Another noted risk is that SNC/Aecon's delay to its procurement activities could complicate the purchasing and delivery of owner-supplied materials. SNC/Aecon's project manager has stated that they now face an aggressive schedule to complete procurements over the months of July and August. Some of the procurements will be made prior to the final certification of the design by the CNSC, although the DR Team believes this is a small risk due to the fact that the RFR engineering is replicated from the existing plant records, so there is no associated modification work.

### 3. Class 3 Estimate and Class 2 Estimate Recommendations

As discussed above, The SNC/Aecon Class 3 Estimate for RFR was accepted by OPG on June 15th, 2014 per the contract milestone date. Overall, the estimate, excluding contingency and fee increased from the Class 4 Estimate by over 20%. This level of growth in the estimate was expected because SNC/Aecon's Class 4 Estimate was by contract based on a "perfect" CANDU refurbishment stripped of all possible and reasonable inefficiencies, while the Class 3 Estimate was the first Darlington-specific estimate representing a reasonable and achievable plan. The estimate will be subject to further refinement in Class 2.

The Class 3 Estimate effort with SNC/Aecon yielded several key lessons learned to be incorporated for a successful Class 2 (as well as for the remaining estimating effort for the DR Project's other projects). Specific to SNC/Aecon, the official review period for the Class 3 Estimate was only about a month long, and in our view, will need to be much longer for

Confidential – Do Not Disseminate

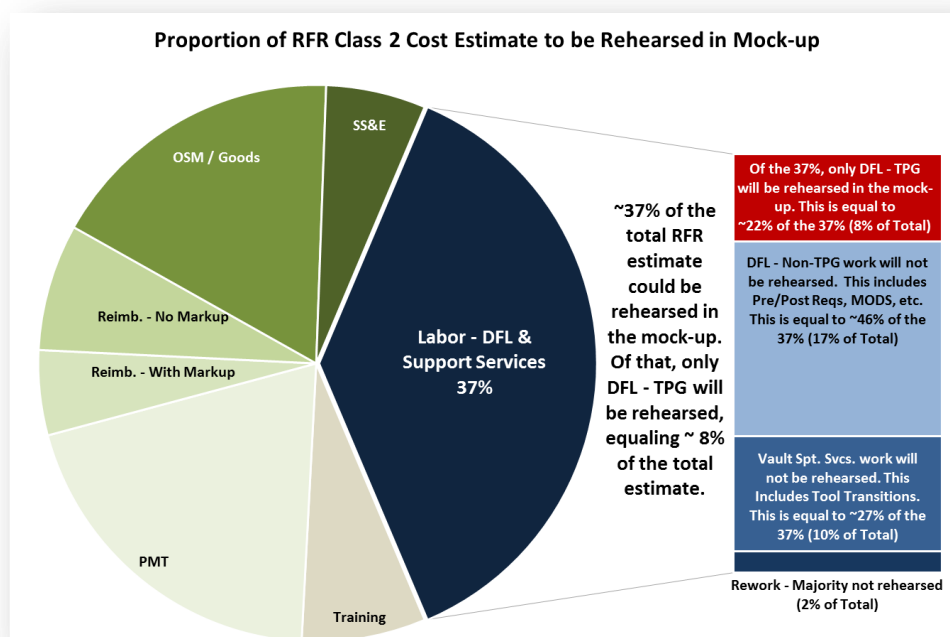

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

Class 2. The next estimate will not only be more detailed, requiring more time to review, but the number of interested stakeholders will increase with Class 2. The DR Team is taking an appropriately hands-on approach to the Class 2 development process, using a dedicated estimating team to work shoulder-to-shoulder with SNC/Aecon.

Also, given the amount of time that will be required for review by all interested parties, it is important advance as many of the estimating activities forward in the schedule as possible. The critical path to completion of the Class 2 Estimate currently runs through engineering, and as mentioned above, engineering has generated a bow wave of work requiring a concerted effort in order to meet the December 2014 engineering complete milestone. If engineering is actually holding up the estimating work, this could push development of many of the precursor components of the construction work packages to January 2015, leaving only about 2-3 months to assess the results, incorporate tested TPG times from the Mock-Up, develop the estimate report and Execution Phase schedule. This could result in a very compressed time-frame and will require a significant number of resources, tight coordination, and rigorous quality control. Given that this final engineering work is duplication of the existing design, the OPG RFR team intends to challenge whether engineering completion is a true predecessor to detailed estimating work, which would give SNC/Aecon more time to complete its estimating activities.

Finally, SNC/Aecon is currently planning to only use the Mock-Up to establish measured times associated with the TPG prior to Class 2. We see this as a potential risk to the quality of the Class 2 Estimate. The other work such as support functions, transitions, staging of materials, and the movement of tools and equipment within the confined spaces of the RFR are not currently planned to be rehearsed or tested in the Mock-Up as part of the Class 2 Estimate or even prior to negotiating the Target Price and Schedule. This means that SNC/Aecon will populate its estimate with unrehearsed times for this work, depriving OPG of a significant benefit of the Mock-Up. As shown in the chart below, this “untested work” represents a significant portion of SNC/Aecon’s Class 2 Estimate for direct work:

As shown above, 37% of the total estimate value is work that could be rehearsed in the Mock-Up. However, SNC/Aecon’s current plan is to rehearse only 8%. Without testing this work in the Mock-Up prior to the Class 2 Estimate through rehearsals, time motion studies, and the like, the accuracy of the final estimate for that portion of the work would be uncertain. The more important issue is that OPG should get the benefit of the Mock-Up in setting the Target Price. It is our understanding that the DR Team has recognized this as an important issue and has commenced discussions with SNC/Aecon to see if it will be possible to include rehearsed times in the Class 2 estimate.

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

### 4. RFR Commercial Risks

The DR Team is currently considering how it monetizes the contingency, risk and incentives/disincentives in the RFR contract for purposes of forecasting the total project cost for the 4d Cost Estimate. Complicating the picture for 4d Cost Estimate is the fact that under the RFR Contract, SNC/Aecon does not have to monetize its contingency (including all identified risk/mitigation events and uncertainties) that will be included in the Target Price until it issues its Class 2 Estimate in May of 2015. Additionally, the DR Team is reviewing the incentive and disincentive structure to ensure that SNC/Aecon is properly enticed to meet the necessary performance objectives. The DR Team has engaged in preliminary discussions with SNC/Aecon with respect to both of these issues in order to agree upon an acceptable resolution. Considering the potential impact of these items on the overall DR Project budget, increasing the confidence on these projected costs will have substantial and obvious benefits.

### 5. RWPB Building

The Retube Waste Processing Building (“RWPB”) project currently being performed by SNC/Aecon has experienced schedule delays and increases in scope that in many ways resemble those experienced by the D2O and Campus Plan projects. As with D2O Storage, RWPB’s increases in projected cost represent increased functionality and additional scope that the DR Team has determined to be necessary. These changes, described further below, were initiated to mitigate potential Execution Phase delays in processing waste removed from the reactor that have impacted the critical paths or near critical paths of prior refurbishments. The original estimate that was prepared for the RWPB was done at a very early stage without consideration of these efficiency advantages; thus, it is not an accurate gauge for comparison.

The initial construction delays to RWPB were caused by the late turnover of the building footprint for preliminary geotechnical work and the scanning and daylighting of buried services. In addition, there are more buried services than originally anticipated and the RWPB needs to accommodate a contaminated tool maintenance area and low-level waste and flask storage and staging areas that were originally intended to be housed in the powerhouse. This additional space could not be found in the powerhouse and has been included as a proposed extension to the current RWPB design. SNC/Aecon’s RWPB proposal includes space required above and beyond that of the waste tooling and provides a justification for its inclusion in the RWPB scope. The proposal was received from SNC/Aecon at the time this report was written that will require more thorough vetting and analysis to verify the increased scope and estimated cost for the RWPB and extension.

### B. Turbine Generator

The SNC/Aecon Class 4 Estimate was submitted in May and the Class 3 Estimate is targeted for submission for OPG review and comment on August 29, 2014, with final OPG acceptance on September 30, 2014. Further progression to Class 2 is scheduled for March 2015. The scope of work for the Turbine Generator is essentially a large maintenance task and the Turbine Generator estimating team has access to station maintenance logs in Passport (including hours) and is working with OPG’s Operations and Maintenance organization to match this data to scope items. In addition, OPG’s estimating contractor, Faithful + Gould (“F+G”), is developing an independent “check estimate” concurrently with SNC/Aecon, aligning scope to ensure comparability when the estimate is delivered. Both Operating Experience (“OPEX”) and F+G’s check estimate will be used to test reasonableness of the final estimate. We will be vetting and reviewing the development of the cost estimate as it continues to progress.

### C. Balance of Plant

In our Initial Project Assessment of August 2013, we identified a risk that the detailed engineering for BOP work would be delayed by the then-current procurement process which required the ESMSA contractors to compete for each package of work. The DR Team took action to revise its process to allow for direct award of work to vendors who were already judged to be qualified through a competitive process. On this basis we believed that the DR Team had resolved this potential issue which would allow them to complete BOP engineering on time.

However, the Balance of Plant work for Refurbishment is currently tracking behind plan for several reasons, including:

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

- **Scope Definition:** The BOP work has experienced some of the same early scope definition problems as the Campus Plan Projects in which the vendors, lacking specific scope identification, initially chose the most conservative design path possible, leading to over-design and the potential for unnecessary or unanticipated project cost increases. Fortunately, the BOP team recognized this trend and stopped these potential increases from materializing;
- **Uncertainty regarding Black & McDonald:** Some work packages that were initially intended for Black & McDonald have been reassigned, and the DR Team is awaiting the resolution of the NCAR;
- **Delays with Project Estimating and other Award Pre-requisites:** Despite abandoning the competitive process, the Project has retained the requirement for check estimates to be performed to compare to the contractors' estimates, and OPG's team and consultant have encountered throughput issues.

As a result, the DR Team has not been able to take advantage of the opportunity presented by the direct award process in order to begin detailed engineering earlier than they had originally planned. In fact, the DR Project is now behind key planned dates and as noted, these delays have put, among other key deadlines, the May 2015 milestone for detailed design completion at risk. While some of this delay could not have been avoided due to on-going contractor performance issues, improved planning and communication could have resulted in the earlier identification and removal of barriers to performance.

It appears that the BOP team has been able to get around some of these hurdles and work appears to be moving forward. The BOP team has developed and put in place a recovery plan in order to mitigate these delays. BOP expects to award three packages (Emergency Heat Sink, Containment and Flux Detectors) by August 1, 2014 and has canceled three others based on positive inspection results. In addition, the final terms and conditions for the repair/replacement valve package appear to be close to resolution. The BOP team has sought confirmation that the vendors could support the May 2015 design completion milestone, and recovery work is in place. Nonetheless, these trends should be closely monitored, as any of these missed milestones could have an impact on the confidence level of a significant slice of the DR Project's estimate at RQE.

### V. Functional Groups Update

#### A. Engineering

The risks associated with engineering have been front and center in the DR Team's plans and in our reporting of the Project. Last year, the DR Team's focus was on completion of the scope-defining MDPs so that detailed engineering could begin with sufficient schedule float. Unfortunately, some of the anticipated risks have materialized: while the MDP's were completed on time, the delay in award of work to contractors has compressed the time available for detailed design.

The Construction Industry Institute ("CII") Research Team 300 has been investigating the most common causes of late deliverables and the severity of their impact on construction activities. This investigation has examined many projects, performed in-depth case studies, conducted questionnaires and surveys and explored the experience of CII member organizations. CII confirmed what is widely believed in the industry, that engineering is the most common late deliverable which also has the most severe impact. While there is wide understanding within the DR Team of these risks, that recognition has not in all cases translated to optimal results.

The DR Team initiated some corrective actions, but valuable time was lost in the process. Once all of the detailed design is underway, the DR Team will need to attend to its ongoing engineering challenges, including: its ability to forecast engineering performance, efficiently managing the work and its need to arrive at final decisions more readily and quickly.

As noted in our 2Q 2014 Report, the DR Team has made a significant shift in engineering strategy and is now directly managing and supervising the engineering service providers' output. The engineering team is also pursuing how to recover some of the lost time and confirm vendors' commitments to meet target dates. In this Report we revisit three

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

aspects of the engineering effort, identifying the progress being made and the major concerns that remain for each: ongoing engineering initiatives; scope definition and management; and engineering metrics.

### 1. Engineering Initiatives

#### (a) Active Management

The DR Team has taken some strong steps to actively manage the engineering work: Engineering has issued a change management plan describing the necessary cultural changes; the updated engineering management plan is written around active management; engineers are now resident at the engineering service providers; the change in role has been stressed at several executive face-to-face meetings with the engineering staff; and the VP of Refurbishment Engineering has held informational sessions with the engineering service providers to provide information and guidance with respect to these changes.

The DR Team is exhibiting a growing sense of ownership of the work, developing a sense of urgency in resolving issues, an improved responsibility to make decisions and a desire to find solutions to help the engineering service providers navigate the detailed design phase. In discussing this initiative with the engineering service providers they acknowledge that this transition represents a much needed and positive change for the DR program.

#### (b) Front-End Planning

The DR Team has examined certain principles in the CII Front End Planning for Revamp and Renovation Projects, and Engineering has embraced this concept. The front-end planning engineering initiative is incorporated in the Collaborative Front End Planning ("CFEP") Process guide issued by DR Engineering in 2Q 2014. The intent of the CFEP is to get all key stakeholders together to establish project scope solutions before mobilization of the detailed design effort. The process is intended to reduce the downstream scope additions and changes that have been evidenced in the past as a result of missing information in the design requirements. Whereas it is still too early to measure the benefits of this initiative, it has thus far been well received by the engineering service providers.

#### (c) Collaborative Approach

OPG's original management strategy and administration of the work has impacted the relationships between OPG and the contractors. OPG's "collaborative approach" initiative intends to reverse this situation by addressing the issues and improving the working relationships, and there is evidence that this initiative, in conjunction with the others is beginning to bear fruit.

Work is now being performed under the active management of the OPG design authority, with a greater focus on front end planning and a collaborative relationship with the engineering service providers. Based upon OPG's experience over the last year, there are several lessons learned that the DR Team needs to consider with respect to future engineering work, including: 1) facilitating the active management of engineering work by directly contracting with the engineers; and 2) contracting for engineering on a time and materials or target price rather than on a fixed-price basis.

### 2. Scope Definition & Management

In our Initial Assessment, BMCD/Modus noted that for the RQE to be reliable, detailed engineering must be sufficiently progressed by the 2nd Quarter of 2015 for the DR Team to develop Class 2 cost estimates (cost estimates that are deemed to meet the criterion of the Association for the Advancement of Cost Engineering ("AACE") cost estimating standards. Per the AACE recommended practices, to achieve a Class 2 Estimate, detailed engineering needs to be between 30% and 75% complete and the results of that estimating maturity need to be translated into the project's estimate. Mindful of the need to have detailed engineering in place for RQE, the DR Project set May, 2015 as deadline to have detailed design complete. However, for portions of the Balance of Plant work, the May, 2015 deadline will likely not be met without a significant recovery plan.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

We have previously described the success the DR Team has achieved with the scope definition process deployed for Refurbishment. Furthermore the MDP process was well executed using the OSS vendors. However, the vendors' interpretation of suitable engineered solutions, delays in awarding the detail design work and inefficient engineering processes have all contributed to a compression of the engineering detail design effort. In addition to RQE, the delayed engineering work may also impact downstream procurement and construction activities.

### 3. Engineering Metrics

The DR Team has developed many of the requisite metrics, to provide visibility into the progress of the engineering effort. However, the reported metrics are being challenged by the project managers and are not proving to be reliable. There are observed issues with the quality of the detailed, level 3 schedules for engineering that must be addressed, including resource loading, logic and full detail of engineering tasks. Because the schedule is unstable at this time, it is not an effective tool for measuring performance.

RFR provides an example of what can be done with a reliable schedule. RFR is the one project that as of the date of this Report has a resource-loaded level 3 schedule for the Definition Phase. While engineering and manufacturing are currently behind plan, this slip is visible, highlighting the need for mitigating actions and active contractor management. In fact, the RFR contractor has a recovery plan that indicates its next milestone will be met. Without integrated, level 3 resource loaded schedules, a complete picture of the engineering effort required to complete detail design is not visible, hampering the planning of adequate resources for this work.

In this regard, schedule improvements for the DR Team to address include:

- Completing integrated level 3 resource loaded schedules;
- Establishing engineering work flow streams with vetted rules of credit needed to verify earned value;
- Including appropriate placeholders in the schedule for un-awarded work (without exceptions) for projects that are lacking schedule detail;
- Ensuring that all engineering work needed for the Project is in the schedule as soon as possible; and
- Identifying and correcting errors cited by DR Team members in Engineering performance metrics.

The effort ahead for the DR Team to complete engineering for RQE needs to be supported by reliable metrics so that the team can make reasoned choices if issues with throughput of engineering product persist.

### B. Project Controls

The DR Project's project controls development is behind where we thought it would be by this time this year in our Initial Assessment. The Project's master integrated schedule still lacks the entirety of engineering activities for all of the Refurbishment work. Earned value management remains immature as well in part because establishing planned values has lagged in conjunction with the schedule; because the planned schedule is not robust, earned value is not being properly calculated. While to a certain extent it is expected that there be a "shake-out" period for earned value, for the P&M work, which is in or close to execution, earned value is an essential management tool that is currently lacking. For the Refurbishment work, the earned value information that is currently needed is for engineering. Until these issues are resolved, the DR Project will have difficulty measuring progress, forecasting work completion and associated cost progression.

It is our understanding that the DR Team intends to reorganize its project controls department to allow the project management team more direct control and access to the scheduling team. The DR Team also intends to have a consolidated scheduling team that will be shared between Refurbishment and P&M, which should increase the overall quality of the scheduling effort for both organizations. As we have noted, the Campus Plan Projects suffered from a lack of schedule control and development, the first solution to which was loading the contractors' schedules into the master

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

schedule as they were available. These schedules, as described above, turned out to be lacking in many respects. Having a single department with consistent criteria for schedule development should be a positive step.

The DR Project's earned value/performance measurement ("EV/PM") system currently has other shortcomings. Despite not having all of the necessary data inputs in place, a well-functioning EV/PM system should still be able to provide meaningful measurement of performance in those pockets of work that have existing plans. The DR Project's current system shows some deviations between the contractors' reports and those from the DR Project, resulting in the need for manual corrections in order to reconcile the reports. The Project Controls Team should instead instruct the contractors regarding how the OPG system works so that their inputs are correct at the outset. In addition, certain modifications will be needed to support the smooth operation of the scheduling software P6 during the Refurbishment project including aspects of OPG corporate governance. We will provide the Project Controls team with our recommendations in this regard.

### C. OPEX/Lessons Learned Program

Concurrent with this report, BMCD/Modus has issued an Assurance Report regarding the DR Team's OPEX and Lessons Learned Program. Of paramount importance is whether the DR Team can provide some assurance that: 1) it is incorporating the lessons learned of other, similar refurbishment projects; and 2) it is capturing and implementing Lessons Learned from its own performance so that it can implement process improvements as well as incorporate OPEX from one unit to the next. As a result, we have recently conducted an in-depth review of the DR Team's OPEX and Lessons Learned Programs.

In our August 2013 Project Assessment, BMCD/Modus identified the several issues with respect to the OPEX Lessons Learned Program. Since that time, the DR Team has continued to develop, implement and make improvements to the OPEX program. Meaningful improvements have been initiated that address matters such as:

- **Communication of potential OPEX and Lessons Learned items:** Identification and communication of external OPEX is now well established. However, we have noted that broad participation in identifying and communicating internal OPEX still needs to be improved, though the Project Controls Team ("PC Team") is taking specific action to improve internal OPEX generation. This will become increasingly important to inform forthcoming activities, such as RQE, final schedules and Execution Phase processes.
- **Training:** The PC Team initiated an OPEX training program at the beginning of 2014 and has addressed topics such as capturing and reporting OPEX, utilizing the new OPEX website, and identifying Lessons Learned.
- **Coordination with the Corrective Action Program:** Monthly OPEX metrics and Lessons Learned Report are now being addressed in Corrective Action Review Board (CARB) meetings. Beginning 3Q 2014, quarterly CARB meetings have been extended an additional 30 minutes to address details of the OPEX Program.

Overall, the PC Team has a clear appreciation for the value of OPEX and has significantly considered Lessons Learned in numerous aspects of the Definition Phase organization and planning processes. The P&C Team tasked with implementing the OPEX program has been able to make significant progress in a short period of time. However, complete implementation and refinement of the above improvements is necessary to ensure that Lessons Learned are efficiently generated and addressed throughout the life of the Project. To that end, an OPEX/Lessons Learned Strategic Plan is under development, which is expected to advocate specific actions for continuous improvement of the OPEX program. Our Assessment Report identifies four areas where further improvement is needed. These include, but are not limited to:

- **Limitations of Reporting and Tracking Software:** Databases used for documenting and tracking OPEX/Lessons Learned items and their associated implementing actions are still not integrated. It is now scheduled to be in operation by the end of 4Q 2014.

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

- **Internal OPEX identification:** Currently, the process is in place for disseminating and evaluating OPEX; and for developing Lessons Learned implementation plans. However, more needs to be done to stimulate the generation of OPEX from within the various projects and departments; and to communicate items to others outside the initiating group. Much of the valuable OPEX and Lessons Learned (both positive and negative) will be derived from the day-to-day management of the contractors. At this time, it appears that lessons learned are generated only as a result of a significant negative event, such as the recent Campus Plan experience. We do note that the PC Team has developed guidance for capturing internal Lessons Learned and has commenced some training activities. Success in this critical area is going to depend on the entire team's awareness of this guidance and their proactive identification and communication of relevant lessons learned.
- **Action Tracking and Management:** OPG has set up an Actions, Issues, Decisions, and Key Assumptions database called AIDA. The intent of this database is to track, review and manage actions and document issues, decisions and assumptions—though “significant” decisions and assumptions have to be further documented through additional processes. The AIDA Actions Database includes activities intended to address lessons learned. In general, the AIDA database has a large number of entries, many of which that have not been actively managed. The condition of the database suggests that many action items are loaded and then forgotten. Obviously, the purpose of an OPEX/Lessons Learned program is defeated if actions to address the lessons are not performed.
- **Implementation of OPEX from Similar Projects:** The question of whether OPG has adequately integrated the lessons learned and OPEX from other, similar refurbishment projects will be a topic of interest for the public and OPG's shareholder. It possible that OPG will have to articulately convey these efforts on an on-going basis. There is clear evidence DR Team has actively sought out and implemented OPEX from these projects. However, OPG's responses to similar-project OPEX and lessons learned are disaggregated throughout its databases or other project documentation. OPG should consider the best way to document and relay its efforts to external stakeholders, particularly its risk mitigation of known significant issues that caused delays and additional costs on other projects.

### D. Supply Chain

In our 2Q 2014 Report, we noted some concerns regarding the interface between Supply Chain and the DR and P&M Project Management teams. This concern regarded the fact that there were on-going and significant delays to the contract award and the issuance of purchase orders milestones for the Campus Plan, SIO, BOP and Shutdown and Layup work. These delays could have potentially serious downstream consequences such as compression of detailed engineering after the vendor contract award, compression of the construction and commissioning planned level 3 schedule degradation of the accuracy of RQE. Over the last month, we have conducted several interviews of Project Managers, Contract Managers and Supply Chain personnel in both P&M and Refurbishment, reviewed the applicable Supply Chain policies and procedures and various other documents including correspondence between members of the various groups.

As noted, the P&M and DR Teams have struggled with getting work ready for award to contractors—even under the ESMSA contracts where a significant portion of the terms and conditions for the work have already been negotiated and there is a “direct award” process. In particular, award of work in Refurbishment's BOP and Shutdown Layup is currently trending 100 or more days behind schedule. Many of the affected purchase orders still have not been issued, though they are expected to be in the coming weeks and recovery plans have been developed and are in the process of being implemented. The DR Team has expressed on-going frustration with Supply Chain's procedures and perceived lack of support for the Project, and Project Schedule.

There is a perception within the DR Team that Supply Chain sees itself as a strict enforcer of technical procurement rules rather than as a helpful member of the Refurbishment team focused on the DR Project's success. This perception, whether true or not, has impacted the on-going working relationships to some degree. We recognize that Supply Chain

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

serves an important control function on the Project. Supply Chain's mandate is to ensure that the procurement process is open and fair and that OPG is given value for money for each and every transaction, and to ensure contract compliance and enforcement during execution of the Project. It is not unusual for there to be a natural tension between Supply Chain and the Project Team. This tension can be a good check and balance to ensure that cost, quality and schedule are each championed. However, it is important that the balance is maintained, and that this tension does not become a barrier to the execution of the project. In our review, we have taken a closer look at the interaction and communication between Supply Chain and the project teams as well as the Supply Chain policies and procedures that govern its support of the Refurbishment Project. Based upon our review, we have made several observations, including the following:

### 1. The Project Teams and Supply Chain Do Not Effectively Communicate

We found that one of the biggest drivers to the perceived issues between Supply Chain and the project teams was a lack of effective communication. Misunderstandings and lack of alignment have contributed to the delays leading to finger pointing and frustration. The areas that need improvement include:

- The DR and P&M Teams should communicate clear expectations and priorities to allow Supply Chain to plan and utilize its resources effectively. Additionally, Supply Chain should be an active participant in setting a reasonable schedule and then be accountable for delivering according to the agreed-upon dates. On the Refurbishment side, each of the project managers makes demands on Supply Chain specific to his project. What is lacking is a prioritization of these demands for the overall program. Additionally, dates that the DR Team expects Supply Chain to meet need to be vetted openly in advance to ensure their reasonableness and buy-in. The communication of expectations also includes discussing dates for completion of various activities and holding the responsible party accountable for meeting those dates. P&M has set up a weekly Projects and Modifications Oversight Committee ("PMOC"), the purpose of which is to communicate and discuss its needs and priorities. P&M has indicated that it sets its expectations, including need dates for Purchase Orders at the PMOC, and though Supply Chain is invited to this meeting, it does not send a representative to participate.
- There needs to be a joint effort to identify and remove barriers to performance. The causes of the delays during the procurement cycle are varied, but one theme prevails—many of the issues that have caused impact thus far could have been quickly identified and eliminated if the DR Team, P&M Team and Supply Chain had proactively worked together. Examples of this are the delays reported by the Shutdown/Layup ("SDLU") project bundle, which the project team said were caused by delays to the contracting process even though most of the work was being awarded under existing contracts on a direct award basis. It appears that the cause of this delay was the inability of the third-party estimator to timely produce a "check estimate"—which the project team had interpreted as a requirement of Supply Chain's procurement procedure (OPG-PROC-0058)<sup>2</sup>. As a result, SDLU waited several months for these check estimates to be completed. Supply Chain, however, does not interpret this requirement as so prescriptive and would have accepted SDLU's 4c Cost Estimate for this work, making the completion of a check estimate an unnecessary barrier and the cause of a 3-4 month delay.<sup>3</sup> Thus, the DR Project's limited estimating resources could have been utilized more effectively and efficiently to simply verify and vet the estimate provided by the contractor rather than create a separate full project estimate. Going forward with this understanding, the DR Team can eliminate the step of reconciling both the 4C Estimates and the check estimate to the contractor's proposal, which should dramatically speed the award of the work.

<sup>2</sup> The OPG-PROC-0058 requirement states: "OPG has obtained a cost estimate for the services in question from a third party estimator or internally prior to reviewing a cost estimate from the supplier."

<sup>3</sup> The Project has its own procedures regarding check estimates, but puts it at the discretion of the project manager who has the flexibility to determine the benefit of a third party estimate versus the harm caused by the delay, and seek a waiver for the requirement from DR management.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

### 2. Inadequate Planning and Lack of Scheduling of Reasonable Procurement Durations

Many of the principles in the Supply Chain processes and procedures are dictated by the Ontario Ministry of Finance's Broader Public Sector Procurement Directive. Supply Chain has published and communicated the anticipated amount of time needed for each phase of the procurement process that should be integrated into the schedule by the Project Managers. Supply Chain indicated its willingness to discuss its ability to shorten those durations on a case-by-case basis, a decision which would be based upon objective factors such as the type of procurement, the contractors involved, its internal resources and workload based upon priority. However, it appears that the DR Team did not adequately plan for the expected procurement activity durations in its work planning schedule, nor did it confer with Supply Chain regarding its capability to meet needed milestone dates, some of which that turned out to be unrealistic. As a result, Supply Chain has never "bought in" to the procurement milestone dates in the schedule, and therefore, does not feel accountable to it. Compounding this issue is the fact that the procurement process is only represented by a single "contract award" or "PO issued" milestone in the Level 3 integrated schedule.

Without visibility to the necessary activities leading up to the milestones, it is difficult to manage the procurement process or to identify on-going issues that need to be corrected. The DR Team and Supply Chain should be focused on a realistic schedule that both can support, and Supply Chain should commit the resources needed to meet challenges if the DR Team needs them to, though such challenges should be known and planned as much in advance as possible.

### 3. Confusion With Respect to Contract Management Accountabilities

The P&M and Refurbishment Organizations have a "Strategic Contract Management" organization that is not found anywhere else in OPG. It is our understanding that the Strategic Contract Management group was first established in order to provide specific expertise in developing contracting strategies for a megaproject. Since its inception, the Strategic Contract Management team has gradually taken over performing contract management responsibilities on behalf of the project managers, though some of those responsibilities, including drafting contract amendments and providing contract interpretation are squarely within the province of Supply Chain accountabilities. There is currently no governing document outlining the Strategic Contract Management group's responsibilities, nor is there a division of responsibility that has been agreed to among the necessary parties (DR Team, P&M Team, Supply Chain and Strategic Contract Management).

The lack of clear roles and responsibilities is causing confusion among the project managers and even within Supply Chain and Strategic Contract Management themselves. In some instances, Strategic Contract Management has started activities that would normally be Supply Chain accountabilities (such as drafting a Contract Amendment) due to the perceived inability or unwillingness of Supply Chain to prepare the necessary documents in a timely manner.

In our experience, the commercial support of a megaproject requires embedded resources who understand the day-to-day events, pace and rhythm of work, and these resources need to act and react quickly to challenges when they occur so that the work is not adversely interrupted. This support also involves allowing the project managers to stay focused on their essential responsibilities. The sheer volume of commercial correspondence, contract notices and the like typically generated on a megaproject can be overwhelming if it is not effectively managed. There is no reason to think that the DR Project will be different. We understand that both Supply Chain and Strategic Contract Management are in the process of developing guidance documents to this effect (albeit separately), but we would encourage them to discuss face-to-face and resolve any outstanding ambiguities first and then cooperatively draft the necessary documents, and tabletop these processes with the DR Team's leadership. This is an issue that needs to be resolved quickly, however, as it is a source of on-going frustration and conflict.

### 4. Processes and Procedures

Supply Chain does not believe that the DR Project should have its own Supply Chain rules that are different from any of the hundreds of projects currently on-going within the company. We would respectfully disagree with this assessment,

**Confidential – Do Not Disseminate**

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

as the DR Project is not only very large but commercially complex. We would encourage Supply Chain to look at its policies and procedures from the corporate level to ensure that they are both flexible and agile enough to support the needs of the Project as it proceeds. We find certain processes, such as the need in P&M to revise the Purchase Order for each and every project change to be cumbersome and time-consuming, utilizing resources that could be better spent elsewhere. Additionally, there may be some ways for OPG to take advantage of some streamlining that is already built-in to the process, such as delegation of signature authority.

### E. Project Team Development

With the recent changes in leadership to both P&M and Refurbishment, the team should view this as an opportune time to clearly define the path forward to both RQE and the Execution Phase of the Project. Leadership should embrace the change and develop a strong communication plan that emphasizes the reasons changes were made and clearly sets out the cultural and behavioral expectations required for the DR Program's success. The Campus Plan Projects have provided clear lessons learned for the DR Team to incorporate in their plans relative to contractor management. There are additional lessons that can be drawn from the Refurbishment project, in particular the progression of the RFR Project that can be used as a positive example of the benefits of active management. As the DR Team is finalizing its functional plans for the 4d Cost Estimate, the team leaders should be mindful of the changes needed to actively manage the work through the entirety of the Execution Phase.

## Attachment A – 3Q 2014 Risk Perspective

Area	Observations	High	Medium	Low	Current Status / Mitigation
RFR	<b>SNC/Aecon Performance:</b> Largest Program risk due to overall risk to the DR Project and OPEX.				<ul style="list-style-type: none"> <li>▶ Tooling recovery progressing; final tool production is being accelerated</li> <li>▶ Detailed Engineering behind schedule though impact limited</li> <li>▶ RWPB and Definition Phase Engineering showing signs of slow progress</li> </ul>
	<b>Class 3 Estimate:</b> Progression to RQE requires SNC/Aecon's Class 3 Estimate to be thoroughly vetted				<ul style="list-style-type: none"> <li>▶ SNC/Aecon completed and OPG accepted Class 3 Estimate on time</li> <li>▶ Monetizing contingency remains a risk for 4d Cost Estimate though SNC/Aecon has agreed to provide input</li> </ul>
	<b>Schedule Development:</b> Level 4 schedule under development; requires challenge to total duration				<ul style="list-style-type: none"> <li>▶ Level 4 schedule accepted though there is room for significant improvement</li> <li>▶ SNC/Aecon identified schedule tracking plan that needs to be proven</li> <li>▶ Integration of support activities and logistics in schedule remains a risk</li> </ul>
	<b>RWPB Delays:</b> Facing similar problems that have plagued Campus Plan projects				<ul style="list-style-type: none"> <li>▶ Contaminated soil, interferences, and seismic issues delaying engineering</li> <li>▶ Lessons learned from Campus Plan work are being integrated</li> </ul>
	<b>RFR Commercial Risks:</b> Contract provisions currently in place may not drive desired contractor performance				<ul style="list-style-type: none"> <li>▶ The RFR Team has approached SNC/Aecon regarding the need to potentially renegotiate incentives and disincentives</li> <li>▶ Need to understand potential changes for 4d Cost Estimate accuracy</li> </ul>
Campus Plan	<b>ESMSA Performance:</b> D20 Storage and AHS work is behind schedule and over budget				<ul style="list-style-type: none"> <li>▶ [REDACTED]</li> <li>▶ [REDACTED]</li> <li>▶ Cost estimates and schedule remain in flux</li> <li>▶ D20 is a threat to Unit 2 breaker open</li> <li>▶ Re-evaluation of business case required in light of new estimates</li> </ul>
	<b>Engineering and Planning:</b> D20 provides key lessons learned for remaining Campus Plan and BOP				<ul style="list-style-type: none"> <li>▶ Engineering is co-locating with ESMSA vendors and taking more active role in directing and managing the work</li> <li>▶ Clarification of RFPs and process ongoing</li> </ul>
BOP	<b>ESMSA Performance:</b> Concern over ESMSA contractors' performance and ability to execute BOP work				<ul style="list-style-type: none"> <li>▶ Allocation of work underway; some issues with cost/scope estimates</li> <li>▶ Risk of ESMSA Performance will continue until improvements on performance issues in Campus Plan are observed</li> <li>▶ Detailed engineering milestone at risk due to late assignment of work</li> </ul>

## Attachment A – 3Q 2014 Risk Perspective

Area      Observations      High      Medium      Low      Current Status / Mitigation

Engineering

**Engineered Solutions:** Options Review Board has increased scrutiny of design decisions

- Conservative design decisions are driving up cost
- Misinterpretation of OPG's requirements are creating churn
- Options Review Board has been effective in challenging scope decisions
- Additional scope decisions may be necessary due to cost velocity measured in 4d Cost Estimate

**Planning of Engineering Work:** Engineering work was not well understood and is poorly planned

- OPG engineering is taking more active role in directing and managing the work at the engineering studios
- "Bottoms-up" estimating process initiated for engineering activities
- Increased focus placed on engineering planning for the design phase; new progress tracking mechanisms in place

**Continued Schedule Development:** Schedule approach was unproven; integration at appropriate level at risk

- Project Team is moving toward industry-wide recommended practices for scheduling
- Substantial work remains to populate detailed level 3 schedule
- Logic and critical path definition remains an issue with Campus Plan Projects; backward pass cannot be accomplished at this time
- Placeholder schedules needed for BOP work to assess resources
- Accurate earned value measurement will be delayed until schedule is more stable

**Progress Towards RQE:** The plan for developing RQE is being developed.

- 4d Cost Estimate is an essential step to RQE and will expose gaps and issues
- RQE development remains essentially on schedule, but will be heavily reliant on the quality of the various inputs.
- The DR Team has assigned a manager for the planning and development of the multiple pieces that must come together for RQE.

**Risk Management Program:** Risk registers require scrubbing; monitoring tools are cumbersome

- DR Team is cleaning up the risk register and improving reporting
- Risk Group is taking a more active role in managing the Risk Program
- Risk training is being conducted but more is required
- Campus Plan Projects risk awareness remains an issue

Project Controls

In our Initial Project Assessment of August 2013, BMcD/Modus summarized our conclusions and recommendations for the DR Project in a concluding table. Below, we have revisited these initial issues, risks and recommendations as a way for NOC to see the Project's progress since our Initial Assessment.

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
Scope	The DR Project's scope exceeds the commitments made to the BOD and Shareholder.	<ul style="list-style-type: none"> <li>Continue the process of reducing and optimizing the Project's scope.</li> <li>Reach a consensus on the scope as expeditiously and reasonably as possible so as to reduce the DR Team's work load and unneeded churn.</li> <li>Once the scope recommendations are adopted, the team will need to re-review the schedule to ensure the logic network is sound.</li> </ul>	<ul style="list-style-type: none"> <li>Scope reduction was accomplished via Blue Ribbon Panel review and results were incorporated in 4c Cost Estimate</li> <li>Scope remains an issue with BOP work – some of the design solutions proposed under ESMSA contracts have been excessively complex</li> <li>Options Review Board and strengthening of Gating process required to root-out remaining potential scope busts</li> <li>4d Cost Estimate may result in another round of required scope reductions</li> </ul>
Engineering	The schedule and pace of procurement related activities may not support a high-quality estimate at RQE.	<ul style="list-style-type: none"> <li>Review strategic considerations for procurement of remaining scope.</li> <li>Consider early "shoulder to shoulder" work by EPC design partners to expedite the start of detailed engineering and constructability reviews</li> <li>Review and prepare for likely RFIs from EPC vendors during the Planning and Assessing Phase.</li> </ul>	<ul style="list-style-type: none"> <li>Engineering for major bundles (RFR/Turbine Generator/Steam Generator/Fuel Handling) appear to be largely on course</li> <li>BOP start of detailed engineering is currently as much as 12 months behind plan which may impact accuracy of large portion of RQE</li> <li>Concerns expressed by BMcD/Modus in August 2013 regarding risks have largely materialized due to late award/start of BOP work</li> <li>Metrics for tracking engineering earned value need additional work and lack fidelity</li> <li>Constructability and Planning &amp; Assessing reviews are underway with RFR and Turbine Generator but lagging behind detailed engineering for BOP</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
Project Management	The Project oriented focus has created management silos that could make integrated program management difficult, resulting in contractor/owner interferences.	<ul style="list-style-type: none"> <li>As the Project matures and contracts with vendors are in place, the DR Team should increase the level of program integration.</li> <li>Address the fact that the Execution Phase may require individuals with different skills for OPG to effectively manage the contracts.</li> <li>Clarify reporting lines for matrixed Project Controls Personnel.</li> <li>Actively seek to assemble the Execution Phase team as soon as possible.</li> </ul>	<ul style="list-style-type: none"> <li>Project team development is progressing though with some notable alignment issues</li> <li>Refurbishment management for execution has been strengthened and “projectizing” of functions is progressing</li> <li>P&amp;M is undergoing a fourth leadership transition since July 2013 and stability and direction is urgently required</li> <li>Project Controls standardization across the entire DR Project is a work in progress and will require significant effort</li> </ul>
	The DR Team plans to implement a C&C Schedule at Level 2 for management which could create a number of coordination issues during the Execution Phase.	<ul style="list-style-type: none"> <li>Continue development of the C&amp;C Schedule through the Definition Phase and migrate to a fully integrated Level 3 schedule for the Execution Phase.</li> <li>Redirect the Project Controls Team’s efforts from the C&amp;C Schedule work to that of monitoring the developing Level 3 schedules from the contractors.</li> </ul>	<ul style="list-style-type: none"> <li>Refurbishment has corrected early potential faults in the schedule methodology and will utilize a Level 3 schedule for execution that is currently under development</li> <li>P&amp;M continues to populate the C&amp;C Schedule though the schedules for individual projects require updating and vetting once final scope and engineering is in place</li> </ul>
Schedule Development	The current schedule development depends on mutual agreement and acceptance of quality standards that owners typically demand, creating the risk that contractors will not comply.	<ul style="list-style-type: none"> <li>Clarify and include in commercial contracts OPG’s requirements for schedule development by the contractors.</li> </ul>	<ul style="list-style-type: none"> <li>DR Project chose not to update its contractual requirements though is seeking a high level of definition from contractors, who appear to be in compliance on Refurbishment but not Campus Plan</li> <li>We continue to recommend that OPG update its commercial arrangements for project controls information that will be propounded by the contractors at the time of finalizing the target price contracts for the Execution</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
			Phase
Risk Management	The current methods for scoring risks are inconsistent and the risk register includes “issues” or “concerns” that needlessly dilute management efforts.	<ul style="list-style-type: none"> <li>• Provide consistent characterization and scoring of risks.</li> <li>• “Concerns” as currently defined should be eliminated from the Risk Management Program.</li> <li>• Ensure that all relevant parties have a seat at the risk table while maintaining a measure of centralized control in the approach to risk identification and tracking.</li> <li>• Consider revising probability scoring to increase granularity and ranking of risks.</li> </ul>	<ul style="list-style-type: none"> <li>• Risk identification is improving in the Refurbishment organization</li> <li>• Scoring and “business as usual” risks are being addressed</li> <li>• Risk Management Program deficiencies are still present and have not been addressed</li> </ul>
	Leadership, training and wide acceptance of the importance of the Risk Management Program is lacking and the Project Controls Risk Group is understaffed.	<ul style="list-style-type: none"> <li>• Consider bringing in an experienced risk management lead with a demonstrated track record who is singularly focused on the risk function.</li> <li>• Review qualifications within the existing risk team.</li> <li>• Elevate Risk Management to a stand-alone functional group with the same level of prominence as the Schedule team.</li> <li>• Provide training with a focus on the overall importance of the Risk Management Program</li> </ul>	<ul style="list-style-type: none"> <li>• The DR Project’s risk management team has been strengthened over the intervening year and has new energized leadership in place</li> <li>• Additional training and risk discussion is still necessary</li> <li>• Reporting of risks needs additional clarification and work</li> </ul>
	The various databases that the Risk Group is populating suffer from a number of IT issues and lack of focus.	<ul style="list-style-type: none"> <li>• IT needs to resolve the outstanding issues as quickly as possible.</li> <li>• Training should include instruction for populating databases.</li> <li>• The AIDA database should be examined and updated if it is to be useful for rate proceedings.</li> </ul>	<ul style="list-style-type: none"> <li>• Database integration issues remain, and still need to be resolved</li> <li>• AIDA still requires examination for usefulness for rate proceedings.</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
Cost Management	The DR Team is inconsistently applying AACE guidelines and other processes and procedures central to the BOD's understanding of the underlying quality of project cost estimates.	<ul style="list-style-type: none"> <li>Consistently apply AACE guidelines, and where they are not (as in the RFR project estimates), the DR Team should seek to return to a condition of compliance.</li> </ul>	<ul style="list-style-type: none"> <li>AACE guidelines have been addressed in the continued development of the Project's estimates; contractors appear to have a better understanding of the nature of compliance with AACE standards</li> </ul>
	Revised planning assumptions for the 2014 Business Plan are currently being assessed—the business case for these assumptions is centered on the opportunity to reduce risk and increase positive outcome.	<ul style="list-style-type: none"> <li>Document and characterize the information for the BOD and consider meaningful reporting metrics.</li> <li>Should OPG adopt the revised assumptions, review commercial agreements so as to identify potential issues that could be impacted by the revised plan, as well as other issues within contracts that can be improved based on current OPEX.</li> <li>Review, capture and document Unit 2 OPEX information so maximum benefit is derived from this revised plan.</li> </ul>	<ul style="list-style-type: none"> <li>Documentation of major decisions still could be strengthened</li> <li>Discussion of key commercial agreements (in particular RFR) is pending though have been fully considered by DR Team management</li> <li>Metrics are still under review for effectiveness, as is earned value system</li> </ul>
	The 2015 Business Plan Budget review will likely repeat the process for the 2015 Business Plan in which the budget is refreshed.	<ul style="list-style-type: none"> <li>Perform a full project reforecast for the 2015 Business Plan in order to progress the project's cost estimates as far as possible before the date of the RQE.</li> <li>Such a reforecast will provide management with a detailed blueprint for all of the work needed to satisfy the RQE with information related to the budget that should match the DR Project's growing level of maturity.</li> </ul>	<ul style="list-style-type: none"> <li>4d Cost Estimate work is progressing, though we have concerns that it will fall short of a full Project reforecast. BMCD/Modus sees a risk in holding back on full examination of the underpinnings of the 4d Cost Estimate for certain cost centers that have not substantially matured since 4c Cost Estimate</li> <li>DR Team has appointed a manager of the RQE efforts, who should be engaged to find gaps in 4d Cost Estimate</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
	Contingency calculations need closer alignment with the Risk Management Program.	<ul style="list-style-type: none"> <li>• Actions summarized above</li> <li>• Create a clear and repeatable process for calculating contingency at all levels and for all program participants.</li> </ul>	<ul style="list-style-type: none"> <li>• BMCD/Modus will be reviewing and vetting the process for contingency identification for 4d Cost Estimate</li> <li>• As the Project matures, our expectation is for the DR Team to move toward deterministic risk and contingency identification with monetization of specific known risks</li> </ul>
Management Processes	OPG's new processes and procedures are in some cases conflicting and repetitive.	<ul style="list-style-type: none"> <li>• Look at reducing the number and optimizing the process map.</li> </ul>	<ul style="list-style-type: none"> <li>• The Project Management Plan remains a work progress</li> <li>• BMCD/Modus recommended each project manager revise the bundle management plans to incorporate changes to management principles</li> </ul>
RFR	SNC/Aecon's Class 4 Estimate (by contractual design) does not monetize contingency nor will it until the date of the 2015 Class 2 Estimate; this fogs the budgeting process and could complicate target price negotiations with SNC/Aecon over risk identification.	<ul style="list-style-type: none"> <li>• Consider asking SNC/Aecon to monetize risks at a much earlier stage.</li> </ul>	<ul style="list-style-type: none"> <li>• SNC/Aecon has agreed to provide certain information related to risks for 4d Cost Estimate though the extent to which it is helpful has to be determined</li> </ul>
	The Class 4 Estimate represents perfect performance; thus, it will form the basis for comparison with actual results.	<ul style="list-style-type: none"> <li>• The DR Team needs to document and explain the nature of the Class 4 Estimate so that there is no such confusion.</li> </ul>	<ul style="list-style-type: none"> <li>• The difference between SNC/Aecon's Class 4 and Class 3 estimates needs to be properly characterized</li> <li>• The RFR team, with vetting from BMCD/Modus, provided a prescriptive estimating plan for the RFR Class 3 Estimate that clearly defines the deliverables.</li> </ul>
	Project maturation	<ul style="list-style-type: none"> <li>• The Class 3 Estimate</li> </ul>	<ul style="list-style-type: none"> <li>• The Class 3 Estimate addressed</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
	specific to the DR Project was not a factor in SNC/Aecon's estimates to date.	<p>preparation should be expedited if possible.</p> <ul style="list-style-type: none"> <li>OPG should seek SNC/Aecon's monetizing of PMT costs.</li> </ul>	<p>these gaps; however, SNC/Aecon did not utilize time well, creating a substantial effort by SNC/Aecon and OPG in a short window of time</p> <ul style="list-style-type: none"> <li>The Class 2 Estimate development must occur at a more predictable pace, as there is less time for SNC/Aecon to prepare it and this estimate will form the basis for target price negotiations.</li> </ul>
	The potential unlapping of the execution of Unit 2 could result in cost increases from SNC/Aecon due to extended overhead and maintaining the workforce for a longer duration.	<ul style="list-style-type: none"> <li>While SNC/Aecon's costs may increase, there are other elements within the contract that should be negotiated that might serve to reduce the overall project's risk.</li> </ul>	<ul style="list-style-type: none"> <li>This remains a work in progress. BMCD/Modus believes it is OPG's intent to close needed gaps in the commercial contract prior to the final Execution Phase negotiations.</li> </ul>
	There are technical improvements that should be reviewed based on OPEX.	<ul style="list-style-type: none"> <li>Study opportunities now that the effort is turning to Darlington.</li> </ul>	<ul style="list-style-type: none"> <li>This is part of Class 3/2 Estimate effort is and under evaluation for the target price</li> </ul>
<b>ThisBOP</b>	The time engineering needs to create MDP packages is delaying the procurement of the work and the commencement of detailed engineering.	<ul style="list-style-type: none"> <li>Accelerate engineering work as necessary / practicable with the OSS vendors.</li> <li>Reduce and optimize BOP scope as soon as reasonably possible to decrease wasted effort.</li> <li>Change procurement method to a packaged approach (see below).</li> <li>Jumpstart detailed engineering by engaging EPC vendors as early as possible in the design process.</li> <li>Eliminate unnecessary duplication of effort between OSS vendors and EPC designers.</li> </ul>	<ul style="list-style-type: none"> <li>MDP preparation was accelerated and was completed ahead of schedule</li> <li>Detailed engineering for BOP work remains a risk; despite changes to the procurement model, assignment of work to ESMSA contractors continues to be delayed or impacted</li> <li>DR Team has initiated a collaborative approach to reviewing and approving engineering product that is intended to eliminate delays in approvals and duplicative effort; results need to be monitored</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
		<ul style="list-style-type: none"> <li>Review and eliminate OPG delays in approval of design work.</li> </ul>	
	The procurement process for BOP is designed around packaging two large bundles of BOP work and a Secondary Compete process which adds time to the schedule; the outcome of this “competition” is essentially already known.	<ul style="list-style-type: none"> <li>Assign work to ESMSA vendors based on qualifications in smaller bundles.</li> <li>Use the existing ESMSA agreements and eliminate bidding process.</li> </ul>	<ul style="list-style-type: none"> <li>Procurement process has been changed and Secondary Competition has been eliminated</li> <li>The direct award process has been hampered by process delays</li> </ul>
	The ESMSA contractors have experienced performance problems on the Campus Plan work.	<ul style="list-style-type: none"> <li>Ensure that appropriate performance metrics are in place and aggressively address specific performance trends and problems as they arise.</li> <li>Increase flexibility in the assignment of BOP work to give OPG an opportunity to mitigate ESMSA performance issues.</li> </ul>	<ul style="list-style-type: none"> <li>ESMSA performance problems with the Campus Plan Projects have persisted</li> <li>Metrics measuring progress and resource allocation have not been developed</li> <li>Assignment of BOP work is now capability-based</li> <li>DR Team has re-assigned work from non-performing contractor’s scope</li> </ul>
	There is a risk that scope defining inspections and discovery work during the Execution Phase will add scope not currently anticipated to the BOP work.	<ul style="list-style-type: none"> <li>Optimize the BOP work so that an appropriate schedule window exists for performance of scope adders.</li> <li>Increase visibility of this potential risk.</li> </ul>	<ul style="list-style-type: none"> <li>Scope defining inspections thus far have resulted in narrowing of the DR Project’s scope</li> <li>Risk of additional work is decreasing</li> </ul>
Campus Plan	The D20 Storage Facility work has been delayed and the contractor’s performance has been subpar	<ul style="list-style-type: none"> <li>Continue to devote adequate resources to recover the D20 Storage Facility’s schedule.</li> <li>OPEX from this project should be used to guide management of the future Execution Phase</li> </ul>	<ul style="list-style-type: none"> <li>D20 Storage remains a significant threat to Refurbishment</li> <li>Contractor performance and P&amp;M’s failure to actively manage the work have resulted in cost overruns and continued schedule</li> </ul>

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
		work.	<p>delays</p> <ul style="list-style-type: none"> <li>OPEX from D2O Storage has been well-studied and was a significant topic of BMcD/Modus's 2Q 2014 Report</li> <li>The DR Team is endeavoring to insert lessons learned into BOP work, though this requires close monitoring</li> </ul>
	Campus Plan work is multi-faceted and schedule driven; the sheer size and timing of the work adds complexity and risk	<ul style="list-style-type: none"> <li>Additional management attention is needed to ensure planning and execution of the work</li> </ul>	<ul style="list-style-type: none"> <li>Management issues with Campus Plan Projects persist</li> </ul>
	The Campus Plan's scope is too large	<ul style="list-style-type: none"> <li>Continue to review the Campus Plan Scope and eliminate unnecessary projects.</li> </ul>	<ul style="list-style-type: none"> <li>Some scope in the Campus Plan Projects was cancelled as part of the Blue Ribbon review—further review and scope reduction may be required.</li> </ul>
<b>OPG Critical Path</b>	OPG-directed work is 25% of the Critical Path of the DR Project.	<ul style="list-style-type: none"> <li>Ensure that this work is given proper focus and resources.</li> </ul>	<ul style="list-style-type: none"> <li>Defueling and Fuel Handling work appear to be progressing after some early delays in awarding contracts and assigning/splitting work with DNGS station.</li> </ul>

# **Report to Nuclear Oversight Committee**

## **4<sup>th</sup> Quarter 2014**

### **Darlington Nuclear Refurbishment Project**

# **ONTARIO POWER GENERATION**

Burns & McDonnell  
Modus Strategic Solutions

November 13, 2014

**Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project**

**I. Executive Summary**

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors ("NOC") regarding the status of the Darlington Nuclear Generating Station's Refurbishment Project ("Project" or "DR Project") as of October 30, 2014. Attached to this Report is the updated quarterly summary of the Project Risks with annotations regarding the Darlington Refurbishment Project Team's ("DR Team") actions with respect to these risks since our August 13, 2014 Report ("Attachment A"). The following is a brief summary of the DR Project's most significant developments over the last quarter.

**A. 4d Cost Estimate and RQE Preparation**

The DR Team is presenting to NOC its 4d Cost Estimate, an important step in the progression to next October's Release Quality Estimate ("RQE"). RQE will form the Project's control budget, or baseline of cost. Based on the results of the 4d Cost Estimate, Management remains committed to not exceeding the \$10B (\$2013) cost for the DR Project. Our team observed the DR Team's process for developing the 4d Cost Estimate and found it to be reasonably robust and followed frequently-seen practices as related to an AACE Class 3-5 estimate. This is in line with what we would expect to support progress to a reliable RQE.

**B. Campus Plan Performance Update**

The Campus Plan Projects remain a concern. Based on current projections (excluding the D2O Storage Facility and certain of the Facilities & Infrastructure projects ("F&IP") that have not started and will likely be cancelled) F&IP costs have increased by 20% since the cost estimate in the 2014 Business Plan ("Release 4c"). This growth is largely due to the maturation of scope; though these projects continue to be compared to and impacted by poor quality initial cost estimates and some of Project & Modification's ("P&M") legacy processes. P&M's leadership acknowledges these trends and is developing a plan to improve management of these projects and stabilize costs. The following is an update to certain key events discussed in our prior Reports.

- **D2O Storage Facility**

On October 16, 2014, OPG terminated Black & McDonald's purchase order for the D2O Storage Facility. In our last

Facility. Based on these events, the DR Team has intensified its efforts in its preparation of a mitigation plan to ensure that there is no impact to breaker open while pursuing options for completing the D2O Storage Facility with another vendor. OPG is preparing a revised business case in which it will fully evaluate options and its next steps with D2O Storage Facility considering the least cost and most prudent option.

- **Auxiliary Heat Steam Building**

The AHS project has an in-service milestone of March 15, 2015, just prior to the start of the station's Spring 2015 Vacuum Building Outage ("VBO") scheduled to begin April 3, 2015. AHS is currently forecast to be in-service on May 25, 2015, nine weeks later than planned. This schedule is currently being reworked but there is a risk that the project may slip beyond the current late finish date. OPG has put into place a mitigation plan so that these delays are no longer a threat to VBO. Additional costs due to poor initial estimates will remain a risk until P&M has finished its detailed vetting the vendor's latest cost estimate.

- **Contractor Performance**

In our 2Q 2014 NOC Report, we highlighted concerns with Black & McDonald's performance on the Campus Plan Projects, and its termination from the D2O Storage Facility does not alleviate those concerns. Black & McDonald is still

Confidential – Do Not Disseminate

Page 14/299  
Page 16/15

November 13, 2014

Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project

performing important predecessor work for the Refurbishment Project, including work that must be performed during the VBO. Black & McDonald's performance needs to be closely monitored so that the same issues that impacted its work on D2O Storage Facility are not repeated.

ES Fox has generally performed more predictably than Black & McDonald and has been much more responsive to OPG's requests and concerns. Nonetheless, ES Fox's scheduling and cost estimating practices need to be improved and P&M's project team needs to request more substantiation and transparency from ES Fox related to project estimates, changes in scope and schedule revisions. On October 15, 2014, OPG met with ES Fox's team and secured its commitment to provide more detailed estimates and schedules, starting with the AHS. Once received, this additional detail will help P&M improve its performance metrics, gate packages, and cost projections. In addition, aggressive action by P&M in seeking this critical information from the ESMSA contractors will improve contractor monitoring.

- **P&M Management**

P&M management is aware of the performance issues we have raised in past Reports and has plans for strengthening the organization, demanding increased rigor from its project teams and sharing processes and resources with Refurbishment. P&M now holds bi-weekly meetings with both of the ESMSA contractors that have key stakeholder involvement and are a good forum for providing visibility to issues, solving problems and improving alignment. Furthermore, OPG's active management of the engineering process is yielding some positive results.

However, P&M's controls currently in place to review and approve changes in scope have proven to be insufficient for forecasting overruns and are not aligned with the DR Project's processes. P&M's senior management is increasing its focus on the project controls program by evaluating and reworking its processes, though it will need to move more quickly in order to have an impact on the on-going work. We recommend all of the project managers be more diligent in establishing and reviewing trends and identifying the causes of adverse trends so that they can be reversed or mitigated. To this end, the DR Team should obtain and vet detailed information (cost and schedule estimates) from the performing contractors and then as the design progresses, closely monitor any scope changes (and their impacts to cost and schedule) to allow for more accurate forecasting during execution.

### **C. Retube & Feeder Replacement Project**

Generally, the Retube & Feeder Replacement ("RFR") Project is progressing well, with a positive working relationship between OPG and SNC/Aecon. SNC/Aecon has performed according to its Recovery Plan and recovered some of the delays to tooling, and mitigated any downstream impacts. The recovery of SNC/Aecon's tool performance provides a good example of the DR Team's identification of an issue through reliable performance metrics and subsequent mitigation of the risk utilizing active contractor management.

The RFR Project's current major work streams include: (1) completion of the tooling for the mock-up; (2) completion of engineering; (3) tool performance guarantee testing in the mock-up; and (4) development of the Class 2 Estimate for the RFR work. Each of these phases is running on or slightly behind schedule at this time.

Our main concerns with respect to ongoing RFR Definition Phase work are: (1) the Class 2 Estimate does not currently contemplate including an assessment of logistics (such as material staging and tool transitions) supporting the removal and refurbishment of the reactor's internal components; (2) further delays to the design and construction of the Retube Waste Processing Building ("RWPB") could pose cost and schedule risk that could divert management attention from the main project work.

As part of the Class 2 Estimate, SNC/Aecon needs to provide an appropriate basis of estimate for its tool transitions, material staging and logistics, and other support activities. Because a significant amount of both the critical path and total hours of work on the RFR project relies heavily on the coordination of activities, not engineering product, it does not fit cleanly into the AACE Class 2 recommendations. The OPG team has proposed that this portion of the estimate should be supplemented through full mock-up simulations and other analytics, which are not currently in SNC/Aecon's plans. OPG and SNC/Aecon are currently working together to see how this logistical work can be incorporated into the

**Report to Nuclear Oversight Committee – 4Q 2014**  
**Darlington Nuclear Refurbishment Project**

schedule. If OPG and SNC/Aecon can reach an agreement, it will reduce uncertainty in the Class 2 Estimate and will ultimately provide confidence that the Target Price is both reasonable and achievable.

Delays to the RWPB's definition are compressing the schedule and causing concerns at this time. However, DR Team has appropriately evaluated its options for the RWPB. The recent Options Review Board meeting set two conditions for the decision on the size of this building that have now been satisfied. This decision clears the way for the design to be finalized without further slippage to the completion date. The RFR project team is continuing to work with SNC/Aecon to improve its schedule. To that end, SNC/Aecon is designing the foundations, and will continue with their construction in parallel with the building design.

**D. Other Major Projects**

Planning and engineering work for the remaining scopes of work continues to progress. The design phase for the Turbine Generator is ongoing. OPG made the decision to maintain the existing Unit 2 controls without modification which will further simplify that work. Balance of Plant ("BOP") and Shut Down/Lay-up work is lagging, in part due to the late award of this work that was further complicated by the issues with Black & McDonald. The DR Team has put in place recovery plans for these projects in order to mitigate delays and the work is being awarded, defined and advanced to this plan. Defueling, Fuel Handling and Specialized Projects appear to be on pace at this time.

**E. Engineering**

Over the last quarter, we have examined the status of OPG's engineering in light of the initiatives the DR Team launched earlier this year. We looked at the impact of the DR Team's decision to actively manage the work, increasing front end planning and collaboration with the vendors. In general, we have observed improvements in the engineering process and vendor commitment, though this is largely anecdotal information. As we will discuss, better engineering performance metrics will allow objective confirmation of these observations.

Engineering's PIMS milestone completion date for all detailed engineering is in August, 2015, though the team is working to a May 15, 2015 target date, often referred to as the "stretch goal" ("May 15<sup>th</sup> Milestone"). While the August date is adequate for purposes of having all detailed engineering completed prior to the Execution Phase, this milestone is not optimal for supporting estimate development for RQE. Thus, the DR Team is currently working to be approximately 90% complete with detailed engineering by May 15, 2015, with the remainder of detailed engineering to be complete by August 2015. Assuming the work planning and assessing can proceed as planned, the majority of the major project work will have advanced to support the development of Class 2/3 cost estimates for RQE. The DR Team will need to carry larger bandwidth of contingency for any project estimate that cannot be categorized at Class 2/3 levels.

Currently, the DR Project reports that it is 69% complete with design engineering, which is approximately 5% behind plan. The major scopes of work which comprise approximately 65% of the DR Project—RFR and Turbine Generator—appear to be on pace or slightly behind the May 15<sup>th</sup> Milestone. The work that is behind appears to be confined to the BOP, Shut Down/Lay-up and Refurbishment Additional Facilities, the latter of which includes a number of projects that will be cancelled or deferred, as well as some of the remaining Campus Plan Projects. Thus, the engineering work that risks missing the stretch goal represents approximately 7-8% of the total direct cost value of the DR Project.

OPG continues to develop an integrated, Level 3 resource loaded schedule for engineering, and this is needed to provide clarity to the current plan. OPG's current summary metrics show a very steep rate of detailed design package completion to meet a May 15<sup>th</sup> Milestone, meaning that a large number of engineering packages will be completed and submitted to OPG at the same time. These metrics need to be further substantiated. We believe that OPG should supply sufficient evidence that this plan is reasonable and achievable including how OPG will perform it is necessary design reviews within a compressed timeframe, and provide assurance that the engineering providers have sufficient resource capacity to complete the work. Further, the DR Team would benefit from giving visibility to those engineering packages that are most likely to miss the May 15<sup>th</sup> Milestone, and what impact, if any, there would be to RQE. This was an effective strategy the DR Team employed to meet its goals for the recently concluded Health of Scope campaign.

Page 196/299  
Page 3 of 15

November 13, 2014

**Report to Nuclear Oversight Committee – 4Q 2014**  
**Darlington Nuclear Refurbishment Project**

**F. Project Management and Controls**

The DR Team's Outage Management and Execution organizations have each developed detailed staffing and plans for actively managing their respective portions of the work. We see this as a major step in the DR Team's acceptance of its role and obligations for the Execution Phase.

All DR Team bundle and functional schedules are integrated in the Level 3 master schedule database at both Level 2 and Level 3. Over the last several months, we have witnessed a marked improvement in the Execution Phase schedule's development. All DR Team bundle and functional schedules are integrated in the Level 3 master schedule database at both Level 2 and Level 3. While these schedules are expected to mature further, the master scheduling plan establishes the right set of priorities and requirements that OPG will need for active management of the contractors.

In our past Reports, we have highlighted some concerns with the Project's Earned Value Management System. During the past quarter, we have performed a detailed assessment of the Cost Management and Earned Value Management Systems. The DR Team's metrics are still maturing and the goal is to have meaningful and industry-standard earned value metrics that provide a complete picture of contractor and Project performance. The DR Team has recognized certain gaps in its processes and is currently working on an improvement plan.

**G. Corporate Support**

In our last Report, we identified certain communication, performance and process issues with Human Resources, Supply Chain and Information Technologies that were impacting or had the potential to impact the DR Team from outside the Project. In particular, the Supply Chain issues related to communication and accountability to the Project are the most immediate concerns to the DR Project. Leadership of Supply Chain has been responsive and has shown a willingness to help the DR Project. Supply Chain and the DR Team have participated in face-to-face alignment meetings which have had an immediate impact on the working relationships. While this will require a continued effort, we are encouraged by efforts made so far.

**II. Assurance Reporting**

In addition to our on-going independent oversight efforts, we have been tasked with providing detailed observations and recommendations on various high-risk areas of the Project as a part of OPG's "Assurance Plan" in conjunction with Internal Audit and Nuclear Oversight. Over the past year, we have issued six Assurance Reports covering the following areas:

- Risk Management Practices and Procedures
- Scope Definition Management and Process
- Release 4c Process
- Schedule Management Program
- Campus Plan
- OPEX Program

BMcD/Modus has been working closely with the DR Team with respect of implementation of acceptable management responses to the observations and recommendations found in these Reports. Attachment A is a summary of all of the Reports completed to date. This summary will be submitted to the Audit & Finance Committee as a part of Internal Audit's composite report of the Assurance Plan for the DR Project. Over the next year, we plan to update our earlier findings as well as evaluate and provide assessments in the following areas:

- Release 4d Process/Gaps for RQE
- Cost Management System
- Commissioning Plan
- Change Management Processes
- RQE Development and Process

**Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project**

We also meet almost daily with members of senior management, Engineering and the project teams for RFR and BOP to monitor Project cost and schedule status, engineering progress and project planning for these high-risk activities. Additionally, we continue to meet monthly with the Refurbishment Project Executive Team (“RPET”) and weekly with the DR Team’s Management Systems Oversight group to discuss the recommendations we have made in these Reports to NOC in order to engage in discussions of appropriate OPG management actions. The DR Team continues to provide its cooperation and transparency to our oversight efforts.

### **III. Campus Plan Update**

#### **A. Overview**

The Campus Plan Projects continue to have schedule and cost risk (particularly D2O Storage). Scope definition of smaller Campus projects may continue to reduce management reserve and contingency. Over the last year, the Campus Plan Projects, excluding D2O Storage Facility, have incurred approximately 20% cost growth overall. While these projects are generally smaller in size and, in aggregate, represent ~5% of the program cost, their success remains important to Refurbishment. In addition to D2O Storage and AHS, some Campus Plan Projects that have received partial funding are showing signs of scope creep and schedule issues; OPG is actively monitoring and mitigating these issues to the extent possible and has increased the effectiveness of its regular meetings with the ESMSA contractors and associated metrics that are intended to root out problems before they increase in severity.

The D2O Storage Facility remains the principal focus for P&M due to its size, growth, lack of predictability and importance to Refurbishment. OPG is currently estimating the cost of the D2O Storage Facility to be \$373M, an increase of \$263M from the full funding release request in May, 2013. The on-going performance issues with the principal contractor, Black & McDonald have diverted management attention from the other projects. While the work needed to replace Black & McDonald and mitigate the impacts will require an intense effort by P&M, the change in course for D2O Storage Facility should have an overall positive impact on P&M and the F&IP work.

#### **B. Major Campus Plan Projects**

##### **1. D2O Storage Facility**

On October 16, 2015, OPG terminated Black & McDonald that its purchase order for the D2O Storage Facility. This termination was limited to D2O Storage Facility; Black & McDonald is expected to continue with its remaining purchase orders for both P&M and Refurbishment, though OPG had previously announced its intentions to restrict or reassign much of that work to other ESMSA contractors. Under the provisions of the ESMSA, OPG has also provided a written notice to Ellis Don that OPG will be assuming direct control of its subcontract to continue work in the field on the D2O project. For the time being, the work will proceed on site according to the current schedule while the DR Team considers the next step.

In light of the termination, OPG will need to reassign or rebid the work to another contractor while it develops a mitigation plan capable of draining the water from Unit 2 with minimal impact to Refurbishment. OPG will need to devote significant attention to vetting the new plan so that it is developed with sufficient quality to meet the needs of Refurbishment. The DR Team has assigned a team consisting of appropriate Engineering and Operations & Maintenance personnel to develop options for an alternative approach that will allow the DR Project to meet the breaker-open date for Unit 2 in the event that D2O Storage is not complete. Such a solution should be properly planned and made ready for execution with a mature a Class 2 level cost and schedule on the assumption that it could, at some point, be the only alternative for storing water from Unit 2.

OPG is currently considering its available options and is developing a revised business case for proceeding. We recommend that OPG consider the following options in its business case:

- *Reassign the D2O work to one of the other ESMSA contractors (assuming there is another ESMSA in place with capacity to handle the work) through either direct award or a secondary compete process. The new ESMSA*

Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project

contractor would have to quickly mobilize, take possession of all purchased materials, plan and schedule the work, subcontract off-site prefabrication and other work, and perform on an accelerated basis in an attempt to complete the building prior to Unit 2's breaker open (or as soon as possible thereafter). The alternative approach will be used only as a mitigation strategy so as not to delay breaker open; or

- *Issue an RFP to qualified contractors that assumes an aggressive schedule in order to complete the work as quickly as possible.* Again, this option would require quick mobilization and acceleration costs. Bid evaluation will be based upon rate sheets, overhead, supervision costs, fees and potentially the best construction plan, but the bid period will be short so that a full schedule and estimate of the work cannot be developed and evaluated as a part of the bid. This plan would allow negotiation of a project-specific contract that would incorporate appropriate milestones for developing cost and schedule as well as incentives and disincentives for contractor performance.
- *Issue an RFP to qualified contractors assuming that the completion milestone will be extended for a reasonable amount of time allowing for a true "competitive bid" process based upon completed engineering.* In this scenario, OPG would implement the mitigation plan to drain the water and complete engineering and some of the current excavation work. Once engineering is complete, the project can then be re-bid on a competitive basis, seeking both a realistic schedule and pricing for the Project. This would also give OPG time to re-examine the needs for the D2O Storage Facility and decide whether the design properly addresses that need, and whether the cost is justified based upon a sound business case. This scenario may also allow OPG to achieve some of the value engineering solutions for reducing the D2O Storage Facility scope in a less compressed time frame.

While the design work is largely complete, the first and second options will require quick action for another contractor to assume the work, develop a cost estimate and schedule and re-plan the work effort to minimize lost time. Such a plan will likely include added costs for acceleration, and even with those added costs, the new contractor may not be able to complete in time to support breaker open. Moreover, whichever contractor takes on the work is likely to include a premium in its price due to these circumstances. The third scenario could provide OPG the opportunity to establish the true cost of the project (whether or not the design changes) in a competitive bid environment, and to show that the cost increases are reasonable and based upon increased scope. It may also enable OPG to seek a different commercial arrangement for its construction. The third option would have the disadvantage of OPG having to incur added carrying costs, which could actually make this option cost prohibitive, but it should be evaluated as a part of the business case.

Under any scenario, completing the D2O Storage Facility to support the start of the Unit 2 Refurbishment has a considerable amount of risk and the option OPG chooses to procure the completion of the building needs to fully account for those risks. Thus, having the alternative solution for draining the water from Unit 2 should be assumed for any modeled scenario, and we would recommend management establish a well-defined decision point appropriately in advance that specifies the direction the team will take if ongoing construction work on D2O Storage Facility cannot meet the needs of Unit 2's schedule. That plan needs to consider long lead items, approvals needed from external stakeholders and impact on operations, at a minimum OPG is reviewing its options at this time, and is preparing a revised business case that should consider these and any other reasonable scenarios for the Board of Directors' review.

## 2. Auxiliary Heat

The Auxiliary Heat System ("AHS") originally was scheduled to be in service prior to the start of the VBO. The current schedule for commissioning the new Auxiliary Boilers shows an in service date of May 25, 2015, nine weeks beyond the original target. P&M management has pivoted its focus on the likelihood that the new AHS will not be available for the start of VBO. The existing boilers will remain in place until the new AHS is available for service, which will meet OPG's needs for VBO. The remaining issues are with the AHS's cost and schedule predictability. As noted, ES Fox has also agreed to deliver to OPG its full estimate for AHS and is working with OPG to further refine its schedule. ES Fox is already working two shifts on the critical AHS work in an attempt to recover as much time as possible. The P&M team is evaluating ways to shorten commissioning and start-up and staging release dates for the equipment.

**Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project**

### **3. Containment Filter Venting System**

In our last report, we identified that CFVS was one of the P&M projects that needed additional attention, as the cost of the project was projected to increase by as much as 35%. There has been an increase in scope, and thus its corresponding cost, however, the contractor's cost estimates lack rigor and P&M's has accepted large cost increases without sufficient justification or explanation.

When the project team proceeded to the Gate Review Board ("GRB") for its partial execution funding to perform some preparatory work before the onset of winter, the estimate for the work presented had not progressed beyond Class 4. This was despite the fact that the design was sufficiently mature to support the development of a much more detailed estimate at that time. Although the GRB rejected the request for being insufficiently supported, the estimate presented by the project team identified a project management weakness that P&M needs to address. As of this September GRB meeting, ES Fox had not provided a quantity breakout of its current cost estimate, and had submitted requests for change orders that were not vetted by the project team; nonetheless, the amount of these changes were included in the estimate at completion ("EAC").

Under the ESMSA contract, the Contractor's actual costs are open book and are subject to audit by OPG upon request. Moreover, the Contractor is obligated to follow OPG's scheduling standards and provide an integrated schedule, and report progress and status on weekly basis. It is essential that OPG enforce these contract requirements; otherwise, it is difficult to evaluate whether changes in scope are necessary and properly estimated. The project team's representation of an EAC that had significantly increased without proper vetting highlighted the need for the P&M project managers to have a better ongoing understanding of the cost impact from design changes, and for the contractors to provide more detailed and timely information to support cost increases. P&M's management is developing a plan to address these deficiencies.

### **4. Vendor Performance Issues**

Black & McDonald is still performing work other than the D2O Storage Facility that is important to Refurbishment. As a result, OPG will have to closely monitor this work to ensure that Black & McDonald is meeting expectations for safety quality and performance.

ES Fox's performance has thus far been more predictable and its team has been very responsive to addressing any issues raised by OPG. However, the scope creep and cost increases evident in some of its work indicate that P&M needs to be vigilant in managing ES Fox's work. Any lessons from Campus Plan Projects should also be understood by the Refurbishment BOP team, which is using ES Fox for multiple scopes of work. Thus, the need for P&M and Refurbishment BOP project managers to vet ES Fox's estimating methodology, including how ES Fox is using factors for productivity, estimating project management team size and engineering costs, among other things.

#### **C. Schedule and Cost Development**

P&M's efforts to develop and update the project schedules for the Campus Plan Projects has had mixed results. The team met an initial goal to have detailed schedules loaded into the OPG network, though many of those schedules were found to have quality issues. As a result, the schedule performance index ("SPI") for these projects may not be reflecting the project's actual progress. The DR Team is intensifying efforts to increase the accuracy of these schedules by performing back pass reviews which have established needed milestone dates for these projects and by holding focused reviews to correct logic and duration issues. However, the contractors' schedules still need improvements in critical path definition, logic and resourcing.

The following chart illustrates the current status of the P&M schedule development for the major F&I projects currently underway. We have distinguished those projects currently in the Execution Phase from those still being planned, as those projects need an executable schedule in place immediately.

Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project

F&I Project Description	EPC Contractor	Schedule Development			Phase of Work/Comments / Schedule Confidence Level
		In OPG Schedule Network	Schedule Developed	Schedule Perf. Index (SPI)	
OSB Refurbishment	Black & McDonald	Yes	Yes	0.87	In the execution phase. Schedule appears adequate for project completion
D20 Handling & Storage Facility	TBD	Yes	No	0.55	In the execution phase. Schedule will have to be reworked by new contractor.
Auxiliary Heating Steam	ES Fox	Yes	No	0.98	In the execution phase. Low schedule confidence. Schedule in rework to address logic issues.
SIO - Emergency Power Generator 3	ES Fox	Yes	No	0.99	In the planning phase; execution schedule to incorporate recovery plan.
SIO - Containment Filtered Venting System	ES Fox	Yes	No	0.59	In the planning phase. Schedule for execution being reworked.
SIO - Powerhouse Steam Venting	Black & McDonald	Yes	Yes	0.89	In the planning phase. Schedule is currently under development for project execution.
Shield Tank Overpressure Protection	Black & McDonald	Yes	Yes	0.79	In the planning phase. Schedule appears adequate for project execution.
Water and Sewer	Black & McDonald	Yes	Yes	0.91	In the execution phase. Project is nearing completion.
RFR Island Support Annex (RFRISA)	ES Fox	Yes	Yes	0.78	In the execution phase. Schedule appears adequate for project execution.
Refurbishment Project Office	ES Fox	Yes	Yes	0.79	In the execution phase. Schedule appears adequate for project execution.
Electrical Power Distribution	Black & McDonald	Yes	Yes	0.73	In the execution phase. Schedule appears adequate for project execution.

The above SPI's for these projects reflect both the status of the projects and a number of deficiencies in the schedules themselves. In order to better understand the true performance trends, the following schedule issues need to be sorted out:

**Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project**

- Because P&M's rules for change management only allow the schedule for a project to reflect approved scope, the budgeted hours used for calculation of SPI appear to be skewing the indices. There should be place holders for known scope that approximate the effort associated with unapproved changes.
- These schedules were built utilizing principles commonly associated with outage or plant modification schedules, with each project's Engineering Change ("EC") packages having independent logic, rather than a typical construction schedule where work is depicted and logically tied by discipline. Scheduling by EC package does not allow for efficient management of contractor resources or prioritization of work—which is important when managing multiple projects, as some carry greater risk.
- As projects pass through gates, P&M allows the work to be fully rebaselined such that prior delays are no longer apparent. As a result, this and the quality of the current vendor supplied Level 3-detailed schedules continue to make efforts to establish meaningful earned value and schedule adherence metrics problematic.

As noted, P&M's project team also needs to increase its vigilance and perform more analysis of performance (schedule and cost) trends. P&M has recently increased its efforts to understand and adequately vet the projects' cost estimates. P&M has met with ES Fox to determine its methodology for developing cost estimates and specifically to obtain a copy of its detailed estimate for AHS to use as a template for all of the other projects. ES Fox was responsive to OPG's goals and has committed to providing its estimate and its cooperation. This is a good initial step though there is substantial work to be done, because the accuracy of earned value indices suffers without reliable cost estimates and planned values.

As noted, the Project Controls Team has been asked to review and standardize the approach P&M is using to conform to that of Refurbishment. However, because P&M is in the execution phase of its work, it needs an earned value system that is seamless to implement, will not cause interruption to ongoing work effort and is useable in the shortest possible time. The DR Team currently has devoted resources to improve P&M's earned value system. We have provided recommendations directly to the P&M and Project Controls teams regarding the method and structure of earned value for these projects. The temptation to over-complicate the implementation of earned value for these smaller, in-flight projects should be resisted. Once the base elements for earned value are defined and reported, the calculation of the performance metrics can be done very simply to allow for proper contractor management and tracking. In order for the earned value system to be useful for the P&M Refurbishment Prerequisite and Campus Plan Projects, it must be developed within the next quarter. We will continue to monitor and vet these activities.

#### **IV. Major Refurbishment Projects – Summary of Key Risks**

##### **A. Retube & Feeder Replacement**

###### **1. Tooling Fabrication**

In our prior Reports, we raised a risk regarding the potential for late tooling delivery to impact the quality or timing of the Class 2 Estimate. Much of our concerns have been alleviated over the last quarter as SNC/Aecon's tooling recovery plan achieved its target of returning to an SPI of 1.0 in September. Those few late tools did cause the SNC/Aecon to miss the Prototype Complete milestone on September 30<sup>th</sup> and are pushing the December 31<sup>st</sup> Qualification Complete milestone, though the impact of these missed milestones is minimal. Further, the project should benefit from a more rigorous qualification process that will result in a much more durable toolset during execution.

In addition to the above, as the tooling schedule has recovered and the delivery dates have approached, the predictability and adherence to the schedule from the tooling vendors has also improved. This has allowed SNC/Aecon to revise its schedule for tool performance guarantee testing, which will commence in earnest in November 2014 and run through March 2015, supporting the input to the Class 2 Estimate. A significant first step in preparations for tool performance guarantee testing was achieved in the first week of October with the delivery and installation of RTP-1 at the DEC mock-up facility. The focus will now be to drive the final few tools to qualification completion and delivery to the DEC to maintain the tool performance guarantee testing schedule.

Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project

## 2. Engineering and Procurement Status

As of the end of September, detailed engineering was 53% complete and showing an approximate one and a half month delay to the contract completion date of June 15, 2015. This delay is largely being driven by a delay in procurement of three subcontractor packages, with the vault crane upgrades being the most severe. SNC/Aecon is expediting the procurements and is working with the vendors to optimize the schedules in order to attempt to mitigate the delay. We will continue to monitor engineering progress throughout the winter months to gauge any impact late engineering could have on the Class 2 Estimate deliverables.

## 3. Class 2 Estimate

The Class 2 Estimate is progressing slowly at this point, although SNC/Aecon has indicated that it expects to meet the June 2015 completion date. The engineering is compressing the available time for completion of the Stage 3 construction work packages and the associated assessment of that work; however, SNC/Aecon will have completed enough engineering to support the AACE Class 2 Estimate guidelines. Similarly, the tool performance guarantee testing is progressing and, as discussed above, does not pose a risk to the Class 2 Estimate. The largest risk remaining to the completion of a quality Class 2 Estimate at this time is the completion of "validation" work for non-tool performance guarantee tasks. Validation work includes running rehearsals, story boards, and modeling of tool transitions, material staging, and other logistics both in the mock-up and/or in computer simulations. This work does not cleanly fit the AACE guidelines because it relies more on logistics activities and laydown space, which is not an engineering product. This work represents a significant amount of both the critical path and total hours of work on the RFR project and without a solid basis for the estimate of this effort; the Class 2 Estimate could be weakened. At this time, discussions with SNC/Aecon are ongoing to determine the work that will be validated in the mock-up over the coming months. If OPG and SNC/Aecon can reach an agreement, it will reduce uncertainty in the Class 2 Estimate and will provide confidence that the Target Price is both reasonable and achievable.

## 4. RWPB Building

The design, construction, and commissioning of the Retube Waste Processing Building ("RWPB") is a concern at this time and is being addressed by OPG and SNC/Aecon. The RWPB will house the tools that reduce the volume of the reactor components after they are removed from the vault. To this point, the RWPB has been delayed awaiting decisions on the final sizing of the waste tooling equipment and the determination of necessary staging and buffer areas around that equipment. In July 2014, SNC/Aecon submitted a revised proposal for the RWPB which has been under evaluation by the RFR project team. In early October, aspects of the proposal was presented to the Options Review Board which gave a conditional approval to move forward with foundation design and construction, as well as resizing and extending the RWPB, pending final evaluation of two alternatives, which have been subsequently closed off as too costly.

Concurrent with OPG's review of the proposal, SNC/Aecon revised its schedule for the RWPB and incorporated it into the master schedule. The result shows a very tight schedule to breaker open, with commissioning of the building to be completed in late January of 2017. OPG is working with SNC/Aecon to rationalize this schedule and improve the completion dates.

The RFR team believes it is important to enclose the building by fall/winter of 2015 so that the waste tools can be delivered, installed, and commissioned prior to breaker open in the fall of 2016. To support this schedule, SNC/Aecon is moving forward with caisson design and construction in parallel with the building design to mitigate the delays in the engineering of the resized and extended RWPB. To ensure the foundations can support the developing design, SNC/Aecon will have additional design margin to support the size of the building and any potential code changes, which is a common practice in the industry at large. In addition, lessons learned from the D20 building are being incorporated into the foundation design to prevent a repeat of the issues that have been encountered on that project. The progression of caisson design and construction, as well as the building design, will be monitored closely over the coming quarters to gauge the impact of any further delays.

**Report to Nuclear Oversight Committee – 4Q 2014**  
**Darlington Nuclear Refurbishment Project**

**B. Balance of Plant and Shutdown/Lay-Up**

The Balance of Plant ("BOP") and Shut Down/Lay-up bundles have been impacted by the reassignment of work from Black & McDonald to ES Fox and by a need for better comparative cost estimates of work scopes. The BOP and Shut Down/Lay-up teams have increased the active management and collaboration with the contractors and the owner's estimator, Faithful + Gould. In addition, the scope of the work continues to narrow based on favorable results from in-plant inspections and further re-examination of the work through the Options Review Board and gate reviews. BOP has identified \$14M that has moved from base scope to contingent scope based on future inspections of plant conditions, and has another \$30M in work that it has similarly targeted. In addition, the recent 4d Cost Estimate work each team performed was very detailed and gives senior management the opportunity to fully examine this work.

Over the next two quarters, BOP and Shut Down/Lay-up will need to mature rapidly to make up for the initial delays in awarding the work. Both BOP and Shut Down/Lay-up have developed recovery plans and are now working toward those plans. The DR Team has now awarded all purchase orders for Shut-Down/Lay-Up and expects to have all of the purchase orders for BOP (except for the Adjusters) in place by the end of November 2014 at which time OPG will have detailed schedules. The estimating process is also being addressed based on lessons learned. Detailed design of many of the Balance of Plant and Shut Down/Lay-up work packages are behind schedule, but the main risk of these delays is limited to increasing the contingency for this work for RQE. Ensuring that the Shut Down/Lay-up work matures quickly is a higher priority right now than BOP as much of this work needs to be well-planned prior to breaker open. The DR Team is also examining the appropriate schedule windows for this work so that staffing plans can be further rationalized and schedule float maximized.

**V. Functional Groups Update**

**A. Engineering**

Over the last two quarters, we have been particularly focused on the DR Team's engineering efforts. In all manner of construction, engineering is typically a leading indicator for the execution phase. Moreover, engineering progress is a major factor in determining the Project's maturity and readiness for RQE.

**1. Progress of Engineering Initiatives**

During the latter part of 2013 BMCD/Modus stressed the importance for OPG to embrace its role as DR Project's integrator and to actively manage the multiple contractors hired to perform the work. We also recommended a greater focus on Front End Planning and suggested a more collaborative approach to working with the different engineering service providers. In early 2014, the DR Team made a shift in its engineering strategy and Engineering launched several initiatives aimed at improving the efficiency and effectiveness of the engineering portion of the program.

In order to assess the impact of these initiatives, our team has monitored the progress of the engineering effort including meeting independently with the engineering service providers to pulse their reaction to the changes OPG has initiated. Our observations confirm that these initiatives have generally improved the communication and work flow between OPG and its engineering vendors. It appears that management and staff have become more engaged, are developing a sense of ownership, and are working to resolve issues with a greater sense of urgency. Evidence that these initiatives are working include:

- OPG Engineering has developed an expediting team that is monitoring the work within the engineering firms on the Campus Plan Projects. This team has been effective at reducing the response time for outstanding inquiries by the vendors, and speeding the process for design reviews. So far, the four projects that have reached design completion have done so in less time as a result of this effort.
- OPG resident engineers have been located in the offices of the engineering service providers, which has eliminated several layers of management and supervision, improved communications and provided a clearer line-of-sight between the OPG Design Authority and the engineers performing the work.

Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project

- Process check points have been implemented so that detail design does not begin until the pre-requisite planning steps have all been satisfied.
- Design Authority decisions are being made on a more informed and timely basis, and the Design Authority is actively engaged in reviewing and answering questions at much earlier stages.
- Senior management has interceded and stopped Operations & Maintenance's untimely COMS reviews that had previously resulted in changes to approved design work at the 60% and 90% complete levels.

The benefits from these initiatives will continue to be realized as the DR and P&M projects advance. Reduced review and comment disposition cycle times, timely approvals, consistent stakeholder alignment to the adopted solutions, more rapid escalation, collaborative issue resolution all serve to enhance the effectiveness and efficiency of the engineering effort. OPEX from the F&I Projects has demonstrated that passive oversight, churn, late design changes, lack of stakeholder alignment, unclear direction, miscommunication and indecision delays the schedule and adds significant cost to the project. The full impact of any cost savings from the engineering initiatives will not be known until the execution phase. The expectation is the upfront planning work will eliminate or minimize late COMS reviews generating design changes and field changes. The DR Team should look for ways to track the overall savings derived from these initiatives.

All of the above have reduced the amount of time and effort required to produce the work product. Further gains in the efficiency of the engineering process and the effectiveness of the design solutions are possible and we encourage OPG and the engineering service providers to take the necessary steps to continue to improve.

## 2. Engineering Progress

Engineering's PIMS milestone completion date for all detailed engineering is in August, 2015, though the DR Team is working to a May 15, 2015 target date, often referred to as the "stretch goal" ("May 15th Milestone"). While the August date is adequate for purposes of having all detailed engineering completed prior to the Execution Phase, this milestone is not optimal for supporting estimate development for RQE. Thus, the DR Team is currently working to be approximately 90% complete with detailed engineering by May 15, 2015, and the remainder of detailed engineering to be complete by August 2015. Assuming the work planning and assessing can proceed as planned, the majority of the major project work will have advanced to support the development of Class 2/3 cost estimates for RQE. The DR Team will need to carry larger bandwidth of contingency for any project estimate that cannot be categorized at Class 2/3 levels.

Currently, the DR Project reports that it is 69% complete with design engineering, which is approximately 5% behind plan. The major scopes of work which comprise approximately 65% of the DR Project—RFR and Turbine Generator—appear to be on pace or slightly behind the May 15th Milestone. The work that is behind appears to be confined to the BOP, Shut Down/Lay-up and Refurbishment Additional Facilities, the latter of which includes a number of projects that will be cancelled or deferred, as well as some of the remaining Campus Plan Projects. Thus, the engineering work that risks missing the stretch goal represents approximately 7-8% of the total direct cost value of the DR Project.

OPG's effort to produce an integrated, Level 3 resource loaded schedule for engineering continues, as the engineering service providers updating their Level 3 work schedules to incorporate awarded work. Some completion dates are currently being constrained by the May 15th Milestone, resulting in a depiction of the EC Completion that appears to be unachievable and unrealistic. We recommend that OPG verify that the engineering suppliers are prioritizing their work for the May and August milestone dates so that the higher value and achievable engineering work is prioritized completed in time for providing the basis to RQE.

