compliant
Guidance The licensee's governance for the conduct of PSR should address that: the PSR team is qualified to carry out the review	As described in the PSR2 Basis Document [B.19-4]: Section 4.0: *PSR2 work will be conducted under OPG's quality management program (compliant with CSA N286-05). Where external contractors are engaged in performing portions of PSR2, they will either work under OPG's quality program, or under a quality program that has been accepted by OPG as meeting the quality requirements for the contracted work scope.* Training and qualification are implicit in the quality management program.	Compliant

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
provisions have been made for peer or independent review of work done controls are in place to ensure that information and data are used consistently across the review requirements for the preparation and verification of documentation are satisfied results are recorded in a systematic and auditable manner The licensee should develop a project plan for the conduct of the PSR that includes established project management processes and quality management provisions.	Section 3.3.1: *The Global Assessment will be conducted by an interdisciplinary team, with appropriate expertise in operations, design and safety at the plant, including appropriate participants from the Safety Factor reviews, and members who are independent from the Safety Factor review teams…* Section 4.0: *Effective communications practices will be used throughout the performance of PSR2. Interfaces between the work of different external contractors and OPG staff will be managed to ensure consistency between related deliverables and accuracy of information.* Section 4.0: *PSR2 work will be conducted under OPG's quality management program (compliant with CSA N286-05).* Preparation and verification of documentation are implicit in the quality management program. Section 3.3.3: *The Global Issues will be tabularized, tracking sources of the issues, to facilitate further review and assessment.* Section 4.0: *PSR2 work will be conducted under OPG's quality management program (compliant with CSA N286-05).* Auditable records are implicit in the quality management program. Section 4 of the PSR2 Basis Document [B.19-4] describes the application of project management principles, and that PSR2 work will be conducted under OPG's quality management program (compliant with CSA N286-05).	
4. Performance of the Periodic Safety Review The licensee shall conduct the PSR in accordance with the accepted PSR basis document following its acceptance by CNSC staff.	PSR2 has been initiated based on the R02 PSR2 Basis Document [B.19-4] which has been reviewed and accepted by the CNSC.	Compliant

REDGOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
Guidance It is recommended that the licensee does not undertake substantive work on the PSR until such time as CNSC staff has accepted the PSR basis document.	PSR2 has been initiated based on the R02 PSR2 Basis Document [B.19-4] which has been reviewed and accepted by the CNSC.	Compliant
4.1 Safety Factor reports The licensee shall ensure that each safety factor report documents: 1. objective, scope, tasks and methodology for the review 2. applicable codes , standards and practices 3. overview of applicable facility programs and processes 4. findings of the review which identify gaps and strengths 5. categorized and prioritized gaps 6. interfaces with other safety factor report findings 7. options for corrective actions for each gap	The content of Safety Factor reports is specified in PSR2 Basis Document Section 3.2.3 [B.19-4]. These reports will include: • The scope of the review; • Review methodology; • Applicable elements of the PSR2 Assessment Basis (Review Tasks and applicable Laws, Regulations, Codes and Standards); • Effectiveness review of OPG programs supporting compliance assessments; • Review findings (Compliances and Gaps); • Assessment of compliance with Review Tasks; • Overall assessment of the Safety Factor. The PSR2 Basis Document Section 3.3.2 specifies that the categorization and prioritization of gaps (at the level of Global issues) is done as part of the Global Assessment and is not done within each Safety Factor Report; • Impacts on other Safety Factor reviews. Options for corrective actions for each gap are done as part of the Global Assessment and are not done within each Safety Factor Report.	Compliant
Guidance The guidance elaborates on the requirements listed above.	Addressed in the discussion above concerning clauses 4 and 4.1 requirements.	Compliant

REDGOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
5. Global Assessment Report		Compliant
The licensee shall prepare a report that documents the results of the global assessment.	PSR2 Basis Document [B.19-4] Section 3.3.4 states: *The results of the Global Assessment will be documented in a Global Assessment Report, presenting the results, assessing the overall defence-in-depth of the plant, and documenting the conclusions, corrective actions, and enhancements to be considered.*	
The global assessment report (GAR) shall present the findings of the PSR, both strengths and gaps, to provide an overall assessment of the safety of plant.	PSR2 Basis Document [B.19-4] Section 3.3.3 states: *The Strengths and Gaps from the 15 individual Safety Factor Reports will be consolidated and grouped by topic area to support the Global Assessment.*	
The GAR shall document the overall conclusions, corrective actions and safety improvements to be considered.	PSR2 Basis Document [B.19-4] Section 3.3.3 states: *After evaluating a range of resolutions for Global Issues, and determining a recommended resolution to be selected, the impact on defence-in-depth, considering both deterministic and probabilistic elements, will be evaluated to assess the aggregate impact on overall safety.*	
The GAR shall be submitted to CNSC staff for review.	PSR2 Basis Document [B.19-4] Section 3.3.4 states: *The Global Assessment Report will be submitted to CNSC staff for review.*	
Guidance		Compliant
The GAR should provide a living database that captures the current state of the gaps. The database should be fully traceable so that a change in a gap, or in the assessment of a gap, can be easily tracked to its resolution.	PSR2 Basis Document [B.19-4] Section 3.4.1 states: *The IIP listing of enhancements will include those resulting from the Global Assessment Report, including both new modifications proposed as part of the resolution of Global Issues, and also considering the existing planned station process and physical modifications that were integral to the overall assessment of safety… The initiatives will be tabularized with owners assigned and planned implementation dates… The listing will include the priority and the basis for the priority. The implementation of the initiatives will be tracked and reported… The Integrated Implementation Plan will be tracked and progress will be regularly reported throughout the implementation period.*	

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
The GAR should include the following elements:	PSR2 Basis Document [B.19-4] states:	
1. summaries of the safety factor reports and identified gaps and strengths	- Section 3.3.2: *The Global Assessment Process consists of … Identification and consolidation of Strengths and Gaps from the Safety Factor Reports.*	
2. overlaps, omissions, and interface issues of the findings from the safety factor reports	- Section 3.3.2: *The Global Assessment Process consists of … Assessment of interfaces between the various Safety Factors, Aggregate Impact of Global Issues.* - Section 3.3.3: *With the assembly of Global Issues and Strengths, and considering the recommendations from the Component Condition Assessments, the aggregate impact of the Global Issues will be assessed. In this way, the interaction between issues will be identified. New Global Issues may be identified as part of this consolidation review.*	
3. consolidation of gaps into global issues where appropriate	- Section 3.3.3: *The Strengths and Gaps from the 15 individual Safety Factor Reports will be consolidated and grouped by topic area to support the Global Assessment.*	
4. safety significance and risk ranking of all gaps (individual and consolidated)	- Section 3.3.2: *The Global Assessment Process consists of … prioritization of Global Issues… Ranking of Global Issues with identified actions.* - Section 3.3.3: *The Safety Significance level will consider deterministic and probabilistic safety analysis impact, as appropriate. The assignment of Safety Significance values for prioritization in Appendices E and F was derived based on OPG experience and takes into account the priority values from the OPG guidelines for evaluating and prioritizing Safety Report Issues, the COG Benefit-Cost Analysis processes, and the OPG Station Condition Record categorization process. Probability levels selected for delineation between categories are based on significance and engineering judgement, and are as used in previous Integrated Safety Reviews. These values account for overall safety impact and align, where appropriate, with requirements and limits in relevant safety standards… All Global Issues whose resolution involves identified actions will be ranked from 1 through N, where N is the total number, in accordance with overall safety significance.*	