The DR Team is also planning to develop a post-RQE check estimate prior to breaker open in 2016 at which time the remaining scopes of work can be refined and the Project's control budget adjusted as needed. At that time, the remaining design packages that are completed after August 2015 can be trued-up in the RQE control budget.

Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project

### 3. Recommendations

The DR Project's goal to complete all of the Detailed Design work prior to the May 15<sup>th</sup> Milestone is considerably challenged at this time. There are multiple contributing factors:

#### (a) Engineering Metrics and Schedule of Activities Need Improvement

OPG engineering's performance tracking metrics are missing a needed level of granularity and as a result, these metrics can be misconstrued. Current metrics in use by OPG and the contractors have been formulated on the basis of earning rules that track completed deliverables. These metrics are not based on resource loaded work schedules, which make progressive schedule performance (i.e. the status of each deliverable as they are being developed) more difficult to determine. The earning rules also incorporate level of effort activities that can skew the earned value picture. Thus, this metric shows a dramatic "cliff" of completion without the appropriate level of granularity to show that design completion can reasonably be achieved in this manner.

Our concern here is two-fold: (1) the engineering work down curve is not providing enough assurance of the work that leading up to the May 15<sup>th</sup> Milestone can be achieved; and (2) if this work-down curve is accurate, there will be a large bow wave of work at the end that will overstress OPG's engineering resources for its approval cycle.

BMcD/Modus sees the following as essential next steps to refine these metrics: (1) Engineering should include a better depiction of the events leading up to the May 15<sup>th</sup> Milestone and the August completion dates so that steps in the actual work effort are more visible; (2) the metrics Engineering is producing for the major bundles need to be verified against the contractors' plans so that there is confidence in the data; (3) to the extent that any design packages are going past the May 15<sup>th</sup> Milestone, those packages should have visibility so that priorities may be vetted; i.e. any work that carries a potentially high value can be prioritized for purposes of RQE.

We recommend that the DR Team adjust the engineering schedule and the related metrics to reflect more realistic expectations, prioritized by the importance of completing the work to the quality of the RQE, and provide more organized input into the downstream activities of estimating, procurement, construction work package development and on-line wiring.

#### (b) Further Gains in Execution Efficiency

OPG's EC process is intended to provide a systematic risk based approach to plant modifications—the higher the technical risk, the more rigor that is demanded. The EC process has been well established for the Project. It is consistent with sound engineering practice within the nuclear industry in North America. Despite the process being sound, from our interviews with the engineering service providers and observations of the execution of the process, the manner in which the work is performed still contains inefficiencies. OPG has embraced a number of activities to further improve the efficiency and effectiveness of the engineering execution summarized below:

- **Non-Value Added Activities:** To address execution inefficiencies, OPG will undertake a LEAN Value Stream Mapping assessment of the engineering performance of the EC process, performed by a third party experienced in this type of evaluation.
- **Value Engineering:** Value engineering is an important step in engineering design and OPG has formal value engineering requirements for the EC process. There is growing evidence that this work has not been performed to the level of rigor expected by OPG as part of the plant modification detail design. OPG are examining this in greater detail.
- **Options Review Board.** The ORB was initiated to deal with the emergence of less than optimal solutions finding their way into the design process despite the various challenge points built into the EC and Gate review processes. The ORB meetings are still evolving, but they do currently supply provide a forum so that the DR Team can make appropriate engineering decisions.

**Report to Nuclear Oversight Committee – 4Q 2014  
Darlington Nuclear Refurbishment Project**

**B. Project Controls**

We noted in our 3Q Report that the DR Project's project controls development had not matured as expected by this time in the Project. The following is a current assessment of the state of the DR Project's Master Schedule and Cost System development.

**1. Schedule Mechanics**

OPG's schedule network is currently set up and functional with all DR Team bundle and functional schedules represented in the database at both Level 2 and Level 3. However, not all of the DR Project's contractors are currently working inside the active OPG schedule database. The DR Team has scheduled a summit to finalize a plan that drives contractor participation in OPG's network for early November of 2014. While the schedule development is somewhat behind, OPG has spent a great deal of time and effort developing the Level 3 Schedule Management Plan, that once implemented, will establish the right set of priorities for developing the Execution Phase schedule. We have reviewed the Level 3 Schedule Management Plan to verify that reasonable scheduling concepts have been incorporated.

**2. Schedule Quality Assessment**

Although each project now has produced a detailed Level 3 schedule, Balance of Plant, Shutdown/Layup and some of the facilities that support the DR Project are the least mature due to the issues as discussed in this Report. It is our understanding that the Level 3 schedule for Balance of Plant and Shut Down/Lay-up is in progress and will be completed in November 2014 with the exception of the Adjusters scope.

The DR Team is focused on developing and integrating the schedule details for the prerequisite work that must be completed prior to execution of Unit 2. The project controls leads for each team are currently focused on this key part of the live schedule. This effort needs to be completed as soon as possible to ensure that the execution work can begin on time. OPG is also growing its execution team and incorporating appropriate placeholders in the schedule for undefined work. The schedule organization is now embedded with the Outage Planning organization providing additional assurance that proper integration will occur.

As we have noted, resource loading is vitally important to measuring contractor schedule and cost performance during the Definition and Execution Phases. This is especially true given the target price nature of the majority of the contracts. The DR Team is currently working to resource load the schedules to support the earned value management system.

**3. Cost Management, Earned Value and Performance Measurement**

During the past quarter, we have performed a detailed assessment of the Cost Management and Earned Value Systems. Based on that assessment, we have made the following observations:

- In general, the Project's Cost Management System functions as we would expect for a project of this size. The DR Team's cost data is now standardized across all of the project bundles, and provides a controlled environment to provide reliable cost data.
- One of the concerns with the Cost Management System is that the data input is a manual process that requires a lot of time and effort. Project Controls is developing a process to automate this.
- Because the current work is mostly engineering and procurement, the DR Team is using deliverable counts as the basis of earned value. However, deliverable counts typically depend on completing by milestones. There can be considerable work needed between milestones that can be difficult to see and forecast. For long-range activities, the time between milestones can create "cliffs" in earned value metrics that appear to be unachievable. To the extent possible, we recommend OPG confirm that the current progress to the milestones will result in the milestones completing on time.

**Report to Nuclear Oversight Committee – 4Q 2014**  
**Darlington Nuclear Refurbishment Project**

- For Execution Phase work, earning rules should be structured to emphasize installed quantities and work-hours to determine project performance. OPG agrees and has created a draft of its earning rules for each of the procurement and construction phases of the Project. The construction phase earning rules are based on installed quantities and will track work hours.
- The performance metrics and reports that are currently being generated from the Earned Value Management System need more detail to support active management of the contractor by the project managers and functional managers. In particular, these metrics need more focus on performance trends.
- The change control processes need to be improved. This includes improving the baseline estimates against which cost is measured and the utilization of an estimating database and standard estimating templates. Additionally, early recognition of trends through forecasting by certain project management teams is not effective.

OPG has recognized many of these issues and has devoted resources to review and implement solutions for these gaps. In particular, two teams have been developed to look at techniques for tracking and measuring man hours and quantities and to develop more effective and standardization of reports. The DR Team is reviewing its estimating and change control processes in light of these programs.

Additionally, the DR Team is planning to utilize the US Cost estimating database to facilitate the evaluation of quantities and work-hours. This database will bring continuity across the project teams and should provide a baseline for performance measurement and project forecasting. The next task at hand is for the Project Controls Team to increase its ability to accurately forecast the Project's cost and schedule based on better estimates and change control. Time remains for the DR Team to move forward with these project enhancements, though we would encourage the team to establish these as possible, given the importance of establishing a sound reporting regime.

# Attachment A – 4Q 2014 Risk Perspective

Area	Risk	High	Medium	Low	Current Status / Mitigation
RFR	<b>SNC/Aecon Performance:</b> Largest Program risk due to importance to the DR Project and OPEX				<ul style="list-style-type: none"> <li>▶ Tooling recovery achieved SPI of 1.0; minimal challenges remain</li> <li>▶ Detailed Engineering behind schedule though impact limited</li> <li>▶ RWPB behind schedule; working to optimize schedule</li> </ul>
	<b>Class 2 Estimate:</b> Progression to RQE requires a robust Class 2 estimate that is thoroughly vetted				<ul style="list-style-type: none"> <li>▶ Class 2 work is just commencing and is currently on-schedule</li> <li>▶ Schedule is very tight and being further compressed by late engineering and TPG testing; OPG engaged in an iterative review process with SNC/Aecon to ensure early reviews and feedback are provided.</li> </ul>
	<b>Schedule Development:</b> Level 5 schedule under development; requires challenge to total duration				<ul style="list-style-type: none"> <li>▶ SNC/Aecon identified schedule tracking plan that needs to be proven; schedule durations to be challenged as part of Class 2 review.</li> <li>▶ Integration of support activities and logistics in schedule remains a risk</li> </ul>
	<b>RWPB Delays:</b> Potential risk to RFR schedule; RWPB and waste tools required for start of removal work				<ul style="list-style-type: none"> <li>▶ RWPB extension conditionally approved by OPG; allows foundation design/construction to move forward, concurrent with building design</li> <li>▶ Current schedule shows commissioning of RWPB occurring parallel with defuel, reactor drain, etc. with little room for error or delays</li> <li>▶ Lessons learned from Campus Plan work are being integrated</li> </ul>
	<b>RFR Commercial Risks:</b> Contract provisions currently in place may not drive desired contractor performance				<ul style="list-style-type: none"> <li>▶ The RFR Team has approached SNC/Aecon regarding the need to potentially renegotiate incentives and disincentives</li> <li>▶ Need to understand potential changes for Class 2 Cost Estimate accuracy</li> </ul>
Campus Plan	<b>ESMSA Performance:</b> D20 Storage and AHS work is behind schedule and over budget				<ul style="list-style-type: none"> <li>▶ D20 is a threat to Unit 2 breaker open; alternatives being evaluated</li> <li>▶ Black &amp; McDonald terminated from project, options under consideration for completing the project; civil contracts assumed by OPG and field work continues.</li> </ul>
	<b>P&amp;M Engineering &amp; Project Management:</b> Process improvements are required in areas of vendor management, project controls, change management, and estimating				<ul style="list-style-type: none"> <li>▶ Engineering co-location and active management beginning to yield results</li> <li>▶ Bi-weekly ESMSA meetings providing visibility to issues</li> <li>▶ More detailed vetting of vendor estimates and schedules required</li> <li>▶ Some improvement in active PM oversight of scope, cost, schedule, and risk, but more is needed to control project baselines</li> <li>▶ Need to improve project controls metrics</li> <li>▶ More rigorous change management process required</li> </ul>
BOP	<b>ESMSA Performance:</b> Concern over ESMSA contractors' performance and execution ability				<ul style="list-style-type: none"> <li>▶ Allocation of work underway; some issues with cost/scope estimates</li> <li>▶ Risk of ESMSA Performance will continue until improvements on performance issues in Campus Plan are observed</li> <li>▶ Detailed engineering milestone at risk due to late assignment of work</li> </ul>

# Attachment A – 4Q 2014 Risk Perspective

Area	Risk	High	Medium	Low	Current Status / Mitigation
Engineering	<b>Engineered Solutions:</b> Options Review Board has increased scrutiny of design decisions				<ul style="list-style-type: none"> <li>Conservative design decisions are driving up cost</li> <li>Options Review Board has been effective in challenging scope decisions</li> <li>Additional scope decisions may be necessary due to cost velocity measured in 4d Cost Estimate</li> </ul>
	<b>Planning of Engineering Work:</b> Engineering work was initially not well understood requiring focus on re-planning				<ul style="list-style-type: none"> <li>OPG engineering is taking more active role in directing and managing the work at the engineering studios</li> <li>"Bottoms-up" estimating process initiated for engineering activities</li> <li>Increased focus placed on engineering planning for the design phase; new progress tracking mechanisms in place</li> </ul>
	<b>Engineering Metrics:</b> Current metrics lack granularity				<ul style="list-style-type: none"> <li>OPG needs assurance that engineering can be substantially complete by May 15, 2015</li> <li>Metrics need more detail evidencing resources and planning</li> </ul>
	<b>Continued Schedule Development:</b> Schedule approach was unproven; integration at appropriate level at risk				<ul style="list-style-type: none"> <li>Project Team adopting industry-wide recommended scheduling practices</li> <li>Substantial work remains to populate detailed level 3 schedule; placeholders schedules incorporated; resource loading started but progressing slowly</li> <li>Logic and critical path definition remains an issue with Campus Plan projects; some backward passes have begun</li> </ul>
	<b>Progress Towards RQE:</b> With 4d delivered, focus must quickly turn to executing the plan for RQE				<ul style="list-style-type: none"> <li>4d Cost Estimate delivered within \$10B range; bundle team challenges will require considerable effort to achieve savings targets included in 4d</li> <li>RQE development remains essentially on schedule, but will be heavily reliant on the quality and timing of the various inputs</li> <li>The DR Team has assigned a director to manage RQE integration</li> </ul>
Project Controls	<b>Risk Management Program:</b> Risk registers require scrubbing; monitoring tools are cumbersome				<ul style="list-style-type: none"> <li>DR Team is cleaning up the risk register and improving reporting</li> <li>Risk Group is taking a more active role in managing the Risk Program</li> <li>Risk training is being conducted but more is required</li> <li>Campus Plan Projects risk awareness remains an issue</li> </ul>
	<b>Cost &amp; Performance Measurement:</b> Current system effectiveness/efficiency should be reevaluated; project controls metrics need improvement				<ul style="list-style-type: none"> <li>Earned value management techniques need to mature</li> <li>Tools for earned value tracking have limitations that need to be reviewed</li> </ul>

**ONTARIOPOWER**  
**GENERATION**

Burns & McDonnell  
Modus Strategic Solutions

November 13, 2014

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMcD/Modus") provide the following Supplemental Report to the Nuclear Oversight Committee of the OPG Board of Directors ("NOC") regarding the Darlington Nuclear Generating Station's Refurbishment Project ("Project" or "Refurbishment Project") 2015 Business Plan and Release 4d Cost Estimate ("4d Cost Estimate" or "4d") as submitted to the NOC. The 4d Cost Estimate is the last in a series of Project estimates included in the planned interim Business Plan releases OPG has prepared as part of its progression to the Project's Release Quality Estimate ("RQE"). OPG will deliver the RQE to the Shareholder in 4<sup>th</sup> quarter of 2015 which it intends to use as the Project's control budget and with underlying cost estimates in general conformance with AACE guidelines<sup>1</sup> for a Class 2 to Class 3 estimate. The content of this Supplemental Report contains information that is commercially sensitive and has been prepared at the direction of counsel.

In this Supplemental Report, we provide our observations related to the process the Darlington Refurbishment Project Team ("DR Team") used for developing the 4d Cost Estimate, including a general characterization of the nature of the estimate, risks and opportunities identified in 4d's development. We also identify gaps and recommendations for strengthening the Project's estimating practices that in our view need to be addressed before RQE, many of which the DR Team has already accepted and are in the process of incorporating into their RQE plan. Throughout the process, the DR Team was fully transparent and very cooperative with our efforts to review the status and trends for Refurbishment's costs. The DR Team included our team in all of its 4d Cost Estimate activities, including all challenge meetings, and provided us with progress reports and all documents necessary. We provided the DR Team with immediate feedback and recommendations as necessary, and our suggestions were well received and many have been taken into account for RQE.

While the DR Team's preparation of the 4d Cost Estimate is an important milestone on the Project's path to RQE, the result should be viewed in the appropriate context. The DR Team prepared the 4d Cost Estimate based upon the current maturity of the Project, with a goal of deriving a cost estimate with a range of variability in line with an AACE Class 3/4 estimate. In the DR Team's view, and we concur, the 4d Cost Estimate should be looked at as the best estimate of cost available at this time; it should not, however, be viewed as having the requisite maturity to form the basis for the Project's control budget with underlying estimates at the Class 2/3 level that the DR Team has committed to provide in next year's RQE. RQE should address all the identified gaps to date including areas for potential cost-saving opportunities with sufficient lead time so as to allow the Project Team to take advantage of those opportunities. In our prior reports to the NOC, we have referred to the 4d Cost Estimate as a "dress rehearsal" for RQE in that it provides the DR Team with an opportunity to measure its progress and identify whether there are significant threats to the overall viability of the Project.

The purpose of this report is not to offer an independent opinion or analysis of the specific monetary values in 4d Cost Estimate. Rather, our focus was on the process the DR Team utilized in deriving the estimate's component parts and whether that process generally conforms with our experience and the industry at large, and identifying gaps that should be addressed so as to improve the confidence of the RQE estimate. BMcD/Modus confirms that 4d Cost Estimate is generally (but not in all cases) as the DR Team describes: an estimate in the range of AACE Class 3 to Class 5. We have some high-level observations from our review, vetting and oversight of the 4d Cost Estimate effort:

- **Estimate Maturity:** Approximately 64% of the project bundle derived cost estimate is currently at the Class 3 level, while other portions are less defined. Estimates for the largest cost components – the RFR and Turbine Generator bundles – are at a Class 3 level or better. Thus, the major building blocks for the estimate have advanced as expected and provide a solid basis for understanding the Project's current level of maturity. Estimate enhancements must advance for smaller Project components, including Balance of Plant, Shutdown/Layup, Defueling and Specialized Projects. Notably, engineering and planning definition of these bundles will need to progress rapidly over the next 6-8 months, as planned, as a condition precedent to providing a high-confidence for those elements of RQE. The precision of the contingency calculation should also be advanced as the base estimate is refined, so the DR Team needs to allow sufficient time for its development for RQE.

<sup>1</sup> See AACE's Recommended Practice No. 17R-97, Cost Estimate Classification System (November 29, 2011) and Recommended Practice No. 18R-97 Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Process Industries (November 29, 2011)

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014**  
**Darlington Nuclear Refurbishment Project**

- **Commercial Strategy is a Key Driver to RQE:** The 4d Cost Estimate has embedded assumptions regarding the expected outcome of future commercial negotiations that will transpire before RQE, in particular with SNC/Aecon over the final terms of the RFR and Turbine Generator contracts. Management has allocated in excess of \$700M in savings relative to SNC/Aecon's Class 3 estimates from these negotiations and further maturation of the work planning. There is a significant risk that the outcome of those negotiations will fail to yield the level of cost savings the team has assumed, and as such, OPG is carrying contingency for this event. Senior management has already advanced the start of the formative reconciliation of the estimate and management goals with SNC/Aecon, which is an important first step. SNC/Aecon's Class 2 estimates for Turbine Generator and RFR are due to be completed by March 15 and May 15, 2015, respectively, by which time the DR Team's planning assumptions embedded in 4d can be revisited. OPG has established an iterative process to review the development of the estimates between 4d's acceptance and May 15, 2015.
- **Functional Costs Need Further Development and Refinement:** Functional costs represent ~30% of the 4d Program Direct Cost Estimate. As part of the 4c Cost Estimate, senior management issued across-the-board directives to the functional group leads to reduce costs, though for the most part, the team did not take up these challenges until 4d. The overall definition of the functional groups required for the Execution Phase has increased significantly since last year's 4c Cost Estimate, and the associated cost estimates facilitated appropriate levels of challenge. Approximately 75% of the total 4d reductions were the result of challenges from the DR Team and the Refurbishment Project Executive Team ("RPET"). Our concern is that the remainder of these reductions occurred late in the process and have not been fully developed or implemented. However, management issued these challenges based on a detailed set of round table reviews and they reflect realistic planning assumptions, though some of these cuts will require the team to rethink elements of their work. Management is putting review and tracking milestones in place to verify the status of these adjustments to their conclusion. To date, the DR Team has incorporated many of the challenges. Meeting management's 4d challenges is necessary if functional costs are to be reigned-in and this will require a determined effort.
- **Campus Plan Project Risks:** The Campus Plan Projects remain a risk to both the cost of the Project and the schedule for Unit 2's refurbishment. One very likely consequence of the DR Team's recent action to terminate Black & McDonald from the D20 Storage work is that OPG will have to bear certain additional costs to replace the contractor and move work forward. The velocity of cost increases and schedule perturbation for these Projects remains a significant concern, and the DR Team will need to have sufficient contingency plans and funds to ensure this work (particularly D20 Storage) will not adversely impact Refurbishment. Included in Release 4D is an additional program level contingency in the amount of \$73M to offset cost increases beyond the amount within approved estimates for Campus Plan projects.
- **Contingency and Risk Management:** Contingency is a significant component of the 4d estimate, representing ~20% of the total. Therefore, the development of RQE contingency should be given a high priority. The DR Team's approach to risk has evolved such that approximately half of the contingency in the 4d Cost Estimate has been deterministically derived based on monetizing specific risks identified by the DR Team. Further increase of the maturity of contingency must be a major goal for RQE. Doing so will likely require much more time than was allowed for 4d after the base estimate data freeze in order for the contingency to be properly developed. Work also remains to increase precision and reasonableness, and OPG could well benefit from a third party, cold eye assessment of contingency given the nature of the RQE. OPG is aware of this need and is planning accordingly. OPG has already commenced the process to hire a third party to perform a review of its RQE results.
- **4d Cost Estimate Identified Process Improvements for RQE:** The DR Team's process was sufficient to produce 4d and included significant challenge from within, though a high-confidence RQE will require a step-up in the level of vetting, analysis and an increase in the overall maturity of the cost elements. We have made several recommendations to the DR Team for improvements to the RQE process, the most important of which is that the DR Team must have a detailed schedule of all necessary RQE-related activities. Furthermore, the team should

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project**

develop accountability metrics that will provide management with the visibility needed to ensure the components of RQE (including contingency targets for reductions to the 4d Cost Estimate) are being addressed. A detailed schedule will also ensure sufficient time for quality assurance efforts so that any potential errors, double counting and the like can be reduced to minimal levels. We also recommend that the estimates be consolidated in a more standardized format for ease of future analysis, including creation of an estimating database.

Overall, BMcD/Modus found the effort associated with the 4d Cost Estimate to be within reasonable expectations, though the greatest value OPG may have derived from this exercise is the identification of gaps that remain to be closed by the time of RQE. The 4d Cost Estimate effort should provide the DR Team with a robust action plan for RQE. Consistent with our recommendations, OPG's management is treating the transition from the 4d Cost estimate to RQE as a continuous exercise in order to achieve the goal of a high confidence cost and schedule estimate for the Project by this time next year.

## **II. BMcD/Modus Process for Review of 4d Cost Estimate**

As noted in our prior reports to NOC, BMcD/Modus referred to the 4d Cost Estimate effort as a "dress rehearsal" for RQE. OPG needed to increase the rigor in the processes used for developing the 4d estimate so that RQE be a further refinement that process. We viewed the 4d Cost Estimate as a way to evaluate the efficacy of the process the DR Team uses for developing cost estimates, and identify any upward cost pressure that might materially threaten the Project's viability. The advantage of identifying these gaps at 4d is to give the DR Team sufficient time to take the actions needed to lower costs, which in some cases may require the development of alternative strategies or changes to its base plans and assumptions. BMcD/Modus's approach to the 4d Cost Estimate was to evaluate the process the DR Team used for determining the base cost underlying the estimate as well as the method used for quantifying contingency, risks and opportunities.

At a high level, we sought to characterize the DR Team's methodology and effort applied to the 4d Cost Estimate and assess whether the current estimate is reflective of the Project's current level of maturity. In doing so, we examined the following aspects of the 4d Cost Estimate in detail:

- Reviewed the major variances from the 4c Cost Estimate to the 4d Cost Estimate and assessed the rationalization of those variances by the DR Team.
- Identified whether process gaps previously identified in our past reports (and most notably apparent in the 4c Cost Estimate effort) have been addressed by the team.
- Reviewed how the DR Team documented estimating results and key assumptions so that these can be revisited at the time of RQE.
- Reviewed the process for developing contingency including the treatment of cost and schedule uncertainty and discrete risks impact.
- Vetted the DR Team's characterization of the components of the estimate, including:
  - Sampling a reasonable amount of the underlying basis of the estimate; and
  - Reviewing whether costs and associated schedules for work components were developed on a bottoms-up or top-down basis.
- Vetted the DR Team's assumptions and judgment to measure whether these were well developed, including evaluating the overall reasonableness of management's direction to the DR Team to reduce cost and associated schedule and risk; and
- Measured effectiveness of the tools in place for developing the estimate and identified gaps in the team's use of those tools.

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project**

As noted in our prior report to the NOC, we emphasized to the DR Team the importance of properly characterizing the basis of the cost estimates it was putting forward for Board approval. In the case of the 4d Cost Estimate, the DR Team has properly characterized the estimate as one that generally meets the AACE's definition for a Class 3 estimate for the majority of program costs for larger projects and Class 5/4 for the balance. Typical expected accuracy ranges for Class 3 estimates are (-10% to -20%) on the low side, and (+10% to +30%) on the high side. For Class 4 estimates (-15% to -30%) on the low side, and (+20% to +50%) on the high side. For Class 5 estimates (-20% to -50%) on the low side, and (+30% to +100%) on the high side.

As mentioned above, BMcD/Modus performed reasonable sampling of the 4d Cost Estimate including:

- Detailed vetting of the current SNC/Aecon Class 3 estimate for the RFR work;
- Review of three BOP projects that total \$77 M, or 19% of the projected Basis of Estimate ("BOE") cost;
- Review of three Fuel Handling projects that total \$17 M, or 14% of the projected BOE cost.
- Review of selected line items in the Turbine Generator estimate that total \$9 M, or 22% of the projected turbine BOE costs for Unit 2.

In all, we considered approximately 53% of the project bundle costs. In this review, we vetted the nature of the driving aspects of these cost estimates, including: work hour estimates, quantities, labor rates and productivity factors, allowances, and the like. Our purpose in doing so was to confirm the reasonableness of the cost estimating process and the level of maturity underlying the information. In addition, we reviewed the development of the OPG costs for project management and support, which are essentially drawn from head counts of staff and flowed-out over time. This analysis essentially confirmed that the DR Team has prepared and presented an estimate that generally conforms, process-wise, to the AACE Class 3/4/5 definitions. This characterization is generally confirmed by the DR Project's current overall status at this time.

As noted, our focus in preparing this report has been on the DR Team's process, not on the outcome of that process. In reviewing the 4d Cost Estimate, we have not prepared or opined on the monetization of the estimate or any of its component costs. We did not prepare a check estimate to determine whether any cost items individually or in total were reasonable or attempt to determine whether the Project can be accomplished for the defined goal of \$10 billion.

In summary, BMcD/Modus found that the processes the DR Team used to develop the 4d Cost Estimate were reasonably robust and followed frequently seen practices as related to an AACE Class 3-5 estimate. The DR Team has also reasonably characterized the nature of the estimate that it has advanced for approval.

### **III. Characterization of 4d Cost Estimate**

The following is a summary of the major cost components in the DR Project and how they are characterized in the 4d Cost Estimate. As noted, approximately 64% of the Project's bundle cost has matured to Class 3 (or better). In the sections below, we focus on the areas with the largest implications to the DR Project and the most significant challenges we see the DR Team facing, as related to cost and planning definition, over the next year.

In this summary, we refer to some of the initial estimates by the different project and functional groups that were then subjected to challenge by the Project Controls team, RPET and the Project's VPs. We have referred to the resultant estimates to highlight the nature of those challenges and their reasonableness. The Project's VPs have broadly challenged the DR Team to refine its estimates over the next year to incorporate the results of the DR Project's planning effort and to look for ways to re-engineer how it is doing business through improved process definition, reduction in duplicative effort and further incorporation of lessons learned into subsequent units. From our view, these challenges were appropriate and generally well received, though achieving the desired results will require a determined effort, if goals are to be reached.

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

A. Major Projects

1. RFR Bundle

The RFR bundle's estimate is perhaps the most mature in the DR Project's overall 4d Cost Estimate. The estimate is largely based on SNC/Aecon's Class 3 estimate, which OPG approved on June 15, 2014. OPG's RFR team believed that SNC/Aecon's Class 3 estimate was conservative. SNC/Aecon's justification for its conservatism was to a large degree based on its view of the contract's terms and conditions, which require the use of predetermined values for tool testing and contain provisions SNC/Aecon interpreted as creating a major risk exposure for themselves. SNC/Aecon's estimate for the direct cost of the RFR work totalled \$2.02B, exclusive of contingency and fee, which according to the terms of the RFR contract will only be monetized as part the Class 2 Estimate SNC/Aecon is currently preparing. This estimate has matured significantly over the preceding Class 4 estimate utilized for 4c; specifically, it has evolved from an OPEX based estimate taken from the results of past refurbishments to a bottom-up, Darlington-specific estimate. In order to approximate the end-cost of the RFR work, OPG's team needed to provide its estimates for the contractor's fee, contingency, budget transfers and prospective change orders, and OPG-related costs, such as OPG's project management team. These portions of the estimate initially totalled an additional \$1.40B before the challenge process was initiated, resulting in an in-flight estimate of \$3.42B.

However, based on the OPG team's specific experience and in an attempt to rationalize the cost of the RFR work, OPG has embedded in the 4d Cost Estimate approximately \$700M in targeted reductions that it expects to realize over the next 6-8 months. These reductions emanate from OPG's view of the likely results of tooling performance guarantee testing in the reactor mock-up and its general reviews and challenges of the non-tooling items as part of the Class 2 estimate review, which may yield still further opportunities for reduction. With the reductions, the final value being carried in 4d for RFR is \$2.69B. Additionally, contract negotiations of the final target price as well as adjustments to existing terms and conditions will also be required. A further analysis of the ~\$700M in reductions is presented below and separated into three major categories:

- **Changes to SNC/Aecon's Staffing:** Based on its review of the Class 3 Estimate, the OPG team believes the estimated direct field labor ("DFL") and PMT costs are excessive. OPG seeks to reduce SNC/Aecon's DFL and the associated PMT supervision costs by changing the shift pattern from a 24 hour, 7 day per week critical path operation utilizing a 4 on/4 off, 12 hour per day shift pattern to two 10 hour per day, 6 day per week shifts. The change in the shift pattern should reduce the total number of people needed and as a result, reduce the staffing level of associated PMT personnel<sup>2</sup>. OPG also will request SNC/Aecon to further reduce its assumed PMT percentages to address redundant and unnecessary positions, which will most likely require a change to the impacting contractual language. These reductions amount to nearly \$289M of the ~\$700M total pool. These potential reductions have not been internalized in SNC/Aecon's estimate to date; thus the values contained in 4d are assumptions based upon the outcome of future negotiations. SNC/Aecon has asserted that its Class 3 Estimate PMT cost is a direct result of certain provisions in the contract that shift risk of potential claims from OPG to SNC/Aecon. Additional supervision is SNC/Aecon's method of mitigating that risk by staffing its team to catch any such issues. In this regard, it appears SNC/Aecon is using the PMT to charge OPG for an embedded risk premium that OPG may choose to manage differently. Resolution of this issue will likely require agreement on certain revisions to the contract or, at a minimum, a common understanding of the effect of the contractual provisions related to which party accepts certain risks within different threshold levels.
- **SNC/Aecon Recommended Changes:** SNC/Aecon has identified certain technical cost reduction opportunities that OPG must accept for the savings to be fully realized. These include: (1) elimination of the channel by channel draining, and (2) elimination of the calandria seal replacement. Upon OPG's agreement, SNC/Aecon can include specific estimate reductions in its Class 2 Estimate.

<sup>2</sup> This change has also been incorporated in OPG's supporting functions, who will work the same shift pattern.

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project**

- **Contract Provisions:** As with the PMT, many of the other assumed 4d reductions will require changes to negotiated provisions of the contract with SNC/Aecon. These items include: (1) a reduction in the contractually allowed 3% rework, which SNC/Aecon has applied to every work hour in the project, including for non-craft workers; (2) offsite infrastructure changes; and (3) alignment of incentives and disincentives to meet with the Minister of Energy's Long Term Energy Plan ("LTEP").

On this last point, we had previously noted in prior NOC reports that the incentives and disincentives in the RFR contract were structured on a four unit, comprehensive performance basis, with the goal to drive the contractor to constant improvement and successively reduce the performance schedule for each of the four units by set targets. Taken to its extreme, these incentives could drive SNC/Aecon to be less aggressive in saving schedule and cost on Unit 2 which would not align with the goals of the LTEP. OPG's Project VPs agree that the contract must have appropriate alignment of incentives to drive SNC/Aecon to the best possible performance on Unit 2, and has directed that the commercial strategy incorporate unitized incentives and off-ramps and seek to remove any unit-over-unit automatic triggers that are currently terms of the contract.

The OPG senior management team has taken the initiative to jump-start what could be a lengthy and difficult negotiation over the final target price for the work. Importantly, the OPG team has sought a reconciliation of the concepts that are embedded in the 4d Cost Estimate for RFR so that SNC/Aecon can include them as part of the Class 2 estimate. This will reduce churn and center the discussion on the result OPG wants to achieve. There is certainly risk in presuming the outcome of this negotiation, particularly since these cost reductions will have a significant impact on SNC/Aecon's anticipated fee for the project. Both parties are likely to have strongly held positions, and the risk of prior refurbishments has clearly driven SNC/Aecon to the positions it has taken to date. In recognition of this, senior management has also requested the RFR team to consider a "Plan B" of OPG self-performing/directing the work. We see this as important, not just as a basis for negotiating leverage but as a realistic mitigation plan in the event the parties cannot come together, or SNC/Aecon is otherwise unable or unwilling to perform.

## **2. Turbine Generator Bundle**

As with RFR, the Turbine Generator ("TG") bundle's estimate has significantly matured since the 4c Cost Estimate. This estimate has three main components: (1) the Alstom engineering and procurement contract; (2) SNC/Aecon's construction estimate; and, (3) OPG's project management estimate. The Alstom portion of the total TG estimate is largely fixed-price and represents approximately half of the total TG estimate. SNC/Aecon's estimate for construction has, like RFR, evolved to a Class 3 level estimate which represents another ~30% of the total TG estimate. SNC/Aecon's estimate was developed in cooperation with OPG and Faithful + Gould, who leveraged a significant amount of existing OPG maintenance data to build and validate the estimate. The final ~20% piece of the TG estimate are OPG's expenses, such as project management. Senior management issued two challenges to the Turbine Generator team to reduce and otherwise rationalize its staff: (1) a directive to rationalize its staffing plan to the execution schedule and significant reductions for non-critical path downtime; and (2) further reduce the execution cost by \$15M across all four units based on OPEX integration. The Turbine Generator team is committed to these reductions and has developed a plan to achieve these savings. In addition, further opportunities exist for reducing SNC/Aecon's cost as its estimate matures to Class 2 as it was generally accepted that the current Class 3 estimate represents SNC/Aecon's reasonable maximum cost. In addition, opportunities to achieve efficiencies in project management and support functions in conjunction with the RFR team have not been incorporated into the Class 3 estimate and will be addressed in Class 2. It should be noted that the future units will include the TG control work as part of Refurbishment, so there is a higher burn rate reserved for post-Unit 2 work.

## **3. Balance of Plant**

Over the last year, BOP work has matured though not at the pace expected due late released packages, and the scope of BOP work has been further rationalized. The BOP scope originally included 323 Darlington Scope Requests ("DSRs"). Between the Blue Ribbon Panel initiatives for 4c and reassigning SIOs to P&M (12 DSRs), the current BOP scope is comprised of 101 DSRs. Approximately \$343M of the 4d work items have defined scope, EPC bids and F&G estimates, and

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project**

are supported by Class 4 estimates. The remaining BOP work constituting \$38M has an estimated value in 4d that is at a Class 5 level estimate.

BOP went through the challenge meeting process and identified few additional reductions and shifts to contingent scope. In addition, management challenged the BOP team to realize an additional \$34M in cost reductions (\$4M in engineering and \$30M in execution). Currently, the BOP team can support \$22.5M of these reductions through specific cost cutting initiatives, though the remainder has been identified as risk. The most significant potential cost risk for RQE is the lack of engineering and planning definition for this work which we believe is relatively limited. The DR Team has established a stretch goal of May 2015 for engineering completion, with a final milestone of August 2015. There is a strong likelihood that BOP (and Shut-Down/Lay-up) will miss the stretch target, the consequence of which would be to increase the uncertainty bands around those select projects. We see this having a very limited impact on RQE, as discussed in 4Q report.

#### **4. Defueling/Fuel Handling/Specialized Projects**

These projects have increased by a total of \$77.8M (39 %) from 4c to 4d, and these increases are largely due to the following:

- Defueling: increase in FTE's transferred from Fuel Handling Refurbishment and new scope;
- Fuel Handling Refurbishment: increased EPC estimate for power track, a new execution strategy that added extra OBUs, and additional labor/core matrix resources;
- Specialized Projects: the SDS computer replacement estimate increased due to added labor costs and scope changes based on a better understanding of the project's requirements.

Similar to Turbine Generator, these projects have been challenged to reduce and rationalize staffing to match the performance period of the actual work.

#### **5. Shut-Down/Lay-up**

These various projects have increased in aggregate by 73% due to maturation of scope, improved estimates based on vendor bids, increases in project management/overhead, and higher than anticipated engineering costs. It appears the velocity of these increases is due to a severe understatement of costs in the 4c Cost Estimate basis of estimate. Even with these increases, the Shutdown/Layup team reports it saved significant time and cost due to implementation of the collaborative scoping process and integrating engineering and estimating into the scope definition process at an early stage. Shut-Down/Lay-up is subject to many of the same risks as BOP, as discussed.

#### **6. Campus Plan Projects**

The Campus Plan Projects including D2O Storage have increased by \$285M, a 52% increase over the \$552M carried in the 4c Cost Estimate, for a current total of \$836M<sup>3</sup>. Excluding \$376M for the D2O Storage Facility, which has a different trajectory, and some small projects not started that will be cancelled, and D2O, the aggregated increase during this period for all remaining P&M projects is 23% (\$375M at 4c to \$460M at 4d). Recent history shows the cost velocity of these projects is generally upward, particularly as seen when engineering nears completion and/or field execution begins. The remaining P&M projects are still showing the effects of poor initial scope definition and cost estimates, though are not generating the same amount of overrun as D2O Storage because these projects are smaller in size. In the past quarter, P&M has started forecasting the estimate at completion ("EAC") of its projects and incorporating this into the overall DRP EAC. BMCD/Modus will continue to monitor the effectiveness of this forecasting and we recommend that P&M take a greater examination of the cost underpinnings, including enhanced trend analysis, greater detail in the change control process and more effective vetting of information from vendors.

We refer in our main report this quarter to the initiatives that P&M's management is undertaking to bring better predictability to these projects. Nonetheless, a series of trends has been established for these projects that will be difficult

<sup>3</sup> All figures include interest and contingency for this comparison.

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

to arrest, in large part because of unrealistic initial estimates. We have recommended that the Project retain sufficient funds to allow for likely cost increases; thus, OPG has included \$73M in contingency at the program level based on these trends.

With respect to the D2O project, OPG is still considering what direction to take in light of Black & McDonald's termination; thus, it is too early to foresee the end cost of the project at this time. However, the risks to the Refurbishment Project's breaker open date are foreseeable. It is our recommendation that the DR Team have a robust mitigation plan in place for draining the water from Unit 2 that reduces or eliminates that cost and schedule impact. It is our understanding that the DR Team is readying this alternate plan and the accompanying business case in once it has the necessary information.

**B. Functional Costs**

The functional costs on the project comprise \$2.3B or ~30% of the overall DR Project before contingency. There are many opportunities in these areas for OPG to streamline and reduce its costs as the DR Team develops specific project management plans through execution. There is a significant amount of work that will need to be done prior to RQE in order for the various groups to align themselves as to the best and most effective way to manage execution of the Project. Additionally, the challenges made by senior management need to be internalized by the functional groups and incorporated into their estimates by making reasonable changes to their base plans that will support these reductions; we understand that these actions are underway and will be tracked to completion, as noted previously in this report.

**1. Operations & Maintenance**

Operations & Maintenance's 4d estimate represented perhaps the greatest overall growth in maturity between 4c and 4d. The Operations & Maintenance team's cost back-up and analysis was detailed, straightforward and verifiable, and a considerable portion of its estimates are based on a combination of past experience with similar work and vendor-supplied bids.

However, the results of Operations & Maintenance's effort showed an increase over 4c of \$103M, or 11%. Overall, the estimate represents a more mature picture of Operations & Maintenance's staffing levels and functions than was presented in the 4c Cost Estimate. The largest of the increases from 4c are as following noting that some of these increases were offset by reductions elsewhere in Operations and Maintenance:

- **Radiation Protection: (total \$264M; variance from 4c of \$97M)** – increase due to (1) additional scope and better understanding of requirements; (2) normalizing FTE's and unit pay rates.
- **Maintenance: (total \$347M, variance from 4c of \$28M)** - this line item includes \$138M of cyclical outage maintenance cost that the Station would have incurred regardless of Refurbishment.
- **Operations & Maintenance Training: (\$39M, variance from 4c of \$7M)** – this line item has been underspent though with the directional change in Fuel Handling, Operations & Maintenance will now have to qualify an additional 40 more personnel.

The information Operations & Maintenance provided is sufficient for senior management to review, vet and make decisions regarding Operations & Maintenance's utilization for the DR Project. Senior management challenged Operations & Maintenance to reduce its overall staffing by 5% or \$50M and to look at achieving economies of scale and elimination of duplication of effort between the Project and the operating Darlington units. The work in support of the major projects needs to be further rationalized based on a more mature execution schedule and division of work responsibilities. In addition, Operations & Maintenance was directed to reduce its effort to straight time shifts and optimize staffing where possible to reduce overtime and weekend work whenever possible. It is our understanding that the Operations and Maintenance organization has already embraced these cost reductions as part of its overall plan going forward.

**2. Engineering**

Engineering and each of its subsidiary functions, including Nuclear Safety, exhibited considerable growth from the 4c Cost Estimate to 4d. The primary driver for this growth was altering the duration of engineering activities, adding key functions

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project**

and assuming a different business model (i.e. Active Management). However, Engineering has another role to play in the cost picture for the DR Project. Engineering is also the leading indicator of project maturity for the purpose of classifying the individual components of cost. As we have previously stated, having reliable and verifiable metrics showing the pace and completion of engineering is an essential element to underpin a high confidence RQE. The DR Team understands this, though the velocity of engineering progress is difficult to assess based on the current maturity of the metrics. For this reason, we have recommended that the engineering schedule needs re-prioritization and more development so that more emphasis is placed on the engineering product with the highest value targets for RQE. Since the goal for the milestone is to improve confidence at RQE, it may be the case that certain of the BOP and Shut-Down/Lay-up packages that are lagging behind are tilting the metrics in a manner such that the more important, higher value work is not being addressed in the right order.

From a functional cost perspective for 4d, Engineering's most notable issues and risks are as follows:

- **Performance and Deadlines:** The current velocity of detailed design work needed to complete Engineering Change packages shows that there will be considerable stress on the DR Project as a whole to meet the stretch goal of May 15, 2015 for completion of detail design, though these metrics show the major work underpinning the Project's cost estimate will complete on time. Thus, it is very likely that the costs will rise due to acceleration of the effort, and the costs will extend beyond current amounts due to late completion of the work. The impact to the budget could be particularly acute if the acceleration effort is spent on lower-valued engineering work, as noted above.
- **Processes and Procedures:** The DR Project's engineering leadership has committed to reducing the overall cost and taken the challenge to "lean out" its processes, which its team believes can net ~15% savings. We agree that Engineering needs to make its processes more efficient and have seen the benefits in other companies, but this is a goal that will take time and concentrated effort to achieve. The tendency when work is behind is to accelerate the effort utilizing additional resources and overtime, both resulting in additional costs. If Engineering is to achieve these significant savings, it must go after this immediately with a plan, targeted areas for reduction and appropriate metrics tracking the results. The initiative of Collaborative Front End Planning should be yielding cost savings, in that speeding the process means fewer people churning away hours. However, while there have been some anecdotal evidence of cost reduction, it is not being visibly measured. The cost savings from process efficiency improvements and any future initiatives also need to have visibility.
- **Changes to Core Business:** Challenged reductions in Nuclear Safety and Component Engineering will require OPG doing business differently, and our experience is this takes considerable time and often meets with resistance from outside stakeholders. If these challenges are to be achieved, the DR Team will need to move forward with tangible strategies and get internal agreement quickly or these projected cost savings will prove difficult to realize.

As with Operations & Maintenance, the Engineering team's overall estimate quality increased since the 4c Cost Estimate so the basis for measuring cost performance (and initiating any more specific cuts) should be readily apparent.

### 3. Other Functional Areas

4d's development provided the DR Team with the opportunity to further develop and refine functional support organizations that were short of details in the 4c Cost Estimate. Some of this increase in maturity is reflective of the DR Team leadership's movement toward an organization that is set-up for active management of the Execution Phase. In this sense, the 4d Cost Estimate represented the first attempt by the DR Team to evaluate and monetize the level of effort needed to support execution. Thus, while the overall effort to develop the plan was necessary, the integration of these support functions is still in its relative early stages. The larger increases in Functional cost were as follows:

- **Execution Organization:** The 4d value of \$178M is \$35M over 4c. At the time of the 4c Cost Estimate, the development of the Execution Organization was in its early stages. Since 4c, the new Project VP (Mike Allen) has

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

developed a much more formative and realistic plan for actively managing the execution of the work. This organization includes the personnel needed to clear process barriers in the field and verify installed work quantities, both of which are needed to assure that OPG is receiving proper value for money.

- **Outage Execution:** The Outage Execution organization is responsible for planning and coordinating all of the activities leading up to, throughout and closing out assigned unit outages. Outage execution must integrate and coordinate the effort of individual project teams with cyclic maintenance, operation and layup requirements. As with the Execution Organization, at the time of the 4c Cost Estimate, the Outage Execution plan was not fully developed, and subsequent changes in the management team have brought greater focus to its function and accountabilities. The final, post-challenge increase from 4c to 4d for this function is \$0.3M.
- **Supply Chain and Contract Management:** Since 4c, costs have increased by 9.4%. These organizations are small in the grand scheme of the Project, though there was some initial confusion within the team regarding cross-over roles and responsibilities that should continue to be resolved prior to RQE.

Increases in bundle costs from 4c to 4d put pressure on the functional groups to hold the line, if possible. The challenges from senior management were for the functions to reduce and rationalize staffing in smart ways that take advantage of the Project's extensive planning effort; reduce unnecessary work; and, maximize the costs attributable to the direct work. This is balanced against the need for Unit 2 to be the collection point of OPEX for the remaining units, and as the first unit, it will certainly require more staff and overall effort; as shown in the overall staffing plan. Management has further challenged all functions to reduce their staff for the subsequent units. For these various challenges to materialize, the DR Team must be subjected to a rigorous, continuous improvement effort, as we discuss below.

### C. Contingency

At the outset of 4d, the Risk Team developed a "white paper" that articulated its plan for developing and monetizing contingency. The 4d effort is generally compliant with the process laid out in the white paper, but for the involvement of estimating subject matter experts ("SME's") in determining refined 3-pt estimates for discrete risk impacts and burn rate determinations. The Risk Team's effort was compressed because the development of the Project's base costs took up so much time that little was left for the estimating team to get involved in the contingency development process. Because contingency cannot be effectively calculated on a base estimate that is still changing, the Risk Team had only one week to perform the 4d contingency calculations where, ideally about three weeks or more are necessary. While some limited contingency work was performed in parallel with the estimate development before it was locked down, the majority of the effort had to wait for the 4d "data freeze," when the base estimate was finalized and subsequently the inputs to the contingency process were finalized.

#### 1. Uncertainty Modeling

Estimating uncertainty accounts for potential variability of that portion of an estimate that is undefined. Estimating uncertainty was included for the project bundles but not for the functional groups in the 4c Cost Estimate, though such was included in 4d. However, because of time constraints, estimating uncertainty in 4c was largely based on judgement of the Project Controls leads rather than stochastic modeling.

For 4d, fifty-eight activities on the Project's critical path were analyzed by the DR Team and a three point distribution was developed for each activity.<sup>4</sup> The Unit 2 schedule was evaluated assuming that the same three-point estimates applied to each of the subsequent units. No efficiency gains were included because in consultation with the project managers as there was no real basis to apply efficiencies to the three-point estimates at this time. This resulted in an 8 week schedule impact per unit for contingency purposes, which was monetized on an assumed \$500K/day basis. Probability ranges were then assumed to be the same for all four units. Additionally, the daily burn rate was assumed to apply from start to finish and did not consider variations in burn rate over the life of the project.

<sup>4</sup> The assumed critical path was for a 36 month outage, not the potential 39 month schedule that emerged as a potential planning assumption during the RFR 4d challenge meetings

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

## 2. Discrete Risks

For discrete risks, the project managers provided input regarding which risks should have specific contingency amounts applied and which should not (e.g. if the risk was low or was likely to go away). This resulted in 96 discrete risks analyzed for contingency. Post mitigation scores were used as the starting point of the analysis and anything with a low risk score that was not already eliminated by the project managers was not included. A high level review for double counting was then conducted with limited identification of such duplication. Schedule and cost three-point ranges were developed based on ranges associated with the risk register entries. Some rationalization was performed if the high or low end of the range was considered inappropriate. Correlation among the risks was not addressed. Bundle-level critical path activities (i.e. the critical path for each project when looked at individually, not the program-level critical path that runs through the RFR work) that had a schedule impact used an assumed rate of \$50K/day. This assumes that only the individual non-critical path project would be delayed, and while this carries some additional costs, it would be significantly lower than if the entire project was delayed. As indicated above, the primary critical path impacts (primarily the RFR risks) were monetized at \$500K/day. The project managers were asked to review the contingency after the analysis and some minor adjustments were made by the teams.

We believe the above contingency analysis performed for 4d is appropriate for a Class 3/4 level estimate. Additionally, the processes used to determine the contingency were a good start for the processes that will need to be employed for RQE. However, the rigor and comprehensiveness of the contingency analysis will need to be significantly increased to support RQE. In addition, an earlier data freeze date is necessary to allow the Risk Team enough time for a robust contingency analysis.

## IV. Major Observations and Recommendations

BMCD/Modus has the following observations regarding the 4d Cost Estimate process and associated recommendations for advancing the estimate to RQE. It should be noted that as part of our ongoing oversight of the 4d Cost Estimate process, we have provided our input to senior management and a high percentage of the recommendations we discuss herein have already been recognized and/or assimilated by the DR Team.

### A. Risks and Opportunities for Cost Reductions

The following summarize certain cost reductions made during the 4d Cost Estimate process that will require additional follow-through and actions in order for the Project to ultimately realize the projected savings for RQE.

- **Savings Achieved through Commercial Negotiations:** The DR Team made significant assumptions regarding the desired/expected outcome of commercial negotiations with its prime vendors which will occur in the coming months. As noted, the DR Team has embedded critical assumptions in 4d Cost Estimate regarding cost reductions and other concessions it will seek from SNC/Aecon in negotiating the final terms of the RFR and Turbine Generator upgrade contracts. These reductions account for over \$700M reduction from SNC/Aecon's Class 3 estimates. These various cost reduction proposals identified by the DR Team have reasonable basis, and some reductions involve OPG invoking conditions on SNC/Aecon must accept without negotiation. Nonetheless, wrapping these reductions into SNC/Aecon's Class 2 estimate and the ultimate target price that emanates forth will require the full agreement of SNC/Aecon. Both OPG and SNC have almost equally strong negotiating profiles for various reasons and this may translate into unfavorable contract value movements for either side.

The DR Team's senior management has begun exploration of these opportunities with SNC/Aecon. We agree with the timing and substance of these efforts and see a meeting of the minds between OPG and SNC/Aecon as essential to ensuring the viability of the Project at RQE. Senior management has made it clear to SNC/Aecon's executives that the approval process alone will require multiple stages, thus the need to jump start the discussions. SNC/Aecon's senior management team initially balked, though now appears to be aligned with the DR Team's view. Nonetheless, the parties need to work together on many core issues as soon as practicable, given the strong likelihood that this negotiation will require internal and external alignment of goals, significant effort and senior management attention from OPG and each of SNC/Aecon's partners. Senior management has also

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

asked the commercial team to accelerate its development of a negotiating strategy to support these efforts. We have also recommended that the DR Team identify the risk of not achieving an optimal result from these negotiations and develop a contingency plan in the case of failure.

- **Reductions in OPG Functional Cost:** ~30% of the line items in the 4d Cost Estimate are costs associated with OPG's functional management of the work. Senior management has challenged the functional groups to reduce staffing levels by: "projectizing" costs where possible, thus allowing costs to be based upon actual project needs and reducing redundancy; changing processes where current methods create unnecessary churn; reducing estimates over the life of the Project based on achieving subsequent unit savings; and looking for economies of scale with the operating unit and other center-led OPG functions. Each of the functional groups was issued an across-the-board challenge to reduce cost by 5%, which given the size of the functional groups does not appear to be unreasonable, at least at a high level. However, the functional groups must internalize the cost reduction and incorporate it into their base plans rather than seeing it as purely as a management directive; OPG is tracking the completion of each of the adjustments and many of these cost challenges have already been firmed up into the base plans. The major challenges ahead as discussed herein include:
  - Operations & Maintenance – \$50M or 5% reduction in all areas excluding Radiation Protection;
  - Engineering - 5% across the board reduction (on top of a \$50M reduction it previously acknowledged), which Engineering has committed to achieve via reducing unnecessary processes, realizing the benefits from collaborative front end planning and rationalizing staffing for replication efforts on future units;
  - Execution Organization – reduction of \$25M (9%) to account for the benefit of the Project's Definition Phase planning; and
  - Nuclear Safety - \$20M challenge to halve the increase from 4c Cost Estimate.

It is our understanding many of the above cuts have been incorporated into these functional budgets, which is a good start. Such initiatives necessary to make these cuts will require consistent effort and transparency which bear management attention and wide visibility. Critical to both will be a needed ramping-up of the analytics needed to assess planning the work that each group is performing. We have previously recommended to Engineering that it ramp up the development and use of meaningful progress metrics and capture cost and schedule trend data; without this information, assessing the possibility of cost reductions within engineering disciplines is problematic. To date this has not been achieved. In addition, OPG still must consider whether it should carry costs for staff and work that would have been incurred regardless of Refurbishment, such as the cyclical outage work.

The 4d Cost Estimate includes significantly more robust functional definitions and associated estimates for the Execution and Outage Management organizations. The estimates and plans included in the 4c Cost Estimate were lacking such definition and the team has addressed this significant gap. Now that these and other functions are better-defined, management can further refine the basis of these costs and make decisions regarding the effort necessary for these costs. The senior management team has given the directive to the functional groups to re-engineer aspects of its business, find new ways of doing business that are less cumbersome and recognize the benefits of the Definition Phase planning effort.

- **Project Bundle Reductions:** Senior management similarly challenged the Project Managers to reduce their PMT costs for managing the major project work. These challenges were based largely on the recognizing benefits from the planning effort during the Definition Phase. Our team interviewed the Project Managers for each of the bundles to pulse their respective plans to achieve these savings and found general acceptance of the premise, though the size of certain reductions (particularly for BOP) may be difficult to achieve without reductions in scope. Potential opportunities for reduction in cost via the continued maturation of the planning effort also exist. As noted, other than RFR, Turbine Generator and Fuel Handling, the majority of the remaining project bundle costs are in the Class 4/5 level at this time.

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

- **Campus Plan Risks:** The Campus Plan Projects provide a significant and distinct risk for the Project and the 4d Cost Estimate. The upward velocity of cost has continued as these projects advance. Moreover, there is low confidence in the quality of the estimates for the remaining work. The DR Team has taken action to make ES Fox's estimating standards more transparent, but much more effort is required before there can be the needed levels of confidence in the Campus Plan Project's cost estimates. The team has also set forth goals to continue improving the quality of the Campus Plan Projects' schedules.

While these negative performance trends continue, the overall cost growth (except for D2O Storage) should not be a major threat to RQE, because these are mostly smaller projects. Nonetheless, the potential adverse impacts from the Campus Plan Projects may evidence themselves in the following ways: (1) additional increases in direct cost of the projects will drain contingency and management reserve from Refurbishment; (2) the schedule risk many of these projects carry (particularly D2O Storage) could impact the start of Unit 2's Refurbishment; and (3) the ongoing distraction from reworking the execution of D2O Storage. As a result, we recommend that the DR Team carry sufficient allowances at the program level to compensate for the strong likelihood of future cost overruns. In addition, the DR Team should advance the preparation of mitigation plans in the event the Campus Plan Projects cannot be executed in time. Included in 4d is an additional program level contingency in the amount of \$73M to account for potential cost increases beyond the amount within approved estimates for Campus Plan projects.

- **Contingency and Management Reserve:** We have noted ongoing improvements in the development of the Project's risk management system, though because of the size and importance of contingency to the Project, more improvements are in order for RQE. The team has improved the internal challenge process related to the risk register and the reporting metrics produced by the Risk Team have increased in quality. The DR Team's focus on risk management must continue advancing, as the Project's increase in maturity to RQE should translate to contingency based on deterministic risk analyses and the development of robust mitigation plans. Moreover, the quality of estimates for mitigation plans and monetized risks must increase above the current Class 5 level.

For RQE, contingency should be based increasingly on determined values and less on percentages of cost and other less specific stochastic modeling. The Project has the benefit of OPEX from prior CANDU refurbishments and other energy industry megaprojects that should allow for a focused approach to contingency. We believe the risk management effort for RQE could be further enhanced by a cold-eye challenge from an experienced external party, which would be fully justified given the size of the Project's contingency. We also recommend the DR Team track the puts and takes from contingency and management reserve in a visible manner through the next year as project estimates continue to mature.

B. Recommended Process Improvements for RQE

BMCD/Modus offers the following recommendations for the DR Team regarding improvement of the cost estimating process for RQE based on the 4d Cost Estimate OPEX.

- **RQE Needs a Detailed Schedule of Activities:** The effort to develop the underpinnings of the 4d Cost Estimate was inconsistent and was too often distracted by ongoing work on the Project, resulting in significant activity occurring late in the process. Prerequisite estimate work was also late and would have benefitted from a schedule reflecting estimate integration for both OPG and the contractors. As a result, senior leadership challenges and input to 4d Cost Estimate occurred in a condensed period of time. OPEX from the 4c Cost Estimate effort indicates much the same occurred last year. In addition to the challenges, time available to properly develop contingency was compressed to a point where some contingency elements had to be created by an abbreviated process that likely resulted in a compromise of quality and reasonableness. Developing a high-confidence RQE will require a continued and consistent effort, and having a detailed P6 schedule of activities with appropriate definition of accountabilities, deliverables and senior management weigh points is essential to map out the time between now and RQE. Sufficient time and energy must be devoted to developing such a schedule, and such requires full buy-in from all of the Project's stakeholders. The DR Team agrees that this is needed. The DR Team's leadership is prepared to initiate the development of a schedule as well as define its detailed expectations for the broader DR

Supplemental Report to NOC – 4<sup>th</sup> Q 2014  
Darlington Nuclear Refurbishment Project

Team, and will attempt to utilize the momentum from 4d Cost Estimate to maintain this effort though RQE. However, we caution the DR Team not to overly complicate this exercise, as development of the Schedule needs to occur with expediency and urgency. We will continue to monitor their progress over the coming weeks.

- **Quality Assurance Should Be Increased and Embedded:** The 4d Cost Estimate lacked a focused program of quality assurance checks. As an example, the effort to vet the 4d Cost Estimate's development was impaired by inconsistent adherence to the standards the Project Controls team promulgated at the beginning of the process. As a result, the challenge process was bogged down by repeated internal checks of information. Within the industry, owners of mega-projects have invested considerable sums in quality assurance in the development of estimates to combat potential double-counting, errors in spreadsheets and ensuring the documentation backing-up the estimate is complete; OPG should follow suit. Based on the OPEX from the 4d Cost Estimate, the aforementioned schedule should allow for proper windows of time for quality assurance. In addition, the RQE estimating effort would be strengthened by full implementation of the US Cost system, which OPG is currently pursuing.
- **Documentation of Assumptions for the Basis of Estimates Needs Attention for RQE:** The process issued by the Project Controls team to the DR Team at the outset of the 4d Cost Estimate development included detailed guidance and templates for developing all of the documentation needed for vetting of the individual estimates. The project teams followed this guidance for purposes of developing their monetized inputs to 4d. However, the different groups used varying ways to develop the collateral information (i.e. analysis, management plans, organization charts) supporting the cost estimate. Management is now undertaking an activity to have all assumptions documented into the ADA database by November 13, 2014. For RQE, we recommend the team employ a more standardized approach for developing the documents that explain the elements of their cost estimates, and utilize those as a guideline the best of the submissions from 4d, including:
  - Functional and program management plans which incorporate all major position descriptions and accountabilities, and a fully developed staffing plan;
  - Project management plans which clearly identify and qualify vendors' pricing, project risks and opportunities, and management plans that are right-sized for Execution Phase; and
  - Clear requirements on the process for documenting assumptions and decisions.
- **RQE will Require More Timely and Determined Vetting of Underlying Assumptions:** Building confidence in the final characterization of RQE will rely on senior management gaining a full understanding of the underpinnings of the Project's costs so that reasonable and principled decisions can be made. As we have observed, senior management has had to issue cost reduction and other challenges to the Team in order to bring cost estimates in line to reign in project costs, which for RQE would not be optimal.

To address this, the RQE effort needs to be organized so that there are multiple weigh points for senior management to test the development and maturation of the Project's costs. We recommend that the schedule of RQE events include such weigh points so that senior management can stay informed of the RQE build-up, make interim decisions that impact cost and issue challenges in a timely manner so that they can be principally answered long in advance of RQE's conclusion. The schedule should also be reflective of the needs for senior management to appropriately and adequately inform the Board, the Shareholder and other key external stakeholders.

- **Characterizing the RQE Result:** The DR Team has committed to providing an estimate for RQE in the Class 2/3 range, which is appropriate for establishing the Project's control budget against which the Project will be measured until completion. However, even a Class 2 (let alone a Class 3) estimate still has an expected range of variability, and in the industry at large, a control budget is not considered a locked-down, never-to-change prediction of final cost. This is especially true for projects as long and complex as the Refurbishment, and which is likely to be executed in the face of a challenged labor market. OPG should consider expressing the RQE as a point number within a reasonable range of cost outcomes a Class 2/3 estimate would presuppose. By doing so,

**Supplemental Report to NOC – 4<sup>th</sup> Q 2014**  
**Darlington Nuclear Refurbishment Project**

OPG would provide its confidence level in the RQE in the context of the reasonable outcomes that such an estimate could predict at this stage.

Overall, the DR Team has shown signs of enhanced performance in the year between 4c and 4d, and the resultant 4d Cost Estimate reasonably reflects the current nature of the Project's maturity when it comes to cost. This effort has also yielded significant lessons learned that the DR Team must internalize for the sake of RQE's success. Most importantly, the RQE effort will be significantly more involved and must capture the current focus and momentum gained from 4d in order to be successful.

# **Report to Nuclear Oversight Committee**

## **1<sup>st</sup> Quarter 2015**

### **Darlington Nuclear Refurbishment Project**

**Burns & McDonnell**  
**Modus Strategic Solutions**

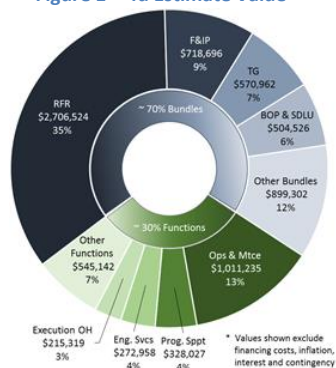

**March 12, 2015**

## I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company (“BMcD/Modus”) provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors (“NOC”) regarding the status of the Darlington Nuclear Generating Station’s Refurbishment Project (“Project” or “DR Project”) as of February 25, 2015. Our main focus for this report is the status of the DR Team’s preparation of the Release Quality Estimate (“RQE”) that will be submitted to the Board in November 2015. We also provide an update on the larger Campus Plan Projects.

### A. DR Project Cost and Estimate Overview

Figure 1 – 4d Estimate Value\*

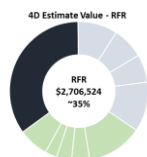

For purposes of evaluating the DR Team’s progress in preparation for RQE, we have provided the adjacent Figure 1, which summarizes the current 4d Cost Estimate into its component parts. The following are the most notable cost elements of the DR Project at this time:

- ❖ **RFR** constitutes approximately 35% or \$2.7B of the DR Project’s estimated costs;
- ❖ **Turbine Generator** constitutes approximately 7% of the DR Project’s estimated costs;
- ❖ **Balance of Plant and Shut Down/Lay-up** constitute 6% of the estimated costs; and
- ❖ **All Functional Groups** constitute approximately 30% of the current cost estimate including: Operations and Maintenance (13%); Engineering (4%); and Execution (3%).

As the inputs to RQE progress, the DR Team will be comparing its revisions to the breakdown presented here from the 4d estimate.

Over the last Quarter, the DR Team has spent a significant amount of time evaluating its plan and processes for developing the components of RQE, including improving the data the team and management will need for analysis and establishing confidence. The following is a brief summary of the status of the major inputs to RQE:

#### Retube and Feeder Replacement:

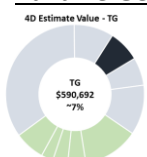

SNC/Aecon’s Class 2 Estimate is the single largest input to RQE. OPG’s Project Team recognizes the importance of this estimate and had requested SNC/Aecon to advance the delivery date to April 10, 2015 (from its original plan May 15, 2015).

OPG has granted a 2-week extension to April 24, 2015

The OPG team is preparing for this review period and intends to vet the various estimate components to ensure they meet the DR Project’s needs. Also,

OPG’s Project Team is mindful of the Campus Plan Projects lessons learned and thus rejected SNC/Aecon’s estimate. The OPG team has a clear understanding of the issues that need to be resolved to arrive at final target price with SNC/Aecon, though significant work remains, thus the current risk level.

#### Turbine Generator:

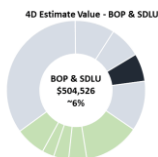

SNC/Aecon is on pace to complete its Class 2 Estimate by late 1Q for Unit 2. Some commercial issues related to the phasing of the turbine generator work over the four units will need to be resolved.

#### Steam Generator:

No issues are apparent at this time; these estimates should be sufficient for RQE.

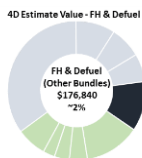

## Balance of Plant/Shut Down-Lay-up:

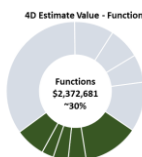

Detailed engineering for these bundles will not be fully complete by the May 15, 2015 target date; thus, development of Class 3 estimates for this work will be challenged to meet the RQE milestone. However, as we previously noted, from a cost standpoint, these estimates in total constitute approximately 6% of the direct costs of RQE, and the non-modification work (approximately half of Balance of Plant) is not engineering dependent and should have mature estimates for RQE. Balance of Plant and Shut Down/Lay-up project teams are proceeding with developing estimates based on the best possible information. The team is committed to carrying appropriate contingency for remaining uncertainties within RQE.

## Fuel Handling/Defueling:

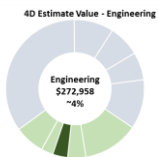

The DR Team is targeting Class 3 level estimates for RQE, and this appears to be an achievable goal, though some challenges remain with vendor submissions for non-critical path work. Defueling constitutes only about 2% of the direct costs of RQE, but it has a much higher risk profile due the reactor's defueling which occurs on the critical path. Therefore, careful planning, risk mitigation and adequate contingency are essential. Execution of the Fuel Handling Equipment Reliability plan is underway to ensure uninterrupted defueling operation.

## Functional Groups:

Currently the DR Team is placing adequate focus on development of the functional group (indirect) costs. The DR Team has addressed a gap from 4d and is committed to developing detailed functional management plans that will allow management to fully vet all critical planning bases for the DR Project's management team. The functional groups must also follow-through on commitments for cost reductions included in the 4d Estimate by incorporating those reductions into their management plans.

## Detailed Engineering:

The majority of the Project's detailed engineering should complete by May 15, 2015. While there are certain to be outliers to this milestone, the Project Team should be in substantial compliance with its goal to define engineering and scope sufficiently to support RQE.

## B. Campus Plan Highlights

- D20 Storage:** As of this writing, the team is in continued negotiation with the ESMSA vendors over the D20 Storage Building's mechanical/electrical/plumbing ("MEP") completion package, and is evaluating the risks associated with this award. Construction of the foundation is ongoing though with some impacts from weather, and P&M is attempting to mitigate future delays by directly purchasing over 600 valves needed for construction.
- ES Fox Resources and Capacity:** ES Fox's field construction was impacted by two separate High MRPH safety incidents; these events plus ES Fox's overall support of the P&M and Refurbishment projects contributes to existing concerns regarding ES Fox's capability to support the volume of its Project work. OPG senior management has raised these concerns with ES Fox, and corrective actions are underway. ES Fox has committed to adding resources in key areas, including project management and project controls.
- P&M Staffing:** P&M has added resources at the Director level and is embarking on additional training and instruction for its management team, including inserting lessons learned to date from the Campus Plan Projects.
- P&M's Project Controls:** P&M's Project Controls will consolidate under Refurbishment. This means that common processes and procedures, including using work-hours for schedule performance tracking, should be employed for future work, including D20 Storage's completion. However, many of P&M's projects will not be fully standardized. P&M has several initiatives underway with the Project Controls team to track these projects, as discussed below.

## II. Refurbishment – Areas of Focus

### A. RQE Processes, Procedures and Team Alignment

The DR Team has formalized its RQE processes in conjunction with the RQE Roadmap presented to NOC in the January Meeting. These processes include a full re-examination of the requirements for each sub-project's Gate 3 submissions and Functional Management Plan ("FMP") submissions. In developing and finalizing these processes, the DR Team has addressed many process gaps BMCD/Modus identified in the 4d Cost Estimate regarding underlying documentation, quality checks, and assuring proper time and opportunity for management vetting of the results.

- ❖ **Schedule:** The RQE Roadmap has well defined milestones that have been fully vetted within the DR Team, and who is being held accountable to meet deadlines. The RQE Roadmap provides sufficient margin for developing program-level reviews for quality and contingency development. The DR Team has set goals for multiple RQE deliverables, including project playbooks, execution plans and improved functional management plans that are due in 1Q 2015. The detailed RQE working level schedule remains under development and will be completed in early March. The RQE team will conduct weekly meetings to review the schedule for adherence with dates and quality of the products.
- ❖ **Estimating:** The team has rolled out new processes that will be applied to estimates for the projects and functions. The largest projects (RFR, Turbine Generator) are currently following estimating processes that conform to the new standards. This process moves the DR Team from parallel independent estimating used for validating bid proposals, which sometimes created confusion, to increasing focus on vetting of the estimates the contractors and work groups provide. This should provide greater confidence in the estimates underlying RQE. Moreover, previous quality concerns are being addressed with new processes.
- ❖ **Documentation of RQE:** The DR Team is preparing the following for RQE that will, when complete, provide a solid basis for vetting and a baseline for future comparison to actual project performance:
  - Data alignment to allow for transparency in support of project and regulatory reporting
  - Functional Groups are required to submit Functional Management Plans in advance of and in support of staffing estimates;
  - Project Teams are preparing "playbooks" that document execution method and other estimating considerations;
  - Project Teams and Contractors are engaged in "Day-in-the-Life" reviews to fully vet execution planning details, mitigate potential gaps, and consolidate similar common work scopes.

We have additionally recommended the DR Team develop a formal division of responsibility ("DOR") matrix that clarifies goals, highlights potential gaps in performance and memorializes accountabilities.

- ❖ **Gate 3 Process:** The RQE team has re-evaluated and re-issued the process for the coming Gate 3 reviews, which are the individual projects' primary RQE inputs. The process has established clear rules for developing the documentation for Gate 3s, as well as a typical sequence of events so that both the Project Team and the reviewers can be adequately prepared. In addition, Finance is prepared to provide "Black Hat" reviews of the Project Team's gate packages to provide appropriate challenges to the information presented. The Gate 3 reviews are scheduled for 2Q and will be a leading indicator of the overall progress to RQE.

### B. Engineering Status for RQE

As of February 1, detailed engineering for the DR Project was 79% complete. The most significant design packages – RFR (~69% complete) and Turbine Generator (~90% complete) – have produced sufficient engineering product for their respective Class 2 estimates. Lagging behind are BOP and Shut-Down/Lay-up (~30% complete), and completion of the BOP engineering is a concern. However, the DR Team's overall engineering effort should produce sufficient output to adequately support RQE and reduce the risk that late engineering work presents. The engineering process has been

significantly aided by:

- ❖ **Front End Planning:** The DR Team and the vendors are working together, increasing the efficiency of engineering and providing a more complete product. In turn, the improved engineering product allows for better assessment for the purposes of developing RQE estimates.
- ❖ **Active Management:** OPG's leadership as design authority and proactive management of the engineering phase is driving more timely and appropriate decision making.
- ❖ **Collaborative Approach:** The placement of resident engineers in the offices of the engineering service providers is expediting the engineering process.

However, Projects & Modifications, who adopted these initiatives after the Campus Plan Projects were underway, continues to struggle with delayed engineering and problems masked by a lack of vendor transparency.

After considerable effort, the DR Project's engineering schedules are now almost completely integrated at level 3, many of these are also resource loaded. Consequently, the DR team now has insight into the resource demands created by the Project's design effort. The availability of the detailed design information is allowing for very tight monitoring of the completion of the detailed engineering design, and identification and resolution of remaining delays. This same approach now needs to be applied to downstream activities in order to forecast future critical resource needs in advance of the peak demand. The schedule and performance metrics and the quality dashboard deployed by Engineering allow the DR Team the opportunity to plan around and mitigate delays and issues with resources and the quality of the engineering product. With the possible exception of the pre-requisite projects (discussed herein), the slippage in the engineering schedules is not likely to affect the breaker open milestone, as more than adequate float exists for performance of most project work.

Other ongoing Engineering initiatives include the following:

- ❖ **Benchmarking:** A recent benchmarking exercise with Exelon, while validating the rigor of OPG's engineering change process, identified some areas worthy of further consideration including the benefits from self-performing procurement. Whereas the planned benchmarking with Bruce Power will support collaboration in the CANDU industry in Ontario, we also encourage OPG to pursue their involvement in INPO's planned nuclear engineering benchmarking exercise.
- ❖ **LEAN Process:** From an engineering efficiency perspective, we endorse OPG's LEAN evaluation of the engineering change process in order to identify areas where value can be enhanced. This goes hand-in-hand with Engineering's commitment in 4d to reduce its functional cost by 15%.
- ❖ **Quality Dashboard:** Project Engineering has created a quality dashboard, focusing attention on nine aspects of engineering quality. Data validity issues with these metrics continue to be addressed along with several process shortfalls that were brought to light by the creation of this dashboard. We view this quality dashboard as a proactive and innovative initiative by the DR team. The SCR process continues to be the vehicle of choice for identifying specific quality issues.

### C. Areas of Focus - RQE Quality

*RFR Project-Class 2 Estimate*

RFR represents approximately 35% of the total estimated DR Project cost. SNC/Aecon's progression to its Class 2 Estimate and the parties' ultimate agreement to a target price for performance of the work represents the largest portion, thus the largest risk to RQE. Moreover OPG is motivated to close the approximate \$700M gap between SNC/Aecon's Class 3

Estimate and the amount OPG carried in its 4d Cost Estimate for RFR. This gap was due to OPG's well-founded determination that SNC/Aecon's Class 3 estimate was very conservative and there were multiple opportunities that SNC/Aecon needed to realize and take into account in the Class 2 estimate and its planning for RFR's execution.

As noted, SNC/Aecon's work on the estimate is behind an agreed target of April 10, 2015, resulting in its request for a 2 week extension of time to complete its work. At present, based on the multiple deliverables that SNC/Aecon is required to provide OPG, SNC/Aecon claims its overall completion is **57%** at this time. The following are concerns that are indicative of this effort to date:

- ❖ Construction Work Packages ("CWP's") form the basis of the detailed estimate and schedule, and are a key tool in establishing the direct field labor component of the Class 2 estimate. To date, SNC/Aecon reports being 70% complete with CWPs, though OPG only recently received the majority of these for review.
- ❖ The Tool Performance Guarantee ("TPG") testing is ongoing at the DEC's Mock-up Facility, and these tests have produced good-to-excellent results that should reduce the estimated direct field labour from the Class 3 estimate. However, the OPG team has observed SNC/Aecon's attempts to re-introduce risk and uncertainty into the estimate that negates these results. The OPG team has strongly objected to SNC/Aecon's attempts to do so.
- ❖ SNC/Aecon intends to assemble the Class 2 estimate into "chapters" to allow for OPG and other stakeholders vetting. SNC/Aecon is 4-6 weeks behind its schedule for producing these chapters and other key material OPG needs to properly consider the quality of SNC/Aecon's estimate.
- ❖ We have observed that SNC/Aecon's earned value trend for the tasks associated with developing the Class 2 estimate is growing increasingly negative. SNC/Aecon has expended 50% to 75% more hours than planned each of the last 3 months in estimating; nonetheless, its deliverables are not meeting the schedule target. We have challenged whether SNC/Aecon has recognized that its original work estimates are under-estimated and whether they have appropriately staffed the work to finish the work on the Class 2 estimate.

The result of SNC/Aecon's delays is that the OPG team will likely receive a much larger quantity of material from the SNC/Aecon to review and vet at the completion milestone than it expected when the process began. This happened with last year's Class 3 estimate, though the consequences around approving that estimate were much less severe than this time. In a recent Executive Oversight meeting with the CEOs of each company present, Tom Mitchell asserted OPG's expectations for SNC/Aecon to submit a transparent estimate with high quality, and that the parties may need to have a discussion at the appropriate time to discuss apportioning risk in order to disposition the likely gap between SNC/Aecon's estimate and OPG's assessment of it.

BMCD/Modus will continue to monitor the development of the Class 2 estimate. We have recommended that whatever reasonable time is given to SNC/Aecon for its preparation of the estimate components should not be absorbed by OPG accelerating its review period. If current trends continue, RFR is unlikely to meet the current RQE milestones for its Gate 3 submission, at a minimum.

#### *Refurbishment Waste Processing Building (RWPB)*

#### Overall Risk Perspective

SNC/Aecon submitted a proposal for the RWPB, which is where SNC/Aecon's waste processing and volume reduction machines for disposing of removed contaminated reactor parts will reside. This proposal was rejected by OPG due to its lack of detail and inadequate schedule, which showed this building completing in the 2Q of 2017, well after breaker open of Unit 2. Moreover, this proposal for \$93M is approximately \$11M more than what OPG carried in 4d, which was a red flag to the OPG team.

Recognizing lessons learned from the Campus Plan Projects, OPG's RFR team has engaged SNC/Aecon in a series of challenge meetings intended make SNC/Aecon produce a more detailed schedule and cost estimate that is properly supported. This should be achievable largely because this building is not very complicated, though it represents a

**Confidential – Do Not Disseminate**

March 12, 2015

distraction to the RFR team at a critical time. The OPG team is seeking to avoid the kind of cost creep that has impacted many of the Campus Plan Projects by having a solid cost estimate and schedule in place for RWPB at the work's outset, and have transparency to SNC/Aecon's subcontractors' work. OPG's VP of Execution initiated a weekly focus meeting on RWPB's challenges with SNC/Aecon leadership, which has increased the visibility of the issues. In order to reverse prior trends established by the Campus Plan Projects, it is critical for OPG to obtain and vet a detailed, well-formulated estimate from SNC/Aecon for RWPB and hold SNC/Aecon accountable for performing to that estimate. In addition, OPG is considering potential work shifting and award of other ESMSA work to SNC/Aecon that could benefit the overall program, particularly if SNC/Aecon can establish economies of scale with similar projects to RWPB.

### *BOP / Shut-Down/Lay-up*

As we have noted in prior reports, the BOP and Shut-Down/Lay-up projects will be challenged to produce Class 2/3 estimates for their modification work projects in time for RQE. The BOP and Shut-Down/Lay-up project managers are mitigating these delays to the extent possible by monitoring the completion of engineering and assessing and advancing development of estimates for this work. The result for RQE should be estimates for this work in the Class 3-4 range with more refined Class 2 estimates available for the Project's planned 2016 Unit 2 check estimate. Assuming the engineering and planning work proceeds as planned, the impact to RQE will be minimal – essentially the difference in holding contingency for a Class 4 v. Class 3 estimate for a relatively small (~6%) portion of the Project's cost. BMcD/Modus is more concerned over ES Fox's capability for planning and executing this work, which we discuss in more detail below.

### *Functional Groups*

The functional groups (essentially what make up the "DR Team" and include Engineering, Operations & Maintenance Project Controls and the Execution Team) constitute approximately 30% of the DR Project's total cost. The RQE team has been working to develop processes needed to increase the amount of detail the functional groups develop for their RQE estimates, and as noted, we see significant progress in this regard. Each functional group was challenged by the Project's VPs to reduce or otherwise rationalize their estimated costs for the Execution Phase, resulting in commitments from each to do so. It is important that those commitments are tracked to completion to avoid re-hashing old ground for RQE, and so management does not have to issue across-the-board directives to reduce cost.

## **II. Campus Plan**

### **A. P&M Management**

P&M's management has initiated changes to its project team to address issues that have been raised regarding P&M's performance. P&M has added experienced resources with construction backgrounds and management is focused on training programs to improve the team's approach to the Campus Plan Projects. In addition, Project Controls management will be consolidated with Refurbishment, and the Project Controls organization is adding resources so that better controls may be employed for tracking future P&M work (most notably the new D20 Storage contract). For the "in-flight" projects that are either too far along or too small to rebaseline, we have recommended, and the team has agreed, to make the specific bases for tracking of this work more visible and increase accountability for adhering to the current schedules. Project Controls is in the process of assessing each Campus Plan Project's estimate to complete and identify the major deliverables and implement, to the extent feasible, earned value metrics that account for major commodities. The projects' schedules are better aligned with the cost reporting tools which will provide more reliable indicators on the status of these projects. All of these measures should improve P&M's ability to manage and track the ongoing work.

## 1. Vendor Performance Issues

We have ongoing concerns, shared by the DR Team, regarding ES Fox's bandwidth to support the volume of the upcoming work on the DR Project. These issues are acute at this time as ES Fox has a number of "in-flight" P&M projects while also being required to support planning efforts for multiple Refurbishment projects. Our comments regarding ES Fox's scheduling and cost estimating capability have been discussed in prior reports, [REDACTED]

In addition, ES Fox must prepare approximately 45 separate project estimates for BOP and Shut-Down/Lay-up Refurbishment projects prior to RQE and oversee the final development of the associated detailed engineering packages from its engineering subcontractors. The Refurbishment BOP and Shut-Down/Lay-up directors have tasked ES Fox with developing estimates and schedule pilots that will be used as a template for the remaining estimates; these pilot estimates and schedules are under review.

The OPG executive team has escalated these issues to ES Fox's senior management, from whom OPG has received assurances that ES Fox intends to strengthen its capability by adding core team members for project management, project controls and other needed positions. ES Fox's actions bear watching, as their ability to complete these critical Campus Plan Projects while simultaneously supporting the planning of BOP and Shut-Down/Lay-up work for Refurbishment is a growing risk to the Project. The DR Team should continue its efforts to evaluate its needs from ES Fox and continue to hold them accountable for making necessary changes to support this work, and consider if there is an opportunity to balance work amongst the other ESMSA contractors.

## 2. Major Campus Plan Projects

### *D20 Storage Facility*

The DR Team has prepared a Superseding Business Case Summary ("BCS") recommending an additional release of \$270.9M, including [REDACTED] of contingency, with a projected total cost of \$381.1M. The BCS examined four alternatives, including slowing down construction at different points and abandoning D20 Storage entirely. The BCS also considered and established the basis for an alternative plan to draining water from Unit 2 in the event that D20 Storage construction is further delayed, and the DR Team has established trigger dates for proceeding with the alternate plan in sufficient time to procure temporary tanks and other material if needed. BMcD/Modus believes the BCS has appropriately considered the reasonable options at this time and provides a basis for justifying the decision to proceed with the best available option, completing D20 Storage based on the original design in time for Refurbishment.

With \$123.1M spent to date, the remaining cost to complete is estimated at \$258M, of which approximately \$140M is estimated for the new completion contract. As of this time, the award for the MEP completion of D20 Storage had not been made, as the OPG team is considering which of the ESMSA contractors should be awarded the completion of the work. In any event, the contract needs to be awarded and progressed by mid-March so that the selected contractor can begin piping prefabrication, procurement and further development of its execution schedule. The P&M team has committed to following Refurbishment's earned value and project controls processes for D20 Storage, which will provide a good proving ground for these processes for Refurbishment as well as significantly improved controls over P&M's past practices. In addition, P&M has added management resources and has established weekly progress meetings to focus on P&M's management of the work.

Based on the current D20 Storage schedule, the revised plan appears achievable, though with all of the issues to date,

## Report to Nuclear Oversight Committee – 1Q 2015 Darlington Nuclear Refurbishment Project

completion of the building will require close attention by the DR Team. Once the contract award is made, we recommend the P&M team: (1) re-evaluate the project risks based on the revised execution model; (2) fully vet the schedule and earned value set-up; (3) apply the project controls strategy to the completion of the foundation work.

### Auxiliary Heat

#### Overall Risk Perspective

As noted, the work on the Auxiliary Heat System Building (“AHS”) was impacted by ES Fox’s safety stand-down following two separate safety incidents. AHS is also impacted by the change to the Vacuum Building Outage (“VBO”). AHS was initially planned to be commissioned before the VBO in the spring of 2015, though its completion was later relaxed because it was determined that the building was not needed for the spring VBO. However, AHS now must be available for service for VBO in the fall. The AHS schedule had slipped by 2 months to October 2015 due to the Steam and Condensate tie-in window changing. This completion date is too close to the start of VBO, and will require ES Fox to resequence its work to recover this slippage. OPG is working with ES Fox to improve its schedule in consideration of the shift in the VBO date.

The current EAC of \$85.14M is being challenged by ES Fox, who has over \$6M in change orders (\$5M for engineering) that it has submitted to OPG. Construction was reported by P&M to be 45% complete, which needs to be verified, in particular because ES Fox has spent 78% of its EPC contract value through February 1, 2015 and ES Fox’s SPI continues to deteriorate. P&M needs to validate these figures, and needs to ensure that ES Fox is motivated to expend the needed direct field labour to complete this project.

AHS also represents the first major Campus Plan Project to be commissioned with cooperation from Operations & Maintenance. We would advise the P&M team insist ES Fox provide as much float as possible before VBO to allow for any slips in commissioning.

### Emergency Power Generator 3

#### Overall Risk Perspective

EPG 3’s current performance trends are also a concern, and the Project Team is reporting the planned September 2015 in-service date is at risk by as much as 2 months. ES Fox’s performance indicators continue to deteriorate and the Project’s EAC is \$96M, an increase of \$8M since 4d. Engineering completion has been delayed to May 2015 due to vendors’ performance challenges. The P&M project team was readying EPG 3 for its final Gate 3, though these trends and ES Fox’s additional cost submissions and delayed schedule development have pushed this gate meeting. The Project Team is also carrying the commissioning of EPG 3 as a significant risk due to the complexity of commissioning and configuration of this equipment.

P&M’s management has requested a full recovery plan from ES Fox, and the SVP of Projects has requested a focused, weekly update to examine ES Fox’s performance. Given the short timeline to complete this SIO project, ES Fox will need to increase its effort and improve its performance.

## III. Other Focus Areas

### A. Corporate Support

BMcD/Modus remains encouraged by the ongoing efforts by OPG’s corporate units to support the DR Project. Among the Project Team’s recent issues is highlighting its software needs for IT to implement needed changes, particularly for change project controls systems needed for project. Large capital projects often struggle using enterprise level business systems to support project needs, and recognition of the shortcomings of the current systems is timely. A similar approach should be pursued with other corporate policies; as previously discussed, tailoring hiring and talent retention processes for short-

**Report to Nuclear Oversight Committee – 1Q 2015**  
**Darlington Nuclear Refurbishment Project**

term project needs often requires flexibility that is not advisable for normal operations.

**B. Project/Station Integration**

Integration between the Project and the Darlington Station needs to be addressed. P&M projects have missed or are projected to miss tie-in dates to the plant, in part due to vendor performance but also due to the Station demanding a level of precision from the Projects that is difficult to achieve from a project environment. BMCD/Modus will be advancing our timeline for a more detailed assessment of this integration and will identify any process or procedural gaps.

In addition, with the shifting of the VBO, the DR Team and the Station will need to re-assess their mutual priorities and assess any impacts to either cost or schedule.

### **Darlington Nuclear Refurbishment Project**

# **ONTARIO POWER GENERATION**

**DRAFT**

Burns & McDonnell  
Modus Strategic Solutions

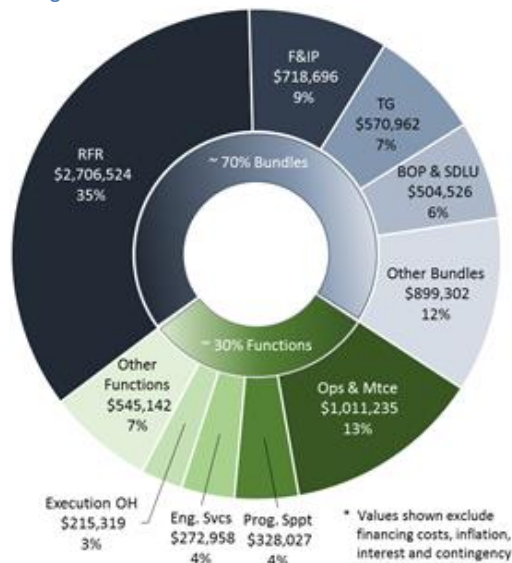

May 21, 2015

## I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company (“BMcD/Modus”) provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors (“NOC”) regarding the status of the Darlington Nuclear Generating Station’s Refurbishment Project (“Project” or “DR Project”) as of May 8, 2015. Our main focus continues to be assessing the status of the DR Team’s preparation of the Release Quality Estimate (“RQE”) that will be submitted to the Board in November 2015. We also provide an update on the larger Campus Plan Projects.

### A. DR Project Cost and Estimate Overview

Figure 1 – 4d Estimate Value\*

As with our 1Q Report, we provide the adjacent Figure 1, which summarizes the current 4d Cost Estimate into its component parts, as a basis for gauging the Project Team’s RQE progress. The following are the most notable cost elements of the DR Project at this time:

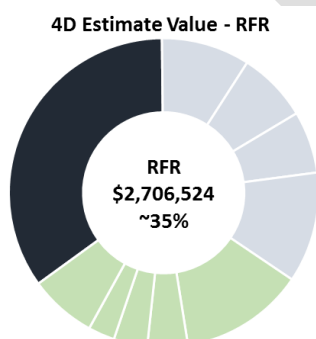

- ❖ **RFR** constitutes approximately 35% or \$2.7B of the DR Project’s estimated costs;
- ❖ **Turbine Generator** constitutes approximately 7% of the DR Project’s estimated costs;
- ❖ **Balance of Plant and Shut Down/Lay-up** constitute 6% of the estimated costs;
- ❖ **All Functional Groups** constitute approximately 30% of the current cost estimate including: Operations and Maintenance (13%); Engineering (4%); and Execution (3%).

As the development of the inputs to RQE progress, the DR Team will be comparing variances based upon the breakdown presented here from the 4d estimate. Over the last Quarter, the metrics and the processes the DR Team

has put in place to track its RQE progress have accurately depicted areas where the team is meeting its plan and other areas that have fallen behind. The largest components to RQE – the Retube and Feeder Replacement (“RFR”), Turbine Generator (“TG”) and project functional costs - are capable of meeting their end milestones, as are Steam Generators, Islanding, and Fuel Handling/Defueling. However, Balance of Plant (“BOP”) and Shutdown/Layup, which are an aggregation of smaller projects, are well behind, prompting the Project Team to reprioritize its efforts and approach with both the vendors and the basis for RQE.

The following is a brief summary of the status of the major inputs to RQE:

#### ● Retube and Feeder Replacement:

SNC/Aecon’s Class 2 Estimate for RFR is the single largest input to RQE. Over the last quarter, SNC/Aecon and OPG have made significant progress in the development of the Class 2 Estimate, identifying the major areas where the parties agree and distinguishing the issues that will need to be resolved prior to negotiating a Target Price for the execution phase. Significantly, the parties have agreed on the basic parameters of RFR’s critical path schedule duration, and agreed to eliminate schedule contingency that had been built into SNC/Aecon’s Class 3 Estimate. Thus, the agreed schedule that is at the heart of the Class 2 Estimate represents an aggressive, but reasonably achievable plan for Unit 2.

Nonetheless, considerable vetting work remains ahead over the next 4-6 weeks to confirm that the quality of SNC/Aecon’s estimate is sufficient to qualify it as a Class 2 Estimate. On May 8, SNC/Aecon delivered its first full project estimate report for OPG’s review. While the OPG team has been vetting the discrete sections of the estimate as it has been assembled, the team needs to now carefully consider how the various parts fit together.

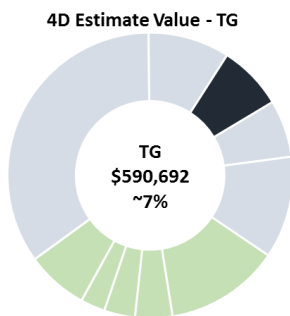

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

Simultaneous to the estimate development, the parties have commenced some high-level commercial discussions at the project executive and CEO levels in an attempt to identify any major contract or commercial issues that will need to be resolved before the Execution Phase contract can be awarded to SNC/Aecon. Primarily, there remains a sizeable pricing gap between the parties that needs to be narrowed to the extent possible. OPG has identified specific areas for possible negotiation and is planning to discuss these items with SNC/Aecon in stages through June 15<sup>th</sup>. We have urged OPG to take whatever reasonable time is necessary to properly vet the Class 2 Estimate and associated schedule, most notably the near critical path work, to ensure that the estimate represents an achievable plan and comports with Class 2 parameters.

OPG's Project Team is mindful of the Campus Plan Projects' lessons learned and thus continues to challenge SNC/Aecon's estimate. Limited field work has been started in parallel with SNC/Aecon's further attempts to bolster its estimate. RWPB has a separate Gate 3 from RFR in early June by which SNC/Aecon must complete its estimate.

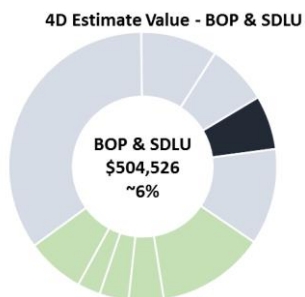

### **Turbine Generator:**

SNC/Aecon issued its Class 2 Estimate for the Turbine Generator for Unit 2 on May [REDACTED], and Alstom has completed its detailed design. SNC/Aecon still must complete its estimate for the TG control work for the subsequent units, and reports it is on track to meet its July 31, 2015 deadline. OPG used the TG estimate as a proving ground for its new estimate vetting process, and this was a significant success. The OPG estimating team sampled approximately 3,000 line items of cost, or over 50% of the estimate, and issued hundreds of comments that SNC/Aecon had to disposition. We believe this process should be repeated for each of the major units of cost on the project. In addition, the parties resolved the commercial issues related to the phasing of the turbine

generator work over the four units. SNC/Aecon needs to meet its commitment to identify economies of scale across its entire portfolio of work (RFR, TG, D20 Storage) that should reduce Project overhead cost.

### **Balance of Plant/Shut Down-Lay-up:**

Detailed engineering for the projects will not be completed by the May 15, 2015 target date. Based on current performance trends, BOP and Shut-Down/Lay-up will be challenged to meet the August detailed design complete milestone. Moreover, [REDACTED]

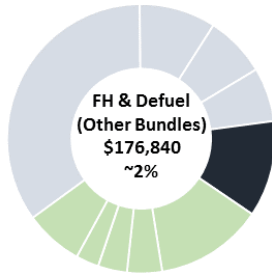

[REDACTED] This inability poses a significant risk to Refurbishment that the team is attempting to mitigate.

The BOP and Shut Down/Lay-up project teams are injecting collaboration into the estimating process to reduce potential gaps and misses that have been evident in the Campus Plan Projects. These bundles are attempting to overcome the lack of mature, detailed design to the extent possible and have directed the Contractor to develop estimates based on the best possible information at this time, though it is unlikely that these bundles will obtain estimates above Class 5 for the majority of this work prior to RQE. In addition, the team is taking appropriate action to re-prioritize those work packages based on the Execution Phase schedule's needs. OPG senior management has significantly ramped up project executive-level attention to the vendors' difficulties. The team is committed to rejecting work product of insufficient quality and intends to carry appropriate contingency within RQE. Refurbishment also needs to ensure that it is carrying program level contingency sufficient to account for the ESMSA vendors' known deficiencies in engineering progress, estimating and scheduling. In addition, [REDACTED]

[REDACTED] While from a cost standpoint, the BOP and Shut-Down/Lay-up estimates constitute approximately 6% of the direct costs of RQE, our concern is that the vendors' issues will drain a disproportionate amount of management attention and divert focus from the more significant scopes of work, which continue to be a risk to Refurbishment through the Execution Phase.

### **Fuel Handling/Defueling:**

4D Estimate Value - FH & Defuel

The DR Team is targeting Class 3 level estimates for RQE, and the team's work over the last quarter has improved the overall outlook for both the estimate and the technical basis for the work. While defueling constitutes only about 2% of the direct costs of RQE, it has a much higher risk profile due to the reactor's defueling which occurs on the critical path. Prior challenges with the vendor's supply of fuel handling equipment appear to be resolved, and the team is working to a more aggressive commissioning schedule to increase schedule float and reduce overall risk. The team has also worked to distinguish differences between Bruce Unit 1's defueling performance and its own planning for Darlington, and is focused on realistic opportunities for shaving time off the current

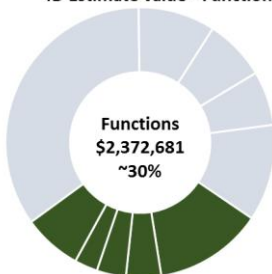

estimated 113-day defueling cycle.

### **Steam Generator:**

No issues are apparent at this time; these estimates should be sufficient for RQE. The team has addressed prior quality issues and its recovery plan has been successful.

### **Functional Groups:**

4D Estimate Value - Functions

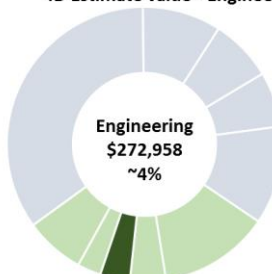

The RQE Roadmap milestone for the DR Team's functional groups to complete their management plans and estimates by May 15<sup>th</sup> will not be met. The functions have developed initial management plans and related estimates which in aggregate are showing the potential to exceed the amounts provided in the 4d Cost Estimate. While it is still early in the vetting process and no firm conclusions should be drawn from this initial review, it is evident that management will need to devote significant attention to right-sizing the team, developing clear roles and responsibilities and locking down appropriate assumptions for RQE. We have recommended the team develop a detailed division of responsibility ("DOR") matrix to ensure there is no unnecessary cross-over or

large gaps in the functional responsibilities within the Project. We have also provided some input to the team to increase the level and effectiveness of the vetting of these costs. Our team will be included in the "black hat" reviews led by Finance of the RQE estimates for the functional groups.

### **Detailed Engineering:**

4D Estimate Value - Engineering

The Project's Detailed Design is 86% complete which means the Project is in substantial compliance with its goal to define engineering and scope sufficient to support RQE. However, BOP and Shut-Down/Lay-up engineering is delayed which is partially driving these bundles' cost estimates to miss current and downstream milestones.

these will require monitoring. The Engineering team's quality metrics highlighted some early warning signs, prompting the engineering VP to hold a brief stand-down of the vendors to examine quality and corrective actions. Thus, OPG management has visibility to the remaining engineering

work and is timely managing those problems that manifest themselves.

## **B. Campus Plan Highlights**

**D20 Storage:** P&M has issued a letter of intent ("LOI") to SNC/Aecon to perform the mechanical and electrical portion of the work for D20 Storage. The LOI's terms provide for \$5M in funding and a 6-week time period for SNC/Aecon to refine its detailed estimate and schedule for the work, upon acceptance of which a final, conformed contract will be issued. P&M believes that the cost associated with the SNC/Aecon contract will be less than the \$140M in 4d and will provide greater confidence in the overall cost and schedule. OPG is managing Ellis Don in the construction of the foundation, which is attempting to recover weather impacts. Ellis Don is currently working on its baseline schedule

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

for the remaining civil work. P&M is working with SNC/Aecon to mitigate delays in purchasing over 600 valves needed for construction.

- **ES Fox Resources and Capacity:** [REDACTED]  
[REDACTED] OPG's senior management has escalated its concerns to ES Fox's executives, and secured Fox's commitment to add resources in key areas, including project management and project controls, [REDACTED]  
[REDACTED] ES Fox has projected that it will exceed its baseline estimates on key P&M projects (Auxiliary Heat Building, EPG 3, RPO and RFRISA) and [REDACTED]  
[REDACTED]  
[REDACTED] In any event, OPG needs to perform adequate due diligence in vetting these cost increases and [REDACTED]
- **P&M Organization:** The focus on P&M's staffing, structure and capabilities for managing work for both the DR Project and the ASIC project portfolio is still under review. The additional senior resources that have been added to the team have had a positive impact on P&M's performance.
- **P&M's Project Controls:** P&M's Project Controls will continue to consolidate under Refurbishment and share processes and resources. The schedule for D20 Storage will be a transition point and allow for the team to establish appropriate metrics for tracking the work. In addition, the EPG 3 schedule for execution and cost estimate for completion is the next in line for detailed vetting, and should take into account the lessons learned from AHS.

## II. Refurbishment – Areas of Focus

### A. RQE Status Summary

In our 1Q 2015 report, BMCD/Modus noted that the team had put in place a processes for tracking RQE deliverables including a schedule and tracking metrics. The early milestones supporting RQE were generally met, though the underlying metrics are forecasting that a significant number of upcoming milestones will be missed.

The RQE Roadmap that provides all of the high-level RQE milestones has been augmented by a weekly report called the "Playbook #1 Weekly Execution Report". This Report measures the DR Team's progress against its plan for the Project-level cost estimates and schedules needed for RQE. The team has identified a total of 341 sub-project estimates and 226 sub-project schedules that are needed to support RQE. Of the estimates, 165 of the 341 (48%) and 156 of the 226 (69%) of the schedules are for numerous smaller projects under two project bundles – BOP and Shut-Down/Lay-up. Both of these project bundles' primary vendor is ES Fox. By comparison, the projects that represent the majority of the cost – RFR and TG – constitute only 10% of the number of individual estimates and schedules. Thus, these metrics are not intended to portray the weight of these deliverables to RQE but do provide a "bean count" of the remaining work and visibility to work that is falling behind schedule.

As of May 1, these metrics show that the smaller BOP and Shut-Down/Lay-up projects are lagging well behind the RQE Roadmap schedule. BOP estimating is 6% complete and 66% of its estimates are tracking behind schedule. The Shut-Down/Lay-up estimates are 11% complete, and 84% of these estimates are behind schedule. These delays mean that the estimates and schedules provided by these bundles in support of their upcoming Gate 3 meetings will be substantially below Class 3 quality. By contrast, the largest projects – RFR and TG – are generally on pace to meet the RQE milestones with Class 2 Estimates by the end of June.

Engineering maturity remains a leading indicator of the team's overall RQE development. The Project will miss the May 15, 2015 goal for completing detailed design, though its achievement of 86% complete at this relatively early stage is a nonetheless a major achievement. The larger packages – RFR and TG – are substantially complete and capable of supporting Class 2/3 project estimates. The remaining engineering work is predominantly in the BOP and Shut-Down/Lay-up bundles. The RQE metrics have highlighted the specific areas that are lagging behind, and using these metrics, the team has revised the engineering priorities for the Contractor to progress the more urgent packages to meet the August

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

engineering milestone. The Contractor's performance to date has been inadequate in managing its work and providing reliable cost estimates and schedules. This is causing the DR Team to devote considerable attention to the recovery effort.

The RQE team has re-evaluated and re-issued its process for the upcoming Gate 3 reviews, which are the individual projects' primary RQE inputs. The process has rules for developing the documentation for vetting the Project's Gate 3s. Each Project sub-bundle will be required to advance to Gate 3, even if that sub-bundle's maturity level is at a Class 4/5 level. The Gate 3 reviews are scheduled for 2Q and will be a leading indicator of the overall progress to RQE. In addition, the DR Team's functional groups have submitted initial estimates and revised functional management plans which will also be vetted during 2Q 2015.

In summary, the major projects and functions, which comprise approximately 92% of the overall Project cost, are tracking on time to 2-3 weeks late with their RQE inputs while the BOP and Shut-Down/Lay-up bundles will struggle to complete Gate 3 with estimates more robust than Class 5 level. The DR Team will have to properly characterize the packages that are late and unlikely to mature beyond Class 4/5 level prior to RQE. A risk the DR Team needs to manage, among others, is devoting a disproportionate amount of attention to the BOP and Shut-Down/Lay-up bundles for the purpose of refining many of these estimates to a level not feasible prior to RQE.

### B. Engineering Status for RQE

As of May 1, detailed design for the DR Project was 86% complete. While this falls slightly short of the 90% goal set by the Project Team, it is sufficient to support the estimating accuracy range for RQE. The most significant design packages – RFR (~86% complete) and Turbine Generator (~86% complete) – are enough to support their respective Class 2 estimates. BOP and Shut-Down/Lay-up engineering maturity (~86% complete) remains the primary outlier, and the team has reprioritized the work based on need.

The engineering team's schedule and quality metrics have matured and are being used to monitor vendor performance. These metrics have highlighted signs of certain adverse trends that the team is working to reverse:

- ❖ **Quality:** Project Engineering's Quality Dashboard has highlighted potentially adverse trends including: human performance errors; vendors employing under-qualified resources; over-specification of engineered materials and unique components; and other short-cuts that could result in downstream changes. To address these issues, the Project's Engineering VP initiated a quality "stand down" during which the results of multiple reviews and audits were shared and discussed with the vendors and OPG team. Each engineering vendor was challenged to provide an action plan to eliminate errors, rework and increase the quality of their work product.
- ❖ **Resourcing:** The metrics have highlighted the specific areas of focus for the remaining detailed design effort, and provide a basis for projecting the resources needed to complete this effort. In addition, these metrics have highlighted potential downstream gaps that require OPG resources, including the drawing office and TSSA registration.

Thus, the metrics tracking engineering are providing management with information it needs to actively manage the work. As engineering transitions to the next phase of supporting procurement and construction work package ("CWP") development, the tools developed during the design phase will need to shift focus.

The current Weekly Project meeting continues to focus on engineering, and remains a good forum for the team to work through issues and focus on the Project's schedule. The team is working to highlight gaps and develop management plans to resolve them. Over time, the team intends to expand this forum to include procurement tracking and construction readiness. The team is currently finalizing metrics for tracking procurement, and intends to introduce those metrics in June 2015.

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

Two issues that the DR Team needs to resolve in the upcoming examination of the Engineering functional cost include: (1) the level of support needed for replication engineering for the units subsequent to Unit 2; (2) the roles, responsibilities and level of effort needed from OPG Engineering and vendors in support of the field work and commissioning. There is valuable OPEX from Pickering Unit 1 RTS that should be reviewed in making these decisions.

### C. Documentation and Data Alignment

The DR Team's data management group is working to align the Project's RQE and schedule data so that costs can be properly viewed and assessed over the entire Project's lifecycle at the work package/scope level. A key aspect of this work is properly mapping data so that the planned and actual cost of performing each element of scope can be baselined and then traced over time. The data management team is currently correcting flaws in data mapping present from the Project's inception. This work is essential to establish and maintain a proper Control Budget going forward from RQE. In addition, this data mapping is integral for future plant configuration control, and will be necessary for OPG to support rate recovery of its investment. If these issues are not resolved in the near term, the DR Team will risk struggling with data alignment issues throughout the entire Project. We have provided management with an assessment of current challenges in the Project's Cost Management system that provides further explanation of these problems in comparison with best practices. We recommend the DR Team make data alignment a priority for RQE so that further rework of these systems can be avoided and RQE has the data integrity necessary.

### D. Areas of Focus - RQE Quality

---

*RFR Project-Class 2 Estimate*

---

RFR represents approximately 35% of the total estimated DR Project cost, and thus the largest single risk to RQE. Since receiving SNC/Aecon's Class 3 estimate for RFR in June 2014, OPG's challenge has been to vet SNC/Aecon's plan and pricing of this work to ensure it is achievable, accounts for the OPEX from past refurbishments, improvements to the tool set and the value of the planning effort to date, including the full-scale mock-up at the DEC.

Moreover, OPG is motivated to close the approximate \$700M gap between SNC/Aecon's Class 3 Estimate and the amount OPG carried in its 4d Cost Estimate for RFR. OPG believes that SNC/Aecon's Class 3 estimate was conservative and included opportunities for SNC/Aecon to realize in the Class 2 estimate and its planning for RFR's execution. OPG has made SNC/Aecon fully aware of its position relative to these opportunities.

SNC/Aecon's Class 2 estimate was initially targeted for delivery by April 10, 2015, though SNC/Aecon was unable to meet this deadline. OPG provided SNC/Aecon with an extension to May 8, 2015 to ensure SNC/Aecon was providing an estimate package of requisite quality<sup>1</sup>. The OPG team also recognized that while monitoring and vetting the SNC/Aecon's incremental progress was necessary and beneficial, the OPG team now needs to review and vet the estimate as a whole.

SNC/Aecon and OPG have agreed on a number of key areas that will ease the vetting of the Class 2 Estimate, including:

- The critical path duration of 1084 days, including OPG's responsibility of 186 days from breaker open to defueling and 223 days after RFR is completed to breaker closed. SNC/Aecon's schedule and estimate are premised on it controlling the critical path in the vault for the 676 days in the middle (the "RFR Duration"). SNC/Aecon's RFR Duration was determined on the basis of its Tool Performance Guarantee ("TPG") durations that were tested in the mock-up and modified by assumptions gained from OPEX of prior CANDU refurbishments. Importantly, SNC/Aecon's RFR Duration is shorter than the actual duration of Wolsong, which was the previous best

---

<sup>1</sup> SNC/Aecon's Class 2 Estimate was received concurrent with the preparation of this report; thus, we cannot comment on its content at this time.

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

refurbishment.

- A major sticking point in the Class 2 Estimate development was SNC/Aecon's conservatism toward potential owner-caused delays. By accepting the critical path in the RFR Duration, SNC/Aecon has agreed to remove contingency time in the schedule, which is a significant concession.
- While still higher than OPG's expectations, SNC/Aecon's initial Class 2 Estimate reflects modest reductions from the Class 3 estimate.
- SNC/Aecon has identified approximately \$40M of additional opportunities to reduce the base cost that are different from those OPG had identified. OPG needs to consider whether these opportunities can be realized. In addition, there is a list of approximately 50 items that OPG has developed that are additional opportunities of varying size that can be worked down.
- The parties have agreed to revisit current assumptions around project risk allocation once the base cost is determined.

The OPG team's vetting process for the Class 2 Estimate is geared toward identifying any areas in the estimate that remain suspect from a cost perspective. While the vetting process will review all aspects of the Class 2 Estimate, the particular areas of focus for the team include: (1) right-sizing of SNC/Aecon's project management team ("PMT"); (2) right-sizing of SNC/Aecon's Support Services; (3) review of non-critical path direct field labor; (4) unit-over-unit resource leveling; and (5) productivity rates utilized for direct field labor. In addition, the parties will work to finalize the risk register and develop contingency.

Assuming there is agreement on the Class 2 Estimate, the parties will finalize target price parameters and seek resolution of any remaining commercial issues. The DR Team has been preparing options for performing the RFR project without SNC/Aecon in the event there is no agreement. However, coming to mutually agreeable terms with SNC/Aecon is clearly the best possible option for performing RFR, given the time investment the parties have made to date and the difficulties inherent with starting over with a new vendor.

BMCD/Modus will continue to monitor the development of the Class 2 estimate. We have recommended that whatever reasonable time is given to SNC/Aecon for its preparation of the estimate components should not be absorbed by OPG through acceleration of its review period. OPG should weigh the risks of rushing the review and vetting process versus missing the RQE milestone.

### *Refurbishment Waste Processing Building (RWPB)*

SNC/Aecon is continuing to develop its cost estimate for the RWPB. SNC/Aecon has submitted different iterations of the estimate and schedule that the OPG team rejected as having insufficient detail. OPG has made clear to SNC/Aecon that the schedule must provide adequate detail to ensure that sufficient float is maintained prior to the mid-2017 need date for this facility. SNC/Aecon has developed a schedule, which still requires full vetting, that pulls the completion date back to December 2016.

With respect to the cost estimate, SNC/Aecon and OPG have agreed on key aspects of the basis of estimate regarding the ability of the RWPB to withstand a seismic event. This agreement may have some additional cost impacts, but these changes will be necessary to support the nuclear safety case. The team has set-up a separate Gate 3 for RWPB from the RFR work with a deadline of June 6<sup>th</sup>. The OPG team has challenged SNC/Aecon to produce the cost and schedule based on final resolution of the design basis and benefits from the Campus Plan Projects' lessons learned in the planning of this work. In the meantime, SNC/Aecon continues to perform caisson work and site preparation to mitigate any further schedule issues. The project executive-level meetings will continue until such time that OPG has confidence in SNC/Aecon's plan for the work, and weekly construction progress meetings will continue through completion.

**Report to Nuclear Oversight Committee – 2Q 2015**  
**Darlington Nuclear Refurbishment Project**

*BOP / Shut-Down/Lay-up*

Overall Risk Perspective

The DR Team has acknowledged that the BOP and Shut-Down/Lay-up modification work projects will be no better than Class 4/5 in time for RQE. However, the relative impact to RQE will be minimal – essentially the difference in holding contingency for a Class 4/5 v. Class 3 estimate for a relatively small (~6%) portion of the Project's cost. The BOP and Shut-Down/Lay-up teams continue to press the Contractor to develop the highest quality estimates based on the best information possible for RQE. ES Fox has set-up an estimating "war room" at its offices, and the OPG teams are actively collaborating with ES Fox to guide the process, provide answers to questions and highlight assumptions. OPG has established for ES Fox a seven-step vetting process and is tracking throughput. The team is committed to carrying sufficient contingency in RQE to compensate for the expected bandwidth around these estimates. BMCD/Modus recommends that these teams increase the level of documentation that is kept so that the actual basis of these estimates can be fully understood and vetted, and so that appropriate classification of these estimates can be applied.

[REDACTED]. Refurbishment's answer is to ensure that it properly characterizes the nature and maturity level of the estimates at the outset. [REDACTED]

[REDACTED] We have recommended to the team to consider this history because it is the most relevant information OPG needs to establish truly appropriate contingency levels for these Refurbishment projects.

In addition, based on the experience to date, the DR Team should be examining other options for delivering this work where practicable. If the schedule allows, [REDACTED]

[REDACTED] The BOP and Shut-Down/Lay-up teams are already taking extraordinary measures [REDACTED] The team should evaluate whether it would really be taking on additional risk by directing the effort. From our team's experience, the risk posed to execution by BOP has to be managed or this typically non-critical path work can have a significant impact on both cost and schedule.

Based on what we have observed of this process, the DR Team is actively managing and attempting to mitigate the deficiencies in these estimates. The DR Team now has metrics in place that should provide early warning signs for management to take mitigating actions. The DR Team's Gate 3 process requires that these projects proceed to their respective gates and visibly report all deficiencies that erode the quality of these estimates.

*Fuel Handling/Defueling*

Overall Risk Perspective

The Fuel Handling/Defueling team, which is integrated between Refurbishment and the station, appears on pace to deliver its Class 3 estimates and has shown the results of good overall cooperation and vendor collaboration. These projects are not significant in terms of overall cost but represent OPG's most significant critical path risk to the Project.

In the ongoing collaboration with Bruce Power, the Project Team received more granular information regarding the success of Bruce Unit 1's defueling for its refurbishment. Bruce Unit 1 achieved defueling 63 total days compared to the

May 21, 2015

**Confidential – Do Not Disseminate**

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

Project's assumption of 113 days. However, the additional details the team received allowed for more detailed analysis, and the team determined that Darlington's more complex and less efficient base design and related processes accounted for 30 of the 48 day difference, and those areas are not ripe for improvement. However, the analysis did net an opportunity to vet the 18 day difference between the stations in assumed Trolley Duty Cycle, which OPG executive management expects to be challenged.

With respect to Fuel Handling, the main challenge remains to improve the fueling machine reliability to increase the potential success for the fueling system's ability to simultaneously support Refurbishment and ongoing station operations. Over the last quarter, the team has made good progress in working through key issues, and OPG and vendor, GE-Hitachi, agreed to move forward by three months the schedule for commissioning the equipment to provide the Project with greater schedule float. While there have been challenges, it appears the schedule is achievable; that cooperation with the OPG team (including the station) and GEH has been good; GEH's engineering product has been of high quality; and the team has accepted and mitigated challenges along the way. While the risk of actual performance will remain until the reliability of the enhanced fuel handling equipment is proven, the actions taken by the team appear to have increased the overall probability of success.

### Functional Groups

#### Overall Risk Perspective

The functional groups (essentially what make up the "DR Team" and include Engineering, Operations & Maintenance Project Controls and the Execution Team) constitute approximately 30% of the DR Project's total cost. The RQE Roadmap milestone for RQE Functional Estimates Complete by May 15 will not be met, though progress toward defining the functions' purpose and related estimates has matured over 4d. Unfortunately, this maturation has resulted in the functional cost estimates for virtually each group increasing over their 4d levels.

These increases require extensive vetting, which as of this writing, has only recently started. Key areas for this vetting process should include:

- Assuring that the functions are properly supporting the Projects, and not duplicating effort the performing contractors are expected to provide;
- Ability to meet all of the true oversight needs an owner's management group should provide, including validation of field execution, timely decision-making when issues arise and management of risks;
- Examining how the functions mesh together so that there is no duplication of effort, excess cost or confusion over roles and responsibilities;
- Identifying whether the functional groups have met 4d goals for right-sizing their teams.

In our view, these goals can be met through: (1) detailed vetting of the functional management plans in comparison to the functional cost estimates to assure that all assumptions for staffing are fully identified; (2) development of a division of responsibility ("DOR") matrix that shows both ownership of functional areas and potential rub points; and (3) detailed vetting of the cost estimates themselves. While considerable work remains before these estimates can be considered to be complete, the progress made thus far allows management to view the functions in a consolidated manner and make appropriate decisions on right-sizing the effort for RQE.

## II. Campus Plan

### 1. P&M Management

#### Overall Risk Perspective

P&M's management has initiated changes to its project team to address issues that have been raised regarding P&M's performance. P&M has added experienced resources with construction backgrounds and management is focused on

May 21, 2015

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

training programs to improve the team's approach to the Campus Plan Projects. In addition, Project Controls management will be consolidated with Refurbishment, and the Project Controls organization is adding resources so that better controls may be employed for tracking future P&M work (most notably the new D20 Storage contract). For the "in-flight" projects that are either too far along or too small to rebaseline, we have recommended, and the team has agreed, to make the specific bases for tracking of this work more visible and increase accountability for adhering to the current schedules. Project Controls is in the process of assessing each Campus Plan Project's estimate to complete and identify the major deliverables and implement, to the extent feasible, earned value metrics that account for major commodities. The projects' schedules are better aligned with the cost reporting tools which will provide more reliable indicators on the status of these projects. All of these measures should improve P&M's ability to manage and track the ongoing work.

### 2. Vendor Performance Issues

ES Fox's bandwidth to support the both the ongoing P&M work and its current work load for Refurbishment has received considerable attention from OPG's management. [REDACTED]

The OPG executive team has escalated these issues to ES Fox's senior management, from whom OPG has received assurances that ES Fox intends to strengthen its capability by adding core team members for project management, project controls and other needed positions. In addition, the Sr. VP of Nuclear Projects has requested ES Fox to take immediate action to reconcile its cost and schedule positions on the Campus Plan Projects and utilize lessons learned from recent projects to help properly characterize the nature of their project estimates.

The DR Team should continue its efforts to evaluate its needs from ES Fox and continue to hold them accountable for making necessary changes to support this work, and consider if there is an opportunity to balance work amongst the other ESMSA contractors. The team is taking measures to do so and must measure how ES Fox responds.

### 3. Major Campus Plan Projects

#### *D20 Storage Facility*

The DR Team has awarded the mechanical and electrical package to SNC/Aecon via a LOI, with the full conformed contract to follow once SNC/Aecon presents its full, detailed execution budget and schedule. SNC/Aecon was given a short but reasonable time frame to complete its work. Based on the multiple iterations SNC/Aecon's RWPB team has produced for that building, we have advised OPG to request ongoing updates during this period to ensure SNC/Aecon prepares its budget and schedule. SNC/Aecon is currently working with OPG to prepare for its mobilization and work through procurement issues. On April 30<sup>th</sup>, RCMT completed its design work and provided SNC/Aecon with the engineering packages it will need to plan and execute the work. SNC/Aecon will provide field engineering through the completion of the work.

Ellis Don continues to work at OPG's direction on the foundation work, which is currently running on or near schedule. The OPG team reported the end date for foundation work had slipped 2-3 weeks, though the teams are working together to look at different shift patterns and work calendars to pull the dates back into early December 2015, if not earlier.

The P&M team has committed to following Refurbishment's earned value and project controls processes for D20 Storage, which will provide a good proving ground for these processes for Refurbishment as well as significantly improved controls over P&M's past practices. In addition, P&M has added management resources and has established weekly progress meetings to focus on P&M's management of the work.

## Report to Nuclear Oversight Committee – 2Q 2015 Darlington Nuclear Refurbishment Project

Based on the current D20 Storage schedule, the revised plan appears achievable to meet the needs of Refurbishment, though with all of the issues to date, completion of the building will require close attention by the DR Team. With the contract award to SNC/Aecon, the P&M team should re-evaluate the project risks based on the revised execution model and implement and report on the revised project controls strategy to the completion of the foundation work.

### Auxiliary Heat

The Auxiliary Heat System Building (“AHS”) schedule and cost estimate continues to be a concern. ES Fox’s current date for construction completion is September 1, 2015, and AFS is scheduled for October 27<sup>th</sup>. These dates have been challenged by OPG’s team. The schedule pushes that are causing these dates to slip appear to be from issues that could be mitigated. This completion date is too close to the start of VBO, and will require ES Fox to resequence its work to recover this slippage. OPG is working with ES Fox to improve its schedule in consideration of the shift in the VBO date.

The current EAC of \$85.14M is being challenged by ES Fox, who has over \$6M in change orders (\$5M for engineering) that it has submitted to OPG. Construction was reported by P&M to be 45% complete, which needs to be verified, [REDACTED]

AHS also represents the first major Campus Plan Project to be commissioned with cooperation from Operations & Maintenance. We would advise the P&M team insist ES Fox provide as much float as possible before VBO to allow for any slips in commissioning.

### Emergency Power Generator 3

EPG 3’s current performance trends are also a concern, and the Project Team is reporting the planned September 2015 in-service date has slipped to April 7, 2016. [REDACTED] and the Project’s EAC is \$\_\_\_\_, an increase of \$\_\_\_\_ since 4d. Engineering completion has been delayed to May 2015 due to vendors’ performance challenges, though ES Fox reported this date will be met. The P&M project team was readying EPG 3 for its final Gate 3, though these trends and ES Fox’s additional cost submissions and delayed schedule development have pushed this gate meeting. The Project Team is also carrying the commissioning of EPG 3 as a significant risk due to the complexity of commissioning and configuration of this equipment.

P&M’s management has requested a full recovery plan from ES Fox, and the SVP of Projects has requested a focused, weekly update to examine ES Fox’s performance. Given the short timeline to complete this SIO project, [REDACTED]

## III. Other Focus Areas

### A. Corporate Support

BMcD/Modus remains encouraged by the ongoing efforts by OPG’s corporate units to support the DR Project. Finance is embracing its role in the vetting and challenging of the various elements of RQE, and continues to provide its full support to the Project. The Project Team and the CIO are working together to implement needed changes that are tailored to the needs of the Project. This collaboration has resulted in the CIO supporting upgrades to software and necessary attention to the Project’s hardware needs. In addition, we are encouraged by the increased focus People and Culture’s senior

**Report to Nuclear Oversight Committee – 2Q 2015**  
**Darlington Nuclear Refurbishment Project**

leadership is providing to develop flexible plans to address the personnel and succession issues that have been highlighted as major risks.

## **B. Risk Management**

An effective risk management program is integral to the success of the Project. The Darlington Risk Management Program continues to evolve. Overall guidance, process and tools have matured and visibility of senior management support has improved. From a process standpoint, the DR Risk Management Program has matured into an excellent vehicle for identifying and facilitating the management of risks. The recent launch of the Risk Management and Oversight (“RMO”) tool has greatly facilitated the review, analysis, tracking, and management of refurbishment risks across bundles, functions, and “Key Risk Areas”.

The concept of “Key Risk Areas” (“KRAs”) has been introduced to consolidate program and project risks by common themes or drivers (e. g. “Regulatory Approval”, “Cost & Estimating Management”). A senior management sponsor is assigned to each of the Key Risk Areas for the purpose of ensuring that project managers and functional team leaders, along with the risk owners focus proper attention on identifying and managing the risks. We have observed a tendency for the project team to focus only on “urgent” issues. The KRA assignments are very critical because managing risks seems to fall into the “Important, but Not Urgent” category of priorities that managers face every day. In fact, the purpose of a risk management program is to identify the important issues before they become urgent—and so they can be effectively mitigated. Once an issue becomes urgent, the possible resolutions are inevitably limited and more costly. The KRA sponsor concept in theory is a good one—however, it will only be effective if it is given a priority and managed daily. That effectiveness has yet to be realized. We have made several recommendations for the improvement of the Risk Management Program and will continue to monitor its progress.

**ONTARIO POWER**  
**GENERATION**

## I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") provide the following Quarterly Report to the Darlington Refurbishment Committee of the OPG Board of Directors ("DRC") regarding the status of the Darlington Nuclear Generating Station's Refurbishment Project ("Project" or "DR Project") as of August 7, 2015. Our main focus continues to be assessing the development of the Release Quality Estimate ("RQE") that the team intends to provide the Board of Directors at the October 1-2, 2015 retreat.

Specifically, this report focuses on the DR Team's current status with its RQE preparation, a summary of the processes used for deriving the estimate, remaining gaps in the RQE effort that the DR Team will need to close, and recommendations for the DR Team to take into account as it evaluates risk and contingency. As we have previously observed, the DR Team's RQE effort has followed an appropriate process for deriving the Project's estimate, though there have been some unexpected challenges that have impacted the planned pace of RQE's completion. Most notably, while some of RQE's work is significantly advanced, the date for OPG's acceptance of the estimate for the Retube and Feeder Replacement ("RFR") project with the SNC Lavalin/Aecon joint venture ("SNC/Aecon"), has slipped from June 15 to at least August 31. The additional time for vetting the RFR Class 2 Estimate has been extremely valuable, as the end result of the DR Team's efforts should be a very robust and defensible basis of cost estimate and schedule for the most significant scope of work in the DR Project. In addition, the team has encountered issues with assembling, verifying and validating the amount of cost data that is inherent with an effort of the magnitude of RQE. Thus, the DR Team's ability to assess the Project as a whole, including the full schedule, resource allocation, contingency and other such considerations, has been delayed and compressed. As a result, we believe the DR Team will be challenged to meet the current schedule for presenting a RQE that can serve as the Project's control budget by October 1-2.

Following the Recommended Practices provided by the Association for the Advancement of Cost Engineering International ("AACEi"), the DR Team has committed to provide a full, four unit Project "Class 3" estimate with an intended accuracy range of +10% to +30% (on the high end) to -10% to -20% (on the low end).<sup>1</sup> Per the AACEi recommended practices and OPG's own procedures, the RQE would be based on a sufficient level of maturity to form the Project's control budget, against which the overall Project's progress will be compared to completion. The DR Team intends to prepare unit-specific check estimates immediately prior to the start of execution for each unit that will leverage additional maturation of the planning effort and account for any lessons learned from prior units' performance. The check estimate for Unit 2, the first unit to reach the execution phase, is scheduled for August 2016 and the goal is to further mature the Unit 2 estimate and schedule for optimal management of the Execution Phase.

The total RQE amount will include the \$2.547 billion OPG plans to spend during the current Definition Phase through October 2016. OPG engaged in this extensive planning and preparatory effort in order to mitigate issues that have severely impacted prior CANDU refurbishments and other nuclear megaprojects. This includes a commitment to complete engineering by August 15, 2015, more than one year before opening the breaker of the first refurbished unit, Unit 2. The Definition Phase has also included hard construction costs for:

- Completion of \$1.2B of pre-requisite Campus Plan Projects needed for Refurbishment and ongoing operations;
- Purchase of all specialized tools required for the units' refurbishment;
- Procurement of Unit 2 pressure tubes, feeders, end fittings needed for refurbishing the units' reactors;
- Fees to vendors for development of detailed engineering, project estimates, execution schedules and construction work packages ("CWPs") needed for execution.

<sup>1</sup> For purposes of characterizing RQE and its component parts, OPG has utilized AACEi Recommended Practice No. 18R-97 COST ESTIMATE CLASSIFICATION SYSTEM – AS APPLIED IN ENGINEERING, PROCUREMENT, AND CONSTRUCTION FOR THE PROCESS INDUSTRIES

## Report to Darlington Refurbishment Committee 3Q 2015 Darlington Nuclear Refurbishment Project

In addition, OPG has already negotiated the terms and conditions of the most significant execution contracts with EPC contractors, many of which include provisions for establishing target pricing and incentives based on acceptance of detailed vendor estimates.

BMcD/Modus recognizes OPG's commitment to plan the work in advance and the DR Team's many accomplishments to date in the Definition Phase. However, the DR Team's RQE effort has been substantially compressed. The original schedule for RQE was to complete the estimate integration and analysis by October 15<sup>th</sup> and then present to the Board in November 2015. RQE preparation for that November delivery included a planned 3 ½ months of detailed integration and vetting of the amassed data; that work under the current schedule has been compressed to 1 ½ months, with much of the work being done in parallel. Significant work remains for the DR Team to meet its commitments with respect to the submission of RQE, as discussed below.

As noted, the DR Team intends to use the period from RQE to Unit 2 breaker open in October 2016 to further mature its planning, estimates and schedules, and present a Class 2 check estimate and detailed execution-ready schedule in 2Q 2016. The team has developed a "Readiness to Execute" regime through which it plans to test multiple processes and improvement initiatives with smaller BOP and Shut-Down/Lay-up packages that need to be performed prior to Unit 2's breaker open.

### II. DR Project RQE Overview—Status

On January 20, 2015, the DR Team presented its RQE Roadmap to the NOC. That initial Roadmap anticipated the DR Team would produce RQE for Board approval at the November 12, 2015 meeting. This schedule was premised on a number of key milestones being met, most notably:

- Completion of Functional Estimates – May 15, 2015
- Acceptance of SNC/Aecon's RFR estimate – June 15, 2015
- All Execution Phase project Gate 3's complete (except for BOP and Shut-Down/Lay-up) and Project Data Frozen – June 30, 2015
- Presentation of RFR target price to NOC – August 20, 2015
- A six week review and validation period of the estimate and schedule date (July 1 to August 20)
- From August 21 to October 15, the senior team planned vetting and rationalization of changes;
- Finance had 3 weeks to provide a final review and approval before the October 15, 2015 planned completion;
- One month (October 15 to November 12) to prepare and route the materials before the November BOD meeting.

The DR Team's time to finalize RQE has been significantly compressed, and the once planned 3 ½ month period (July 1<sup>st</sup> to October 15<sup>th</sup>) for vetting of the integrated cost and schedule has been reduced in its current plan to 1 ½ months (July 31<sup>st</sup> to September 15<sup>th</sup>). The current schedule is premised on the DR Team completing the RQE base cost and contingency and associated unit by unit cash flows and consolidated business case by September 15<sup>th</sup> for presentation to the DRC 10 days later. To meet these challenging dates over the next month, the DR Team must complete:

- A thorough vetting of the Project's cost components through a series of "Program Integrated Scope and Reasonability Reviews" with the Project Managers leveraging the work completed to date;
- The receipt and review of an acceptable estimate and schedule submission from SNC/Aecon, which is currently expected on August 31, 2015, though which will still require verification, vetting and reconciliation with the rest of the RQE files;
- Concluding the negotiations with SNC/Aecon on the RFR target price;

Confidential – Do Not Disseminate

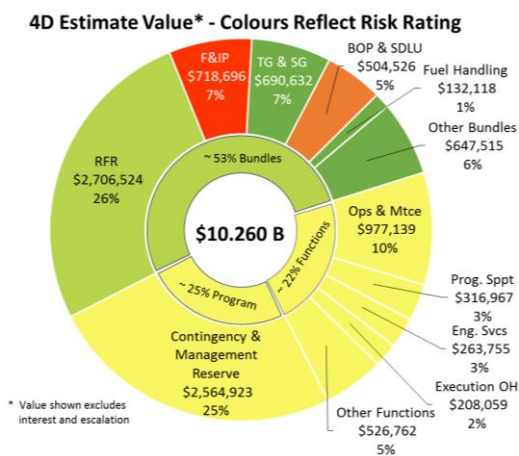

- Finalizing the documentation for the basis of estimates for each of the Project's "bundles" or sub-projects;
- Final vetting of the DR Team's Functional groups, functional management plans, and associated cost estimates
- Senior management vetting and challenge of the program and its constituent parts to validate the overall schedule, resourcing, roles and responsibilities and confidence level in performing the work;
- Finalizing development of the DR Project's contingency, including reviewing all of the discrete risks for each bundle and the program as a whole, and capturing and properly modeling risk of performance for all four units;
- Integrating the cost and schedule data for each of the Program's component parts so that an integrated review can be performed to ensure proper alignment for future cost and schedule control; and
- Addressing potential quality control and quality assurance concerns in order to provide the confidence in the reliability and accuracy range RQE as the control budget for the Project.

This represents a tremendous amount of work in a short period of time and assumes that work feeding RQE outside of OPG's direct control will finish on time and with requisite quality. Moreover, for this effort to be successful, the data produced for developing RQE must be free of error and understandable, as there is no margin for rework. As discussed below, the team is currently integrating the data for these reviews to begin, and this effort has also proven to be more time consuming than initially thought, and currently lacks the final and most important part, the RFR estimate. BMcD/Modus is concerned that the remaining time to October will not be sufficient for the DR Team to finalize RQE commensurate with the necessary quality to establish the Project's control budget.

## A. Status of the Components of RQE

As with our prior reports, Figure 1 shows the 4d cost estimate values for each of the major sub-projects, or bundles, as well as the OPG Functional costs and contingency. Once RQE is finalized, we will update this figure to reflect the current values and percentages of the Project's cost.

Figure 1 also provides context for the size and percentage of each component of RQE. The three largest parts of RQE are: RFR (26%); OPG Functions (22%); and Contingency and Management Reserve (25%). BOP and Shut-Down/Lay-up (5%), the Turbine Generator project (6%) and Campus Plan Projects (7%) are next largest slices of the budget. Below, we provide a brief update regarding the status of each of the major inputs to RQE, and in Section IV below, we provide additional details regarding key areas – RFR, Functions, and Contingency.

## B. Major Inputs to RQE

### Detailed Engineering:

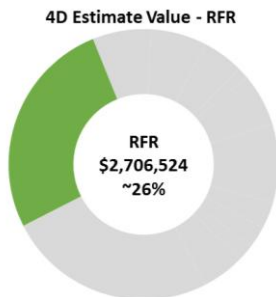

One of the lessons learned from other refurbishment and other nuclear megaprojects is that the control budget should be based upon completed engineering in order to mitigate the risk of unreliable and uncertain initial cost estimates. As a result, OPG has made a commitment to complete as much engineering as reasonably possible for the basis of the RQE control budget, and to ensure that engineering is sufficiently complete for each unit to prepare a Class 2 cost estimate prior to field execution. As of June 30, the Project's Detailed Design was 92% complete which means the Project is in substantial compliance with its goal to define engineering and scope sufficient to support RQE.

As the BOP and Shut-Down/Lay-up projects proceed with their development of detailed Class 3 estimates for their upcoming Gate 3s and prior to the check estimate, the DR Team should account for a risk that has manifested itself in

the Campus Plan Projects, that the definition of “design complete” needs to include in the engineering package all of the vendor/supplier procurement information. P&M projects have also had cost impact and scope creep due to the later incorporation of these details by the EPC contractor’s revised “Issued for Construction” drawings, and this additional effort was not estimated at the outset of the work. The DR Team’s Engineering VP has highlighted this risk which now must be monetized and carried in RQE.

### Retube and Feeder Replacement:

SNC/Aecon’s Class 2 Estimate for RFR is the single largest input to RQE. Some notable highlights since our 2Q Report:

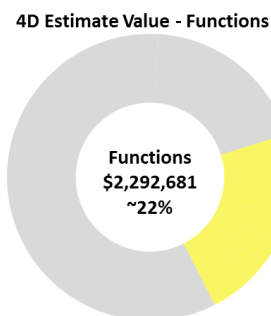

- SNC/Aecon’s initial Rev 0 submission dated 5/8/15 was rejected by OPG for quality deficiencies and omissions. SNC/Aecon’s submitted schedule was significantly longer (1086 critical path days with 396 days of contingency time) and higher in cost (in excess of \$3.3B) than acceptable to OPG.
- From 5/8/15 to 7/20/15, OPG led a series of challenge meetings with SNC/Aecon’s VPs to identify gaps in schedule, cost and quality. On a parallel path, the project teams have engaged in “bottom-up” vetting of the estimate and schedule.

- These initial efforts resulted in OPG and SNC/Aecon agreeing to target a schedule duration of 1110 days and an associated cost of \$2.6B (at P50 contingency level).

The teams are currently working to these goals with a target of mid-August for completing the analysis and August 31<sup>st</sup> for SNC/Aecon’s “Rev. 1” submission, approximately 2 ½ months later than the DR Team anticipated. Because of RFR’s importance to the Project, this delay threatened to impact the DR Team’s ability to complete key elements of RQE. There has been increased cooperation between the teams to optimize the work flow to the extent possible. However, due to the enormity of the effort at both the project and executive levels, concluding this estimate is taking significantly longer than OPG anticipated. The DR Team has engaged in some work-arounds to keep the rest of the RQE process moving in parallel. Moreover, the DR Team and our team are concerned that SNC/Aecon will have a large amount of work in a short time to meet the August 31<sup>st</sup> date for the Rev. 1 submission, and this could impact the quality of the revised submission. OPG is attempting to mitigate this with near-constant contact with SNC/Aecon until the submission is delivered.

### Functional Groups:

The DR Team’s intention for RQE with the Functions is to develop a bounding estimate that incorporates all necessary roles and responsibilities, and then examine the organization in the Readiness-to-Execute roll-out after RQE.

Early in the RQE process, the initial functional estimates had shown 9% growth over what was presented in the 4d Estimate. The SVP commissioned a team drawn from multiple areas within the Project and the centre-led functions to examine the DR Team’s functional estimates and provide recommendations for reducing redundancy and overall staffing size. The recommendations from this review have been accepted and are now being integrated into the various staffing plans. Once complete, the DR Team will need to vet the results to

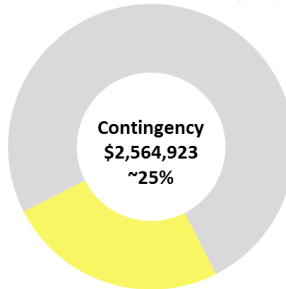

confirm that the current estimates are bounding in nature.

Management will still need to devote significant attention to right-sizing the team, defining clear roles and responsibilities and locking down appropriate assumptions prior to the Unit 2 check estimate. Past attempts to make top-down adjustments to the functional estimates have not been effective at holding down cost estimates, and this remains a risk. More importantly, the DR Team needs to be arrayed in a manner that is capable of effectively managing the execution phase. The DR Team’s leadership is committed to doing so.

## **Risk and Contingency:**

4D Estimate Value - Contingency

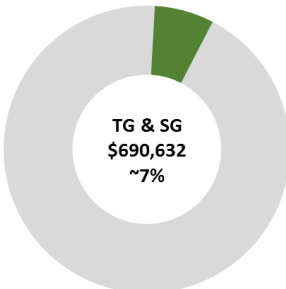

Contingency is the third largest category of costs in RQE behind RFR and the Functional Groups. The DR Team has developed and matured risk registers over the life of the project to date. The Risk team held workshops with each of the project and functional teams to review the current state of the risk registers to establish estimating uncertainty, clearly identify risks and fine-tune risk scoring so that contingency can be calculated and analyzed using Monte Carlo analysis methods. Once the data establishing the Project's base cost is fully available, the project teams will need to vet the results, and the DR Team's leadership intends to follow with full project reviews which are intended to challenge and affirm the variability in the estimates and approximate the level of estimate uncertainty.

We find the process for developing contingency to be robust, and the team has received help and advice from OPG's Enterprise Risk Management and OPG's vendor. However, the overall quality of the contingency development will be dependent on the quality of the data inputs. Due to the compressed RQE schedule, we remain concerned that the time for developing the base costs, understanding the estimate classifications and analysis of the residual impacts of discrete risks will compress the proper formation of contingency.

## **C. Status of Remaining RQE Inputs:**

### **Turbine Generator and Steam Generator:**

4D Estimate Value - TG & SG

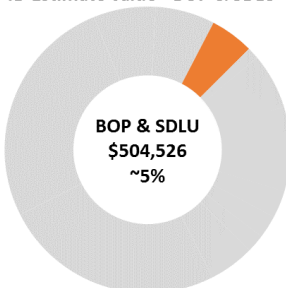

OPG has accepted SNC/Aecon's Class 2 Estimate for the Turbine Generator for Unit 2, and Alstom has completed its detailed design. SNC/Aecon and Alstom have submitted their full estimates for the subsequent units, which are characterized as Class 3 in nature. OPG's approval of those detail estimates is pending final review, though is expected shortly.

As with RFR, the OPG and the SNC/Aecon project teams are integrated and working well together. The remaining risks at this time appear to center on completing the CWP's for execution and finalizing the Unit 3, 1 and 4 detailed schedule. In addition, the risk profile for the Project changes significantly with Unit 3, which will be the first of three units that will have a full replacement of the original TG controls during Refurbishment. This will be a first time evolution for OPG and will require significantly more planning than the limited scope for Unit 2.

The OPG Steam Generator Team has done a good job in managing its activities in order to meet its milestone dates and this project is currently on-track. No issues are apparent at this time; these estimates are expected to support RQE.

### **Balance of Plant/Shut Down-Lay-up:**

4D Estimate Value - BOP & SDLU

At this time, the focus for BOP and Shut-Down/Lay-up has been Phase I/II engineering and planning work. The DR Team projects that detailed engineering for these projects will be substantially completed by the August 15, 2015 milestone. The DR Team has provided guidance to ES Fox to improve the development and quality of its related project estimates, and is in the process of characterizing the estimates it has received at this time. Approximately 35% of the BOP and Shut-Down/Lay-up work estimates will be in the Class 4/5 range, which increases the risk of estimating uncertainty and accuracy bandwidth for these projects. The OPG Estimating Team has taken a reasonable approach in characterizing the estimates on the basis of differences in their maturity level. Prior to RQE, the DR Team

needs to devote significant time in finalizing the risk registers for these projects so that contingency can be properly attributed.

In addition, ES Fox must continue its planning work with more detailed and mature estimates, execution schedules and

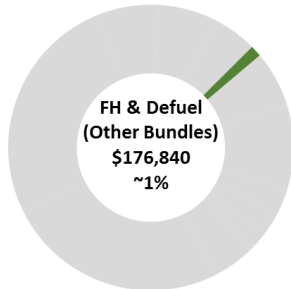

## Report to Darlington Refurbishment Committee 3Q 2015 Darlington Nuclear Refurbishment Project

development of CWP's. The DR Team has placed a goal of having BOP projects proceed to their Gate 3 between late November 2015 and January 2016. To do so, ES Fox will need to complete the detailed level 3 execution schedules, Class 2/3 estimates and Construction Work Packages to support these gates. To meet these goals, the BOP team has set interim milestone dates with ES Fox for these deliverables which will be regularly pulsed by the team.

### Fuel Handling/Defueling:

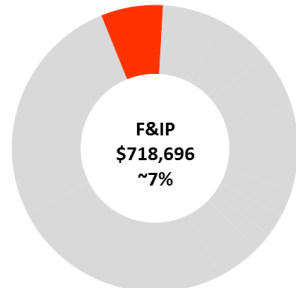

4D Estimate Value - FH & Defuel

The DR Team has received and accepted vendor Class 3 level estimates for RQE based on completed engineering from GE/Hitachi. Cold commissioning is ongoing for Fuel Handling system modifications, and while performance indicators had been lagging, recent progress has dramatically improved overall schedule performance. The recovery plan has also allowed the team to advance plans for testing and training. These recent improvements should allow for a better understanding of the critical path project durations and performance risks

### Campus Plan Projects:

4D Estimate Value - F&IP

The overall performance of the most significant Campus Plan Projects – D20 Storage, Auxiliary Heat System (“AHS”) Building, and Emergency Power Generator 3 (“EPG3”) - has continued to be impacted by ongoing issues with poor initial estimates and scope definition, site conditions, contractor performance and OPG oversight.

- **D20 Storage** – OPG issued a purchase order to SNC/Aecon on July 31, 2015 that covers the mechanical, electrical and civil/structural work from grade. SNC/Aecon has provided an estimate and schedule for the work that still needs continued development. SNC/Aecon initially submitted its cost and schedule proposal on April 9, 2015 though it was rejected by OPG due to a number of unacceptable commercial and scope exclusions.

SNC/Aecon revised its submission on July 8, 2015 including an estimate proposal of \$148M, an increase of \$8M from the prior submission, with a Class 3 bandwidth. OPG’s estimating team issued approximately one hundred comments to which SNC/Aecon agreed to respond; to date, these have not been fully addressed. While it was necessary for P&M to release this work to SNC/Aecon, it is important SNC/Aecon complete and fully submit its estimate for RQE so that OPG can properly assess risks of performance and potential costs. The Refurbishment Estimating team is supporting P&M in completing the vetting of the details of SNC/Aecon’s estimate to determine whether it is of sufficient quality to meet contractual requirements and allow for OPG’s assessment of risk and contingency. This is needed to support RQE.

Ellis Don continues to perform the underground civil work, including foundations, dyke walls and closure slab at grade. Currently, the schedule (dated August 4) shows Ellis Don is 57 work days (82 calendar days) behind in meeting the key milestone for setting of the D20 tanks. On August 6, the D20 Storage team identified a partial recovery of approximately 15 days (to January 13<sup>th</sup>) of this milestone through resequencing of the work. However, at Ellis Don’s current pace (SPI is 0.58), it is likely that these dates will continue to slip. If this work cannot be recovered, it will significantly compress SNC/Aecon’s work and could impact Unit 2’s need to use the D20 Storage tanks for moderator and primary heat transport drain after breaker open. OPG needs an execution schedule for D20 Storage that can be executed by the performing contractors based on the current understanding of the work, realistic projections based on field productivity to date, and which accounts for the limiting factors in the construction of the building.

We have recommended that P&M assess these risks using SNC/Aecon’s estimate and schedule and revisit the business case to confirm whether the path chosen for execution is the most prudent course, and whether the team should revisit options for temporary storage of Unit 2’s heavy water. It is notable that SNC/Aecon

Confidential – Do Not Disseminate

currently classifies its estimate at Class 3, as the business case was premised on a Class 2 estimate, meaning that additional contingency may be needed to cover the risks. P&M is also pursuing options with SNC/Aecon to further improve the schedule and sequence of the work. In any event, this analysis must proceed so that the risks of performance are adequately captured and monetized in RQE.

- **AHS** – The AHS project, which has been subject to schedule delays and cost increases, is nearing completion. The current schedule shows the work is 92% complete and construction testing of the systems has begun. The target for completion is October 2015 based on a full understanding of the commissioning effort. OPG and ES Fox have executed a fixed price amendment to cover the outstanding costs that had been pending for several months. The current projected final cost is \$99.5M, which has required a contingency draw of \$15M over the approved \$84.52M budget in 4d. AHS has provided multiple lessons learned that Refurbishment is taking into account in planning of BOP and Shut-Down/Lay-up work with ES Fox.
- **EPG 3** – This project must be completed prior to Unit 2's breaker open. Construction has been impacted by issues with plant tie-ins and unforeseen underground conditions. Engineering of modifications to the EPG unit are complete, and ES Fox has provided OPG with an estimate at completion of \$115M (increased from \$88M in 4d). The Refurbishment Estimating team needs to fully vet the details of the estimate to determine whether it is of sufficient quality and represents a sound plan. In addition, the schedule for construction requires additional vetting to confirm the constructability and sequence of ES Fox's plan. These details need to be addressed before the project advances to its upcoming Gate 3.

In prior reports, we have commented extensively on the P&M team's structure and capabilities for managing the work. P&M had previously committed to making improvements in areas of project management, project controls and risk management through additional training and adopting Refurbishment processes, where necessary. These improvements need to be accelerated to properly manage the remaining Campus Plan Projects to completion within the RQE control budget. In addition, we have raised the risk of ESMSA contractors' performance deficiencies. The step-up in collaboration between the Refurbishment team and the ESMSA contractors has resulted in higher quality engineering packages and project estimates. The vetting effort described above with SNC/Aecon's D20 Storage proposal provides an example of the benefits that P&M has achieved. These same efforts need to be applied to all remaining Campus Plan Projects, as necessary, to reduce risk of remaining performance and attempt to properly characterize the risks of these Projects to the Refurbishment program.

### III. Areas of Focus - RQE Quality

#### Estimate Characterization

The process of validating and vetting EPC cost estimates for the Project's bundles has followed the approved DR Project RQE Cost Estimate Plan. The vendors presented the cost estimate packages to the OPG Project team in a multi-stage progressive review process for comments and disposition. Among the issues covered at each review stage were scope, COMS, schedule, identification of key cost drivers, estimate basis, benchmark ratios, exclusions and assumptions, as well as cost challenges on a number of issues, such as vendor PMT, indirect costs and productivity factors. Once the EPC vendor completed the comments and disposition phases, and a final revised estimate was received, OPG's estimating team then loaded the estimates into the US Cost estimating platform for analysis.

Once loaded into OPG's US Cost database, OPG's estimating team then vetted and validated the estimate data to determine if the estimate was accurate, reasonable and competitive to the desired classification; as well as, identified any gaps in the documentation or methodology that may negatively impact the quality of the final estimate. The team then performed a technical review of the estimate from a scope point of view and proposed an AACE classification for further review. The process is documented with review checklists. Another member of the estimating team performed

## Report to Darlington Refurbishment Committee 3Q 2015 Darlington Nuclear Refurbishment Project

a peer review of the estimate checklists. The estimating manager then conducted a final challenge of the proposed classification of the estimate. Upon completion of the review process, the estimating team issued an estimate declaration of appropriate AACE estimate class.

The estimating team is in the process of performing a reasonability review to obtain buy-in of the vetting process. The focus was to ensure the estimate and its classification is transparent and justifiable. A final estimate review report is then issued memorializing and summarizing the AACE classification, scope review, estimate review, and reasonability review for approval by the Project Manager. This report is targeted for the end of August 2015.

Over the coming weeks, BMcD/Modus will be reviewing and sampling the process to test whether the OPG estimating team has consistently applied its standards and accurately assessed the estimates.

### RFR Project-Class 2 Estimate

RFR represents approximately 26% of the total estimated DR Project cost (per the 4d estimate, including contingency), and thus, remains the single largest risk to RQE and the DR Project as a whole. To provide context for the RFR estimate's current status, the following is a summary of the events over the past year.

After receiving SNC/Aecon's Class 3 estimate in June 2014, OPG worked collaboratively with SNC/Aecon to ensure that its Class 2 estimate plan and pricing of the work would be, when delivered, reasonable and achievable. This collaborative review process was intended to ensure that SNC/Aecon's estimate accounted for OPEX from past refurbishments, improvements to the tool set for Darlington and the value of the planning effort to date, including the full-scale mock-up at the Darlington Energy Centre ("DEC"). The collaborative review process spanned much of the year between the delivery of the Class 3 estimate in June 2014 to mid-April 2015, though SNC/Aecon was consistently behind in its preparation. In April, OPG paused its review to allow SNC/Aecon to complete the estimate documentation on its own. It was clear to the OPG team at that time that proper vetting of the estimate required SNC/Aecon to deliver the entire Rev. 0 submission, as piecemeal reviews of the estimate's components were of increasingly limited value. On May 8<sup>th</sup>, 2015, after several changes to the agreed to delivery date<sup>2</sup>, SNC/Aecon presented its first draft of the Class 2 estimate to OPG.

From an initial reading, it was immediately apparent that SNC/Aecon's Class 2 submission was based on a substantially longer duration and higher cost than OPG anticipated, considering the results from testing in the mock-up were very favorable. In fact, the base duration in Rev. 0 exceeded the scaled-up duration of Wolsong (which is a smaller unit), and the reasonably achievable duration was in excess of Bruce Unit 1, both of which had problems during execution that SNC/Aecon and OPG had strived to eliminate for the DR Project.

Following SNC/Aecon's delivery of its Rev. 0 Class 2 estimate, OPG's project management team (including members of the Estimating, Scheduling, and RFR organizations) commenced detailed reviews, ultimately producing over 2,000 comments regarding various noted deficiencies. OPG began bottom-up estimate vetting exercises consisting of "deep dives" and "vertical slices" through the estimate documentation. The deep dives generally addressed specific items of cost such as tool management, support services, direct field labor, performance adjustment factors, and the like. The "vertical slices" evaluated SNC/Aecon's estimate at different key points in time, testing the veracity of SNC/Aecon's planning, resourcing, and constructability; in particular, areas of high complexity such as peak man-power staffing, unit over unit overlaps, and waste processing logistics were carefully analyzed. The results of the early vetting revealed problems with SNC/Aecon's submission that needed to be corrected for OPG to accept the estimate and utilize it as the

<sup>2</sup> The SNC/Aecon contract specifies that the Class 2 Estimate would be delivered by May 15<sup>th</sup>, 2015. By mutual agreement, SNC/Aecon's Class 2 estimate was accelerated for delivery by April 10<sup>th</sup>, 2015, though SNC/Aecon was unable to meet this deadline. OPG ultimately provided SNC/Aecon with an extension to May 8<sup>th</sup>, 2015 to ensure SNC/Aecon was providing an estimate package of requisite quality.

**Report to Darlington Refurbishment Committee**  
**3Q 2015 Darlington Nuclear Refurbishment Project**

basis of the Project's target price.

Simultaneous to OPG's review, the parties jointly engaged an expert panel (including individuals selected by OPG and SNC/Aecon) who have played significant roles in virtually every CANDU refurbishment to date. The expert panel reviewed SNC/Aecon's submission and generally agreed with OPG's conclusions regarding the excessive schedule, cost, size of the labour force and risk monetization. BMcD/Modus also provided input from our review of the submission, focusing largely on inconsistencies in the information presented and areas lacking in appropriate back-up and rigor. Areas we highlighted to OPG were as follows:

- Overall quality is insufficient to support a Class 2 submission
- Contingency is built into the base estimate and schedule
- Subsequent unit estimates are assumed to be a replication of Unit 2, with overlapping schedules, and did not consider distinct risks from the overlaps and changes in the execution model
- OPEX is not utilized in a meaningful manner for establishing the basis of the estimate or testing reasonability
- Resource leveling is questionable and resultant resource curves are not achievable
- Based on comparable metrics, the PMT is oversized and is not presented as a well-integrated organization
- SNC/Aecon's inaccurate understanding of conformance to AACEi recommended practices for estimate preparation

Overall, the expert panel and BMcD/Modus produced over 300 comments regarding the Rev. 0 estimate's quality.

Based on the DR Team's initial reviews and input from third parties, it was clear to OPG that SNC/Aecon's Rev. 0 submission was insufficient, and resolving the multitude of issues would require substantially more time and effort than originally planned. The resultant estimate vetting process has run well past the initial mid-June 2015 target date for approving SNC/Aecon's Class 2 estimate. Starting in June, OPG and SNC/Aecon proceeded down parallel paths to resolve the current estimate issues:

- Project executive-level working sessions, intent on establishing a set of baseline cost and schedule objectives and addressing potential risks and barriers to performance that caused SNC/Aecon to take an excessively conservative approach to the estimate;
- Continued bottoms-up vetting of the detailed estimate and schedule, with subject matter experts ("SMEs") from OPG and SNC/Aecon working shoulder-to-shoulder to resolve OPG's comments and challenges.

Based on the agreement reached at the project executive-level, the combined OPG and SNC/Aecon teams have been given targets for what OPG deems an acceptable schedule and cost (a P50 schedule of 1,100 days and a target cost of ~\$2.6B including contingency). These targets were provided for context only, as the direction given by both management teams was to focus on coming to agreement on what is realistic and achievable, supported by workable plans, concrete data, and OPEX, rather than meeting top-down targets. This process has netted excellent progress towards reaching closure on many of OPG's challenges and developing a principled basis for SNC/Aecon's estimate.

The current target date for delivery of the revised estimate is August 31<sup>th</sup>. Meeting this target will require completing the following:

- Finalize review of schedule critical path and sub-critical path durations from "bottoms-up"
- Rationalize risk register and reach agreement on nature, severity and ownership of risk
- Complete monetizing Unit 2 estimate based on outcome of SME examination
- Review all accepted changes to schedule and monetize differences in overhead/Project Management Team ("PMT") costs

**Report to Darlington Refurbishment Committee  
3Q 2015 Darlington Nuclear Refurbishment Project**

- Provide analysis of discrete risks for Units 3/1/4 and monetization of same
- Complete all steps in pre-negotiated term sheet including finalizing incentive/disincentive approach
- Dispositioning all items in expert panel and BMCD/Modus list
- RWPB estimate which needs to be fully vetted.

From the outset, we have recommended that OPG take a reasonable amount of time to vet the Class 2 estimate given its importance. Completing all of this work by August 31<sup>st</sup> will be a significant challenge, and ensuring that the resultant SNC/Aecon Rev. 1 submission is of the quality capable of being approved will also take time. However, the work done to date in vetting the estimate has had tangible results and greatly improved the price, schedule and risk profile for the overall Project.

---

### *Functional Groups*

---

The Project's functional groups (essentially what make up the "DR Team" and include Engineering, Operations & Maintenance, Project Controls and the Execution Team) constitute approximately 22% of the DR Project's total cost. The RQE Roadmap milestone for completing functional estimates by May 15<sup>th</sup> was not met, and the initial functional cost estimates for virtually every group increased over their 4d levels.

The SVP of Nuclear Projects challenged the functional team managers to both reduce their overall cost and right-size their staffing plans, and investigate ways to leverage other parts of OPG's business to reduce staffing burdens. To assist in this regard, the SVP requested formation of a senior review panel that included a broad spectrum of knowledge within the company. This panel provided the following observations from this review:

- Many of the panel's recommendations related to removing overlapping responsibilities between different functions;
- Future staffing reductions, based on Lessons Learned from the first unit, should be possible for the subsequent units included in RQE;
- Approximately 50% of the reductions contained in the report have been agreed to by the Functions. A 'top down' instruction will be required to achieve the balance of the reductions recommended. In addition, a single leader must be assigned to ensure the reductions are implemented and that a Divisional Self-Assessment or audit be performed prior to the 'Check Estimate' to ensure the reductions have remained in the estimate; and,
- Going forward, the project philosophy must be that if something is to be added to the estimate an equivalent reduction must be taken.

The panel made a number of recommendations regarding clarifying roles and responsibilities and resource allocation. From a cost estimate perspective, the panel essentially reversed much of the cost growth that the functions had estimated post 4d. These recommendations were presented to the SVP, who directed the functions to follow suit and revise their staffing plans.

In our view, the results of the senior panel still need to be vetted to ensure that the recommendations have been incorporated into both the teams' management plans and cost/staffing estimates. The SVP has directed top down adjustments in prior cost forecasts that have not been realized; thus, ensuring full buy-in of the panel's recommendations is necessary at this time. Moreover, once these changes are made, we would advocate vetting of the result to see whether the revised plans truly represent a bounding estimate. At a minimum, the functional management plans from the team must reflect that the panel's recommendations have been embraced and the staffing plan needs to reflect those assumptions.

Ultimately, the DR Team's leadership intends to "live test" the organization through the Readiness to Execute plan,

leading to potential refinements of the organization needed for the full Execution Phase. We have recommended that management also look at the division of responsibility (once available) to confirm the roles are well defined and duplication is eliminated, and examine the work itself and right-size the staff in accordance. The senior leadership is committed to doing so prior to the Unit 2 check estimate. There is considerable value in re-assessing the DR organization's structure considering the current transition to execution phase work and the ways in which the Project's planning has matured.

---

### *Risk and Contingency*

---

Contingency for RQE will be comprised of seven (7) major "buckets", each of which require separate and unique inputs. These buckets include:

- Cost estimating uncertainty (determined based upon the class of estimate of the base costs and the opinion of OPG estimators and subject matter experts);
- Schedule estimating uncertainty;
- Discrete risks (both for the individual project bundles and the entire program);
- High impact/low probability risks
- Contingent work;
- Campus Plan/F&IP life cycle contingency estimates; and
- Insurance uncertainty

OPG has taken a scalable approach to calculating contingency for project bundles and functions. The rigor applied and method used (stochastic or deterministic) will depend on the state of the project bundle or function at the time the RQE package is assembled. Where the base plan cost and schedule estimate is mature enough to allow it, certain buckets will be run through a Monte Carlo simulation using the @RISK program. Other buckets (such as the high impact/low probability risks, Campus Plan life cycle contingency risks and insurance uncertainty) are derived deterministically using expert analysis and will be added to the outcome of the Monte Carlo simulations to comprise the total RQE contingency estimate.

OPG has retained the PALISADE Corporation to provide third-party expertise in supporting RQE and to ensure integrity of the modelling process. This third party expert will review the inputs generated by the risk management process, design the risk model, define the detailed modeling feed stock and execute and oversee the contingency modeling processes. PALISADE is the developer of the @RISK program and has performed this function for many capital projects.

During the week of July 20, 2015, the DR Risk Management team conducted contingency workshops with the project bundle and function teams. The purpose of these brief (1-2 hour) workshops was to guide the teams on the expectations regarding the data inputs needed for RQE contingency development. In these workshops, the discussions focused primarily on discrete risks and the scoring of those risks (probability of occurrence, cost and schedule impact if realized). These assumptions were then challenged by a panel that also reviewed the scoring, 3-point ranges and recurrence frequencies in the templates.

The Project and function teams were to take the comments from the workshop and update their contingency inputs for final submittal on July 27<sup>th</sup>. The Risk team has entered the input data and run a preliminary Monte Carlo analysis to arrive at preliminary contingency numbers for the DR Project. These amounts will need to be further analyzed to determine if the contingency is appropriate and reasonable. Once these inputs are adjusted, another Monte Carlo analysis will be run. The following are some of our key observations from these risk workshops:

## Report to Darlington Refurbishment Committee 3Q 2015 Darlington Nuclear Refurbishment Project

- The workshop concept is good and leverages the work ongoing with risk identification since the start of the Project. However, the key to success is how the projects/functions develop appropriate contingency inputs. This is no small task considering the available time and the amount of effort involved. Individuals from the Risk Management Group will work with the project and functional groups to facilitate acceptable input for RQE. However, project and functional personnel must develop the justifiable content.
- When BMCD/Modus began work on the Project, risk was a very low priority for the managers. Over the last year, additional management focus has been placed on developing and rationalizing risks, and management's goals are well known to the project managers. Some groups have embraced risk analysis, but others pockets within the team have produced contingency input merely to meet the RQE deadline; despite effective Risk Management tools, infrastructure and a support organization. RQE will be the test of how deeply the DR Team understands the risk aspect of their work.
- Some of the estimates of the impact costs were not derived using accepted estimating practices—but were based upon the project manager or functional group representative's "gut feel". The calculations for the cost impacts of discrete risks should be estimated and vetted by the Estimating team with the same rigor as the base cost estimates.
- The Risk Management Team will also review all registers to identify and resolve duplicate and overlapping entries. Clarity and precision in the risk descriptions will influence how efficiently this review can be conducted. Eliminating such redundancy only increases confidence.
- The BOP team has a significant challenge. Its major contractor has noted performance issues on Campus Plan projects, necessitating significant BOP schedule and cost contingency in order to have sufficient funds budgeted. That creates problems developing firm estimates and schedules. Nonetheless, absent detailed Construction Work Packages, fairly accurate OPEX for executing some of the BOP work, such as valve repair/replacement, can be employed. To develop the best input for RQE contingency, the BOP team has to rely on creative approaches such as existing DNGS OPEX, SME input and appropriate risk analysis. BOP (and, where necessary, other groups) are working closely with the Risk Team to timely develop acceptable contingency inputs.

The Project Controls team managing RQE is intent on issuing a number of key questions for the team to consider in looking at their contingency. In developing the global, program level contingency, the DR Team should fully consider the following risk areas as part of that exercise:

- **Address vendors' concerns regarding OPG's role as overseer and integrator of the work:** Each of the vendors have voiced their concern that OPG's history is to provide multiple points of contact during a work cycle, who often provide conflicting information and direction and otherwise interfere with the field work. For the Project to be successful, the DR Team needs to dispel these fears with an optimized Execution Phase organization with clear accountabilities, and ensure that the Station and the Project are fully integrated. To address this, the DR Team has identified a plan to test its Readiness to Execute the work using actual work scheduled in 2015-16 prior to Breaker Open. This plan should be finalized and fully vetted for RQE and tracked with appropriate metrics and targets during the coming year. Nonetheless, for purposes of RQE, these risks need to be fully addressed.
- **Fully analyze and account for the distinct risks inherent with the performance of Units 3, 1 and 4:** RQE is establishing a control budget for measuring OPG's performance on all four units. While this is sufficient for establishing the control budget's base cost, the full DR Project as it currently is planned actually consists of four separate and distinct execution models: Unit 2 is intended as a stand-alone project; Unit 3 will be completed while Unit 1 is started; Unit 1 will be started simultaneous to Unit 3's completion and completed at the same time Unit 4 is started; and Unit 4 will be "lapped" at its start by Unit 1. The DR Team has embedded certain risks regarding the subsequent units; these should be vetted for consistency and whether they cover the impact, needed resources, and other key factors that could make the execution of the subsequent units different, if not

more difficult. Thus, full consideration needs to be given to contingency and other cost factors associated with future unit performance.

- **Developing appropriate succession plans for both OPG and vendors:** OPG is carrying as its most prominent enterprise risk the availability of qualified staff and craft resources over the 12-year lifecycle of the DR Project. Mitigating this risk will require increased flexibility in hiring of staff and potentially additional cost for incentivizing workers. The risk of losing key staff over time will manifest itself in multiple ways, including losing the learning curve and “tribal knowledge” provided by the performance of prior units. Thus, unless this risk is properly addressed (as well as the aforementioned risk of multiple unit performance), assumptions regarding unit-over-unit performance improvement could prove to be overstated.
- **Scope definition for subsequent units:** Our understanding is the Darlington units are as close to alike as any multi-unit station in the world. This assumption has been tested through inspections and operational performance. However, the methods for replicating engineering and scoping effort for the remaining units presents an opportunity to reduce cost. These assumptions also could impact the direct work, as the cost for “design once, build four times” needs to be confirmed.
- **Re-Assess utilization of the ESMSA agreement:** The Campus Plan Projects have provided OPG with an initial opportunity to assess its vendors under the ESMSA, and the record shows significant evidence of poor performance in both cost and schedule. Most of the ESMSA work in Refurbishment in the Balance of Plant and Shut Down/Lay-up bundles has not yet advanced to construction phase purchase orders. The DR Team has committed to finalizing the estimates for this work by next year’s Unit 2 Check Estimate. The DR Team is aware of the track record established to date, and is committed to holding appropriate contingency for Refurbishment work. However, the team should consider whether the current contracting arrangement is also contributing to these problems, and whether there is a reasonable mitigation strategy available before finalizing the work plan for Balance of Plant and Shut Down/Lay-up.

#### Documentation and Data Alignment

Assembly of the massive amount of data that underpins RQE would be a challenge by itself; adding the compressed time for integration and quality assurance makes the integration effort much more difficult. The Project Controls team leading the effort is currently tasked with integrating the multiple estimate submissions from the vendors, OPG functions and other costs into a Master Consolidated File (“MCF”) for purposes of analyzing the individual estimates as well as the sum of the multiple parts. As of this writing, Project Controls reports being substantially complete with compiling the data, though that is the first step.

For full vetting of the DR Project as a whole to be effective, the DR Team will need to have the MCF fully populated and QC checked so that the team can analyze issues such as whether:

- The project management team (both OPG and contractors) is right-sized;
- Work windows are available for non-critical path work;
- Resource profiles for craft workers are properly leveled so that the work can be supported, and so that troughs in the work flow are smoothed out and the contractors know when and whom to hire and train;
- Productivity factors and assumptions used in the estimates are consistent and properly characterized;
- Unit-over-unit direct work costs have been properly considered;
- Resources identified in the vendors’ cost estimates match the resources in their P6 schedules;
- Ratios of direct field labour to supervision are appropriate for the work and consistent across the program;

**Confidential – Do Not Disseminate**

**Report to Darlington Refurbishment Committee**  
**3Q 2015 Darlington Nuclear Refurbishment Project**

- Other such considerations.

Vetting the MCF once assembled will take considerable effort and likely will run longer than anticipated.

## I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company (“BMcD/Modus”) provide the following Report to the OPG Board of Directors (“BOD”) regarding the status of the Darlington Nuclear Generating Station’s Refurbishment Project (“Project” or “DR Project”) as of October 30, 2015. This report provides the summary of our team’s assessment of the DR Team’s development of the Release Quality Estimate (“RQE”). This report also summarizes the DR Team’s current status of “post-RQE” work that will be its focus going forward, assuming the Board of Directors’ approval of RQE at the November 2015 meeting and subsequent shareholder approval, as well as the status of work that is currently being executed on the Prerequisite (“Campus Plan”) work and the DR Project.

### A. RQE

OPG and the DR Team have been working toward developing a realistic RQE for the DR Project since 2009. The major focus of the DR Team over this time period has been the development of detailed cost estimates of sufficient quality and basis in order to establish a four-unit, program level **control budget** for the DR Project. In order to develop the control budget, the DR Team needed to mature the planning to the point where the cost estimates were substantively based. While the DR Team will continue to refine the unitized estimates for each of the four units in order to make specific funding requests, the control budget, if accepted by the Board, will be the baseline against which both the stakeholder confidence and public trust will be measured.

Megaprojects (\$1 billion or more in cost) are often adversely impacted by overly optimistic initial cost estimates that do not fully consider the risks and complexities inherent in such undertakings. The DR Team is aware of the industry track record and has taken reasonable steps to account for the particular risks of CANDU refurbishments and develop its cost estimates accordingly. In order to properly communicate the nature of the DR Project’s estimate and approximate appropriate contingency, OPG has chosen to utilize the guidance of the Association for the Advancement of Cost Engineering International (“AACE International”). OPG’s strategy in this regard is aligned with reasonable and acceptable industry practice for a multi-year, multi-phase megaproject.

In our last report (October 2015) we noted that the month leading up to the November Board Meeting would be challenging given the amount of work the DR Team had left to complete. The DR Team met each of its goals, including:

- Finalizing the target price negotiations with SNC/Aecon on the RFR contract;
- Completing outstanding actions regarding all of the sub-projects from the initial round of senior management-level reviews and revising cost projections accordingly, and vetting the results of those changes;
- Firming up and vetting direct cost estimates and associated critical path schedule basis; and
- Performing integrated reviews of contingency and developing recommendations for amounts of contingency “buckets” and which entity (i.e. project, executive management, BOD) should control those buckets.

With these activities accomplished, the DR Team has completed the work necessary for establishing its control budget, and as an additional benefit, the team has an improved understanding of the Project. Based on our nearly three years of oversight of the DR Project’s planning, BMcD/Modus believes the process used for developing the control budget and critical path schedule that form the basis for RQE meets or exceeds industry thresholds. The control budget is based, most notably, on well-defined scope and detailed engineering, which has sufficiently matured to allow classification using the AACE International guidelines in the manner OPG intended for RQE. In addition, the level of detail in the RQE control budget is in line with our experience for projects of this nature and should form the basis for a robust project controls regime that will be used to track progress.

Given the complexity and length of the DR Project, it is impossible for OPG to predict all of the issues that the DR Team may confront during execution. In order to reasonably incorporate the risk of these unknown issues, it is important to build a deterministic-based contingency augmented by a strong risk-management process and stochastic Monte Carlo model. Over the course of the Definition Phase, the DR Team’s risk management approach has matured and the team has

**Report to Darlington Refurbishment Committee  
OPG Board of Directors, November 12, 2015**

put into place a robust process for modeling and monetizing contingency that considered the issues experience on prior CANDU refurbishments as well as issues previously encountered by OPG. In the course of developing the RQE contingency, all project and function managers increased their focus on risk matters to ensure that risks were reasonably identified; response plans were established; and occurrence probabilities and impact quantification were developed. The DR Team performed a reasonable amount of challenge and review of the risks. While risk management and contingency development has many subjective aspects, the DR Team's process is well constructed and executed. It is in the upper percentile of comparable project practices. As with any complex megaproject, contingency values can never be perfect, though OPG has developed contingency at an appropriate level of maturity for establishing the Project's control budget.

While there is still considerable work ahead for the DR Team to further refine its estimates, schedule and execution planning for each of the Project's units, the DR Team has substantially met the goals it set in 2009 at the DR Project's inception for its Definition Phase. With RQE's completion, the DR Team is focusing on ensuring the documentation needed to substantiate its decisions is properly archived and available for future needs, including the unit-specific estimates and future regulatory proceedings. The team has set a goal of completing the RQE document archive by the end of 4Q 2015. We discuss the process used to derive RQE's control budget and recommendations for further refinement in the Unit 2 Estimate<sup>1</sup> that will be issued prior to the Execution Phase in 2016.

## **B. Status of Prerequisite Projects**

We have noted the need for Projects & Modifications ("P&M") to provide greater confidence that the remaining key Campus Plan Projects, most notably D20 Storage and EPG 3, can be completed in time to support Refurbishment and meet current cost estimates. Providing such confidence depends as much on progress in the field as it does on P&M providing requisite metrics and progress reports so that this work can be accurately forecasted and managed. P&M has made good progress over the past month with D20 Storage. The Project Controls team is now tracking quantities of installed concrete by Ellis Don, the civil contractor, which will allow for better forecasting. Ellis Don has also added a second shift to increase its production. All of these efforts have improved the outlook for the foundation work, though P&M must continue to track Ellis Don's progress in order to confirm that it can meet its recovery schedule dates for turnover to SNC/Aecon of November 30, 2015 for the south side of the D20 West Annex Basement and December 22, 2015 for the seismic dyke.

As P&M's attention begins to shift to SNC/Aecon, P&M is closely monitoring the SNC/Aecon's recovery of initial delays in its preparatory activities, including procurement and prefabrication of process piping. P&M has assigned key staff [REDACTED] P&M's ability to manage this transition should be further enhanced by performance metrics SNC/Aecon is providing for its critical path activities. The other key prerequisite project being performed by SNC/Aecon is the Reactor Waste Processing Building ("RWPB"). Site work is ongoing while SNC/Aecon continues to develop its full execution cost estimate and schedule.

Another key project, the Emergency Power Generator 3 ("EPG 3"), is being performed by ES Fox. Based on ES Fox's assessment, the civil construction of this project is currently approximately 20% complete, though ES Fox and P&M must still agree to a cost estimate and full performance schedule to progress the work. SNC/Aecon's performance with D20 Storage and RWPB and ES Fox's performance with EPG 3 should be a leading indicator of OPG's ability to open breaker on time in October 2016 for Refurbishment and provide important lessons learned going forward.

## **C. Readiness for Execution**

With the completion of RQE, the Definition Phase also completes, and assuming BOD approval, the Execution Phase of the Project will formally begin. As we have noted, the key work ahead before Unit 2's Breaker Open in October 2016 will be focused on its "Readiness to Execute" plan ("RTE") in which the DR Team intends to live-test its plans for unit execution using pre-requisite work. During this time, the DR Team intends to, among other things: complete all execution processes and procedures; finalize its execution schedule and confirm the schedule's critical path and sub-critical paths for Unit 2; develop and test all of its tracking metrics for execution work; finalize tracking methods for vendor performance and

<sup>1</sup> The Unit 2 Estimate has also been referred to as the "Unit 2 Check Estimate". However, because the term "check estimate" has a particular meaning within the industry, we prefer use of the term Unit 2 Estimate.

**Report to Darlington Refurbishment Committee  
OPG Board of Directors, November 12, 2015**

procurement, and; finalize the Division of Responsibility (“DOR”) and staffing for the execution organization. The Readiness to Execute is an aggressive plan that has multiple deliverables and will involve effort from the entire DR Team, and will leverage the work the DR Team has already accomplished with the vendors to prepare for execution. We have recommended that the DR Team schedule as many of the activities as possible in a resource-loaded, logic-based schedule and track its progress in the same manner as any project. The DR Team has initiated its Readiness to Execute planning in earnest and should be prepared to provide the BOD and senior management with meaningful progress reporting.

## **II. DR Project RQE – Summary of BMcD/Modus Assessment**

### **A. Overview**

RQE represents the culmination of the DR Team’s efforts in the Definition Phase. In order to formulate our opinions regarding RQE, BMcD/Modus have performed two in-depth assessments:

- Assessment of the DR Team’s Process for Developing RQE (“RQE Assessment”);
- Assessment of OPG’s Critical Path Schedule, on which RQE is based (“Critical Path Assessment”).

This report summarizes these detailed assessments which provide the DR Team with our view of RQE and identify certain issues and challenges the Team should consider in its continued preparation for Unit 2’s Execution Phase and beyond. In summary, the RQE Assessment and Critical Path Assessment conclude that:

- The estimates developed for the multiple sub-projects have the requisite basis to establish a meaningful control budget;
- OPG met the broad goals for RQE it established at the outset of the Definition Phase and in doing so followed acceptable industry practice, including its use of the guidance of AACE International that OPG chose for specific guidance in its estimating, risk and schedule development;
- RQE is based upon sufficiently mature scope and engineering definition, as well as an understanding of necessary operational experience (“OPEX”) and lessons learned from prior refurbishments and other similar megaprojects, and reasonable alignment with the vendors who are performing the work;
- The DR Team and OPG as a company have adequately assessed the DR Project’s risks and have reasonably approximated contingency necessary to offset those risks over time;
- The critical path for the Project was developed using a deterministic approach that considered past similar evolutions, simulated work in the Mock-Up reactor and reasonable assessments of potential improvements in key work series;
- The critical path has been captured using acceptable scheduling practices and resource curves have been sufficiently analyzed and incorporated into the estimate for the current phase of planning;
- The DR Team has a comprehensive plan to prepare for the Execution Phase of the Project; and
- The areas of RQE that are less mature – namely that Balance of Plant (“BOP”) and Shut-down/Lay-up (“SDLU”)– have adequate contingency for the known risks and uncertainties.

### **1. OPG’s Goals and Adherence to AACE International Guidance**

In order to aid OPG in its development and characterization of the RQE estimate, OPG appropriately chose to utilize AACE International’s Cost Estimate Classification System<sup>2</sup>, which explains the importance of these guidelines and the intent of their general use:

<sup>2</sup> See AACE’s Recommended Practice No. 17R-97, Cost Estimate Classification System (November 29, 2011) and Recommended Practice No. 18R-97 Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Process Industries (November 29, 2011)

**Report to Darlington Refurbishment Committee  
 OPG Board of Directors, November 12, 2015**

*An intent of the guidelines is to improve communication among all of the stakeholders involved with preparing, evaluating, and using project cost estimates. The various parties that use project cost estimates often misinterpret the quality and value of the information available to prepare cost estimates, the various methods employed during the estimating process, the accuracy level expected from estimates, and the level of risk associated with estimates,... improving communications about estimate classifications reduces business costs and project cycle times by avoiding inappropriate business and financial decisions, actions, delays or disputes caused by misunderstandings of cost estimates and what they are expected to represent.*

AACE recommends that cost estimates be categorized into five different “Classes” based on the project’s level of maturity and definition. Class 5 estimates are based upon a low-level of project scope definition and therefore these estimates have the highest amount of uncertainty and the lowest level of accuracy. In contrast, a Class 1 estimate should have little uncertainty and very high accuracy. As noted in our past assessments of the DR Team’s cost estimates (4c and 4d), this approach was appropriate and allowed for better understanding of the nature of RQE.

Pursuant to the Nuclear Refurbishment Project RQE Cost Estimate Plan (NK38-PLAN-09701-10235):

*The target classification of the RQE cost submission is AACE Class 3 with an expected 50% level of confidence on the point estimate and accuracy range, exclusive of applying escalation, interest and management reserve, within:*

<i>Class 3</i>	<i>Level of Project Definition: 10% to 40%</i>	<i>Budget authorization or control</i>	<i>Accuracy Range: L: -10% to -20% H: +10% to +30%</i>
----------------	--	--	--

*An assessment of the class of estimate achieved by each project bundle will be performed by the NR Estimating Team based upon AACE Recommended Practices and the nature of the project scope of work.*

As stated above, AACE International’s guidelines use maturity level of project definition deliverables as the primary characteristic for classifying estimates. In its procedure, OPG listed the specific deliverables that would need to be developed in order to sufficiently advance the Project to support an RQE within the target Class 3 classification.

Based on our RQE Assessment, we concur that the DR Team has sufficiently matured the work in these areas in order to support RQE as a Class 3 estimate and establish a control budget. We do note that some bundles lack Class 3-level maturity (i.e. BOP and SDLU) while others have been deemed Class 2 (RFR). These differences in maturity are not unusual for projects of this complexity, and the DR Team has a full understanding of those parts of the work that need greater definition.

During the Definition Phase, the DR Project’s scope was substantially developed and supported with detailed engineering packages. With some exceptions, the detailed engineering packages were prepared in sufficient time for that scope to be adequately assessed and estimated by the DR Project’s EPC vendors. Additionally, as we noted in our 3Q 2015 report to the DRC, the process the DR Team used for validating and vetting the cost estimates for the Project’s bundles has followed the approved DR Project RQE Cost Estimate Plan, and the result of this process was as intended – the vendors’ estimates for project cost have been classified so that management understands the underlying quality, accuracy and reasonableness. This knowledge aided management in identifying potential risks in performance, gaps in the vendors’ planned approaches, and areas to shore up for the future unit-specific cost estimates.