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
5. corrective actions, safety improvements and appropriate dispositions proposed for all gaps and global issues	- As identified in PSR2 Basis Document [B.19-4] Section 3.3.3: For Global Issue resolution – the process will be: o Evaluate the Global Issue to understand safety basis, and intent of requirement. o Consider possible options for resolution/mitigation. Consider safety significance and defence-in-depth elements. o Evaluate options with respect to effectiveness, cost, schedule, practicality. For potential plant modifications, this may require an evaluation of the safety impact, both deterministic and probabilistic. If it is not practicable to fully resolve a Global Issue, other mitigation options will be considered for enhancements. o Practicality of a proposed resolution will be evaluated in terms of cost, resources, schedule, and considered in relation to the overall safety impact. o Some proposed resolutions will be dependent on whether plant operation is assumed to continue into the 2025-2028 time period. These proposed resolutions will be distinguished as such. o Propose recommended resolution/mitigation. o Document the decision making process.	
6. a global assessment based on the aggregate effect of the findings resulting from all safety factor reports, taking the proposed corrective actions and safety improvements into account, and defence in depth	- PSR2 Basis Document [B.19-4] Section 3.3.3: *An important element of the development of proposed recommendations will be to assess the overall defence-in-depth and aggregate impact of the residual Global Issues / Acceptable Deviations. After evaluating a range of resolutions for Global Issues, and determining a recommended resolution to be selected, the impact on defence-in-depth, considering both deterministic and probabilistic elements, will be evaluated to assess the aggregate impact on overall safety.*	
7. statement of the licensee's assessment of the overall acceptability of operation of the NPP	- PSR2 Basis Document [B.19-4] Section 3.3.3: *As a final step in the assessment process, the team will assess the overall acceptability of operation of the plant over the period considered in PSR2. This will entail a review of the results of the Safety Factor Reviews, a consideration of enhancements planned (both newly identified in PSR2 and from other station plans), and a consideration of plant performance and initiatives underway.*	

REDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
6. Integrated Implementation Plan The licensee shall develop an Integrated Implementation Plan (IIP) that addresses the results of the global assessment. The IIP shall be submitted to CNSC staff for acceptance.	PSR2 Basis Document [B.19-4] Section 3.4 states: *The proposed enhancements resulting from the Global Assessment will be documented in the Integrated Implementation Plan.* PSR2 Basis Document [B.19-4] Section 3.4.2 states: *The Integrated Implementation Plan Report will be submitted to CNSC staff for acceptance, per CNSC REGDOC-2.3.3.*	Compliant
In the IIP, the licensee shall:		
1. list the corrective actions and safety improvements (including necessary physical NPP modifications) that will address all gaps identified in the PSR, and findings	PSR2 Basis Document [B.19-4] Section 3.4.1 states: *The initiatives will be tabularized with owners assigned and planned implementation dates. Existing initiatives integral to the overall assessment of safety during the Global Assessment will also be included in this listing. The listing will include the priority and the basis for the priority. The implementation of the initiatives will be tracked and reported.*	
2. specify the schedule for implementing the corrective actions and safety improvements	PSR2 Basis Document [B.19-4] Section 3.4 states: *The IIP will provide the proposed timeline for the implementation of the enhancements.* PSR2 Basis Document [B.19-4] Section 3.4.1 states: *… a change management process will be implemented to manage evolution of the resolution details and implementation schedules.*	
Guidance An overview of the acceptability of safe operation of plant in view of the proposed changes should be included in the IIP, to demonstrate that the outcome of safety improvements serves the intended purpose of the PSR.	The PSR2 Basis Document [B.19-4] states: - Section 3.3.4: *The Global Assessment Report will include a statement of OPG's assessment of the overall acceptability of operation of the plant.*	Compliant
In the IIP, the licensee should:		
1. demonstrate traceability and provide references to the GAR	- Section 3.4.2: *The processes will allow tracking of initiatives to completion or resolution in an auditable manner, consistent with OPG's Management System.*	

REGDOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
2. specify the processes used for determining the detailed scope, including prioritization and scheduling of corrective actions and safety improvements	The PSR2 Basis Document [B.19-4] Section 3.4.1 defines the logistics for the IIP.	
3. schedule and implement corrective actions and safety improvements commensurate with their safety significance	The PSR2 Basis Document [B.19-4] Section 3.4.1 states: *The listing* [of IIP initiatives] *will include the priority and the basis for the priority. The implementation of the initiatives will be tracked and reported.*	
4. specify processes for identification and management of project risks and controls	As defined in the PSR2 Basis Document [B.19-4] Section 4.0: *OPG project management principles will be applied in performing PSR2.* Management of project risks and controls is an element of OPG project management practice.	
5. specify the process to be used to track the progress and completion of the corrective actions and safety improvements	The PSR2 Basis Document [B.19-4] Section 3.4.2 states: *The [IIP] report will also summarize the implementation tracking and reporting process, and the change management process for the IIP. The processes will allow tracking of initiatives to completion or resolution in an auditable manner, consistent with OPG's Management System.*	
The IIP should be organized according to the CNSC's safety and control areas	The PSR2 Basis Document [B.19-4] Section 3.4.2 states: *To facilitate the CNSC review of the Integrated Implementation Plan, the plan will be presented in a manner aligned with the CNSC Safety and Control Areas.*	
The licensee should have the following in place:		
1. a project organization, structured to execute the IIP	The PSR2 Basis Document [B.19-4] Section 3.4.1 states: *The initiatives will be tabularized with owners assigned and planned implementation dates.* The PSR2 Basis Document [B.19-4] Section 3.4.2 states: *The report will also summarize the implementation tracking and reporting process, and the change management process for the IIP. The processes will allow tracking of initiatives to completion or resolution in an auditable manner, consistent with OPG's Management System.*	

REDGOC-2.3.3 Clause	PSR2 Review	Compliant or Gap
2. governance for IIP delivery 3. scope, schedules and dependencies, at least for the earlier tasks 4. definition of resources and a resourcing plan 5. a mechanism for overall integration, peer or independent review and oversight	- Section 4.0 Governance [B.19-4]: *PSR2 work will be conducted under OPG's quality management program (compliant with CSA N286-05).* - The PSR2 Basis Document [B.19-4] Section 3.4 states: *The proposed enhancements resulting from the Global Assessment will be documented in the Integrated Implementation Plan (IIP). The IIP will provide the proposed timeline for the implementation of the enhancements.* - The PSR2 Basis Document [B.19-4] Section 3.4.1 states: *The initiatives will be tabularized with owners assigned and planned implementation dates.* - Section 3.4.1 [B.19-4]: *A review will be conducted with program owners and appropriate managers to derive plans for implementation based on priority and resources.* - Section 3.3.4 [B.19-4]: *Reviews and approval of the report will be conducted as required under the OPG Management System.*	
Appendix A: Safety Factor for Radiation Protection	Assessed in Appendix C of OPG Report, P-REP-03680-00003 R000, "Pickering NGS Periodic Safety Review 2 (PSR2) Definition of Safety Factor Review Tasks" [B.19-7].	Compliant
Appendix B: CNSC Safety and Control Areas	Provides information and does not establish any requirements.	Compliant

Additional Information	Provides information and does not establish any requirements.	Compliant

B.19.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CNSC REGDOC-2.3.3 (2015) [B.19-1]. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CNSC REGDOC-2.3.3 (2015).

B.20 CSA N286.7.1-09, "Guideline for the Application of N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants"

B.20.1 Background

The following paraphrased from the purpose and scope of CSA N286.7.1 [B.20-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *CSA N286.7.1 provides guidance on the application of CSA N286.7, based on industry experience. It is intended to assist owner organizations and participants in the preparation and implementation of software quality assurance processes in compliance with CSA N286.7. CSA N286.7 contains requirements that need interpretation or expansion in order to be implemented. CSA N286.7.1 provides guidance on graded implementation and draws from software quality assurance/management processes currently in use by owner and participant organizations. CSA N286.7.1 is based on the AECL document, Guideline for the Application of CSA N286.7-99, and has been provided to CSA as a supporting document for CSA N286.7.*

CSA N286.7.1 is relevant to Safety Factors 1 (Plant Design), 5 (Deterministic Safety Analysis), 6 (Probabilistic Safety Assessment), 7 (Hazard Analysis), and 10 (Organization, the Management System and Safety Culture). CSA N286.7.1 is not discussed in the R04 Pickering Licence Conditions Handbook [B.20-2].

The N286.7.1 guide has been amalgamated into the new (2016) edition of the N286.7 Standard. The N286.7 CSA Impact Statement states [B.20-3]: "The CSA N286.7.1 guide will no longer be maintained after this new edition of N286.7 is issued. Any relevant guidance has been put into the new edition of N286.7." As a result, only the review of N286.7-16 has been prepared for PSR2.

B.20.2 Compliance Assessment Summary for Pickering PSR2

As discussed in Section B.20.1, an assessment of N286.7.1 has not been performed as any relevant guidance from N286.7.1 has been amalgamated into CSA N286.7-16. A review of CSA N286.7-16 was performed as part of PSR2.