Moreover, with this effort complete for the control budget, the DR Team is better positioned for all of its remaining cost estimating work, which will be considerable during the Project’s lifecycle. The Unit 2 Estimate the DR Team intends to deliver in the 3Q of 2016 to the Board of Directors will support that unit’s execution. The team is committed to performing a similar estimate prior to each unit’s execution. In addition, projects of this type must have ongoing cost estimate support for evaluating potential change orders, claims and cost overruns. The process the DR Team has used for RQE should be adaptable for each of these future needs.

November 12, 2015

**Confidential – Do Not Disseminate**

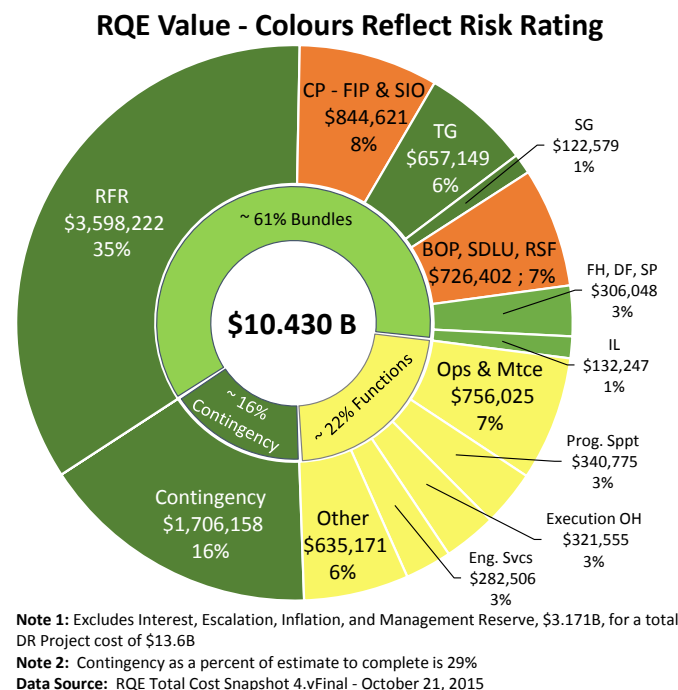

In addition, with the development of the control budget, the DR Team has advanced its understanding of the Project's estimated costs such that it should no longer need to depend upon AACE International's cost estimate classification. The DR Team has now established its own measuring stick. With the exception of those projects (BOP and Shut-Down/Lay-up) that have not advanced to Class 2/3 designation and which still need to reach appropriate maturity, OPG should henceforth measure its progress against the control budget without further regard to AACE International classification.

## 2. Summary of RQE Elements

In the following sections, we discuss in summary fashion: the basis for each of the DR Project's major cost elements; how these estimates were developed and characterized; the risks identified for each bundle, and; recommendations for further maturation of the estimates.

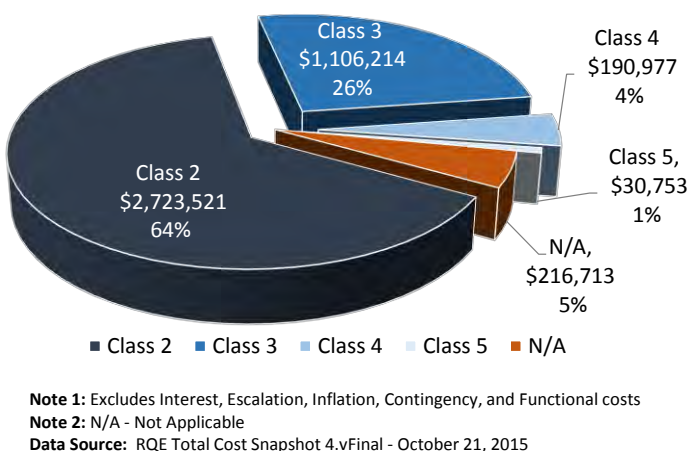

**Figure 1**

The adjacent **Figure 1** shows the updated RQE control budget values for each of the major sub-projects, or bundles, as well as the OPG Functional costs and contingency (in 2015\$). Figure 1 shows the entire control budget including Definition Phase costs of \$2.3B.

**Figure 1** also provides context for the relative size and percentage of each component of RQE. The three largest parts of RQE are: RFR (35%); OPG Functions (22%); and Project and Program Contingency (16% of the total control budget and 29% of the estimated cost to complete). The Turbine Generator and Steam Generator projects (7%), Campus Plan Projects (8%), and BOP, Shut-Down/Lay-Up, and Retube Support Facilities (7%) are the next largest slices of the budget.

## AACE Classification of RQE Estimate to Complete

**Figure 2**

**Figure 2** provides a depiction of the estimate class applied to each sub-project (or "bundle") per AACE International guidance and OPG's governance for RQE.

Below, we provide a brief update regarding the status of each of the major inputs to RQE in which we summarize the basis of the estimates that are being included in the control budget; the method and depth of vetting the DR Team applied to those estimates; a summary of the basis of the control budget's contingency, and; a summary of the current issues each project should address during the Ready to Execute period leading to breaker open.

**Report to Darlington Refurbishment Committee  
 OPG Board of Directors, November 12, 2015**

**B. Schedule Basis for RQE**

Establishing a control budget for a construction project requires an understanding of the project's planned schedule. In particular, setting the control budget requires the ability to identify the execution critical path and the resources necessary to support it, as the critical path influences a large portion of the project's costs and the risks on which contingency is based. As a result, we performed a Critical Path Schedule Assessment as a part of our RQE evaluation to determine whether the DR Project's schedule provides sufficient underpinning to the RQE control budget.

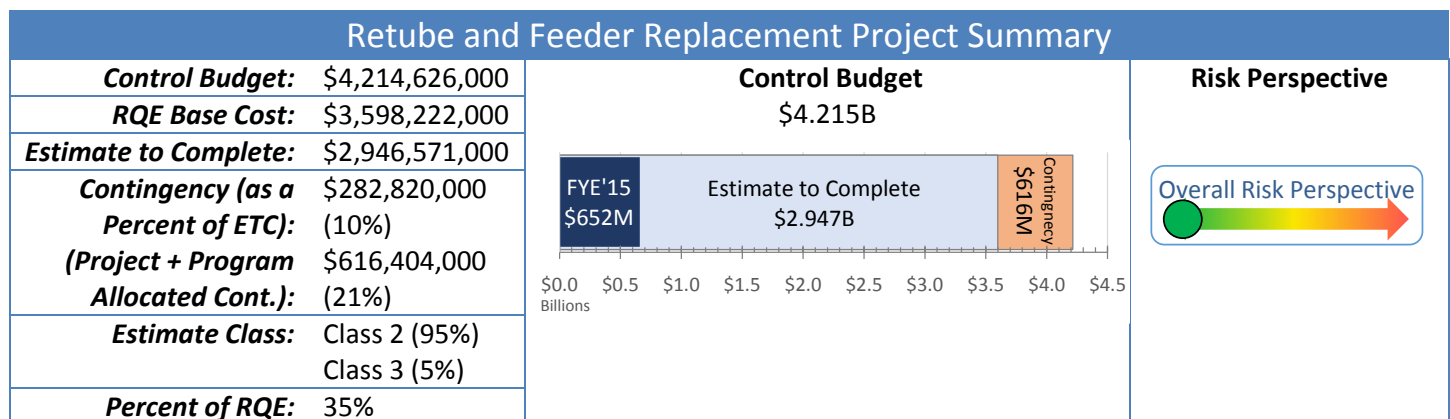

Our Schedule Assessment is based upon our review of four main phases of the schedule: Pre-requisite projects to breaker open; defuel and drain with system shutdown / layup; re-tube and feeder replacement; and system commissioning / return-to-service. Due to the current maturity of the integrated schedule, we have focused on the critical path work and schedule only, covering primarily the following questions:

- Does the process used to develop the schedule conform with the DR Project's contracts and approved scheduling plans and procedures;
- Is the basis for the critical path well defined and documented;
- Does the resulting schedule match the documented critical path basis utilized in monetizing the cost estimates; and
- What work remains to complete the schedule and increase quality (i.e. Does the schedule reflect an executable plan for the DR Unit 2 Outage?).

As part of RQE, the DR Team has developed the integrated schedule's critical path at a level consistent with the overall project status. Due to several issues, including delays in issuing purchase orders, the projects have varying stages of schedule maturity. As a result, many of them (particularly those for Balance of Plant) are not detailed enough to be execution-ready schedules. For a large number of DR Project's bundles, implementation planning and work order development are in the early stages and overall integration between OPG Operations and outside vendors is not yet complete. These details are the subject of the next phase of schedule maturity that will occur during the Readiness to Execute period. However, we have determined that the schedule is sufficient for purposes of supporting RQE and is adequate as a baseline for the critical path durations. The DR Team recognizes that much work needs to be done over the next several months in order to have a fully integrated executable schedule.

**C. Project Summaries**

**RETUBE AND FEEDER REPLACEMENT (RFR)**

## 1. RFR Basis of Estimate

RFR is the single largest element of the RQE and its budget reflects the overall importance of this work to the DR Project. The RFR cost estimate was developed over the past three years by SNC/Aecon, the project's EPC contractor, under the terms of contract executed between the parties on February 8, 2012. SNC/Aecon prepared four separate estimate submittals, each intended to be a further refinement of the prior estimate. SNC/Aecon's current estimate was updated and finalized on September 18, 2015 and forms the basis of the target price contract the parties intend to finalize prior to the Board of Directors meeting. OPG's estimating team confirmed that the underlying quality of this estimate is Class 2. The most significant supporting facts for this classification include:

- The final target price value of \$2.750 B (2015\$) has been fully negotiated and is based on mutually agreed upon project durations and schedule contingency, and encompasses 12.9M work hours, project management, supporting tasks, fee and all other costs;
- SNC/Aecon has designed and procured the specialized tools needed for the work. Some of the schedule task durations used in the estimate basis are derived from actually using the tools on the Mock-Up reactor and timing the results;
- All detailed engineering for Unit 2 is complete;
- Construction Work Packages ("CWP's") have been prepared and submitted as a part of the estimate;
- All 53,000 pages of the SNC/Aecon's submission were vetted by OPG's subject-matter experts;
- Both OPG and SNC/Aecon have teams with considerable experience on prior CANDU refurbishment projects and much of that experience has been incorporated into the estimate;
- Tool design has been significantly improved over those used in prior refurbishments, increasing reliability and making the tools easier to use;
- Training on the full-scale Mock-Up, which has never been done on prior refurbishments, should significantly increase the trades' performance in the field;
- Risk identification and contingency planning have been thoroughly performed and known risks are incorporated into the base schedule durations and work planning efforts.

## 2. Vetting and Characterization of Estimate

Over the course of the 3+ years of SNC/Aecon's estimate development, OPG worked collaboratively with SNC/Aecon to ensure that its final Class 2 estimate plan and pricing of the work would be, when delivered, reasonable and achievable. This collaborative review process was intended to ensure that SNC/Aecon's estimate accounted for OPEX from past refurbishments, improvements to the tool set for Darlington and the value of the planning effort to date, including the full-scale Mock-Up at the Darlington Energy Centre ("DEC"). On May 8<sup>th</sup>, 2015, SNC/Aecon presented its first draft of the Class 2 estimate to OPG, [REDACTED]

From this point through September 2015, OPG engaged SNC/Aecon in a detailed vetting process aimed at reducing the overall cost estimate, providing substantive basis for SNC/Aecon's portion of the critical path, and challenging the nature of SNC/Aecon's stated risks and contingency. The OPG and SNC/Aecon teams established a review and vetting process that was driven by subject-matter experts from each team with specific experience in prior CANDU refurbishments. This process was extremely successful at achieving consensus between the subject-matter experts, who objectively agreed with the underlying schedule durations in most instances. In fact, there were only minor disagreements over a small handful of items with a value of approximately \$12M of the nearly \$750M of direct craft performance estimates. As we noted in our last report, the process utilized to reach these final estimates was extremely detailed and rigorous, which should provide confidence in the results of the vetting process.

### 3. Contingency

Contingency related to the RFR work is split between the following major buckets:

- The contract includes a contingency amount that can be utilized to resolve issues without impact on the target price. SNC/Aecon is holding, as part of the Target Cost, contractually required contingency in which the parties agreed to a set amount based on the results of the base cost development. The basis and monetization of this contingency was heavily vetted by the subject-matter experts and senior management. The resulting 13.5% contingency totaling \$368M is largely based on a deterministic analysis of the potential duration for work task performance and other discrete risks that could impact the work, as monetized with the use of Monte Carlo simulation. The DR Team has assumed for purposes of the control budget that this contingency will be utilized.
- OPG is holding \$282M of contingency at the project level which includes discrete risks not carried under the contract.
- OPG is also holding \$334M for schedule uncertainty which, due to the RFR project's significant critical path duration, is based on the modeled difference in impact to the critical path between SNC/Aecon's "most likely" (or P50) schedule and OPG's "late finish" (or P90).

In total, OPG is carrying \$616M in contingency for RFR or RFR-related risks over and above the contingency that is built into the contract. With a remaining cost for RFR of \$2.33B, this equates to 26%. Given the track record of prior CANDU refurbishments, the work performed to identify performance risks and the overall importance of RFR to the work, this level of contingency appears, at this stage, to be appropriate.

### 4. Summary and Remaining Issues

BMCD/Modus have been closely monitoring the development of SNC/Aecon's cost estimate and OPG's vetting of same, and believes the process the parties used to develop the cost estimate was robust and produced an estimate with significant detail. Moreover, we have witnessed the relationship between the parties substantially improve at every level, which will be important as issues arise. Based on the initial commercial goals the parties set forth, the contract appears to have thus far driven appropriate behaviours and a beneficial result.

With the Class 2 Estimate and target price agreement in place, the RFR team's attention is now turning to execution. The major near-term focus will be on the following:

- Recovery of procurement dates for some components: SNC/Aecon's procurement is generally lagging behind, though some of this lag is driven by aggressive contract milestones, not actual needs for the material. This is currently being addressed by the joint SNC/Aecon and OPG RFR team who have established a "war room" similar to that exercised for the Class 2 estimate development.
- Retube Waste Processing Building ("RWPB") estimate, schedule and performance: the work on RWPB continues while the estimate and schedule preparation continues. The \$167M estimate included in RQE was presented as an upper limit estimate, though SNC/Aecon's final estimate and execution plan needs to be fleshed out before that can be definitively stated.
- Logistics need further refinement: SNC/Aecon needs to devote further attention to its supporting activities for material and tooling logistics during the Execution Phase.
- SNC/Aecon's construction organization needs to be built.
- Execution Phase schedule needs additional work and must align with the Project's work breakdown structure so that metrics for reporting progress can achieve needed fidelity.
- SNC/Aecon needs to remobilize in the DEC and make full and beneficial use of the Mock-Up to practice tasks and

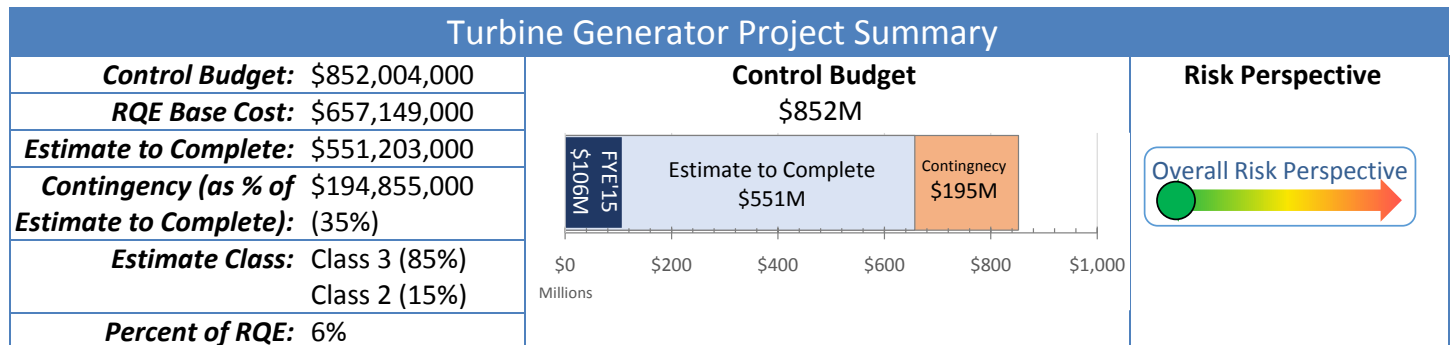

**Report to Darlington Refurbishment Committee  
 OPG Board of Directors, November 12, 2015**

train workers (this work is commencing as of the end of October).

Each of these elements will provide necessary information regarding cost, schedule, risk and overall confidence as the DR Project advances that can be rolled into the Unit 2 Estimate.

**TURBINE GENERATOR (TG)**

**1. Turbine Generator Basis of Estimate**

The Project's Turbine Generator work consists of two significant evolutions: (1) maintenance work; and (2) digital controls change-out for Unit 3, Unit 1 and Unit 4. In 2014, the DR Team decided to postpone the controls change-out for Unit 2 until the conclusion of the DR Project in order to reduce the risk of the Unit 2 work. Thus, the risk profile for the Project changes significantly with Unit 3, which will be the first of three units that will have a full replacement of the original TG controls during Refurbishment. The digital controls upgrade will be a first time evolution for OPG and will require significantly more planning than the limited maintenance scope for Unit 2. The risk profile of the subsequent units has been developed with this in mind. Based on the risk profile of similar controls replacements, the decision to delay Unit 2 appears to have been prudent.

Unit 3 will also be the first replacement of the generator mid-section and stator rewind. A new stator will be installed for Unit 3, and the existing Unit 3 stator will be rewound and installed in Unit 4. These evolutions have been planned sufficiently in advance that this work should not be a threat to the schedule of the later units.

OPG has accepted SNC/Aecon's Class 2 Estimate for the Turbine Generator for Unit 2, and Alstom has completed its detailed design. SNC/Aecon and Alstom have submitted their full estimates for the subsequent units, which are characterized as Class 3 in nature. These estimates are expected to be fully accepted before the Board of Directors meeting.

**2. Vetting and Characterizing the Estimate**

Vetting of the Turbine Generator Project estimates came in two phases. Alstom, the original equipment manufacturer ("OEM"), is supplying parts and engineering per a fixed price. That contract was assigned to SNC/Aecon for management after its team was awarded the labour portion of the work. SNC/Aecon's estimate followed much of the same structure as its RFR effort, including successive iterations of the estimate from Class 5 to Class 2. The final Class 2 estimate that forms the basis of the target price with SNC/Aecon was the test case for OPG's estimating process which was robust and laid the groundwork for the RFR estimating vetting that followed thereafter.

**3. Contingency**

The total contingency of \$194.8M equates to 35% of the project's remaining cost. The TG bundle includes three contingency buckets: (1) \$27.9M for cost uncertainty; (2) \$49.8M for discrete risks identified by the Project Team; and (3) \$117M for potential component replacement based on the results of concealed condition assessments on each unit's turbine generator. This contingency bucket was vetted and classified using the OPG estimating process. The team has fully examined the potential schedule impact of discovery work and believes it has reserved sufficient non-critical path

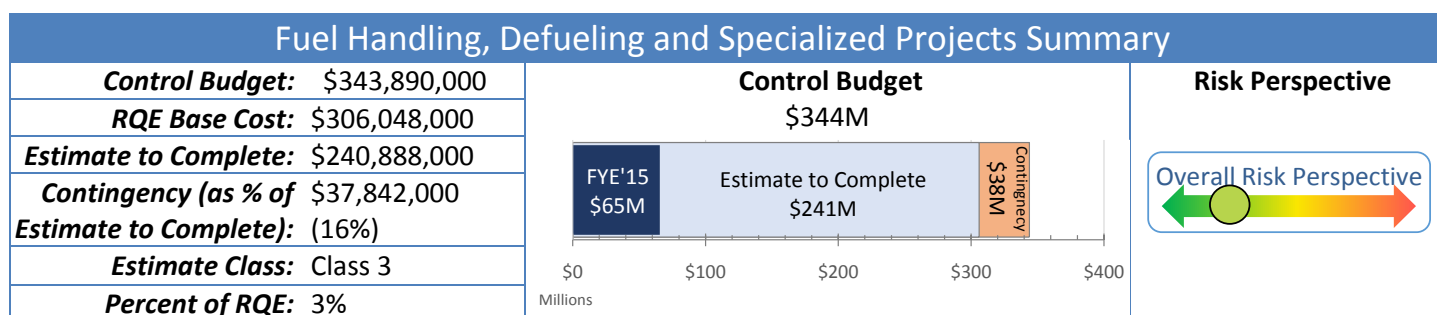

time for major component procurement and replacement in the event such work is required.

#### 4. Summary and Remaining Issues

BMCD/Modus monitored the process used for vetting the TG estimates, and we believe this effort was robust and resulted in further maturation of the estimate. SNC/Aecon's plan for execution was fully explored and significant cost reductions were realized for RQE. As stated above, the Unit 2 work is essentially routine maintenance, though the performance of that work will allow for improved understanding and efficiency for the future units. The controls change-out for Unit 3 needs to be further examined so that the team is assured the labour hours are properly estimated and risks from schedule impacts are mitigated. These will be issues for future unit estimates.

### **FUEL HANDLING, DEFUELING AND SPECIALIZED PROJECTS (FH, DF, SP)**

#### 1. Fuel Handling, Defueling and Specialized Projects Basis of Estimate

In summary, the scope of these project bundles includes: (1) Defueling each of the reactors to begin refurbishment, which is the first major evolution on the critical path and fully in OPG's control; (2) Fuel Handling equipment replacement to increase the likelihood of the power track maintaining operation through the Refurbishment outages; and (3) Specialized Projects to replace out of-date components to the Darlington Shutdown System computers, and replacement of the vault coolers that have reached the end of their useful lives. The work for these sub-bundles is directed by OPG, with the DR Team and the Darlington Station working cooperatively, with vendors supplying engineering, parts and labour for portions of the work. OPG decided to minimize the number of engineering changes to these critical components by calling for "like-for-like" replacements and thus limited the potential risk of execution.

While the total cost estimate for Fuel Handling/Defueling/Specialized Projects constitutes only about 3% of the total cost of the DR Project, each of these projects could strongly influence the critical path. Defueling each of the Project's reactors is the first critical path activity in the Unit 2 outage, and this is a first time evolution for Darlington. Ensuring the Fuel Handling components work throughout the DR Project is OPG's responsibility, as OPG will seek to maintain the operation of the running units during each defueling period of each unit's refurbishment. For these reasons, the planning, scheduling and risk mitigation of this work is extremely important. The DR Team has been focused on evaluating the past defueling evolutions at other CANDU plants and scrubbing the planned durations to the extent possible.

#### 2. Vetting and Characterizing the Estimate

The process for vetting the estimates for these sub-projects was robust, included a team drawn from the station and the project and involved an assessment of reasonable performance in light of past CANDU refurbishment execution, station and vendor performance, and the first-of-a-kind nature of some of this work. It was the latter that drove the estimated Class 3 designation, as the Defueling/Fuel Handling team needed at least one unit's performance before committing to tighter cost estimates.

The current assessment from the Defueling team shows the best case for defueling is 90 days, the most likely (i.e. P50) is 113 days, and the 90% confidence level duration is 134 days. **Figure 3** below depicts the criticality of the defueling duration

Low Moderate High

No Change

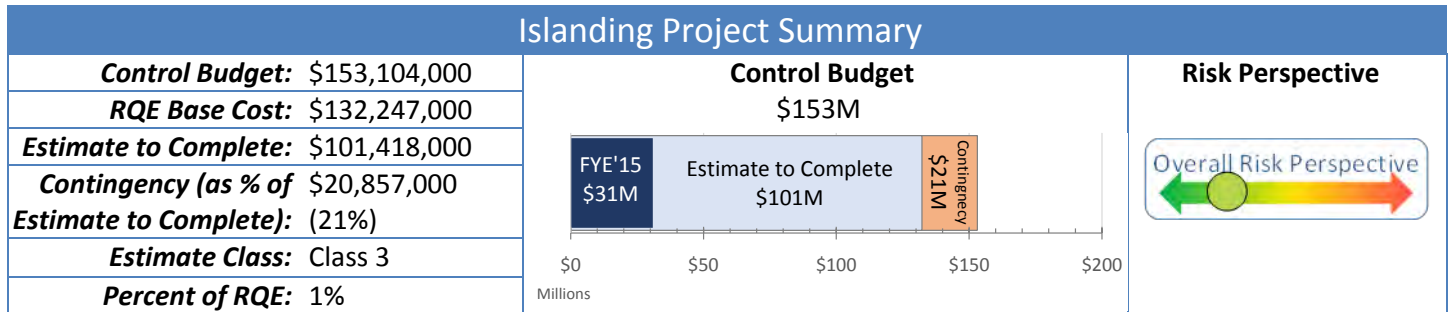

Decreasing Increasing

**Report to Darlington Refurbishment Committee  
 OPG Board of Directors, November 12, 2015**

**ISLANDING (IL)**

**1. Islanding Basis of Estimate**

The various islanding projects are relatively small in cost but are very significant to the DR Project's success. The design of the Darlington plant makes isolating a single unit for refurbishment a challenge. These projects include: (1) Installing a bulkhead that isolates the Refurbishment unit reactor vault from station containment once the irradiated fuel has been removed from the core, which will allow both airlock doors to be opened to facilitate worker and material transfer into/out of the vault, thus significantly improving RFR worker efficiency. Bulkhead installation is the single largest element of the Islanding Project and its performance will be by SNC/Aecon; (2) Establishing barriers and access control around the Refurbishment Island to keep the Refurb station staff from entering operating unit areas and to keep Station workers from entering Refurbishment work areas; and (3) Establishing terminal points on station systems to allow them to be isolated from the operating units to the maximum extent possible.

**2. Vetting and Classification**

The majority of the cost for the Islanding work is being carried under SNC/Aecon's contract and was estimated by SNC/Aecon using essentially the same process as it did for RFR.

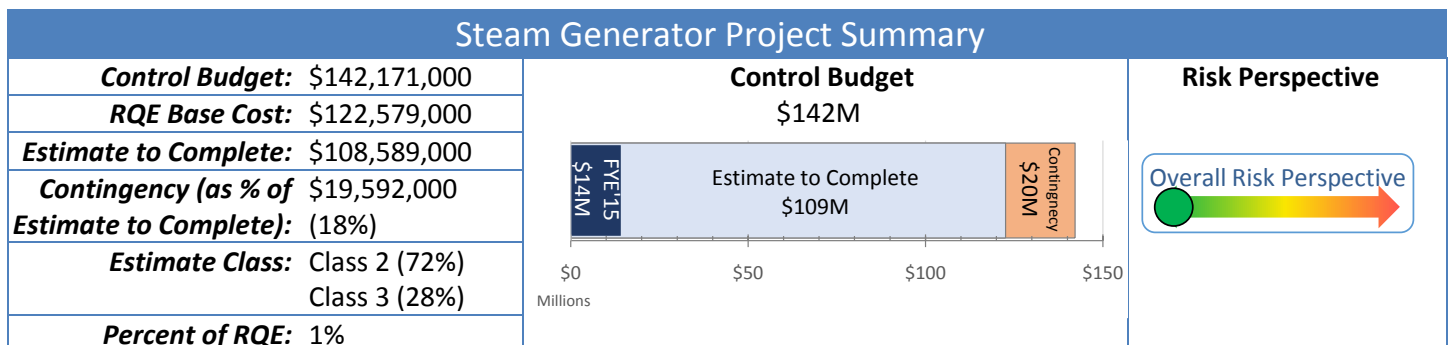

**3. Contingency**

The total contingency of \$20.86M equals 21% of the remaining costs. The largest and most significant driver of contingency is the potential impact on the DR Project's schedule from potential delays installing the bulkhead. The risk register for Islanding appears to be appropriate for its current state of maturity.

**4. Summary and Remaining Issues**

The DR Team has performed extensive reviews of plant conditions and OPEX, particularly from Bruce Power, and its efforts appear to have isolated and mitigated the risks to the extent possible. There will be some Islanding work during the Readiness to Execute phase that will allow the team to test its processes and metrics for the larger, more important scopes after breaker open.

**STEAM GENERATOR (SG)**

## 1. Steam Generator Basis of Estimate

The scope of the Steam Generator Bundle is largely composed of maintenance work, including the following: (1) Primary side cleaning; (2) Secondary side cleaning (Tubesheet Water Lancing); (3) Access Port installations (modification); (4) Inspection and Repair (Primary and Secondary Side); (5) Divider Plate Inspections, Boiler Open/Close & Inspection Support; (6) Lay-up work, and; (7) Bleed Cooler Inspection. All of the work has been executed in other plants. The contract for the work was let to a joint venture of B&W and CANDU Energy, a subsidiary of SNC Lavalin.

## 2. Vetting and Classification of the Estimate

The SG work is classified as Class 2 due to the nature of the work and the fixed-price contract.

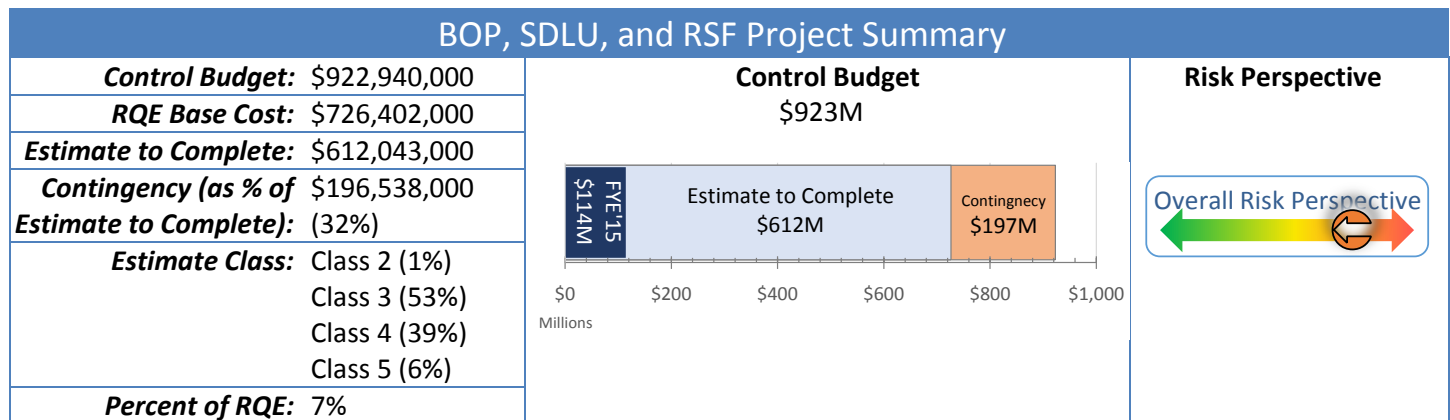

## 3. Contingency

The project is carrying \$19.6M in contingency (18% of remaining cost) which is largely driven by the potential for discovery work, and coordination issues with RFR and OPG's Inspection Maintenance Services.

## 4. Summary and Remaining Issues

The development of the SG project has proceeded well and the work planning is well underway. The risks discussed above with coordination and the Project's schedule appear to be the most important factors for the team to consider. The performance of the Primary Side Cleaning is currently planned to be the only work other than RFR to extend past the 60% window designated for non-critical path work.

### **BALANCE OF PLANT, SHUT DOWN LAY-UP AND REFURB. SUPPORT FACILITIES (BOP, SDLU, RSF)**

## 1. BOP, SDLU and RSF Basis of Estimate

This work scope includes a number of smaller to medium-sized packages. Approximately two-thirds of the work is based on design modifications, while the rest of the work is like-for-like replacement of aging components. The DR Team completed detailed engineering for the modification projects in time for the August 15, 2015 milestone, with some minor exceptions. The BOP work includes seventeen unique sub-projects that range in value from approximately \$700,000 to \$66M, and the scope includes replacement of components, electrical cable, and inspect and repair/replacement of valves. SDLU consists of twenty-eight different sub-projects and includes a number of prerequisites for construction, including breathing air for workers in the vault and barriers, as well as lay-up of plant systems for the unit being refurbished. RSF consists of building, improving and maintaining shops and other facilities for use during construction. The majority of this work has been released to ES Fox under the terms of the ESMSA contract.

The majority of the BOP work will be performed during the first 50-60% of the refurbishment schedule, with the goal of keeping BOP work off the critical path. Much of the SDLU and RSF work will proceed breaker open, but maintenance of the lay-up of systems will stretch throughout the length of the Project.

**Report to Darlington Refurbishment Committee  
 OPG Board of Directors, November 12, 2015**

## 2. Vetting and Characterizing the Estimates

These project bundles are the least mature in the Refurbishment scope, which is reflected by their respective estimate classifications; 1% is Class 2, 53% is Class 3, 39% is Class 4, and 6% is Class 5. Based on our observations, these characterizations by the estimating team appear to be appropriate. The DR Team has set aggressive goals to receive all of ES Fox's remaining BOP/Shut-Down/Lay-up/RSF estimates to a Class 3 level by no later than January 2016. The OPG estimating team is collaborating with ES Fox's estimators on these remaining estimates to keep the process on schedule and test the quality of the estimates.

## 3. Contingency

These bundles' contingency is broken down as follows:

Bundle	Base Cost Estimate	Est. to Complete	Contingency	% Contingency on ETC
Balance of Plant	\$430.0	\$353.6	\$125.3	35%
Shut-Down/Lay-up	\$218.0	\$196.8	\$53.1	27%
Refurbishment Support Facilities	\$78.4	\$61.6	\$18.1	29%
Total	\$726.4	\$612.0	\$196.5	32%

The drivers for contingency include: (1) cost uncertainty due to the maturity level of the packages and the recent completion of supporting detailed engineering; (2) potential upfront delays to Refurbishment causing early schedule issues; (3) past performance of ES Fox on the Campus Plan Projects; and (4) potential for discovery work.

ES Fox's performance on the Campus Plan Projects provides vital OPEX that the team has considered in identifying risk for these projects. The DR Team is aware of the issues [REDACTED] and are attempting to mitigate those issues. [REDACTED]

[REDACTED] The OPG scheduling team has recognized these shortcomings and worked with ES Fox to improve the deliverables. 45% of the BOP and Shut-Down/Lay-Up work estimates are in the Class 4 or 5 range, which increases the risk of estimating uncertainty for these projects. Moreover, the risk profile of these projects should reflect the risks from ESMSA vendor performance. The BOP and Shut-Down/Lay-Up project teams have identified discrete risks related to vendor performance. Additionally, OPG has included some program-level contingency due to the past track record of these vendors in the event performance issues resurface during Refurbishment.

## 4. Summary and Remaining Issues

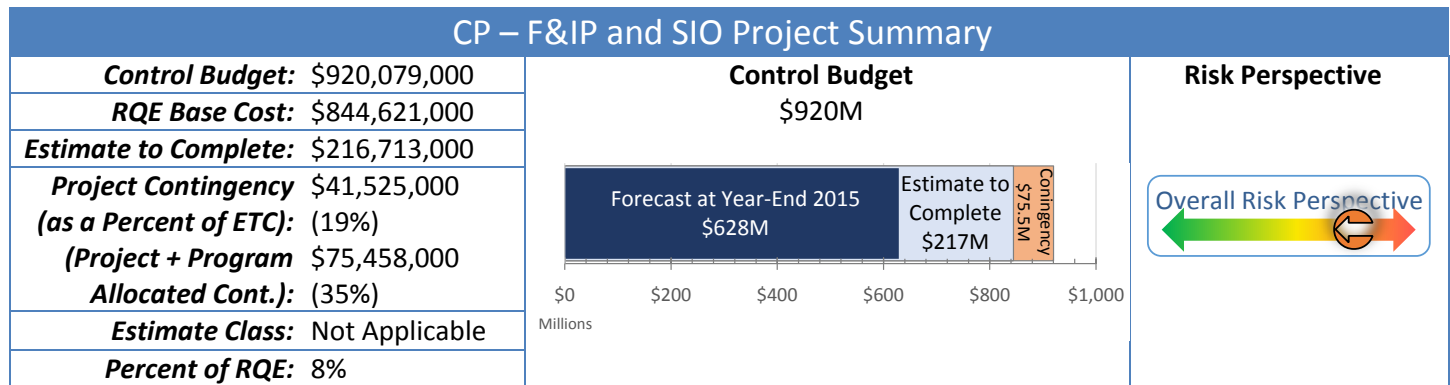

BOP and Shut-Down/Lay-Up will be under significant scrutiny once the DR Team's focus shifts to the Readiness to Execute plan. ES Fox must continue its planning work with more detailed and mature estimates, execution schedules and development of Construction Work Packages. The DR Team has placed a challenging goal of having all of the BOP projects proceed to their respective Gate 3 between late November 2015 and January 2016. To do so, ES Fox will need to complete the detailed level 3 execution schedules, Class 2/3 estimates and Construction Work Packages to support these gates. The BOP team has set interim milestone dates with ES Fox for these deliverables which may be too aggressive for the DR Team to receive quality work product.

**Report to Darlington Refurbishment Committee  
OPG Board of Directors, November 12, 2015**

**CAMPUS PLAN PROJECTS (CP – F&IP AND SIO)**

**1. Budget Status**

There are six active Campus Plan Projects in execution at this time with the Refurbishment Project Office (“RPO”), the RFR Island Support Annex (“RFRISA”) and Replacement of Buried ESW Piping approaching completion. There are two other pre-requisite projects, the Auxiliary Heat System (“AHS”) which for budgetary purposes was reclassified as a Station project though P&M is still managing the work. The costs for AHS are no longer carried in RQE. The other pre-requisite project, the Refurbishment Waste Processing Facility (“RWPB”) is being performed by SNC/Aecon under the RFR Definition Phase contract and is not part of P&M’s reporting.

We have noted in past reports that while the remaining dollars involved in the Campus Plan Projects do not necessarily have a significant monetary impact to RQE, certain of the projects, most notably D20 Storage and EPG 3, remain a risk to breaker open of Unit 2. These projects’ completion dates have shifted over time and further delays could result in drawing attention away from the Readiness to Execute plan. Overall, the entire portfolio of Campus Plan Projects experienced \$76.3M in base cost growth from 4d to RQE, an increase of 9%, which resulted in contingency drawdowns from the allocated budget amount set in 4d. P&M is currently forecasting an Estimate to Complete (“ETC”) for all remaining Campus Plan and SIO work of \$216,713,000.

**2. Contingency**

Based on the history of these projects, the velocity of change and the volume of remaining work, the \$75.5 million in remaining contingency needs to be closely tracked to ensure it is enough to cover any remaining cost issues with completing these projects. In particular, D20 and EPG3 pose the greatest risk to the remaining Campus Plan Contingency, and EPG 3’s final cost estimate has not been fully vetted and approved. P&M’s change control process needs to be monitored so that the use of contingency is readily identified and so there are sufficient funds going forward. In Section III below we discuss the status of these projects and describe some of the risks that could cause the base costs for these projects to increase.

**FUNCTIONS**

With the exception of Operations & Maintenance, the remaining functional groups that compose the DR Team jumped in size from 4d to RQE. The non-Operations & Maintenance groups’ cost estimates increased in aggregate from \$1.28B (2015\$) to \$1.53B, an increase of 20%. The largest gains were for the Execution Organization (48%), Contract Management (38%) and Managed Systems Oversight (42%). Operations & Maintenance’s budget decreased by from \$1.1B (2015\$) at 4d to \$0.81B for RQE, a reduction of 27%. This reduction was due primarily to identification and removal from the DR Project of non-Refurbishment Operations & Maintenance costs.

The DR Team has high confidence in the extent of the estimates it has prepared for RQE and are all-inclusive of what could reasonably be identified for staffing at this time. However, the pace of the proposed ramp-up of the DR Team’s staff is aggressive and will be very difficult to meet. In order to meet the plan, the DR Team would have to increase from 770 to

**Report to Darlington Refurbishment Committee**  
**OPG Board of Directors, November 12, 2015**

just over 900 (17%) staff in less than 3 months. The team has been chronically under-spent during the Definition Phase, and missing these major ramp-up dates will further impact the accuracy of the team's staffing forecasts.

The commitment from the NPET to further rationalize and organize the functions on the basis of a division of responsibility matrix ("DOR") has been held over to the Readiness to Execute phase. The DR Team committed to putting a DOR in place that defines each function's accountability and responsibility by early 1Q 2016, which in turn should result in optimizing the organization. While the DR Team's goal for RQE was to identify the outer cost limit for the functions, BMcD/Modus is more concerned that the DR Team operate efficiently, have highly qualified and skilled resources, and actively manage the field work during the Execution Phase. The team has considerable work ahead to meet these goals.

## **D. Summary of RQE Risk and Contingency**

As part of our assessment of RQE, BMcD/Modus has focused a lot of time and attention on the DR Team's development of contingency for the Project's control budget. Our review focused on the development of input factors, the Monte Carlo stochastic modeling, results analysis, and finalization of RQE contingency provisions. Specifically, we focused on the following aspects of the DR Team's contingency development:

- Whether the processes used for capturing risks were sufficiently robust;
- The extent to which contingency is properly modeled; and
- Whether the risks and associated contingency amounts were properly monetized.

The DR Team's development of the contingency for RQE compares favorably with what our team has observed in the industry. While risk management and contingency development has many subjective aspects, the DR Project's process is well constructed and executed. It is probably in the upper percentile of comparable project practices. Nonetheless, because of uncertainties and unknowns, contingency values are not perfect, but the DR contingency process likely contributes to a reliable and defensible RQE.

### **1. Contingency Process**

OPG prepared and approved the RQE Contingency Development Plan NK38-NR-PLAN-09701-10006 in Q1 2015, establishing the approach for developing the RQE contingency and describing the associated contingency development principles and processes. The Plan established a contingency process utilizing a number of AACE recommended practices for contingency development. It appropriately states that the practices will be supplemented with the expert opinion and judgment of the NPET (Nuclear Projects Executive Team) to ensure there is confidence that the contingency estimate is robust and sufficient to deal with the risks and uncertainties characterized at the time of RQE.

Six basic buckets were addressed in developing the RQE contingency:

1. **Cost Estimating Uncertainty** - The project managers and function leads provided three point estimate uncertainty ranges.
2. **Schedule Uncertainty** – Uncertainty range estimates for critical path durations were provided to the risk team by the project managers. Schedule cost impact was determined by applying a daily "burn rate" to any schedule impacts. Allocation of schedule contingency between the affected project and the overall program critical path was carefully addressed.
3. **Discrete Risks** - Discrete risks from the project, program and function Risk Registers were reviewed and post-mitigation probability of occurrence values were finalized. Quantitative cost & schedule impact values were developed with associated three point ranges as model input. In addition, provision for risk event recurrence over the four units was established for model input.
4. **High Impact Low Probability Risks** – The Board of Directors Controlled Contingency was established deterministically to address these issues and to provide for some coverage of unanticipated items beyond control of the DR team.

**Report to Darlington Refurbishment Committee  
OPG Board of Directors, November 12, 2015**

5. **Campus Plan/ F&IP** – The nature of Campus Plan risk registers, estimates and schedules required that contingency be established through a combination of stochastic, deterministic and expert judgment means. Probabilities and impact ranges for the discrete risks were updated. Cost elements were assigned uncertainty ranges. The results of the risk probabilities and impact quantification with three point ranging, along with estimate uncertainty ranges were then submitted for Monte Carlo analysis. The Monte Carlo contingency values were assessed by P&M's management and deterministic adjustments were made for RQE. The stochastic and deterministic numbers were then compared and justifiable adjustments were made. In addition, program contingency was added to reflect the historic performance issues associated with Campus Plan projects.
6. **Insurance Uncertainty** – A premium cost point estimate and pessimistic/optimistic uncertainty range was provided by Finance and factored into the contingency calculation.

In developing the contingency at the project level, the DR Team took care to ensure there was no double-counting or duplication. From our review, the team was successful in not over-generating the contingency.

## 2. Vetting of Risks and Contingency

The RQE contingency was subjected to many stages of review and vetting. The RFR project received focused attention from SNC/Aecon and the DR Team, given its overall importance to the Program. The process used for vetting the base contract amounts also resulted in thorough understanding and development of the risk model.

For the various projects the Risk Team conducted contingency workshops, where subject-matter experts challenged, critiqued and provided constructive feedback. After the workshops, members of the risk team met with the respective managers to update data that was entered into the @RISK Monte Carlo model and preliminary results were obtained. Those results were analyzed and changes were made to the model and input data was refined. To monetize schedule impact, Finance reviewed cash flow projections and developed a point estimate for daily burn rate and an associated uncertainty range. That approach is considered reasonable.

The DR management team recommended establishing a contingency to be controlled at the Board of Directors level. This was done by considering deterministic estimates primarily based on experience-based judgement. Other considerations included OPG's risk tolerance, the budget ceiling, and the overall established contingency. Provisions for "Black Swan" (high impact low probability) risks were considered in establishing this layer of contingency. Factors included acts of God, the labor and political environment, vendor defaults, nuclear safety or security events, unforeseeable scope increases, and financial matters. No strict rules or best practices exist for estimating low probability/high impact events and the subjective approach employed by DR is not uncommon.

## 3. The Monte Carlo Model

The DR Team used modeling experts from the Palisade Corporation<sup>3</sup> to develop a Monte Carlo simulation method for the Project. In Palisade's final report, which focused on the RQE contingency process, Palisade stated that the model used by the DR Team contains all the elements of risk management's best practices and contains well-defined methodology as its foundation. Palisade also cited the collaboration of risk experts interfacing with project/functional managers and SMEs.

The RQE Monte Carlo model is extremely robust and comprehensive. All four units are addressed in one integrated fashion. Over 2600 three point estimates were used to model outcome (maximizing use of three-point range estimating contributes to the veracity of the input by allowing the source to avoid conservative single value "plug-in" numbers). Over 470 discrete risks were analyzed. Approximately 273 risks were included in the contingency calculation, which 55 were program/function related and 218 were from projects. Close to 800 estimate uncertainties were analyzed and 128 schedule activities assessed across the four Units.

<sup>3</sup> Palisade Corporation provides widely accepted @RISK software system to a global base of customers and consults on the process for developing stochastic tools for understanding and quantifying risks and uncertainties.

**Report to Darlington Refurbishment Committee  
OPG Board of Directors, November 12, 2015**

A schedule correlation factor of 70% is included the contingency model, reflecting interdependence of schedule activities. In addition, because DR is a multiple unit project, provisions to address risk recurrence are incorporated based on project and functional manager input.

#### 4. Contingency Results

The resultant contingency amounts are reflected in **Table 1**. Monte Carlo based values are at the P90 level for Projects/Bundles/Functions and for allocated Program Contingency. “P90” means that, based on the inputs and model structure, there is a 90% confidence that the contingency value is appropriate to cover the risks and uncertainties analyzed by the model.

**Table 1**

#### RQE Contingency Summary

Contingency Element	P90 Amount (\$x1,000) <sup>4</sup>	Basis	Simplified Contingency Draw Approval Requirements <sup>5</sup>
<b>Projects/Bundles/Functions</b>	\$851,648	Monte Carlo analysis of Discrete Risks and Schedule/Estimating Uncertainty <sup>6</sup>	If less than \$100K – Project Manager approves for trending with no contingency draw until accumulated. Then... <sup>7</sup> ...If greater than \$100K and less than \$5M – Project Manager and Project Director approves contingency draw. <sup>8</sup> ...If greater than \$5M, CCB approves <sup>9</sup>
<b>Program</b>	\$854,475	Monte Carlo analysis of Discrete Risks and Schedule/Estimating Uncertainty	Program Change Control Board (“PCCB”) <sup>10</sup>
<b>Board of Directors Controlled Contingency</b>	\$800,000	Subjective analysis of unanticipated/uncontrollable items (Vendor default, Labor/political matters, etc.	PCCB + CEO or DR Board Committee <sup>11</sup>
<b>Total Contingency</b>	\$2,506,123		

The third column in **Table 1** reflects the DR Project’s recommendation for the management of contingency. It should be noted that the Board has not yet provided approval of this process. In determining level of control for contingency, it may also be beneficial for the Board to review contingency at both the P50 and P70 levels. We will provide a comprehensive review of how OPG intends to monitor and use contingency in our Change Management Assessment Report that will be issued later this year.

<sup>4</sup> See RQE Total Cost Snapshot 4 October 21, 2015.

<sup>5</sup> Other provisions are in place based on percentage of baseline and for schedule changes impacts.

<sup>6</sup> See Campus Plan Exception described earlier in this report.

<sup>7</sup> Change costs are trended and do not result in contingency draw unless the project/bundle/function can’t absorb the cost. At that point, approval is based on the amount of accumulated cost impact for the affected project, bundle, or function.

<sup>8</sup> N-MAN-00120-10001 PC-12 “Nuclear Refurbishment Program Change Management Section 6.1.

<sup>9</sup> *Ibid.* Section 6.1. The Change Control Board (“CCB”) is comprised of: VP Refurbishment Execution, Director Refurbishment Engineering, Director Refurbishment Operations & Maintenance, Director Refurbishment Planning & Controls, Director Refurbishment Unit Outage, and Director Nuclear Controllershship.

<sup>10</sup> *Ibid.* Section 5.13. The Program Change Control Board (“PCCB”) is comprised of NR Dir. Planning & Controls, SVP NR, VP Nuclear Finance, VP Assurance, VP NR Engineering, VP Refurbishment Execution and VP Operations & Maintenance.

**Report to Darlington Refurbishment Committee**  
**OPG Board of Directors, November 12, 2015**

## 5. Observations and Recommendations

As stated, BMcD/Modus have found the process OPG has utilized for developing contingency to be sufficiently robust to support RQE. However, risk management is not a once-a-year exercise; it should be considered a pillar of project management. Thus, we have made certain recommendations for further enhancing the management of risk and governing the appropriate use of contingency established in the control budget:

- With some exceptions, the DR Team chose to monetize contingency utilizing the experience of the project managers as opposed to developing detailed estimates that were vetted by the OPG estimating team. We recommend that for the Unit 2 Estimate, OPG utilize the same estimating process for the contingency as it does for the base costs.
- OPG should ensure that significant contributors to contingency are justified and well documented. Justification of components such as: a) the broad application of schedule correlation; b) schedule burn rates; and c) levels of management control over contingency should be well documented.
- The infrastructure for identifying and managing risks has been in place for several years, though to a large extent, the program has been relegated to the “important, but not urgent” category as projects and functions focused on day-to-day challenges. While the RQE contingency process required the projects and functions to devote considerable attention to risk and contingency development effort, we observed some of that focus wane as the RQE effort was completed. Momentum and a sense of urgency for risk management needs to be maintained through the Execution Phase. The DR Team should consider making the discussion of risks and risk management a greater priority in its internal communications.
- Consideration should be given to developing information and training sessions that discuss the value of the risk program not only for development of RQE contingency but also the importance of sustained (or increased) efforts in executing and managing the DR Program. (This is also important for documenting and managing internal OPEX).
- OPG needs to increase senior management visibility and risk program advocacy throughout the organization.

Finally, it is important to understand that stochastic processes for developing contingency values do not create conclusive “answers”. They serve as statistical tools to inform management regarding a basis for establishing and justifying contingency. These tools do not manage or mitigate risks; only management can do so. Therefore, management focus on risks needs to be strong and ongoing.

## E. Remaining Work – Program Level

### 1. Quality Assurance

The DR Team is in the process of tying-up the remaining loose ends in the RQE submission and is performing quality assurance checks to ensure there are no major data fidelity issues in the control budget. The following are the priorities the team is using to ensure the quality of the RQE submission:

- All costs need to be supported by the documentation necessary to tie all numbers to their source;
- Risk registers need to incorporate any changes that came from NPET reviews; and
- The RFR team must close-out review SNC/Aecon’s full Class 2 submission that OPG received on September 18, 2015 to ensure that there are no significant gaps or unresolved issues prior to locking down the target price.

The process for close-out of 4d was not given priority status, which elongated its close-out. The team is putting appropriate focus on close-out of RQE at this time.

### 2. Schedule

A major component of the Readiness to Execute plan will be developing and finalizing the Unit 2 execution schedule with all work at the appropriate level of detail. The DR Team’s original goal of having the full execution schedule completed

**Report to Darlington Refurbishment Committee  
OPG Board of Directors, November 12, 2015**

for RQE was not met, though as noted, the control budget is supported by a well-defined critical path and windows for non-critical path work have been vetted and considered. We believe that the DR Team has done sufficient schedule work to support RQE, though considerable work remains before the schedule is execution-ready. BMcD/Modus will be providing our comments and recommendations regarding the schedule development as the work progresses.

### **3. Documentation**

The DR Team developed considerable documentation in support of RQE that must be properly archived through a document control process which is directly traceable to the RQE. The team intends to implement a robust Integrated Data Base where the documentation will ultimately reside. The organization of this documentation should consider the future needs of subsequent cost estimates, configuration management, commercial uses and requirements for substantiating the basis of Project costs for regulatory purposes. Once the IDB is set-up, we recommend testing the sufficiency of the organization of the documents to ensure the documents are accessible and comprehensive. The team has put a goal of completing the document archive by the end of 2015.

## **III. Status of Campus Plan Projects**

The outlook for completion of the largest and most significant remaining Campus Plan Projects – D20 Storage and Emergency Power Generator 3 (“EPG3”) – had generally improved, though there are significant remaining issues and risks that have impacted both these projects’ schedules and cost estimates.

### **A. D20 Storage**

Ellis Don continues working on the foundation for D20 Storage, and SNC/Aecon is preparing to complete the building and perform the mechanical, electrical, HVAC and steel/structural erection. Ellis Don’s work must be substantially completed before SNC/Aecon can start its work in the basement of the D20 building. P&M has bifurcated its team to simultaneously focus on Ellis Don’s progress and SNC/Aecon’s preparation.

Ellis Don’s recent progress has ramped up since our last report. As of October 30, 2015, P&M reported Ellis Don to be 83% complete with its foundation work, and had only two walls and one staircase left to pour. Ellis Don’s progress has been positively impacted by adding a second shift to increase the volume of work. In addition, the P&M team has benefitted from assigning an experienced project manager to oversee the civil construction and from the Project Controls effort to field verify and report Ellis Don’s progress.

The DR Team’s Program Status Report dated October 23, 2015 stated that Ellis Don’s “concrete placement in the basement is expected to be completed by December 22<sup>nd</sup> for the north section and 1-2 weeks later for the south section.” The current schedule (as of October 30 in OPG’s network) shows Ellis Don completing its work on December 26, 2015 however with the increase in production and with good weather, their completion date could move forward. Ellis Don’s recent improvement makes completing the foundations in mid-to-late-December much more likely. Turnover of the entire site from Ellis Don to SNC/Aecon will likely miss the contractual date of November 30, 2015. However, Ellis Don is currently working on a recovery schedule so that it will turn over the West Annex Basement on November 30, 2015 and the seismic dyke by December 22, 2015. SNC/Aecon has fallen behind in its pre-fabrication of piping that is on its critical path, and has further indicated that it may accept partial acceptance of the site on November 30<sup>th</sup>. However, since its piping work and tank setting is on critical path, the value of SNC/Aecon’s partial site acceptance may be minimal until it can recover its critical work streams. Due to the fact that both contractors will be working in a confined space, it will be important for OPG to carefully manage this transition. The contractors’ schedule progress needs to be accurately recorded and based on recent objective progress so that OPG can document this transition for commercial purposes.

SNC/Aecon has prepared and revised its cost estimate and schedule (which still requires final vetting and disposition of its basis of estimate), and is now producing metrics that are reporting its progress based on quantities of work. These early metrics are showing SNC/Aecon is behind by approximately 2-3 weeks in its procurement and prefabrication of piping. The baseline schedule shows SNC/Aecon’s plan to meet all of the project’s key milestones; however, as noted these dates are likely to be impacted. Schedule updates from SNC/Aecon need to be properly captured so that an accurate forecast

**Report to Darlington Refurbishment Committee**  
**OPG Board of Directors, November 12, 2015**

of any impact can be properly documented and managed. [REDACTED]

[REDACTED] SNC/Aecon intends to do so once it has secured agreements with its major structural, civil and HVAC subcontractors. SNC/Aecon has committed to reporting key subcontractor status via earned and actual work hours against its plan, which should provide P&M with enough information to track this key work.

The current SNC/Aecon schedule is based on the D2O project meeting an interim deadline of June 28, 2016 to accept water from Unit 2 so that there is confidence that Refurbishment of Unit 2 can proceed. This deadline was initially set about 1 year ago when the DR Team reviewed the need for a contingency plan for D2O Storage in the event the building could not be completed. We have recommended that P&M and Refurbishment re-examine this milestone if it is able to implement one of the alternatives it is currently reviewing for draining primary heat transport and moderator water from Unit 2. If an effective mitigation strategy can be implemented, it could allow deceleration of some of the work which could potentially reduce the overall risk of construction. However, such a deceleration should only occur if it is supported by objective progress data from field progress that substantially improves the confidence of all concerned that D2O Storage Facility will be available for Refurbishment of Unit 2.

## **B. EPG 3**

OPG has committed to placing EPG 3 in service prior to Unit 2's breaker open. The civil construction is currently approximately 20% complete, and ES Fox intends to set the EPG unit by the end of November. Construction has previously been impacted by issues with plant tie-ins and unforeseen underground conditions. In its Project Status Report issued October 29, 2015, P&M reports that "Corporate milestone "Generator In Place" – Nov 30, 2015 currently at risk." While there is a recovery schedule in place, the Project Status Report currently shows that the Turnover/Available For Service milestone is not forecasted to occur until August 5, 2016 (323 days late), only two months in advance of breaker open. Furthermore, it should be noted that neither the additional forecasted costs (\$21.3M over the approved amount of \$88.2M) nor the recovery schedule have gone through a gate for final approval. The gate approval was originally scheduled for September 11, 2015, but that has been delayed until 4Q 2015. It is critical for OPG and ES Fox to agree on a schedule that is doable and predictable as soon as possible.

In its Project Status Report, P&M reports that "Engineering holds remain on a number of packages to incorporate design input from LLM Vendors. Holds to be resolved by Dec 2015." These engineering issues should not impact the civil work, though some involve changes to allow the stock generator to meet OPG operational requirements which could impact the installation or in-service date of the EPG unit if they are not resolved in time. The VP of Engineering and Sargent & Lundy have established a process for working through these issues and bringing more timely visibility to engineering issues as they arise on ESMSA (Campus Plan, BOP and Shut-Down/Lay-up) projects.

P&M also identified EPG 3's commissioning as a risk. "This is a first time evolution for these modifications and there is limited commissioning experience with this type of equipment. The risk is that the commissioning of this new system may take longer and be more challenging than anticipated/estimated resulting in numerous work interruptions/clarifications and extension to the schedule or missing AFS (OPEX from Pickering Temporary Emergency Power System)." To mitigate this risk, the DR Team has assigned a dedicated manager to lead the commissioning effort, though the schedule should accommodate the time needed for commissioning with these risks in mind.

P&M's Program Status Report dated October 23, 2015 showed the forecast as \$115M, and noted that, "the forecast is expected to increase by an additional \$5-10M. The increase is a result of additional costs to recover schedule delays that occurred during excavation and fuel line relocation, design changes based on newly available equipment information, and additional resources and time allotted for commissioning. This cost increase can be accommodated within the available contingency." P&M further noted in the October 27<sup>th</sup> Project Status Report that, "Significant costs increases are being addressed with contractor. SCRs in place," and "A new gate package will be prepared to identify the new EAC and schedule completion," which P&M anticipates having in 4Q 2015. The gate approval was originally scheduled for September 11, 2015, but that has been delayed until 4Q 2015. It is critical for OPG and ES Fox to agree on a cost estimate and schedule that is doable and predictable as soon as possible.

**Report to Darlington Refurbishment Committee**  
**OPG Board of Directors, November 12, 2015**

#### **IV. Readiness to Execute Planning**

With the completion of RQE, the DR Team intends to shift its entire focus to the Readiness to Execute plan. The team has developed detailed milestones and has established forums for progressing deliverables. In our review, we believe the Readiness to Execute plan is comprehensive and should provide a solid basis for testing the DR Team's execution planning. There are certain parts of the plan that are intended to deal head-on with key project risks; in future reports, BMcD/Modus intends to focus on certain key aspects of the readiness work, including the following:

- **Procurement:** The DR Team is piloting processes for tracking and overseeing vendor procurement, and is enhancing the warehouse capacity for the storage of materials and equipment. The risks for procurement are well known and documented in the industry, and OPG and its vendors are already experiencing some issues that will need to be managed carefully. Transparent reporting of status and identification of problem areas are the most effective means for mitigating those problems.
- **Project Team Development:** With the DOR in place, the team intends to sort out accountabilities and test its responses to real-time work situations. As part of this exercise, the team needs to review protocols for frequency and timing of key meetings and expectations for key communications.
- **Completion of Construction Work Packages:** Completing CWP's for the remaining work will require substantial effort, and is a necessary prerequisite for developing the schedule. In particular, BOP work packages must be completed by April 2016 to support the schedule and Unit 2 Estimate development.
- **Schedule Development:** The DR Team intends to iterate the baseline schedule two times prior to breaker open. In its Rev. B schedule, the team will flesh out all of the work known for RQE, which will expose certain areas in the schedule that are potentially problematic. During the first half of 2016, the schedule will be further refined, with Rev. C supporting the Unit 2 Execution Phase. In the process of developing the schedule, the DR Team should review lessons learned from the schedules prepared by SNC/Aecon and ES Fox for the Campus Plan Projects. These schedules are a leading indicator of how these vendors will schedule work (if allowed) for the Refurbishment. There are a number of issues with the vendors' current approach ( [REDACTED] ) that if not corrected will inhibit the schedule's ability to properly calculate and forecast the work. Not correcting these deficiencies will cause OPG to be reactive throughout the Execution Phase. Moreover, the Campus Plan Projects have also learned the importance of planning commissioning tasks well in advance, so that execution of the work (including physical testing, preparation of a multitude of documents and turnover activities) is performed in a manner that allows for the work to be accepted. These details need attention in the final Rev. C schedule.
- **Reporting and Metrics:** The DR Team has considerable work planned to improve metrics and reporting as part of the Readiness planning. It intends to put in place a new cost tracking system and developing metrics that will provide useful tools for project management. The team is committed to basing these systems on installed quantities which is standard in the industry. Much of the DR Project's current controls suite is based on financial reporting, which has its place but is not appropriate for field execution. In addition, the team needs to define a single source of data so that there is fidelity across all reports. BMcD/Modus will be closely reviewing the team's efforts in developing its reporting regime.
- **Unit 2 Cost Estimate:** The culmination of the Readiness to Execute activities will be the development of the Unit 2 Estimate for the BOD's approval. The work performed for RQE should position the team for this exercise, though it should consider lessons learned from the RQE effort and develop a Unit 2 Estimating Plan. As part of that plan, the DR Team should consider using the same RQE processes and protocols for all of the Unit 2 Estimate. During RQE, a decision was made to vary from the approved estimating process for some of the components of the estimate, including PMT costs, functional costs and the discrete risks. With the goal of the Unit 2 Cost Estimate being to tighten the estimates, the established process used for vetting EPC costs will allow for more formative vetting of these costs, increasing their reliability.

## **Nuclear External Oversight Assessment Report**

### **Cost Management & Earned Value**

#### **Objective and Scope**

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") have performed an assessment with respect to OPG's cost management system; cost, earned value/performance reporting; and the forecasting capabilities for the Darlington Nuclear Refurbishment Project ("Project") programs. This assessment generally focuses on four major areas related to these topics:

1. Description of cost tracking and management systems and methodologies typically used in the construction industry.
2. Observations regarding the systems and methodologies currently being utilized by OPG.
3. Comparisons of system functionalities and methodologies being utilized by OPG versus those typically used in the construction industry for large capital / mega-projects. .
4. Examples of where OPG's selected cost and earned value systems and methodologies comport with the industry at large and identification of potential problems or inefficiencies with those systems.

In addition, BMCD/Modus provides recommendations for closing the observed gaps and addressing deficiencies in systems and methodologies being utilized by OPG.

#### **Period of Assessment**

August 1 2014 through October 16, 2014.

#### **Overall Assessment Risk Score: HIGH**

#### **Background and Methodology**

On August 13, 2013, BMCD/Modus presented its comprehensive Independent Project Assessment ("IPA") based upon our review of the Project from February 25 through mid-July, 2013. At that time, we reported that the team was encountering difficulties setting up and running the tools and programs for the Cost and Earned Value systems, focused mainly on the Proliance and Microsoft Business Intelligence ("BI") software. OPG had previously implemented these tools within the Projects and Modifications organization earlier on and so they were chosen to be implemented for the Darlington Refurbishment Program. We noted the generally problematic nature of setting up these systems, with particular concern over the potential timing issues of setting them up during the DR Project growth period. As of the IPA, we noted that only one Project Bundle, RFR, had an earned value process that was functioning for SNC/Aecon's Definition Phase work, though even its system had bugs.

Since then, OPG has made progress developing the Cost and Earned Value systems, and that progress allows for our team to perform a "dipstick" of those systems' effectiveness. Additional project bundles have been added to the system and at this time, nearly 100% of the project bundles have portions of an earned value process up and running. This assessment focuses on the output of OPG's cost, earned value, and forecasting system for those reporting Project Bundles with analysis performed by our own team. In addition, we have conducted numerous interviews with members of the Planning and Controls ("P&C") organization and the Cost & Schedule Analysts ("CSA") for each Project Bundle to determine to what extent the CSAs are utilizing the systems, how well they are performing, and current strengths and weaknesses.

BMCD/Modus has performed several Project Assurance reports prior to embarking on this oversight review of the OPG Cost Management and Earned Value programs. Observations and recommended actions with either

the Cost Management or Earned Value systems that have been documented in previous reports will be referred to or incorporated into this report as necessary.

**Interviews of the following individuals:**

Mike Allen, Vice President, Refurbishment Execution  
Gary Rose, Director, Planning and Controls  
Art Depres, Outage Director  
Robert Obertries, Section Manager, Estimating, Refurbishment Project Infrastructure  
Roy Brown, Project Manager, RFR  
Sorin Marinescu, Project Manager, Fuel Handling  
Ken Graham, Project Manager, Shutdown, Layup  
Scott Guthrie, Project Manager, Balance of Plant  
Andy Elliot, Cost Manager, Planning and Controls

Neil Mitchell, Vice President Engineering, Nuclear Refurbishment  
Art Rob, Vice President, Projects and Modifications  
Dragan Popovic, Director, Projects and Modifications  
Lindsey Greenland, Project Planning & Control Lead  
Alberto Castellanos, Cost & Scheduling Analyst  
Leo Saagi, Director Controllershship  
Derek McAuley, Schedule Manager, Refurbishment Project Infrastructure  
Norman Chan, Section Manager, Reporting / Cost  
Sudhakar Pulagam, Cost & Scheduling Analyst, Refurbishment & Feeder Replacement  
Walid Masud, Cost & Scheduling Analyst

**Attended the Following Meetings:**

06/06/13: Andy Elliot, Gary Rose, Eric Gould, Dan Meyer, Joe Byce, Ned Markey – Status of Proliance and the BI tools  
09/16/13: Andy Elliot, Eric Gould, Duke Bell - 4c Estimate, Gate Approvals, Proliance, Change Control and the data fidelity issue  
11/17/13: Norman Chan, Duke Bell – Review of Proliance and BI software as installed and operational  
08/13/14: Roy Brown, Sudhakar Pulagam, Carrie Okizaki, Duke Bell – RFR Cost Management, Earned Value and Performance Metrics  
08/21/14: Gary Rose, Art Depres, Derek McAuley, Andy Elliot, Duke Bell – Project Cost Management, Earned Value and Performance Metrics  
09/19/14: Sudhakar Pulagam, Justin Alizadeh, Duke Bell – JV daily, weekly and monthly metrics, use of SCADA system and schedule database integration with OPG  
10/07/14: Gary Rose, Duke Bell – Integration Findings and Cost Management Assurance Plan  
10/08/14: Scott Guthrie, Duke Bell – Cost Management, Performance Metrics and Earned Value issues and needs for BOP  
10/08/14: Leo Saagi, Duke Bell – Cost Management and Finance's role in the program  
10/09/14: Mike Allen, Gary Rose, Eric Gould, Geoff Thomas, Duke Bell – Discussion on assimilation of PMs for performance analysis needs  
10/16/14: Mike Allen, Gary Rose, Eric Gould, Duke Bell – Discussion on estimating program and

support of Cost Management and Performance Measurement

**Overall Assessment:**

OPG's original management philosophy for the Project was based on an EPC contracting strategy, where the risk of engineering, procurement and construction is shifted to the contractor and OPG would act in a role of passive oversight for the DR Project. This meant that the Project Controls processes and systems were set up to monitor progress of construction based on this passive approach.

In the first and second quarters of 2013, several of the contracts had been put into place and the overall philosophy of project management began to change based upon the shifting risk profile for the Project. It was generally recognized that while OPG continued with its EPC contracting strategy, there would be more than one contractor performing work at one time that would require more active management and coordination by OPG. Additionally, the project was not a greenfield project but the refurbishment and construction of new facilities on an operating nuclear site, and several of the contracts were being performed on a cost reimbursable basis. These facts, taken together, required OPG to engage in a much more active management philosophy of the contractors. This meant that the Project Controls processes and systems would need to be more extensive than had been originally planned. The Project Team began to realize that changes had to be made and began to contemplate change to the processes, procedures and systems. We have noticed that over the last two years, the active project management philosophy has taken root and begun to flourish. The Project Team Managers and Project Controls teams are developing the processes, procedures and

systems to support this new philosophy. The purpose of this report is to highlight areas within the Cost Management and Earned Value Management System (“EVMS”) where improvements could be made to support OPG’s ability to actively manage the DR Project.

In evaluating OPG’s systems, BMCD/Modus has reviewed the relative sophistication of the selected cost management, earned value and project forecasting process in light of what is generally used in the industry. OPG’s currently deployed EVMS and project forecasting processes and systems rely almost entirely on monthly financial cycles and cumulative performance to date; a methodology we understand has been utilized by the OPG Projects and Modifications organization on smaller projects. While this type of system may adequately support a portfolio of small projects spread over a very long period of time, such a Cost and EVMS system is not consistent with and unlikely to support an actively-managed project as large and fast-changing as the DR Project.

The Project Bundle managers within the DR Project are responsible for controlling and forecasting the project work and related costs. However, certain gaps within the EVMS, as of the Third Quarter of 2014, caused some Project Bundles to measure progress in unique and separate ways from the overall Program. While these “work-arounds” aided each project individually, it led to a lack of standardization across the organization. Additionally, OPG’s current system utilizes a process of manually inputting cost, budget and forecast data into a database that is cumbersome and requires duplicative work processes to keep the data aligned with the project teams’ forecasts. This lack of standardization and the cumbersome nature of the manual inputs caused conflict and variances in the reporting systems that were constantly being challenged by both the Project Controls and Project Teams. The organization is now addressing several of these misalignment issues between the Project Team Managers and the Project Controls organization and they reaching consensus on both program and process alignment. Teams have been put together to determine the best methodologies for analyzing and managing performance and guidance is being rewritten and standardized within the Project Teams to match current needs.

This report assesses the programs and processes the DR Team currently is using to control and forecast cost on the DR Project, and compares those systems that are generally considered to be the industry standards for these uses. In this Assessment, we provide: an overview of the system the DR Project is using for EVMS; a summary and comparison of best industry practices; and an assessment of the gaps that OPG should address with recommendations for improvement. Our findings include:

- The DR Program lacks an overall project EVMS and Cost reporting strategy (including corporate level reporting) that properly considers the planned, earned and actual quantities of work installed and workhour performance in a manner that is visible and which rolls up for validation of the monthly financial reports.
- The DR Team’s decision to utilize a fully integrated Primavera P6 schedule database results in the Project having most of information needed for an EVMS, including rules of earning credit based on quantities and work-hours performed. This information, however, needs to be integrated at the cost account level, especially for determining percent completions and remaining task durations for each project’s control accounts. While deliverable and quantity-based Earned Value mechanisms have been established for determining percentage completion of activities, hours and quantities are currently not integrated with the reporting system, thus impairing OPG’s ability to effectively monitor and report performance.
- Reports from the Project Team need more emphasis on forecasting, which depends on having recent data needed for trending. There is the potential that OPG will not recognize and mitigate cost and schedule issues/trends in a timely manner because cost data is being used as the basis for earned value and forecasting calculations can be up to 1.5 months old. Best industry practices are based on weekly analysis cost components in order to evaluate

performance and make informed management decisions.

- Level of Effort (LOE) activities are included in OPG's earned value and performance reporting calculations which is skewing indices and leading to inaccurate/ineffective metrics.
- The DR Program's cost management procedures do not require alignment between estimates and cost data in the cost management system at any point in time other than at a gate. The DR program does not have a standard format for project estimate preparation or a standard estimating platform for preparing and archiving project estimates.
- The DR Team lacks an estimating database and standard estimating template from which all project-specific controls are normally based. An accurate, clear and concise estimate that when updated properly represents the project Estimate at Completion ("EAC") is imperative for managing a large project and is an essential baseline to measure performance. This standard is being developed and is anticipated to be utilized for RQE.
- The DR program's change control process is partially reliant on the gated process for full identification of project scope; however, lag times in reaching gates has resulted in long periods during which projects are not accurately updating forecasts. This could be a self-correcting process for Refurbishment once all of the major projects are through their Gate 3 reviews and are funded for execution.
- Quantity and manhour data cannot be cross-referenced or validated to identify unit rate or production trends, which are usually not easily recognized by financial trends.
- The DR Team needs to evaluate its use of Proliance as the cost management database and Microsoft BI as the reporting software. This evaluation should include a review of whether Proliance and BI will be able to handle the volume of data regularly produced in a mega-project and if there are ways to improve system functionality.

Recent interviews with the DR Team have revealed the desire to implement the changes needed to the program to help them manage work and more accurately forecast the associated costs. These recommendations have been discussed in detail with the P&C Team and, as of this writing, are being integrated into the Project's cost management processes. For example, OPG is obtaining an estimating database, piloting quantity and work-hour analysis and reporting, and further specifying data needed for reporting and what should be delivered by the contractors. OPG is also addressing the software system deficiencies, the earned value process and system, identifying the data, data integration and data storage needs and developing quality analysis programs for schedule and schedule integration. While the Project Team is currently behind where we would expect them to be in terms of the development of these systems, time still exists to get these controls incorporated prior to the beginning of the Unit 2 Execution Phase, when it will be the most critical.

**OBSERVATIONS/FINDINGS**

#	Observations/Findings	Risk Rating (Prior to MR)	Recommendations	Management Response
1	The DR Program lacks an overall project reporting strategy (including corporate level reporting) that considers and includes the necessary quantity and workhour performance analysis in a manner that rolls up for validation of the monthly financial reports, utilizing standardized formats.	MEDIUM	<ul style="list-style-type: none"> <li>• A strategy for reporting that identifies the data needed, the data mapping, the data storage and that enforces standard formats and analysis techniques on each Project Bundle needs to be developed.</li> <li>• Develop a standardized daily, weekly and monthly project reporting strategy and format should be developed, tested, implemented and rolled out to all Project Bundles.</li> <li>• Increase the ability of the Project Team to forecast and perform trend analyses. The data needed for monitoring and forecasting work activities should be gathered at more granular and timely intervals. The system should be capable of performing cumulative analysis techniques of daily, weekly and monthly earned value and performance reporting with quantities reported daily, workhours weekly and the cumulative results analyzed monthly for validation against cost.</li> <li>• The Primavera P6 schedule database information (such as quantities and work-hour based rules of credit) needs to be integrated at the cost account level so that EVMS will capture material quantities installed, earned / actual work-hours, unit rates and labor rates data on a timely basis (when available).</li> </ul>	<ul style="list-style-type: none"> <li>• Management will update it's Program Management Plans by the end of Q2, 2015 as well as the associated play books and governance. The updates will include : <ul style="list-style-type: none"> <li>○ Overall Reporting Strategy, and</li> <li>○ Identify the requirements, processes for Daily, Weekly, Monthly Quarterly reporting for each stakeholder group with a documented implementation plan.</li> </ul> <p>TCD April 30, 2015</p> </li> <li>• A forecasting/trending play book is under development. It will be rolled out to all Project Management and Project Controls staff.</li> </ul> <p>TCD May 15, 2015.</p>

2	Level of Effort (LOE) activities are included in OPG's earned value and performance reporting calculations which is skewing indices and leading to inaccurate/ineffective metrics.	MEDIUM	<ul style="list-style-type: none"> <li>The definition of measurable or direct work should be established to better identify the work that should be considered for performance measurement by this system.</li> <li>LOE work should not be included or combined with direct work for determining individual project SPI or CPI. It should only be included in total project CPI and identified when/if included.</li> <li>It should be validated that LOE work is separated from any other measurable work in all control accounts.</li> </ul>	<ul style="list-style-type: none"> <li>Changes are already in place to segregate Level of Effort activities from work packages that can be earned. A review of this will be completed as part of the reporting standards and implemented with Managements Response under Item 1.</li> </ul>
3	The DR program does not have a standard format for project estimate preparation or a standard estimating platform for preparing and storing project estimates	MEDIUM	<ul style="list-style-type: none"> <li>Create standard estimate forms to collect estimates from contractors.</li> <li>Complete the implementation of the US Cost estimating database.</li> <li>Add/update all current and future estimates to the estimating database and true-up estimates to desired format.</li> <li>All estimates should contain all of the elements that need to be measured for performance and earned value measurement (commodities, commodity units, unit rates, and labor rates, etc.)</li> <li>Each estimate should contain cost account detail down to the work package level to properly link the estimate, cost system and schedule databases.</li> </ul>	<ul style="list-style-type: none"> <li>All recommendations are accepted and incorporated into the current implementation plan for US Cost and as part of the RQE deliverables.  TCD June 30, 2015.</li> </ul>
4	The DR Program's cost management procedures do not require alignment between estimates and cost data in the cost management system at any point in time other than at a gate.	HIGH	<ul style="list-style-type: none"> <li>Establish the methodology for keeping the estimate database and cost system aligned for analysis, including change control process and identification of needed updates to Estimates to Complete.</li> <li>Changes in project scope should be estimated utilizing the standards in the estimate database (not yet established) prior to establishing the change and updating the cash flow and Estimate at Completion.</li> <li>Changes should contain the detailed information (quantities, unit rates, work hours, etc.) necessary for performance measurement and earned value</li> <li>The estimate database should be tied to the "data store" to align the two systems and provide a check mechanism.</li> </ul>	<ul style="list-style-type: none"> <li>NR is currently updating its Project Controls Playbooks and associated governance which will incorporate the requirement for alignment between estimate and cost data in the cost management system. The governance updates will address all recommendations. <ul style="list-style-type: none"> <li>TCD March 31, 2015</li> </ul> </li> </ul>

5	The DR program's change control process is partially reliant on the gated process for full identification of project scope, which without analysis of trends not related to costs does not allow timely adjustments based on forecasts and trends in performance unless notified of changes identified by the contractor	HIGH	<ul style="list-style-type: none"> <li>Create a formal change management process that monitors trends and other potential cost/quantity misalignments and addresses changes in scope and cost impacts in a more expedient manner. This would then allow for more timely evaluation and decisions by the management team.</li> <li>Formal weekly change control meetings should be held to address the changing financial needs and management of the organization in conjunction with providing guidance and focus to the Project Team for developing and utilizing trends and maintaining contingency.</li> </ul>	<ul style="list-style-type: none"> <li>A formal change management process and a Change Management Board will be established in conjunction with the execution organization. <ul style="list-style-type: none"> <li>TCD June 30, 2015</li> </ul> </li> </ul>
6	Rules of credit for percent complete and remaining activity duration used in the P6 database are primarily used for determining percent complete utilized in the earned value system. The backup data however (usually quantity or manhour data) is not available or not validated in conjunction with performance measurement.	MEDIUM	<ul style="list-style-type: none"> <li>Develop a process for quality checking or providing quantity and work-hour data from the performing contractors in the Project reporting system for progressing schedules and forming the basis of schedule performance indices.</li> <li>Review the existing rules of credit and basis for determining percent completions for P6 activities to ensure they meet the needs of a work hour and quantity based reporting system</li> <li>If not in place in all projects, move to a system that reports percent complete in P6 based on planned, earned and actual work-hour or quantity progress and validates that percent complete through a corresponding analysis technique.</li> </ul>	<ul style="list-style-type: none"> <li>A revised earned value process has been developed and associated Play Book and governance is being finalized and rolled out. After rollout, validation of appropriate earning rules will be verified at each Gate and results monitored on an ongoing basis. <p>TCD May 15, 2015.</p> </li> </ul>
7	The IT programs and software currently utilized for maintaining cost management data such as budgets (original and current) and actual cost were not designed as a mega-project cost management or earned value system, and is already reaching the limits of its capability. In addition, data manipulation required for developing project reports and metrics is tedious and cumbersome, requiring a duplication of effort to manually load data by a 3 <sup>rd</sup> party after collection from the project teams.	MEDIUM	<ul style="list-style-type: none"> <li>In conjunction with the automated change project underway, evaluate potential alternative data storage techniques to improve database integration and alignment for reporting.</li> <li>Reevaluate the use of Microsoft Business Intelligence (BI) software as the project's sole reporting toolbox. The decision to utilize BI as the report writing tool is based on a corporate standard. With the Nuclear Data Warehouse set-up, determine whether other reporting tools could be utilized that do not require trained programmers to set up reports.</li> <li>Consider whether it is desirable or feasible to replace Proliance with cost management software built for construction projects or standardized database system, preferably one that already contains a quantity and workhour storage database. In the alternative, establish that Proliance will be able to meet the cost management needs of a mega-project.</li> </ul>	<ul style="list-style-type: none"> <li>NR is discussing this issue with CIO and has had meetings with an external consultant to validate the scalability of the cost and reporting systems in conjunction with the implementation of the cost system and data storage improvements currently underway. <p>TCD June 30, 2015.</p> </li> </ul>

**Nuclear External Oversight Assessment Report**  
**Assessment of 4c Estimate and Cost Management**

**Objective and Scope of Assessment**

This assessment covers OPG's cost management processes and procedures as of the development of the Release 4c project cost estimate and 2014 Business Case (4c Estimate), including:

- Processes and procedures OPG has created internally to govern the development, implementation and management of project estimates and project related costs,
- OPG's actual development, implementation and management of the 4c Estimate, and
- OPG's planned continuous and ongoing improvements to its estimating and cost management processes and procedures in preparation for the next phases of Project estimating.

**Period of Assessment**

Our assessment was conducted over a four month period from roughly August 1, 2013 to December 15, 2013.

**Overall Assessment Risk Rating: MEDIUM**

**Background and Methodology**

Since the beginning of our engagement, BMcD/Modus has performed ongoing assessments of the Darlington Refurbishment Project's estimating and cost management processes and procedures. BMcD/Modus also reviewed in detail the methodology used by the DR Team in its preparation and development of its 4c Estimate. BMcD/Modus's assessments were provided to the Nuclear Oversight Committee of the Board of Directors (NOC) as part of our Initial Project Assessment report (dated August 13, 2013) and our Q4 2013 Nuclear Oversight Committee report (dated November 12, 2013). From Mid-July through the end of December, BMcD/Modus continued to review and assess the estimating and cost management processes, and the 4c Estimate, and to note progress against our initial observations and recommendations. Specifically, we have performed the following due diligence with respect to this assessment report:

**Documents Reviewed:**

See Appendix 1.

**Interviews and Meetings:**

See Appendix 2

**Overall Assessment**

In our Initial Project Assessment and in our reviews continuing through December 2013, BMcD/Modus has identified the following concerns:

- The overall quality of the 4c Estimate is commensurate with industry standards for this phase of estimate, e.g. one which is based on a level of project definition with little detailed engineering completed.

- For purposes of tethering its estimating effort to known industry standards, the DR Team has embraced utilizing the estimating standards from the Association for the Advancement of Cost Engineering (AACE) and its guidelines (discussed in detail herein) for the classification of cost estimates. In practice, BMcD/Modus found that the DR Team had inconsistently applied AACE guidelines and other processes and procedures central to the BOD's understanding of the underlying quality of the project cost estimates.
- The single most significant portion of the 4c Estimate and the entire DR Project's costs is the cost of the Reactor Retube and Refurbishment (RFR) Project, with whom OPG has contracted with the joint venture of SNC-Lavalin and Aecon (SNC/Aecon). The RFR cost estimate is also the most mature large scope of work due to the timing of the contact with SNC/Aecon. BMcD/Modus's initial focus for reviewing the 4c Estimate was on the SNC/Aecon's estimate, from which we drew the following conclusions:
  - By contractual design, SNC/Aecon's RFR Class 4 Estimate does not follow all aspects of the AACE classification. In particular, the Class 4 Estimate does not monetize contingency nor will it until the date of the 2015 Class 2 Estimate. This has the potential to fog the budgeting process and could complicate later target price negotiations with SNC/Aecon over risk identification. Moreover, as of the time of this assessment, OPG and SNC/Aecon appeared to have differing opinions regarding the definition and identification of certain types of risks.
  - The methodology used by SNC/Aecon in the development of the RFR Class 4 Estimate portrays project performance under best "theoretical conditions"; thus, it will form the basis for comparison with actual results. Contrary to AACE guidelines, Project maturation specific to the DR Project was not a factor in SNC/Aecon's estimates through the Class 4 estimate.
  - Other aspects of the SNC/Aecon's estimates, such as its tooling prove-out and mock-up practice, will require an ample window of time once the Class 3 Estimate is completed. To the extent that SNC/Aecon's work in these areas is behind the baseline schedule, this could compress the time needed, and thus the quality, of the Class 2 Estimate.
- BMcD/Modus's review of the 4c Estimate yielded the following high-level observations:
  - The estimating and risk management functions need to be better aligned with regard to deriving contingency. The essential linkage between contingency and cost estimating needs clearer definition and would be helped by more deterministic identification of specific risk items.
  - The 4c Estimate is not a full re-examination of the DR Project's underlying cost estimates; this may be appropriate at this stage of estimate though BMcD/Modus would recommend OPG focus on more of a "bottoms-up" approach for 4d.
  - Revised planning assumptions in the 4c Cost Estimate are calculated toward reducing the Project's risk and increase positive outcome, though the full impact of those planning assumptions, as well as the Minister's Long Term Energy Plan (LTEP) will need to be modeled in 4d.
- OPG's new processes and procedures are in some cases conflicting and repetitive.

- The 4c Estimate work began in earnest in the summer during vacation season, and was impacted by the new planning assumptions which caused considerable reworking of many aspects of the estimate.

In addition to the above observations, BMcD/Modus has the following additional concerns and recommendations:

- The DR Team should consistently apply AACE guidelines to the extent these guidelines are applicable. Where they are not, such as with the RFR estimates, the DR Team should seek to identify how the estimate will differ from AACE guidance while still meeting the same level of confidence intended in the classification system.
- Since RFR is the test case for the other project cost estimates, the team needs to ensure that adequate vetting of the RFR estimate is accomplished as the cost estimate moves toward the RFR Class 3. The DR Team also should ensure that the vendor is aligned with OPG's view of the criticality of the Class 3 Estimate.
  - As of this writing, SNC/Aecon's Class 3 Estimate preparation is behind schedule and all related estimating activities are without float. The DR Team needs to carefully monitor and question SNC/Aecon as it prepares the estimate, and plan to deal with the bow wave of information that SNC/Aecon is likely to produce at the last minute.
  - OPG should seek SNC/Aecon's monetizing of PMT costs.
  - OPG should consider asking SNC/Aecon to monetize risks at a much earlier stage, and create a clear and repeatable process for calculating contingency at all levels and for all program participants.
- OPG should perform a full project reforecast for the Release 4d 2015 Business Plan estimate in order to progress the project's cost estimates as far as possible before RQE. Such a reforecast will provide management with a detailed blueprint for all of the work needed to satisfy the RQE with information related to the budget that should match the DR Project's growing level of maturity. Moreover, this effort should start earlier and with more focus than with the 4c Cost Estimate.
- Proliance with all of its functions needs to be implemented as soon as possible to ensure the cost and schedule management systems and reporting are aligned and in sync. This is critical to ensure data fidelity as the bundles move through the gate review process and move toward RQE and execution.
- Although designed to provide a forum for challenging scope and cost estimates, the gate review process has thus far had mixed results for that purpose.
  - Quality and consistency of the materials in Gate packages should be addressed. Gate review packages are often hastily assembled by the project teams and provided to the GRB only shortly before the gate review meetings.
  - Within gate packages, there are requirements for explaining variances in cost estimates, though there is no formal controlled process for presenting these changes. We have generally found little consistency between the various files kept on the bundles, and in some cases, the estimates used for gate reviews were not preserved.

- Records preserving the progression of the estimates are also inconsistent. The backup documentation for each gate should clearly be organized to provide the reader with the needed steps, particularly when scope has changed.
- OPG has mischaracterized the maturity level of vendor-supplied proposals for Campus Plan work as Class 2 or 3 level submissions, even though those estimates from the vendors had not reached the needed design plateau to make such a claim. This has caused OPG to make decisions based on unrealistic cost estimates and under-reserve contingency for certain scopes of work to date, resulting in draws from general or program-level contingency. This practice needs to be thoroughly reviewed by the DR Project.
- Contingency: Our review found that while risks are being identified and analyzed in a reasonable manner, the value of individual risks are not directly traceable or otherwise transparent all the way through the estimate to the bottom line. Instead, management has made a decision to carry Monte Carlo Output risk amounts at a more global level, namely, at the project bundle level only. As a result, discrete risks and associated amounts are merely subsumed into a single contingency number with no traceability back to the individual risk elements.
- The number, mapping and consistency of the various cost control processes and procedures should be reviewed by the DR Team, with an eye toward simplifying and streamlining such procedures. OPG's estimating and cost management procedures should be revised and updated to reflect to explain OPG's revised and current processes.

## **OBSERVATIONS/FINDINGS**

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
1	<b>4c Estimating Process:</b> The processes the DR Team used to develop the 4c Cost Estimate were robust and generally conformed to customary practices for an AACE Class 4/5 estimate. The DR Team has also properly characterized the nature of the estimate that it has advanced for approval. This characterization is generally confirmed by the DR Project's current overall status at this time. However, Vetting of OPG costs was impacted by the timing of the 4c Cost Estimate effort, which began in the middle of the summer months.	None	<ul style="list-style-type: none"> <li>The next phases of estimating should have a schedule of activities and begin earlier in the year, particularly considering the increased complexity expected for the 4d Cost Estimate. It is our understanding that the DR Team intends to assign to a SPOC the management of the 4d Estimate and RQE readiness effort. This should address our concern and increased focus on the 4d Estimate.</li> </ul>	

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
2	<p><b>4d Cost Estimate:</b></p> <p>The 2015 Business Plan, 4d Cost Estimate will need to reflect an expected leap in Project maturity that will occur over the next 8 to 10 months; thus, we would expect that the quality of OPG's estimate would parallel that increase.</p>	MEDIUM	<ul style="list-style-type: none"> <li>With the expected ramp-up of the amount of information needed to support estimates, the DR Team should focus on improving traceability, sourcing, vetting and suitability of database information underlying the estimate as this will be even more essential for vetting the Class 3 Estimates.</li> <li>OPG should perform a full project reforecast for the Release 4d 2015 Business Plan estimate in order to progress the project's cost estimates as far as possible before RQE. Such a reforecast will provide management with a detailed blueprint for all of the work needed to satisfy the RQE with information related to the budget that should match the DR Project's growing level of maturity.</li> <li>Quality control will be critical as the estimates move from ranges to point numbers. The DR Team is migrating to a standard estimating platform (US Cost) that is similar to what SNC/Aecon is now utilizing for its Class 3 RFR cost estimate.</li> <li>Many of the tools Finance and Project Controls developed for reviewing of the 4c Cost Estimate should be captured in the metrics the DR Team uses in an attempt to increase cost consciousness in between forecasts and gates.</li> </ul>	

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
3	<b>Source of Hard Costs:</b> The primary driver of hard costs in the 4c Cost Estimate is direct “norm” labor hours which are sourced from an F+G library of data bases and OPG Model Work Orders held in Passport. When in-house data was not available, third party sources were used as appropriate; such as international standards, OPCA (Oil and Petroleum Contractors Association), DACE (Dutch Association of Cost Engineering) and RS Means.	MEDIUM	<ul style="list-style-type: none"> <li>With the expected ramp-up of the amount of information needed to support estimates, the DR Team should focus on improving traceability, sourcing and vetting of database information underlying the estimate as this will be even more essential for vetting the Class 3 Estimates.</li> </ul>	

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
4	<b>Estimating Factors:</b> The 4c Cost Estimate relies on a number of estimating factors, some of which are a product of the current level of Project definition (i.e. Class 5/4). Factors have been used to approximate the result that will come with greater Project definition.	MEDIUM	<ul style="list-style-type: none"> <li>Utilizing such factors in estimating is common industry practice. However, OPG should increase the level of documentation regarding the factors that are used so that these are traceable when used.</li> <li>Going-forward, OPG will need a more organized set of estimate templates for vetting of Class 3 estimates and target price proposals from contractors. Utilizing a standard estimating platform (US Cost) should provide an acceptable alternative.</li> </ul>	

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
5	<b>OPG Estimating Factors:</b> Labor estimates used in the 4c Cost Estimate are generally based on productivity and include: a crew sheet that analyzes process flow and work series and height of operations. These factors are unique to OPG and have been developed over the past three years.	MEDIUM	<ul style="list-style-type: none"> <li>Traceability of the source of such factors is critical. Industry-based studies for developing productivity factors can be distinguishable, as can a contractor's experience when work is not entirely similar.</li> <li>Vetting of these factors and record-keeping related to the source will be critical for Class 3 estimate reviews.</li> </ul>	

#	Observations	Risk Rating	Recommendations/Findings	Management Action Plan
6	<p><b>OPG Cost Drivers:</b> The major drivers the DR Team examined for the 4c Cost Estimate were: Impact of unlapping of Unit 2, Scope rationalization and impact on overall size of the Project and associated level of effort. The different work groups were given a blank template for defining their staffing needs; this was later changed to variance reporting against 4b when it was apparent the work groups were exceeding cost boundaries. Costs were eventually brought in line via vetting and challenge meetings with RPET and the efforts of the Finance and Project Controls groups.</p> <p>Finance and Project Controls developed metrics for showing cost flows and variances over time that were extremely helpful in determining the right-sizing of the team. These (and similar) tools should be incorporated into the metrics the team is reviewing in an attempt to increase cost consciousness</p>	MEDIUM	<ul style="list-style-type: none"> <li>The DR Team needs to thoroughly examine the Operations and Maintenance estimates and buckets of cost for the DR Project. This is a large cost item that should be thoroughly vetted in light of the reduction in maintenance work scope the DR Team has adopted.</li> </ul>	

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
7	<p><b>Gate Review Process:</b></p> <p>Although designed to provide a forum for challenging scope and cost estimates, the gate review process has thus far had mixed results for that purpose.</p> <p>Quality and consistency of the materials in Gate packages should be addressed. Gate review packages are often hastily assembled by the project teams and provided to the GRB only shortly before the gate review meetings.</p> <p>Within gate packages, while there are requirements for explaining variances in cost estimates, there is no formal controlled process for presenting these changes. We have generally found little consistency between the various files kept on the bundles, and in some cases, the estimates used for gate reviews were not preserved.</p>	HIGH	<ul style="list-style-type: none"> <li>• Key documents should be delivered well in advance of the GRB, and increased accountability for timely delivery of the entire gate package.</li> <li>• The DR Team needs to exercise care in making assumptions regarding the maturity of contractor submissions in the gate process. The Campus Plan work has examples where OPG has associated greater maturity to an estimate simply because it was the result of a competitive bidding process.</li> <li>• Improve record keeping and chain of document retention.</li> <li>• The estimates developed for evaluation at the gates should follow the same general vetting methodology and adhere to the same quality and consistency standards as those used in vetting Estimate 4c.</li> <li>• Provide a reconciliation within the gate package template of the estimates presented with the gate package to prior estimates (i.e., 4b, 4c) and the basis of estimates so that changes can be traced and sources are identifiable.</li> <li>• In addition to Project Controls, the DR Team should consider utilizing a 3rd Party (e.g., Finance and the Controllershship) to provide an independent analysis and examination of the sufficiency of the gate packages. The 3rd party can report to the GRB its findings and concerns.</li> </ul>	

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
8	<p><b>Contingency:</b> Our review found that while risks are being identified and analyzed in a reasonable manner, the value of individual risks are not directly traceable or otherwise transparent all the way through the estimate to the bottom line. Instead, management has made a decision to carry Monte Carlo Output risk amounts at a more global level, namely, at the project bundle level only. As a result, discrete risks and associated amounts are merely subsumed into a single contingency number with no tractability back to the individual risk elements.</p> <p>OPG's choice to aggregate risk at the bundle level is not without precedent in the industry. However, given this choice, OPG will lose transparency as well as the ability to focus on and manage individual post-Monte Carlo risk amounts, which is particularly important for addressing the Project's most significant risks.</p>	HIGH	<ul style="list-style-type: none"> <li>As noted in our Initial Project Assessment, the DR Team needs wider and increased appreciation of the importance of accurately identifying risks and related parameters. Furthermore, as evidenced by a review of the risk register, more than a few DR Team members do not understand the distinction between management performance issues, business as usual issues and true project risks. Senior management needs to continue to focus the DR Team on weeding-out unnecessary risk items that take up management time and attention.</li> <li>The risk group needs to be more involved and empowered as part of the initial risk identification efforts. Challenge meetings would help to identify true project risks and proactively eliminate false risks and duplicate inputs.</li> <li>Without having a discrete risk basis for formulating contingency, project managers will need to request individual Monte Carlo analyses on selected risk items and expend extra effort to track those risks. In addition, such retrospective calculations will not be consistent with the results of bundled-level analyses.</li> <li>The distinction between Management Reserve and Contingency needs further definition as do the rules for allocation of funds.</li> <li>Future cost estimates should include a composite roll-up of contingent scope so that the extent of the "unknowns" in the estimate are transparent.</li> <li>Going forward, contingency dollars for the Project's most significant known risks should be developed on a deterministic basis with stochastic modeling limited to chances of occurrence.</li> </ul>	

#	Observation	Risk Rating	Recommendation	Management Action Plan
9	<b>OPG Estimating and Cost Management Procedures:</b>  OPG's estimating and cost management procedures should be streamlined, revised and updated to reflect to explain OPG's revised and current processes.	LOW	<ul style="list-style-type: none"> <li>N-MAN-00120-10001 PC-13 Nuclear Refurbishment - Cost Management And Reporting and N-MAN-00120-10001-CST-R000 2012-07-19 Nuclear Refurbishment - Cost Management and Project Reporting should be consolidated.</li> <li>OPG estimating procedures should be updated and revised to clarify and qualify the references to the AACE estimating classes, procedures and standards.</li> </ul>

**Nuclear External Oversight Review of**  
**OPG Risk Management Practices and Procedures**

**Objective and Scope**

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMcD/Modus") have performed an assessment with respect to OPG's Risk Management Program for the Darlington Nuclear Refurbishment Project ("Project"). This assessment addresses the risk management procedures, risk registers, training, management and overall execution of the Risk Program. The assessment was conducted during the second, third and fourth quarters of 2013. Our assessment measures both progress during this time as well as observations and recommendations for further improvement.

**Background and Methodology**

On August 13, 2013, BMcD/Modus presented its comprehensive Project Assessment Report based upon our review of the Project from February 25 through mid-July, 2013. At that time, we reported that the Darlington Refurbishment Project Team ("DR Team") established a Risk Management Program that is generally consistent with those commonly encountered on other large mega-projects and complies with published literature such as the Project Management Book of Knowledge ("PMBOK") published by the Project Management Institute. We also noted several areas for improvement, particularly with respect to risk identification, leadership and training.

From Mid-July through the end of December, BMcD/Modus continued to review and assess the Risk Management Program and to note progress against our initial observations and recommendations. Specifically, we have performed the following due diligence with respect to this assessment report:

**Interviews of the following individuals:**

Gary Rose, Director, Planning and Controls  
Ninke Smith, Manager, Refurbishment Project Infrastructure  
Tracy Leung, Risk Section Manager  
Ryan Smith, Section Manager  
Atef Soliman, Cost and Schedule Analyst  
Roy Brown, Project Manager, RFR  
Todd Josefovski, Project Manager, Turbine Generator, Steam Generator  
Sorin Marinescu, Project Manager, Fuel Handling  
Ken Graham, Project Manager, Shutdown, Layup and Services

Bert Boston, Section Manager, Islanding  
Scott Guthrie, Project Manager, Balance of Plant  
John Gierlach, Senior Manager Strategic Initiative  
Jody Hamade, VP Enterprise Risk Management  
Carlo Crozzoli, SVP Corporate Business Development  
Patrick Iemma and Steve Wong, RFR Risk Management (outside contractors)  
Andre Macatangay, Risk Manager, AECON  
Simon Taylor, OPG independent Risk Consultant, Questant, Inc.

**Attended the Following Meetings:**

Risk Management Workshop (Identification of Risks) held on September 6, 2013  
Risk Oversight Committee Meetings on September 12, 2013 and December 4, 2013  
Monthly Risk Review Meeting for Balance of Plant on October 2, 2013 and October 25  
JV RFR Monthly Risk Workshop on November, 21 2013  
JV Risk Management Process Review on December 18, 2013

**Reviewed the Following Documents:**

- DR Risk Management Plan (NK38-PLAN-09701-10067 0006 R003)
- Nuclear Projects Risk Management Process (N-MAN-00120-10001-RISK-R001)
- Task Instruction—Closing Risks (N-MAN-00120-10001-RISK--R000)
- Risk Management Guide (N-MAN-00120-10001 RISK-04 R001)
- Contingency Development and Management Guide (N-MAN-00120-10001-RISK-05 R001)
- Darlington Refurbishment Lessons Learned And Opex Management (N-MAN-00120-10001-RISK-06-R001)
- Assumptions & Decision Management (N-MAN-00120-10001 RISK-07)
- Program Risk Registers run on November 19, 2013; December 3, 2013 and January 4, 2014
- Project Risk Registers run on November 19, 2013, December 3, 2013 and January 4, 2014
- Risk SPOC Meeting Materials, November 7, 2013
- Risk Oversight Committee Meeting Handout Materials, September 12, 2013 and December 4, 2013
- Risk Identification Training Materials prepared by Simon Taylor

**Overall Assessment**

In our Project Assessment in August, BMcD/Modus identified the following concerns with respect to the Risk Management Program:

- **Risk Identification and Scoring Issues:** Many of the identified risks are really “concerns” (or “business as usual risks”) stemming from potential inadequate management and thus serve to only clutter the Risk Register – contingency should not be added for poor management, rather, better management should be added. Cluttering the register with false risks is energy consuming and serves no productive purpose. In addition, there is evidence of wide ranging ambiguity and inconsistency in the risk titles and descriptions which leads to uncertainty in understanding the risk that may in turn lead to misplaced mitigations.
- **Tools for Risk Management Program:** The reporting systems databases used for Risk Management and related programs (i.e. RADAR, AIDA, OPEX) are cumbersome with limited capabilities and do not interface well or cross reference with each other. This limits effectiveness as a management tool and causes inefficient use of personnel time. Efforts by the IT group to improve this critical system has been slow in coming.
- **Opportunities:** A good Risk Management Program also attempts to identify “opportunities” and provide for a proactive response to improve the likelihood of the “opportunity” occurring. No such opportunities have been observed in the DR Project RM Program, suggesting that latent opportunities may be out there.
- **Training:** There was a noted lack of training for the Risk Management Program that would foster an understanding and acceptance of the importance of risk management and stimulate proactive participation and encourage the identification of risks and opportunities in the Risk Registers.
- **Lack of Metrics:** The Risk Management and associated programs have a less than desirable number of meaningful metrics to provide management with a sense of the maturity or fidelity of the underlying the data and the DR Project's performance.

- **Staffing and Leadership:** The Refurbishment Planning and Controls Risk Group (“Risk Group”) is responsible for the development, implementation and oversight of the Risk Management Program. The Risk Group is staffed with capable but relatively inexperienced individuals - several staff are Co-ops or interns. The DR Project’s philosophy appears to be for the individual projects and departments to perform the majority of Risk Management duties and related work, while the central Risk Group serves only an administrative, support and oversight role. This creates a condition that risk management is viewed as a collateral duty of project or department personnel which dilutes and diminishes the attention focused on risk management efforts, given other duties of such entities.

Since the Project Assessment, the DR Team has continued to develop and implement the Risk Management program through the end of the last quarter. Although much remains to be done to effectively initialize the program, numerous improvements have been initiated that address matters such as:

- Greater emphasis on risk identification clarity and the progressive elimination of “business as usual” items from the Risk Registers
- Some formal training has been conducted
- Improvement to the Risk Register Reports
- Consolidation and clarification of the applicable risk procedures
- The Risk Group has taken a more aggressive role in managing the Risk Management Program

However, complete implementation of these essential improvements has yet to be accomplished. To date, there remains over 500 named risks in the project and program risk registers, many of these risks are still what could be considered “business as usual” type risks. The risk reporting tool is somewhat cumbersome and is difficult for end users to sort and analyze information. The DR Team has commenced some formal training on the Risk Management Program, however, there needs to be more as evidenced by the current state of the Project Risk Registers. While we have seen some evidence that the Planning and Controls Risk Group has taken a more active role with respect to the implementation and management of the Risk Management Program, we would like to see much more progress in this regard. Additionally, we have not seen much improvement with respect to the identification of opportunities or the development of useful metrics.

The assessment Observations listed below and discussed herein reflect matters where improvements have been initiated as well as matters that still need to be addressed.

Observation 1: Risk Register Reporting Limitations

Observation 2: Lack of Clarity of Risk Titles and Descriptions

Observation 3: Numerous Entries in the Risk Registers are not “Risks”, but Business as Usual “Issues”

Observation 4: Lack of Appropriate Risk Management Program Staffing & Leadership

Observation 5: Risk Management Program Training

Observation 6: Missing Identification of “Opportunities”

Observation 7: Weak Risk Responses

Observation 8: Long Periods Between Risk Register Reviews and Updates

Observation 9: Risk Oversight Committee Effectiveness

Observation 10: Lack of Trending and Other High-Level Metrics

Issues identified in these Observations are causing the DR Risk Management Program to be cumbersome and sub-optimized. Once properly addressed, a streamlined, efficient and effective Risk Management Program will result, eliminating unnecessary and wasted effort and contributing to the success of the Darlington Refurbishment Program.

## **1.0 Observations**

### **1.1 Observation 1: Risk Register Reporting Limitations**

RADAR (Risk Assessment Database and Register), the DR Program's and Project's Risk Registers, were developed and maintained by the Risk Group using a Microsoft Access-based platform. It has served a purpose in initially documenting risks associated with the Darlington refurbishment. However, RADAR data entry and report generation was limited to a few trained individuals and the program lacked the functionality to effectively support the risk management program. In addition, RADAR was not integrated with related databases, thereby limiting the ability to effectively track and manage OPEX, Issues, Decisions, Assumptions and Action Items as they relate to the management of identified risks.

A recent migration from Access to SharePoint is a step in the right direction because it provides direct risk register access to the DR Team. Additional work remains, however, before an essential integrated risk management software tool is in place. These include:

- Establish interfaces between the Risk Register and other supporting databases. Hyperlinks to Action Items that track each risk's mitigating activities are desirable to understand how each risk is managed. The current schedule for incorporating this feature is June 2014.
- Establish a methodology for creating custom Risk Register reports. Only three "canned" reports are available from the SharePoint Risk Register. Users cannot directly obtain the data sorts that suit their specific need. For instance, users should be able to sort by "project/bundle" and "phase" of the project. However, users must export the entire SharePoint Risk Register file to Excel in order to manipulate the data. While this does not require a large effort, a potential document control issue may arise, causing confusion when users are not working with current data. These limitations also make it less likely that end users will want to take the time to analyze the critical information in the Risk Register.
- Create the ability to generate reports detailing mitigating actions for each risk. Such reports should identify the action, the responsible party and relevant required dates. Clearly, the necessary data must be in the Actions database before such reports can be produced. Ideally, with a fully integrated database system, managers could obtain reports that support their need.
- Provide reference in the Risk Register to P6 activities which reflect the mitigation strategy for scheduled risk responses. Where multiple activities constitute a risk response (especially those with precursor and successor ties), risk mitigation activities should be scheduled in the integrated P6 schedule. As an example, pre-outage scope defining inspections that are linked to risk items should have a schedule tie back to resolving an open risk item.

### **RECOMMENDATIONS:**

- Expedite interfacing the SharePoint Risk Register with other related databases.
- Consider formally exporting a "controlled" Excel version of the Risk Register into a SharePoint folder on a definite time table (e.g. the 1<sup>st</sup> of each month and the 15<sup>th</sup> of each month). That way, everyone will know when updated versions are available; and therefore, when their working copies are outdated. Each exported RR filename should include the date and the worksheets should include a locked footer with the version and date. Doing this will allow users to create needed reports while retaining the dated version identification.
- Ensure that all risk mitigations items are included in the Actions Database and that a reference to associated risks is provided. In addition, provide for the sorting of the Actions Database by risk number, responsible party, due date and other fields
- Increase efforts to schedule multi-activity risk responses in P6 and provide reference to the P6 activity string in the Risk Register.
- Consider convening a group of SharePoint Risk Register users to obtain feedback on the current database. Take necessary actions to further conform the Risk Register and associated databases to the need of users.

## 1.2 Observation 2: Clarity of Risk Titles and Descriptions

In general, a “risk” involves an event driven by a cause; and the event, along with its impact, is the focus of the Risk Response (e.g. mitigation) strategy. Many DR Risk Titles and Risk Descriptions are poorly written and ambiguous, causing confusion regarding the intended meaning. This is not a mere administrative compliance matter. Risk Responses must target the cause of the event. Without a clearly defined cause, it is difficult, if not impossible, to develop an effective strategy for reducing the likelihood of occurrence. Furthermore, without clearly defined impact, it is difficult to create an impact reduction strategy and to determine financial and schedule impact scores.

The Risk Management Program procedures, in particular Risk Management Guide, N-MAN-00120-10001 RISK-04 R001 (“Risk-04”) provides very clear instruction on risk identification and descriptions. The Risk Group has implemented various training sessions with respect to risk identification and appropriate descriptions. This has included the hiring of Simon Taylor, an independent risk consultant, to conduct training workshops specifically on risk identification. Seven Risk Workshops have been conducted between August 22 and Dec 3, 2013. Additionally, a training session for Risk SPOCS on the entire Risk Management Program was held in early November. At the September Risk Oversight Meeting, there was an action taken by all risk stakeholders to “clean up” the risk register—i.e. the removal of business as usual risks. As a result, we have seen noticeable improvement in the risk descriptions from September through December. However, this effort is not complete as the Program and Project Risk Registers still have risks that are not well identified or defined. In December, the Risk Group issued a Manager’s Briefing Card, mandating updating of all risks in accordance with Risk-04 by the end of January. Until all risks have been updated, review of the Risk Registers will cause much wasted time and confusion when assessing risk scores and responses. Such confusion has been observed in project meetings, as well as in Risk Oversight Committee meetings. Examples of vague and misleading Risk Titles and Descriptions are provided in Appendix 1 Table A1.1.

### RECOMMENDATIONS:

- Once the risks have been updated, the Risk Group should act as a gatekeeper to ensure that all risk titles and risk descriptions in the current Risk Registers to be consistent with the revised RISK-04 guideline<sup>1</sup>. Doing so should add clarity and eliminate the wasteful confusion. In addition, by describing a risk as an event and indicating the cause, one can focus on the actual risk rather than an open-ended ambiguous description that creates difficulty in: a.) communicating the problem, b.) creating and reviewing risk responses, c.) understanding the effectiveness of mitigations and d.) causing uncertainty when considering closure.
- The Revised RISK-04 document is a major step forward to consolidate and clarify a number of risk program requirements. It should be rolled out with a strong message regarding its purpose and key changes. The rollout presents a significant opportunity for senior management to demonstrate commitment to effective risk management and to stress the importance of all personnel to participate in the RM program and to properly use the procedure. Furthermore, once RISK-04 is approved and issued, a collective effort, driven from the Project’s RPET in combination with ERM, should be undertaken to perform a thorough review of risk titles and descriptions, re-writing them where necessary and confirming that risk responses effectively and aggressively address the risks.

Once the Risk Registers are cleaned up, tracking and managing risks can become focused, efficient, and effective.

<sup>1</sup> RISK-04 Revision 1 addresses “Vague or Misleading Risk Titles and Risk Descriptions” at Sect. 2.2.1.3:

#### **Risk Titles**

(a) Risk titles describe the **event** and the **context** of the event. E.g. “There is a risk of insufficient welders available **<event>** to support Execution **<context>**”

(b) Risk titles should not include potential impact, especially if there are multiple impacts (as these should be characterized under Risk Description instead)

#### **Risk Descriptions**

(a) Risk descriptions should be comprised of the risk **event**, the **cause**, and the **impact** of the event.

E.g. “There is a risk of insufficient welders available **<event>** to support Execution due to competition with other large industrial projects in the province **<cause>**, resulting in a delay that will impact the critical path by 30 days **<impact>**”.

### **1.3 Observation 3: Numerous Entries in the Risk Registers are not “Risks”, but are “Issues”**

Based on a review of the Project Risk Registers, a large number of entries are not risks, but are “issues” that should be addressed in the normal course of business; or they are events that have 100% probability of occurring, or have occurred already and require resolution. OPG has recognized that there were a fair number of “issues” on the Risk Registers and made a sustained effort to “scrub” both the Project Risk Registers and the Program Risk Register. As a result, the total number of risks carried on the Project and Program Risk Registers has gone down by approximately 22% since October 1, 2013. However, we believe that the DR Team would continue to benefit from additional work and focus to cut the risks down to an even more manageable level.

Risks require a higher level of management attention than issues as well as specific (and often extraordinary) actions to reduce the likelihood of occurrence and impact. Risks may also be factored in contingency calculations. In addition, “issues” should be addressed in base cost budgets, not as contingency. Therefore, “issues” should not be considered “risks” and should be tracked in the Issues Database, not the Risk Registers.

Examples of Risk Register entries that should be considered “Issues” are provided in Appendix 1 Table A1.2.

#### **RECOMMENDATIONS:**

To date, the DR Team has undertaken an effort to eliminate “Issues” from the Risk Registers. This effort needs to be completed as soon as possible and Risk Register maintenance instituted through training and periodic review. As stated above, the Risk Group has implemented various training sessions with respect to risk identification and appropriate descriptions. This has included the hiring of Simon Taylor, an independent risk consultant, to conduct training workshops specifically on risk identification. Additionally, a training session for Risk SPOCS on the entire Risk Management Program was held in early November. The DR Risk Team has also begun one-on-one training/challenge sessions with each of the Project Teams. This effort needs to continue.

#### **1.4 Observation 4: Risk Management Program Staffing & Leadership**

The Refurbishment Planning and Controls Risk Group is lean and staffed with capable but relatively inexperienced individuals – until recently, several staff members dedicated to the implementation of the Risk Management Program within the Projects were Co-ops or interns. As currently constituted, the Risk Group lacks the appropriate deference from the various project groups, which is necessary for effective, efficient and consistent risk program management. This results in a sub-optimized inter-organizational interface and lack of full attention to established risk program requirements, as evidenced by:

- A general unwillingness of project groups to accept support from the Risk Group when it is clearly needed.
- Lack of attention to direction from the Risk Group (e.g. in developing conforming contingency input, creating unambiguous Risk Register entries, and addressing risk vs. issue considerations) leading to inconsistent application of Risk Management Program requirements.
- Apparent willingness to accept an outside contractor, Simon Taylor's, guidance over that of the Risk Group.

In addition, limited senior management visibility in driving a strong risk program tends to relegate the risk management effort to a back seat priority. We have seen some positive movement with respect to this observation—as the Risk Group has begun a more “hands-on” approach with respect to the Project Risk SPOCS. Projects that had previously identified interns as their Risk SPOC have now appointed more qualified and senior individuals for this role. However, there still appears to be a lack of a project culture that sees risk management as an important part of the overall project management strategy. Additionally, several key personnel are transferring out of the Risk Group as of the end of January—including Tracy Leung and Ninke Smith. Ryan Smith will replace Ms. Leung (a position that he has held in the past), but thus far there has been no named replacement for Ms. Smith. This is a key position with respect to the Risk Management Program, and it will be important to put an individual with the right risk management experience in this position. It is also our understanding that ERM will be playing a more active role in monitoring the Project risks, which should be very beneficial in raising the level of importance of risk management.

#### **RECOMMENDATIONS:**

- Appoint or hire a strong, experienced, and assertive central Risk Management Program Manager/Coordinator with an established track record of success. The risk manager should be visibly supported by senior management, and have well-defined responsibilities such as: a.) oversee RM, OPEX, AIDA activities on a day-to-day basis, b.) proactively advocate the documentation of decisions, assumptions, lessons learned, etc., c.) eliminate ambiguity and inaccuracies of database entries, d.) facilitate consistency in risk analysis/scoring and in contingency development, e.) conduct training, f.) establish and maintain risk program tracking metrics, etc.
- Require the Risk Management Program Manager/Coordinator to periodically challenge the various project (function) risk register and risk management activities. This responsibility should be done with strong endorsement from the Darlington Refurbishment SVP.
- Consider performing a staffing analysis to ensure that the Risk Group is right-sized with the appropriate skill sets. This is important for everyone in the Risk Group, not just the Section Managers and above. Currently, the Section Manager and Manager are spending too much time doing what should be lower level tasks due to the fact that there are not enough qualified individuals in the Risk Group.
- Consider elevating the Risk Group in the DR Project organization to give it more stature and to demonstrate that senior management considers Risk Management, OPEX Management, Decision and Assumption Programs to be critical elements of a successful Nuclear Refurbishment. A culture change that sees risk management as an important part of project management will need to be driven top-down from executive management.

### 1.5 Observation 5: Risk Management Program Training

Lack of formal risk program training contributes to ineffectiveness and inconsistencies in how the various groups implement and execute the Risk Management Program. This is evident by the execution of the risk program to date (See Observations 2 and 3 above).

Seven Risk Workshops have been conducted between August 22 and Dec 3, 2013. While success of these sessions has been noted, they were limited to small groups (primarily project and functional group SPOCs) and comprised limited scope. Several more workshops are scheduled for Q1-2014. The small group limit has value insofar as the groups are comprised of individuals from a specific project or function and the sessions are focused on salient issues associated with that group's risk program. However, the training effort does not reach broadly into the DR organization to educate all personnel. Lack of broad participation may suppress identification of risks and opportunities; thereby, omitting critical risks and opportunities from the program. Limiting participation in the risk program may also exclude effective input regarding risk response strategies. Proper training could stimulate meaningful and productive participation by a broader slice of the DR population.

The P&C Risk Team plans to employ feedback from the project and functional workshops as input for a Risk Management Program training plan to be developed by February 28, 2014.

#### **RECOMMENDATIONS:**

- Establish a structured training program and curriculum that includes all relevant aspects of DR risk management and consists of regularly scheduled sessions that require attendance by DR personnel in a progressive manner that reflects the individuals' role in the DR organization. The curriculum should address the value of and rationale for a strong risk management program and the role of all individuals in supporting it. Examples of other projects where risks were not properly addressed would be helpful in creating an appreciation for a strong RM program. Such examples could be pulled from personal experience and the OPEX database. Training content could also focus on current risk program matters such as "risk" vs. "issue", clarity of risk descriptions, thoroughness and efficacy of risk responses, etc.
- Consider training by the current qualified F&G contractor to initiate the program, with the intention for an OPG person to assume direct training responsibility (i.e. "train the trainer").
- Establish attendance requirements, track attendance and hold managers accountable for personnel attendance.
- If appropriate, advanced detailed sessions could be conducted for individuals expected to perform detailed functions such as contingency development, etc.

### **1.6 Observation 6: Identification of “Opportunities”**

Most successful risk management programs also attempt to identify “opportunities” that could improve project performance. Risk-04 alludes briefly to opportunity identification, but does not provide details regarding identifying and managing opportunities. No “opportunities” have been identified in the Risk Registers to date. Forgoing the identification and management of “opportunities” may leave significant program/project improvements on the table.

#### **RECOMMENDATIONS**

- Elevate attention to the identification and management of opportunities by strongly addressing “opportunities” in training, establishing metrics for tracking opportunities and directing managers and supervisors to be more proactive in identifying and managing opportunities.
- Often, some of the best opportunities are identified by individual contributors. As with safety, strong risk identification culture provides meaningful input on risk and mitigation, and instills within project team members a greater sense of pride and common purpose. Therefore, all members of the DR team should be strongly encouraged and incented to identify new ideas and opportunities and management should be receptive to status quo challenges from the floor.

### **1.7 Observation 7: Weak Risk Responses**

The key to a successful Risk Management Program (and overall project success) includes the thoughtful development of effective Risk Responses (e.g. mitigating) actions. Based solely on a review of the Risk Registers, many risk responses appear to be perfunctory and ineffective. Risk responses should be well-calculated actions that directly address the cause of the risk and/or the impact. As stated previously, it is difficult to address cause and impact, if the cause and impact are not clearly stated. Even when the cause and impact are clear, risk responses don’t always provide a well thought out strategy for dealing with the risk.

Examples of weak responses in the Risk Register are provided in Appendix 1 Table A1.3.

#### **RECOMMENDATIONS:**

- Expedite the removal of “issues” from the Risk Register (Observation #3) and complete creation of clear unambiguous risk titles and descriptions (Observation #2).
- Once those items are addressed, a rigorous review of Risk Responses should be undertaken with a focused challenge of every risk response by senior management.

**1.8 Observation 8: Risk Register Reviews and Updates are not Occurring at Required Frequency**

In many respects, risk registers are not being properly used as a management tool. Periodic management reviews of the Risk Registers, if they occur at all, appear to be ineffective. This is evident by other Observations in this report related to the quality of the risk registers and the apparent lack of timely entry updating.

Revision 1 to "NUCLEAR REFURBISHMENT RISK MANAGEMENT GUIDE (N-MAN-00120-10001 RISK-04) requires that each risk owner perform, at minimum, monthly risk reviews to:

- (a) Ensure risk responses are still reasonable based on the latest information
- (b) Ensure mitigation actions are on track and status the actions in the Actions Log
- (c) Determine if the assumptions related to the risks are still valid and update in the Key Assumptions Log, if applicable
- (d) Determine if the risk characteristics have changed and update in RADAR
- (e) Determine if new risks should be identified
- (f) Determine if risk has realized or expired and can be closed in RADAR (with justification)

While attention to this prudent practice seems to be increasing, it is not at the level necessary to achieve a strong Risk Management program.

**RECOMMENDATIONS:**

- Management should stress the value and importance of periodic Risk Register reviews that are meaningful and effective. Monthly Project Integration meetings provide an opportunity to both challenge and elevate the importance of high level risks, as well as increase accountability for mitigating risks.
- Project managers and functional managers should conduct a detailed review of all risk registers for clarity, and quality considering the Observations of this report. Once completed, a senior management spot-review should be performed to confirm conformance.
- Subsequent to the initial detailed review identified above, establish a program for periodic management review of a different project/function risk register every two weeks. Review items can be based on the RISK 04 requirements delineated above and on the Observations of this report. This review would be most effective if performed by responsible managers at the Vice President level.

### 1.9 Observation 9: Risk Oversight Committee Effectiveness

The Risk Oversight Committee is addressed in the Darlington Refurbishment Risk Management Plan (Section 3.4 of NK38-PLAN-0971-10067 Sheet 006 R003). The Plan refers to a "Terms of Reference" for the committee that describes the "objective, scope, membership and meeting frequency". According to the "Terms of Reference" (NK38-REF-08130-xxxxxxx R000<sup>2</sup>) provided to External Oversight, the scope of the Risk Oversight Committee is to:

- ✓ Review top program risks
- ✓ Evaluate their assessment of probability and impact
- ✓ Evaluate the adequacy of mitigation plans
- ✓ Evaluate the status of mitigation actions

The ROC meets quarterly. Three meetings have been held to date and, as the risk program matures, they are progressively improving by focusing less on process and more on substance. The meetings to date have lacked focus and become mired down in discussions regarding process and the actual meaning of risk descriptions. Once the Risk Registers are properly constructed and the Risk Management Program processes are settled, the ROC meetings can more readily focus on the intended purpose. At the December 4, 2013 ROC meeting, remaining Risk Register deficiencies (such as proper titles and descriptions, effective risk responses, elimination of "issues", etc.) were directed to be completed by the next ROC meeting in March, 2014.

#### **RECOMMENDATIONS:**

- Ensure that Risk Register deficiencies are corrected before the March, 2014 ROC meeting and structure subsequent ROC meetings to focus on their intended risk review functions, rather than process and interpretation discussions.
- Hold ROC meetings monthly rather than quarterly. Such meetings will be more effective if they are held more often and shorter in duration, at least until the program stabilizes.

### 1.10 Observation 10: Lack of Trending and Other High-Level Metrics

DR has struggled with establishing effective metrics to track Risk Management Program performance. This is due, in part, to the functionality of the lack of database integration and the quality of entries in the registers. Proper metric tracking is an essential element of an efficient risk management program. These metrics should focus on effective visibility of risk items and mitigation. The Risk Group recognizes this and is currently evaluating various metrics for implementation. The last Program Report included a metric to identify how many risks had been put into the correct format.

#### **RECOMMENDATIONS:**

- Create a strawman of potential metrics and seek input from the management on their utility. The metrics package should include some sort of trending information related to the overall Program Risk. The metrics should be more than bulk numbers of risks in various categories. Issues such as changes in risk scores (particularly trending), the number of risk responses to be developed, projected costs of risk responses, and cumulative cost impacts should all be visible through a published set of metrics
- After development of appropriate metrics, the Risk Group should aggressively use the metrics as a tool for Risk Management Program compliance and monitor their effectiveness.

<sup>2</sup> An unapproved Document was provided to External Oversight. No "approved" TOR has been reviewed.

## Appendix 1

### Assessment Supporting Details

**Table A1.1 Examples of Vague and Misleading Risk Titles and Descriptions<sup>3</sup>**

#### **Risk 641**

Title: Uncertainty related to ability to recover Refurbishment costs

Description: The risk is that there is uncertainty in ability for OPG to recover its costs.

*[This states that the risk is "uncertainty". No cause of the uncertainty is provided and nothing is indicated to trigger the risk.]*

#### **Risk 11821**

Title: RFR Contractor Claims

Description: The risk is that OPG does not meet its obligations resulting in the contractor claiming for additional cost and schedule per article 4 of the Agreement

*[It's not clear which obligations would not be met, what would cause them to be missed. There may be numerous obligations, each with a different risk response. Moreover, this entry may be considered an "issue" that is addressed in the normal course of action...not a "risk". See Observation No. 3 below.]*

#### **Risk 11866**

Title: Shutdown Layup Project - Secondary Side Steam and Water Systems (SG, SGECs and feedwater circuit)

Description: General risks that apply to the SG secondary side, SGECs, and secondary side steam and water systems. The dry air will be provided by and executed by an ESMSA contractor (doing Dry Air systems Risk 11854). Dry air connection points for the layup of multiple systems will be provided by an ESMSA contractor.

*[The risk title merely identifies systems and does not state an event or the context of an event. The risk description does not address an event. It states that some vague "general risks" apply. No cause that can be mitigated is stated. Any relevance for the provision of dry air is lost. Currently, there is no risk response strategy in the Risk Register.]*

<sup>3</sup> The examples were extracted from early January 2014 Risk Registers. They are illustrative of the Observation. However, these specific examples may be eliminated or modified as the DR team makes changes to the Registers.

**Table A1.2 Examples of Risk Register Entries that should be considered “Issues”<sup>3</sup>**

ID	Title	Description	Risk Response Strategy
11860	Valve and Valve Parts Delivery	The risk is that valve parts are not delivered on time for the required installation leading to schedule impacts.	-monitor work orders for parts holds. Expedite through materials/PE as required.
11143	Emergent scope or new knowledge impacts Project	The risk is that effort outside the RFR project or additional DSRs that once planned impacts RFR leading to extra refurbishment scope or rework. This may occur in the Definition, preparation and execution stages.	-Oversight Focus - Provide Adequate Prioritization, Follow DR Gated Process, Follow SRB process, Keep stakeholders aware of processes, Attend Scope Fidelity Meetings, Ensure DRAS's are completed where required / warranted.
11158	Contractor Ramp up too Slow - Definition	The risk is that the RFR Contractor takes too long to fully implement their plan leads to delays and thus impacting cost and schedule due to the delays.	-Weekly Meeting of Team Leads -Elevate to higher organizational levels in the event it continues -Integrated Baseline Schedule - OPG and Vendor -RFR Action ID 21
11866 <sup>4</sup>	Gate 1 Cost Assumption for Cold Water Flooding is incorrect due to vague scope	There was not a DSR cost associated with this DSR SI0290-5. The scope of work is vague in the DSR. Conceptual design has not been completed. A CBA is required after Conceptual design which has just been assigned to OSS Eng.	-Reevaluate cost for Gate 2 based on Conceptual design and CBA due in Nov 2013

<sup>4</sup> Risk 11866, as written, is an example of a “risk” that has already occurred (i.e. the cost assumption is incorrect).

**Table A1.3 Examples of Weak Risk Responses<sup>3</sup>**

ID	Title	Description	Risk Response Strategy	Assessment Comment
11060	Contractor damage to plant equipment	There is risk that the contractor may damage plant equipment resulting in unanticipated repairs.	-Article 2.16(e) and cost allocation table covers	Response appears to be limited to contract penalty upon contractor, with no equipment protection, no training, and no removal of susceptible equipment.
11232	TG Installation of Mechanical Side	The risk is that there is delays to critical path due to inexperienced trades/vendor staff during turbine reassembly.	-Oversight discovers that EPC or OEM is unable to acquire skilled craft labour specific to turbine generator work as planned, or oversight discovers quality issues in installation due to lack of skilled or experienced labour. Delay to critical path. Retain experienced staff to perform the work.	Response seems to be more of a trigger statement that the risk has been realized, rather than a risk mitigation. No consideration is given to establishing a plan for acquiring and training skilled craft or for providing qualified professional craft supervision.
639	Work that can be performed by contractor is limited by regulator	The risk is that the proposed new regulatory document on hours of work which will include casual construction trades workers will be onerous to implement and will limit the availability of construction trades workers for execution of Refurb.	-Within OPGN, the VP of Fleet O&M has the lead in addressing this concern. He is supported by DRAD, Human Resources and the Refurbishment VP of Execution.	Risk Response states responsibility, not mitigating actions.

### Appendix 3

#### Summary Table

Area	Observation No.	Comments	Change from Previous Assessment
Risk Register Reporting Limitations	1	Migration to SharePoint and Excel reporting tool have increased reporting functionality, but there are still limitations.	↑
Lack of Clarity of Risk Titles and Descriptions	2	Significant progress has been made by the DR Team over the last several months on this issue. Current TCD to complete updating of all risks is January 31, 2014.	↑
Numerous Entries in the Risk Registers are not "Risks", but Business as Usual "Issues"	3	Significant progress has been made by the DR Team over the last several months on this issue. Current TCD to complete updating of all risks is January 31, 2014.	↑
Lack of Appropriate Risk Management Program Staffing & Leadership	4	There will be some significant changes to the Risk Group in January. This issue will have to be monitored once the new team is in place.	↔
Risk Management Program Training	5	There has been a concerted effort to implement formal training by the Risk Group	↑
Missing Identification of "Opportunities"	6	There has been no effort to identify opportunities within the risk register.	↔
Weak Risk Responses	7	The key to a successful Risk Management Program (and overall project success) includes the thoughtful development of effective Risk Responses (e.g. mitigating) actions. Based solely on a review of the Risk Registers, many risk responses appear to be perfunctory and ineffective.	↑
Long Periods Between Risk Register Reviews and Updates	8	Efforts to update all risks has caused more frequent review of risks. OPG should consider having ROC meetings more frequently than once per quarter.	↑
Risk Oversight Committee Effectiveness	9	Three meetings have been held to date and, as the risk program matures, they are progressively improving by focusing less on process and more on substance.	↑
Lack of Trending and Other High-Level Metrics	10	There was no change as of the end of December. However, we have noted some improvement in this area in the last couple of weeks. New metrics are being developed, but not yet rolled out.	↔

Legend: ↑ = improved, compared to Project Assessment  
 ↓ = weaker, compared to Project Assessment  
 ↔ = no change, compared to Project Assessment  
 ↔ = no change

## **Report to Board of Directors**

### **Board Retreat**

**October 1-2, 2015**

**Darlington Nuclear Refurbishment Project**

**Burns & McDonnell  
Modus Strategic Solutions**

**October 1-2, 2015**

## I. Executive Summary

---

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") provide the following Report to the OPG Board of Directors ("BOD") regarding the status of the Darlington Nuclear Generating Station's Refurbishment Project ("Project" or "DR Project") as of September 21, 2015. Our main focus continues to be assessing the DR Team's development of the Release Quality Estimate ("RQE"). In this report, we provide the BOD with our view of the current status of RQE and the remaining gaps the DR Team intends to resolve with RQE prior to the next Board Meeting and a look-ahead to the DR Team's post-RQE activities that will be focused on for the preparation of the execution of Unit 2, the first refurbished unit at Darlington. BMCD/Modus will provide its full assessment of RQE as part of its report to the Darlington Refurbishment Committee ("DRC") for the November 12, 2015 meeting.

As part of our ongoing oversight of the DR Team's RQE activities, BMCD/Modus has monitored the development of the vendors' estimates for work, schedules and identification of risks. We have also monitored the DR Team's progress in developing its management team and its plan for Project execution, as well as the performance of key prerequisite "Campus Plan Projects" executed by OPG's Projects & Modifications ("P&M") organization. As we have previously noted, OPG's commitment to pre-planning the Refurbishment Project stems from OPG's strong desire to learn from and avoid the problems that have caused prior CANDU refurbishments to exceed their budgets and schedules. Notably, the DR Team has been committed from the start of the Project's Definition Phase to:

- Complete scoping and design engineering well in advance of execution, which the team recently accomplished;
- Utilize the Recommended Practices provided by the Association for the Advancement of Cost Engineering International ("AACEi") in order to develop detailed sub-project (or "bundle") cost estimates in a progressive manner based on the design, scope and planning as they matured;
- Provide intense focus on the Retube and Feeder Replacement ("RFR") project with the SNC Lavalin/Aecon joint venture ("SNC/Aecon"), including: carefully studying the reasons for the difficulties experienced by past CANDU refurbishments; building and utilizing a full-scale mock-up of the Darlington Units' reactors in order to refine the schedule of the longest portion of the Project's critical path, and; engage in detailed vetting of SNC/Aecon's estimate, which is the largest single cost component in the DR Project; and
- Build over \$1B in new facilities needed to support the construction and future operation of the refurbished Darlington station. Some of these required pre-requisite projects, including the Heavy Water Storage Facility ("D20 Storage"), Auxiliary Heating Steam ("AHS") building and Emergency Power Generator 3 ("EPG 3"), have experienced ongoing difficulties that the DR Team is addressing. These projects have also provided lessons learned and operational experience ("OPEX") that will be valuable as the Project moves forward into the DR Project's Execution Phase.

While the DR Project remains a complex and difficult project to execute, the planning effort in the Definition Phase has demonstrably reduced the risk of performance, which should result in greater predictability and therefore reduced overall cost relative to other CANDU refurbishments.

All of the DR Team's efforts during the Definition Phase will culminate in the RQE. Should the BOD accept the RQE, it will form the DR Project's control budget against which the DR Team's progress will be measured for the full, four-unit duration of the DR Project. Additionally, the DR Team is planning to further refine the RQE and present a unit-specific cost estimate and execution schedule to the BOD prior to each unit's execution. The first such estimate for Unit 2 will be presented in August 2016 on the basis of the DR Team's "Readiness to Execute" initiative with each subsequent unitized budget and schedule building upon the experience of the prior units.

From the outset of our engagement, BMCD/Modus has focused on the process the DR Team has employed for developing RQE, rather than on specific cost and schedule outputs. In our experience, the proper cost and schedule will emerge from

a robust process. Our last report expressed concerns over the DR Team's ability to meet the revised RQE submission date, which has subsequently been restored to the original November 12<sup>th</sup> milestone. Over the last month, the RQE-related components have matured and the DR Team's leadership team (Nuclear Projects Executive Team, or "NPET"), consisting of the SVP of Nuclear Projects, the VP of Execution and their direct reports, has conducted initial vetting sessions focused on each sub-project (referred to also as "bundles"), the OPG functional support groups and the Project's risks and contingency. With more time available, NPET can now complete these initial reviews and perform more detailed vetting of the integrated RQE package.

A major concern in completing RQE was the delay to the preparation of SNC/Aecon's Class 2 Estimate, which arrived 2 ½ months later than planned. SNC/Aecon presented its Class 2 estimate totalling \$2.713B, and a schedule upon which OPG can base its critical path for each of the four refurbishment units. The estimate review culminated with a three-month long detailed vetting process in which subject matter experts from SNC/Aecon and OPG collaboratively challenged each work series and component of cost. The resultant estimate and schedule is, importantly, based on the mutual confidence of both teams and will result in a lessening of the overall project duration and associated burn rates. SNC/Aecon's Class 2 estimate should significantly strengthen the Project's outlook. The parties must now conclude the target price negotiations based upon this estimate.

While the majority of the vendor estimates have now been received, there is important work remaining for RQE that will require the entire DR Team's focus until it is completed. The major priorities for completing the work are:

- (1) **Quality Assurance** – providing sufficient basis and support to the elements of RQE and closing remaining challenge items;
- (2) **Integration** – now that the individual estimate components are substantially complete, the NPET plans to engage in more integrated reviews of contingency, risk, schedule and the like;
- (3) **Campus Plan Projects** – while not a large cost item, the DR Team needs to shore up the schedule, costs and fully identify and effectively manage remaining risks so that there is confidence the key pre-requisite projects (D20 Storage, EPG 3) will not threaten Refurbishment; and
- (4) **Readiness to Execute Planning** – the DR Team needs to finalize and test its processes for the Execution Phase, optimize its team, complete and vet the integrated Level 3 Execution schedule and develop the Unit 2 estimate.

BMCD/Modus believes that given ample time, the DR Team is capable of providing the Project's RQE with an appropriate level of confidence that would be commensurate with AACEI's recommended practice for a megaproject's control budget. The next 4-6 weeks will be challenging and there is a great deal of work left for the DR Team to do. Our next report will evaluate the basis for RQE and the associated critical path schedule in more detail.

## II. DR Project RQE Overview—Status

In our last report to the DRC, we expressed concern that the DR Team would have difficulty completing its RQE activities by the revised October 1-2 date. Subsequently, the original schedule for BOD presentation in November has been restored which should result in a more complete estimate for RQE. Since our last report, the following major developments contributing to RQE have occurred:

- SNC/Aecon met its revised date for submitting its Class 2 Estimate, detailed schedule and agreed risk register. We discuss some of the key points regarding this submission below.

- The DR Team has provided its NPET leadership team with bundle and sub-bundle-specific reports that summarize the bases of estimates, scope, schedule, risks and other details. These initial reports provided a good basis for NPET to begin its reviews but the meetings that were held for their discussion resulted in a significant number of questions, gaps and open items that need resolution before further vetting. NPET also initiated further vetting of the DR Team's functional groups, which makeup approximately 22% of the Project's expected cost. These vetting sessions netted similar challenges that the DR Team is currently addressing.
- An initial "snapshot" was taken of the DR Project's contingency for NPET's vetting. NPET issued a number of challenges based on this presentation that the Project Teams and the risk team are endeavoring to resolve, including another full review of the formulation of the Project's critical path.
- SNC/Aecon has issued its revised schedule and cost estimate for D20 Storage, and the DR Team engaged in a lengthy vetting session with SNC/Aecon to validate its basis. SNC/Aecon should be able to produce meaningful metrics showing its progress on D20 Storage in the near future. In the meantime, P&M has put additional resources over the foundation work for D20 Storage, which must be completed by Ellis Don prior to SNC/Aecon's mobilization, though this work continues to lag 1-2 months behind schedule and has encountered additional field performance problems.

#### A. Summary of RQE Status

The DR Team has significant work remaining to complete the RQE effort. In general, we see the cost elements for the direct work of RQE coming together. The EPC base cost estimate for each of the bundles has been reviewed by the estimating team, and most of the estimates have been classified pursuant to the AACEi recommended guidelines. Additionally, the risk and contingency development process is robust and if followed with sound inputs, should provide the necessary basis for contingency amounts needed for RQE. However, a "bounding" estimate for RQE must still be supported by the documentation describing the assumptions that have been made as the basis for RQE as an upper limit.

BMCD/Modus sees the following as major focus areas for the DR Team to complete RQE:

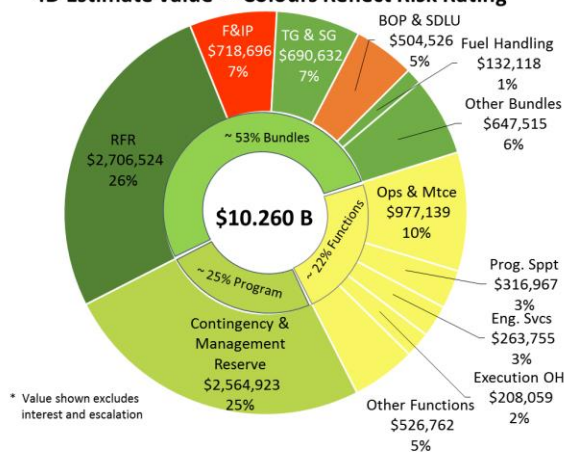

- **Quality Assurance:** The DR Team needs to tie-up the remaining loose ends in the RQE submission and perform sufficient quality assurance to show that there are no major data fidelity issues in the submitted product. The DR Team intends to lock-down all submissions on September 30<sup>th</sup> and devote time to addressing quality issues and ensuring that the documentation necessary to support RQE is in place and that all numbers can be tied to their source. In addition, the RFR team must review SNC/Aecon's full Class 2 submission that OPG received on September 18, 2015 to ensure that there are no significant gaps or unresolved issues prior to locking down the target price. In a product of this size, there will certainly be some quality issues that will not reasonably be caught prior to RQE, though the goal should be to limit those issues to technical compliance needed for maintaining the Project's controls suite and not have issues that would be considered material to the BOD's decision.
- **Integrated Reviews:** NPET and key stakeholders to the Project need to engage in multiple additional integrated reviews, particularly regarding the Project's overall schedule and basis for contingency in order to fully vet the interrelationships in the work windows for each bundle in the integrated schedule and to identify and evaluate risks that affect multiple bundles and functions. Moreover, NPET needs the time and opportunity to vet the result of any changes (i.e. has the change been properly captured in all of the documentation? Does a change impact other bundles? If a risk is accepted, is there a downstream schedule impact?). Doing so ensures the impact of each successive review/challenge stage has been properly captured. The functions also will require additional attention, with focus on ensuring that the proper division of responsibilities between and among the project teams and functions is well established. We have provided some specific recommendations for these reviews to the team. One gap for RQE that should be noted is the relative immaturity of the BOP and Shut-Down/Lay-Up estimates and schedules. Due to their relative size, this gap can be accommodated through the use of adequate

risk identification and contingency, but there is significant integration work that will need to occur post-RQE with the Project's execution schedule in order to incorporate these work packages once they have been developed.

- **Campus Plan:** While the dollars involved in the Campus Plan Projects do not necessarily have a significant impact to the total amount of RQE, the fact that the schedules (D20 Storage, EPG 3 and potentially others) are a risk for breaker open of Unit 2, and these projects' paths continue to be uncertain, is drawing attention away from readiness for Refurbishment. The P&M team needs to ramp up its management of the contractors' performance in order to obtain realistic and achievable schedules and cost estimates. The recent award of the D20 Storage completion to SNC/Aecon is a positive step but the rest of the work needs similar focus.
- **Readiness to Execute Planning:** As noted, the DR Team intends to use the period from RQE to Unit 2's breaker open in October 2016 to further mature its planning, estimates and schedules, and present a Class 2 unitized estimate and detailed execution-ready schedule in 3Q 2016. The team has developed a "Readiness to Execute" ("RTE") plan through which it will test multiple processes and improvement initiatives with smaller BOP and Shut-Down/Lay-Up packages that need to be performed prior to Unit 2's breaker open. We have recommended to the DR Team that the RTE plan needs a detailed, resource-loaded schedule of activities with assigned owners who are held accountable for their portion of the product. This type of schedule was not deployed for RQE and we believe its absence has resulted in some churn, delays and uncertainty within the Project Team that must be avoided in the future. It will be particularly important for the DR Team to incorporate into the RTE schedule resolving the remaining open issues with the BOP and Shut-Down/Lay-Up work packages as they are completed by the vendors, which will involve closely tracking the vendors' progress.

A major component of the RTE plan will be developing and finalizing the Unit 2 execution schedule with all work at the appropriate level of detail. The DR Team's original goal of having the full execution schedule completed for RQE was not met, though the critical path durations and windows for non-critical path work have been well-defined. We believe that the DR Team has done sufficient schedule work to support RQE, though considerable work remains before the schedule is execution-ready. BMCD/Modus will be providing detailed assessments of the schedule development as the work progresses.

**4D Estimate Value\* - Colours Reflect Risk Rating**

As with our prior reports, the adjacent **Figure 1** shows the 4d cost estimate values for each of the major sub-projects, or bundles, as well as the OPG Functional costs and contingency (in \$2010). We will update this figure to reflect the RQE-based values and percentages of the Project's cost in our next report.

**Figure 1** also provides context for the relative size and percentage of each component of RQE. The three largest parts of RQE are: RFR (26%); OPG Functions (22%); and Contingency and Management Reserve (25%). BOP and Shut-Down/Lay-Up (5%), the Turbine Generator project (6%) and Campus Plan Projects (7%) are next largest slices of the budget. Below, we provide a brief update regarding the status of each of the major inputs to RQE.

## B. Status of RQE Components

### **Detailed Engineering:**

One of the lessons learned from other refurbishment and other nuclear megaprojects is that the control budget should be based upon completed engineering in order to mitigate the risk of unreliable and uncertain initial cost estimates. OPG met its commitment to substantially complete detailed engineering for Refurbishment well in advance (15 months) of Unit 2's breaker open date. However, there is still considerable engineering effort left for the DR Project throughout the

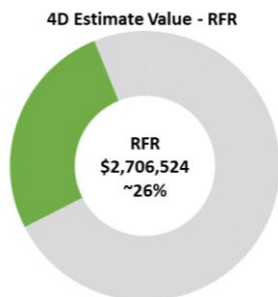

program's lifecycle, including:

- **Procurement Engineering and Support** – the DR Team must ensure that components the vendors are purchasing meet the intent of the specifications and resolve any sourcing issues;
- **Field Engineering** – issues will inevitably arise in the field that will require engineering to address and evaluate;
- **Construction Work Planning** - the development of Construction Work Packages needs to involve engineering, and the Construction Work Packages' accuracy will depend on proper insertion in the "Issued for Construction" engineering plans, those details needed for construction; and
- **Configuration Management** – OPG's engineering team will need to ensure that the work in the field is captured in the plants' permanent documentation record.
- **Detail Engineering** – the engineering packages that were excluded from the Detailed Design Complete milestone, including the RWPB design, needs to be completed, and P&M projects require ongoing engineering support.

Currently, there are very few (less than 15%) of these future engineering tasks that are resource-loaded in the Project's integrated schedule. This needs to be addressed so that the OPG engineering team can be right-sized and critical work effort and milestones are properly assessed within the overall schedule. Moreover, engineering resources should be "projectized" so that the work is properly integrated in the work flow.

#### **Retube and Feeder Replacement:**

SNC/Aecon's Class 2 Estimate for RFR is the single largest input to RQE. Some notable highlights since our 3Q Report:

- The final estimate of \$2.713 B (2015\$) is based on mutually agreed upon project durations and schedule contingency, and encompasses 12.9M work hours, project management, supporting tasks, fee and all other costs.
- As we noted in our last report, the OPG and SNC/Aecon teams reviewing the details of the schedule were given targets (including contingency) for cost (\$2.6B) and schedule (1110 days). The "Rev 1." Submission was approximately \$110M more than the \$2.6B target and 28 days longer (for Unit 2) than the 1110 day target. However, the process utilized to reach these final estimates was robust, which should provide confidence in the level of accuracy.
- The final assessment of risk and contingency in the SNC/Aecon estimate was on the basis of lengthy technical and commercial discussions. The resulting 13.5% contingency totaling \$368M is largely based on durations and potential risk items that could impact the work. The OPG team successfully negotiated the SNC/Aecon risk register to omit risks that were considered "business as usual" in nature and agreed to shift a limited number of risks to OPG's responsibility in exchange for reasonable cost reductions.
- SNC/Aecon's Rev 1 Class 2 answered some key questions regarding its estimate of for Units 3, 1 and 4. After significant commercial discussion, the parties decided to leave as-is the successive unit improvement (from 1138 days on Unit 2 to 1095 days on Unit 4) in place. The agreed base duration (which does not include any contingency) of 847 days is identical for the last 3 units though contingency durations drop by 55 days across these units.
- There are some issues that have not been included in the SNC/Aecon's estimate which still need to be resolved totaling approximately \$12.5M per unit that the SNC/Aecon has not able to confirm in the Rev 1 estimate.
- While not part of the SNC/Aecon's Class 2 Estimate, completion of the Retube Waste Processing Building ("RWPB") estimate has been hampered to a certain extent by changes in the building's design basis and completion of engineering. These changes have caused the cost estimate to steadily increase by 20-30% to its current estimate of \$160 M. With the award of D20 Storage to SNC/Aecon, there should be some economies of scale that could be

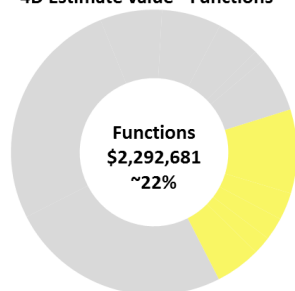

achieved that have not, as yet, been quantified.

The DR Team is in the process of finalizing the target price negotiations around SNC/Aecon's Class 2 estimate. SNC/Aecon has resubmitted a full Rev.1 version of the Class 2 Estimate concurrent with the preparation of this report; this submission will require review and vetting by OPG, though the DR Team is confident that the remaining issues with SNC/Aecon over their estimate are relatively small in nature and can be achieved in time to support the RQE submission.

### **Functional Groups:**

4D Estimate Value - Functions

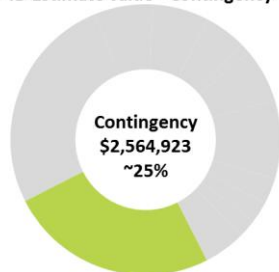

The DR Team's intention for RQE with the Functions is to develop a "bounding" estimate that incorporates all necessary staff, roles and responsibilities, and then examine the organization in the Readiness-to-Execute roll-out after RQE. The initial round of NPET reviews of the Functions revealed that there are still many open questions regarding roles, responsibilities and accountabilities that need to be resolved in order to determine whether the RQE estimate is inclusive of all potential costs. Management is also still committed to taking another looking at the integration and management of centre-led resources. While the DR Team's stated goal of developing a bounding estimate for functions should be possible, as these costs are completely in OPG's control, doing so will require additional work and focus by the team.

The final Functional resources and responsibilities will be determined through the RTE exercise.

### **Risk and Contingency:**

4D Estimate Value - Contingency

Contingency is the third largest category of costs in RQE behind RFR and the Functional Groups. In our last report, we noted that the process the DR Team was using for developing risk and contingency was robust, though we were concerned that the time for vetting the result for RQE would be condensed. Even with additional time, the team will need to stay focused to complete and document all of its risk-based assumptions for RQE.

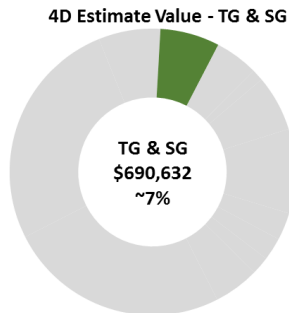

In order to get an idea of the total integrated contingency amount for RQE, the Risk team put together an "initial snapshot" for review by NPET. The initial snapshot of contingency was approximately \$1.9B (30% of remaining Estimate to Complete) derived from a combination of contingency for estimating and schedule uncertainties and the discrete risks identified by the DR Team and project bundle teams. Upon review, NPET requested additional vetting of the critical path durations and the contingency amounts set aside for schedule uncertainty, which made-up the largest portion of contingency. These vetting sessions that have been completed to date have resulted in an increased understanding of basis of those estimates and greater confidence in the contingency amounts. However, there is still a lot of remaining work that needs to be done in order to complete the contingency review.

In our view, the most critical remaining work on contingency includes:

- The NPET needs to analyze the results of integrating all the project bundles in order to see if there has been adequate identification of risks;
- The Project Teams should perform quality checking—including integration of the contingency input data for accuracy, reasonableness of all OPEX from past refurbishment projects and completeness – and finalize all descriptions and risk bases;
- Provide greater analysis of Project expected burn rates for more accurate monetization of potential schedule risks;
- OPG's experience with the Campus Plan Projects needs to be fully integrated and accounted;
- OPG's executive management needs to identify any potential management reserves that it may want to maintain over and above the DR Project's contingency.

Related to the last item, the DR Team and management should consider whether the existing processes for management reserve needs adjustment for the DR Project. Once set, the contingency can be carefully monitored and tracked against the original assumptions.

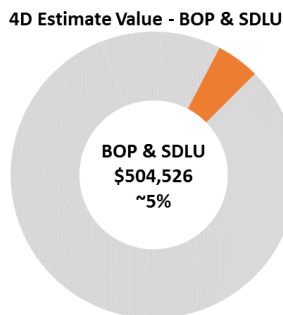

### **Turbine Generator and Steam Generator:**

OPG has accepted SNC/Aecon's Class 2 Estimate for the Turbine Generator for Unit 2, and Alstom has completed its detailed design. SNC/Aecon and Alstom have submitted their full estimates for the subsequent units, which are characterized as Class 3 in nature. OPG's approval of those detail estimates is pending final review, though a recently identified issue in finalizing the four-unit estimate has delayed approval.

As with RFR, the OPG and the SNC/Aecon project teams are integrated and working well together. The remaining risks at this time appear to center on completing the Construction Work Packages for execution and finalizing the Unit 3, 1 and 4 detailed schedule. In addition, the risk profile for the Project changes significantly with Unit 3, which will be the first of three units that will have a full replacement of the original TG controls during Refurbishment. This will be a first time evolution for OPG and will require significantly more planning than the limited scope for Unit 2. The risk profile of the subsequent units is being developed with this in mind, though the results still need to be fully vetted at the NPET level.

### **Balance of Plant/Shut Down-Lay-Up:**

At this time, the focus for BOP and Shut-Down/Lay-Up has been Phase I/II engineering and planning work. The DR Team completed detailed engineering for these projects in time for the August 15, 2015 milestone, with some minor exceptions. The DR Team has provided guidance to ES Fox to improve the development and quality of its related project estimates, and is in the process of characterizing the estimates it has received at this time. Approximately 50% of the BOP and Shut-Down/Lay-Up work estimates are in the Class 4/5 range, which increases the risk of estimating uncertainty for these projects. Moreover, the risk profile of these projects should reflect the risks from ESMSA vendor performance. While the BOP and Shut-Down/Lay-Up project teams have identified discrete risks related to vendor performance

NPET will need to decide if the associated contingency has been properly monetized in the DR Project's risk profile.

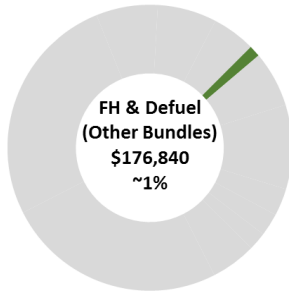

The initial round of NPET reviews of these projects produced a long list of items that require answers for RQE. These issues must be resolved along with further vetting of costs to increase the confidence level of the BOP and Shut-Down/Lay-Up projects. Notably, the DR Team needs to finalize the risk registers for these projects so that contingency can be properly attributed.

BOP and Shut-Down/Lay-Up will be under significant scrutiny once the DR Team's focus shifts to the RTE plan. ES Fox must continue its planning work with more detailed and mature estimates, execution schedules and development of Construction Work Packages. The DR Team has placed a challenging goal of having all of the BOP projects proceed to their Gate 3 between late November 2015 and January 2016. To do so, ES Fox will need to complete the detailed level 3 execution schedules, Class 2/3 estimates and Construction Work Packages to support these gates. The BOP team has set interim milestone dates with ES Fox for these deliverables which may be too aggressive for the DR Team to receive quality work product.

## Fuel Handling/Defueling:

4D Estimate Value - FH & Defuel

While the total cost estimate for Fuel Handling/Defueling constitutes only about 1% of the total cost of the DR Project, Defueling each of the Project's reactors is the first critical path activity. Furthermore, this is a first time evolution for Darlington. For these reasons, the planning, scheduling and risk mitigation of this work is extremely important. For these reasons, the planning, scheduling and risk mitigation of this work is extremely important. The DR Team has been focused on evaluating the past defueling evolutions at other CANDU plants and scrubbing the planned durations to the extent possible.

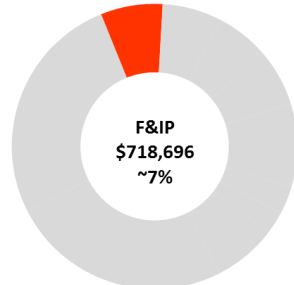

The current assessment from the Defueling team shows the best case for defueling is 90 days, the most likely is 113 days, and the 90% confidence level duration is 134 days. The Defueling

Project Team believes these same durations should be carried for all four units, as the learning curve for performing defuel will have limited value in improving performance over time. The team believes the 90 day best case is strictly a function of reactor physics and cannot be improved, while the worst case is based largely on the potential for equipment failure. In the course of deriving these point durations, the Defueling team has dispositioned OPEX from Bruce Power and Pickering and has consulted with its vendor, GE/Hitachi. The due diligence performed by the Defueling team has greatly improved the DR Team's understanding of this critical duration.

Regarding the Fuel Handling refurbishment, which is needed to support the Project's critical path, cold commissioning is ongoing for Fuel Handling system modifications and vendor progress has dramatically improved overall schedule performance. The recovery plan initiated in 2Q 2015 with GE/Hitachi has also allowed the team to advance plans for testing and training.

## Campus Plan Projects:

4D Estimate Value - F&IP

The most significant Campus Plan Projects – D20 Storage, Auxiliary Heating Steam ("AHS") building, and Emergency Power Generator 3 ("EPG3") – continue to be impacted by ongoing issues with poor initial estimates and scope definition, site conditions, contractor performance and OPG oversight.

- **D20 Storage** – Ellis Don is currently working on the foundation for D20 Storage and SNC/Aecon is preparing to complete the building and perform the mechanical, electrical, HVAC and steel/structural erection. Ellis Don's work must be substantially completed before SNC/Aecon can start its work. P&M has bifurcated its team to simultaneously focus on Ellis Don's progress and SNC/Aecon's preparation.

Ellis Don's progress in completing the foundation continues to lag behind schedule. The current schedule shows that Ellis Don is approximately 2 months behind schedule, depending on the outcome of the pour of a wall section that will require rework. The key November 30, 2015 date for turn-over from Ellis Don to SNC/Aecon is a milestone in the SNC/Aecon purchase order which will almost certainly be missed, so forecasting the extent of the delay and mitigating its impacts will be critical for 4Q 2015. The P&M team is currently focused on driving Ellis Don to completing by December 22, 2015 which will require acceleration and reversal of some of its performance trends. P&M has added new field personnel who have been charged with managing Ellis Don's progress and clearing issues. It will be essential for P&M to quickly ascertain the current performance trend so that the date for transfer of the site to SNC/Aecon can be more accurately forecasted.

In accordance with its purchase order, SNC/Aecon has prepared and revised its cost estimate and schedule. The OPG team has vetted the schedule, but still needs to complete its review on the estimate. The schedule shows SNC/Aecon's plan to meet all of the project's key milestones; however, as noted, this plan is based on a turn-over date from Ellis Don that is unlikely to be met. The SNC/Aecon team believes it will experience essentially a day-for-day push should the turnover date be missed. We have reviewed the schedule and it would appear that SNC/Aecon has limited opportunities to recover any upfront delays and will be impacted in some manner as long

as Ellis Don is working on the building. SNC/Aecon has agreed to provide OPG with the necessary metrics from which its progress can be more accurately forecast, which should result in increased confidence once SNC/Aecon has mobilized.

The current SNC/Aecon schedule is based on the D20 project meeting an interim deadline of June 28, 2016 to accept water from Unit 2 so that there is confidence that Refurbishment of Unit 2 can proceed. This deadline was initially set about 1 year ago when the DR Team reviewed the need for a contingency plan for D20 Storage in the event the building could not be completed. We have recommended to P&M and Refurbishment to re-examine this milestone if it is able to implement one of the alternatives it is currently reviewing for draining primary heat transport and moderator water from Unit 2. If an effective mitigation strategy can be implemented, it could allow deceleration of some of the work which could potentially reduce the overall risk of construction.

The OPG team is working on updating the D20 Storage project's risks for RQE and management tracking. We have recommended that P&M assess these risks based on Ellis Don's performance trends and using SNC/Aecon's estimate and schedule. P&M needs to evaluate whether there is sufficient contingency and should also revisit the business case to confirm whether the path chosen for execution is the most prudent course, and whether the team should update its options for temporary storage of Unit 2's heavy water in the event of further schedule delays.

- **AHS** – The AHS project, which has been subject to schedule delays and cost increases, is nearing completion though the Available for Service date has slipped to November 15, 2015 due to some commissioning and fit-up issues. P&M's cost projection remains unchanged at \$99.5M, which required a contingency draw of \$15M over the approved \$84.52M budget in 4d. AHS has provided multiple lessons learned that Refurbishment is taking into account in planning of BOP and Shut-Down/Lay-Up work with ES Fox.
- **EPG 3** – This project must be completed prior to Unit 2's breaker open. Construction has previously been impacted by issues with plant tie-ins and unforeseen underground conditions. Currently, the project is being further impacted by incomplete design, issues with rebar supply and installation, and lacks an acceptable schedule or cost estimate for the full execution phase. There are a number of engineering packages that require completion, though P&M has withheld approval pending substantiation of \$2.2M in charges. Some of these engineering packages involve modifications to the stock EPG unit so that it will operate in a similar fashion to the existing units.

ES Fox has prepared a "what-if" schedule that depicts its attempts to recover the time lost due to the various issues that have impacted the project. That schedule shows the building being available for service on August 12, 2016, which is only two months in advance of breaker open. ES Fox also submitted a revised "Estimate at Completion" in mid-June that was initially lacking sufficient back-up. The Estimating Team is now assisting P&M in the review of this estimate. In the meantime, the project missed its September 11, 2015 gate and without an approved schedule and cost estimate, the project is in danger of running out of authorized funds to continue. This project will require an immediate recovery in order to meet the breaker open need date for Refurbishment.

There are other projects within P&M that will require close monitoring as the DR Refurbishment draws nearer and the need to begin using these facilities becomes imminent.

**BMcD/Modus Recommendations  
2Q 2015 Report to NOC**

*Jos: Take sure all  
of these are in the  
RMO foot. Let me know  
if you need help.*

*Reg.*

*cc. Graeme*

• **RFR**

- In light of SNC/Aecon's delays delivering the completed Class 2 Estimate, DR Team should take necessary time to review, vet and comment, and should consider SNC/Aecon's delays as (at least) a "day for day delay"

• **Balance of Plant / Shut Down/Lay-up**

- DR Team should consider whether to carry contingency at the Program level due to contractor performance under ESMSA agreement
- DR Team should revisit roles and responsibilities for ESMSA contractors, as well as level of management oversight needed
- DR Team should take a risk based approach to estimating, scheduling and engineering completion related to Balance of Plant and Shut Down/Lay-up to balance the resources needed for assisting the ESMSA with pre-RQE tasks
- DR Team should develop lessons learned from AHS project for use in Refurbishment; focus should include estimating, scheduling, engineering progress, constructability planning and execution of work in field

• **RQE**

- Project Team should identify all risk mitigation plans that can be estimated in a deterministic fashion and ensure that these estimates are (1) properly developed; and (2) properly characterized within AACE guidance
- Data alignment and mapping of results of RQE should be given significant attention and be fully vetted to ensure that schedule and cost inputs into the Project's control budget are aligned and capable of cost comparison for the entire lifecycle of the Project.

• **Engineering**

- Requirements for replication engineering for Units 1,3 & 4 need to be fully vetted, and team should consider release of funds for long lead engineering needed to support subsequent units in RQE
- Engineering and the Project Teams need to develop a roles and responsibilities guideline for field engineering during the Execution Phase

• **Campus Plan Projects**

- P&M should review its change management process to ensure standards for contractors' proposed change authorizations ("PCA's") are robust and being adhered to by the contractors and project teams; in particular, vendors should be required to support changes emanated from OPG's direction or other allowable conditions under their contract, and not due to their own rework/mismanagement

## **Nuclear External Oversight Assessment of** **OPG Operating Experience & Lessons Learned Practices and Procedures**

### **Objective and Scope**

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") have performed an assessment of OPG's Operating Experience and Lessons Learned Program (the "OPEX" program) for the Darlington Nuclear Refurbishment Project ("Project"). This assessment addresses the OPEX procedures, action tracking, training, management and overall execution of the OPEX Program. Our assessment measures both progress during this time as well as observations and recommendations for further improvement.

### **Period of Assessment**

August 2013 through June, 2014.

### **Overall Assessment Risk Score: MEDIUM**

### **Background and Methodology**

On August 13, 2013, BMCD/Modus presented its comprehensive Project Assessment Report based upon our review of the Project from February 25 through mid-July, 2013. An in-depth analysis of the OPEX Program was not performed at that time. However, during that report period, we did focus on the incorporation of OPEX/Lessons Learned into the Darlington Refurbishment ("DR") Definition Phase schedules, estimates processes and risk registers. We reported that an OPEX Program was established that is consistent with nuclear industry practices. We also noted several DR activities where OPEX and Lessons Learned could be improved, particularly with respect to tracking metrics and database software integration.

BMCD/Modus continued to review and assess the OPEX Program considering our initial observations and recommendations as well as overall performance and execution. Specifically, we have performed the following due diligence with respect to this assessment report:

### **Interviews of the following individuals:**

Ryan Smith, Manager (Acting), Refurbishment Project Infrastructure  
Joe Reid, Nuclear Refurbishment Section Manager OPEX & Lessons Learned  
Roy Brown, Nuclear Refurbishment RFR Project Manager  
Various RFR JV managers, in conjunction with the review of the RFO Class 3 Estimate

### **Attended the Following Meetings:**

### Overall Assessment:

In our August 2013 Project Assessment, BMCD/Modus identified the following issues with respect to the OPEX Lessons Learned Program:

- **Software Tools for OPEX and Lessons Learned Management Program:** The OPEX database was not fully integrated or cross referenced with the RADAR and AIDA databases. In addition, the software systems were cumbersome with limited capabilities. These issues reduce the database effectiveness as a management tool, cause inefficient use of personnel time, and can result in important OPEX and lessons learned issues to be lost, ineffectively tracked, or not executed. We also noted that the DR Team had not fully updated the AIDA databases, which further compromises their overall usefulness in tracking important action items.
- **OPEX Training:** We observed limitations of the training program and recommended that the DR Team consider developing and executing a comprehensive Risk, OPEX and AIDA training program. This training would foster an understanding and acceptance of the importance of these programs, stimulate proactive participation and encourage the identification of (Lessons Learned).
- **OPEX Action Tracking Metrics:** The Risk Management and associated programs (OPEX) had a less than desirable number of meaningful metrics to provide management with a sense of the maturity or fidelity of the underlying data and the DR Project's performance.
- **Execution and Tracking:** The DR Project's philosophy at that time appeared to be for the individual projects and departments to perform the majority of Risk Management (OPEX) duties and related work, while the central Risk (OPEX) Group serves only an administrative, support and oversight role. This created a condition that risk (OPEX) management was viewed as a collateral duty of project or

department personnel, which diluted and diminished the attention focused on risk (OPEX) management efforts, given other duties of such entities. In addition, the available software tools (addressed above) limited effective and efficient tracking and management of Lessons Learned action items.

- **Processes and Procedures.** OPG's processes and procedures were in some cases conflicting and repetitive. We recommended that OPG consider a strategic review and consolidation of redundant procedures, and optimization of the process map.

Since the August 2013 Project Assessment, the DR Team has continued to develop and implement the OPEX program. Meaningful improvements have been initiated that address matters such as:

- **Dedicated Lessons Learned Personnel:** The DR Team now has a dedicated OPEX manager. The team tasked with implementing the OPEX program has a lot of enthusiasm and has been able to make significant progress in a short period of time.
- **Communication of potential OPEX and Lessons Learned items:** Identification and communication of external OPEX has improved. This will become increasingly important to inform forthcoming activities, such as the release quality estimate, final schedules and execution phase processes.
- **Training:** An OPEX training program was initiated at the beginning of 2014 and has addressed topics such as capturing and reporting OPEX, utilizing the new OPEX website, and identifying Lessons Learned.
- **Tracking metrics:** An initial set of tracking metrics have been deployed. These focus primarily on communicating and dispositioning OPEX.
- **OPEX procedures consolidation and clarification:** The key DR OPEX Procedure, "Processing Operating Experience and Key Lesson Learned" (N-MAN-00120-10001), has been advanced to Revision 002. It now reasonably clarifies and consolidates DR OPEX process requirements. In addition, an DR OPEX website has been established in SharePoint. This serves as a convenient access portal for OPEX related information and material.
- **Coordination with the Corrective Action Program:** Monthly OPEX metrics and Lessons Learned Report are now being addressed in Corrective Action Review Board (CARB) meetings. Beginning 3Q 2014, quarterly CARB meetings will extend an additional 30 minutes to address details of the OPEX Program.

Overall, the DR Team has a clear appreciation for the value of OPEX and has significantly considered Lessons Learned in numerous aspects of the Definition Phase organization and planning processes. However, complete implementation and refinement of the above improvements is necessary to ensure that Lessons Learned are efficiently generated and addressed throughout the life of the Project. To that end, an OPEX/Lessons Learned Strategic Plan is under development, which is expected to advocate specific actions for continuous improvement of the OPEX program. The assessment observations listed below and discussed herein reflect matters where improvements have been initiated as well as matters that still need to be addressed.

Observation 1: Limitations of Reporting and Tracking Software

Observation 2: Internal OPEX identification

Observation 3: Action Tracking and Management

Observation 4: OPEX and Lessons Learned Metrics

Issues identified in these Observations may result in relevant OPEX or Lessons Learned to be missed causing avoidable project impact to occur.

## **OBSERVATIONS**

#	Observations	Risk Rating	Recommendations	Management Action Plan
1	<p><b>Limitations of Reporting and Tracking software:</b></p> <p>Databases used for documenting and tracking OPEX/Lessons Learned items and their associated implementing actions are still not integrated. The lack of cross referencing between these databases creates difficulty in tracking Lessons Learned descriptions to their respective actions items (and vice versa). This encumbers management's ability to review the combined data sets and to oversee the timely performance of required actions. Failing to effectively define or execute the prescribed actions may cause preventable problems with the Project performance.</p>	MEDIUM	<ul style="list-style-type: none"> <li>• Expedite interfacing of the SharePoint OPEX and Lessons Learned databases with related databases that document and track relevant actions (e.g. AIDA, Risk Register). Hyperlinks to action items that connect OPEX and Lessons Learned descriptions with related responses and action activities would facilitate understanding and management of how each Lesson Learned is intended to be addressed.</li> <li>• Ensure that all cross references are accurately identified and properly mapped in the initial software launch and that future interfaces are automatically incorporated.</li> <li>• Ensure that end users have appropriate input to the development of the software tool.</li> </ul>	

#	Observations	Risk Rating	Recommendations	Management Action Plan
2	<p><b>Internal OPEX identification:</b></p> <p>Currently, the process is in place for disseminating and evaluating OPEX; and for developing Lessons Learned implementation plans. However, more needs to be done to stimulate the generation of OPEX from within the various projects and departments; and to communicate items to others outside the initiating group.</p> <p>The DR Team has developed a strong and effective culture that has drawn upon OPEX lessons learned for the Definition Phase of the Refurbishment program. Appropriately, most of that OPEX has come from sources external to the Project. As the Refurbishment Program matures, positive and negative experiences will be generated. If properly captured, communicated and addressed, these internal experiences can guide subsequent Project activities.</p> <p>This will be particularly true between successive unit refurbishments. Much of the valuable OPEX and Lessons Learned (both positive and negative) will be derived from the day-to-day management of the contractors. At this time, it appears that lessons learned are generated only as a result of a significant negative event, such as the recent Campus Plan experience. We do note that the OPEX Team has developed guidance for capturing internal Lessons Learned and has commenced some training activities. Success in this critical area is going to depend on the entire team's awareness of this guidance and their proactive identification and communication of relevant lessons learned.</p>	MEDIUM	<ul style="list-style-type: none"> <li>• Proceed with the planned training regarding Internal OPEX and Lessons Learned generation and communication. Ensure the training has appropriate focus on the value proposition of proper OPEX identification. This may help motivate team members to identify OPEX.</li> <li>• Work with vendors to disseminate their relevant OPEX and Lessons Learned throughout the Project.</li> <li>• Increase visibility of the current metric that tracks the "Monthly Total of Internal DR OPEX/Lessons Learned Submissions", as well as its trend.</li> <li>• Consider providing proactive management encouragement of internal OPEX/Lessons Learned Identification.</li> </ul>	

#	Observations	Risk Rating	Recommendations	Management Action Plan
3	<p><b>Action Tracking and Management</b></p> <p>OPG has set up an Actions, Issues, Decisions, and Key Assumptions database called AIDA. The intent of this database is to track, review and manage actions and document issues, decisions and assumptions—though “significant” decisions and assumptions have to be further documented through additional processes such as Decision Record and Analysis Summary (DRAS) Form, N-FORM-11390, and the Key Assumption Identification Form, N-FORM-11394.</p> <p>The AIDA Actions Database includes activities intended to address lessons learned. In general, the AIDA database has a large number of entries, many of which that have not been actively managed. We found a significant number of old entries that have not been updated. This is true for OPEX related entries as well as for non-OPEX actions. Due dates have passed, but status updates have not been made, and many of items that have been closed lack adequate closure notes.</p> <p>The condition of the database suggests that many action items are loaded and then forgotten. Obviously, the purpose of an OPEX/Lessons Learned program is defeated if actions to address the lessons are not performed.</p>	MEDIUM	<p><i>The below recommendations should be considered for all AIDA actions, whether OPEX related or not.</i></p> <ul style="list-style-type: none"> <li>• Identify and assign responsible parties to refresh the AIDA Actions database, ensuring that entries are still relevant, responsible parties are accurately identified, actions are clear and “actionable”, and due dates are appropriate.</li> <li>• Institute a process to periodically review the entire actions database, especially overdue actions; and to hold responsible parties accountable.</li> <li>• The question of whether OPG has adequately integrated the lessons learned and OPEX from other, similar refurbishment projects will be a topic of interest for the public and OPG’s shareholder. It possible that OPG will have to articulately convey these efforts on an on-going basis. There is clear evidence DR Team has actively sought out and implemented OPEX from these projects. However, OPG’s responses to similar-project OPEX and Lessons Learned is disaggregated throughout its databases or other project documentation. OPG should consider the best way to pull together in a single document or database this information in order to effectively communicate and relay its efforts to publically, particularly of known significant issues that caused delays and additional costs on other like-projects</li> </ul>	

#	Observations	Risk Rating	Recommendations	Management Action Plan
4	<p><b>OPEX and Lessons Learned Metrics</b></p> <p>The recently-created OPEX metrics are a good start. They focus on OPEX and Lessons Learned identification and disposition. Current metrics however do not track implementing actions.</p>	MEDIUM	<ul style="list-style-type: none"> <li>• Develop additional metrics that will track AIDA action items. Elements of these metrics may be temporary to monitor near-term database updating (e.g. “number of entries remaining to be reviewed and refreshed”); or more long term (e.g. “number of entries past due”, “number of entries past due by ‘Owner Organization’”). Lessons could be learned from the CARB metric process.</li> <li>• As time progresses, track trends of the individual metric data.</li> <li>• Establish a forum (or a designated individual in authority) to hold responsible parties accountable for executing their assigned actions and updating the database in a timely manner.</li> <li>• As the upgraded database software is developed, consider building in an automatic metrics generation feature.</li> </ul>	

## **Nuclear External Oversight Review of**

### **Darlington Refurbishment Schedule Management Practices and Procedures**

#### **Objective and Scope**

The Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company external oversight team ("BMcD/Modus") has performed an assessment with respect to OPG's Schedule Management Program for the Darlington Nuclear Refurbishment Project ("Project" or "DR Project"). This assessment addresses the DR Project's integrated master schedule development ("Project Schedule") and associated schedule management procedures, standards, training, and metrics. This assessment was conducted during the second, third, fourth quarters of 2013 and the first quarter of 2014 and includes ongoing progress monitoring during this period. Our assessment measures both progress of the development of the Project Schedule as well as observations and recommendations for further improvement regarding the execution of the Schedule Management Program.

#### **Period of Assessment**

The assessment was conducted during the second, third, fourth quarters of 2013 and the first quarter of 2014.

#### **Overall Assessment Risk Score: MEDIUM**

#### **Background and Methodology**

On August 13, 2013, BMcD/Modus presented its comprehensive Independent Project Assessment ("IPA") based upon our review of the Project from February 25 through mid-July, 2013. At that time, we reported our concerns regarding the manner in which the DR Project Team was developing the integrated Project Schedule for both the Definition and Execution Phases of the Project. We recommended several changes which have since been accepted and implemented by OPG. From mid-July of 2013 through the end of March 2014, BMcD/Modus continued to review and assess the maturation of the Project's Schedule Management Program. This Schedule Assessment Report ("Assessment") provides some additional observations and recommendations based upon this review. Specifically, we have performed the following due diligence with respect to this Assessment:

#### **Interviews of the following individuals:**

Gary Rose, Director, Planning and Controls  
Derek McAuley, Schedule Manager, Refurbishment Project Infrastructure  
Walt Arnsby, Outage Manager  
Robert Adley, Section Manager, Scheduling, Refurbishment Project Infrastructure  
Roy Brown, Project Manager, RFR  
Norman Chan, Section Manager, Reporting / Cost  
Todd Josefovski, Project Manager, Turbine Generator, Steam Generator  
Sorin Marinescu, Project Manager, Fuel Handling

- Various C & C Schedule Reports and Schedule Binders from August 2013 through March 2014

It is important to note that this Assessment is specific to the master schedule that is being developed for the planning and execution of the DR Project. Schedules for the Campus Plan Projects by the Projects and Modifications organization will be discussed in a separate assessment report.

**Summary of Assessment**

The DR Team has made significant strides in addressing the concerns and observations we raised at the time of our IPA. In particular, the DR Team has changed its Schedule Management Plan to call for OPG to manage a fully integrated Level 3 schedule as the Project's master schedule, this in place of a manually created Control & Coordination (C&C) Level 2 Schedule that merely depicts the aggregation of multiple detailed schedules. There were other observations regarding the Project Schedule in the IPA including:

- Resource work hour loading was generally absent from the contractor Level 3 schedule files;
- Unacceptable/inconsistent time frames allowed for contractor schedule delivery after contract award;
- Complete standards, processes and tools for establishing and maintaining industry best practices for scheduling did not exist;
- The DR Team had not defined or vetted its schedule float management process;
- Earned Value rules were built for “hands-off” oversight, not active project management;
- The DR Team was not requiring that the contractors build or progress their schedules in a manner that would allow OPG to identify risks or hold contractors accountable to planned productivity.

Since our IPA, the DR Project Controls team has revised the Schedule Management Program, culminating with the issuance of the Schedule Management Plan For Integrated Level 3 Execution (N-MAN-00120-1000-SCH-11) in April, 2014 (“Schedule Management Plan”). As part of this revision, the DR Team has launched a significant number of initiatives to address many of the identified issues. Some of the improvements we have noted include:

- The DR Senior Management Team now recognizes that in order to be successful, it will have to actively manage all of the DR contractors. For purposes of schedule management, this active management approach means making specific demands from the contractors with respect to schedule quality, requiring sufficient information that allows for real-time schedule progress and monitoring, and holding the contractors accountable for meeting schedule commitments. For example, the DR Team has required the RFR Contractor, a joint venture between SNC Lavalin Group, Inc. and Aecon Group Inc. (“SNC/Aecon”) to provide its planned work hour loading; measured progress (% complete), and actual hours expended. Moreover, SNC/Aecon is reporting on its schedule progress in all meetings with OPG, which the DR Team plans to use for all contractors.
- The DR Team is now developing and implementing a Level 3 integrated Project schedule, which is being updated by each contractor/work group on a monthly basis. The current schedule at any time during the Definition Phase reflects the level of development for each project bundle; as of this writing, the most complete of the bundle schedules is for the RFR project. The integrated Level 3 schedule will provide a detailed, logical finish to start sequence with the longest duration linked tasks creating the critical path. As the Execution Phase approaches and the Level 3 schedule matures, the contractors will be required to update their activities once a week.
- The DR Team is developing placeholder activities for detailed schedules not yet received from the DR contractors. We note that such placeholder schedules should include enough detail so that the Work Breakdown Structure (“WBS”), key milestones, integration points with other work groups, responsibility codes and any other necessary activity codes are in place and mature with the schedule. This allows for continued schedule development, as well as supporting other on-going front-end planning activities by the project managers.

The DR Team has acquired several licenses for the Acumen Fuse software that will help OPG assess the quality of the Project Schedule (and the various contractor schedules that are integrated into the Project Schedule). While these changes are positive in nature, there is still work to be done before the DR Team will fully resolve all the issues we noted in our IPA and subsequent reports. In particular, the change in project management style is a cultural issue that will have to be continuously stressed by senior management—not just with respect to the Schedule Management Plan, but with all aspects of the DR Project. Additionally, we believe that more can be done by the DR Team to identify and communicate the schedule requirements to the contractors.