B.21 CSA N290.12-14, "Human Factors in Design for Nuclear Power Plants"

B.21.1 Background

The following paraphrased from the purpose and scope of CSA N290.12-14 [B.21-1] provides an overview of the purpose of this standard and the requirements expressed therein:

> *Human Factors (HF) in Design for Nuclear Power Plants applies to nuclear safety, protection of the environment, health and safety of persons, security, productivity, and economics. The goal of HF in design is to apply theory, principles, data, and other methods to the design of structures, systems, and components (SSCs) to optimize human and system performance.*
>
> *CSA N290.12 covers HF in design for existing and new NPPs and covers HF in design activities related to construction, commissioning, operation, maintenance, inspection, testing, and decommissioning.*

CSA N290.12-14 is relevant to Safety Factors 1 (Plant Design) and 12 (Human Factors).

Compliance with CSA N290.12 is not currently a licence requirement for Pickering NGS (in accordance with PROL 48.02/2018) per the R04 Pickering Licence Conditions Handbook [B.21-2].

CSA N290.12-14 is the first edition of this standard. N290.12-14 was issued in December 2014, with a revision errata update made in February 2015. However, there was no change in technical content in this errata update [B.21-1].

The following "Significant Features" were obtained from the CSA Impact Statement for public review related to the release of N290.12-14 [B.21-3]:

1. *This new standard establishes:*
    a. *the requirements for Human factors in design for water-cooled nuclear power plants*
    b. *criteria for determining the level of effort (grading)*
    c. *how HF in design is considered from conceptual design through installation and commissioning*
    d. *the need to consider, planning, interfacing with other organizations, analysis and evaluation.*
2. *This standard identifies the purpose and expected outcomes (e.g. for validation) but does not attempt to describe detailed methodology.*

The following are the "Impacts of Standard" from the CSA Impact Statement:

1. *This standard will contribute towards the integration of HF into the design process and consistent application.*
2. *This standard is aligned with the CNSC's expectations for HF in design.*
3. *This standard is expected to be a reference when updating CNSC's regulatory documents concerning HF in design.*
4. *Some organizations may require minor changes to procedures to match N290.12:*
   a) *to ensure the grading criteria from the standard are reflected in the procedures (criteria include safety as well as others). The grading may result in an intermediate level of effort depending on the procedures in place at the various organizations.*
   b) *to ensure changes initiated during implementation are reviewed for HF in design considerations.*
   c) *to ensure HF in design has the opportunity to input to commissioning and installation.*
   d) *to ensure the HF aspects of the as-build are evaluated.*
   e) *to ensure application of the Appendix on Control Centres.*
   f) *to ensure evaluation of Commercial Off the Shelf (COTS) equipment.*
5. *Some organization's procurement may be impacted to ensure contracts and item equivalencies reflect HF approaches.*
6. *Some organizations may feel the need to produce a program level document to complement their procedures. This may be an economic consideration more than a technical consideration.*
7. *Some organizations may have to advance the HF planning to an earlier stage of design.*

The results of PSR1 CSA N290.12 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.21.2. As identified in Reference [B.21-4], the Pickering PSR2 review of CSA N290.12-14 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.

- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

B.21.2 Compliance Assessment for Pickering PSR2

B.21.2.1 Application of PSR1 Reviews

The versions of N290.12 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering and Darlington NGSs

As discussed earlier, CSA N290.12-14 is the first edition of this standard. As a result, N290.12 was not assessed during the Pickering B or Darlington ISRs, or for Pickering A Return to Service.

With respect to the evolution of CSA N290.12, Darlington ISR Report NK38-REP-03680-10211 R000 [B.21-5] states the following:

> *Around 1996 a draft CSA standard was under consideration (N290.12, "Control Room Design for CANDU Nuclear Power Plants"), but N290.12 was never issued. OPG's Engineering Change Control (ECC) process ensures that all modifications to the station are designed, installed, commissioned, and placed into service within the Safe Operating Envelope, design basis, and plant licensing conditions. The program and supporting procedures ensure proper reviews and approvals, including human factors, are achieved before modifications are implemented. It is also noted that under the current ECC process for new designs, there is systematic consideration of human factors as part of the design process.*

N290.12-14 was subsequently issued in 2014 (with revision errata update in 2015). Per Section 6.1 of the R04 Pickering Licence Conditions Handbook [B.21-2]:

> *The CSA standard N290.12 Human factors in design for nuclear power plants, was published in 2014. CNSC intends to add it to the licensing basis of NPPs in the future. The CNSC recommends that the licensee complete its gap analysis/implementation plan, currently scheduled for 2016.*

The status of implementation of N290.12-14 is discussed in Section B.21.2.2 below.

B.21.2.2 Application of Post PSR1 Reviews

OPG completed a review in October 2016 of OPG's Human Factors Engineering (HFE) practices against the fundamentals of N290.12-14, per OPG Memorandum N-REF-06700-0615412 [B.21-6], which had the following objectives:

- Identify governance requiring revision in order to become compliant with the mandatory clauses of N290.12-14;

- Identify governance in which N290.12-14 should be identified as a performance reference; and

- Provide insight to potential areas of weakness in the OPG HFE process (i.e. non-compliances) for possible consideration in future divisional self-assessments.

The assessment showed OPG to be largely compliant with CSA N290.12-14 and stated [B.21-6]:

> *Rather than by a unique HFE program, compliance is achieved primarily under the auspices of N-PROG-MP-0001 Engineering Change Control, N-PROG-MP-0009 Design Management and associated governance as well as some dependence on interfacing programs and governance.*
>
> *Additionally N-MAN-06700-10002* [B.21-7] *specifies the following:*
>
> *(a) OPG's HFE processes and approach to the conduct of HFE activities*
>
> *(b) OPG's expectations for performing HFE activities.*

Two partially non-compliant clauses were identified as follows [B.21-6]:

> ***Clause 4.4 b):*** *OPG is not fully compliant with Clause 4.4 b) for the HF in design plan to define the Project and Regulatory interfaces with Human Factors Engineering (HFE). There are a number of OPG programs and procedures that define and bound the communication interfaces between the Engineering (in general), Project and Regulatory organizations. For modifications categorized as "Full" HFE, N-FORM-10580 "Identifying Human Factors Level of Activity" and N-MAN-06700-10002 "Guide to OPG Human Factors Engineering Process" requires a Human Factors Engineering Program Plan (HFEPP) meeting certain CNSC guidelines and industry standards which require the definition of roles, authorities, resources and interfaces. Modifications categorized as "Basic" HFE utilize N-FORM-10221 as a pre-defined HFEPP and to document the HFE analysis and evaluations. Neither N-FORM-10221 nor the associated instruction, N-INS-06700-10000, define these interfaces. To be fully compliant with this clause it is recommended to revise N-MAN-06700-10002 and expand N-INS-06700-10000 1.4.14 to include the interfaces identified in N290.12-14 clause 4.4 b) notes and to provide the cross references to the OPG governance that mandate these interdepartmental interfaces and interaction. The implementation of this recommendation is tracked through assignment 28194048-01.*
>
> ***Clause 5.1.1 a) through d):*** *OPG is not fully compliant with the Clause 5.1.1 requirement that HF in design "shall consider" interfaces with other organizations, namely, a) procedure development, b) training development, c) safety analysis and d) staffing. Compliance with the clause requires documentation of the consideration of interface between HFE and these organizations. A number of OPG programs and governance prompt the interaction and interface between engineering (in general)*

and stakeholders in other departments. Neither N-MAN-06700-10002 "Guide to OPG Human Factors Engineering Process" nor N-INS-06700-10000 "Preparation of the Human Factors Engineering Worksheet" requires documentation of the considerations of these inter-departmental interfaces. N-INS-06700-10000 1.4.14 discusses the nature of interfaces with other departments including: Nuclear Safety, Conventional Safety, Training, Procedure Development, Installation and Commissioning. It does not include consideration of staffing. In order to fully comply with this clause, it is recommended to revise both of these documents to explain the requirement to record the specific consideration of these areas in the HFEPP, HFESR [Human Factors Engineering Summary Report] *and N-FORM-10221 and revision of N-MAN-06700-10002 to include staffing in addition to the other areas. The implementation of this recommendation is tracked through assignment 28194048-02.*

Work is in progress to address these minor issues, with interim mitigation in place. Given that the partially non-compliant clauses identified above do not have a nuclear safety impact, there is no PSR2 gap.

B.21.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N290.12-14 [B.21-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N290.12-14.

B.22 CSA N288.3.4-13, "Performance Testing of Nuclear Air-Cleaning Systems at Nuclear Facilities"

B.22.1 Background

The following paraphrased from the preface and scope of CSA N288.3.4-13 [B.22-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *Nuclear facilities or licensed activities can release radioactive, airborne contaminants to the surrounding environment. Therefore, in order to mitigate the airborne release of these substances, nuclear air-cleaning systems are often installed in the ventilation systems of nuclear facilities. Regular testing is required to confirm that nuclear air-cleaning systems are performing within their design basis. The design basis approach allows systems to be tested to their individual performance requirements. CSA N288.3.4 provides guidance for pre-operational acceptance testing of new and refurbished nuclear air-cleaning systems and for in-service performance testing of nuclear air-cleaning systems.*
>
> *CSA N288.3.4 addresses the design, implementation, and management of a nuclear air-cleaning system testing program that meets legal and business requirements and incorporates current best practices and technologies used internationally.*

CSA N288.3.4 is relevant to Safety Factor 8 (Safety Performance) and Safety Factor 14 (Radiological Impact on the Environment). CSA N288.3.4 is not discussed in the R04 Pickering Licence Conditions Handbook [B.22-2].

CSA N288.3.4-13 is the first edition of this standard. The CSA Impact Statement and public review notice for this edition identifies the following significant features [B.22-3]:

1. *The Standard addresses pre-operational acceptance testing of new and refurbished nuclear air-cleaning systems and routine in-service performance testing of nuclear air-cleaning systems at nuclear facilities.*

2. *The Standard establishes minimum performance requirements for the following system components: moisture separators, heaters, pre-filters, high efficiency carbon adsorbers, HEPA* [High Efficiency Particulate Air] *filters, filter housings, ductwork, dampers, system monitoring equipment and performance testing equipment.*

3. *The Standard identifies what routine tests are required during commissioning and normal operation and the recommended testing schedule. Criteria are also established for non-routine testing after a system upset (e.g. caused by filter media disturbance or replacement, suspected wetting, condensation or flooding of the filters or adsorbers, system modifications or repair to the housing, ductwork, damper or monitoring systems, etc.).*

4. *The Standard provides guidance for the design, implementation, execution and management of a nuclear air cleaning system testing program. It incorporates current*

best practices and available technologies to verify nuclear air cleaning system performance within its design basis.

5. *Additional informative material is provided. Included are examples of a visual inspection check list to detect obvious deficiencies, a typical HEPA filter bypass test procedure, a typical carbon adsorber bypass test procedure, and required staff qualifications.*

The results of PSR1 CSA N288.3.4 reviews (Pickering A Return to Service assessments, and Pickering B and Darlington Integrated Safety Reviews (ISRs)), as well as reviews performed since PSR1, have been assessed for applicability to PSR2 in Section B.22.2. As identified in Reference [B.22-4], the Pickering PSR2 review of CSA N288.3.4-13 is an Incremental review. PSR2 Incremental review includes an assessment of the intent of recent changes to the Law, Regulation, Code or Standard on a topic or subject-matter basis where there is potential to impact nuclear safety. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the change in the safety requirement, per the topical review, is met.
- Gap: A Gap indicates that the change in the safety requirement, per the topical review, is not met.

Per the PSR2 basis [B.22-4], the only system that has nuclear safety credited functions for filtration is containment, for which FADS (Filtered Air Discharge System) is the credited filtration system. Hence the focus of this review will be the performance testing of the FADS filters.

B.22.2 Compliance Assessment for Pickering PSR2

B.22.2.1 Application of PSR1 Reviews

The versions of N288.3.4 (or its predecessors) subject to previous PSR1 reviews conducted for Pickering and Darlington, as well as their applicability to Pickering PSR2, are identified and discussed below.

Pickering NGS

Pickering Units 5-8

The first edition of this standard was issued in March 2013 after the completion of the Pickering Unit 5 to 8 ISR. Therefore, it was not reviewed for the Pickering B ISR.

Pickering Units 1,4

The first edition of this standard was issued in March 2013 after the completion of the Pickering A Return to Service. Therefore, N288.3.4 was not reviewed for Pickering A Return to Service. CSA N288.3.4 is not mentioned in the R04 Pickering Licence Conditions Handbook [B.22-2] or Pickering PROL Renewal Application [B.22-5].

Darlington NGS

An assessment of testing of air cleaning systems against the ASME requirements in ASME N-510-2007, "Testing of Nuclear Air Treatment Systems" was completed in 2011 as part of the Darlington ISR [B.22-6]. As part of this review, several compliance gaps were identified. These gaps were combined under Darlington ISR Issue D247 [B.22-7] and the Issue was determined to have low (level 4) safety significance. The resolution of the Issue was to adopt the N288.3.4 standard, given that it was considered to be more applicable to Darlington and superseded ASME N510. As part of the ISR, a Code Refresh review was subsequently performed against N288.3.4 in March 2014 and documented in Reference [B.22-8]. For this review two systems were selected for review as being representative of other ventilation systems, the Emergency Filtered Air Discharge System (EFADS) and the Powerhouse Ventilation System. This review did not identify any gaps against the standard for Darlington and concluded the following:

> *The changes made in CSA N288.3.4 [R-1] relative to ASME N510 [R-5] included substantial changes in structure and changes in intent of some of the clauses. The review of the clauses in this code refresh report confirms that Darlington NGS design and OPG Nuclear governance meets the intent of the requirements of CSA N288.3.4 [R-1].*

Given the similarities between the Pickering FADS and Darlington EFADS designs, and the common Nuclear testing governance (as identified in References [B.22-9] and [B.22-10]), the same conclusions are applicable to Pickering NGS and PSR2.

B.22.2.2 Application of the Post-PSR1 Reviews

A code review assessment against CSA N288.3.4-13 for OPG Nuclear facilities including Pickering NGS, Pickering Waste Management Facility, Darlington Waste Management Facility and Western Waste Management Facility was issued in January 2016 [B.22-11]. The scope of this review was much broader than just FADS and the clause-by-clause review identified thirty-five gaps [B.22-11] relating to multiple systems filters. Given the scope of the PSR2 review specifically relates to nuclear safety, FADS (as part of Containment) is the only filtered air or air cleaning system that needs to be considered per [B.22-4]. Therefore, the assessment in [B.22-11] has been reviewed to determine if any of the identified gaps could be applicable to Pickering FADS.

The review of [B.22-11] did not identify any gaps specifically related to FADS. The identified gaps relate to the generic test program design, documentation issues (e.g., inability to obtain historical records), treatment of uncertainties, and basis requirements. The recommendation from the review was,

> *Based on an assessment of documents and records that have been provided, there are numerous gaps in compliance of the OPG filter test program with the requirements and recommendations of CSA Standard N288.3.4.*
>
> *It is recommended that the main document describing the program, N-PROC-OP-0042, be expanded to more fully address the clauses of the Standard, either by adding description and explanation to the program document or by including explicit references*

to documents and records that provide the necessary evidence of compliance with the Standard. It may be helpful to construct a mapping of the sections of N-PROC-OP-0042 onto the clauses of the Standard to more clearly show compliance.

Because FADS is a Containment sub-system and part of a Special Safety System, the filter system has explicit design basis requirements to ensure that the nuclear safety credits are satisfied [B.22-12]. These are documented in the Safe Operating Envelope (SOE) for Pickering 1,4 and Pickering 5-8 in the Containment Operational Safety Requirements (OSRs) [B.22-13],[B.22-14], and in the associated OSR Compliance Tables. The Compliance Tables identify the routine operational tests and periodic surveillances specified to provide assurance of filter availability and effectiveness.

N-PROC-OP-0042 [B.22-9], Section 3.2.2 identifies the required FADS filter test frequency and Section 3.4 identifies the test acceptance limits. Entry A.7 of the Pickering B OSR Compliance Table [B.22-15] identifies the specified surveillances on the FADS filters. Iodine removal effectiveness is addressed by periodic replacement of charcoal. Report P-REP-03480-00042 [B.22-16] presents the test results of filter testing from 2002 to 2014. Appendix B and C of [B.22-16] present historical FADS bypass test results which demonstrate that the PROC [B.22-9] requirements of <0.05% and SOE requirement of <0.1% are consistently achieved. In addition to these surveillance requirements, there is a System Performance Monitoring Plan for the FADS system [B.22-17]. This plan specifies additional inspection and trending requirements for the filters.