Since issuing the IPA, we have continued to monitor the progress of the Project’s schedule development, and as a result, have documented some additional observations. If executed properly, the Schedule Management Plan should provide a good baseline that incorporates industry standard schedule management techniques. Our observations, identify gaps in the Schedule Management Plan as well as identify potential barriers to its

successful implementation and execution. The observations and associated recommendations discussed in this Report are as follows:

Observation 1: DR Team Requires Training in Schedule Management Practices

Observation 2: Continued Lack of Clarity for Contractor Schedule Requirements

Observation 3: Schedule Float Management Plan Needs Focus for the Execution Phase

Observation 4: Earned Value Implementation Needs Focus

Observation 5: Metrics for Monitoring Level 3 Schedule Development Performance Need Improvement

Observation 6: Refurbishment Scheduling Network Needs Attention

These observations and associated recommendations are set forth in the following table. All of the observations noted in this Assessment have been communicated to DR Project Controls. Once properly addressed, an integrated Execution Phase schedule can be used and maintained as an effective project management tool. Confidence in the earned value reporting and project forecasting should also increase.

## OBSERVATIONS/FINDINGS

#	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
1	<p><b>DR Team Requires Training in Schedule Management Practices:</b></p> <p>The team now sees themselves as a project management (rather than an “oversight”) organization and is putting programs in place to properly manage the Project’s contractors, including an integrated Level 3 Project Schedule.</p> <p>While this is a good start, we have observed some confusion among the rank and file as to what this change means. We have also observed a lack of understanding of basic schedule management techniques. Additionally, the DR Team will likely need different skills to fulfill management’s expectations, and it is likely that the team will need to acquire resources where gaps are currently apparent.</p>	LOW	<ul style="list-style-type: none"> <li>Identify and communicate the resource/skill set requirements needed to support development and management of the new Level 3 integrated schedule. Acquire the proper resources for positions not adequately staffed and relocate skillsets that are no longer necessary. The earlier these needs are provided in the business planning review effort, the more likely these needs will be approved.</li> <li>Provide training to the DR Team with respect to the newly-issued Schedule Management Plan for Integrated Level 3 Execution. This should also include senior management cultivating a “schedule culture” where knowledge of, and adherence to, the Project Schedule is paramount.</li> <li>Additionally, we would recommend that the various schedule procedures be merged into one document to facilitate use, updating, and to eliminate redundancy and potential conflicts. Those documents include: <ul style="list-style-type: none"> <li>Nuclear Projects Schedule Management N-MAN-00120-10001-SCH-R001 2013-05-14</li> <li>Nuclear Refurbishment Program\Project WBS Manual N-MAN-00120-10001-SCH-05</li> <li>Nuclear Refurbishment - Milestone Definition Framework N-MAN-00120-10001-SCH-06</li> <li>Nuclear Refurbishment Earned Value Management N-MAN-00120-10001-SCH-07</li> <li>Nuclear Projects Scheduling Requirements From EPC Contractors N-MAN-00120-10001-SCH-09</li> <li>Darlington Refurbishment: Schedule Management Plan For Integrated Level 3 Execution N-MAN-00120-1000-SCH-11</li> </ul> </li> </ul>	

	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
2	<p><b>Continued Lack of Clarity for Contractor Schedule Requirements:</b></p> <p>The level of detail now required by the DR Team from the various contractors for proper schedule management is currently neither standardized across all of the project bundles nor are contract requirements specific enough. The vendors were not given specific direction to deliver, among other things, fully resource-loaded (planned work hours) and actual work hours per vendor task alignment to the Level 3 schedules for preparing resource curves and earned value SPI and CPI calculations.</p> <p>We have observed that the DR Team has worked well with SNC/Aecon to identify the schedule requirements, and negotiated an agreement with the contractor to adhere to those requirements despite a lack of specific contractual language. Recently, some of the same requirements have been communicated to the other DR Project contractors, however, as of the end of the first Quarter of 2014, there is no written "protocol" or process document fully approved and accepted that identifies all of the needed requirements that can be used by all of the project managers. This is important to ensure that all of the contractors submit and maintain the same level of schedule detail and quality for each sub-project.</p>	HIGH	<ul style="list-style-type: none"> <li>• Develop a protocol document detailing the contractor scheduling requirements for some or all of the following areas: <ul style="list-style-type: none"> <li>• Roles and Accountabilities</li> <li>• Communication</li> <li>• Security</li> <li>• Hammock Structure</li> <li>• Integration Protocols</li> <li>• Asset Suite and p6 Rules</li> <li>• Coding Requirements</li> <li>• Reporting Requirements</li> <li>• Resource loading requirements</li> <li>• Schedule change control standards</li> <li>• Baseline, Updating, Status and Earned Value Rules</li> </ul> </li> <li>• Once developed, the protocol document should be agreed-to and executed by all of the Project's vendors. If possible, it should be made a contract document (i.e. through an executed project change directive or change order).</li> </ul>	

	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
3	<p><b>Schedule Float Management Plan Needs Focus for the Execution Phase:</b></p> <p>Currently, it is anticipated that OPG's activities will be on the DR Project's critical path (i.e. defueling and commissioning) for approximately 25% of the time while RFR will be on the critical path for the remainder of the Execution Phase. All of the other planned DR Project work is expected to fit within a 60% time window of the RFR critical path duration.</p> <p>The change to an integrated Level 3 schedule for planning the Execution Phase requires that both critical and non-critical area float is properly managed. In particular, it important to maintain sufficient float for non-critical path Balance of Plant work and potential discovery work on the first unit. As a result of this requirement, float management will be an increasingly important factor in developing the Execution Phase schedule.</p> <p>In order for OPG to effectively manage all of the DR Project work, it will need to have visibility to all DR Project float, first by phase and then cumulatively. It does not appear to us that there is widespread understanding or consensus on managing the float on non-critical path project schedules within these phases.</p>	MEDIUM	<ul style="list-style-type: none"> <li>The DR Team needs to reach consensus on Project phase definitions, management of Project phase float (including non-critical work), overall project float and management of contractor float by the various project teams. These standards should be documented in the appropriate DR Project manuals (N-Man level documents).</li> <li>The term "Negative Float" needs to be defined consistently in the schedule manuals along with the standard methodologies for resolving Negative Float on a project-by-project basis. Because Negative Float is generally considered unacceptable, its' visibility should spur some action by the DR Team such as development of a recovery plan, mitigation strategies, lessons learned, etc.</li> <li>The DR Team should revisit the implementation requirements for each of the project bundles and evaluate the best overall float management strategy for the DR Project. All stakeholders including Darlington Plant Operations should be included. Specific milestones and assumptions for the team's overall conclusions need to be well documented. .</li> <li>The Project should perform a backwards pass analysis of the Execution Phase schedule when enough of the schedule's detail has been developed, which should determine whether float rules or allocation need adjustment.. Once again all appropriate stakeholders need to be included in these reviews. The first reviews could be performed at a higher level to develop familiarity with the schedule for those not involved in the day to day planning process.</li> <li>The final Execution Phase schedule needs to be developed with the 60% limitation in mind for BOP work and appropriate contingency for discovery work.</li> </ul>	

	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
4	<p><b>Earned Value Implementation Needs Focus:</b></p> <p>The DR Project Controls team has not yet provided a complete prescriptive program of earned value techniques, rules of credit and reporting requirements.</p> <p>The Project Controls group has put a significant amount of effort into creating a system that utilizes Proliance and the Microsoft Business Intelligence reporting software to perform earned value analysis. While this program should provide (once working) a check methodology for the financial performance of level of effort and indirect tasks where the units being measured are consistent (ex: OPG FTE's per shift; equipment rentals per period, etc.), it will be challenged to measure differences between planned, actual and earned work hours per the Level 3 Schedule task alignment.</p> <p>Currently a number of manual adjustments are being made by Projects and Modifications and the DR Project teams to the existing reports to make earned value results align. The DR Team needs to focus on providing a comprehensive earned value plan that clearly defines how each category of work will be measured, who will measure it and how it will be reported. This will provide a consistent rule set for each team and a clear set of rules for earned value program deliverables to be</p>	HIGH	<ul style="list-style-type: none"> <li>• The DR Team should thoroughly vet each project's WBS to determine if improvements can be made prior to the Project maturing. These improvements include: Control account alignment with work estimates, cash flows and alignment with the schedule. The project teams should share OPEX regarding WBS alignment and scrubbing.</li> <li>• The DR Team should develop a complete set of rules for the contractors that are required for a reliable and consistent performance and earned value system. Currently, only the RFR Contractor is providing quantity-based performance forecasts.</li> <li>• The DR Team should develop a standard among the project teams for tracking and reporting commodity quantities estimated and actually installed per week; commodity unit rates and earned value analysis techniques. Some of the teams are already performing this analysis and their techniques need to be considered in the development process.</li> <li>• The DR Project Team will have to establish the commodities (quantities) for which it wishes to monitor unit rates and actual quantities installed vs. quantities estimated by task.</li> <li>• The earned value system needs to be based on planned, earned and actual work-hour progress. A comparison of earned vs. planned work hours can be extracted from Primavera P6 based on progression of earning rules. Each contractor should provide its actual work hours expended per the level 3 Schedule line item tasks so that CPI (productivity) can be measured at the appropriate level. . To this end, the DR Team will have to require that the contractors monitor their unit rates, track project actual work hours, and provide status weekly the earned value system and metrics. The RFR and JV team are already working on examples of these techniques and the models they develop</li> </ul>	

	<p>required from the contractors.</p> <p>Currently, OPG measures earned value in dollars per unit completed. This technique requires a documented control system for labor rates as well as commodity unit rates, which creates two control variables in a calculation that only has three components. Forecasting in this scenario becomes ambiguous and lacks credibility, leaving too much room for error in a truly managed project. These potential errors are compounded when rolled into the summary analysis of a control account that contains indirect, material and OPG costs in a dollar based analysis.</p>		<p>should be translated and utilized for performance measurement by the other Project Teams. Where contractors are reluctant to publicize unit rate performance, such can be calculated by the Project Teams once quantities installed and actual hours are reported.</p> <ul style="list-style-type: none"> <li>• The DR Team should perform a tabletop exercise testing the techniques with several different types of work and different contractors prior to completing the earned value system design, which will (1) identify other database functions that are not working properly, especially in the finance system from which the actuals for earned value are retrieved and task alignment; (2) provide a template for reporting key performance indicators; (3) allow for project management to determine the level of needed reporting.</li> <li>• Once the DR Team establishes the earned value system, it needs to finalize the proper reporting techniques to measure and provide visibility of the results. The DR management team needs a system founded on actionable information from which they can make timely and prudent decisions regarding the Project.</li> </ul>	
--	--	--	--	--

	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
5	<p><b>Metrics for Monitoring Level 3 Schedule Development Performance Need Improvement</b></p> <p>The Project Controls team is currently publishing a monthly schedule health chart with the C &amp; C Level 2 Schedule Report that provides some view of the ongoing Level 3 schedule development, and while this is a good start, further communication of the schedule's status would be beneficial.</p> <p>In addition, metrics that show ongoing schedule adherence could encourage greater overall awareness of the schedule and its importance to the Project. These metrics need to be published and the appropriate parties held accountable to meeting established standards and target schedule development dates. Metrics that show ongoing schedule adherence could help breed more overall awareness of the schedule and its importance to the Project.</p>	LOW	<ul style="list-style-type: none"> <li>• Project controls should develop a set of metrics to make visible the status of the development of the execution-phase schedule by the project teams and their respective contractors. These metrics should be straightforward and understandable, and aggregate all of the necessary data should be available in the Project Controls reporting database. The metrics should be objective in nature, and could include, as an example, the number of Level 3 schedules that are resource loaded, the number of projects now loaded into P6, schedule adherence and the like.</li> <li>• Project Controls should report a weekly status by project that includes: the number of tasks currently loaded into the Level 3 Schedule; the status of resource work hour loading of the schedule tasks, the status of key commodity quantities identified per project; and aggregate number of work hours per contractor. The number of Level 3 Schedule tasks reported per week could be broken down to show the number of Engineering tasks, Procurement tasks and Construction tasks.</li> </ul>	

	Observations/Findings	Risk Rating	Recommendations	Management Action Plan
6	<p><b>Refurbishment Scheduling Network Needs Attention:</b></p> <p>As part of Level 3 schedule development and the need for all project partners to operate in a common environment, contractors will need to acquire OPG network access in a timely manner. Currently OPG is experiencing delays in getting this accomplished. As part of this same effort, the user profiles need to be re-visited and potentially modified to match the access needs that are going to be required to execute in a fast paced outage environment once implementation begins. This is already an issue within the Projects and Modifications organization, giving the DR Team an opportunity to implement lessons learned.</p> <p>Also requiring attention is the OPG scheduling database configuration model needed for this complex project. Because the contractors will be required to manage and update their projects inside of the OPG database, their rules of operation will have to be established as early as possible. The number of projects and the controls needed on development schedules, what-ifs and the production environment require a rigid set of parameters to operate. Ownership hierarchy and user rights (profiles) have to be addressed as well. Once set, these all need to be integrally tested in tabletop reviews to ensure not only that the system functions properly but that all users know how to function in the system environment.</p>	MEDIUM	<ul style="list-style-type: none"> <li>Through working sessions with IT, the DR Team should prepare processes and procedural guidance that enables timely access to the OPG P6 schedule environment for required individuals.</li> <li>The team should review user profiles for adequacy with the contractors and IT and modify as needed, and develop operational parameters for control of the database environments by the proper personnel to ensure that changes can be made around the clock with minimal communication.</li> <li>Once all operational parameters have been set, the access process is timely, profiles are appropriate and an effective number of schedules have been provided in the database, users should perform tabletop exercises to properly test and vet any issues that may exist in the system. The proper stakeholders should be included in this process along with the proper OPG and contractor personnel. Several different projects and work scopes should be tested as well as all types of schedule change and update scenarios.</li> </ul>

### Update of BMcD/Modus Recommendations from Initial Project Assessment of August 2013

In our Initial Project Assessment of August 2013, BMcD/Modus summarized our conclusions and recommendations for the DR Project in a concluding table. Below, we have revisited these initial issues, risks and recommendations as a way for NOC to see the Project's progress since our Initial Assessment.

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
Scope	The DR Project's scope exceeds the commitments made to the BOD and Shareholder.	<ul style="list-style-type: none"> <li>Continue the process of reducing and optimizing the Project's scope.</li> <li>Reach a consensus on the scope as expeditiously and reasonably as possible so as to reduce the DR Team's work load and unneeded churn.</li> <li>Once the scope recommendations are adopted, the team will need to re-review the schedule to ensure the logic network is sound.</li> </ul>	<ul style="list-style-type: none"> <li>Scope reduction was accomplished via Blue Ribbon Panel review and results were incorporated in 4c Cost Estimate</li> <li>Scope remains an issue with BOP work – some of the design solutions proposed under ESMSA contracts have been excessively complex</li> <li>Options Review Board and strengthening of Gating process required to root-out remaining potential scope busts</li> <li>4d Cost Estimate may result in another round of required scope reductions</li> </ul>
Engineering	The schedule and pace of procurement related activities may not support a high-quality estimate at RQE.	<ul style="list-style-type: none"> <li>Review strategic considerations for procurement of remaining scope.</li> <li>Consider early "shoulder to shoulder" work by EPC design partners to expedite the start of detailed engineering and constructability reviews</li> <li>Review and prepare for likely RFIs from EPC vendors during the Planning and Assessing Phase.</li> </ul>	<ul style="list-style-type: none"> <li>Engineering for major bundles (RFR/Turbine Generator/Steam Generator/Fuel Handling) appear to be largely on course</li> <li>BOP start of detailed engineering is currently as much as 12 months behind plan which may impact accuracy of large portion of RQE</li> <li>Concerns expressed by BMcD/Modus in August 2013 regarding risks have largely materialized due to late award/start of BOP work</li> <li>Metrics for tracking engineering earned value need additional work and lack fidelity</li> <li>Constructability and Planning &amp; Assessing reviews are underway with RFR and Turbine Generator but lagging behind detailed engineering for BOP</li> </ul>

### Update of BMcD/Modus Recommendations from Initial Project Assessment of August 2013

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
Project Management	The Project oriented focus has created management silos that could make integrated program management difficult, resulting in contractor/owner interferences.	<ul style="list-style-type: none"> <li>As the Project matures and contracts with vendors are in place, the DR Team should increase the level of program integration.</li> <li>Address the fact that the Execution Phase may require individuals with different skills for OPG to effectively manage the contracts.</li> <li>Clarify reporting lines for matrixed Project Controls Personnel.</li> <li>Actively seek to assemble the Execution Phase team as soon as possible.</li> </ul>	<ul style="list-style-type: none"> <li>Project team development is progressing though with some notable alignment issues</li> <li>Refurbishment management for execution has been strengthened and “projectizing” of functions is progressing</li> <li>P&amp;M is undergoing a fourth leadership transition since July 2013 and stability and direction is urgently required</li> <li>Project Controls standardization across the entire DR Project is a work in progress and will require significant effort</li> </ul>
	The DR Team plans to implement a C&C Schedule at Level 2 for management which could create a number of coordination issues during the Execution Phase.	<ul style="list-style-type: none"> <li>Continue development of the C&amp;C Schedule through the Definition Phase and migrate to a fully integrated Level 3 schedule for the Execution Phase.</li> <li>Redirect the Project Controls Team’s efforts from the C&amp;C Schedule work to that of monitoring the developing Level 3 schedules from the contractors.</li> </ul>	<ul style="list-style-type: none"> <li>Refurbishment has corrected early potential faults in the schedule methodology and will utilize a Level 3 schedule for execution that is currently under development</li> <li>P&amp;M continues to populate the C&amp;C Schedule though the schedules for individual projects require updating and vetting once final scope and engineering is in place</li> </ul>
Schedule Development	The current schedule development depends on mutual agreement and acceptance of quality standards that owners typically demand, creating the risk that contractors will not comply.	<ul style="list-style-type: none"> <li>Clarify and include in commercial contracts OPG’s requirements for schedule development by the contractors.</li> </ul>	<ul style="list-style-type: none"> <li>DR Project chose not to update its contractual requirements though is seeking a high level of definition from contractors, who appear to be in compliance on Refurbishment but not Campus Plan</li> <li>We continue to recommend that OPG update its commercial arrangements for project controls information that will be propounded by the contractors at the time of finalizing the target price contracts for the Execution</li> </ul>

### Update of BMcD/Modus Recommendations from Initial Project Assessment of August 2013

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
Cost Management	The DR Team is inconsistently applying AACE guidelines and other processes and procedures central to the BOD's understanding of the underlying quality of project cost estimates.	<ul style="list-style-type: none"> <li>Consistently apply AACE guidelines, and where they are not (as in the RFR project estimates), the DR Team should seek to return to a condition of compliance.</li> </ul>	<ul style="list-style-type: none"> <li>AACE guidelines have been addressed in the continued development of the Project's estimates; contractors appear to have a better understanding of the nature of compliance with AACE standards</li> </ul>
	Revised planning assumptions for the 2014 Business Plan are currently being assessed—the business case for these assumptions is centered on the opportunity to reduce risk and increase positive outcome.	<ul style="list-style-type: none"> <li>Document and characterize the information for the BOD and consider meaningful reporting metrics.</li> <li>Should OPG adopt the revised assumptions, review commercial agreements so as to identify potential issues that could be impacted by the revised plan, as well as other issues within contracts that can be improved based on current OPEX.</li> <li>Review, capture and document Unit 2 OPEX information so maximum benefit is derived from this revised plan.</li> </ul>	<ul style="list-style-type: none"> <li>Documentation of major decisions still could be strengthened</li> <li>Discussion of key commercial agreements (in particular RFR) is pending though have been fully considered by DR Team management</li> <li>Metrics are still under review for effectiveness, as is earned value system</li> </ul>
	The 2015 Business Plan Budget review will likely repeat the process for the 2015 Business Plan in which the budget is refreshed.	<ul style="list-style-type: none"> <li>Perform a full project reforecast for the 2015 Business Plan in order to progress the project's cost estimates as far as possible before the date of the RQE.</li> <li>Such a reforecast will provide management with a detailed blueprint for all of the work needed to satisfy the RQE with information related to the budget that should match the DR Project's growing level of maturity.</li> </ul>	<ul style="list-style-type: none"> <li>4d Cost Estimate work is progressing, though we have concerns that it will fall short of a full Project reforecast. BMcD/Modus sees a risk in holding back on full examination of the underpinnings of the 4d Cost Estimate for certain cost centers that have not substantially matured since 4c Cost Estimate</li> <li>DR Team has appointed a manager of the RQE efforts, who should be engaged to find gaps in 4d Cost Estimate</li> </ul>

## Attachment B

### Update of BMcD/Modus Recommendations from Initial Project Assessment of August 2013

Initial Project Assessment – August 2013			3Q 2014
Issue	Risk/Opportunity	Recommendation	Update/Status
	Contingency calculations need closer alignment with the Risk Management Program.	<ul style="list-style-type: none"> <li>• Actions summarized above</li> <li>• Create a clear and repeatable process for calculating contingency at all levels and for all program participants.</li> </ul>	<ul style="list-style-type: none"> <li>• BMcD/Modus will be reviewing and vetting the process for contingency identification for 4d Cost Estimate</li> <li>• As the Project matures, our expectation is for the DR Team to move toward deterministic risk and contingency identification with monetization of specific known risks</li> </ul>
Management Processes	OPG's new processes and procedures are in some cases conflicting and repetitive.	<ul style="list-style-type: none"> <li>• Look at reducing the number and optimizing the process map.</li> </ul>	<ul style="list-style-type: none"> <li>• The Project Management Plan remains a work progress</li> <li>• BMcD/Modus recommended each project manager revise the bundle management plans to incorporate changes to management principles</li> </ul>
RFR	SNC/Aecon's Class 4 Estimate (by contractual design) does not monetize contingency nor will it until the date of the 2015 Class 2 Estimate; this fogs the budgeting process and could complicate target price negotiations with SNC/Aecon over risk identification.	<ul style="list-style-type: none"> <li>• Consider asking SNC/Aecon to monetize risks at a much earlier stage.</li> </ul>	<ul style="list-style-type: none"> <li>• SNC/Aecon has agreed to provide certain information related to risks for 4d Cost Estimate though the extent to which it is helpful has to be determined</li> </ul>
	The Class 4 Estimate represents perfect performance; thus, it will form the basis for comparison with actual results.	<ul style="list-style-type: none"> <li>• The DR Team needs to document and explain the nature of the Class 4 Estimate so that there is no such confusion.</li> </ul>	<ul style="list-style-type: none"> <li>• The difference between SNC/Aecon's Class 4 and Class 3 estimates needs to be properly characterized</li> <li>• The RFR team, with vetting from BMcD/Modus, provided a prescriptive estimating plan for the RFR Class 3 Estimate that clearly defines the deliverables.</li> </ul>
	Project maturation	<ul style="list-style-type: none"> <li>• The Class 3 Estimate</li> </ul>	<ul style="list-style-type: none"> <li>• The Class 3 Estimate addressed</li> </ul>

## Attachment B

**See Ex. D2-2-8, Attachment 2**

## **Independent Oversight Team - Assessment of OPG Scope Definition and Management Process**

### **Objective and Scope**

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") have performed an assessment with respect to OPG's scope definition and management process for the Darlington Nuclear Refurbishment Project ("DR Project" or "Project")<sup>1</sup>. With this assessment report, BMCD/Modus considers three questions related to the methodology of the scope identification effort as well as the ongoing scope management process: 1) whether the DR Project Team's scope strategy and scope identification effort is prudent, 2) whether the DR Project Team's recent scope review process is effective, and 3) whether there are effective processes and procedures in place to approve and control scope. Note that our review considered the scope definition process for the DR Project only, and not the Campus Plan Projects. However, some of our recommendations for scope control result from lessons learned from the Campus Plan Projects.

### **Period of Assessment**

This assessment was conducted during the fourth quarter of 2013 and the first quarter of 2014 and builds on prior BMCD/Modus reports. This assessment provides a measure of progress during this time as well as observations and recommendations for further improvement.

### **Overall Assessment Risk Rating: LOW**

### **Background and Methodology**

On August 13, 2013, BMCD/Modus presented its Initial Project Assessment Report ("Project Assessment") based upon our review of the DR Project from February 25 through mid-July, 2013. In our Project Assessment, we reported that between the years of 2009 and 2012, the Darlington Refurbishment Project Team's ("DR Team") overall cost estimate had grown significantly, on the order of approximately 20%. The majority of this cost estimate increase was due to scope growth resulting from OPG's initial scope definition methodology, which was premised on casting a "wide net" and identifying all of the possible scope that could be included in the DR Project.

In our Project Assessment, we noted that this was likely a net positive for the Project as many large capital projects are adversely impacted by late scope identification. We were also concerned with the rigor the DR Team was using to rationalize scope after it was initially considered. Thus, we wanted to gain a more robust understanding of the DR Team's continuing scope strategy and to determine how the current DR Project's scope has been defined and evaluated. To that end, it was necessary to delve into the scope drivers and supporting documents in order to characterize the DR Team's scope definition methodology. This assessment provides our opinion of the DR Team's scope strategy and the identification process.

Also at the time of writing our August 2013 Project Assessment, the DR Team's Scope Review Board ("SRB") was commencing an effort to finalize and align the scope for the DR Project. We

---

<sup>1</sup> This report considers the scope management practices specific to the DR Project and does not directly consider the scope definition processes and actions utilized by OPG's Projects & Modifications (P&M) in the development, planning and execution of the pre-requisite Facilities & Infrastructure projects, also known as the "Campus Plan Projects." BMCD/Modus will assess the scope management practices for the Campus Plan Projects in a separate, dedicated Assurance Report.

noted in our report that due to OPG's initial scope strategy, the next challenge for the DR Team would be to weed out scope that was not consistent with the original commitments to the OPG Board of Directors, the Shareholder, and the CNSC. From October 2013 through the end of January 2014, BMCD/Modus continued to monitor the DR Team's scope review process to determine its effectiveness in right-sizing the Project's scope. Whereas our Q4 2013 report provided an interim review, this assessment covers the outcome and closure of that process occurring through early 2014.

Finally, we wanted to understand whether the Project's processes in place today to approve and control scope were effective. Although we have touched on aspects of scope management in our prior reports, we have not provided a complete assessment until this time. In our Q4 2013 report, we discussed how the gate process was similar to those typically found in the industry but that execution within the process could be improved. To gain a complete picture of the scope management process, we attended a number of Gate meetings and reviewed several gate packages. We have engaged key team members in in-depth interviews and have reviewed a large sample of the documentation the DR Team developed and maintained through this process.

This assessment report covers the Refurbishment project scope and scope management processes and, although mentioned, does not directly address P&M's or the station's management processes; these will be addressed in future reports. Our assessment does not make a qualitative judgment regarding the nature of the Project's scope, only the DR Team's process for such assessment. Additionally, we have not fully assessed the change management process which will also be addressed in future reports.

### **Due Diligence**

To support this assessment, we performed the following due diligence:

#### **Interviewed the following individuals:**

Neil Mitchell, VP Refurbishment Engineering Controls

Brian Coulas, Director - Design Engineering

Walter Arnsby, Assistant Outage Manager

Cindy Sawyer, Section Manager - Outages

Gary Rose, Director - Planning and

Roy Martin, Director - Nuclear Safety

Paul Pasquet, Senior Vice President

Bill Bacon, Consultant

**Attended the following meetings:**

Various Scope Status monthly meetings between September 2013 and March 2014

Various Gate Review Board meetings between September 2013 and March 2014

Various Project and Program Status meetings between September 2013 and March 2014

**Reviewed the following documents:**

Darlington Refurbishment Project Charter – D-PCH-09701-10000-001

Darlington NGS Integrated Implementation Plan – NK38-REP-03680-10185-R000

CNSC RD-360 – Life Extension of Nuclear Power Plants

Darlington Scope Request Database, dated February 5, 2014

Darlington Nuclear Refurbishment - Scope Review - Closure Report – NK38-REP-09701-0467871-R000 LOF

Refurbishment Program Scope Management Plan – NK38-Plan-90701-10067-0002-R001

Darlington Nuclear Refurbishment Program Scope Control – NK38-INS-09701-10001-R005

Darlington Refurbishment Scope Strategy And Plan – NK38-PLAN-01060-10008-R001

Darlington NGS Refurbishment Project Reference Plan - Scope Definition – NK38-PLAN-01060-10003

Nuclear Projects Scoping Process – N-MAN-00120-10001-SCOPE-R000

Nuclear Projects Gated Process – N-MAN-00120-10001-GRB-R001

Nuclear Projects Records And Document Management

CNSC Correspondence Related to the Integrated Safety Review

Darlington Refurbishment Program – Program Scope Review Board – Terms of Reference – NK38-PLAN-09701-10003-R002

Gate Packages, including RFR, BOP, Turbine Generator, RFR Island Support Annex and D20 Building

HOS metrics included in the monthly Program Status Reports and presented at the Scope Status meetings

A variety of project progress reports

**Overall Assessment**

In our Project Assessment in August 2013, BMCD/Modus noted that OPG's methodology had cast a wide net in identifying all of the DR Project's potential scope. Our additional analysis of the underlying scope drivers generally confirms our Project Assessment's conclusions (see Observations 1 and 2 below) though expands on that initial review to examine how the scope was ultimately pared down. Our review showed that the DR Team has continued to refine this approach as the project progresses. For example, the DR Team performed several scope reduction efforts culminating in the Scope Review Board's latest scope reduction exercise completed in the first quarter of 2014. These earlier scope reviews included:

- An assessment performed in 2012 to determine the scope that could be removed from Refurbishment if OPG were willing to accept future outages extended by up to 150 days;
- A scope prioritization process performed in April, 2013 that identified scope items that could be removed from Refurbishment based upon their low level of importance; and,
- An assessment based upon operational past experience performed in July, 2013 that identified scope that could potentially be removed from Refurbishment scope.

These reviews were utilized as inputs to the DR Team's final assessment performed in late 2013 and completed in early 2014 during which the team evaluated each Darlington Scope Request (DSR) against four criteria and dispositioned them into one of eight categories. Four of these categories constitute scope to be

performed within the refurbishment and life extension windows and four of these categories represent scope that is not required or will be performed under the station OM&A, projects or capital spares budgets. This effort reduced the DR Project scope by 254 DSR's for a total estimated reduction of ~\$179M.

Coupled with the above scope reviews, we found that the initial scope identification effort was effective in identifying the universe of potential scope items while reducing unnecessary scope as the project progressed and matured. Further, our review showed that the scope approval process for the DR Project generally conforms to Construction Industry Institute recommended practices for front-end planning and incorporates a gated approval process, requiring greater levels of definition as time progresses. This is typical for large and complex projects; however, we believe that extra care should be taken in the gate review process to prevent a recurrence of scope growth as the project progresses toward the Release Quality Estimate (RQE). In addition to the gate process, the Health of Scope process has shown to be an effective scope monitoring tool, providing a good metric of the DR Project's progression of scope definition.

Overall, BMCD/Modus finds the DR Team has taken a balanced approach to the development of the DR Project scope. The initial scope identification effort incorporated scope beyond that of refurbishment and life extension, potentially increasing the budget and project complexity. However, to even this out, the DR Team has continuously monitored and repeatedly tested the included scope through scope reviews and de-scoping exercises. Additionally, the DR Team has monitored scope definition through the gate review process and Health of Scope (HOS) metrics. We believe the DR Team has struck an important balance between overly limiting scope (and risking scope growth during execution) and being overly-inclusive (and risking excessive project budgets).

The assessment Observations listed below and discussed herein reflect our overall opinions on certain topics as well as matters where improvements may need to be addressed or are already being implemented.

Observation 1: The DR Project Team's scope strategy was effective in identifying a wide range of potential scope.

Observation 2: The scope identification process was thorough and utilized a significant number of source documents to identify potential scope items.

Observation 3: The Scope Review Board needs a more challenging attitude in order to be effective in controlling scope.

Observation 4: The scope reviews performed on the project are not well documented and little formal project record exists related to their outcomes.

Observation 5: Despite the scope definition process being sound, the development of engineered solutions needs improvement.

#	Observations	Risk Rating	Recommendations	Management Action Plan
1	<p><b>The DR Project Team's scope strategy was effective in identifying a wide range of potential scope.</b></p> <p>The DR Team adopted a very conservative initial scope strategy in order to incorporate operating experience (OPEX) from Pickering, Wolsong, Pt. Lepreau, and other similar projects. Several of these projects saw large amounts of scope growth during the execution phase due to poor initial project definition. OPG's strategy was to identify this scope early on, in the definition phase, which led to significant scope growth from 2009 to 2012 and allowed some scope into the DR Project that would otherwise be excluded. We believe this strategy was prudent and will ultimately be beneficial in reducing the potential for scope growth during the execution phase.</p> <p>During the 2009 to 2012 period, the DR Team recognized that increased scope had the potential to jeopardize the DR Project by exceeding the OPG Board of Director's requirements and increasing the Project's complexity. To mitigate this risk and the potential cost and schedule impact of this extra scope, the DR Team completed several scope reviews to remove non-refurbishment related scope items. The scope reviews performed, culminating in the SRB's final scope review completed in early 2014, provided a forum for challenging the validity of the DR Project scope.</p>	None	<ul style="list-style-type: none"> <li>None.</li> </ul>	

#	Observation	Risk Rating	Recommendation	Management Action Plan
2	<p><b>The scope identification process was thorough and utilized a significant number of source documents to identify potential scope items.</b></p> <p>The DR Project Team used a significant number of sources to identify both the regulatory and non-regulatory driven scope.</p> <p>OPG's methodology has cast a wide net in identifying all of the DR Project's potential scope while its analysis of the underlying scope drivers has taken into consideration the many process frameworks that define the regulatory and non-regulatory Project scope. As a result, the DR Team and all of the stakeholders should be confident that the Darlington NGS scope needs have been properly addressed to satisfy the mandate of the project charter.</p>	None	<ul style="list-style-type: none"> <li>None</li> </ul>	

#	Observations	Risk Rating	Recommendations	Management Action Plan
3	<p><b>The Gate Review process needs a more challenging attitude in order to be effective in controlling scope.</b></p> <p>There are a number of processes in place that are intended to manage scope including the gate process. Our review of the gate process reveals some room for improvement.</p> <p>The scope reviews performed by the DR Team described in Observation No.1 took a much harder look at whether a scope item was truly required for refurbishment. The gate process appears to apply a much less critical eye towards challenging scope.</p> <p>Since 3Q 2014, the DR Team has made some improvements to the gate process. Leo Saagi, Director of Finance was added to the gate review board as a third-party reviewer. This addition should increase the level of scrutiny placed on project teams as they come to the gate meetings. Moreover, the DR Team has established two new controls: (1) the Options Review Board, which is an opportunity to challenge the method for accomplishing the work based on a more mature plan; and (2) Readiness Schedule review, which will impose outage-style readiness requirements as the work progresses to execution. Critical to both of these controls is timing; these reviews need to occur before detailed design and planning occur so that changes can be economically made.</p>	MEDIUM	<ul style="list-style-type: none"> <li>• Adopt a more challenging attitude in reviewing and approving gate packages.</li> <li>• As the Gate Review process evolves more to a readiness review for the remaining and approved scope, the focus should shift to the schedule and constructability of the identified scope.</li> <li>• The DR Project's planning efforts should borrow from RFR which has tested certain processes for planning, estimating, scheduling and identifying solutions for its work scope.</li> </ul>	

#	Observations	Risk Rating	Recommendations	Management Action Plan
4	<p><b>The scope reviews performed on the project are not well documented and little formal project record exists related to their outcomes.</b></p> <p>With the exception of the scope review completed in early 2014, we see little formal documentation that the prior reviews took place and the decisions made based upon those reviews.</p> <p>Additionally, any scope items that pose a potential risk of increasing scope, for example, items awaiting scope-defining inspections, should be clearly identified and tracked in a transparent way to limit the risk of surprises.</p>	LOW	<ul style="list-style-type: none"> <li>• OPG should formally document the output from the prior scope reviews to complete the project record for rate proceedings.</li> <li>• Track any remaining scope risks, including those resulting from future scope-defining inspections, in a transparent manner so that there are no surprises.</li> </ul>	

#	Observations	Risk Rating	Recommendations	Management Action Plan
5	<p><b>Despite the scope definition process being sound, the development of engineered solutions needs improvement:</b></p> <p>B&amp;McD Modus has evaluated the performance of the Facilities and Infrastructure (“F&amp;I” or “Campus Plan”) projects. The Campus Plan work provides important OPEX related to OPG’s utilization of the project management strategies developed for the DR Project. In particular, we have found that some of the scope growth in the Campus Plan projects was caused by the following:</p> <p>OPG’s design requirements often caused confusion, misalignment and very complicated solutions driven by the perceived need to over-design all components due to the fact Darlington is a nuclear facility. As an example, based on the guidance from the original MDP, the dehumidification of the turbine deck would have cost upwards of ten times more than OPG has spent in the past performing the same work on laid-up fossil units. In order to be rationally resolved, these issues needed to be identified and discussed with the vendors prior to the start of engineering.</p> <p>The performance specifications in some packages provided the vendors with limited guidance, and in such cases, vendors will usually take the most conservative route.</p> <p>OPG often relied on the vendors to suggest more creative solutions to their issues when OPG’s team knew the best (or preferred) course to take based upon</p>	MEDIUM	<p>We acknowledge that OPG has implemented the following:</p> <ul style="list-style-type: none"> <li>• OPG has recently implemented a revised strategy based upon the active management of the ESMSA engineering work. As this new approach takes root, the DR Team needs to examine the assumptions and engineered solutions for many of the Darlington Scope Requests (“DSRs”)</li> <li>• The DR Team Senior Leadership has initiated a new control, a monthly Options Review Board (“ORB”), the intent of which is to re-review the approaches the project teams are taking to determine if the means and methods in the plan are appropriate, cost effective and still required.</li> </ul> <p>These could both be very effective in combatting the engineering issues that have occurred to date causing unforeseen scope and budget increases. However, their effectiveness will rest in the execution. Therefore, we encourage OPG to perform a self assessment on these two items before the end of this year to determine whether tweaks need to be made.</p> <ul style="list-style-type: none"> <li>• OPG should also consider additional scrutiny of scope solutions when project estimates during engineering are trending upwards, including: <ul style="list-style-type: none"> <li>○ Developing a “Rough Order of Magnitude” (ROM) test – ROM estimates of the engineered solutions should progress as the scope definition progresses and if the ROM estimate exceeds predefined control limits, triggers a review of the considered solutions.</li> <li>○ Refreshing the view of net present value and/or other project selection criteria.</li> <li>○ Questioning whether scopes of work that are driven by regulatory requirements and have experienced significant estimate increases</li> </ul> </li> </ul>	

	<p>OPG's own operating history and culture. This was evident with the polar crane package inside the plant. OPG left it to the vendors to discern what was needed. The vendors decided to replace all of the cranes, even though OPG's team determined only refurbishment, not replacement, was required.</p>		<p>are still cost effective. If not, request relief from the CNSC.</p> <ul style="list-style-type: none"> <li>○ Review the lessons learned from scope creep that occurred with the F&amp;I projects to determine whether additional controls are necessary.</li> </ul>

<b>9. State of Readiness</b>	<b>33</b>

## **1. Minister Summary**

This report provides a quarterly review of trends, accomplishments and challenges related to the Darlington Nuclear refurbishment project.

### Changes from the Previous Quarter

The most significant changes from last quarter are:

- Art Rob replaced Terry Murphy as Vice President of the Projects & Modifications organization.
- The CNSC approved OPG's request for a one-year extension to the Darlington operating license to December 31, 2015. This extension results in a change in the milestone for the CNSC approval of the Integrated Implementation Plan (IIP) from December 31, 2014 to December 31, 2015. OPG is in discussion with the CNSC to ensure there is good alignment on the expectations for the IIP schedule and management of any changes to it.
- Work has started in the review of the individual work windows for the execution of the Unit 2 refurbishment outage. This work is identifying potential conflicts and sequencing issues for the development of the level 3 execution schedule.
- Recognition of the need to improve the performance by ESMSA contractors in the execution of the Campus Plan and Safety Improvement projects has been recognized by OPG senior management. Several actions are in progress.
- The Joint Venture successfully implemented a recovery plan for the design and manufacture of the prototype tooling. Although there are a remaining few tools to be delivered to the mock-up, they do not represent a barrier to the testing schedule at the mock-up.
- The draft 4d cost estimate calculated by the end of the quarter was within the bounding estimate of \$10B (including contingency and management reserve, but excluding interest and escalation). The final 4d estimate will be presented to the OPG Board in mid November. The realization of the assumptions and opportunities to close this variance will need to address through the Release Quality Estimate (RQE) process, which has a milestone date of October 15, 2015.

### Refurbishment Program Challenges

One objective of this oversight is to identify performance trends that require refurbishment management's attention to prevent the trends becoming significant issues. These are identified as Refurbishment Program Challenges. In general, refurbishment

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

management is aware of these performance trends. These challenges have been reviewed with OPG refurbishment management, responses with specific actions will be developed and managed by refurbishment management, and this report will monitor the effectiveness of the implementation of these actions until the challenge is closed. This process will be followed for future refurbishment program challenges that are identified.

The current refurbishment program challenges are:

- The initial inputs provided by the individual projects and functions resulted in a total cost that exceeded the business case value of \$10B. Refurbishment management took actions to challenge these inputs, resulting in the 4d estimate remaining within the \$10B bounding estimate. The current challenge is for the sustainability of the assumptions and opportunities that are the basis for final 4d estimate during the development of the Release Quality Estimate (RQE).
- The management of engineering workload challenge is based on on-going weaknesses in the use of schedules and work down curves for the large amount of detailed design engineering work, the lack of monitoring effective quality indicators to identify and correct adverse performance trends, and benchmarking and management of the future cost of engineering.
- Without improvement in the contract management of the Campus Plan and Safety Improvement projects and ESMSA contractors, there is a challenge in having some of the projects completed when they are required. In addition, at least one of the ESMSA vendors has been awarded work for the Balance of Plant and Shutdown/Layup projects.

Conclusion on Readiness:

Although there are specific challenges that OPG needs to successfully overcome, they continue to have established the framework that is needed to be ready to successfully execute the refurbishment of the four Darlington units beginning with the first unit in October 2016. The basis for this conclusion is provided in Section 9.

A review (section 8) of the alignment of OPG's strategies, contracts, actions and decisions shows good alignment with the Ministry's principles for refurbishment that were described in the 2013 Long Term Energy Plan. The one gap area is the cooperation between the two nuclear operators. This will remain a gap until Bruce Power is further along in its planning for the refurbishment of its units.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**2. Purpose of Report**

In February, 2013 CALM Management Consulting, Inc (CALM) was retained to provide independent oversight of the Darlington Refurbishment Project on behalf of the Ministry of Energy (MOE). This agreement includes a monthly report to the MOE to identify progress in preparations for the refurbishment of the Darlington nuclear units as well as potential challenges to the successful planning and completion of the project. In this case, as with similar projects, success is defined as the preparation and execution of 100% of the correctly identified project scope safely, on schedule, within budget and with quality. The monthly reports include the following areas:

- Changes from Previous Month
- Accomplishments and Progress
- Darlington Nuclear Refurbishment Scorecard
- Basis for Scorecard Ratings
- Refurbishment Program Challenges

In addition to these routine monthly reports, it is beneficial to review performance trends and to provide insights into additional areas. This is accomplished through a quarterly report that, in addition to the contents of the monthly report, provides a review in the following areas:

- Status of the individual projects
- A review of the issues identified by the independent external oversight team that reports to the OPG Board
- Insights into the leadership team and the cultures which it is developing
- A review of the efforts to meet the principles that were provided in the ministry's 2013 Long Term Energy Plan
- A review of the overall state of readiness

It is the belief of the MOE's Independent Oversight Advisor that the importance of the Refurbishment Program Challenges that are identified in Section 5 deserve consideration by OPG Refurbishment management. It is the intention to identify such challenges when they represent an early trend rather than wait until they become a significant issue. It is recognized that management may be taking actions to address these challenges and there may only be small gaps. However, it is appropriate that the

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Minister of Energy is aware of the strategy and/or actions to address the identified challenges and that the effectiveness of actions be monitored until closure of the challenge.

**3. Darlington Nuclear Refurbishment Scorecard**

**Darlington Nuclear Refurbishment Scorecard – September 2014**

	Current Month	Previous Month	Trend	Notes
<b>Safety and Regulatory Approvals</b>				
Personnel Safety	✓✓	✓	→	Good safety performance within the ore projects and minor incidents in the Campus Plan projects.
Radiological Safety	✓	✓	→	
Regulatory Approvals	✓	✗	→	Work in progress with CNSC to manage the IIP commitments
<b>Project Management Controls</b>				
Risk Management	✓	✓	→	
Scope Management	✓	✓	→	
Cost Management	✗	✗	→	Addressed high initial inputs to 4d estimate
Milestone Compliance	✗	✗	→	
Release Quality Estimate	✓	✓	→	
<b>Project Execution</b>				
Time Management	✓	✗	→	
R&FR Project Performance – Cost, Schedule & Quality	✓	✗	→	
Campus Plan Performance – Cost, Schedule & Quality	✗✗	✗✗	→	Schedules and cost estimates revised
Safety Improvement Opportunities Performance – Cost, Schedule & Quality	✗✗	✗✗	→	Schedules and cost estimates revised

**Confidential Advice to the Minister of Energy**

	<b>Current Month</b>	<b>Previous Month</b>	<b>Trend</b>	<b>Notes</b>
Engineering Performance – Cost, Schedule & Quality	xx	xx	→	Lack of work down curves and quality metrics.
Contractor Management	x	x	↗	Contracts issued for BoP and some S/D and Layup projects
Quality Management	✓	x	↗	Action plan in place.
Procurement Management	✓	✓	→	
Resource Management	x	x	→	
<b>Learning and Oversight</b>				
Operating Experience & Corrective Action	✓	✓	→	
Oversight	x	x	→	Missed opportunity to identify degrading trends before being a significant issue.

### 3.2 Basis for Scorecard Ratings

#### Personnel Safety - WHITE

Field performance in the R&FR project and manufacturing of refurbishment core project materials shows good safety performance. There has been a number of low level safety events associated with Campus Plan projects work. There has been a trend of incidents associated with vehicles.

#### Radiological Protection - WHITE

After the completion of the D1411 outage, there has been limited refurbishment work in radiological areas. The project is moving towards the development of ALARA plans for individual projects (such as R&FR) and the development of the RP services strategy. ALARA plans are likely 6 months to a year before they can be reviewed.

#### Regulatory Approvals – WHITE

Although acceptance of the Integrated Implementation Plan (IIP) will not occur until the renewal of the Darlington Nuclear Operating license for a 14 year period, scheduled for the end of 2015. In the meantime, there is indication that CNSC staff is in agreement

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

with the content of the IIP, and OPG is working with CNSC staff to develop and implement a process for the management of changes to the IIP; either in terms of content or schedule. The other regulatory risk is the current court challenge to the Refurbishment project's Environmental Assessment.

**Risk Management – WHITE**

The Risk Management program has identified Nuclear Refurbishment Key Risk Areas, which are the result of an aggregate analysis of the risk registry. They have management sponsors who are responsible to monitor the progress of the individual risks associated the area for the development and implementation of mitigating action plans. These Key Risk Areas are:

- Availability/Retention of Key Staff (identified as a Red risk)
- Cost and Estimating Management (identified as a Red risk)
- Completion of Unit 2 Prerequisites (identified as a Yellow risk)
- Regulatory Approvals (identified as a Yellow risk)
- Fuel Handling Reliability (identified as a Yellow risk)
- Vendor Default/Continuity Planning (identified as a Yellow risk)
- Integrated Schedule Development (identified as a Yellow risk)
- Timely Procurement of Materials (identified as a Yellow risk)
- Completion of Engineering (identified as a Yellow risk)
- Integration with External Organizations (identified as a Yellow risk)

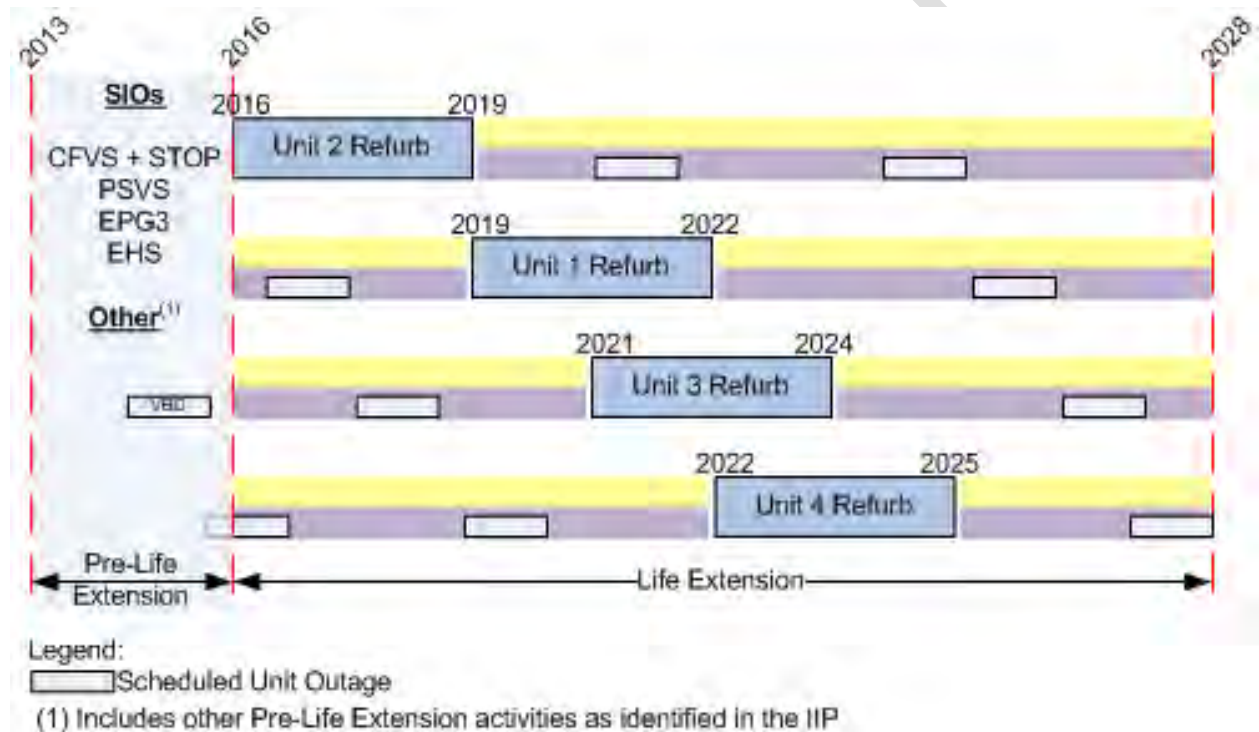

This identification of the Key Risk Areas is a positive step towards managing the known risks associated with the refurbishment program. The challenge now will be the necessary focus on these key risk areas to ensure that the post mitigation risk is low or acceptable with allocated contingency funding. With quarterly Risk Oversight Committee meetings, there would be 8 remaining senior management touches of these key risks to ensure they are sufficiently addressed prior to the start of the Unit 2 refurbishment outage.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Scope Management - WHITE

The current strategy for the scope of the refurbishment outage relies strongly on the concept of 'life extension window'. The life extension window starts with the shutdown of the first refurbishment unit (Unit 2) and ends upon the completion of the first planned outage after the refurbishment of the last unit (Unit 4). This represents the twelve-year period from 2016 to 2028. This provides two planned outages, in addition to the refurbishment outage, to complete each unit's life extension commitments. The strategy is shown below.

This strategy is appropriate to maintain control scope of the actual refurbishment outage. On-going monitoring of any scope creep into the refurbishment outage will identify any deterioration of this performance. The currently approved dates and durations for each unit are summarized in the following table.

Unit	Start of Refurbishment Outage	Finish of Refurbishment Outage	Duration (months)	Overlap on Previous Unit
D2	October 2016	September 2019	36	
D1	October 2019	September 2022	36	0
D3	March 2021	February 2024	36	19
D4	October 2022	September 2025	36	17
Total Unit Outage Months (4 units)			144	
Refurbishment Window			108	

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Cost Management - YELLOW

Project to date total cost as of the end of August 2014 is \$1,284M, which is \$100M below the plan of \$1,348M. The \$100M below plan consists of delays in Balance of Plant, Shutdown, Layup & Services projects, and delays in progressing design engineering for Campus Plan and Safety Improvement projects.

Refurbishment management conducted challenges of the initial inputs from project bundles and functions through September to obtain a 4d estimate that is within the bounding cost estimate provided in the original 2009 business case. This estimate will be presented to the OPG Board in November 2014.

For the next year, the focus on costs for refurbishment management is to maintain cost estimates within the 4d estimate while completing the Release Quality Estimate by the milestone of October 15, 2015.

Cost challenges remains as one of the challenges for the refurbishment program, and thus more details are provided in Section 5, Most Significant Challenges.

Milestone Compliance – YELLOW

There are a large number of milestones associated with the refurbishment project. Refurbishment has not identified a single subset that it monitors on a routine basis. The monthly performance report has identified multiple versions of milestones that represent different levels of importance. This report will monitor progress for specific milestones that are critical to the start of the first unit's refurbishment. These are related to the completion of the Release Quality Estimate in October 2015. In addition, general compliance with milestones will be reviewed. There was one RQE milestone date within this quarter, the completion of Modification Design Requirements. The milestone was met in Q4, 2013. On the other hand, there were several missed low level milestones associated with the Balance of Plant, Shutdown/Layup and Services projects. These were a result of the delays in implementing their contracting strategy.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

**Release Quality Estimate Milestones**

<b>Milestone</b>	<b>TCD</b>	<b>Status</b>
MDRs Complete	August 15, 2014	These were completed in Q4, 2013 with a live 0 value of about 15 as discovery work is identified.
U2 Work Order Scope Definition complete	October 15, 2014	
Program Health Review complete	October 15, 2014	
U2 Outage Planning Organization complete	October 15, 2014	
U2 Pre-Outage Metrics prepared	October 15, 2014	
U2 Long Lead Materials identified	November 15, 2014	
Release 4D Estimate completed	November 13, 2014	
Integrated Implementation Plan (IIP) approved by the CNSC	December 31, 2014	This milestone is tied to the renewal of the Darlington Operating License for an extended duration, which has been moved to December 31, 2015. This delay impacts this milestone.
U2 Level 1 Rev B execution schedule issued	April 15, 2015	U2 Level 1 Rev A execution plan has been issued and is being revised as more details on work execution are provided.
U2 Design complete	May 15, 2015	
Success Plan Presentation	July 15, 2015	
U2 Design Documents complete	August 15, 2015	
U2 Work Order Scope Freeze	October 15, 2015	Scope is frozen at the higher level of Scope forms.
RQE & Release 5 Release issued	October 15, 2015	

**Release Quality Estimate - WHITE**

A plan to develop the Release Quality Estimate has been developed, with critical milestones identified. These are provided in the section Milestone Compliance. An RQE Risk Workshop was held in June to identify potential risks to meeting the individual milestones and thus the overall RQE milestone. The 4d estimate has been drafted with finalization and presentation to the OPG Board by November 13, 2014.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Time Management - WHITE

Time management has improved during the third quarter. Improvements include:

- With the exception of the D<sub>2</sub>O Storage project, the Campus Plan and Safety Improvement projects have schedules that provide a reasonable level of confidence.
- The August refurbishment integrated performance report provides an overall schedule performance index (SPI) of 0.96 (which is a Green rating).
- The SPIs for the Campus Plan and Safety Improvement projects are provided as 0.95 (increased from 0.91) and 0.0.73 (an increase from 0.65), respectfully.
- Another indicator of completion of work is the number of work packages completed in a month versus the planned number. This has improved from 27 of 94 (29%) in July to 93 of 109 (49%).
- Work is continuing to refine the Level 1 execution plan for the Unit 2 refurbishment outage.

Re-tube & Feeder Replacement Project Performance - WHITE

In December 2013, the Joint Venture (JV) reported challenges in meeting its schedule for the design and production of prototype tooling. A recovery plan was developed and implemented to get back to acceptable performance by the end of September, 2014. The JV reported an SPI of 0.96 as of the end of August, 2014. By the end of September, there were 8 remaining tools out of more than 800 individual tools that were designed and manufactured. Each remaining tool has a recovery plan to completion and none of the remaining tools impacts critical path. This performance demonstrates R&FR's ability to identify an adverse trend before it becomes a crisis, work with the JV in the development of a recovery plan and have the JV successfully implement the plan.

The manufacturing of the major components is on schedule. To reduce the risk associated with single source for the pressure tubes and end fittings, OPG has had the JV obtain two manufactures for each of these major components. This will result in the manufacture of two sets of pressure tubes during the definition phase of the project. However, the second set will be used for the second refurbished unit.

Although progress is good on the R&FR project, there are several challenges that will need to be effectively addressed prior to the start of the Unit 2 refurbishment outage. These include:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The design and construction of the Retube Waste Processing Building (RWPB) are undergoing similar issues as the Campus Plan projects associated with the potential of underground services, as well as the management of potentially contaminated soil and water. The original target completion date of October 2016 is at risk and a revised date of January 2017 has been proposed. This new date provides very little buffer until the building will be needed to process fuel channels.
- The case for the R&FR mock-up was made on the opportunity it provides in the verification of tooling, the validation of associated procedures, optimizing the duration of each removal/install sequence, optimizing the radiological protection procedures and requirements, and the training of staff. The mock-up will need to be effectively used to realize this opportunity.
- The cost of the R&FR project represents a single largest contribution to the cost of the refurbishment Darlington Nuclear units. The JV's class 3 estimate resulted in an initial input into the 4d estimate significantly higher than the 4c estimate. This was reduced in for the 4d estimate through a number of opportunity assumptions. These need to be realized in the development of the JV's class 2 estimate and then the refurbishment's Release Quality Estimate.
- The R&FR project management organization conducts oversight of the deliverables associated the deliverables of the JV and its subcontractors. There is considerable oversight of the development of Class 2 estimate, including the OPG independent external oversight team and a third party hired by the JV. There currently is no plan to conduct a broad based assessment of the R&FR project's readiness for refurbishment. Given the operating experience from previous refurbishment projects and the critical nature of the project to the overall success of Darlington's the refurbishment, the benefit of such an assessment should be reviewed.

**Campus Plan Performance - RED**

The performance of the Campus Plan projects continues to be a significant challenge to OPG and is describe in details provided in section 5.

**Safety Improvement Opportunity (SIO) Projects Performance – RED**

The performance of the SIO projects continues to be a significant challenge to OPG and is describe in details provided in section 5.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Engineering Performance - RED

Management of the upcoming engineering workload continues to be a significant challenge, with details provided in Section 5.

Contractor Management - YELLOW

The main challenges related to Contractor Management are captured with the issues related to the Campus Plan and SIO projects, and Engineering Performance

The R&FR, Fuel Handling and Turbine Generator projects have a routine senior management steering committee meeting to review performance, as well as periodic executive oversight committee meetings that include the Chief Executive Officers of OPG and the contractors' companies.

Although contracts have been awarded, the remaining core projects have not sufficiently progressed to provide good insight of performance. The challenge will be to obtain improved performance using the ESMSA contractors as compared with the Campus Plan and SIO projects. [REDACTED]

[REDACTED] As a result, contractor management is rated Yellow.

Quality Management - WHITE

With the current EPC contracting strategy, OPG needs to develop the capability to manage the quality of work performed by its contractors. Refurbishment management's response to this need challenge is through a combination of project management activities, oversight activities by the project management team, supply chain procurement audits and assessments, and audits conducted by teams within the refurbishment organization and other OPG organizations. Through an Oversight Steering Committee, management has started the shift from a focus on doing oversight activities to their quality and lessons learned. This shift is too early to the performance improvement for the next performance level. There is currently an initiative to integrate the various quality management activities and risk management into a single platform in order to more easily implement the program and review the results.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Procurement Management – WHITE

With the exception of the radiation protection services contract, all major contracts have been awarded. The late awarding of the contracts for the Balance of Plant and Shutdown/Layup projects will challenge the vendors and OPG to meet the completion of engineering milestone. The long lead materials for the R&FR project have been ordered for Unit 2. The Supply Chain is engaged in assessing and monitoring the procurement process used by the main contractors of a project in selecting and managing subcontractors. The results of this process are evident in improvements in the quality management of subcontractors demonstrated by the R&FR Joint Venture and ESMSA contractor, ES Fox. In addition, the Supply Chain provides a monthly report on the status of quality issues and restrictions for each of the main vendors.

Resource Management - YELLOW

The availability/retention of key project staff is identified as one of the program's Key Risk Areas. It consists of:

- The possibility of limited skilled trade resources and supervision for project execution as its highest program risk. Currently the trades unions predict that there may be a total shortfall of approximately 50,000 personnel during the duration of the Darlington refurbishment. They have also identified poor progress in increasing the number of journeypersons in several trades. The current rate of individuals moving from the apprenticeship program to become is a journeyperson is 18% - 20%. It is recognized by all parties that this must improve. The Darlington VP of Execution is leading an initiative that includes the unions, OPG and its main contractors to address this potential shortfall.
- The potential that project leadership and specialized resources are not in place when required. There are a number of initiatives under development to reduce the significance of this risk. Refurbishment management is constrained its ability to implement the corporate policies and procedures that have been developed for operating facilities and small projects for this mega project.
- The possibility of an insufficient number of Authorized Staff for both station and refurbishment needs. This is being addressed through a combination of increased number of candidates for the associated positions as well as challenging the extent of the need for such staff once the unit is defueled and isolated through the bulkhead.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The potential of an insufficient number of qualified radiation protection coordinators to support project execution. This should be addressed through the awarding of the radiation protection services contract.

Corrective Action Program and Use of Operating Experience – WHITE

There have been no changes to the performance in the areas of the Corrective Action Program and Operating Experience. OPG has implemented several high level lessons learned from previous refurbishment projects; including Browns Ferry, Pickering A and Bruce A. These include the need for detailed planning and preparations prior to the start of execution of the project, the need for an integrated schedule, the project reporting to the Chief Executive Officer and the use of a reactor mock-up to verify re-tube tooling and train staff. In addition, there has been an improvement in the identification and distribution of lessons learned throughout the refurbishment organization. These are reviewed by the refurbishment leadership team in its monthly Corrective Action Review Board meeting. There is one area of operating experience for which the manner that the project has implemented is unclear. That area is the review and incorporation of appropriate Significant Operating Experience Reports and equivalent. These are reports issued by WANO (World Association of Nuclear Operators) and INPO (Institute of Nuclear Power Operations) related to significant adverse trends within the industry and they provide both the causes and required actions by individual plants.

The Corrective Action Program is in place and is being used. The majority of issues adverse to quality have been identified in the engineering activities. This is not surprising since engineering represents the most active function at this time. Although the refurbishment CAP program is good, the program implemented by the Projects and Modifications (P&M) organization has several known weaknesses. This should be a concern to the refurbishment organization since the Campus Plan and SIO projects are being managed by the P&M organization and thus conditions adverse to quality are managed through its CAP.

OPG Oversight – YELLOW

The effectiveness of the OPG independent external oversight team (BMcD/Modus) to identify adverse performance trends is adversely impacted by the a certain loss of independence resulting from their providing detailed advice, direction and support to the refurbishment management team.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**4. Accomplishments and Progress**

The following accomplishments were achieved during the third quarter:

1. Project to date total cost as of the end of August 2014 is \$1,284M, which is \$100M below the plan of \$1,348M. The \$100M below plan consists of delays in Balance of Plant, Shutdown, Layup & Services projects, and delays in progressing design engineering for Campus Plan and Safety Improvement projects. The project's CPI is 1.01 and SPI is 0.96. These values include the available information for the Campus Plan and safety Improvement Opportunity projects.
2. Work on the 4d estimate has resulted in the current value being within the bounding estimate of \$10B (2013\$). This estimate is an important input for the Release Quality Estimate (RQE). The sustainability of the 4d estimate as compared with the initial inputs from the project bundles and functions is essential for the successful development of the RQE.
3. Actions continue to address the performance issues related to the engineering and execution of the Campus Plan and Safety Improvement projects. The key actions include:
  - a) Collaboration between OPG and the ESMSA contractors in the conceptual design, schedule development, cost estimate and planning.
  - b) Resident engineers located with the ESMSA engineering contractors to provide real time resolution of questions and timely review and approval of engineering products.
  - c) Weekly progress meetings with senior ESMSA and OPG management. Currently this is focused on Black & McDonald projects, with ES Fox being started on July 16<sup>th</sup>. At that time each contractor will be reviewed every second week. This oversight will include a monthly CEO meeting with OPG and the two ESMSA contractors.
  - d) Cost estimates and level 3 schedules have been submitted for these projects, with the exception of the D<sub>2</sub>O storage building.
4. Work has started on the Joint Venture's class 2 estimate. The process and schedule have been established for its completion by the milestone of June 15, 2015.
5. Good progress was made in the development of a province-wide nuclear projects agreement with the EPSCA unions. All but two trade unions have agreed with

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

the agreement. The agreement will be for 32 years in order to cover OPG and Bruce projects and has a clause for no strikes and no lockouts.

6. Although Joint Venture did not complete 100% (over 96%) of the tooling prototypes by September 30, there progress in implementing the tooling recovery plan (starting in December 2013) is considered a successful demonstration of the ability to identify and respond to an adverse performance trend before it becomes a crisis.
7. The CNSC accepted the OPG request to extend the operating license for Darlington Nuclear Station for one year, extending it to December 2015.

**Refurbishment Program Challenges**

Throughout the life of refurbishment program specific challenges have been, and will be, identified that in the belief of the Independent Advisor to the Minister of Energy should have actions by OPG Refurbishment Management to address them, before they become significant issues. The currently identified Refurbishment Program are related to program cost controls, the management of engineering workload, and contractor management of the Campus Plan and Safety Improvement Opportunity projects.

Cost Challenge

The initial inputs provided by the individual projects and functions resulted in a total cost that exceeded the business case value of \$10B. Refurbishment management took actions to challenge these inputs, resulting in the 4d estimate remaining within the \$10B bounding estimate. The current challenge is for the sustainability of the assumptions and opportunities that are the basis for final 4d estimate during the development of the Release Quality Estimate (RQE).

The initial inputs provided for the 4d estimate resulted in a total project cost that was \$2.235B greater than the 4c estimate as of August 11, 2014). This was exclusive of interest and escalation. In response to this challenge, senior refurbishment management established an enhanced process to review the inputs in the development of the class 4d estimate. This included initial challenge meetings of each project and function by a mid-management team to identify potential savings. This was followed by further challenges by senior management on the assumptions and bases made for each function and project.

The process that was used to challenge the individual inputs from the projects and functions has resulted in a current 4d refurbishment program total cost of \$7,653M or \$7,500M (\$2013) plus contingency and management reserve, and excluding interest and escalation. This is within the \$10B bounding estimate. The sustainability of the basis of

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

the 4d cost estimate through the development of the Release Quality Estimate will be monitored by the MOE Independent Oversight Advisor through:

- Identify any additional changes to the 4d estimates for each of the project bundles and functions.
- Review refurbishment management's basis document 4d estimate for the project bundles and functions.
- Monitor the progress of the resulting actions to realize the assumptions and opportunities credited in the above basis.
- Monitor the progress of reviewing the generic issues (opportunities) identified by OPG through this challenge process and the progress of implementing any resulting beneficial actions.
- Monitor the incorporation of the basis document from the 4d estimate into the development of the Release Quality Estimate (RQE).

Management of Engineering Workload

The challenge associated with the management of the large engineering workload has been identified in monthly reports to the MOE since June 2013. This was based on several observations; including the underestimation of the scope of work for the Modification Design Requirements (N-2013-01589), the initial rejection of the Plant Condition Assessment submission to the CNSC because of quality issues (N-2013-20839), the start of construction of Campus Plan projects without design engineering being nearly completed, a cumbersome OPG review and approval process for engineering deliverables resulting in delays, increased costs and rework, several examples of design rework in Campus Plan and Safety Improvement projects, rework and cost increases in the re-tube waste containers resulting from errors in shielding calculations, and the delay in awarding contracts in the Shutdown/Layup and Balance of Plant contracts resulting in a challenge to meet the May 2015 milestone for the completion of engineering.

In Q2, 2014, refurbishment senior management recognized the issues related to engineering and initiated interim actions and a root cause investigation. The focus of the improvement actions is the implementation of a collaborative approach to planning (preliminary engineering, scope definition and cost/schedule estimations) and detailed design engineering. This has resulted in examples of shorter review cycles for approval of an engineering package by the Design Authority.

However, there has not been sufficient progress in the management of the engineering workload to remove the current challenge. The continuation of this challenge is based on on-going weaknesses in the management of engineering scheduled work to ensure

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

overall ability to complete the workload, monitoring quality of the engineering work to identify and correct adverse performance trends, and management of the cost of engineering.

Schedule Issues. There is currently no detailed schedule or work down curve at the individual detailed design engineering package level for the total engineering workload. This is required to manage the progress of engineering to meet the engineering complete milestone. The scope of engineering includes the core refurbishment projects, the Campus Plan projects and the Safety Improvement Opportunity projects. Revising detailed design engineering milestones for Campus Plan and SIO projects has been frequently done. The engineering complete forecast date for the Retube Waste Processing Building (RWPB) for the R&FR project is now July 15, 2015 versus the contract date of March 15, 2015. During September 5 of 15 engineering packages were completed for the Auxiliary Heating System project. Refurbishment management is working to develop a detailed engineering schedule and work down curve at the individual engineering change package level.

Quality Issues. Engineering is currently being conducted without effective quality performance indicators. Engineering errors are considered latent errors because they normally do not show the consequence until construction, commissioning or operations. That is the basis for the need for quality indicators that measure breakthrough events (such as rejection by the regulator or Design Authority), significant rework events, events involving cost increases and significant comments. Without effective quality indicators, senior management is not able to monitor the current performance and trend in this area. It is recognized that engineering is currently working on an indicator. During Q3, 2014 examples of quality issues have been identified that would be inputs into a quality indicator; including:

- D<sub>2</sub>O storage building project documents were submitted to the TSSA (regulator for pressure boundary approvals) that were immediately returned because signatures were not on the documents, some documents were missing and some assumptions were not verified by the component's manufacturer. (SCR N-2014-22003)
- An engineering design package for the D<sub>2</sub>O storage project had 47 deficiencies when submitted to OPG. This was considered a breakthrough event by the design agency's senior management. (N-2014-22018)
- After installation of a transformer associated with the RFRISA project it was identified that the grounding design may not be acceptable, since it may directly connect the station grounds to the site facilities grounds. (N-2014-

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

22830) Although identified as a potential issue in mid July, resolution has not been secured by August month end. A High Impact Team has been formed to determine the adequacy of the current design. If the design is found to be unacceptable, there will be considerable rework in both the design and construction of the facility. If it is found to be acceptable, it is a significant near miss.

- A package for the Containment Filtered Venting System (CFVS) was submitted to the TSSA regulator requesting a code relaxation. The package was returned because it was not complete.
- The design of STOP has to be reworked since it did not include the need for anchors within containment. This was discovered after the design was approved and installation work plans under development.

Cost Issues. Although each project has the budget for its engineering, there is no source for the aggregate cost of future engineering for the refurbishment project. Although not essential to manage the refurbishment project, the total cost estimate for engineering would be a useful benchmark comparison to determine value of the current engineering direction and opportunities to reduce overall engineering costs.

Contractor Management of the Campus Plan and Safety Improvement Projects

Without improvement in the contract management of the Campus Plan and Safety Improvement projects, there is a challenge in having some of the projects completed when they are required. This challenge has been identified in the monthly reports to the MOE since April 2013. For example, there is sufficient in the readiness of the Auxiliary Heating System project (current AFS of June 2, 2015) to be ready for the 2015 Vacuum Building Outage (April 2015) that the station has done sufficient refurbishment of the current Boiler House to credit it for the outage. There is sufficient uncertainty in the D<sub>2</sub>O Storage Building being completed by the start of the Unit 2 refurbishment outage (current completion date is January 2017) that senior refurbishment management has initiated contingency planning. Both of these represent prudent decisions. However, the fact that they are needed reinforces the challenge associated with managing the contractors associated with these projects.

OPG senior management has taken actions to address the ESMSA performance related to these projects. These include:

- A new VP of P&M organization was brought in July, 2014.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The performance review of the Campus Plan and Safety Improvement projects is intended to be included in the Refurbishment Project's monthly oversight meeting – although this has not been fully implemented.
- There are weekly oversight meetings between OPG senior project management and ESMSA contractors' senior management to review the status of the projects and issues that need to be resolved.
- There has been improvement in the conduct of the daily project meeting; although there is detailed execution schedule and integration is limited.
- The collaborative approach to planning and engineering has made inroads in shortening the duration for the review and approval process for engineering products. However, engineering delays are still very common and quality issues results in a fair amount (although not measured) of rework.
- Detailed schedules and cost estimates have recently been completed for the Campus Plan and Safety Improvement projects. The D<sub>2</sub>O storage project is still under review.

A common observation is that the CPI and SPI values produced by OPG in its monthly program monitoring are significantly different (and poorer performance) than those provided by the ESMSA contractors in the bi-weekly reports for the oversight meetings. Because of the large variance, they have CPI/SPI performance is not included in this report.

The need for improvement in the management and performance of the ESMSA contractors is needed to increase the confidence that the projects will be completed to the revised schedule and completed when required. In addition, work for the core refurbishment projects has been awarded to one of the ESMSA contractors as well as the Joint Venture (beyond the R&FR and Turbine Generator projects). Improved performance in the execution of the Campus Plan and Safety Improvement projects will provide some confidence in the planning and execution of these core refurbishment projects.

## **5. Status of Individual Projects**

The Darlington Refurbishment Program consists of seven individual projects and a number of infrastructure projects (also called Campus Plan) and Safety Improvement Opportunity projects:

- Re-tube and Feeder Replacement (RFR)
- Fuel Handling/Defueling (FH)
- Turbine Generator and Controls (TG)

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Steam Generator and Auxiliary Systems (SG)
- Balance of Plant (BOP)
- Islanding
- Shutdown, Layup and Services
- Campus Plan
- Safety Improvement Opportunities Projects

**5.1 Re-tube and Feeder Replacement Project**

The Re-tube and Feeder Replacement (RFR) project represents the largest scope and cost component of the Darlington Refurbishment Project. The RFR project will define the project's critical path and thus duration. As demonstrated by the schedule delays, cost overruns and performance issues in previous CANDU refurbishment projects, the RFR project also represents the largest risk to the project being completed on schedule and on cost. Thus, understanding the lessons learned from these previous refurbishments and the risks for this project is essential for developing the RFR project plan, schedule and cost estimates. The RFR project consists of the removal and replacement of 480 pressure tubes, 480 calandria tubes, 960 end fittings and 960 feeder pipes for each of the Darlington four units. This requires the development, testing, manufacturing and maintenance of specialized tooling; the generation and verification of specialized procedures; and the training of the staff that will perform the field work. The project also includes the construction of a realistic reactor mock-up for the purposes of tooling testing, procedure verification and staff training.

In March, 2012, OPG awarded the RFR contract to the SNC Lavalin/Aecon Joint Venture Agreement (JV Agreement). The contract is for the Definition Phase of the RFR project from early 2013 through mid-2016. The value of the contract is estimated to be over \$650 million. As of the end of August, 2014, the project has spent \$399M.

The accomplishments for this quarter are:

- The tooling schedule recovered from the low SPI of 0.71 in December, 2013 to 0.99 as of the end of September.
- The tooling prototype complete milestone of September was not met as a result of eight smaller tools not being manufactured. There is a schedule to meet this milestone in November. With more than 95% of the tools manufactured, this delay will have no impact on critical path.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Tool Performance Guarantee (TPG) testing at the mock-up has started.
- The March 30, 2015 milestone for the completion of modification engineering is at risk due to a few modifications. However, a recovery plan has been developed, and the risk will not likely have an impact on critical path to the start of unit 2's refurbishment outage.
- The long lead materials, such as end fittings, pressure tubes and feeder piping) have been ordered and delivery dates are planned to be met.
- The completion of the RWPB is tentatively scheduled for January 2017. This date leaves little room for delays; as it is very close to the date it will be needed to receive re-tube waste for processing.
- Work on the class 2 estimate (cost and schedule) has started. The process includes detailed involvement of OPG through the process as well as on-going independent audit of the process by Berkeley Research Group.

## **5.2 Fuel Handling/Defueling Project**

This project consists of two main subprojects – the defueling of the reactor to start the outage and the refurbishment of the fuel handling equipment and associated systems. An initial contract has been awarded to GE-Hitachi for equipment supply and technical support during the planning and execution of the defueling subproject.

The most significant risk with this project is the reliability of the fuel handling equipment. At the current performance level, the equipment is challenged to meet current operational demands to fuel four operating units. However, the reliability will need to improve to meet the required duration to defuel the reactor, for installation of the bulkhead, and to support the fuel handling refurbishment schedule. Darlington station and refurbishment management initiated an upgrade project in the first quarter of 2013. Work progressed as planned during the third quarter of 2014. In particular, the coarse drives for each of the fuel machine trolleys have been repaired.

Although progress has been made on this project, the reliability of the fuel handling equipment remains as a significant concern for the project's executive steering committee, which includes the CEO of OPG and senior executive of GE Hitachi. A requirement for demonstration of the ability to fuel three units with two fuel handling trolleys for a long duration has been established. This is to simulate the required performance of the machines during the defueling of Unit 2.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**5.3 Turbine/ Generator Project**

The scope of the Turbine/Generator includes:

- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of generator components (including generator stator rewind) and a number of generator auxiliaries,
- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of High Pressure (HP) and Low Pressure (LP) turbine components and a number of turbine auxiliaries;
- Moisture Separator Reheater (MSR): inspection, overhaul, and/or replacements of MSR internals and auxiliaries (e.g. strainers, valves);
- Turbine Control Upgrade: replacement of the obsolete analogue Steam Turbine Electronic Control (STEC) System, includes entire Turbine Supervisory System with modern design (digital system); and
- Generator Excitation Upgrade: replacement of the analog Generator Excitation system controls with a digital design and a set of additional Generator Excitation and Protection equipment to resolve obsolescence issues.

A contract was awarded to Alstom for the design and delivery of the digital controllers as well as technical support during the execution of the project. The design work by Alstom is progressing on schedule.

The TG engineering integration and field installation vendor (SNC/Aecon Joint Venture) has submitted a class 3 cost estimate and a level 4 schedule for field execution. They are under review by the OPG project team. There are likely opportunities to reduce proposed costs by building on the available synergy from having the JV perform field execution for both the RFR and TG projects. This should result in a reduction in the number of project management personnel and the use of trades' staff on both projects.

The decision to swap the unit 1 and unit 3 refurbishment outages has a potential cost increase as does the decision to defer the installation of Unit 2's digital controllers to a future outage. Both of these decisions are prudent based on Unit 3 fuel channel life considerations and reduction of overall risk for the Unit 2 outage.

**6.4 Steam Generators**

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

The Steam Generator Engineer Procure Construct (EPC) contract has been awarded to a consortium of Babcock & Wilcox Canada and Candu Energy Inc. The project consists of maintenance activities and modifications to meet the requirements of its Life Cycle Management Plan. This includes:

- Tube sheet water lancing to address possible degradation from sludge accumulation
- Installation of access ports to improve secondary side inspection capabilities for future inspection outages
- Primary side tube cleaning to improve overall thermal efficiency, increase neutron overpower margin and reduce radiation fields
- Divider plate leakage characterization to establish a baseline for cross flow between the cold and hot legs of the SGs
- Primary and secondary side ultrasonic, eddy current and visual inspections

Currently engineering work and testing are progressing as scheduled.

#### **5.4 Balance of Plant Project**

The Balance of Plant (BOP) scope consists of plant modifications and maintenance work in the following areas:

- Pre-refurbishment work
- Safety and Control Systems
- Reactor component systems
- Conventional Systems
- Common Systems

The changes to the contracting strategy for the BOP delayed the awarding of the contracts and the start of engineering. Although improvements are in progress to address the performance problems associated with the ESMSAs' execution of the Campus Plan and SIO projects, the use of the ESMSA contractors remains a risk, even though reduced. The risk is further reduced through the requirement for a separate project team for the BOP work than for the Campus Plan and SIO work. In addition,

[REDACTED]

The impact of the late implementation of the strategy is a large risk to meeting the May 2015 milestone for the completion of engineering.

#### **5.5 Station Readiness Projects**

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

There are a number of core refurbishment projects that are critical to support the refurbishment of the unit, but do not provide refurbishment of equipment. These are:

- Islanding projects. These projects are required to establish the physical and administrative separation of the refurbished unit from the operating plant, as well as separate a number of common areas for the duration of the refurbishment outage.
- Shutdown/Layup projects. These projects are in place to shutdown and layup individual systems at different stages and for different durations through the unit's refurbishment outage. This is required to protect the systems against corrosion and other damage mechanisms when not in normal operation.
- Services projects. These projects provide the needed services to support the unit's refurbishment outage. Such services include electrical, breathing air, service air, instrument air, and water.

In general, the Islanding projects are making use of the other contracts that align with its work in the same or adjacent area. For example, the EPC contract for the installation and removal of the bulkheads has been awarded to the R&FR Joint Venture. This is a sound decision since the JV has the most to gain from the timely installation of the bulkheads, there is elimination of coordination issues in the vault, and the required capabilities for the two projects are similar.

Since the strategy to perform the Shutdown/Layup and Services projects is the same as for the BOP projects (use of the ESMSA contractors), the issues, response and risks that were identified under BOP also exist for these projects.

## **5.6 Campus Plan and Safety Improvement Opportunities Projects**

The Campus Plan represents a number of infrastructure projects to support the refurbishment of the Darlington units. In addition, the campus plan includes the Safety Improvement Opportunity projects that OPG committed to the Canadian Nuclear Safety Commission (CNSC) through the Environmental Assessment process. The Campus Plan projects are being executed by the two ESMSA contractors and managed by the Projects and Modifications (P&M) organization on behalf of Darlington Refurbishment and include the following projects:

- D<sub>2</sub>O Storage Building
- Low Pressure Service Water Line Relocation
- Water and Sewer Upgrades

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- New Maintenance Facility
- Auxiliary Heating System
- Refurbishment Island Annex
- Power and Electrical
- OSB Refurbishment
- Emergency Power Generator #3 (Safety Improvement Opportunity)
- Powerhouse Steam Venting System (Safety Improvement Opportunity)
- Containment Filtered Venting System (Safety Improvement Opportunity)

These projects must be completed prior to the first unit's outage. The sheer amount of work associated with these projects represents a risk to the refurbishment project. It has taken close to a year for refurbishment management to recognize the severity of the challenge. The external oversight team identified significant issues related to the Campus Plan projects (specifically the D<sub>2</sub>O Storage Building and the Auxiliary Heating System) in its May 13<sup>th</sup> report to the OPG Board. This represented the accumulation of an adverse trend that was identified in early 2013 to a significant issue that was identified in early 2014, with the start of being address during the second quarter and has continued through the third quarter. The main actions that have been initiated in response to the issue are:

- Collaboration between OPG and the ESMSA contractors in the conceptual design, schedule development, cost estimate and planning.
- Resident engineers located with the ESMSA engineering contractors to provide real time resolution of questions and timely review and approval of engineering products through detailed design engineering.
- Weekly progress meetings with senior ESMSA and OPG management. Each contractor is reviewed every second week. In addition, this oversight includes a routine CEO meeting with OPG and the two ESMSA contractors.
- Development of improved cost estimates and execution schedules (Level 3) for refurbishment projects performed by the ESMSA vendors. This includes the projects managed by the Projects & Modifications organization – Campus Plan and Safety Improvement projects. With the exception of the D<sub>2</sub>O storage project, theses have been done.

In conclusion, the Campus Plan and Safety Improvement projects are behind schedule and thus poise a risk to the start of Unit 2's refurbishment outage. OPG refurbishment

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

management has initiated actions to drive improvement in the performance of the ESMSA contractors.

**6. Oversight of the Darlington Refurbishment Program**

Both OPG and the Ministry of Energy (MOE) understand the need for a successful refurbishment for the Province, the company and the industry. In line with that importance, the Minister of Energy established the role of independent advisor and OPG established the role of an external independent oversight team reporting to the OPG Board. This team consists of individuals from the companies Burns & McDonnell and Modus.

The OPG external independent oversight team issued its Q3 report to the OPG Board in August 2014. A summary of the issues and status identified in the report and alignment with the MOE's reports is provided in the following table:

<b>OPG External Oversight Assessment</b>	<b>MOE Assessment</b>	<b>Comments</b>
Campus Plan projects remain significant risks to the overall refurbishment project.	Both the Campus Plan and Safety Improvement projects are identified as Refurbishment Program challenges.	Consistent alignment between the two groups.
RQE development is on schedule, with the 4d cost estimate being an essential step to RQE. Variances with 4c will need to be explained.	The challenge to maintain the cost within the bounding estimate of \$10B is identified as a Refurbishment Program challenge. The 4d retained the bounding estimate. Focus will be placed on the resolution of the variances between the initial inputs and final 4d estimate.	Slightly different focus between the two groups focus on variances; 4c vs. 4d and initial inputs into 4d and final 4d estimate.
In general good progress in the R&FR project, with the exception of the delays in the RWPB, which is facing similar problems as the Campus Plan projects.	In general good progress in the R&FR project, with the exception of the delays in the RWPB, which is facing similar problems as the Campus Plan projects.	Good alignment between the two groups.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>OPG External Oversight Assessment</b>	<b>MOE Assessment</b>	<b>Comments</b>
The planning of engineering work has moved to green based on OPG taking a more active role in direction and managing the work at engineering studios, the bottoms-up estimating for engineering activities and increased focus on engineering activities.	Remains as a program challenge and red rating due to the lack of a detailed engineering schedule or work down curve at the EC level, lack of metric to measure quality of deliverables and not fully understanding the cost of engineering. The lack of effectively managing the engineering workload challenges meeting the engineering complete with quality.	There is not alignment between the two groups in the progress made in the engineering function.
Concern remains over the ESMSA contractors' performance and the ability to execute the BOP work.	Concern remains over OPG's performance in managing the work of the ESMSA contractors to meet high performance standards related to safety, quality, cost and schedule.	There is good alignment in this area.

**7. Alignment with the Principles of the Long Term Energy Plan**

The MOE's 2013 Long Term Energy Plan identified seven principles by which it expects OPG and Bruce Power to follow in the development and execution of their respective units. The following table provides observations which demonstrate alignment by OPG as well as opportunities for additional alignment.

<b>Principle</b>	<b>Observations of Alignment</b>	<b>Possible Opportunities</b>
1. Minimize commercial risk on the part of ratepayers and government.	<p>The majority of DNR contracts are fixed/firm price with the remaining tied to cost and schedule performance.</p> <p>Commercial risk is mitigated through the use of stakeholder review committees and approval processes to support commercial controls at several phases of each</p>	Incentives in the RFR contract were developed and established on the basis of four unit performance, allowing the RFR contractor to make-up cost overruns and schedule delays to the first unit on subsequent units. However, the LTEP prioritizes the urgency of a success on Unit 2.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Principle	Observations of Alignment	Possible Opportunities
	<p>project.</p> <p>Risk management process includes commercial risk.</p> <p>Commercial individuals embedded on each project team to manage commercial risk.</p>	
2. Mitigate reliability risks by developing contingency plans that include alternate supply options if contract and other objectives are at risk of non-fulfillment.	<p>One DNR contingency action contributing to this principle is the decision to start the second unit after unit 2, rather than overlapping the units. In addition, the effort to improve the reliability of fuel handling equipment reduces the chance that fueling of the operating units will be reduced during the defueling of the refurbishment unit.</p>	
3. Entrench appropriate and realistic off-ramps and scoping.	<p>Each contract has an off-ramp for termination. Reimbursement limited to reasonably incurred costs.</p> <p>A scope review by senior management was completed in Q4/13 to reduce scope to work required for life extension or can only be done in drained/defueled state.</p> <p>Management acknowledges the potential of an off-ramp being implemented and used in communications with staff.</p> <p>The yearly release strategy and gating process for funding individual project initiatives has wide visibility and adherence within the DR Team.</p> <p>The contract with SNC/Aecon includes provisions that allow OPG to take over the tooling and the mock-up at the conclusion of the Definition Phase if the parties are unable to negotiate the target price contract for the Execution Phase.</p>	<p>Ensuring the scope that is required for life extension, though performed outside of the DR Project, is staffed, funded and executable.</p>

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Principle	Observations of Alignment	Possible Opportunities
4. Hold private sector operator accountable to the nuclear refurbishment schedule and price.	Not included in this oversight.	
5. Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price.	<p>Schedule accountability is built into each contract. The contractor is required to provide a detailed schedule for planning (and later execution). This schedule is reviewed monthly during planning phase.</p> <p>Cost accountability is built into contracts to establish target cost and incentives/disincentives.</p> <p>Monthly senior level meetings OPG are improving its oversight to monitor performance.</p> <p>Each OPG project team includes Project Controls member to monitor and report cost and schedule performance.</p> <p>OPG has chosen to perform the work in the Execution Phase on a target price basis which increases the contractors' transparency. This will enhance OPG's ability to resolve issues as they arise.</p> <p>There is an executive steering committee for major projects that includes the CEOs and senior executives of OPG and he contracted vendors.</p>	<p>The estimating process has undergone changes as a result of the significant variances between the contractors' estimates and OPG's estimates.</p> <p>The RQE will require work to reduce the assumptions by contractors that contribute to potential higher than planned contract values.</p>
6. Make site, project management, regulatory requirements and supply chain considerations, and cost and risk containment the primary factors in developing the implementation plan.	<p>Site and regulatory requirements are the inputs to the defined scope.</p> <p>The program is being managed in accordance with PM Institute standards and INPO project principles.</p> <p>Cost estimate process used Association for Advanced Cost</p>	<p>Improve the ability to identify and address adverse trends in performance in a timely and effective manner.</p> <p>The station and refurbishment project are developing an agreement on the condition that the unit will be turned over to the project and the condition it will be</p>

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Principle	Observations of Alignment	Possible Opportunities
	<p>Engineering (AACE) best practices. Cost estimate is understood by team and the cost ceiling is routinely communicated to staff.</p> <p>Risk management is recognized as a key element of success, a program is in place, but its implementation requires improvement.</p>	<p>returned to the station.</p>
<p>7. Take smaller initial steps to ensure there is opportunity to incorporate lessons learned from refurbishment including collaboration by operators.</p>	<p>To fully incorporate lessons learned from the first unit's (Unit 2) refurbishment, the second unit's (Unit 1) start has been delayed until the completion of the first unit.</p> <p>If appropriate, other units may be able to be delayed to continue this risk reduction. However, this will likely result in an overall increase in cost.</p> <p>To reduce risk for the first unit, the decision was made to install its digital controller in a future outage.</p> <p>To prevent the risk associated with single source suppliers of key reactor components, OPG has qualified second vendors for key components. This will help Bruce Power with an associated materials risk.</p> <p>OPG and Bruce Power are working successfully to develop a long term agreement with the trades union to ensure uninterrupted execution of the projects.</p> <p>Bruce Power VP of projects is scheduled to visit Darlington refurbishment for benchmarking.</p>	<p>The opportunity to seek out opportunities with Bruce Power has not been fully started, and will not likely be seen until Bruce Power develops its plan and schedule for refurbishment of its units.</p>

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**8. State of Readiness**

The Nuclear Refurbishment program is fully into its Definition Phase to support the successful execution of Unit 2, starting in October 2016. There are several areas that provide high confidence that the organization is tracking to a high state of readiness by this time; including:

- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. Although there have been recently identified actions required for the approval of the Integrated Implementation Plan (IIP), they do not represent a significant risk to the project. Since the IIP and Darlington's request for a 14-year license are together, OPG has decided to request the CNSC for a one-year extension to its current license. This should provide sufficient time to address the outstanding issues.
- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The remaining challenge is to identify the period to perform non-refurbishment outage work that is required for life extension.
- Project management processes and oversight monitoring are in place for the project. These include schedule performance, cost performance, scope control and risk management. The final cost estimate (Release Quality Estimate (RQE) that is scheduled for October 2015) needs to be consistent with the business case justifying the project.
- The project management and support organization is in place for the Definition Phase and assembly of the execution organization has started.
- Contracts are in place for the Definition Phase to ensure planning is complete prior to Unit 2 breaker open. This includes the completion of engineering, the purchase orders for parts and materials, work procedures, and the establishment of execution contracts.
- To date, over 95% of the non project scheduled work is being completed. This includes on-line work and outage work. However, work that is planned and is not ready is not scheduled. As a result, this is not the best performance indicator of completing work to be ready for the refurbishment outage. Starting next quarter the percentage of planned work that is completed will be reported.
- There is a draft Level 1 plan for Critical Path of the execution phase of the program. This can be reviewed, along with its basis, to identify initial risks for execution.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The Class 3 estimate for the Re-Tube and Feeder Replacement project has been issued by the Joint Venture to OPG. This project represents the largest element of the Refurbishment program, both in terms of cost and duration. The process to review and challenge assumptions to obtain a more accurate Class 2 estimate (due in June 2015) has started.
- The 4d estimate has been drafted with final estimate to be presented to the OPG Board in mid November.