Hence, it is concluded that Pickering FADS filter performance satisfies the requirements of N288.3.4-13 and there are no PSR2 gaps. The gaps identified in [B.22-11] do not have any safety significance relating to FADS performance and therefore, are not applicable to PSR2.

B.22.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N288.3.4-13 [B.22-1]. Per the definition of Compliance for an Incremental review, Pickering has a PSR2 Compliance associated with CSA N288.3.4-13.

B.23 CSA N288.7-15, "Groundwater Protection Programs at Class I Nuclear Facilities and Uranium Mines and Mills"

B.23.1 Background

The following text paraphrased from the introduction of CSA N288.7-15 [B.23-1] provides a brief overview of the purpose of this standard and the requirements expressed therein:

> *The purpose of this Standard is to provide requirements and guidance which facilitate groundwater protection at Class 1 nuclear facilities and uranium mines and mills. Compliance with the Standard will allow facilities to demonstrate that they will not pose an unreasonable risk to the environment or the health and safety of humans and non-human biota from groundwater.*
>
> *The CSA N-Series Standards provide an interlinked set of requirements for the management of nuclear facilities and activities. The CSA N286 Standard provides overall direction to management to develop and implement sound management practices and controls while the other CSA nuclear Standards provide specific technical requirements and guidance that support the management system. This Standard works in harmony with CSA N286 and does not duplicate the generic requirements of CSA N286; however, it may provide more specific direction for meeting those requirements.*
>
> *This Standard addresses the design, implementation, and management of a groundwater protection program that incorporates best practices in Canada and internationally.*

CSA N288.7-15 is relevant to Safety Factor 14 (Radiological Impact on the Environment).

CSA N288.7-15 is the first edition of this standard. According to the N288.7-15 CSA Impact Statement and Public Review Notice [B.23-2]:

> *This NS* [New Standard] *is intended to provide requirements and guidance on designing and operating a GWPP* [Groundwater Protection Program] *throughout all phases of the facility lifecycle, with consideration given to baseline characterization, and facility construction, operation, decommissioning, and post-decommissioning phases. The focus is on radiological and non-radiological contaminants that have the potential to enter groundwater and that can impact humans and non-human biota. The Standard acknowledges the site-specificity of GWPP requirements, and gives consideration to monitoring approaches which are commensurate with the level of risk based on a designated groundwater end-use.*

Compliance with CSA N288.7 is not currently a licence requirement for Pickering NGS (in accordance with PROL 48.02/2018) per the R04 Pickering Licence Conditions Handbook [B.23-3].

As identified in Reference [B.23-4], the Pickering PSR2 review of CSA N288.7-15 is a High Level review. For a PSR2 High Level review, the degree of conformance with clauses or groups of clauses in the Law, Regulation, Code or Standard (L/R/C/S) is demonstrated by supporting evidence stating whether the intent of the requirements stipulated in the requirement document is met. The review identifies Compliances and Gaps, where required, as defined below:

- Compliance: Compliance indicates that the intent of the safety requirement is met.
- Gap: A Gap indicates that the intent of the safety requirement is not met.

B.23.2 Compliance Assessment for Pickering PSR2

B.23.2.1 Application of PSR1 Reviews

CSA N288.7 was not reviewed as part of PSR1 as the document did not exist at the time that the previous Darlington and Pickering PSR1 reviews were performed. A high level review of N288.7-15 is provided in Section B.23.2.2 below.

B.23.2.2 Application of Post PSR1 Reviews

According to the N288.7-15 CSA Impact Statement and Public Review Notice [B.23-2], the following is a "Summary of Significant Features" of N288.7-15:

- *Feature 1: This is the first edition of CSA N288.7. This New Standard (NS) addresses the design and operation of groundwater protection programs (GWPPs) for Class I nuclear facilities and uranium mines and mills.*
- *Feature 2: This NS addresses design and implementation of groundwater monitoring programs (GWMP) for: i) pre-licensing baseline characterization; ii) site preparation, construction, and commissioning; iii) operations; iv) refurbishment or restarting after a prolonged shut-down; v) decommissioning; and vi) post-decommissioning prior to abandonment and/or institutional control.*
- *Feature 3: The scope of this NS includes: i) hazardous substances; ii) nuclear substances; and, iii) geochemical and physical characteristics of groundwater.*
- *Feature 4: This NS addresses review of systems, structures, and components (SSCs), and sentinel groundwater monitoring to provide early warning of any potential groundwater contamination issues, notwithstanding technical limitations.*
- *Feature 5: This NS has the following scope exclusions: a) groundwater monitoring of releases during accident scenarios; b) groundwater that has been discharged to, or mixed with, an effluent stream (Note: This is addressed in CSA N288.5); c) selecting or implementing risk management or remediation options; and d) defining dose assessment methods (Note: This is addressed in CSA N288.6.)* [11]

[11] PSR2 L/R/C/S reviews for CSA N288.5 and N288.6 are addressed separately.

OPG governance does not identify CSA N288.7-15 as a requirement. However, CSA N288.7 is not currently listed in the Pickering PROL or Licence Conditions Handbook. Therefore, this is not a PSR2 gap.

A compliance review against CSA N288.7-15 was not undertaken as part of previous PSR1 reviews and the following High Level assessment has been completed. In the review below, the degree of conformance with clauses or groups of clauses in the Standard is assessed for Pickering NGS by reference to supporting evidence stating whether the intent of the requirements stipulated in the Standard is met.

CSA N288.7-15 Clause	**PSR2 Review**	**Compliant or Gap**
0. Introduction	There are no requirements specified. The introduction describes the purpose of N288.7-15 and groundwater protection and monitoring programs.	N/A
1. Scope	There are no requirements specified. Sets context.	N/A
2. Reference Publications	There are no requirements specified. Describes the publications that N288.7-15 refers to.	N/A
3. Definitions and Abbreviations	There are no requirements specified. Defines various words or phrases, or acronyms, used in N288.7-15.	N/A
4. Goals and objectives of groundwater protection and groundwater monitoring programs *The overall goal of a groundwater protection program shall be to protect the quality and quantity of groundwater by minimizing interactions with the environment from activities associated with a nuclear facility, allowing for effective management of a groundwater resource.*	N-PROG-OP-0006, "Environmental Management" [B.23-5] gives authority to N-PROC-OP-0044, "Contaminated Lands and Groundwater Management" [B.23-6], which outlines directions and accountabilities for the groundwater monitoring program. Section 1.2.2 of [B.23-6] gives the requirement for a groundwater sampling and analysis plan (P-PLAN-10120-00001 for 2016) [B.23-7]. The sampling and analysis plan is updated yearly, and is based on P-REP-10120-10037, "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8]. This document develops the groundwater monitoring program.	Compliant
4.1 Groundwater protection programs	There is no existing GWPP for Pickering NGS. However, the objective of the Pickering site GWMP is "to monitor the groundwater conditions on the site, including quality and quantity, and to identify any potential off-site impacts so that appropriate remedial actions can be taken" [B.23-8]. The GWMP design [B.23-8] generally follows CSA N288.4-10 [B.23-9], and is compliant with EPRI 1015118, "Groundwater Protection Guidelines for Nuclear Power Plants" [B.23-10]. This document is sufficiently comprehensive to also include	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	the goals and objectives of a GWPP [B.23-8], and therefore Pickering meets the intent of Clause 4.1.	
4.2 Groundwater monitoring programs general objectives	The general objective of the GWMP is "to monitor the groundwater conditions on the site, including quality and quantity, and to identify any potential off-site impacts so that appropriate remedial actions can be taken" [B.23-8], as has been stated for Clause 4.1 above. The specific objectives of the GWMP are given in P-REP-10120-00041, "2015 Pickering Nuclear Groundwater Monitoring Program Results" [B.23-11]: • *Confirm predominant on-site groundwater flow characteristics of the PNGS site;* • *Monitor changes to on-site groundwater quality to ensure timely detection of inadvertent releases of nuclear and hazardous substances to groundwater; and,* • *Ensure that that there are no adverse off-site impacts from contaminants in groundwater.*	
5. Criteria for establishing groundwater protection and groundwater monitoring programs This section sets out the criteria for which a groundwater protection program and/or monitoring program must be implemented, as well as criteria for when a program should be considered. If the criteria for establishing a program are not met, there is a requirement for this to be documented.	See reviews of Clauses 5.1 and 5.2 below.	Compliant
5.1 Groundwater protection programs	Although there is no existing documentation specific to a GWPP, the GWMP design [B.23-8] includes the goals of a GWPP as discussed above in Clause 4.1, and the information required for a GWPP exists in other documents as discussed in the assessment for the Clauses in Section 6. Therefore, the lack of documentation specifically related to a GWPP is not safety significant. This finding is administrative and therefore is not a PSR2 gap.	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
5.2 Groundwater monitoring programs	There is an existing CSA N288.4-10-compliant GWMP for Pickering nuclear [B.23-8] which is currently in use [B.23-11]. Based on the assessment of Clauses 6-13 performed below, the existing GWMP for Pickering meets the intent of Clause 5.2.	
6. Design of a groundwater protection program This section sets out the requirements for the design of a groundwater protection program, including:	The existence of a GWPP for Pickering NGS has been discussed in Clauses 4.1 and 5.1 above, and is not repeated for the Clauses in Section 6. OPG is in compliance with the intent of CSA N288.7 section 6 [B.23-1] as a number of documents exist which contain information which is to be included in the design of a GWPP demonstrating that Clause 6 is met, including:	Compliant
6.1 General 6.2 Establishing of a conceptual site model 6.2.1 General 6.2.2 Evaluation of sources and potential releases to the subsurface 6.2.3 Characterization of the groundwater flow systems and contaminant migration 6.2.4 Groundwater end-use including receptors	• The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] contains the groundwater protection goals, conceptual site model, a review of contaminants of potential concern based on previous assessments, and potential sources of contaminants. • Annual GWMP result reports (such as [B.23-11]) include a high-level discussion of the groundwater flow pattern, and contaminant sources. • NK30-REP-07701-00006, the "Refurbishment and Continued Operation of Pickering B Nuclear Generating Station Environmental Assessment Geology, Hydrogeology and Seismicity Technical Support Document" [B.23-12] contains a detailed description of the geology, hydrogeology and groundwater quality at the regional, local, and site level. It also summarizes the potential areas of groundwater contamination, groundwater/surface water interactions, end uses, and some receptors. • P-REP-07010-10012, the 2014 "Environmental Risk Assessment Report for Pickering Nuclear" [B.23-13] includes a description of the hydrogeology, including previous hydrogeological investigations. It also includes discussions on meteorology, soil quality, potential receptors, exposure pathways, and contaminants of potential concern. • P-REP-10120-10003, "2010 Pickering Nuclear Groundwater Monitoring System Report" [B.23-14] includes information on the groundwater flow characteristics of the site, the horizontal and vertical groundwater flow, the groundwater quality, and potential sources of contamination. This document	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	indicates that hydrogeological investigations have been conducted at Pickering NGS since 1997. • The annual natural attenuation reports (such as P-REP-10120-0588548 [B.23-15]) for fuel oil impacted areas discuss the biodegradation of hydrocarbons by bacteria. • A site wide study of tritium in groundwater was performed in 2000 (NA44-REP-07010-10001, "Tritium in Groundwater Study Volume 1") [B.23-16] which details the regional land use and geology, site geology, hydrogeology, and groundwater flow regime. It examines the extent of the tritium contamination in the groundwater and investigates the sources of this contamination, and determines the impact to the environment.	
6.2.5 Groundwater vulnerability	No explicit assessment of groundwater vulnerability could be found; however, consideration of the hydrogeology, including water flow paths, recharge areas, and the penetrability and hydraulic conductivity of the overlying geology, can be found in the following documents: • The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8]; • The "Refurbishment and Continued Operation of Pickering B Nuclear Generating Station Environmental Assessment Geology, Hydrogeology and Seismicity Technical Support Document" [B.23-12]; • The 2014 "Environmental Risk Assessment Report for Pickering Nuclear" [B.23-13]; • "2010 Pickering Nuclear Groundwater Monitoring System Report" [B.23-14], and; • The tritium in groundwater study performed in 2000 [B.23-16]. Therefore Pickering meets the intent of Clause 6.2 relating to groundwater conceptual site model development.	
6.3 Prevention or minimization of potential releases	Prevention or minimization of potential releases is discussed in the following documents: • The tritium in groundwater study performed in 2000 [B.23-16] makes recommendations for mitigating the potential for future releases to groundwater, and;	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	• Prevention or minimization of potential releases would be provided through equipment monitoring, inspection, and maintenance programs including the buried piping program (N-PROC-MA-0088, "Buried Piping Program Requirements") [B.23-17] and P-INS-07290-00001, the "Spill Prevention and Contingency Plan" [B.23-18]. Clause 6.3.2 states that "New (modern) facility designs and operations should, commensurate with the level of risk, include specific provisions for secondary containment and effective in-facility leak detection." • With respect to secondary/spill containment: o N-REP-07292-0255802, "Spill Risk Assessment for Pickering and Darlington Nuclear Power Stations" [B.23-29], lists the containment structures and measures in place at Pickering NGS for spills from storage facilities, operation units, and transportation activities. Per N-REP-07292-0255802, secondary containment is provided for most areas of the station via inactive and active drainage sumps, tanks and lagoons. o Per N-STD-OP-0026, "Spill Management" [B.23-30], applicable codes and design standards are to be applied to spill containment for any new equipment, storage tanks, drums, and containers of liquids. Appendix F provides guidance on spill containment requirements, including physical containment for interim and long-term storage as well as process systems at the station. • With respect to in-facility leak detection, various systems are available at Pickering Units 1,4 and 5-8 for this purpose (e.g., Heavy Water Transfer and Storage leak detection, tritium leak detection, Reactor Building D2O leak detection via beetles, etc.). In addition, the buried piping program [B.23-17] is in place to govern pipe condition monitoring and leak detection. Therefore, the intent of clause 6.3 is met and there is no PSR2 gap.	
6.4 Development of specific groundwater protection goals	The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] discusses the goals of the GWMP, which include identifying potential off-site impacts and demonstrating there are no adverse impacts from hazardous substances to the receiving environment. The GWMP also develops the conceptual site model and discusses existing groundwater quality and flow and exposure pathways to potential receptors.	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	The annual GWMP result reports (such as [B.23-11]) also discuss the monitoring goals and the results of the monitoring program. Impact on groundwater quality, groundwater flow, and impacts to receptors are discussed in the report. Therefore Pickering meets the intent of Clause 6.4 relating to GWPP goals.	
6.5 Development of a groundwater monitoring program	There is an existing GWMP, which is enacted under [B.23-6]. The program was designed in [B.23-8] and is performed under the groundwater monitoring plan which is updated each year [B.23-7]. Therefore Pickering meets the intent of Clause 6.5.	
6.6 Development of other programs associated with groundwater protection	Other programs associated with groundwater protection include programs such as: • Groundwater well inspection, as discussed in N-GUID-10120-10001, the guide for "Inspection of Groundwater Monitoring Wells" [B.23-19]; • The buried piping program [B.23-17]; • The "Spill Prevention and Contingency Plan" [B.23-18]; • N-STD-OP-0031, "Monitoring of Nuclear and Hazardous Substances in Effluents" [B.23-20]. Therefore Pickering meets the intent of Clause 6.5. Hence, Pickering meets the intent of all requirements in Clause 6 and is PSR2 compliant.	
7. Design of a groundwater monitoring program This section sets out the requirements for the design of a groundwater monitoring program, including:	The existing GWMP was designed in 2012 [B.23-8]. CSA N288.7 was published in 2015 [B.23-1]. OPG is in compliance with the intent of CSA N288.7 Clause 7 based on the following existing information:	Compliant
7.1 General 7.2 Systematic planning processes for the development of a groundwater monitoring program 7.2.1 General 7.2.2 Systematic planning process	• The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] defines the objectives of the GWMP, and outlines the monitoring program including requirements for: o The program boundary and areas of concern; o Monitoring locations; o Sampling frequency and the sampling protocol;	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
7.2.3 Definition of GWMP objectives 7.2.4 Information required to meet groundwater monitoring program objectives 7.2.5 Spatial boundaries of the GWMP 7.2.6 Data evaluation methods 7.2.7 Data quality 7.2.8 Definition and establishment of groundwater evaluation criteria 7.2.9 Development of a process to address exceedances of groundwater evaluation criteria 7.2.10 Detailed design of GWMP 7.2.11 Review of GWMP	○ Data interpretation and results, including recommendations based on the program; ○ Data quality is discussed, with reference to blind duplicates, field blanks, and trip blanks; ○ The monitoring program was designed in accordance with CSA N288.4-10 [B.23-9]; ○ Groundwater evaluation criteria are given for contaminants of concern in Appendix A; and, ○ Audit and review of the program. • P-CLP-10120-00001, the "Chemistry Laboratory Procedure: Sampling Groundwater Monitoring System and Site Drainage" [B.23-21] includes objectives for the GWMP, and sample collection criteria including blind and blank samples. • The 2016 "Pickering Groundwater Sampling and Analysis Plan" [B.23-7] identifies the objectives of the monitoring plan, wells to be monitored, sample availability targets, total number of samples to be taken, and method detection limits. Therefore Pickering meets the intent of Clause 7.2 relating to planning and design of a GWMP.	
7.3 Selection of monitoring strategy 7.3.1 General 7.3.2 Monitoring in proximity of a potential release point 7.3.3 Monitoring along the down gradient perimeter of a site 7.3.4 Monitoring along the groundwater flow path of a contaminant plume	• The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] identifies requirements for monitoring locations, including source monitoring, upgradient and downgradient monitoring along groundwater pathways, and perimeter monitoring at the site boundary. • The "2016 Pickering Groundwater Sampling and Analysis Plan" [B.23-7] identifies the wells to be monitored. Therefore Pickering meets the intent of Clause 7.3 relating to selection of a monitoring strategy for a GWMP.	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
7.4 Nuclear and hazardous substances to be monitored 7.4.1 General 7.4.2 Gross Parameters 7.4.3 Surrogate Parameters 7.4.4 Indicator Parameters	• The “Pickering Nuclear Generating Station Groundwater Monitoring Program Design” [B.23-8] defines the nuclear and hazardous substances to be monitored based on previous groundwater monitoring. Field chemistry and physical parameters measurement requirements are also discussed. • The “Chemistry Laboratory Procedure: Sampling Groundwater Monitoring System and Site Drainage” [B.23-21] discusses sampling and analysis for various nuclear and hazardous substances defined in Appendix A. • The “2016 Pickering Groundwater Sampling and Analysis Plan” [B.23-7] identifies substances to be monitored, as well as their method detection limits. Therefore Pickering meets the intent of Clause 7.4 relating to substances to be monitored as part of a GWMP.	
7.5 Boreholes and monitoring wells 7.5.1 General 7.5.2 Borehole drilling 7.5.3 Monitoring well design and installation 7.5.4 Borehole logs 7.5.5 Retention of borehole logs 7.5.6 Monitoring well assessment	The monitoring well network was established prior to the design of the GWMP. Existing boreholes were used in the “Groundwater Monitoring Program Design” [B.23-8]. The installation of some of the existing groundwater monitoring wells is discussed in NA44-REP-10130-10001, the “Groundwater Quality Investigation South of the Irradiated Fuel Bay at Pickering NGS ‘A’ Monitoring Well Network Installation” report [B.23-22]. This report discusses the subsurface stratigraphy of the area, and the methodology for choosing the well locations and for well construction. Detailed information on each borehole and well was recorded, including location, elevation, and borehole logs.	
7.5.7 Maintenance and inspection of monitoring wells	• The guide for “Inspection of Groundwater Monitoring Wells” [B.23-19] includes information on the frequency of well inspection as well as guidance on well maintenance. The guide also discusses physical protection and access control for wells. o The associated form N-FORM-11445, “Inspection of Groundwater Monitoring Wells” [B.23-23] gives detailed instructions for well inspection. • The “Sampling and Analysis Plan” [B.23-7] identifies requirements for the frequency of well inspection and maintenance in section 4.2.	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	• The "Groundwater Monitoring Program Design" [B.23-8] considers the wells which would be required to meet the monitoring program objectives, and discusses deactivation of wells that are not required in section 4.6. • The "Chemistry Laboratory Procedure: Sampling Groundwater Monitoring System and Site Drainage" [B.23-21] states the requirement for well inspection prior to sampling in section 4.5.1. Therefore Pickering meets the intent of Clause 7.5 relating to boreholes and monitoring wells used as part of a GWMP.	
7.6 Sampling locations 7.6.1 General considerations 7.6.2 monitoring well placement for a new facility or in an unaffected setting 7.6.3 Monitoring well placement for assessing an existing plume	• The "Groundwater Monitoring Program Design" [B.23-8] determines sampling locations by considering the location of existing wells in the context of previous groundwater monitoring results. Monitoring locations are chosen to incorporate source monitoring, upgradient and downgradient monitoring along groundwater pathways, and perimeter monitoring at the site boundary. • The "Sampling and Analysis Plan" [B.23-7] includes a list of wells at which the groundwater level should be measured to confirm the groundwater flow characteristics. Therefore Pickering meets the intent of Clause 7.6 relating to boreholes and monitoring wells used in the GWMP.	
7.7 Sampling frequency 7.7.1 General considerations 7.7.2 Sampling frequency for routine groundwater monitoring 7.7.3 Sampling frequency for plume monitoring	• The "Groundwater Monitoring Program Design" [B.23-8] specifies the sampling frequency at each well, and identifies the rationale for the suggested frequency and circumstances that may result in a change to the sampling frequency. • The "Sampling and Analysis Plan" [B.23-7] identifies the schedules for the water level snapshots and hazardous substance sampling. The plan also lists any changes to the sampling schedule along with the rationale for the change. • Annual GWMP result reports (such as [B.23-11]) make recommendations on changes to the monitoring program, including changes to sampling frequencies, to be implemented in the following year's plan. Therefore Pickering meets the intent of Clause 7.7 relating to the sampling frequency used in the GWMP.	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
7.8 Supplementary studies and other monitoring activities 7.8.1 General 7.8.2 Refinement of conceptual site model 7.8.3 Characterization of potential effects from plume discharge	• Annual GWMP result reports (such as [B.23-11]) make recommendations for supplementary studies and changes to the monitoring program based on the monitoring results. • The annual natural attenuation reports (such as [B.23-15]) for fuel oil impacted areas discuss the biodegradation of hydrocarbons by bacteria. Therefore Pickering meets the intent of Clause 7.8 relating to studies to supplement or that relate to the GWMP.	
8. Sampling and analytical procedures This section sets out the requirements for the sampling and analysis procedures for the groundwater monitoring program, including: 8.1 General 8.2 Sampling equipment 8.3 Sample collection 8.4 Sample volume, containers, and preservatives	• The "Chemistry Laboratory Procedure: Sampling Groundwater Monitoring System and Site Drainage" [B.23-21] thoroughly describes the steps for groundwater sampling and monitoring, including sampling for water levels and for hazardous substances. The procedure includes instructions for well water purging, sample handling and storage, sampling equipment and materials, sample collection, management of waste water, blank and duplicate samples, and instructions for field measurements. • The "Sampling and Analysis Plan" [B.23-7] identifies the method detection limits for the substances to be monitored, and includes a discussion on duplicate and blank samples, as well as the sample availability target. Lab qualification requirements are also given. • The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] summarizes the sampling protocol in section 4.4. This section references [B.23-21] and discusses well purging, sample collection method, field measurements, and storage and transportation. The design also includes the detection limits and benchmark values for the hazardous substances. • Annual GWMP result reports (such as [B.23-11]) discuss elements of the sampling procedures used in the preceding year, including lab qualification. • The annual natural attenuation reports (such as [B.23-15]) discuss elements of the sampling procedures used in the preceding year for hydrocarbons, including lab qualification and quality control requirements and limits. • N-PROC-OP-0014, the "Chemistry Measurement and Analysis" procedure [B.23-24] identifies "the minimum expectations to ensure chemistry measurements are	Compliant