However, there are challenges that OPG need to address to increase the state of readiness to a comfortable level. These include:

- The variances between the initial inputs and the final 4d estimate need to be realized in a manner to assure the sustainability of the estimate during the development of the Release Quality Estimate.
- Management of the detailed design engineering workload to ensure that the May 2015 milestone for engineering to be completed is met with quality products.
- The current performance of the ESMSA contractors has resulted in a risk that some work required for the start of refurbishment may not be completed. OPG is working with senior management of the ESMSA vendors to implement actions to improve performance and meet milestones.
- The initiative to improve the reliability of fuel handling equipment needs to start making progress in the development and implementation of detailed plans in order to obtain confidence that defueling and bulkhead installation will meet their Critical Path Duration.

Although there are specific challenges that OPG needs to successfully overcome, they continue to have established the framework that is needed to be ready to successfully execute the refurbishment of the four Darlington units beginning with the first unit in October 2016.

## **1. Minister Summary**

This report provides a quarterly review of trends, accomplishments and challenges related to the Darlington Nuclear refurbishment project.

### Changes from the Previous Quarter

The most significant changes from last quarter are:

- The release 4d estimate was approved by the OPG Board of Directors at its November meeting. The release was for \$1,124M to complete the 2015 planning activities for a cumulative release of \$2,732M. The bounding cost estimate for the project remains within \$10B (2013B). The breakdown of this estimate, its evolution since 2009 and resulting impact on LUEC is shown in the following table.
- Collaboration with Bruce Power to share operating experience, strategies, processes and negotiating with Building Trades Unions has started.
- Work has started on the Joint Venture's class 2 estimate for the RFR project. There is increased monitoring by the OPG/JV Steering Committee. It is the intention for the committee to provide reconciliation of outstanding issues as they are identified. The target for its completion is April, 2015.
- The application to the Federal Court for a judicial review of the Darlington Refurbishment Environmental Assessment was dismissed.
- The SNC/Aecon Joint Venture has been signed onto the ESMSA master agreement.
- An on-boarding facility for nuclear projects has been established at Darlington Energy Complex.

### Refurbishment Program Challenges

One objective of this oversight is to identify performance trends that require refurbishment management's attention to prevent the trends becoming significant issues. These are identified as Refurbishment Program Challenges. In general, refurbishment management is aware of these performance trends. It is the expectation that OPG refurbishment management takes actions to address these trends.

The current refurbishment program challenges are:

- The assumptions and opportunities that were the basis of the 4d cost estimate

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

need to be sustained through the development of the Release Quality Estimate.

- The management of engineering workload challenge is based on on-going weaknesses in the use of schedules and work down curves for the large amount of detailed design engineering work, and the lack of monitoring effective quality indicators to identify and correct adverse performance trends.
- With the acceptance of performance weaknesses the contract management of the Campus Plan and Safety Improvement projects and ESMSA contractors, there is a need for refurbishment management to take concrete actions to address the individual lessons learned to prevent similar performance in the core refurbishment projects.

**Conclusion on Readiness:**

Although there are specific challenges that OPG needs to successfully overcome, there is the established framework that is needed to be ready to successfully execute the refurbishment of the four Darlington units beginning with the first unit in October 2016. The basis for this conclusion is provided in Section 9.

A review (section 8) of the alignment of OPG's strategies, contracts, actions and decisions shows good alignment with the Ministry's principles for refurbishment that were described in the 2013 Long Term Energy Plan. The previously identified gap related to the cooperation between the two nuclear operators has been addressed through on-going meetings among representatives to build on operating experience and alignment on common issues.

## **2. Purpose of Report**

In February, 2013 CALM Management Consulting, Inc (CALM) was retained to provide independent oversight of the Darlington Refurbishment Project on behalf of the Ministry of Energy (MOE). This agreement includes a monthly report to the MOE to identify progress in preparations for the refurbishment of the Darlington nuclear units as well as potential challenges to the successful planning and completion of the project. In this case, as with similar projects, success is defined as the preparation and execution of 100% of the correctly identified project scope safely, on schedule, within budget and with quality. The monthly reports include the following areas:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Changes from Previous Month
- Accomplishments and Progress
- Darlington Nuclear Refurbishment Scorecard
- Basis for Scorecard Ratings
- Refurbishment Program Challenges

In addition to these routine monthly reports, it is beneficial to review performance trends and to provide insights into additional areas. This is accomplished through a quarterly report that, in addition to the contents of the monthly report, provides a review in the following areas:

- Status of the individual projects
- A review of the issues identified by the independent external oversight team that reports to the OPG Board
- Insights into the leadership team and the cultures which it is developing
- A review of the efforts to meet the principles that were provided in the ministry's 2013 Long Term Energy Plan
- A review of the overall state of readiness

It is the belief of the MOE's Independent Oversight Advisor that the Refurbishment Program Challenges that are identified in Section 5 deserve consideration by OPG Refurbishment management. It is the intention to identify such challenges when they represent an early trend rather than wait until they become a significant issue.

### 3.2 Basis for Scorecard Ratings

#### Personnel Safety - WHITE

During December, incidents related to lifting and rigging occurred in the RFR project and the installation of VD10 for the CFVS project. Lifting and rigging is the subject of an industry WANO Significant Operating Event Report. During November, a number of safety events occurred during field execution of the prerequisite projects. The most significant was a subcontractor worker traversing a beam without fall protection and thus exposed to a 45 foot fall (N-2014-30652). This occurred on work at the D<sub>2</sub>O Storage Building project, with subcontractor supervision observing and taking no action. It was classified as a High MRPH (Maximum Reasonable Potential for Harm) and resulted in the station safety light being changed from Green to Red. Another incident involved a contractor working on a 480 V panel without the required personnel protective equipment (D-2014-31024). These events combined with previous vehicle events indicate the beginning of an adverse trend in personnel safety.

#### Radiological Protection - WHITE

After the completion of the D1411 outage, there has been limited refurbishment work in radiological areas. The project is moving towards the development of ALARA plans for individual projects (such as R&FR) and the development of the RP services strategy. ALARA plans are likely 6 months to a year before they can be reviewed.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Regulatory Approvals – WHITE

Although acceptance of the Integrated Implementation Plan (IIP) will not occur until the renewal of the Darlington Nuclear Operating license for a 14 year period, scheduled for the end of 2015. In the meantime, there is indication that CNSC staff is in agreement with the content of the IIP, and OPG is working with CNSC staff to develop and implement a process for the management of changes to the IIP; either in terms of content or schedule. The other regulatory risk is the current court challenge to the Refurbishment project's Environmental Assessment.

Risk Management – WHITE

The Risk Management program has identified Nuclear Refurbishment Key Risk Areas, which are the result of an aggregate analysis of the risk registry. They have management sponsors who are responsible to monitor the progress of the individual risks associated the area for the development and implementation of mitigating action plans. These Key Risk Areas and their current ratings (by management) are:

- Availability/Retention of Key Staff (identified as a Red risk and improving)
- Cost and Estimating Management (identified as a Yellow risk and improving)
- Completion of Unit 2 Prerequisites (identified as a Yellow risk and degrading)
- Regulatory Approvals (identified as a Yellow risk and stable)
- Fuel Handling Reliability (identified as a Yellow risk and improving)
- Vendor Default/Continuity Planning (identified as a Yellow risk and stable)
- Integrated Schedule Development (identified as a Yellow risk an stable)
- Timely Procurement of Materials (identified as a Yellow risk and stable)
- Completion of Engineering (identified as a Yellow risk and improving)
- Integration with External Organizations (identified as a Yellow risk and improving)

This identification of the Key Risk Areas is a positive step towards managing the known risks associated with the refurbishment program. Although there is some discussion of the risks at the individual manager level, senior management review of the mitigating actions is done through the Risk Oversight Committee, which meets quarterly. This means there will be approximately 7 opportunities for the management team to review the health of these key risks prior to the start of the Unit 2 refurbishment outage.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Scope Management - WHITE

The current strategy for the scope of the refurbishment outage relies strongly on the concept of 'life extension window'. The life extension window starts with the shutdown of the first refurbishment unit (Unit 2) and ends upon the completion of the first planned outage after the refurbishment of the last unit (Unit 4). This represents the twelve-year period from 2016 to 2028. This provides two planned outages, in addition to the refurbishment outage, to complete each unit's life extension commitments.

This strategy is appropriate to maintain control of the scope of the first refurbishment outage. On-going monitoring of any scope creep into the refurbishment outage will identify any deterioration of this performance. The currently approved dates and durations for each unit are summarized in the following table.

Unit	Start of Refurbishment Outage	Finish of Refurbishment Outage	Duration (months)	Overlap on Previous Unit
D2	<b>October 2016</b>	September 2019	36	
D1	October 2019	September 2022	36	0
D3	March 2021	February 2024	36	19
D4	October 2022	<b>September 2025</b>	36	17
<b>Total Unit Outage Months (4 units)</b>			144	
<b>Refurbishment Window</b>			108	

Cost Management - YELLOW

Project life to date total cost as of the end of November 2014 is \$1,504M, which is \$91M below the plan of \$1,596M. The below plan consists of delays in Balance of Plant, Shutdown, Layup & Services projects, and delays in progressing design engineering for Campus Plan and Safety Improvement projects.

The release 4d estimate was approved by the OPG Board of Directors at its November meeting. The release was for \$1,124M to complete the 2015 planning activities for a cumulative release of \$2,732M. The bounding cost estimate for the project remains within \$10B (2013B). The breakdown of this estimate, its evolution since 2009 and resulting impact on LUEC is shown in the following table.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>2014\$</b>	<b>2009</b>	<b>2013 (release 4c)</b>	<b>2014 (release 4D)</b>
Project Estimate	n/a	\$7,223M	\$7,635M
Contingency	n/a	\$2,133M	\$2,135M
Management Reserve	n/a	\$844M	\$430M
TOTAL	\$10,970M	\$10,200M	\$10,200M
Levelized Unit Energy Cost (LUEC)	8.9¢	7.7¢	7.8¢

The \$7,635M cost estimate for the refurbishment project incorporates a number of assumptions and opportunities that refurbishment management need to realize through various contract negotiations for execution and in the staffing of the various OPG functions. These represent the basis for the release 4d estimate. The current cost challenge is the sustainability of the basis for the release 4d estimate during the development of the Release Quality Estimate (RQE). This is discussed in more detail in the section on refurbishment challenges.

One positive cost reduction action recently taken by OPG refurbishment management is to initiate new contracts with the OSS vendors. Both vendors have submitted new proposals that provide a reduction in the costs of their services.

**Milestone Compliance – YELLOW**

As a measure of the management of milestones, this report will on the completion of the milestones associated with the Release Quality Estimate milestone of October 2015. There was one milestone in December, the acceptance of the Integrated Improvement Plan (IIP) by the CNSC. OPG management has stated that this acceptance has been verbally received with a letter expected by the end of December. As a result, this milestone rating has changed from Yellow to White with a further change upon verification that the letter was received.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

**Release Quality Estimate Milestones**

<b>Milestone</b>	<b>TCD</b>	<b>Status</b>
MDRs Complete	August 15, 2014	These were completed in Q4, 2013 with a live 0 value of about 15 as discovery work is identified.
U2 Work Order Scope Definition complete	October 15, 2014	This milestone was met.
Program Health Review complete	October 15, 2014	This milestone has been moved to May 2015.
U2 Outage Planning Organization complete	October 15, 2014	This milestone was met.
U2 Pre-Outage Metrics prepared	October 15, 2014	This milestone was not met. A mitigation plan is under development to minimize any impact on downstream milestones.
U2 Long Lead Materials identified	November 15, 2014	This milestone was revised to February 15, 2015
Release 4D Estimate completed	November 13, 2014	This milestone was met with the presentation at the Board's November meeting.
Integrated Implementation Plan (IIP) approved by the CNSC	December 31, 2014	OPG management stated that the letter will be received by the end of December, 2014.
U2 Level 1 Rev B execution schedule issued	April 15, 2015	U2 Level 1 Rev A execution plan has been issued and is being revised as more details on work execution are provided.
U2 Design complete	May 15, 2015	
Success Plan Presentation	July 15, 2015	
U2 Design Documents complete	August 15, 2015	
U2 Work Order Scope Freeze	October 15, 2015	Scope is frozen at the higher level of Scope forms.
RQE & Release 5 Release issued	October 15, 2015	

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Release Quality Estimate - WHITE

A draft RQE development flowchart that identifies the required milestones to support the completion of Critical milestones for the Release Quality Estimate (RQE) has been revised. The organization to lead the development of the RQE is in place. The management plan for the RQE project was issued at the end of November, along with the schedule for its implementation. The 4d estimate has been completed and accepted by the OPG Board at its November meeting. A key component of the development of the RQE is the development of the Class 2 estimates for the Re-tube & Feeder Replacement and Turbine Generator projects. These are being performed by the Joint Venture with close monitoring and involvement by OPG. The milestone date for the acceptance is May 2015, although the schedule has an early finish in mid April. The milestone for the submission of the RQE is October 2015.

Time Management - WHITE

Work continues to progress well for the start of Unit 2's refurbishment outage. Current performance includes:

- The November refurbishment schedule performance index (SPI) is 0.96, excluding the D<sub>2</sub>O storage and CFVS projects. This value includes a significant contribution from the function groups (close to 25%), which are level of effort and thus do not have schedules. The SPIs for the three project groupings are:
  - Core bundles have an SPI of 0.98.
  - The Safety Improvement Opportunity projects have an SPI of 0.96, excluding the CFVS project, with its schedule under revision.
  - The Campus Plan projects have an SPI of 0.88 excluding the D<sub>2</sub>O Storage project, with its schedule under revision.
- Another indicator of completion of work is the number of activities completed in a month versus the planned number. This information provides a gross indicator of the organization's ability to complete planned work. As can be seen from the following table, the project has not been very successful in completing activities that are planned for each month.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Month</b>	<b>Number of Planned Activities</b>	<b>Number Completed</b>	<b>% Completed</b>
July	94	27	29%
August	190	93	49%
September	264	107	41%
October	197	113	57%
November	170	71	42%

- Work is continuing to refine the Level 1 execution plan for the Unit 2 refurbishment outage.

**Re-tube & Feeder Replacement Project Performance - WHITE**

The benefits of the mock-up started to be realized during the fourth quarter. Examples to date include:

- A dimensional discrepancy in the Re-Tube Platform (RTP) was identified and corrected.
- Validation of non-interference was validated, which removed one Temporary Modification (TMOD) from the vault. The removal of this TMOD results in a critical path savings of a few days.
- Panel locations and cable lengths have been verified.
- Tool Performance Guarantee (TPG) tests have started. Pressure tube (PT) cuts have been performed using the remote controls and the PT cutter. The cut was consistently performed within 20 minutes, which is about a factor of 3 better than the TPG.
- Tool integration testing has started and will be used in the development of the Class 2 estimate.

The tooling qualification testing continues and is currently on schedule. It is an important input into the RFR Class 2 estimate, which has an early target completion date of mid April, 2015. However, the use of the tooling represents about 30% of RFR's critical path time. The remainder is the movement, set-up and dismantle of the tools. Although this

is recognized as an important variable and will be incorporated into the Class 2 estimate, it is unclear the extent to which it will be conducted using the mock-up prior to the submission of the Class 2 estimate.

Refurbishment and Joint Venture management recognizes the importance of the Class 2 estimate in the development of the Release Quality Estimate. As a result, the Berkeley Research Group has been hired to provide independent oversight of the Class 2 process and its implementation. In addition, OPG and the JV are in the process of establishing an Expert Panel to review the quality of the inputs into the process. The first meeting is planned for January 2015. Both of these activities will be monitored and reported in these reports.

The design and construction of the Retube Waste Processing Building (RWPB) are undergoing similar issues as the Campus Plan projects associated with the potential of underground services, as well as the management of potentially contaminated soil and water. A detailed schedule has not been accepted by OPG project management.

Campus Plan Performance – RED and Safety Improvement Opportunity (SIO) Projects Performance – RED

Campus Plan and SIO projects continue to struggle in meeting cost estimates, schedules and high performance standards. Without additional improvement and focus on the execution of the Campus Plan and Safety Improvement projects, there is a challenge in having some of the projects completed when they are required. OPG senior management has taken some actions to address the ESMSA performance related to these projects. These focus on the collaborative front end planning and engineering environment, biweekly status meeting for the projects executed by each ESMSA contractor, and the development of detailed execution schedules. These actions have had limited effect in the execution of the projects.

OPG management has not communicated specific actions to improve performance related to contractor management of the Campus Plan and Safety Improvement projects. However, number of initiatives would likely be required to obtain and demonstrate sustained performance improvement. These include:

- The alignment of OPG and ESMSA performance metrics, including Schedule Performance Indicator, Cost Performance Indicator, Earned Value, and Available for Service (project completions) dates.
- The effective use of the P6 schedule in the daily schedule review meetings (PCC meeting).

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The ability to identify and address project issues that delay field execution in a timely and effective manner. The response to safety, quality and productivity issues will be the main focus in this review.
- The effectiveness of OPG field execution oversight.
- The interface and integration among contractors and between contractors and the station.

The challenge associated with the Campus Plan and SIO projects is currently focused on the need for refurbishment to take concrete actions from the lessons learned from these projects.

Engineering Performance - RED

Management of the upcoming engineering workload continues to be a significant challenge, with details provided in Section 5.

Contractor Management - YELLOW

The main challenges related to Contractor Management are captured with the issues related to the Campus Plan and SIO projects, and Engineering Performance

The R&FR, Fuel Handling and Turbine Generator projects have a routine senior management steering committee meeting to review performance, as well as periodic executive oversight committee meetings that include the Chief Executive Officers of OPG and the contractors' companies.

Although contracts have been awarded, the remaining core projects have not sufficiently progressed to provide good insight of performance. The challenge will be to obtain improved performance using the ESMSA contractors as compared with the Campus Plan and SIO projects. [REDACTED]

[REDACTED]. As a result, contractor management is rated Yellow.

Quality Management - WHITE

With the current EPC contracting strategy, OPG needs to develop the capability to manage the quality of work performed by its contractors. Refurbishment management's response to this need challenge is through a combination of project management

activities, oversight activities by the project management team, supply chain procurement audits and assessments, and audits conducted by teams within the refurbishment organization and other OPG organizations. Through an Oversight Steering Committee, management has started the shift from a focus on doing oversight activities to their quality and lessons learned. This shift is too early to the performance improvement for the next performance level. There is currently an initiative to integrate the various quality management activities and risk management into a single platform in order to more easily implement the program and review the results.

#### Procurement Management – WHITE

With the exception of the radiation protection services contract, all major contracts have been awarded. The late awarding of the contracts for the Balance of Plant and Shutdown/Layup projects will challenge the vendors and OPG to meet the completion of engineering milestone. The Supply Chain conducted an audit of the processes in place for Alstom to procure critical parts in support of the Turbine Generator project. The audit identified four findings:

- The need to use tracking tools for the OEM parts which are to be delivered by the vendor associated with Unit 2 refurbishment.
- Additional progress of schedule activities/level of detail to monitor the overall progress of procurement/manufacturing of OEM parts associated with Unit 2 refurbishment.
- Update the Project Management Plan to reflect oversight related to monitoring/tracking of OEM parts associated with the above items.
- Increase oversight efforts for the integration of the installation vendor (the Joint Vendor) as well as the OEM vendor to ensure that the actual need dates for the parts are accommodated/considered in oversight activities.

In themselves, these findings do not represent challenges or risks to Alstom supplying the necessary quality parts. The bigger concern is the fact these issues are identified within a company that is recognized within its field as providing quality parts and materials in a timely manner. If OPG standards for procurement processes and oversight are not met within Alstom, it is likely that a number of parts suppliers will have more significant issues identified in audits of their procurement process.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**Resource Management - YELLOW**

The availability/retention of key project staff is identified as one of the program's Key Risk Areas. It consists of:

- The possibility of limited skilled trade resources and supervision for project execution as its highest program risk. Currently the trades unions predict that there may be a total shortfall of approximately 50,000 personnel during the duration of the Darlington refurbishment. They have also identified poor progress in increasing the number of journeypersons in several trades. The current rate of individuals moving from the apprenticeship program to become a journeyperson is 18% - 20%. It is recognized by all parties that this must improve. The Darlington VP of Execution is leading an initiative that includes the unions, OPG and its main contractors to address this potential shortfall.
- The potential that project leadership and specialized resources are not in place when required. There are a number of initiatives under development to reduce the significance of this risk. Refurbishment management is constrained its ability to implement the corporate policies and procedures that have been developed for operating facilities and small projects for this mega project.
- The possibility of an insufficient number of Authorized Staff for both station and refurbishment needs. This is being addressed through a combination of increased number of candidates for the associated positions as well as challenging the extent of the need for such staff once the unit is defueled and isolated through the bulkhead.
- The potential of an insufficient number of qualified radiation protection coordinators to support project execution. This should be addressed through the awarding of the radiation protection services contract.

**Corrective Action Program and Use of Operating Experience – WHITE**

There have been no changes to the performance in the areas of the Corrective Action Program and Operating Experience. OPG has implemented several high level lessons learned from previous refurbishment projects; including Browns Ferry, Pickering A, Bruce A, and Watts Bar. In 2012, refurbishment management made a presentation to the OPG Board on how they addressed the US Inspector General's findings from the investigation of Watts Bar Unit 1 cost overruns and schedule delays. It is not clear if OPG management has revisited the health and current effectiveness of the stated response to these issues. There is an additional area of operating experience for which it is unclear the extent to which refurbishment management has implemented. That area

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

is the incorporation of appropriate Significant Operating Experience Reports and equivalent. These are reports issued by WANO (World Association of Nuclear Operators) and INPO (Institute of Nuclear Power Operations) related to significant adverse trends within the industry and they provide both the causes and required actions by individual plants. This is presently under review and results will be provided in Q1, 2015.

The Corrective Action Program is in place and is being used. The majority of issues adverse to quality have been identified in the engineering activities. This is not surprising since engineering represents the most active function at this time. Although the refurbishment CAP program is good, the program implemented by the Projects and Modifications (P&M) organization has several known weaknesses. This should be a concern to the refurbishment organization since the Campus Plan and SIO projects are being managed by the P&M organization and thus conditions adverse to quality are managed through its CAP.

OPG Oversight – WHITE

OPG's independent oversight team (Modus/Burns & McDonnell) reports to the Nuclear Oversight Committee of the OPG Board of Directors. They conduct their oversight in accordance to an approved plan and provide quarterly reports to the Board.

#### **4. Accomplishments and Progress**

The following accomplishments were achieved during the fourth quarter:

- Project life to date total cost as of the end of November 2014 is \$1,504M, which is \$91M below the plan of \$1,596M. The below plan consists of delays in Balance of Plant, Shutdown, Layup & Services projects, and delays in progressing design engineering for Campus Plan and Safety Improvement projects.
- The release 4d estimate was approved by the OPG Board of Directors at its November meeting. The release was for \$1,124M to complete the 2015 planning activities for a cumulative release of \$2,732M. The bounding cost estimate for the project remains within \$10B (2013B). The breakdown of this estimate, its evolution since 2009 and resulting impact on LUEC is shown in the following table.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Collaboration with Bruce Power to share operating experience, strategies, processes and negotiating with Building Trades Unions has started.
- Work has started on the Joint Venture's class 2 estimate for the RFR project. There is increased monitoring by the OPG/JV Steering Committee. It is the intention for the committee to provide reconciliation of outstanding issues as they are identified. The target for its completion is April, 2015.
- The application to the Federal Court for a judicial review of the Darlington Refurbishment Environmental Assessment was dismissed.
- Regulatory documents required by the CNSC for undertaking a project to extend the life of a nuclear plant have been submitted to and mostly accepted by the CNSC (Environmental Assessment, Integrated Safety Review, Global Assessment Report, and Integrated Implementation Plan).
- The SNC/Aecon Joint Venture has been signed onto the ESMSA master agreement.
- OPG held a four-day open house at the Darlington Energy Complex that included tours of the Re-tube and Feeder Replacement mock-up. Approximately 3,500 people attended, including members of the public, local business community, employees and their families, retirees and vendor partners. There was very positive feedback on the event.
- Refurbishment scope has been defined to the component level (Health of Scope 4).
- An on-boarding facility for nuclear projects has been established at Darlington Energy Complex.

## **5. Refurbishment Program Challenges**

Throughout the life of refurbishment program specific challenges have been, and will be, identified that in the belief of the Independent Advisor to the Minister of Energy should have actions by OPG Refurbishment Management to address them, before they become significant issues. The currently identified Refurbishment Program are related to maintaining the assumptions and basis for the 4d cost estimate into RQE, the management of the engineering workload, and implementing concrete actions to address lessons learned from the Campus Plan and SIO projects.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**4d Cost Estimate Challenge**

The 4d cost estimate was presented and accepted by the OPG Board at its November meeting. The estimate is within the \$10B (2013\$), or \$10.2B (2014\$) bounding estimate. The breakdown is \$7.635B for the project, \$2.135B for Contingency and \$0.43B for Management Reserve. The \$7.7B cost estimate for the refurbishment project incorporates a number of assumptions and opportunities that refurbishment management need to realize through various contract negotiations for execution and in the staffing for the various OPG functions. The current cost challenge is the sustainability of the 4d cost estimate basis (including assumptions and opportunities) during the development of the Release Quality Estimate (RQE).

The sustainability of the basis of the 4d cost estimate through the development of the Release Quality Estimate will be monitored by the MOE Independent Oversight Advisor through:

- Review refurbishment management's basis document 4d estimate for the project bundles and functions.
- Monitor the progress of the resulting actions to realize the assumptions and opportunities credited in the above basis.
- Monitor the progress of reviewing the generic issues (opportunities) identified by OPG through this challenge process and the progress of implementing any resulting beneficial actions.
- Monitor the incorporation of the basis document from the 4d estimate into the development of the Release Quality Estimate (RQE).

OPG refurbishment management has documented its basis for the 4d cost estimate in early December. The following observations are made regarding the documented basis of the 4d cost estimate based upon an initial cursory review:

- The documented basis is a combination of the assumption log and department Functional Plans.
- There are over 390 assumptions in the assumption log. These are provided for individual projects, with very few rolled up to the refurbishment program level. During a meeting to review the issuance of the 4d cost estimate basis, it was stated that a review of all assumptions would be made to determine those that impact the overall program.
- The assumption log does not have an associated financial value associated with each assumption. This will make it more difficult to monitor their sustainability. However, there is some documentation on the reductions for individual projects and functions during the development of the 4d cost estimate.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The R&FR project has good documentation to support its 4d cost estimate, from which the cost associated with assumptions can be determined.
- The Functional Plans identify a number of shared responsibilities and resources with the station. It is not clear if the associated transition plans have been revised to demonstrate station acceptance of these changes. There should be a schedule and plan to obtain alignment between the station and refurbishment organizations on the actual support to be provided by the station during the refurbishment outage.
- The RQE plan provides guidance on the development of the estimate. However, there is not a clear expectation that the RQE process will monitor the sustainability of the assumptions and opportunities that resulted in the 4d cost estimate.

In conclusion, the recent submissions associated with the 4d estimate require further work to ensure that the key assumptions, opportunities and bases are clearly identified for monitoring their health and sustainability during the development of the Release Quality Estimate.

**Management of Engineering Workload**

The challenge associated with the management of the large engineering workload has been identified in monthly reports to the MOE since June 2013. In Q2, 2014, refurbishment senior management recognized the issues related to engineering and initiated interim actions and a root cause investigation. The focus of the improvement actions has been the implementation of a collaborative approach to planning (preliminary engineering, scope definition and cost/schedule estimations) and detailed design engineering. This has resulted in examples of faster response for requested information and shorter review cycles for approval of an engineering package by the Design Authority.

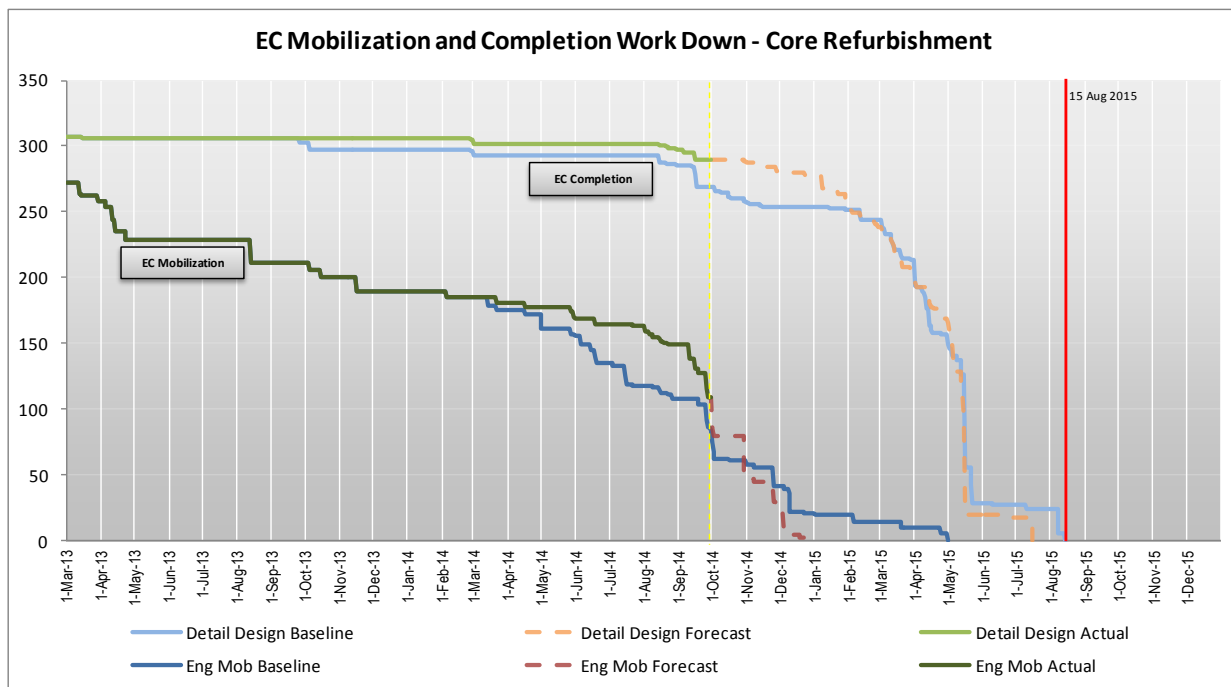

However, there has not been sufficient progress in the management of the engineering workload to remove the current challenge. This is based on on-going weaknesses in the management of engineering scheduled work to ensure overall ability to complete the workload, as well as monitoring the quality of engineering work to identify and correct adverse performance trends. The Nuclear Oversight Committee (NOC) of the OPG Board of Directors has also expressed concern over the ability to complete the large amount of engineering work by the engineering complete milestone of May 2015.

In response to this concern, a detailed design package work down curve was presented to the NOC at its November meeting. This diagram shows that the large majority of

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

engineering packages (225 of 300) will be completed between March 1 and May 15, 2015. The NOC has sufficient concern over the detailed engineering schedule that it has requested an update in January 2015.

It is noted that this curve represents the completion of engineering work associated with the core refurbishment projects. It does not include the remaining engineering work for the Campus Plan and Safety Improvement Opportunity (SIO) projects. This engineering work will require some of the same resources that will be used for the engineering for the core refurbishment projects. Since there is not a similar work down curve for the Campus Plan and SIO projects, it is not possible to assess the impact of this parallel work load. However, it is not trivial. At the December 19<sup>th</sup> engineering project meeting, a table was provided identifying the number of engineering packages managed by the refurbishment organization as 244 and the number managed by the Projects & Modifications (P&M) organization for the nuclear refurbishment as 421. In addition, there are an unknown number of station projects that are managed by the P&M organization that must be completed prior to the start of the Unit 2 refurbishment outage. One example for which assistance has been requested from refurbishment engineering is PHT LRV Modifications to address waterhammer issues. The total engineering effort for the first six months of 2015 includes the work for the core refurbishment projects, the Campus Plan projects, the SIO projects, and other prerequisite projects. The core refurbishment projects have a work down curve for the engineering packages, but the others don't - thus not permitting an assessment of the aggregate engineering workload.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

By its nature, the large engineering workload in a relatively short period of time introduces a challenge to maintain high levels of quality. The monitoring and trending of engineering quality are critical for a large project. During Q4, refurbishment engineering has developed an engineering quality dashboard of nine sections that include both quality results and quality enablers. One key indicator of quality is the number of engineering Event Free Day Resets (EFDRs) during the period. During the first three quarters of 2014, there were 4 EFDRs declared, while in Q4, there have been 5 declared. The likely cause of the increase in number is improvement in sensitivity of quality issues rather than degradation in quality. To provide a consistent measure of quality performance, a single quality indicator has been developed for the quarterly report to the ministry.

Engineering Quality Indicator =  $100 - 15 \times (\text{L1 events (rejection by external approving authority + rework after field installation)}) - 10 \times (\text{L2 events (rejection by internal approving authority + rework during field installation + other event free day reset)}) - 5 \times (\text{L3 events (other rework (greater than \$10K)})} + 1 \times (\text{GC (documented good catches prior to submission for OPG review to maximum of 10)})$ . The following values are used for the colour rating:

Green: >80

White: 65 – 79

Yellow: 50 – 64

Red: <50

Month	Index	Rating	Basis
October 2014	65	White	1 L1 event and 2 L2 events
November 2014	36	Red	2 L1 events, 1 L2 event, 5 L3 events and 1 GC
December 2014	70	White	1 L1 event, 1 L2 event and 1 L3 event
Q4/14	57	Yellow	

The Q4 indicator is 57, which represents a potential concern for quality. OPG management correctly states that its engineering change control (ECC) process is consistent with industry practices. However, the ECC process is one aspect of quality engineering. With the EPC contracting model is used for projects, an equivalently critical

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

process is the owner acceptance of design agency products. It is not clear that OPG's owner acceptance is fully aligned with industry practice. Given the cost impact and latent risk of engineering errors, it is recommended that OPG request WANO/INPO to perform a review of its engineering processes, specifically its owner acceptance of design agency products.

In conclusion, further management focus is required to support the timely completion of quality engineering packages.

**Incorporating Lessons Learned from the Campus Plan and Safety Improvement Projects**

With the acceptance of performance weaknesses the contract management of the Campus Plan and Safety Improvement projects and ESMSA contractors, there is a need for refurbishment management to take concrete actions to address the individual lessons learned to prevent similar performance in the core refurbishment projects.

The challenges associated with the Campus Plan and Safety Improvement Opportunity projects are well acknowledged by OPG senior refurbishment management, with routine updates to the Nuclear Oversight Committee (NOC) of the OPG Board of Directors. This challenge has been identified in the monthly reports to the MOE since April 2013. OPG is managing these projects for their completion prior to the start of Unit 2's refurbishment outage. Where completion is challenged (such as the D<sub>2</sub>O storage building project), an alternative project is under development to accomplish the requirement for Unit 2. Because of the increased oversight by the NOC and management's increased focus on these projects, it is felt there is no need to continue the specific challenge related to the performance of these projects. The performance will continue to be monitored and reported in the report's scorecard.

These projects have had a number of lessons learned that need to be effectively addressed by the refurbishment organization for the successful refurbishment of the Darlington units. Some of these are recognized by OPG senior management because they have resulted in direct impact on cost overruns and schedule delays. However, there are several that observations and monitoring of the daily activities of these projects. With the exception of refurbishment maintenance and work management, the monitoring of daily performance of these is not performed by refurbishment management. However, if refurbishment manager does not take concrete actions to prevent these (or similar) lessons learned these observations will have negative contributions to the ability for a successful refurbishment outage. These lessons learned and OPG's current ability to prevent a recurrence in performance is summarized in the following table.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Lesson Learned</b>	<b>Basis</b>	<b>OPG actions and effectiveness</b>	<b>Likelihood of recurrence</b>
Poor cost estimates	OPG recognizes that several of these projects were started and continued without the appropriate level of cost estimate.	There is increased rigour in the cost estimates for the core projects and revised estimates for these projects. This includes collaborative front end planning for a better understanding of the scope of work and the use of third party estimates for comparison.	Low
Poor execution schedules	Many of these projects started and continued without detailed schedules for engineering and field activities. There is an effort to recover this problem as the projects are in progress.	OPG is supporting the vendors in the development of detailed schedules. There is a requirement for detailed schedules as part of the gate review process. Currently there are struggles obtaining detailed schedules for engineering deliverables.	Medium
Completion of engineering prior to the start of field execution	These projects have started prior to the completion of engineering. Currently there are examples of design engineering delaying field execution in these projects. This will likely continue through the completion of these projects.	This is one of the high level lessons learned that OPG addressed through its infrastructure and milestones for the refurbishment project. That is the basis for having the engineering complete milestone a year prior to the start of the Unit's refurbishment outage. Even with the current challenges in managing the engineering workload, there is sufficient float to complete engineering by the start of execution.	Low

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Lesson Learned</b>	<b>Basis</b>	<b>OPG actions and effectiveness</b>	<b>Likelihood of recurrence</b>
Availability of parts when required	On several occasions there have been issues in obtaining the parts to support field execution. This has resulted in some delays and in some cases the acquisition of parts from the OPG warehouse. The ESMSA vendors have not been totally successful in managing the procurement process.	There are milestone for the identification of long lead materials (February 2015). However, the identification of parts will be done through the completion of engineering and start of assessing. A recent audit of the Alstom procurement process identified weaknesses in the tracking of materials and oversight of subcontractors. There is no reason to believe that this issue is isolated.	Medium
Quality and timeliness of CWP	Once engineering is complete, the information is converted to a Comprehensive Work Package (CWP) that is used for field execution. It is not uncommon to have the field execution delayed while waiting for the completion, review and approval of the CWP. In response to the problem with ESMSAs have with the development and approval of CWPs, refurbishment maintenance personnel have supported these projects.	Although the RFR project has started to generate CWPs, it is for the purpose of the class 2 estimates. The capability of the ESMSA to generate CWPs has not improved.	Medium

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Lesson Learned</b>	<b>Basis</b>	<b>OPG actions and effectiveness</b>	<b>Likelihood of recurrence</b>
Integration with the station work management process	The P&M organization has had trouble integrating its work through the station's on-line and outage processes. This has resulted in an overreliance on the use of scope injection, which frequently is rejected. The station has stated that the acceptance of work injection will be further curtailed in 2015.	Between the need to perform prerequisites in support of the start of the outage, the work to be coordinated prior to islanding of the unit and the return of the unit to service at the end of refurbishment there will be a significant amount of integration with the station and its processes. There are no specific actions to address this potential integration issue.	High
Coordination among contractors for common issues and processes	Several projects have had process issues with daylighting, dewatering, removal of contaminated soil, management of associated totes and RP support. Rather than have a lead in the management of such common processes, each project was left to its own to resolve the issues. This resulted in some delays and likely some increase in costs.	There will be common processes that will be used by multiple vendors; such as scaffolding, lifting and rigging, FME. A lack of coordination among contractors in such common processes increases the potential of delays and issues.	High

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Lesson Learned</b>	<b>Basis</b>	<b>OPG actions and effectiveness</b>	<b>Likelihood of recurrence</b>
Effectiveness of PCC and POD meetings	The PCC and POD are not effective at meeting the objective of driving the projects to maintain schedule, to coordinate among projects, to prioritize issues and resources and to identify and resolve issues before they impact field execution. This weakness includes the use of metrics and schedules at the daily POD meeting. For example, for many projects schedule performance is reported as 'on track' rather than use the schedule. Frequently the first indication of a risk was when the report states that the milestone will be missed.	The need for a PCC is recognized. However, its organizational structure, responsibilities and procedures are still under development. Because there is little understanding by refurbishment organization of the PCC and POD performance issues, there is little reason to believe that it will be more effective at this point.	High
Requirements to restart work when stop work order is initiated	There have been events after which OPG P&M or station management has stopped work. However, there no guidance provided to management on determining the criteria to restart work. This results in a reduction in the timeliness and sometimes effectiveness of the actions to restart work.	There is currently nothing in place.	High

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Lesson Learned</b>	<b>Basis</b>	<b>OPG actions and effectiveness</b>	<b>Likelihood of recurrence</b>
Management of subcontractors	These projects have had issues with the performance of subcontractors. Issues have included the delivery of engineering products in a timely manner, some engineering quality problems, timely delivery of parts, some quality issues related to parts manufacture, field execution rework and safety performance.	Similar issues have started with the management of subcontractors for core refurbishment projects.	High
Not effectively using station processes	There are a number of station processes which are required to be used by the contractors, but are not effectively implemented. These include work management processes, work protection, work authorization, event free challenge process, etc. Refurbishment operations and maintenance is assisting in facilitating the ESMSA contractors through some of these processes.	It is assumed that the contractors and subcontractors will have processes similar to the OPG processes. This is believed to be a contractual requirement. Processes have not been fully aligned or equivalent in the few cases that have been tested. For example, during Q4 there have been incidents involving lifting and rigging with both the Joint Venture and ES Fox. The initial Turbine Generator FME plan was rejected.	Medium

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Lesson Learned</b>	<b>Basis</b>	<b>OPG actions and effectiveness</b>	<b>Likelihood of recurrence</b>
Not responding to adverse trends in a timely and effective manner	These projects have had several issues. The organization has not been effective at identifying and addressing them in a timely and effective manner to reduce their impact on safety, quality, cost and schedule delays. This is a particular concern because this issue is similar to the cause of the Pt LePreau calandria tube insertion production and quality event.	Currently the refurbishment project organization does not have the processes to support the timely and effective response to an adverse trend in performance.	High

## 6. Status of Individual Projects

The Darlington Refurbishment Program consists of seven individual projects and a number of infrastructure projects (also called Campus Plan) and Safety Improvement Opportunity projects:

- Re-tube and Feeder Replacement (RFR)
- Fuel Handling/Defueling (FH)
- Turbine Generator and Controls (TG)
- Steam Generator and Auxiliary Systems (SG)
- Balance of Plant (BOP)
- Islanding
- Shutdown, Layup and Services
- Campus Plan
- Safety Improvement Opportunities Projects

## **6.1 Re-tube and Feeder Replacement Project**

The Re-tube and Feeder Replacement (RFR) project represents the largest scope and cost component of the Darlington Refurbishment Project. The RFR project will define the project's critical path and thus duration. As demonstrated by the schedule delays, cost overruns and performance issues in previous CANDU refurbishment projects, the RFR project also represents the largest risk to the project being completed on schedule and on cost. The RFR project consists of the removal and replacement of 480 pressure tubes, 480 calandria tubes, 960 end fittings and 960 feeder pipes for each of the Darlington four units. This requires the development, testing, manufacturing and maintenance of specialized tooling; the generation and verification of specialized procedures; and the training of the staff that will perform the field work. The project also includes the construction of a realistic reactor mock-up for the purposes of tooling testing, procedure verification and staff training.

The benefits of the mock-up started to be realized this quarter. Examples to date include:

- A dimensional discrepancy in the Re-Tube Platform (RTP) was identified and corrected.
- Validation of non-interference was validated, which removed one Temporary Modification (TMOD) from the vault. The removal of this TMOD results in a critical path savings of a few days.
- Panel locations and cable lengths have been verified.
- Tool Performance Guarantee (TPG) tests have started. Pressure tube (PT) cuts have been performed using the remote controls and the PT cutter. The cut was consistently performed within 20 minutes, which is about a factor of 3 better than the TPG.
- Tool integration testing has started and will be used in the development of the Class 2 estimate.

The tooling qualification testing continues and is currently on schedule. The strategy is summarized in the following diagram.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Establishment of a war room for the generation and review of CWP's in a timely manner.
- Have an OPG alignment meeting to establish a common understanding of the review process and turnaround times.
- Identify the key points and strategy for senior management oversight.

The OPG-JV Oversight Committee will monitor the progress of the Class 2 estimate as well as provide the initial reconciliation of differences in inputs into the estimate. This reconciliation effort will be highly active during the first quarter of 2015 in order to support the submission of mid April.

The design and construction of the Retube Waste Processing Building (RWPB) is required to be in-service by April or May of 2017 to support the RFR critical path. It is currently scheduled to be ready in January 2017, which provides little float between the planned and needed dates. The project is undergoing similar issues as the Campus Plan projects associated with the potential of underground services, as well as the management of potentially contaminated soil and water. In addition, it has several tie-ins with station services (civil, mechanical, electrical and instrumentation & control) and will require a large number of caissons. In the December oversight meeting the JV identified that approvals were being sought to extend the engineering completion date and schedule relief. In addition, a number of issues/opportunities were identified in meeting schedule and cost estimates. These included the engineering process to be followed and the quality requirements for the temporary building. The VP-Execution identified several actions to support the timely resolution of issues:

- Have the RFR team identify all issues to the senior management team and conduct a weekly meeting to address progress in their resolution.
- Establish weekly meetings with the station to identify and obtain needed support.
- Determine if it is possible to have building constructed as 'owner-only', which reduces the complexity of the engineering and quality processes.
- Include an RWPB dashboard in the monthly oversight meeting.

## **6.2 Fuel Handling/Defueling Project**

This project consists of two main subprojects – the defueling of the reactor to start the outage and the refurbishment of the fuel handling equipment and associated systems. An initial contract has been awarded to GE-Hitachi for equipment supply and technical support during the planning and execution of the defueling subproject.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

The most significant risk with this project is the reliability of the fuel handling equipment. At the current performance level, the equipment is challenged to meet current operational demands to fuel four operating units. However, the reliability will need to improve to meet the required duration to defuel the reactor, for installation of the bulkhead, and to support the fuel handling refurbishment schedule. Darlington station and refurbishment management initiated an upgrade project in the first quarter of 2013. Some work was accomplished through 2014, the most significant being the repair of the coarse drive for the trolleys. The Fuel Handling Equipment Reliability Index (ERI) showed improvement during the first three quarters of 2014, but then showed a negative trend in October and November, as seen in the below table. Although the trend is not a significant concern, the amount of work that is required to have confidence in the performance of the fuel handling equipment during the defueling of the reactor is significant for the next 18 months. This was recognized by the Executive Steering Committee at its Q4 meeting, in that they requested a detailed plan be developed for the recovery of the fuel handling equipment for the Q1, 2015 meeting. The draft plan was presented at the December 17<sup>th</sup> Fuel Handling Equipment Reliability Committee meeting. A number of the elements are identified at risk. The highest risk is associated with the return to service of the Service Area Rehearsal Facility (SARF). It has been idle for several years, and requires considerable work for it to be able to be used to support the defueling project.

	<b>Q1/14</b>	<b>Q2/14</b>	<b>Q3/14</b>	<b>Oct-14</b>	<b>Nov-14</b>
<b>ERI</b>	67%	71%	74%	70%	62%

The project has decided to replace the fuel trolley track system with the identical track. This reduces the cost and complexity of the work, including the elimination of the need to perform modification engineering.

### **6.3 Turbine/ Generator Project**

The scope of the Turbine/Generator includes:

- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of generator components (including generator stator rewind) and a number of generator auxiliaries,
- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of High Pressure (HP) and Low Pressure (LP) turbine components and a number of turbine auxiliaries;

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Moisture Separator Reheater (MSR): inspection, overhaul, and/or replacements of MSR internals and auxiliaries (e.g. strainers, valves);
- Turbine Control Upgrade: replacement of the obsolete analogue Steam Turbine Electronic Control (STEC) System, includes entire Turbine Supervisory System with modern design (digital system); and
- Generator Excitation Upgrade: replacement of the analog Generator Excitation system controls with a digital design and a set of additional Generator Excitation and Protection equipment to resolve obsolescence issues.

A contract was awarded to Alstom for the design and delivery of the digital controllers as well as technical support during the execution of the project. The design work by Alstom is mainly on schedule on schedule, with some delays in the controllers that are not being included in unit 2's refurbishment.

The TG engineering integration and field installation vendor (SNC/Aecon Joint Venture (JV)) has submitted a class 3 cost estimate and a level 4 schedule for field execution. The JV has started the work for the Class 2 estimate, which has a milestone of the end of March. OPG senior management has communicated the expectation of efficiency gains (and thus cost reductions) since the JV has both the RFR and TG projects. The one small complication in the development of the Class 2 estimate is the fact that Unit 2's refurbishment does not include the modifications (including digital controllers). This results in reduced certainty in the overall Class 2 estimate.

This project is unique in that it includes one company (Alstom) providing the design and manufacture of equipment and technical expertise during the actual TG refurbishment and modifications, and one company (the Joint Venture) providing the interface engineering and the construction. This unique model requires increased oversight and integration by OPG, since the two companies are not fully integrated for the project.

#### **6.4 Steam Generators**

The Steam Generator project had its first senior management oversight meeting on November 24, 2014. Although the format of the meeting package was not aligned with the oversight meeting packages of the other projects, it did cover safety, quality, schedule and cost.

The Engineer Procure Construct (EPC) contract has been awarded to a consortium of Babcock & Wilcox Canada and Candu Energy Inc. The project consists of maintenance activities and modifications to meet the requirements of its Life Cycle Management Plan. This includes:

- Tube sheet waterlancing to address possible degradation from sludge accumulation

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Installation of access ports to improve secondary side inspection capabilities for future inspection outages
- Primary side tube cleaning to improve overall thermal efficiency, increase neutron overpower margin and reduce radiation fields
- Divider plate leakage characterization to establish a baseline for cross flow between the cold and hot legs of the SGs
- Primary and secondary side ultrasonic, eddy current and visual inspections

Progress to date includes the completion and OPG acceptance of:

- Project Management Plan
- Project Controls Plan
- Engineering Plan
- Site Infrastructure Layout Plan

The status of the individual subprojects is:

- Access Port
  - Deliverables for project mobilization have been completed and accepted.
  - Detailed design report submitted.
  - Design review for Access Port Tooling completed.
- Waterlancing
  - Deliverables for project mobilization have been completed and accepted.
  - Design reviews completed for waterlancing tools
- Primary side cleaning
  - Deliverables for project mobilization have been completed and accepted.
  - Optimization test phases 1 and 2 of 4 complete
  - Preliminary engineering completed for all subsystems, with the exception of waste collection
- Primary side layup
  - Baseline schedule accepted by OPG
  - Design plans for manway cover completed and accepted

The contract is mainly fixed price. The overall SPI, as of the end of October is 0.89.

#### **6.4 Balance of Plant Project**

The Balance of Plant (BOP) scope consists of plant modifications and maintenance work in the following areas:

- Pre-refurbishment work
- Safety and Control Systems
- Reactor component systems
- Conventional Systems

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Common Systems

The changes to the contracting strategy for the BOP delayed the awarding of the contracts and the start of engineering. All 13 engineering contracts have been awarded, with a large number being awarded to ES Fox. To reduce the potential of having similar engineering issues as it has in the Campus Plan and Safety Improvement projects, ES Fox has engaged a number of engineering companies as subcontractors, rather than rely on a single company. These projects are too early in the engineering phase to assess the effectiveness of this strategy.

The impact of the late implementation of the strategy is a risk to meeting the May 2015 milestone for the completion of engineering.

## **6.5 Station Readiness Projects**

There are a number of core refurbishment projects that are critical to support the refurbishment of the unit, but do not provide refurbishment of equipment. These are:

- Islanding projects. These projects are required to establish the physical and administrative separation of the refurbished unit from the operating plant, as well as separate a number of common areas for the duration of the refurbishment outage.
- Shutdown/Layup projects. These projects are in place to shutdown and layup individual systems at different stages and for different durations through the unit's refurbishment outage. This is required to protect the systems against corrosion and other damage mechanisms when not in normal operation.
- Services projects. These projects provide the needed services to support the unit's refurbishment outage. Such services include electrical, breathing air, service air, instrument air, and water.

In general, the Islanding projects are making use of the other contracts that align with its work in the same or adjacent area. For example, the EPC contract for the installation and removal of the bulkheads has been awarded to the R&FR Joint Venture. This is a sound decision since the JV has the most to gain from the timely installation of the bulkheads, there is elimination of coordination issues in the vault, and the required capabilities for the two projects are similar.

Since the strategy to perform the Shutdown/Layup and Services projects is the same as for the BOP projects (use of the ESMSA contractors), the issues, response and risks that were identified under BOP also exist for these projects.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**6.6 Campus Plan and Safety Improvement Opportunities Projects**

The Campus Plan represents a number of infrastructure projects to support the refurbishment of the Darlington units. In addition, the campus plan includes the Safety Improvement Opportunity projects that OPG committed to the Canadian Nuclear Safety Commission (CNSC) through the Environmental Assessment process. The Campus Plan projects are being executed by the two ESMSA contractors and managed by the Projects and Modifications (P&M) organization on behalf of Darlington Refurbishment and include the following projects:

- D<sub>2</sub>O Storage Building
- Low Pressure Service Water Line Relocation
- Water and Sewer Upgrades
- Auxiliary Heating System
- Refurbishment Island Annex
- Power and Electrical
- OSB Refurbishment
- Emergency Power Generator #3 (Safety Improvement Opportunity)
- Powerhouse Steam Venting System (Safety Improvement Opportunity)
- Containment Filtered Venting System (Safety Improvement Opportunity)

These projects must be completed prior to the first unit's outage. The sheer amount of work associated with these projects represents a risk to the refurbishment project. It has taken close to a year for refurbishment management to recognize the severity of the challenge. The external oversight team identified significant issues related to the Campus Plan projects (specifically the D<sub>2</sub>O Storage Building and the Auxiliary Heating System) in its May 13<sup>th</sup> report to the OPG Board. This represented the accumulation of an adverse trend that was identified in early 2013 to a significant issue that was identified in early 2014, with the start of being address during the second quarter and has continued through the third quarter. Although there have been several actions in response to the performance issues, there remains a significant effort required for the completion of the projects prior to the start of the Unit 2 refurbishment outage. Key aspects of the current status include:

- [REDACTED]  
[REDACTED] In addition, OPG is directly managing the civil

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

construction work while a revised plan and alternative contracting strategy is developed and implemented. OPG is also developing a contingency plan for the storage of the heavy water for the Unit 2 refurbishment outage. Because of the current status of the project, there is a need for a superseding business case for the project, along with a detailed cost estimate and schedule. This is expected to be provided to the OPG Board for approval in January 2015.

- Design engineering for EPG3 project (SIO project) was completed and accepted by the Design Authority in December 2014. The installation of the fuel lines has been delayed. It requires close integration with the station, which has been challenging during Q4. With the station's Vacuum Building Outage in the first half of 2015, the project will have a struggle to obtain the required support to accomplish key activities. The most significant risk for the project is the required station commitment and resources to conduct the commissioning of EPG3 after its construction and installation. The current schedule has an in-service date of September 2015.
- The AHS (Campus Plan project) project made good progress in the civil construction of the building in Q4. Engineering delays have resulted in a risk to meeting the completion milestone of July 2015. There was a vendor quality issue in the construction of the system's deaerator. Although it was identified by ES Fox in a pre shipment inspection, it does highlight the need for a strong inspection and quality program for all parts and materials.
- Installation work for the Powerhouse Steam Venting System (PSVS, an SIO project) started in Unit 2 in early December. This project is on schedule to meet the Available for Service (AFS) milestone of October 2015.
- The Shield Tank Overpressure Protection (STOP, an SIO project) has engineering complete and is on schedule to meet its AFS milestone of April 2016.
- The Containment Filtered Venting System project (CFVS, SIO project) had design engineering packages accepted by the Design Authority in December 2014, meeting its milestone for completion of engineering. There were issues related to the first VD10 tie-in. Although there was significant amount of oversight, including the use of OPG's Event Free Challenge process, the tie-in was not started on the scheduled weekend. This was a result of the required valve not being delivered, the realization that a scaffold was needed for installation and the cancelation of the window by the station. In this case, the event free challenge process was not effectively implemented. However, there was not an SCR initiated to ensure lessons were learned and addressed prior to the VD9 tie-in. The second attempt for the tie-in also failed as a result of an inadequately engineered scaffold. The third attempt was successful.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

In conclusion, the Campus Plan and Safety Improvement projects are behind schedule and thus pose a risk to the start of Unit 2's refurbishment outage. OPG refurbishment management continue to drive completion of projects.

## 7. Oversight of the Darlington Refurbishment Program

Both OPG and the Ministry of Energy (MOE) understand the need for a successful refurbishment for the Province, the company and the industry. In line with that importance, the Minister of Energy established the role of independent advisor and OPG established the role of an external independent oversight team reporting to the OPG Board. This team consists of individuals from the companies Burns & McDonnell and Modus.

The OPG external independent oversight team issued its Q4 report to the OPG Board in November 2014. A summary of the issues and status identified in the report and alignment with the MOE's reports is provided in the following table:

<b>OPG External Oversight Assessment</b>	<b>MOE Assessment</b>	<b>Comments</b>
Campus Plan projects continue to have schedule and cost risk (particularly the D <sub>2</sub> O Storage project). There is considerable focus on the D <sub>2</sub> O Storage project because of its magnitude and issues. It is acknowledged that the AHS will not be ready for the VBO outage. P&M's efforts to develop and update Campus Plan projects have had mixed results. These schedules require improvement in critical path definition, logic and resourcing.	The Campus Plan and SIO projects remain rated as Red based on cost overruns, schedule delays, quality issues and some safety performance events.	Consistent alignment between the two groups.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>OPG External Oversight Assessment</b>	<b>MOE Assessment</b>	<b>Comments</b>
Based on the results of the 4d cost estimate, management is committed to not exceeding the \$10B (2013\$) cost.	The current challenge is the sustainability of the assumptions and opportunities identified in the 4d cost estimate.	Both recognition of the need to maintain the total cost within the bounding estimate of \$10B (\$2013).
The concerns of late tooling impacting the quality or timing of the class 2 estimate has been alleviated as a result of the JV's tooling recovery plan. As of the end of September, detailed engineering was 53% complete, with some delays. Class 2 estimate is progressing slowly. There is concern over the design, construction and commissioning of the Retube Waste Processing Building (RWPB).	Good progress in the tooling performance testing, although more effort on the tooling movement, setup, changes and teardown would be useful to determine the overall time for the retube of the reactor. Concerns expressed in the development of the class 2 estimate as well as the design and construction of the RWPB.	Good alignment between the two groups.
The oversight team supports the increased engagement of engineering with the design agencies. The team believes that the majority of engineering work will be completed by May 15, since the work at risk is BOP, Shutdown/Layup and additional facilities, which represents 8% of the total direct cost of the project. The team acknowledges that the current engineering work down curve can be achieved by May 15 <sup>th</sup> , and if the curve is accurate the required effort will overstress OPG engineering resources during the approval cycle.	Remains as a program challenge and red rating due to the immature engineering schedule or work down curve at the EC level, immature quality dashboard, and not reviewing these indicators at a senior management project forum. The lack of effectively managing the engineering workload challenges meeting the engineering complete with quality.	There is not alignment between the two groups in the progress made in the engineering function.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>OPG External Oversight Assessment</b>	<b>MOE Assessment</b>	<b>Comments</b>
Concern for the need of the ESMSA contractors who have recently been awarded contracts to mature rapidly to make up for the initials delays resulting from the changes in OPG's contract strategy.	Concern remains over OPG's performance in managing the work of the ESMSA contractors to meet high performance standards related to safety, quality, cost and schedule.	There is good alignment in this area.

**8. Alignment with the Principles of the Long Term Energy Plan**

The MOE's 2013 Long Term Energy Plan identified seven principles by which it expects OPG and Bruce Power to follow in the development and execution of their respective units. The following table provides observations which demonstrate alignment by OPG as well as opportunities for additional alignment.

<b>Principle</b>	<b>Observations of Alignment</b>	<b>Possible Opportunities</b>
1. Minimize commercial risk on the part of ratepayers and government.	<p>The majority of DNR contracts are fixed/firm price with the remaining tied to cost and schedule performance.</p> <p>Commercial individuals embedded on each project team to manage commercial risk.</p> <p>Project scope has been defined to the component level, and detailed engineering will be completed prior to the start of construction.</p> <p>OPG has invested in a reactor mock-up and training facility, to perform full testing of the tools, processes and procedures, as well as train staff prior to performing work on the actual reactors.</p> <p>The contract with SNC/Aecon includes provisions that allow OPG to take over the tooling and the mock-up at the conclusion of the Definition Phase if the parties are unable to negotiate the target price contract for the Execution Phase.</p>	<p>Incentives in the RFR contract were developed and established on the basis of four unit performance, allowing the RFR contractor to make-up cost overruns and schedule delays to the first unit on subsequent units. However, the LTEP prioritizes the urgency of a success on Unit 2. This will need to be included in the Class 2 estimate for the RFR and TG projects.</p>

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Principle	Observations of Alignment	Possible Opportunities
2. Mitigate reliability risks by developing contingency plans that include alternate supply options if contract and other objectives are at risk of non-fulfillment.	<p>One DNR contingency action contributing to this principle is the decision to start the second unit after unit 2, rather than overlapping the units.</p> <p>In addition, the effort to improve the reliability of fuel handling equipment reduces the chance that fueling of the operating units will be reduced during the defueling of the refurbishment unit.</p>	
3. Entrench appropriate and realistic off-ramps and scoping.	<p>Each contract has an off-ramp for termination. Reimbursement limited to reasonably incurred costs.</p> <p>Each unit requires unit-by-unit approval provide well-defined off-ramps.</p> <p>A scope review by senior management was completed in Q4/13 to reduce scope to work required for life extension or can only be done in drained/defueled state.</p> <p>The yearly release strategy and gating process for funding individual project initiatives has wide visibility and adherence within the DR Team.</p>	Ensuring the scope that is required for life extension, though performed outside of the DR Project, is staffed, funded and executable.
4. Hold private sector operator accountable to the nuclear refurbishment schedule and price.	Not included in this oversight.	
5. Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price.	<p>Schedule accountability is built into each contract. The contractor is required to provide a detailed schedule for planning (and later execution). This schedule is reviewed monthly during planning phase.</p> <p>Cost accountability is built into contracts to establish target cost and incentives/disincentives.</p>	<p>The estimating process has undergone changes as a result of the significant variances between the contractors' estimates and OPG's estimates.</p> <p>The RQE will require work to reduce the assumptions by contractors that contribute to potential higher than planned contract values.</p>

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Principle	Observations of Alignment	Possible Opportunities
	<p>Monthly senior level meetings OPG are improving its oversight to monitor performance.</p> <p>Each OPG project team includes Project Controls member to monitor and report cost and schedule performance.</p> <p>OPG has chosen to perform the work in the Execution Phase on a target price basis which increases the contractors' transparency. This will enhance OPG's ability to resolve issues as they arise.</p> <p>There is an executive steering committee for major projects that includes the CEOs and senior executives of OPG and he contracted vendors.</p>	
<p>6. Make site, project management, regulatory requirements and supply chain considerations, and cost and risk containment the primary factors in developing the implementation plan.</p>	<p>Site and regulatory requirements are the inputs to the defined scope.</p> <p>The Unit 2 execution organization is being defined and filled. It will likely be fully established in Q2, 2015.</p> <p>There is an agreement between the station and refurbishment on the condition that the unit will be turned over to the project and then returned to the station.</p> <p>The program is being managed in accordance with PM Institute standards and INPO project principles.</p> <p>Cost estimate process used Association for Advanced Cost Engineering (AACE) best practices. Cost estimate is understood by team and the cost ceiling is routinely communicated to staff.</p>	<p>Improve the ability to identify and address adverse trends in performance in a timely and effective manner.</p>

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Principle	Observations of Alignment	Possible Opportunities
	<p>Risk management is recognized as a key element of success, a program is in place, but its implementation requires improvement.</p>	
<p>7. Take smaller initial steps to ensure there is opportunity to incorporate lessons learned from refurbishment including collaboration by operators.</p>	<p>To fully incorporate lessons learned from the first unit's (Unit 2) refurbishment, the second unit's (Unit 1) start has been delayed until the completion of the first unit.</p> <p>If appropriate, other units may be able to be delayed to continue this risk reduction. However, this will likely result in an overall increase in cost.</p> <p>To reduce risk for the first unit, the decision was made to install its digital controller in a future outage.</p> <p>To prevent the risk associated with single source suppliers of key reactor components, OPG has qualified second vendors for key components. This will help Bruce Power with an associated materials risk.</p> <p>Bruce Power and OPG refurbishment organizations have started to cooperate in several areas, summarized below.</p> <p>OPG and Bruce Power have negotiated Project Agreements with the Building Trades Unions.</p>	

OPG and Bruce Power refurbishment management have met on two occasions to develop areas in which they can be mutually supportive. The next meeting is planned for January 2015. The following are areas in which collaboration is being sought by senior management:

- Common dose management initiative aligned with EPSCA.
- Project dose estimates.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Use of 10 hour days with staggered starts to permit around the clock coverage.
- Evaluate performing system drain and dry in parallel with bulkhead installation.
- D<sub>2</sub>O storage techniques
- Camera protocols used by Bruce Power in its previous refurbishment outages.
- Balance of Plant preventive maintenance strategy.

## **9. State of Readiness**

The Nuclear Refurbishment program is fully into its Definition Phase to support the successful execution of Unit 2, starting in October 2016. There are several areas that provide high confidence that the organization is tracking to a high state of readiness by this time; including:

- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. There has been agreement with the CNSC on the Integrated Improvement Plan, with written acceptance expected by the end of December, 2014.
- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The remaining challenge is to identify the period to perform non-refurbishment outage work that is required for life extension.
- Project management processes and oversight monitoring are in place for the project. These include schedule performance, cost performance, scope control and risk management.
- The 4d cost estimate was submitted to the OPG Board in November, 2014. It maintains the overall cost to be within the bounding case of \$10B (\$2013). The Release Quality Estimate (RQE) (scheduled for October 2015) needs to sustain the assumptions and opportunities that contributed to the basis of the 4d cost estimate.
- The project management and support organization is in place for the Definition Phase and assembly of the execution organization has started.
- Contracts are in place for the Definition Phase to ensure planning is complete prior to Unit 2 breaker open. This includes the completion of engineering, the

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

purchase orders for parts and materials, work procedures, and the establishment of execution contracts.

- To date, over 95% of the non project scheduled work is being completed. This includes on-line work and outage work. However, work that is planned and is not ready is not scheduled. As a result, this is not the best performance indicator of completing work to be ready for the refurbishment outage. Starting next quarter the percentage of planned work that is completed will be reported.
- There is a draft Level 1 plan for Critical Path of the execution phase of the program. This can be reviewed, along with its basis, to identify initial risks for execution.
- The Class 2 estimate for the Re-Tube and Feeder Replacement project is under development with a target completion date of April 2015. There are several challenges in meeting this date with the alignment between the JV and OPG, resulting in increased oversight by the project management team and the project steering committee.
- Work is well underway to refine the Level 1 execution plan to better define Critical Path as well as define the non critical path windows with logic ties.

However, there are challenges that OPG need to address to increase the state of readiness to a comfortable level. These include:

- The assumptions and opportunities that make up the 4d cost estimate need to be sustained through the establishment of the Release Quality Estimate.
- Management of the detailed design engineering workload to ensure that the May 2015 milestone for engineering to be completed is met with quality products.
- The current performance of the ESMSA contractors has resulted in a risk that some work required for the start of refurbishment may not be completed. OPG is working with senior management of the ESMSA vendors to implement actions to improve performance and meet milestones.
- Refurbishment management needs to implement concrete actions to prevent the performance issues that occurred during the Campus Plan and Safety Improvement Opportunity projects.
- The initiative to improve the reliability of fuel handling equipment needs to start making progress in the development and implementation of detailed plans in order to obtain confidence that defueling and bulkhead installation will meet their Critical Path Duration.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Although there are specific challenges that OPG needs to successfully overcome, they continue to have established the framework that is needed to be ready to successfully execute the refurbishment of the four Darlington units beginning with the first unit in October 2016.

## **1. Minister Summary**

This report provides the detailed quarterly review of trends, accomplishments and challenges related to the Darlington Nuclear refurbishment project. The project is reaching a critical phase, with completion of Definition Phase by yearend of 2015 and the start of execution of some core refurbishment projects in the second quarter of 2015. Between now and breaker open the refurbishment organization will be executing projects associated with the Re-tube Waste Processing building, refurbishment support facilities, services and shutdown/layup projects.

Refurbishment management is progressing well towards being in a state of readiness for breaker open. This progress includes:

- The Life to date total cost of the project as of the end of February 2015 is \$1,682M, which is \$135M below the plan of \$1,817M.
- The Release Quality Estimate is currently under development to meet its October 2015 milestone. The RQE will include the cost estimate for the four units, the Level 1 plan for the four units and Level 3 schedule for Unit 2, the refurbishment outage scope for each unit and the execution strategy.
- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. There has been agreement with the CNSC on the Integrated Improvement Plan, with written acceptance tied to the Darlington operating license renewal process, scheduled in 2015.
- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The work not performed as part of the refurbishment outage will be executed by the station and Projects & Modifications.
- Although there is a challenge to meet the August milestone, engineering will be complete in sufficient time before breaker open to support downstream activities, such as the order of materials and generation of field execution instructions.
- Scope and responsibilities of functional departments are documented in Functional Management Plans, assumptions on the support needed for each project have been identified and documented, and responsibilities for the transition of the unit between Darlington Operations organization and refurbishment organization have been accepted by both.
- The project management and support organization is in place for the completion

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

of the Definition Phase and the transition into the execution phase has started.

- The assembly of the execution organization has started. There is the commitment to hire a construction management company to support the project's execution phase. In addition, an Executive Performance Assurance Group will be established to provide execution oversight.
- Contracts are in place for all projects to complete the engineering and develop the estimate (cost and schedule) required for the RQE.
- The Class 2 estimate for the Re-Tube and Feeder Replacement project is under development. There are several issues that still need to be resolved to OPG's satisfaction. These issues have resulted in an increased, yet appropriate level of oversight by senior refurbishment management and OPG's CEO.
- The RFR full scale reactor mock-up is proving to be a valuable asset in the verification of tool designs and validation of Tooling Performance Guarantee (TPG) durations. Its value will increase in the refining of the procedures for the reactor face series, and the training of re-tube face and feeder replacement personnel.
- Pre-production qualification runs for the major reactor components are well in progress.
- The on-boarding center, fully operational in the first quarter, has significantly improved the time it takes for individuals to complete administrative, security, training and radiation protection tasks in order to obtain site access.

Although OPG is making good progress towards breaker open readiness, there are a number of issues that need to be resolved to increase the comfort level of successful execution. These include:

- Probably the most significant need is for the refurbishment organization to demonstrate effective execution of field work in 2015 and 2016. The current focus on execution is to put the infrastructure (processes, facilities and organization) in place for breaker open. However, the current execution of prerequisites provides an opportunity to ensure contracts are effectively managed and contractors perform to the expected standards. In addition to addressing performance issues as they arise, management needs to incorporate lessons learned from the Campus Plan and SIO projects during this early execution phase.
- However, with the lack of high performance in the Campus Plan and SIO projects and the JV's RWPB, there has been little demonstration of effective management

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

of contractors to perform field execution to high performance standards. This demonstration should be led by the core refurbishment execution team, and encouraged prior to breaker open.

- Tied to execution is the fact a good fraction of the work is first time execution for the vendor, very infrequently performed work or first of a kind method. This refurbishment outage is the first time for the Joint Venture to execute a re-tube and feeder replacement. It is the first time in a decade for B&W to clean the Darlington steam generators. And the equipment and process for the handling and reduction of re-tube radioactive waste is first of a kind. OPG has taken a number of actions to mitigate the risk – the most visible being the full-scale reactor mock-up. The need for OPG to have effective oversight and the ability to identify and respond to degrading execution performance is essential for project success.
- There is confidence that the RQE will be completed on time. However, there is a risk that the JV's target price plus requested contingency will exceed the class 4d estimate by a sufficient amount to have a target price not achieved. OPG and the JV are working diligently to resolve a number of remaining issues. A failure to achieve an acceptable target price will require OPG to implement an alternative plan in a relatively short period of time.
- The performance of the fuel handling equipment during the defueling of the reactor will set the stage for the first phase of the refurbishment outage. The station has an initiative to improve fuel handling equipment reliability. This initiative is challenging, and is being monitored by a station oversight committee and the Defueling Project's senior management oversight committee.

In summary, OPG has the infrastructure and framework for execution of the outage at the time of breaker open. The ability to demonstrate successful execution of projects and initiatives during the next 18 months will be needed to provide confidence in the ability to effectively execute the outage.

There have been several upcoming changes within the refurbishment organization identified this quarter. The President and Chief Executive Officer, Tom Mitchell, has notified the OPG Board of Directors of his intention to resign when a replacement is identified. Glenn Jager has been appointed President of OPG Nuclear and Chief Nuclear Officer. This will continue the current situation of one senior executive having responsibility for both nuclear operations and the Darlington Refurbishment Project. In addition, the Director of Operations and Maintenance (DOM) and the Maintenance Manager have notified the organization of their upcoming retirement. The new DOM will be the fourth in just over two years, a challenge to both knowledge retention and consistent direction within that organization.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

The challenges that were identified in the fourth quarter continue to exist, with some change in focus to assist OPG in understanding their significance. These challenges represent performance trends that should be addressed to reduce the possibility of becoming significant issues.

The first challenge is related to the management of the large engineering workload. The milestone for the completion of engineering is August 15, 2015 with an early date of May 15<sup>th</sup>. There is a significant number of engineering packages (over 250) that require to be approved by the Design Authority in this period. Even if the milestone is not met, there will be little impact on the quality of the Release Quality Estimate or the ability to be ready for breaker open. The concern is the potential impact on the quality of the design engineering products from the possible perceived time pressure combined with the robustness of OPG's owner acceptance process to identify quality issues in design products. Since engineering errors are latent in nature (not likely detected until installation, commissioning or operation), it is important that there is strong confidence in the owner acceptance process and its effective implementation. That is the basis for a recommendation that WANO be requested to review OPG's process for rigor and implementation. The Vice President of Refurbishment Engineering has recently expressed concern regarding the current level of design engineering errors. He is planning a stand down for all engineers to reinforce quality expectations, and is considering a request to WANO for a review.

The second challenge is for refurbishment management to implement robust actions to address the many lessons learned from the problems and issues seen in the planning and execution of the Campus Plan and Safety Improvement Opportunity projects. Actions have been implemented for the planning (definition) phase of the project. Actions for the execution phase are still in early development. Although this is sufficient time for breaker open, there is a need to take selective actions to manage the execution of core projects scheduled for 2015 and 2016.

The third identified challenge is related to the Release Quality Estimate. OPG has an infrastructure in place for its development and has hired KPMG to provide an independent assessment of the process and results. The current challenge is to address a number of the issues of which OPG has knowledge and is addressing. In particular, since the RFR project represents the largest component of execution, the ability to reach an acceptable target price with the Joint Venture (JV) is the largest risk. Identified issues are being worked by the RFR project team and the JV, with an appropriate amount of participation and oversight by the senior management of all involved companies.

## **2. Purpose of Report**

This quarterly report provides a more detailed review and expansion of the monthly reports to the Ministry of Energy of OPG management's progress to plan and execute a

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

successful refurbishment outage of the Darlington nuclear units. Success is defined as the preparation and execution of 100% of the correctly identified project scope safely, on schedule, within budget and with quality. It is the belief of the MOE's Independent Oversight Advisor that the Refurbishment Program Challenges that are identified in Section 5 deserve consideration by OPG Refurbishment management. It is the intention to identify such challenges when they represent an early trend rather than wait until they become a significant issue.

**Basis for Scorecard Ratings**

Safety Performance and Preparations for Unit 2– YELLOW

Execution of the Campus Plan and Safety Improvement Opportunities (SIO) projects has had a number of safety events during the last quarter of 2014 and first quarter of 2015. The trend includes events related to lifting and rigging; work at heights and vehicle movement. P&M management has initiated an adverse trend investigation in response to these events. In addition, the contractors have taken actions to improve safety performance, including strengthening field observation and coaching and reinforcement of standards during pre-job briefings and supervisory turnover.

During the first quarter OPG decided to cancel the request for proposal for radiation protection service and perform it themselves. OPG has high standards in radiation protection and the program to support them. The challenge for OPG is to establish the infrastructure to be prepared to train with RFR and execute RP services, as well as have radiation protection oversight of the effectiveness of the services.

Regulatory Approvals – WHITE

The CNSC provided a letter to OPG stating that the revised Integrated Implementation Plan (IIP) meets the intent of CNSC regulatory document RD-360. The CNSC staff accepts OPG's IIP Revision 001 with implementation of specific changes that were documented in the letter. The changes are required to be made in the document's revision for submission to the CNSC in support of the 2015 licensing renewal for the Darlington nuclear plant. The IIP represents OPG's commitment to the CNSC in response to findings of the Environmental Assessment and Integrated Safety Review.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Risk Management – WHITE

There was one Risk Oversight Committee meeting during the first quarter of 2015. The Risk Management program has identified Nuclear Refurbishment Key Risk Areas, which are the result of an aggregate analysis of the risk registry. They have management sponsors who are responsible to monitor the progress of the individual risks associated the area for the development and implementation of mitigating action plans. These Key Risk Areas and status are:

- Availability/Retention of Key Staff (identified as improved from Red to Yellow risk)
- Cost and Estimating Management (identified as improved from Red to Yellow risk)
- Completion of Unit 2 Prerequisites (remained as a Yellow risk)
- Regulatory Approvals (remained as a Yellow risk)
- Fuel Handling Reliability (remained as a Yellow risk)
- Vendor Default/Continuity Planning (remained as a Yellow risk)
- Integrated Schedule Development (remained as a Yellow risk)
- Timely Procurement of Materials (remained as a Yellow risk)
- Completion of Engineering (remained as a Yellow risk)
- Integration with External Organizations (remained as a Yellow risk)

There has been some improvement in the development and implementation of mitigating actions to reduce the individual risks associated with these key areas.

During the first quarter there has been an increased focus on the development of the contingency funding for both program and project risks. This work is required to support the generation of the Release Quality Estimate. The methodology for quantifying the contingency value for risks was assessed by Palisades Corporation, the provider of the software that OPG is using for contingency funding determination. The assessment concluded that the documentation and methodology to build the Contingency Calculation inside the Risk Management process are consistent with quantitative risk management best practices that Palisade aligns with during its consulting engagements. The report also states that the execution of the model needs optimization, and some improvements could be made to increase the accuracy of this result. The report provided a number of recommendations to support this improvement.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Release Quality Estimate (RQE) - YELLOW

OPG has created a strong focus during the first quarter to meet the October 2015 milestone for the RQE submission. The RQE has four major deliverables:

- The cost estimate for the refurbishment of four units, including contingency. This requires a detailed understanding of the basis and assumptions for the outages and the associated risks.
- A schedule for the four units – detailed for level 2 and high level for the remaining units.
- Confirmation of the scope of the project and specifically Unit 2. This not only includes the scope of the refurbishment outage but also the commitments to the CNSC tied to the unit's return to service but assigned to the station.
- The Execution Strategy for Unit 2. This includes many items that have not been effectively implemented during execution of the Campus Plan (CP) and Safety Improvement Opportunity (SIO) projects. These are described in the challenge for incorporating lessons learned from the CP and SIO projects.

The project has a dedicated team and plan for the generation of the RQE. Key deliverables that will be monitored for the Minister of Energy are:

- The refurbishment team will develop and document the RQE Basis and significant assumptions. The first draft of the RQE basis scheduled for April 1<sup>st</sup>.
- Ongoing resolution and finalization of issues related to assumptions and the Basis of the Estimate is scheduled for June 1<sup>st</sup>.
- Design Authority approval of engineering deliverables for modifications by August 15<sup>th</sup>, with an early date to support the development of RQE by May 15<sup>th</sup>.
- The submission of the Joint Venture's Class 2 estimate for the RFR project is scheduled to be submitted to OPG by April 10<sup>th</sup>, with OPG acceptance/rejection by June 15<sup>th</sup>. The date for submission has been revised to May 8<sup>th</sup>.
- Completion of individual core project estimates by June 30<sup>th</sup>.
- Department Functional Management Plans completion of revision by May 1<sup>st</sup>.
- Department functional estimates of costs by May 15<sup>th</sup>.
- Execution Strategy Plan initial draft to be issued for review by March 15<sup>th</sup> with final issuance by May 1<sup>st</sup>.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- Level 3 schedule to be submitted for Unit 2 refurbishment outage by June 30<sup>th</sup>, along with Level 1 for the remaining outages.
- Unit 2 cyclic outage scope freeze, cost estimate and schedule scheduled for April 1<sup>st</sup>, with the Level 1 schedule submitted July 15<sup>th</sup>. Although this is being done as part of the refurbishment project, it is the routine outage required for the maintenance of equipment and systems not in the refurbishment scope.
- RQE data freeze date, including scope, cost estimate, schedule and strategy, is June 30<sup>th</sup>, with the completion of the report by October 15<sup>th</sup>. It is submitted to the OPG Board of Directors in November. During July through September, the project will develop resource and cash flow reports, validation of project and function estimates and contingency analysis will be performed.
- OPG has scheduled an external 3<sup>rd</sup> party review of RQE starting in March.

The current status of the development of RQE includes:

- Scope validation for individual projects planned for the refurbishment outage was completed by February 27<sup>th</sup>. The Life Extension work that has been moved from the outage to the station will need to be managed by OPG to ensure all life extension work is completed.
- KPGM has been selected to perform the independent review of the RQE process and results. This review started in March and will continue until the RQE is submitted.
- The Joint Venture (JV) is working towards Class 2 estimates for the RFR and Turbine Generator projects. These represent about 70% of the overall cost of the core projects. There will be obstacles to obtain an estimate that is acceptable to OPG. Examples are provided in Section 6, Refurbishment Program Challenges.
- Reviews of the program basis for the refurbishment outage (and thus RQE) and the key assumptions made by the projects and functions have been started. Defining the basis is essential for the development of the cost estimate. Decisions need to be made in several areas including:
  - The source of funding for life extension projects that are not included in the nuclear refurbishment outage requires to be identified.
  - The condition of the unit that is turned over to refurbishment organization and the returned condition need to be defined in detail. This includes the action and responsibility on the discovery of emergent work that is directly

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

related to the refurbishment projects and emergent equipment conditions that are outside the scope of the core projects.

- The duration of the outage and the state of the unit (synchronization, commercial operation, full power) for return to the operations organization.
- The start of Unit 3's outage as related to the completion of Unit 2's outage.
- Shift structure for critical path for each phase of the outage. There currently is a question regarding the RFR shift structure.
- An initial RQE scorecard has been developed.
- Monthly management alignment meetings have been initiated to provide direction and alignment to the organization (projects and functions) on the RQE requirements, schedule and progress.

The sheer magnitude of the RQE effort, its overall importance to the approval for the start of the Unit 2 refurbishment and the relatively short schedule has resulted in this being identified as a challenge. The Yellow rating is reflective of the need for monitoring, not current performance.

Cost Management - WHITE

For the purpose of this scorecard, cost management has been separated from the risks associated with the basis and assumptions for the refurbishment project, which are captured under the RQE element. Life to date total cost of the project as of the end of February 2015 is \$1,682M, which is \$135M below the plan of \$1,817M.

The release 4d estimate was approved by the OPG Board of Directors at its November meeting. The release was for \$1,124M to complete the 2015 planning activities for a cumulative release of \$2,732M. The bounding cost estimate for the project remains within \$10B (2013B). The breakdown of this estimate, its evolution since 2009 and resulting impact on LUEC is shown in the following table.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>2014\$</b>	<b>2009</b>	<b>2013 (release 4c)</b>	<b>2014 (release 4D)</b>
Project Estimate	n/a	\$7,223M	\$7,635M
Contingency	n/a	\$2,133M	\$2,135M
Management Reserve	n/a	\$844M	\$430M
TOTAL	\$10,970M	\$10,200M	\$10,200M
Levelized Unit Energy Cost (LUEC)	8.9¢	7.7¢	7.8¢

Unit 2 Refurbishment Core Projects Readiness - WHITE

The readiness of the core projects is a measure of the completion of engineering, the ordering of parts and materials, the generation of Comprehensive Work Packages (CWPs) to execute the work in the field, and the development of Class 3 estimates (Class 2 for the RFR and TG projects). Design engineering has a challenge to meet the early milestone of May 15<sup>th</sup>, with the quality for the successful completion of the project. However, that challenge is with respect to meeting an early target date for the August milestone. Engineering is progressing at a rate that it will be a risk to breaker open, even if the milestone is not met. Strategy for the procurement of parts and materials is in progress for some projects, but under development for Balance of Plant and Shutdown/Layup. The generation of CWPs and cost estimates requires the same focus as the completion of design engineering deliverables. This includes the needs to be incorporated into schedules and monitoring through work down curves.

Unit 2 Execution Readiness - WHITE

In recognition of the challenge of the refurbishment project and to increase the overall project execution capability, OPG is seeking a contractor partner to provide project execution management support and oversight services. Selection of a partner is expected in early April.

The execution strategy is currently under development as one of the four elements of RQE. There are several decisions that need to be made for execution; including the providing of common services and consumable materials, the demonstration of equivalency with OPG programs (such as FME, lifting and rigging, control of chemicals),

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

and the interface with Darlington operations during the start of the outage prior to unit islanding.

There currently is some overlap in the areas of responsibility for the Execution organization and the Operations and Maintenance organization. Refurbishment senior management should review the structure of the organizations to determine if cost savings, efficiency gains and improved effectiveness can be obtained through their amalgamation.

There were execution problems during the initial stages of the Campus Plan and Safety Improvement Opportunity projects. The focus of refurbishment execution planning is breaker open. However, execution has started with the RWPB and will increase significantly through the remainder of 2015 and through 2016 until breaker open, with shutdown/layup, services, refurbishment support and islanding projects. Refurbishment management should consider a staged implementation of its execution organization, processes, meetings and facilities to both enhance the execution of these projects and correct performance weaknesses prior to breaker open.

Unit 2 Return to Service Readiness - WHITE

OPG refurbishment management recognizes the need to start the strategy to perform commissioning of systems and return the unit back to service upon the completion of each unit's refurbishment. This is seen in a Return to Service section reporting to the Refurbishment Director of Operations and Maintenance, as well as an associated functional management plan. It is recognized that the strategy is still in early development and will require a step change in detail to support the development of the RQE, as compared to the Class 4D estimate. This work is currently in progress.

Unit 2 Schedule Development - WHITE

Progress is being made with the further refinement of the Level 1 refurbishment outage schedule. The current focus is on reviewing vertical slices of the critical path sequences in order to identify constraints on non-critical path windows being performed in parallel at specific times. This will support the goal of minimizing the likelihood that Balance of Plant work will become critical path towards the end of the refurbishment outage. In addition, the development of a detailed schedule (Level 3) for Unit 2 execution is in progress. The revised Level 1 plan and Level 3 schedule are deliverables for the RQE.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Unit 2 Scope Control - WHITE

The scope for the Unit 2 refurbishment outage is well defined, and is controlled by an established process and Unit Scope Control Board. This controls any desire to add additional work to the outage as well as drop necessary work. It is expected that some scope addition will occur as a result of discovery work associated with the core projects, as well as corrective maintenance on components that are planned to be operating during the outage. Some of this work will need to be done, and the RQE contingency funds will recognize this reality. The work performed within the core refurbishment projects is not the only source of work to be performed during the outage period. Additional work will be done as a result of:

- The Unit 2 cyclic outage will be performed during the unit's refurbishment outage. Its scope includes corrective maintenance and preventive maintenance activities that are not included in the core refurbishment projects, but necessary for the continued health of the asset. The scope of this outage is in the process of being defined and controlled through a separate scope control process. Its scope and associated estimate are required to support the submission of the RQE.
- There will be a number of projects managed by Projects and Modifications that will be conducted during the refurbishment outage period. They are not associated with the refurbishment outage and thus will not be part of RQE. However, the scope of work needs to be fully defined and controlled to prevent impact on the core refurbishment project.
- Although not funded by the refurbishment project or part of its scope, the station organization has a number of work activities for which it is responsible and has a CNSC commitment for completion prior to Unit 2 start-up. These will be managed through established station processes.

The first Unit Scope Review Board meeting was conducted in February. There were fourteen AISC projects brought to the meeting for consideration to be included in the refurbishment outage. Two were accepted into the outage. Four were withdrawn by the station. The remainder required further information to be provided for a decision to be made. The main lesson from the meeting was the need for the station and sponsor of the work to be better prepared with the supporting information. However, an expectation that the engineering for these projects must meet the refurbishment milestone for engineering complete has the potential to result in work important for long term operation may not be done. Few (if any) of these projects will have the engineering completed by August 2015. The importance of completing all engineering prior to the start of the outage is recognized. However, the early engineering milestone was set to support the development of the RQE. Since these projects are not part of the refurbishment scope

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

and not included in the RQE, the need for such an early date is not justified, particularly if it results in not performing important work. This potential risk will be monitored.