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	accurate and representative," including field sampling requirements and contamination control.	
9. Interpretation of data This section sets out the requirements relating to the interpretation of data for the groundwater monitoring program, including: 9.1 Objectives of data 9.2 Data evaluation 9.3 Parameters 9.4 Comparison to groundwater evaluation criteria 9.5 Statistical analysis 9.5.1 General 9.5.2 Descriptive statistics 9.5.3 Outliers 9.5.4 Non-detectable results 9.5.5 Hypothesis testing 9.5.6 Trend analysis 9.5.7 Contour maps 9.6 Contextual considerations when interpreting results 9.7 Data management 9.8 Significant figures	• The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] identifies general requirements related to data interpretation and reporting in Section 4.8. This section requires annual reporting, with data interpretation, evaluation of data quality, and a discussion of the implication of the data to be included in the report. There is a requirement to compare groundwater concentrations to administrative limits. • Annual GWMP result reports (such as [B.23-11]) contain the discussion of the interpretation of groundwater data as per the GWMP objectives. These reports include interpretation of the data for all contaminants measured (as per [B.23-8], [B.23-21], and [B.23-7]), comparison to the criteria, a statistical analysis and summary, a graphical representation of the monitoring data, and contour maps. • N-GUID-10120-10000, the "Annual Groundwater Monitoring Program Roles and Responsibilities" guide [B.23-25] discusses the responsibilities for the site-wide groundwater database in section 6.0. • The "Chemistry Measurement and Analysis" procedure [B.23-24] identifies the requirements and procedures for determining the appropriate analytical method. Requirements procedures for determining measurement accuracy, the use of statistics and data management are also discussed. • N-PROC-OP-0017, the "Laboratory Work and Data Management" procedure [B.23-26] describes procedures and requirements for management of data from laboratory results and for the Chemistry and Environment Management System.	Compliant
10. Quality assurance and quality control This section sets out the quality assistance and quality control requirements for the groundwater monitoring program, including: 10.1 General	• The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] identifies quality assurance and quality control requirements for the program in section 4.7. Requirements for blank and duplicate samples, as well as sample precision, are discussed. • The "Sampling and Analysis Plan" [B.23-7] describes the requirements and process for quality assurance and quality control for field collection and lab analysis. The	Compliant