**Resource Management - YELLOW**

The availability/retention of key project staff is identified as one of the program's Key Risk Areas. It consists of:

- The possibility of limited skilled trade resources and supervision for project execution as its highest program risk. Currently the trades unions predict that there may be a total shortfall of approximately 50,000 personnel during the duration of the Darlington refurbishment. They have also identified poor progress in increasing the number of journeypersons in several trades. The current rate of individuals moving from the apprenticeship program to become a journeyperson is 18% - 20%. It is recognized by all parties that this must improve. The Darlington VP of Execution is leading an initiative that includes the unions, OPG and its main contractors to address this potential shortfall.
- The potential that project leadership and specialized resources are not in place when required. There are a number of initiatives under development to reduce the significance of this risk. Refurbishment management is constrained its ability to implement the corporate policies and procedures that have been developed for operating facilities and small projects for this mega project. The realization of this risk started in the first quarter and is expected to continue through this year. The Refurbishment Director of Operations and Maintenance, the Manager of Maintenance and Section Manager of Maintenance have given notice that they are leaving by June. In addition, the Outage Work Control Manager has accepted another position within OPG. This represents a challenge to project leadership and the retention of project knowledge.
- The possibility of an insufficient number of Authorized Staff for both station and refurbishment needs. This is being addressed through a combination of increased number of candidates for the associated positions as well as challenging the extent of the need for such staff once the unit is defueled and isolated through the bulkhead.
- The potential of an insufficient number of qualified radiation protection coordinators to support project execution.

OPG refurbishment management is developing and implementing actions to ensure its leadership team is in place for the current outage and future leaders are identified and

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

developed for the program's sustainability. However, the recent trend of key individuals leaving OPG or the project represents a degrading trend in this area.

**Performance of Campus Plan & Safety Improvement Opportunity Projects - YELLOW**

Although the performance of the Campus Plan and Safety Improvement Opportunity projects continues to be a challenge to OPG, several improvements have been noted through the first quarter. Noted improvements include:

- The ESMSA contractors have embraced the concept of observation and coaching of field activities, including paired observations. They are able to discuss the benefits of specific observations at the bi-weekly status review meetings. The nuclear industry has embraced this technique as a contributor to improving human performance during field execution.
- Projects & Modification (P&M) senior management recognizes the importance of effective response to a stop work decision as well as improving performance to reduce their frequency. The first step is to clearly establish the responsibilities between station and P&M, as well as within the P&M organization. This work is currently in progress.
- P&M and the ESMSA contractor have started to plan for commissioning activities for several projects, including the AHS, EPG3 and CFVS. The commissioning of these projects requires the support of and coordination with the station, including Unit 0 operator resources, as well an understanding of the testing provided by the equipment suppliers and contractors. This planning supports the ability to integrate the commissioning with station work activities, which has been a challenge in the past.
- The ESMSA contractor has been transparent with its problems and proposed resolutions with a number of subcontractors. This provides OPG management with increased understanding of the issues and confidence that they will be addressed to support the current schedule.
- The Project Control Centre's (PCC) daily Plan of the Day meeting has transformed into a daily update of the schedule. This change was made in early March and the resulting behaviours have resulted in an increased focus on schedule, as well as the identification of issues and needed help for their resolution.
- Both P&M and ESMSA management have recognized an adverse trend in safety behaviours and have initiated actions. P&M management have initiated an adverse trend investigation to identify the causes of these behaviours. ESMSA

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

management has providing sessions for its personnel to learn of personal consequences of fatalities. P&M and ESMSA management are working to build on each organization's initiatives. This represents the start to a long journey in improving field behaviours, but the chances of success are greatly improved through this joint effort.

- The ESMSA contractor successfully used the lessons learned from installation of VD 10 in CFVS project in the recently installed VD 9. Specific lessons learned included the procurement of materials in sufficient time not to delay installation, the required coordination with the station and the handing of the valve (including the need for engineered scaffolding). The most significant lesson learned and improvement was in the execution of the event free challenge meetings during the planning and preparation of the installation.

The current completion milestones and changes from the January presentation to the OPG Board's Nuclear Oversight Committee for these projects are identified in the following table.

<b>Project</b>	<b>Need Date</b>	<b>Current Forecast</b>	<b>Float to Need Date (months)</b>	<b>Notes (changes highlighted in bold)</b>
Auxiliary Heating Steam		Aug. 2015		This project is not tied to the start of Unit 2 refurbishment. As a result, the need date has been removed.
Heavy Water Storage and Drum Handling Facility	Feb. 2017	June 2017 (Partial) and May 2017 (full)	8	The partial is required to store Unit 2's heavy water. In addition, a mitigating action plan is under development.
Holt Road Interchange Improvements	Oct. 2016	Dec. 2015	10	
Electric Power Distribution	Sept. 2015	April 2015	5	The need date was changed from October 2016 to September 2015. The current forecast was revised from January 2015 to April 2015.
Operations Support Building Refurbishment		Sept. 2015	13	This project is not tied to the start of Unit 2 refurbishment. As a result, the need date has been removed. The current forecast has been changed from November 2015 to September 2015 as a result of the desire to have the building available for the fall Vacuum Building Outage.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Project</b>	<b>Need Date</b>	<b>Current Forecast</b>	<b>Float to Need Date (months)</b>	<b>Notes (changes highlighted in bold)</b>
Refurbishment Project Office	Oct. 2016	Sept. 2015	13	
Re-Tube & Feeder Replacement Island Support Annex	Oct. 2016	Sept. 2015	13	
3 <sup>rd</sup> Emergency Power Generator	Oct. 2016	Feb. 2016	8	
Containment Filtered Venting System	Oct. 2016	May 2016	5	
Fire Water and Emergency Cooling		November 2015 (partial)	1	The strategy for this project has significantly changed. The replacement of emergency service water piping will be installed during the fall VBO and fully completed during Unit 2 refurbishment. Backup fire pumps, which are included in this project's scope, will move the start of Unit 2 refurbishment to the completion of the refurbishment outage. This change will need to be accepted by the CNSC.
Powerhouse Steam Venting System	Oct. 16	Oct. 2015	12	
Shield Tank Overpressure Protection	April 2017	December 2015 for Unit 3	N/A	The remaining units are tied to specific outages. Unit 2 is to be completed during the refurbishment outage. <b>Unit 3's has been moved from June 2015 to December 2015 as a result of the change in the VBO from spring to fall.</b>
Re-Tube Waste Storage Building	April 2017	December 2016	4	
Used Fuel Dry Storage Building	Oct. 2016	December 2015	12	A decision was made not to continue this project during the coldest months, resulting in a change in forecast dates from October 2015 to December 2015.

The projects that have the highest risk of not meeting the current forecast are:

- Heavy Water Storage and Drum Handling Facility for the legacy issues and introduction of a new ESMSA contractor to continue the project.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- Containment Filtered Venting System because of potentially contaminated soil and little float to need date.
- Fire Water and Emergency Cooling project because of the need to have the CNSC accept the change in dates and strategy.

The life-to-date costs for these projects, as of February month end, are \$589M, \$60M below plan. The estimate at completion is currently forecast at \$1,213M, as compared to the 4D release, \$1,217.8M.

The current life to date, end of life completion budget and estimates are provided in the following table:

Project	Life to Date Planned Costs (\$M)	Life to Date Actual Costs (\$M)	Budget at Completion (\$M)	Estimate at Completion (\$M)
OSB Refurbishment	39.7	31.7	53.0	53.0
RFRISA	21.9	21.2	40.7	40.7
RPO	58.7	50.5	99.9	99.9
Holt Road	18.5	6.2	35.2	28.0
Electrical Power Distribution	16.5	15.4	17.7	16.9
AHS	70.0	63.6	85.1	85.1
Heavy Water Storage & Drum Handling Facility	95.2	126.5	373.1	382.7
EPG #3	51.3	39.2	88.2	88.2
CFVS	36.4	37.4	90.6	78.2
PSVS	2.7	2.6	5.4	4.6
STOP	4.9	4.2	14.0	13.5
Fire Water and Emergency Cooling	8.4	10.3	14.6	21.3

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

It is noted that the Re-tube Waste Storage Building and the Used Fuel Dry Storage Building projects are Provision funded and currently do not have cost estimates and schedules.

As frequently stated in these reports, the Campus Plan and Safety Improvement Opportunity projects have had multiple issues in the establishment of cost estimates, the development of schedules, completion of engineering and the start of field execution, particularly related to building foundations. Although these issues remain to some extent, the true challenge is to ensure that the projects are completed when required to support the execution of Unit 2's refurbishment outage.

Unit 2 Prerequisite Work

There is a large amount of work that needs to be completed at the station to support the start of the Unit 2 refurbishment outage. In addition to the visible Campus Plan and Safety Improvement Opportunity projects, other work that needs to be completed prior to the start of the unit 2 outage. These can be categorized as:

- Fuel Handling Reliability Improvement Work. There is a need to improve fuel handling equipment to support current operations and the defueling of the reactor. This work is being planned and executed by the station fuel handling organization. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 141.
- Fuel Handling Work to support Unit 2 Refurbishment Outage. In addition to the fuel handling equipment reliability improvement initiative, the station fuel handling organization is executing the work to support the Defueling project. An example is to have the Service Area Rehearsal Facility (SARF) returned to service to support the commissioning of defueling equipment in September 2015. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 41.
- Station Ready for Refurbishment Work. There is work that the station is responsible to complete that is required for the start of the unit 2 refurbishment outage. This is related to improving the health of key systems, such as containment vapour recovery systems. If this work is not accomplished prior to the outage it will need to be completed at the start of the outage. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 47.
- Refurbishment Organization Work. There is some work for which the refurbishment organization is responsible. This work must be coordinated

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

with the station schedule and use station processes. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 242.

In addition, the Refurbishment Core Project has several projects that must be completed prior to the start of the Unit 2 refurbishment outage. Field execution of these projects is scheduled through 2015 and 2016. Most of these are associated with Islanding, Shutdown/Layup and Balance of Plant and are summarized in the following table.

Core Project	Project	Status
Unit Islanding	Negative Pressure Containment Modifications	Field execution through 2015. This includes 4 engineering packages.
	Area Islanding Barriers	Planned for execution in Q3, 2016. This represents 4 engineering packages.
	EFADS, PAMS and CLRTS modifications	Starts in VBO and continues through 2016
Refurbishment Support Facilities	Non-contaminated maintenance workshops and offices	This contains 7 engineering packages. Scheduled for Q1 and Q2, 2016.
	Wireless Network Infrastructure	This contains 1 engineering package. Scheduled for Q4, 2015.
	Turbine Cargo Elevator	This contains 2 engineering packages. Scheduled for Q1 and Q2, 2016.
	Work Control Area and Permit Preparation	This contains 2 engineering packages. Scheduled for Q4, 2015 and Q1, 2016.
	Radiation Protection Offices and Teledosimetry	This contains 2 engineering packages. Scheduled for Q1 into Q3, 2016.
	Contaminated Shops, decontamination and contaminated scaffold storage area	This contains 1 engineering package, although likely separate areas. Scheduled for Q2 and Q3, 2016.
Shutdown/Layup/Services	Breathing Air System	This contains 3 engineering packages. Scheduled for Q1

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Core Project	Project	Status
		and Q2, 2016.
	Service Air System	This contains 2 engineering packages. Scheduled for Q1 and Q2, 2016.
	Washrooms – install and tie-in	Scheduled for Q3, 2016

As can be seen, 2015 and 2016 will have the four identified groups of station work, the identified core projects and the Campus Plan & SIO projects that will require integration, coordination and support from the station. This will have to be done in conjunction with the fall Vacuum Building Outage, a spring Unit 4 outage and the on-line work required for the continued safe operation of the plant. This will be a vast challenge for all three organizations. This challenge has now been recognized by the organization at its March 23<sup>rd</sup> Refurbishment Integration meeting. A team from the three organizations will overlap the Projects & Modification (P&M) projects requiring operations and maintenance support, required work within the station to support the start of refurbishment, core projects and station work to determine the resource demands, schedule pinch points and establish priorities. The review will conclude that critical resources (such as control maintenance personnel and Unit 0 operators) will be challenged to support all the required work during this period. In addition, the review will identify that the organization will be limited in its ability to plan and schedule the large amount of work that is required for P&M projects, refurbishment preparations and maintaining station systems to the desired high level of performance and reliability expected for Darlington Nuclear. OPG senior management will need to make difficult priority decisions between now and the start of the refurbishment outage. The consolidation of all Nuclear Operations and the Darlington Refurbishment under the President, OPG Nuclear and Chief Nuclear Officer should support more timely and effective decisions.

A specific focus of the Refurbishment organization (particularly the R&FR project) is the planning, engineering and construction of the Re-Tube Waste Processing Building (RWPB). Although not required for Unit 2 breaker open, it is required prior to the start of removal of feeders and fuel channels, it is being planned and executed by the RFR Joint Venture, and thus is the first example of field execution by the Refurbishment Organization. This project has had some of the same issues seen in the Campus Plan and SIO projects and that contributed to their cost increases and schedule delays. In response, refurbishment senior management has increased focus and oversight of this project starting in Q1. Issues facing the RWPB include:

- The engineering started before the completion of a nuclear safety assessment to determine if the design had to be nuclear safety related code or the national

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

building code. Certain conservative assumptions were made in the current iteration of the RWPB design in order to permit the start of procurement and construction. These assumptions are now being addressed to get the appropriate level of safety related requirements applied to the design of the RWPB. The CVFS had the same issue, resulting in engineering schedule and cost increases.

- There has been considerable work on the schedule to improve its completion and the cost estimate to support this schedule is expected by the end of March. It is recognized that the cost estimate and schedule are planned to be accepted prior to significant construction being started. This is improvement compared with the CP and SIO projects.
- The start of the installation of caissons was initially planned for December 2014 and subsequently rescheduled to start in February 2015. The start of the caisson installation has been delayed until April as a result of quality issues with the rebar and concrete. The project is using this delay to perform a test caisson (no pedigree) to identify any technical/process issues as well as help to validate a production rate for estimate purposes. Issues with caisson installation were identified in the D<sub>2</sub>O Storage Building and Drum Handling project. It is recognized that the caissons for the D<sub>2</sub>O Storage Building and Drum Handling project serve a different purpose and represent a different complexity than the RWPB caissons.
- The project is being managed by the RFR organization. However, since the Refurbishment Organization does not have the construction organization to manage field execution, the P&M Contract Management Office is performing this role.
- Progress of the project is currently not monitored by management on a daily through a plan of the day (POD) or equivalent meeting. It was previously discussed weekly at the P&M POD meeting, but this had limited value since there was no refurbishment project leadership participation in the meeting. This may change with the start of installation of the caissons in April. Ineffective daily POD meeting was a weakness in the CP and SIO projects. However, this weakness has been significantly improved by the P&M organization during a March improvement initiative.
- The current design of the RWPB has the electrical source for the RWPB being one of two possible station transformers. The management of the electrical loads will have to be carefully coordinated with the station to maintain their configuration control.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

In response to these issues, refurbishment management has taken several actions to increase focus and drive progress; including:

- A weekly meeting with the VP Execution, RFR Project Director and the vendor to review issues and the status of actions for their resolution.
- A separate scorecard (not included in the RFR scorecard) to increase visibility and focus on the project.
- The planned inclusion (sometime in April) of the RWPB status in the CNO call on a weekly basis.

**Corrective Action Program and Use of Operating Experience – WHITE**

The refurbishment Corrective Action Program (CAP) and Operating Experience program (OPEX) represent nuclear industry standards and well implemented. Particular strengths are the quarterly trend reports and the Corrective Action Review Board. Both of these are consistent with OPG and industry standards. The additional challenge for the refurbishment organization is the integration of all sources of quality and human performance information into a broader trending product. For operating nuclear plants, the main source of quality and human performance information is the Station Condition Reports (SCRs). However, for the project this is only a small component of the available information on quality and human performance. Additional sources are the audits and surveillances performed by Supply Chain, receipt inspections of parts and materials, project oversight logs, and the corrective action program results for each vendor. To identify a potential adverse trend before it becomes a significant issue will require improved capability to trend across projects, vendors and programs.

**Oversight – WHITE**

OPG is increasing its focus on oversight of the project. During 2014 the focus of oversight has been the independent oversight team (Modus/Burns & McDonnell) that reports to the Nuclear Oversight Committee of the OPG Board of Directors, internal audits by various oversight organizations and the monitoring/oversight associated with the management of the core projects. In addition, each core refurbishment project has a senior management oversight committee and an executive CEO steering committee. During 2015, OPG senior management is having a third party review of the Release Quality Estimate and establish an executive performance assurance group reporting to the CEO. The role of this oversight group is still under development.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**4. Accomplishments and Progress**

The following accomplishments were achieved during the first quarter of 2015:

- The CNSC staff has accepted the Integrated Implementation Plan, with Commission approval planned to occur during the Darlington license hearing in the fall of 2015.
- The Balance of Plant and Shutdown/Layup/Services design contracts have been awarded.
- The design of the Turbine/Generator equipment has been completed by Alstom to permit the JV to perform the engineering for installation.
- Manufacturing of the initial tool set for the Re-tube & Feeder Replacement (RFR) project is complete. Tool Performance Guarantee testing is continuing with a completion target of April.
- Collaboration with Bruce Power is progressing well with a number of topics that will be mutually beneficial. Both organizations have demonstrated good willingness to work with each other towards mutual success.
- OPG is progressing on the selection of a partner to provide construction management support and additional oversight services. Bids from four companies are under evaluation.
- There is a strong focus on the development of the Release Quality Estimate (RQE). An organization is in place, a roadmap for successful completion has been generated with interim milestones, estimating processes are in place, performance scorecard has been established and reinforcement of the need for support is made at each meeting. KPMG has been hired to provide the independent assessment of the RQE process and results.
- The Joint Venture's development of Class 2 (the largest component of the RFR) is in progress. Although delayed from its original target date, this was done with the realization of the significance of the task and the risks associated with a poor product. There remain several issues between OPG and the JV, whose resolution is essential for an acceptable target price.
- Each project and functional department conducted an exercise to identify the assumptions that were made for the scope, planning and execution of their work. This is an important input into the RQE. The exercise identified several areas that need further attention. Actions were documented with resolution tied to the RQE schedule.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The on-boarding center has significantly improved the time it takes for individuals to complete administrative, security, training and radiation protection tasks in order to obtain site access.

## **5. Refurbishment Program Challenges**

Throughout the life of refurbishment program specific challenges have been, and will be, identified that in the belief of the Independent Advisor to the Minister of Energy should have actions by OPG Refurbishment Management to address them, before they become significant issues. The currently identified Refurbishment Program challenges are related to the development of the Release Quality Estimate (RQE), the management of the engineering workload, and implementing concrete actions to address lessons learned from the Campus Plan and SIO projects.

### Release Quality Estimate

Although there is currently no indication that the RQE will not be completed by its October 2015 milestone, its importance, challenging schedule and potential obstacles result in increased focus both within OPG and the MOE Independent Oversight Advisor. The following are in place to support the completion of the RQE to the desired standard:

- An RQE team is in place to drive the various components of the RQE.
- An RQE plan and schedule have been developed and Playbooks that provide the deliverables and target dates for each specific project and function.
- A scorecard has been developed to report progress in meeting RQE deliverables as well as risks to achieving the milestone.
- KPMG has been hired to provide OPG senior management with independent oversight of the RQE process.
- Each project and functional department has identified its assumptions regarding its scope and support it is expecting from others.
- There are various communication tools to reinforce the requirements to support RQE, timetable, status and roles.

Although progress is being made, there are a number of issues that OPG needs to successfully address for a successful RQE. These include:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The RFR Class 2 estimate represents the single largest component to the execution costs, and thus the highest risk to an acceptable RQE. The JV is currently behind schedule in its development of the estimate, resulting in an extension from April 10<sup>th</sup> to April 24<sup>th</sup> (and potentially May 8<sup>th</sup>). A third party (BRG) has been hired to provide independent review of the validity of the process used to obtain the Class 2 estimate. However, to date there has not been sufficient product for this team to review. OPG has an expert panel in place to review the inputs into the Class 2 estimate for reasonableness. There are a number of difficult issues that require to be successfully resolved prior to RQE; including:
  - Dose Estimate. The dose estimate for the RFR project is a direct input into the number of staff required to be trained for the project and thus cost. There is significant difference between the Joint Venture's (JV) initial dose estimate (> 2500 rem) and a target based on industry operating experience (1500 rem). The JV's current estimate of 1700 rem shows improvement, but further effort is required.
  - Although Tooling Performance Guarantee testing is showing excellent results, this has not resulted in savings in overall series durations. This is a result of the JV introducing risk and uncertainties in the overall series duration.
  - The generation of Construction Work Packages (CWPs) will not likely be provided to OPG in a timely manner, resulting in the need for OPG to prioritize the CWPs for review in support of RQE.
  - The holder of the contingency for possible project work delays resulting from Radiation Protection performance will have a significant impact on the final target price for the RFR project. The JV proposes to have it within its contingency. This would likely be the single highest contingency value (likely \$100sM) and thus there is a strong desire for its elimination from the JV or at least reduction. The one possible option is to have the JV responsible for its own radiation protection. This self reliance would eliminate the need for the contingency. However, this decision would be inconsistent with operating experience and basic principle that radiation protection needs to be independent of the production contractor.
- The second largest contribution to the project execution cost is from the Turbine/Generator (TG). The risk associated with the installation of the digital controllers is considered sufficiently high to have OPG senior management mitigate it for Unit 2 by delaying installation to a future outage. It is unclear how the JV will manage this risk for subsequent units.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The basis of the refurbishment outages needs to be established. The basis includes such items as the duration of the individual outages, the operating state at which time Darlington Operations takes over the unit, the response to and funding for non-project specific discovery work, the time between completion of Unit 2 and start of Unit 3 outages, and the condition of the plant for return to Darlington operations.
- The duration of the outage and coordination of returning Unit 2 to Darlington operations with the shutdown of Unit 3 are critical decisions for the scheduling of the subsequent units. In particular, upon completion of these decisions, OPG will need to determine and communicate the impact (if any) on the current life for Unit 4, including the possibility and duration of idle time prior to its refurbishment.
- There are several assumptions within the functional departments that need to be validated. In addition, there are several decisions regarding field execution and support that need to be made to assess their impact on functional department costs.

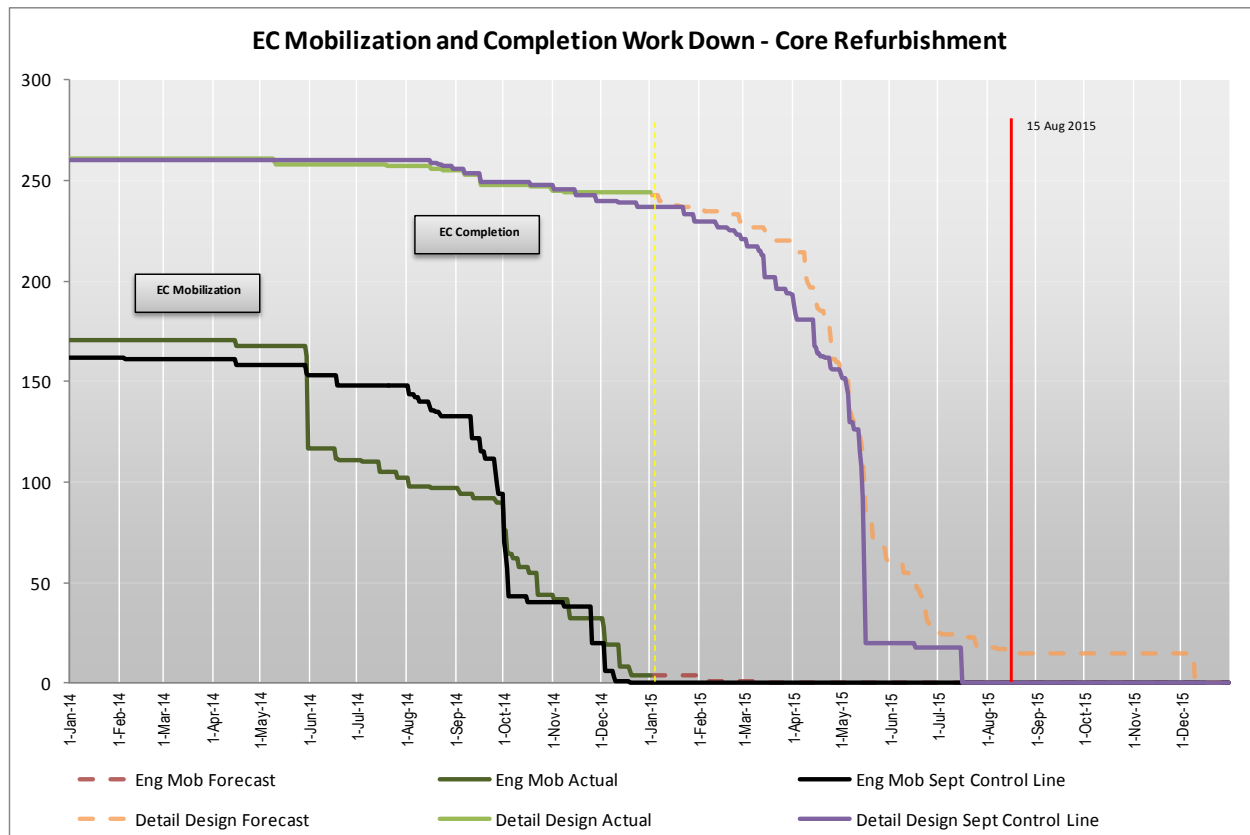

In conclusion, the development of the RQE is in progress and adequately managed. However, there are obstacles that need to be successfully resolved to obtain an acceptable RQE.

**Management of Engineering Workload**

The large engineering workload associated with the core refurbishment projects represents a challenge for completing design engineering with high quality by the May target date. There are two components to this challenge; completing the design engineering packages per a manageable schedule and assurance that the completed packages are of the necessary quality to support error free field execution and event free operation. The schedule challenge has been acknowledged by OPG management and status is routinely provided to the Board through its Nuclear Oversight Committee (NOC). The curve that was provided to the NOC at its January 20th meeting is shown below.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Performance to date is summarized in the below table:

Time Period	Number of ECs planned to Be completed per baseline	Number of ECs completed
Total to the end of December 2014	24	15
Total to the end of January 2015	31	19
Total to the end of February 2015	38	25

The 'waterfall' in the above curve represents the risk to completion of engineering. The most recently established forecast shows a high number of engineering packages to be completed prior to the milestone date in August; specifically:

- March – approximately 30

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- April – approximately 50
- May – approximately 80
- June – approximately 30
- July – approximately 45

Refurbishment management has reviewed the challenge and reforecast the completion of engineering to be complete by the actual milestone date of August 15, 2015. Although this will be challenging, planned completion is sufficiently ahead of field execution that there is little risk of impact on field execution. In addition, there will be sufficient engineering completed to provide the necessary information the development of the Release Quality Estimate.

The second element of this challenge is the assurance of quality products. By its nature, any perceived time pressure to complete a large engineering workload in a short period of time introduces a challenge to maintain high levels of quality. This feature combined with the latent nature of engineering errors results in the need for effective implementation of a rigorous and high quality process for the acceptance of engineering design deliverables. The latent nature of engineering errors in approved designs refers to the fact that the consequences of these errors are not realized immediately. They are seen in construction, commissioning and too frequently during plant operation. As a result, the MOE Independent Advisor has identified the potential risk associated with engineering quality as an element of management of engineering workload through 2014. A quality indicator has been developed for the use in this quarterly report to provide trends in quality, starting in Q4, 2014. The following table provides the results to date.

Engineering Quality Indicator =  $100 - 15 \times (\text{L1 events (rejection by external approving authority + rework after field installation)}) - 10 \times (\text{L2 events (rejection by internal approving authority + rework during field installation + other event free day reset)}) - 5 \times (\text{L3 events (other rework (greater than \$10K)})} + 1 \times (\text{GC (documented good catches prior to submission for OPG review to maximum of 10)})$ . The following values are used for the colour rating:

Green: >80

White: 65 – 79

Yellow: 50 – 64

Red: <50

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Month	Index	Rating	Basis
Q4/14	57	Yellow	
January 2015	65	White	1 L1 event and 1 L2 event and 2 L3 events
February 2015	70	White	2 L2 events and 2 L1 events
March 2015	35	Red	1 L1 event, 2 L2 events and 6 L3 events
Q1/15	57	Yellow	

The Q1 indicator of 57 continues to represent a potential concern for quality.

It is recognized that OPG has an Engineering Change Control (ECC) process that is consistent with industry standards. It is also recognized that the process for owner acceptance implemented by OPG has some good features – the use of a Requirement Traceability Matrix (RTM), use of Comment and Disposition record table, the practice of collaborative engineering and the a Design Completion Assurance Verification and Review meeting (DACVR).

Because of the latent nature of potential errors, it is important that the OPG process to accept design agency products be rigorous and sufficiently intrusive to identify potential errors and effectively implemented. This is particularly important for high risk and infrequently conducted designs. Actually, INPO generated an important operating experience document related to such engineering (IER L1 14-20, Integrated Risk – Healthy Technical Conscience), particularly recommendation 3, which deals with vendors conducting engineering work for the owner. Several designs fall into this category; including, Emergency Power Generator 3 (EPG3), Containment Filtered Ventilation System (CFVS), access ports for the Steam Generators, the digital controllers for the Turbine/Generator and fire pumps as additional supply to the Emergency Service Water system. Such a rigorous process for high risk and infrequently performed or first of a kind designs could include verification that the design is consistent with INPO/WANO important operating experience (SOERs and IERs), independent validation of key assumptions, and independent verification of key elements - as determined by the complexity of the design, the importance of the system to safety and the potential consequence of engineering error. Because of the criticality of a strong owner acceptance process, it is recommended that refurbishment management request a Technical Support Mission from WANO/INPO to review the health and effectiveness of its owner acceptance process, capability and implementation.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

It is believed that OPG refurbishment Vice President, Engineering has concern with the number and nature of errors by design agencies and has initiated actions to support improvement; including:

- Planning a stand down to be attended by all engineering personnel (internal and design agency) that discusses performance weaknesses, causes and requirements that are in place to reduce the potential for consequential errors.
- Review of the Quality Dashboard at his direct report meeting and the project engineering status meeting.
- Request for a WANO Technical Support Mission to review design quality.

**Incorporating Lessons Learned from the Campus Plan and Safety Improvement Projects**

During more than eighteen months of observations, a number of lessons learned from the Campus Plan and Safety Improvement Opportunity (SIO) projects have been identified by the Independent Oversight Advisor. These need to be effectively addressed by the refurbishment organization to prevent recurrence. It is the intention of this paper to identify these lessons learned for a discussion on the extent to which OPG senior management is confident in preventing reoccurrence during the refurbishment project. This is neither a current status of performance within the Campus Plan and SIO projects nor an analysis of the refurbishment project in each of these areas.

The following Lessons Learned have a low likelihood of recurrence with the current processes and management focus:

a. Poor cost estimates

OPG recognizes that several of these projects were started and continued without the appropriate level of cost estimate. As a result of this issue, there is increased rigour in the cost estimates for the core projects. This increased rigour includes:

- i. Collaborative front end planning for a better understanding of the scope of work, production of an independent estimate, and reconciliation prior to contract award. To support this effort for Balance of Plant, ES Fox has established a 'war room' in its facility to facilitate the collaboration.
- ii. RFR and TG have estimating templates for which agreement has been reached with the JV and OPG is monitoring progress.
- iii. A central estimating tool is being implemented to document and monitor all estimate submissions.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

These actions should maintain any risk from inaccurate cost estimates as low.

b. Completion of engineering prior to the start of field execution

Many of these projects started and continued field construction without the completion of detailed for engineering. For several projects, engineering was done in parallel with field execution and in some cases field work was delayed due to the need for the completion of design engineering. This was previously identified as one of the major lessons learned from previous refurbishment and large nuclear projects – engineering must be completed prior to the start of field execution. As a result, OPG established a milestone for the completion of engineering of August 2015 (with an early target of May 2015), and resource loaded schedules are in place for more than 80% of the core projects. Even with the current challenges in managing the engineering workload, there is sufficient float to complete engineering for the projects being executed after Unit 2 breaker open.

The current challenge is for core refurbishment projects that are being executed prior to Unit 2 breaker open. The RWPB has started construction without completion of engineering or nuclear safety analysis. It is recognized that engineering has been done for the portions of procurement and construction that have been started, but this is not the standard of engineering complete prior to start of construction that refurbishment management is striving. In addition, there are several shutdown/layup/services and support projects to be executed in 2016 and 2016, prior to breaker open. A number of these have engineering in progress, but at least six contracts have just been awarded, with a target of August 2015 for the completion of engineering.

The following Lessons Learned have a medium likelihood of recurrence without on-going management focus and successful completion of planned actions:

c. Poor engineering and field execution schedules

Through the duration of the Campus Plan and Safety Improvement Opportunity projects, the organization has been plagued with inaccurate and unreliable schedules for engineering and field execution. Currently, the refurbishment organization is supporting the ESMSA vendors and Projects & Modifications organization in the development of detailed schedules. There is a now requirement for detailed schedules as part of the gate review process. The core

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

refurbishment projects now have schedules for the completion of design engineering. Level 3 execution schedules are to be included in the estimates for the RQE. The current challenge is that there is no detailed engineering or execution schedule for RWPB beyond the substructure. Construction has recently started.

d. Availability of parts when required

There have been some examples of difficulty in obtaining the parts to support field execution. This has resulted in some delays and in some cases the acquisition of parts from the OPG warehouse. Refurbishment management recognizes the risk associated with this issue and has initiatives to support the timely procurement of parts; including:

- i. Each Project Manager is currently developing a 'Playbook' that will outline preparation milestones for Unit 2 refurbishment, including procurement of materials.
- ii. Each vendor will complete initial Assessing (including the identification of parts and materials) as part of its RQE estimate.
- iii. Engineering is establishing a process to assist vendors in obtaining parts of the correct quality level, rather than the current practice of over specification of quality level.

The current challenge will be for the procurement of parts for execution of projects that will be scheduled for completion prior to Unit 2 breaker open, although they have started to be identified and scheduled. For example, to facilitate the start of construction the RFR JV made the decision to design the RWPB base to nuclear safety standards. The initial rebar and concrete delivered for the RWPB caissons were not to this quality, resulting in about six weeks of delay in construction of the caissons.

e. Quality and timeliness of Comprehensive Work Packages (CWPs)

Once engineering is complete, the information is converted to a Comprehensive Work Package (CWP) that is used for field execution. OPG has a detailed process and high standards for the generation, review and approval of these CWPs. CWPs require the review of several disciplines; including operations and engineering. The vendors for the Campus Plan and SIO projects initially had problems meeting the station expectations to obtain timely approval of some

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

execution CWPs. As a result, it was not uncommon to have the field execution delayed while waiting for the completion, review and approval of the CWP. In response to this problem, refurbishment operations and maintenance personnel have provided support in the generation and approval of CWPs. The core refurbishment projects will require vendors to generate CWPs that will be reviewed and approved by OPG refurbishment and likely in some cases station organizations. There is a refurbishment guideline for the generation of these CWPs; however, unless the involved personnel have experience with the OPG procedure, it is likely that initially, there will be similar issues with the quality of CWPs. Specification of the required standards for CWPs by the Refurbishment Execution Construction Director will support the EPC vendors in generating acceptable CWPs.

f. Integration with the station work management process

Once the unit is isolated from the other units there will not likely be much of a need to interface with the station work management process. However, between the need to perform prerequisites in support of the start of the outage, the work to be coordinated prior to isolating the unit and the return of the unit to service at the end of refurbishment there will be a significant amount of integration with the station and its processes. The P&M organization initially had trouble integrating its work through the station's on-line and outage processes. This has resulted in an overreliance on the use of scope injection, which frequently is rejected. As a result of these problems, refurbishment work management personnel have supported P&M organization in interfacing with the station process. Transition plans are being developed to transfer the refurbishment unit to the Refurbishment Organization at the start of the refurbishment outage and back to the operating organization upon completion of the outage. A commissioning strategy is under development. In addition, Refurbishment management has initiated the 'Day in the Life' exercise to define interfaces and transitions during the outage. These actions focus on the refurbishment outage itself, and do not address the issue identified from the current P&M projects that is related to prior to Breaker open. There is an action associated with the plant/refurbishment integration meeting that is designed to prioritize needs for station support and support its schedule.

g. Not effectively using station processes

There are a number of station processes which are required to be used by the ESMSA contractors, but were not initially effectively implemented. These include

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

work management processes, work protection, work authorization, event free challenge process, etc. Refurbishment operations and maintenance is assisting in facilitating the ESMSA contractors through some of these processes. For the core refurbishment contracts, it is assumed that the contractors and subcontractors will have processes equivalent to the OPG processes. In addition, the 'Day in the Life' initiative is given credit to address this issue.

These actions may not be sufficiently rigorous to address this issue. Examples in the core project include:

- Lifting and rigging practices for both the Joint Venture (JV) and ES Fox have not always been consistent with OPG processes and WANO SOER 2008-1 recommendations.
- The initial Turbine Generator FME plan was found deficient in several areas.
- The JV's first Event Free Challenge meeting for the RWPB trial caisson was not to OPG standards or consistent with the requirement to identify challenges to the safe, effective and timely execution of a job.
- The process by which OPG will ensure equivalency of a vendor's process to OPG's process is not clearly documented, nor has been visibly demonstrated. It is intended to be included in the Execution Strategy.

The following Lessons Learned with high likelihood of recurrence without increased management focus and associated initiatives:

h. Coordination among contractors for common issues and processes

Several Campus Plan and SIO projects have had similar issues and problems, such as daylighting, dewatering, removal of contaminated soil, management of associated totes and RP support. In general, rather than identify a lead organization or company in the management of such common processes, each project was left to its own to resolve the issues. This resulted in some delays, conflicts among contractors and likely some increase in costs.

For the core refurbishment projects, there will be common processes that will be used by multiple vendors; such as scaffolding, lifting and rigging, confined spaces, management of consumables, and FME, to name a few. A lack of coordination among contractors in such common processes increases the potential of delays and issues. The Construction Execution Strategy organization

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

is currently evaluating the benefits (cost and work impact) from identifying a single vendor for some supply of common services and materials.

i. Effectiveness of PCC and POD meetings

The P&M's PCC and POD was not effective at meeting the objective of driving the Campus Plan and SIO projects to maintain schedule, to coordinate among projects, to prioritize issues and resources and to identify and resolve issues before they impact field execution. The meeting did significantly improve during March 2015.

The 'Day in the Life' initiative is intended to cover all daily status meetings and POD meetings and which parts of the refurbishment outage they will cover. It is the intention to have a fully staffed PCC during defueling and bulkhead installation. It is also the intention to move the PCC to a day operation once there is confidence that it is not required for 24 hours per day.

Although the 'Day in the Life' initiative does include the PCC and daily status meetings, progress has not been sufficient to assess its future effectiveness. However, there is no daily status meeting for the current refurbishment work being executed – the RWPB. Also, since the P&M improvement initiative that started in early March, the RWPB has not been included in the P&M meeting. Also, refurbishment management's intention for status meetings during the increase in prerequisite project execution is unclear. Establishing a daily execution status meeting and an equivalent of a PCC would be an excellent opportunity to demonstrate the required execution behaviours prior to breaker open, as well as support the safe, effective and timely execution of the prerequisite projects.

j. Requirements to restart work when stop work order is initiated

There have been events resulting in the stoppage of work. These have normally been associated with safety or environmental incidents. Normally, once the stop work has been issued, the P&M organization has struggled to identify what specific actions are required to be performed prior to restarting the work. There is no guidance provided to management on determining the criteria to restart work. This has resulted in a reduction in the timeliness and sometimes effectiveness of the actions to restart work. Refurbishment intends to address this issue through its 'Day in the Life' initiative.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

k. Management of subcontractors

The ESMSA contractors have had issues with the performance of subcontractors in the engineering, procurement and field execution associated with the Campus Plan and SIO projects. Issues have included the delivery of engineering products in a timely manner, some engineering quality problems, timely delivery of parts, some quality issues related to parts manufacture, field execution rework and safety performance. The lead contractor typically responds to individual issues.

The core refurbishment projects have had some similar issues, although with lower consequences. The Joint Venture (JV) has had some schedule and quality issues in tooling program. OPG project monitoring identified quality issues with one inspection technique associated with the Steam Generator project. ES Fox identified performance issues with the design agency for two services projects and replaced them with another company.

Refurbishment management's strategy to address this issue includes:

- i. Holding the prime contractors accountable for the performance of their subcontractors.
- ii. Creation of a Vendor Leadership Forum and All Vendors summit.
- iii. Field observations by the execution construction organization and results of the 'Day in the Life'.
- iv. Conducting appropriate weekly project schedule review meetings that cover the current work being performed by the vendors for core projects. Currently, covering engineering, shifting to procurement and finally CWP production as the work progresses.

l. Performance of Contractors

The overall performance of the main ESMSA contractors was not consistent with OPG expectations during 2014. The performance for each company as measured by the OPG scorecard was less than 60% with significant point losses in Human Performance and schedule adherence. In addition, an adverse performance trend in personnel safety was identified in March and is currently under investigation by OPG. As with the management of subcontractors'

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

performance, OPG is relying on accountability of the contractor, creation of the Vendor Leadership Forum and the execution construction organization's field presence as the strategy to address potential weaknesses by contractors. For core refurbishment projects, emphasis is being placed on having quality schedules and estimates for the completion of all aspects of the work and having the detailed schedules in place prior to a particular phase of the beginning.

m. Not responding to adverse trends in a timely and effective manner

These projects have had several, longstanding issues, starting with the D<sub>2</sub>O storage project, but also cost estimates, development of reliable schedules, completion of engineering, performance of subcontractors and interfacing with the station to execute field work. Many of these issues existed for several months – some years. The P&M organization has not been effective at identifying and addressing performance issues in a timely and effective manner in order to limit their impact on safety, quality, cost and schedule delays. This behaviour of not identifying and addressing performance issues is similar to the cause of the Pt LePreau calandria tube insertion production and quality event.

Refurbishment management's strategy to reduce this risk includes the following items:

- i. Establishing a meeting focus on performance against plan and the identification/resolution of issues.
- ii. The future creation of a project Change Control Board.
- iii. Creation of a Project Decision Making forum.
- iv. Formalizing the purpose and function of the 'contrarian' in the deliberations of important program and project decisions.
- v. Formalize the application and use of Event Free Challenge meetings for critical work.

These actions will support addressing this issue. However, there should be recognition and actions to improve the culture to drive issues to a more timely and effective resolution. The slow response to address the management of the large engineering backlog, the resolution of BOP and shutdown/layup/services contracts and the RWPB performance issues can be used to help refurbishment mid management understand the issue and the need for its reduction.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

The Refurbishment Execution leadership is driving a proactive approach to ensuring that lessons learned by one core project in one area are effectively communicated and addressed in the other projects via the Horizontal Integrator roles for engineering, materials/procurement, construction and estimating reporting to the VP Execution.

## **6. Status of Individual Projects**

The Darlington Refurbishment Program consists of seven individual projects and a number of infrastructure projects (also called Campus Plan) and Safety Improvement Opportunity projects:

- Re-tube and Feeder Replacement (RFR)
- Fuel Handling/Defueling (FH)
- Turbine Generator and Controls (TG)
- Steam Generator and Auxiliary Systems (SG)
- Balance of Plant (BOP)
- Islanding
- Shutdown, Layup and Services

The status of Campus Plan and Safety Improvement Opportunity projects is provided in the relevant section of the scorecard.

### **6.1 Re-tube and Feeder Replacement Project**

The Re-tube and Feeder Replacement (RFR) project represents the largest scope and cost component of the Darlington Refurbishment Project. The RFR project will define the project's critical path and thus duration. As demonstrated by the schedule delays, cost overruns and performance issues in previous CANDU refurbishment projects, the RFR project also represents the largest risk to the project being completed on schedule and on cost. The RFR project consists of the removal and replacement of 480 pressure tubes, 480 calandria tubes, 960 end fittings and 960 feeder pipes for each of the Darlington four units. This requires the development, testing, manufacturing and maintenance of specialized tooling; the generation and verification of specialized procedures; and the training of the staff that will perform the field work. The project also

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

includes the construction of a realistic reactor mock-up for the purposes of tooling testing, procedure verification and staff training.

There are currently five focus areas for the RFR project:

- The development of the Class 2 estimate and OPG's review and acceptance, as part of the Release Quality Estimate (RQE). The Class 2 estimate is based on detailed performance information gained from tool performance guarantee work and limited procedural testing that is currently underway. This is covered in the Scorecard under RQE.
- The design and construction of the Re-tube Waste Process Building (RWPB). This is reviewed in the Scorecard under Unit 2 Prerequisite Work.
- The testing of tooling performance and time durations for individual series.
- Completion of design engineering for Unit 2 modifications. The completion of engineering has the same challenges described in the challenge on management of the large engineering workload. (Section 5).
- Order and management of procurement of major reactor components and other materials for Unit 2's re-tube and feeder replacement.

A key component of OPG's strategy for a successful refurbishment is the construction and use of a full—scale reactor mock-up to ensure excellent tooling performance, verification of procedures, validation and refining of sequence durations and the training of execution staff. The training provided on the reactor mock-up reduces the likelihood of significant human performance events and supports high performance standards in conventional and radiological safety. Some concrete examples of the benefit of the mock-up include:

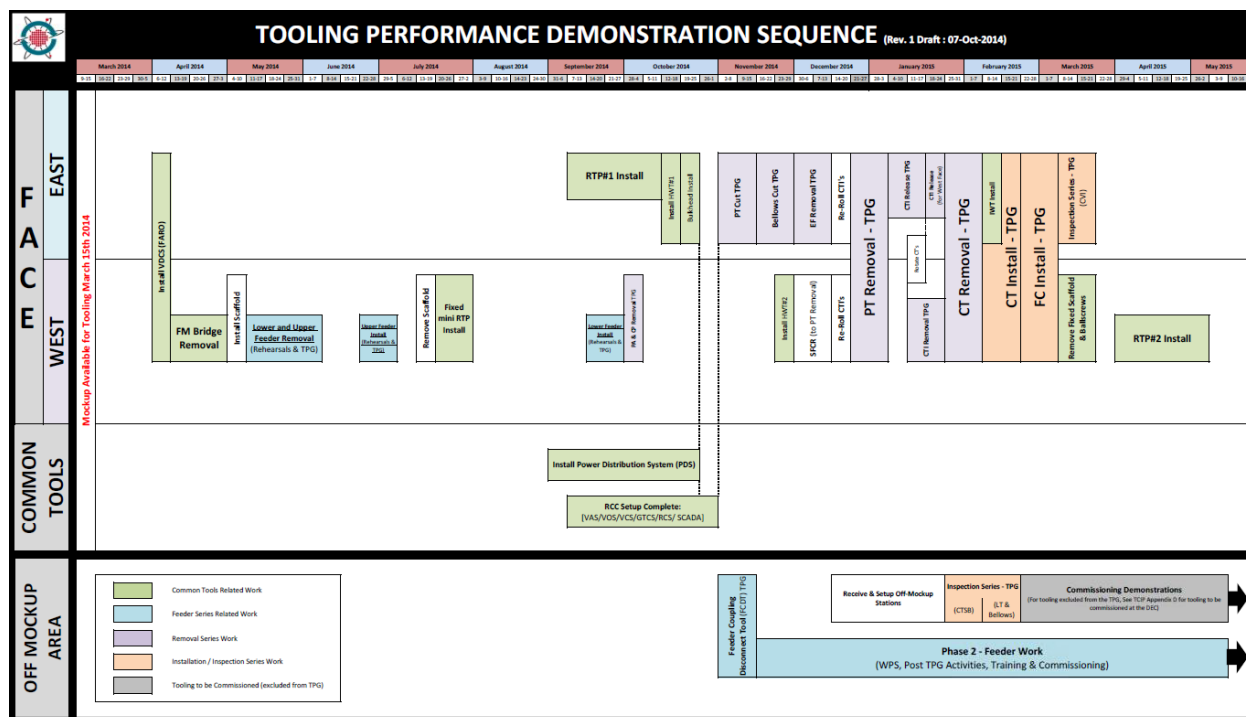

- A dimensional discrepancy in the Re-Tube Platform (RTP) was identified and corrected.
- Validation of non-interference was validated, which removed one Temporary Modification (TMOD) from the vault. The removal of this TMOD results in a critical path savings of a few days.
- Panel locations and cable lengths have been verified.
- Tool Performance Guarantee (TPG) tests have started. Pressure tube (PT) cuts have been performed using the remote controls and the PT cutter. The cut was consistently performed within 20 minutes, which is about a factor of 3 better than the TPG.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- Tool integration testing has started and will be used in the development of the Class 2 estimate.

The tooling qualification testing continues and is currently on schedule. The strategy is summarized in the following diagram.

The use of the tooling represents about 30% of RFR's critical path time. The remainder is the movement, set-up and dismantle of the tools and work platforms, or individual sequences. These will not be fully validated prior to the submission of the Class 2 estimate, but should be fully explored and optimized in the 18 months leading to the start of the RFR execution.

Procurement of the OSM (Owner Supplied Material) is the responsibility of the Joint Venture. The key components include feeder piping, end fittings, pressure tubes and calandria tubes. Manufacturers have been identified for each component and pre-production qualification manufacturing for each component by each manufacturer is in progress. Although there are some challenges in this demonstration, they do not represent a significant risk to the project. In addition, the Inspection and testing Procedures for their manufacturing are in progress.

## 6.2 Fuel Handling/Defueling Project

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

This project consists of two main subprojects – the defueling of the reactor to start the outage and the refurbishment of the fuel handling equipment and associated systems.

The defueling of the reactor represents the first critical path activity for the project. It is currently estimated that the duration for defueling the reactor will be 113 days. This duration is based on a project report that makes a number of assumptions for success. Key assumptions include:

- The defueling will be conducted by station fuel handling operators around the clock, 7 days a week. The organization is currently obtaining sufficient qualified individuals to perform this work.
- The reliability of fuel handling equipment will be improved to support defueling with limited breakdown maintenance required.
- Testing and commissioning of tooling will be performed on available station equipment. This will require the return to service of the SARF (Service Area Rehearsal Facility), which the project has identified as currently at risk with a recovery plan.
- Sufficient maintenance resources to implement the current Preventive Maintenance Program and schedule for major overhauls, as well as support the defueling window. This has been identified as an at risk component of the plan.

The project has a Fuel Handling Defueling Readiness Plan that integrates the fuel handling equipment reliability improvement work with the work required to directly support the defueling of the reactor (such as SARF return to service and commissioning of tools on SARF).

The completion of the work to improve fuel handling equipment reliability represents a risk to the defueling project meeting its objective of reactor defueling duration of 113 days. To address this risk, a station/refurbishment Fuel Handling Equipment Reliability Steering Committee was established in mid 2013, with a project plan developed in Q1 2014. The project did not make the desired progress during 2014 resulting in the following actions:

- Move from an equipment reliability improvement plan to a Defueling Readiness Plan whose status is reviewed at the regular Defueling Project Steering Committee and Executive Steering Committee meetings.
- Redefine the Fuel Handling Equipment Reliability Index to provide a more reliable indicator of progress towards readiness. The ERI target for the start of defueling is 80. The following table provides the current values.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

	<b>Jan – 15</b>	<b>Feb – 15</b>			
<b>ERI</b>	72	74			

- The station has flagged work orders that are required to be completed to improve the Fuel Handling Equipment Reliability. The ability of the station to complete this work is a direct measure of the ability to manage the associated risk on the duration of the critical path activity for defueling the reactor.

The second risk associated with this project is the ability to complete the testing and commissioning of tooling and procedures in order to defuel the reactor as planned. The first set of tests is being performed at GE Hitachi (GEH-C) in Peterborough. Although they are currently behind schedule, a recovery plan has been developed to ensure they do not impact the completion of engineering or the delivery of equipment. However, there is a need to perform commissioning of tooling (Universal Carrier and New Fuel Transfer Mechanism Modifications, and defueling equipment) at the station. These are to be done on the Pressure Test Facility (PTF) as well as the SARF. Both of these currently have their challenges.

To perform the commissioning on the PTF, scheduled for June 2015, requires:

- Completion of the testing at the GEH-C facility in Peterborough.
- Sufficient verification and validation of the OPDATA software to permit commissioning on the PTF of the tooling.
- An available fuel machine head for 4 weeks to support the commissioning.

To perform the commissioning on SARF, scheduled for September 2015, requires:

- The availability of a fuel handling trolley for the duration of commissioning.
- Sufficient verification and validation of the OPDATA software to permit commissioning on the SARF of the tooling.
- Rehabilitation and return to service of the SARF. This requires completion of a number of work orders by station staff.

There is one additional risk for the readiness to defuel the reactor – the OPG re-categorization of OPDATA from a database to a software program requires that Quality

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Assurance verification requirements be met that were not previously demonstrated. This has been identified by the project as a significant risk that has the potential to impact both cost and schedule for defueling readiness. The overall schedule has the completion of verification and validation in early 2016. The addition of a second simulator, which is under discussion, will progress this schedule. Work is currently in progress to understand the full impact of the project by mid April.

The success of this project requires the coordination of work by the vendor (GEH-C), the refurbishment project team and the station. Although support was good in 2014, integration of efforts will need to be increased for success in 2015. For example, station representation does not always attend the monthly project oversight meeting with GEH-C, and this meeting does not always review the status of the station work to support the project.

In summary, the defueling of the reactor is planned to be 113 days in duration. There are three risks to meeting this objective, which are recognized by OPG refurbishment management. Prevention of these risks requires the effective integration of the efforts of refurbishment project team, the contractor (GEH-C) and the station fuel handling organization.

### **6.3 Turbine/ Generator Project**

The scope of the Turbine/Generator includes:

- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of generator components (including generator stator rewind) and a number of generator auxiliaries,
- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of High Pressure (HP) and Low Pressure (LP) turbine components and a number of turbine auxiliaries;
- Moisture Separator Reheater (MSR): inspection, overhaul, and/or replacements of MSR internals and auxiliaries (e.g. strainers, valves);
- Turbine Control Upgrade: replacement of the obsolete analogue Steam Turbine Electronic Control (STEC) System, includes entire Turbine Supervisory System with modern design (digital system); and
- Generator Excitation Upgrade: replacement of the analog Generator Excitation system controls with a digital design and a set of additional Generator Excitation and Protection equipment to resolve obsolescence issues.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

A contract was awarded to Alstom for the design and delivery of the digital controllers as well as technical support during the execution of the project. The design work by Alstom is mainly on schedule, with some delays in the controllers that are not being included in unit 2's refurbishment outage.

The TG engineering integration and field installation vendor (SNC/Aecon Joint Venture (JV)) has submitted a class 3 cost estimate and a level 4 schedule for field execution. The JV has started the work for the Class 2 estimate, which has a milestone of the end of March. Because the Unit 2 refurbishment will not include the modifications designed by Alstom, the integration engineering packages have been delayed, and are scheduled to be completed by July 31, 2015. There is a significant amount of engineering to be completed in the second quarter to meet the July 31<sup>st</sup> completion date. As of the end of February the project estimated that 50.5% of the engineering was complete. Considering the operating experience with the integration of digital controllers at other plants, OPG resources will be challenged to review and approve the engineering design deliverables to meet the contractor's production curve.

This project is unique in that it includes one company (Alstom) providing the design and manufacture of equipment and technical expertise during the actual TG refurbishment and modifications, and one company (the Joint Venture) providing the interface engineering and the construction. This unique model requires increased oversight and integration by OPG and the project's senior management oversight committee, since the two companies are not fully integrated for the project.

There are 2 noteworthy risks for this project:

- Weaknesses in the replacement of analog controllers with digital controllers have resulted in several events in the industry both during commissioning and normal operation. This was the reason for OPG senior management to defer the introduction of digital controllers until the second unit's refurbishment, and back fit Unit 2 at a future outage. Although there is the opportunity to validate the design through the use of a simulator, it is not clear that these events (provided in INPO operating experience reports) have been studied during the design of the controllers and their integration with Darlington systems.
- Maintenance on the turbine, generator and stator systems is considered high Foreign Material Exclusion risk both because of the potential consequences of foreign material in the system when operating and the difficulty to retrieve foreign material, particularly in the generator and stator. OPG refurbishment will need to review these work plans for industry standards in the prevention of foreign material intrusion.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**6.4 Steam Generators**

The Steam Generator project had its first Executive Oversight meeting on March 6, 2015. The Engineer Procure Construct (EPC) contract has been awarded to a consortium of Babcock & Wilcox Canada and Candu Energy Inc. The project consists of maintenance activities and modifications to meet the requirements of its Life Cycle Management Plan. This includes:

- Tube sheet waterlancing to address possible degradation from sludge accumulation. The DACVR meeting for Design Authority approval of the detailed design was successfully completed on March 10.
- Installation of access ports to improve secondary side inspection capabilities for future inspection outages. An enhanced COMS (constructability, operability, maintainability, safety) meeting was held on February 25, with no additional requirements specified.
- Primary side tube cleaning to improve overall thermal efficiency, increase neutron overpower margin and reduce radiation fields
- Divider plate leakage characterization to establish a baseline for cross flow between the cold and hot legs of the SGs
- Primary and secondary side ultrasonic, eddy current and visual inspections. These will be performed by the OPG Inspection, Maintenance Service organization.

With exception of installation of the access ports, the activities associated with this project are services performed during routine planned outages. There are two noteworthy risks that exist for this project:

- The tooling that is used for the waterlancing and primary side cleaning represent tooling entering systems that are required to be free of foreign material. Although designed to be fully intact, there is always the risk that a component may become loose and enter the primary side or secondary system. This would result in the need to develop and execute a recovery plan.
- The installation of 7 access ports into each steam generator represents cutting into a containment boundary. Although the contractor has successfully performed this installation at other plants, any time a containment boundary is modified is considered a risk.

**6.4 Balance of Plant Project**

The Balance of Plant (BOP) scope consists of plant modifications and maintenance work in the following areas:

- Pre-refurbishment work
- Safety and Control Systems
- Reactor component systems

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Conventional Systems
- Common Systems

During the first quarter, the project has worked closely with contractors to establish the schedules and plans to perform the detailed engineering. It was recognized that the engineering products would be challenged to meet the engineering completion milestone as a result of the late awarding of contracts to the vendors. Currently, of the 46 identified EC products for Balance of Plant, 5 have been completed, 29 are scheduled for completion prior to the August 2015 milestone, 4 do not have a completion date and 8 are scheduled for completion in 2016. Balance of Plant (BOP) is using one ESMSA contractor for much of its work. Because of engineering performance issues with its engineering subcontractor, the ESMSA contractor has mitigated this risk through subcontracting to multiple engineering companies. In addition, BOP management is reducing the potential and consequences of future performance issues through weekly performance reviews of the project bundles. This has provided oversight that has contributed to the ESMSA contractor taking timely action to address identified issues. It is noteworthy that the ESMSA contractor has identified and initiated corrective actions when engineering performance is not meeting expectations. OPG project management is kept informed of issues and proposed actions.

Although not currently a risk, operating experience has indicated that Balance of Plant work can become the critical path to restarting the unit if not effectively scheduled and managed. One action taken by refurbishment management to reduce this potential is to not have work scheduled after the critical path is 60% completed. Exceptions would be limited to work that can only be done in the conditions that are provided after 60% completion. Additionally, Refurbishment Execution will perform an additional detailed review of the BOP work to verify that there are robust plans in place to complete the work without effecting critical path.

## **6.5 Station Readiness Projects**

There are a number of core refurbishment projects that are critical to support the refurbishment of the unit, but do not provide refurbishment of equipment. These are:

- Islanding projects. These projects are required to establish the physical and administrative separation of the refurbished unit from the operating plant, as well as separate a number of common areas for the duration of the refurbishment outage.
- Shutdown/Layup projects. These projects are in place to shutdown and layup individual systems at different stages and for different durations through the unit's refurbishment outage. This is required to protect the systems against corrosion and other damage mechanisms when not in normal operation.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- Services projects. These projects provide the needed services to support the unit's refurbishment outage. Such services include electrical, breathing air, service air, instrument air, and water.

In general, the Islanding projects are making use of the other contracts that align with its work in the same or adjacent area. For example, the EPC contract for the installation and removal of the bulkheads has been awarded to the R&FR Joint Venture (JV). This is a sound decision since the JV has the most to gain from the timely installation of the bulkheads, there is elimination of coordination issues in the vault, and the required capabilities for the two projects are similar.

The strategy for the Shutdown/Layup and Services projects is the same as for the BOP projects (use of the ESMSA contractors). These projects are also using the same ESMSA contractor as selected for several of the Balance of Plant projects. As a result, the engineering strategy and weekly meetings described for the Balance of Plant also exist for these projects. As with the Balance of Plant, this focus provides the ESMSA the opportunity to take timely corrective action when engineering performance does not meet expectations. This has been done for both Breathing Air and Service Air projects.

## **7. Oversight of the Darlington Refurbishment Program**

Both OPG and the Ministry of Energy (MOE) understand the need for a successful refurbishment for the Province, the company and the industry. In line with that importance, the Minister of Energy established the role of independent advisor and OPG established the role of an external independent oversight team reporting to the OPG Board. This team consists of individuals from the companies Burns & McDonnell and Modus.

The OPG external independent oversight team issued its Q1, 2015 at the March Nuclear Oversight Committee meeting. The focus of the report was the refurbishment team's preparation of the Release Quality Estimate. The following observations were identified in the report:

- The independent oversight team believes that the RQE roadmap provides sufficient milestones to generate the RQE by its October 2015 milestone, a process that will provide quality estimations, solid documentation that will permit a good basis for vetting and an effective Gate 3 process as primary RQE inputs.
- The progress of engineering is sufficient for input into the RQE and does not represent a risk to breaker open milestone.
- The Joint Venture's (JV) progression to its Class 2 estimate and the ultimate agreement to target price for execution of the work represents the largest portion,

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

and thus largest risk to RQE. Currently the risk includes closing the \$700M gap between the JV's Class 3 estimate and the amount OPG carried in its 4d cost estimate. As a result of the JV being behind schedule in the development of its Class 2 estimate, a 2-week extension to April 24 has been approved with a second extension to May 8 very likely and the OPG RFR team will receive a very large amount of material from the JV close to the submission date.

- The initial JV proposal for the RWPB was rejected by OPG due to its lack of detail and inadequate schedule. The RFR team initiated challenge meetings with the JV to produce a more detailed cost estimate and schedule. To reverse the trends of the Campus Plan and SIO projects will require an excellent estimate and strong accountability to the cost and schedule.
- The ability for corporate IT to support the needs for such a mega project and the risk associated with the current hiring and talent retention processes were highlighted as risks.
- The independent team will conduct a detailed review of the integration between station and refurbishment.

These observations are similar to those made by the Independent Oversight Advisor (IOA). Two challenges identified by the IOA have not been mentioned by the OPG independent oversight team. The risk associated with quality of design engineering deliverables by design agencies has been a common theme within these reports. The refurbishment VP of Engineering has recently (March) expressed the same concern. The second challenge related to addressing lessons learned from the Campus Plan and SIO projects is recognized by the VP Execution.

**Alignment with the Principles of the Long Term Energy Plan**

The MOE's 2013 Long Term Energy Plan identified seven principles by which it expects OPG and Bruce Power to follow in the development and execution of their respective units. OPG performance to these principles is good, as can be seen through the review of this section.

Principle 1: Minimize commercial risk on the part of ratepayers and government.

The majority of DNR contracts are fixed/firm price with the remaining tied to cost and schedule performance. Commercial individuals have been embedded on each project team to manage commercial risk. Project scope has been defined to the component level, and detailed engineering will be completed prior to the start of construction. OPG has invested in a reactor mock-up and training facility, to perform full testing of the tools, processes and procedures, as well as train staff prior to performing work on the actual

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

reactors. The contract with SNC/Aecon includes provisions for OPG to take over the tooling and the mock-up at the conclusion of the Definition Phase if the parties are unable to negotiate the target price contract for the Execution Phase.

Incentives in the RFR contract were established on the basis of four unit performance, allowing the RFR contractor to make-up cost overruns and schedule delays to the first unit on subsequent units. However, the LTEP prioritizes the importance of a successful Unit 2 refurbishment. This will need to be included in the target price for the RFR and TG projects.

Principle 2: Mitigate reliability risks by developing contingency plans that include alternate supply options if contract and other objectives are at risk of non-fulfillment.

One contingency action contributing to this principle is the decision to start the second unit after unit 2, rather than overlapping the units. In addition, the effort to improve the reliability of fuel handling equipment reduces the chance that fueling of the operating units will be reduced during the defueling of the refurbishment unit.

Principle 3: Entrench appropriate and realistic off-ramps and scoping.

Each contract has an off-ramp for termination. Reimbursement to contractors is limited to reasonably incurred costs. Each unit requires individual approval that provides well-defined off-ramps. The yearly release strategy and gating process for funding individual project initiatives has wide visibility and adherence within the DR Team. be done in drained/defueled state.

Principle 5: Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price.

Schedule accountability is built into each contract. The contractor is required to provide a detailed schedule for execution as an input into the Release Quality Estimate. Cost accountability is built into contracts to establish target cost and incentives/disincentives. Monthly project oversight meetings with OPG senior management and contractor senior management have improved oversight and contractor accountability. Quarterly CEO meetings reinforce this principle. OPG has chosen to perform the work in the Execution Phase on a target price basis which increases the contractors' transparency. This will enhance OPG's ability to resolve issues as they arise. This may result in OPG performing specific work rather than use a contractor. For example, agreement could not be reached with a supplier of radiation protection services, resulting in OPG deciding to perform the services itself.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Principle 6: Make site, project management, regulatory requirements and supply chain considerations, and cost and risk containment the primary factors in developing the implementation plan.

Regulatory requirements were a primary input to the defined scope of the refurbishment outage and life extension projects. There is an agreement between the station and refurbishment on the condition that the unit will be turned over to the project and then returned to the station. The program is being managed in accordance with PM Institute standards and INPO project principles. The Release Quality Estimate process is using Association for Advanced Cost Engineering (AACE) best practices and is being monitored by KPMG. Risk management is recognized as a key element of success and the program is being well implemented.

One opportunity for improvement is the ability to identify and address adverse trends in performance in a timely and effective manner.

Principle 7: Take smaller initial steps to ensure there is opportunity to incorporate lessons learned from refurbishment including collaboration by operators.

To fully incorporate lessons learned from the first unit's (Unit 2) refurbishment, the second unit's (Unit 1) start has been delayed until the completion of the first unit. If appropriate, other units may be able to be delayed to continue this risk reduction. However, this will likely result in an overall increase in cost. To reduce risk for the first unit, the decision was made to install its digital controller in a future outage. To prevent the risk associated with single source suppliers of key reactor components, OPG has qualified second vendors for key components. This will help Bruce Power with an associated materials risk.

OPG and Bruce Power refurbishment management have met on three occasions to develop areas in which they can be mutually supportive. In addition, the engineering organizations have met to discuss opportunities to improve the efficiency and effectiveness of design engineering. The following are areas in which collaboration is being sought by senior management:

- a framework for collaboration
- Reviewing the significant work scope in each program
- Reviewing key performance and workplace challenges
- Reviewing planned trades work schedules
- Reviewing resource leveling strategies and likely high resource demand periods
- Reactor Defueling planning and tools

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Plans and Lessons Establishing learned on systems layups and drying of systems that are drained
- Modifying field work controls on defueled units
- Lessons learned on transitioning into and out of Refurbishment
- Plans for completing Balance of Plant work without impacting critical path
- Performance of RFR tools and value of full mock-up of the reactor
- Close out issues and unit return to service challenges

An additional opportunity from this collaboration would be to analyze series which have different durations between the two refurbishment Level 1 plans. For example, Bruce Power has estimated defueling the reactor in about a third of the duration that is estimated for the Darlington units. Since neither plant has direct operating experience, it would be useful to understand the assumptions each estimate has made to determine if any should be challenged. Another example is that Bruce Power estimates more than four times the duration for bulkhead installation than OPG. Since Bruce Power did install bulkheads for the refurbishment of Units 1 and 2, there is some operating experience that may be of value to verify the estimate for the Darlington units.

## **8. State of Readiness**

The Nuclear Refurbishment program is fully into its Definition Phase to support the successful execution of Unit 2, starting in October 2016. There are several areas that provide confidence that the organization is on track for breaker open; including:

- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. There has been agreement with the CNSC on the Integrated Improvement Plan, with written acceptance tied to the Darlington operating license renewal process, scheduled in 2015.
- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The life extension work that is not included in the refurbishment outage will be performed by Projects & Modifications and the station.
- Although there is a challenge to meet the August milestone, engineering will be completed in sufficient time before breaker open to support downstream activities, such as order materials and generation of field execution instructions.
- The Release Quality Estimate is currently under development to meet its October 2015 milestone. The RQE will include the cost estimate for the four units, the

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Level 1 plan for the four units and Level 3 detailed schedule for Unit 2, the refurbishment outage scope for each unit and the execution strategy.

- A number of products to support the RQE will define several key areas for success, such as scope and responsibilities of functional departments, assumptions on the support needed for each project and responsibilities for the transition of the unit between Darlington Operations organization and refurbishment organization.
- The project management and support organization is in place for the Definition Phase and the transition into the execution phase.
- The assembly of the execution organization has started. There is the commitment to hire a construction management company to support the execution phase.
- Contracts are in place for all projects to complete the engineering and develop the estimate (cost and schedule) required for the RQE.
- The Class 2 estimate for the Re-Tube and Feeder Replacement project is under development. There are several issues that still need to be resolved to OPG's satisfaction, resulting in an appropriate level of oversight by senior refurbishment management and OPG's CEO.
- The RFR full scale reactor mock-up is proving to be a valuable asset in the verification of tool designs and validation of Tooling Performance Guarantee (TPG) durations. Its value will increase during the refining of the procedures for the reactor face series, and the training of re-tube face and feeder replacement personnel.
- With the unsuccessful negotiation for a contract for radiation protection services, OPG has decided to self perform this function.
- Pre-production qualification runs for the major reactor components are well in progress. The few existing issues are being managed by the Joint Venture with the active involvement of OPG supply chain and RFR project team. OPG implemented the strategy to have two vendors qualified for each major component. This will provide OPG the ability to mitigate significant quality issues with one vendor, as well as provide Bruce Power with the same flexibility in procurement of these critical components.

Although OPG is making good progress towards breaker open readiness, there are a number of issues that once resolved will increase the comfort level for the execution of the project. These include:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Probably the most significant need is for the refurbishment organization to demonstrate effective execution of field work in 2015 and 2016. The current focus on execution is to put the infrastructure (processes, facilities and organization) in place for breaker open. This creates an opportunity to ensure contracts are effectively managed and contractors perform to the expected standards. In addition to addressing performance issues as they arise, management needs to incorporate lessons learned from the Campus Plan and SIO projects during this early execution phase. This demonstration should be encouraged prior to breaker open.
- Tied to execution is the fact a good fraction of the work is first time execution for the vendor, very infrequently performed or first of a kind. A few examples include that this is the first time for the Joint Venture to execute a re-tube and feeder replacement, first time in a decade for B&W to clean the Darlington steam generators, first of a kind process for the handling and reduction of re-tube radioactive waste and some first of a kind turbine inspection at Darlington. Since refurbishments by their nature are infrequently performed, this is not a surprise. In addition, OPG has taken a number of actions to mitigate the risk – the most visible being the full-scale reactor mock-up. However, execution is significantly different than planning and the need for OPG to have effective oversight and the ability to identify and respond to degrading execution performance is once again emphasized.
- Radiation protection issues have been resulted in work stoppage and delays in previous refurbishments, projects and outages. By self-performing radiation protection services, OPG has accepted the responsibility to prevent unplanned events, but also effectively respond to them in a timely manner (although, one could argue they have this responsibility in any model). OPG has a solid radiation protection program. It will have a self-contained RP organization for field execution. In addition it will need to prepare a response to a variety of unplanned radiological events in order that an unplanned event does not result in a significant delay.
- Although there is confidence that the RQE will be completed on time, there is a risk that the JV's target price plus requested contingency will exceed the class 4d estimate by a sufficient amount to have a target price not achieved. OPG and the JV are working diligently to resolve a number of remaining nontrivial issues. A failure to achieve an acceptable target price will require OPG to implement its contingency plan in a relatively short period of time.
- The performance of the fuel handling equipment during the defueling of the reactor will set the stage for the first phase of the refurbishment outage. The station has an initiative to improve fuel handling equipment reliability. The

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

success of this initiative is imperative for the success of the defueling of the reactor.

Although OPG has the infrastructure and framework for execution of the outage, there the ability to demonstrate successful execution of projects and initiatives during the 18 months prior to breaker open will provide increased confidence in the ability to effectively execute the outage.

## **1. Minister Summary**

This report provides the detailed quarterly review of trends, accomplishments and challenges related to the Darlington Nuclear refurbishment project. The project is reaching a critical phase, with completion of Definition Phase by yearend of 2015 and the start of execution of some core refurbishment projects. Between now and breaker open the refurbishment organization will be executing projects associated with the Re-tube Waste Processing building, refurbishment support facilities, services and shutdown/layup projects.

Refurbishment management is progressing well towards being in a state of readiness for breaker open. This progress includes:

- Life to date total cost of the project as of the end of May 2015 is \$1,889M, which is \$214M below the plan of \$2,103M.
- The Release Quality Estimate is currently under development to meet its October 2015 milestone. The RQE will include the cost estimate for the four units, the Level 1 plan for the four units and Level 3 schedule for Unit 2, the refurbishment outage scope for each unit and the execution strategy.
- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. There has been agreement with the CNSC on the Integrated Improvement Plan, with written acceptance tied to the Darlington operating license renewal process, scheduled in 2015.
- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The work not performed as part of the refurbishment outage will be executed by the station and Projects & Modifications. There is a scope control process in place to review and approve additional work that will be performed during the Refurbishment outage; irrespective if it is to be executed by Refurbishment, Projects & Modifications or the station.
- Although there is a challenge to meet the August milestone, engineering will be complete in sufficient time before breaker open to support downstream activities, such as the order of materials and generation of field execution instructions.
- Scope and responsibilities of functional departments are documented in Functional Management Plans, assumptions on the support needed for each project have been identified and documented, and responsibilities for the transition of the unit between Darlington Operations organization and

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

refurbishment organization have been accepted by both.

- The assembly of the execution organization has started. This includes the use of Kiewit as the construction partner to assist in active management and oversight of field activities. In addition, an Executive Performance Assurance Group will be established to provide additional oversight to the OPG executive.
- The Class 2 estimate (revision 0) for the Re-Tube and Feeder Replacement project was submitted by the Joint Venture (JV) in May. There are several issues that still need to be resolved to close the gap between the estimate and OPG's expectations. The Class 2 estimate (revision 1) is expected to be submitted by the JV by August 31.
- The RFR full scale reactor mock-up is valuable in the verification of tool designs and validation of Tooling Performance Guarantee (TPG) durations. Its value will increase in the refining of the procedures for the reactor face series, and the training of re-tube face and feeder replacement personnel.
- Pre-production qualification runs for the major reactor components are well in progress.
- The on-boarding center, fully operational in the first quarter, has significantly improved the time it takes for individuals to complete administrative, security, training and radiation protection tasks in order to obtain site access.

Although OPG is making good progress towards breaker open readiness, there are a number of issues that once resolved will increase the comfort level for the execution of the project. These include:

- Probably the most significant need is for the refurbishment organization to demonstrate effective execution of field work in 2015 and 2016. During the second quarter Refurbishment Execution senior management established a Ready to Execute Plan. This plan includes the use of Refurbishment managed prerequisite projects to test the processes, infrastructure, organization and oversight that will be used in full refurbishment outage. This is an excellent opportunity to identify needed improvements prior to the start of full execution at breaker open. The plan has 5 months to analyze performance and incorporate improvements prior to the October start of the full outage.
- Tied to execution is the fact some of the work is first time execution for the vendor, very infrequently performed or first of a kind. For example, this is the first time for the Joint Venture to execute a re-tube and feeder replacement, first time in a decade for B&W to clean the Darlington steam generators, first of a kind process for the handling and reduction of re-tube radioactive waste and some

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

first of a kind turbine inspection at Darlington. Since refurbishments by their nature are infrequently performed, this is not a surprise. OPG has taken a number of actions to mitigate the associated risk – the most visible being the full-scale reactor mock-up. However, execution is significantly different than planning and the need for OPG to have effective oversight and the ability to identify and respond to degrading execution performance is emphasized.

- There is confidence that the RQE will be completed on time. However, there is a risk that the JV's target price plus requested contingency will exceed the class 4d estimate by a sufficient amount to have a target price not achieved. OPG and the JV are working diligently to resolve a number of remaining issues. A failure to achieve an acceptable target price will require OPG to implement an alternative plan in a relatively short period of time.
- The performance of the fuel handling equipment during the defueling of the reactor will set the stage for the first phase of the refurbishment outage. The station has an initiative to improve fuel handling equipment reliability. This initiative is challenging, and is being monitored by a station oversight committee and the Defueling Project's senior management oversight committee.

OPG has the infrastructure and framework for execution of the outage. With the recently developed Ready to Execute Plan, the organization will monitor completion of prerequisite projects (including Campus Plan and SIO projects) and processes needed for the start of the Unit 2 outage, and test the processes, infrastructure, organization and oversight prior to the breaker open in order to implement desired improvements.

The challenges that were identified in the first quarter continue to exist, with a fourth challenge related to a contractor personnel safety. These challenges represent performance trends that should be addressed to reduce the possibility of becoming significant issues.

**Safety performance**

The adverse trend in contractor and subcontractor safety performance in the Campus Plan and SIO projects continues, with some examples in the Re-tube and Feeder Replacement (RFR) field activities. The adverse trend includes moving vehicles hitting site objects, improper practices related to working at heights, and lifting and rigging. These poor safety practices cut across the ESMSA contractors, the RFR contractor and a subcontractor directly managed by OPG and has resulted in some increased oversight and discussions by OPG and contractor management. The organization will need to implement a number of mitigating interim actions while a long term corrective action plan is developed and implemented. Actions that have been effective at other facilities should be considered for this initiative.

### Release Quality Estimate

The development of the Release Quality Estimate (RQE) was the major focus of the refurbishment organization during the second quarter. OPG has several challenges to overcome in a short period of time to meet the RQE timeline. However, it is on course to provide a defensible upper bounding RQE. The challenges that need to be successfully addressed include:

- **RFR Class 2 Estimate.** The Joint Venture (JV) submitted a Class 2 estimate (revision 0) in early May. There are three major components to the estimate that are essential for RQE – schedule, cost and risk. Although OPG had reviewed many of the individual elements of the estimate prior to the submission, OPG and the JV had not reached agreement on most individual elements and this was the first opportunity for OPG to review the integrated and consolidated estimate (including cost, critical path schedule and risk). All three components of the Revision 0 submission were outside of OPG's planning basis, resulting in the need for detailed reviews and meetings between the JV and OPG. These will continue until their resolution and submission of revised Class 2 estimate (revision 1) by August 31, 2015.
- **Project Estimates.** By the end of this quarter, the vendors of the projects have submitted over 95% of the cost estimates and schedules and those submitted have been reviewed by the responsible OPG project managers. This represented a total of 341 cost estimates and 80 schedules. This information is in the process of being reviewed by the RQE team for acceptance.
- **Functional Estimates.** Along with the RFR project, the OPG functions represent the largest cost component of the refurbishment program. With the exception of the maintenance function, this cost is strictly support and does not touch the plant. As a result it is easy to have increases that individually do not seem significant but the aggregate can result in a more significant contribution to the overall cost of the program. Refurbishment senior management established a Functional RQE Review Team to critically analyze the individual functional submissions for savings. As a result, an opportunity to save nearly \$300M was identified which will bring the functional RQE value in line with the 4D estimate.
- **Contingency Funds.** Now that the project and functional estimates have been submitted, it is possible to focus on risks and their monetization. A series of workshops have been scheduled during July to examine the risks associated with the projects, the functions and the program. From these workshops, RQE contingency will be developed in terms of cost uncertainty, schedule uncertainty and discrete risks in projects and functions. Unrealized risks associated with the

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Campus Plan and SIO projects will be included in the RQE contingency determination.

- KPMG is performing an independent review of RQE. It contains two components – a review of the RQE processes and a review of their implementation through a deep dive in the RFR, Balance of Plant and Operations and Maintenance function estimates. The review of the RQE process has been completed with the report expected by the end of July. The conclusion of the review is that the RQE processes are consistent with industry practices and the effort is appropriate for a megaproject. A number of improvement opportunities are identified, but none impact the validity of the RQE.

Management of Engineering Workload

The challenge related to large engineering workload associated with the core refurbishment projects and the ability to complete design engineering with high quality by the May target date. This stretch target date was not made. However, the impact on RQE is not significant. The organization will again be challenged to meet its milestone of completing design engineering packages by August 15, 2015 (with some approved exceptions related to computer software and the Re-tube Waste Processing Building (RWPB)).

The concern is the potential impact on the quality of the design engineering products from the possible perceived time pressure combined with the robustness of OPG's owner acceptance process to identify quality issues in design products. The Vice President of Refurbishment Engineering has recently expressed concern regarding the current level of design engineering errors. He held a stand down for the engineering design agencies during the second quarter. Since engineering errors are latent in nature (not likely detected until installation, commissioning or operation), it is important that there is strong confidence in the owner acceptance process and its effective implementation. The rigor of this process and its implementation has not been reviewed to provide a high level of confidence.

Incorporating Lessons Learned from Campus Plan and Safety Improvement Opportunity Projects

This challenge is for refurbishment management to implement robust actions to address the many lessons learned from the problems and issues seen in the planning and execution of the Campus Plan and Safety Improvement Opportunity projects. Actions have been implemented for the planning (definition) phase of the project. Actions for the execution phase are being developed with a test period planned for the first five months of 2016. This test period will use, to the extent possible, the processes, infrastructure, organization and oversight that will be used through the refurbishment of Unit 2. This is

an excellent opportunity to identify improvement opportunities and implement them for breaker open.

## 2. Purpose of Report

This quarterly report provides a more detailed review and expansion of the monthly reports to the Ministry of Energy of OPG management's progress to plan and execute a successful refurbishment outage of the Darlington nuclear units. Success is defined as the preparation and execution of 100% of the correctly identified project scope safely, on schedule, within budget and with quality. It is the belief of the MOE's Independent Oversight Advisor that the Refurbishment Program Challenges that are identified in Section 5 deserve consideration by OPG Refurbishment management. It is the intention to identify such challenges when they represent an early trend rather than wait until they become a significant issue.

## 3. Darlington Nuclear Refurbishment Scorecard

**Basis for Scorecard Ratings**

Safety Performance and Preparations for Unit 2– YELLOW

The adverse trend in worker safety performance in the Campus Plan and Safety Improvement Opportunities (SIO) projects has continued through the second quarter of 2015. This trend includes incidents involving lifting and rigging, work at heights and vehicle movement. In addition, during Q2 the Joint Venture has had safety incidents while working at the mock-up and the Re-tube Waste Processing Building. Since there has not been a corrective action plan developed to address this continuing adverse trend, it has been identified as a challenge.

The first refurbishment ALARA committee meeting was held in the second quarter. The establishment of an ALARA committee during the planning phase is an excellent practice. However, it has set the end of Q1, 2016 as the target for a Unit 2 ALARA plan. This late date will provide little opportunity to have the ALARA plan influence the projects both in terms of dose reduction techniques during the execution of Unit 2's refurbishment, as well as minimize source term and radiological hazards during post refurbishment operation.

Regulatory Approvals – WHITE

The CNSC provided a letter to OPG stating that the revised Integrated Implementation Plan (IIP) meets the intent of CNSC regulatory document RD-360. The CNSC staff accepts OPG's IIP Revision 001 with implementation of specific changes that were documented in the letter. The changes are required to be made in the document's revision for submission to the CNSC in support of the 2015 licensing renewal for the Darlington nuclear plant. The IIP represents OPG's commitment to the CNSC in response to findings of the Environmental Assessment and Integrated Safety Review.

Risk Management – WHITE

There were two Risk Oversight Committee meetings during the second quarter of 2015. The April meeting reviewed the status of the identified Nuclear Refurbishment Key Risk Areas, which are the result of an aggregate analysis of the risk registry. The June meeting reviewed the Contingency Development Plan for RQE. The Key Risk Areas and status are:

- Availability/Retention of Key Staff (remained as a Yellow risk)
- Cost and Estimating Management (remained as a Yellow risk)
- Completion of Unit 2 Prerequisites (remained as a Yellow risk)
- Regulatory Approvals (improved from a Yellow risk to a Green risk)
- Fuel Handling Reliability (remained as a Yellow risk)
- Vendor Performance (remained as a Yellow risk)
- Integrated Schedule Development (remained as a Yellow risk)
- Materials not Procured Prior to Lead Time Expiry (remained as a Yellow risk)
- Completion of Engineering (remained as a Yellow risk)
- Integration with External Organizations (remained as a Yellow risk)
- Support Staff Resourcing (this is a new key risk area regarding the availability and retaining specialty support resources to support the refurbishment project.)

There has been some improvement in the development and implementation of mitigating actions to reduce the individual risks associated with these key areas.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

During the second quarter the contingency development process and plan for RQE were developed, with initial implementation. The actual determination and allocation of contingencies for individual projects, the functions, and the program, and management reserve will be completed for inclusion in the RQE.

As the organization refines its analysis of risks, there will be some medium and perhaps high risks, which will either be accepted or not fully mitigated. It would be prudent to select a subset of these risks and develop a contingency plan in the event that the risk materializes.

Release Quality Estimate (RQE) - YELLOW

Progress towards RQE has been a major refurbishment focus during the first half of 2015, and will continue until its submission in October, 2015. The RQE has four major deliverables:

- The cost estimate for the refurbishment of four units, including contingency. This requires a detailed understanding of the basis and assumptions for the outages and the associated risks.
- A schedule for the four units – detailed for level 2 and high level for the remaining units. This also requires an understanding of the basis and assumptions for the outages and the associated risks.
- Confirmation of the scope of the project and specifically Unit 2. This not only includes the scope of the refurbishment outage but also the commitments to the CNSC tied to the unit's return to service but assigned to the station.
- The Execution Strategy for Unit 2. This includes many items that have not been effectively implemented during execution of the Campus Plan (CP) and Safety Improvement Opportunity (SIO) projects. These are described in the challenge for incorporating lessons learned from the CP and SIO projects.

OPG is working through a number of issues to meet its milestone of October 15, 2015. The status of the RQE is provided in the RQE challenge. The sheer magnitude of the RQE effort, its overall importance to the approval for the start of the Unit 2 refurbishment and the relatively short schedule has resulted in this being identified as a challenge. The Yellow rating is reflective of the need for continued monitoring.

Cost Management - WHITE

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

For the purpose of this scorecard, cost management has been separated from the risks associated with the basis and assumptions for the refurbishment project, which are captured under the RQE element. Life to date total cost of the project as of the end of May 2015 is \$1,889M, which is \$214M below the plan of \$2,103M.

The release 4d estimate was approved by the OPG Board of Directors at its November meeting. The release was for \$1,124M to complete the 2015 planning activities for a cumulative release of \$2,732M. The bounding cost estimate for the project remains within \$10B (2013B). The breakdown of this estimate, its evolution since 2009 and resulting impact on LUEC is shown in the following table.

<b>2014\$</b>	<b>2009</b>	<b>2013 (release 4c)</b>	<b>2014 (release 4D)</b>
Project Estimate	n/a	\$7,223M	\$7,635M
Contingency	n/a	\$2,133M	\$2,135M
Management Reserve	n/a	\$844M	\$430M
TOTAL	\$10,970M	\$10,200M	\$10,200M
Levelized Unit Energy Cost (LUEC)	8.9¢	7.7¢	7.8¢

**Unit 2 Refurbishment Core Projects Readiness - WHITE**

The readiness of the core projects is a measure of the completion of engineering, the ordering of parts and materials, the generation of Comprehensive Work Packages (CWPs) to execute the work in the field, and the development of Class 3 estimates (Class 2 for the RFR and TG projects). Design engineering did not meet the early completion milestone of May 15<sup>th</sup> and is challenged to meet the milestone of August 15<sup>th</sup>. However, engineering is progressing at a rate that it will not be a risk to breaker open, even if the milestone is not met. The RQE focus has schedules and work down curves for estimated and schedules. As of June 30<sup>th</sup>, most projects have submitted their RQE deliverables. Strategy for the procurement of parts and materials is in progress. The generation of CWPs requires the same focus as the completion of design engineering deliverables. The effectiveness of the processes to procure materials and have CWPs available when required will be assessed during the test period that uses the prerequisite projects scheduled in 2015 and 2016 prior to breaker open.

Unit 2 Execution Readiness - WHITE

In recognition of the challenge of the refurbishment project and to increase the overall project execution capability, OPG has issued a contract to Kiewit Corporation to provide project execution management support and oversight services. The Construction Execution Strategy document has been issued.

The execution strategy is currently under development as one of the four elements of RQE. Refurbishment execution will use prerequisite support projects to pilot processes, organization and infrastructure to assess their effectiveness in managing execution and addressing the identified lessons learned from the Campus Plan and SIO projects.

Unit 2 Return to Service Readiness - WHITE

OPG refurbishment management recognizes the need to start the strategy to perform commissioning of systems and return the unit back to service upon the completion of each unit's refurbishment. This is seen in a Return to Service section reporting to the Refurbishment Director of Operations and Maintenance, as well as an associated functional management plan. Since the return to service requires detailed input from and coordination between operations and engineering, there should be documented roles and responsibilities of each group.

Unit 2 Schedule Development - WHITE

The current focus is the completion of the critical path duration and schedule as part of the JV Class 2 (revision 1) estimate. This will be submitted by August 31. However, during its finalization refurbishment work management personnel are placing non critical path activities and projects in appropriate windows. The goals of this exercise are to have a detailed schedule (Level 3) that provides safe conditions for execution at all times, that has a challenging but achievable Critical Path and has a low probability that other work (such as Balance of Plant) piles up to the point it becomes Critical Path. The Unit 2 Level 3 schedule is a commitment for RQE. In addition, Level 1 schedules for the remaining units will be included in the RQE.

Unit 2 Scope Control - WHITE

The scope for the Unit 2 refurbishment outage is well defined, and is controlled by an established process and Unit Scope Control Board. This controls both the addition and

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

removal of work to the outage. It is expected that some scope addition will occur as a result of discovery work associated with the core projects, as well as corrective maintenance on components that are planned to be operating during the outage. Some of this work will need to be done, and the RQE contingency funds will recognize this reality. The work performed within the core refurbishment projects is not the only source of work to be performed during the outage period. Additional work will be done as a result of:

- The Unit 2 cyclic outage will be performed during the unit's refurbishment outage. Its scope includes corrective maintenance and preventive maintenance activities that are not included in the core refurbishment projects, but necessary for the continued health of the asset. The scope of this outage is in the process of being defined and controlled through a separate scope control process. Its scope and associated estimate are required to support the submission of the RQE.
- There will be a number of projects managed by Projects and Modifications that will be conducted during the refurbishment outage period. They are not associated with the refurbishment outage and thus will not be part of RQE. However, the scope of work needs to be fully defined and controlled to prevent impact on the core refurbishment project.
- Although not funded by the refurbishment project or part of its scope, the station organization has a number of work activities for which it is responsible and has a CNSC commitment for completion prior to Unit 2 start-up. These will be managed through established station processes.

A Unit 2 Scope Review Board meeting was conducted in May, and a number of projects to address equipment reliability issues were accepted into the Unit 2 refurbishment outage. These projects will be managed and funded through the Projects & Modifications organization since they are operating projects rather than required for the refurbishment of the unit.

**Resource Management - YELLOW**

The availability/retention of key project staff is identified as one of the program's Key