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
10.2 Roles and responsibilities 10.3 Measurements and quality control 10.3.1 Equipment maintenance 10.3.2 Non-conformance 10.3.3 Performance verification 10.3.4 Procedures verification 10.4 Records	plan also includes the requirement for ISO 17025 certification for the analytical lab. • The "Chemistry Laboratory Procedure: Sampling Groundwater Monitoring System and Site Drainage" [B.23-21] identifies the quality assurance and quality control measures to be taken while performing groundwater sampling, including blank and duplicate samples. Instructions for instrument checks and sample storage and transportation are also given. • The "Contaminated Lands and Groundwater Management" procedure [B.23-6] outlines personnel accountable for all aspects of the groundwater management program and their responsibilities, including quality assurance and quality control. Requirements for records are also given, including a retention period. • The "Annual Groundwater Monitoring Program Roles and Responsibilities" guide [B.23-25] describes the training and qualification requirements, as well as responsibilities for GWMP personnel. • Annual GWMP result reports (such as [B.23-11]) discusses the quality assurance and quality control measures used in the GWMP, as well as the quality control results. The report discusses the results and interpretation of the monitoring data. • The "Chemistry Measurement and Analysis" procedure [B.23-24] identifies the requirements and procedures for laboratory quality control, including quality control samples, contamination control, measurement accuracy, blind sample assessments, and routine and long-term quality control monitoring. Instrument maintenance and calibration requirements are also described.	

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap

11. Reporting, review and audit
 	
This section sets out the reporting, review, and audit requirements for the groundwater monitoring program, including:
 	
11.1 Preparation of monitoring reports documenting the GWMP
 	
11.2 Periodic review of the groundwater protection program and groundwater monitoring program
 	
11.3 Annual assessment of the groundwater monitoring program
 	
11.4 Audits
	• The "Pickering Nuclear Generating Station Groundwater Monitoring Program Design" [B.23-8] sets out reporting, review, and audit requirements for the GWMP in sections 4.8 and 4.9.
	
	    o Reporting requirements include an annual report with interpretation of the monitoring data and evaluation of data quality.
	
	    o An audit of the GWMP is required every five years, or more frequently if site conditions change substantially. Audit contents, auditor qualifications, and documentation requirements are also outlined. Additionally, the audit of the GWMP meets the intent of the audit of the GWPP given in CSA N288.7 section 11.2 [B.23-1].
	
	    o An annual internal assessment of the GWMP is required each year. The scope of the assessment, staff qualifications, and documentation requirements are given.
	
	• A GWMP result report (such as [B.23-11]) is prepared annually as per the program design [B.23-8]. The report includes the results of the monitoring program, relevant groundwater and hydrogeological characteristics, an assessment of the QA results, and recommendation of supplementary studies. The report also includes the results and recommendations of the annual assessment of the GWMP.
	
	• A natural attenuation report (such as [B.23-15]) is prepared annually to document the results of the hydrocarbon natural attenuation monitoring as per the program design [B.23-8].
	
	• The "Contaminated Lands and Groundwater Management" procedure [B.23-6] outlines personnel accountable for the GWMP self-assessments and audits.
		Compliant

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
12. Staff qualifications and training This section sets out the staff qualification and training requirements for the groundwater protection program and monitoring program, including: 12.1 Personnel qualifications 12.2 Training 12.3 Maintenance of training records	• The “Annual Groundwater Monitoring Program Roles and Responsibilities” guide [B.23-25] documents roles and responsibilities for the operation of the GWMP, including training and qualification requirements. • The “Pickering Nuclear Generating Station Groundwater Monitoring Program Design” [B.23-8] summarizes the qualification and training requirements for staff performing work related to the groundwater management program, as well as requirements for documentation and ongoing assessment of qualifications. • The “Contaminated Lands and Groundwater Management” procedure [B.23-6] gives a high-level description of the directions and accountabilities for establishing and maintaining the GWMP, including staff qualification and training requirements. • N-TQD-419-00001, the “Environment Professional Training and Qualification Description” [B.23-27] establishes training and qualification requirements for Environment Professionals, including groundwater management personnel, at OPG. • The “Chemistry Measurement and Analysis” procedure [B.23-24] specifies the qualification and training requirements for chemistry laboratory staff. • N-PROC-TR-0008, the “Systematic Approach to Training” procedure [B.23-28] identifies document retention periods for training records.	Compliant
13. Documentation This section sets out the documentation requirements for the groundwater protection program and monitoring program, including: 13.1 Groundwater protection program documentation 13.2 Groundwater monitoring program documentation	• The “Pickering Nuclear Generating Station Groundwater Monitoring Program Design” [B.23-8] documents the detailed design of the monitoring program, as described above. This includes identification of hazardous substances to be measured, sampling locations and frequency, data interpretation, evaluation criteria, quality assurance and quality control requirements, staff qualification and training requirements, audit and review of the program, and groundwater monitoring site maps. • The “Sampling and Analysis Plan” [B.23-7] is updated each year, and documents quality control requirements, hazardous substances to be measured, sampling locations and frequency, detection limits, sampling schedule, and well maintenance.	Compliant

CSA N288.7-15 Clause	PSR2 Review	Compliant or Gap
	• The "Chemistry Laboratory Procedure: Sampling Groundwater Monitoring System and Site Drainage" [B.23-21] documents the instructions for sampling, quality control requirements, substances to be measured, and sample requirements. • The guide for "Inspection of Groundwater Monitoring Wells" [B.23-19] documents inspection and maintenance requirements for monitoring wells. • Annual GWMP result reports (such as [B.23-11]) include a site map of the monitoring stations sampled. • The "Annual Groundwater Monitoring Program Roles and Responsibilities" guide [B.23-25] documents roles and responsibilities for the operation of the GWMP, including training and qualification requirements. • The "Contaminated Lands and Groundwater Management" procedure [B.23-6] outlines directions and accountabilities for establishing and maintaining the GWMP, and includes the document retention period.	
Annex A – Additional guidance for conceptual site models	There are no requirements specified. Informative.	N/A
Annex B – Development of groundwater evaluation criteria	There are no requirements specified. Informative.	N/A
Annex C - Uncertainty	There are no requirements specified. Informative.	N/A

B.23.3 Compliance Assessment Summary for Pickering PSR2

There are no PSR2 gaps for CSA N288.7-15 [B.23-1]. Per the definition of Compliance for a High Level review, Pickering has a PSR2 Compliance associated with CSA N288.7-15.
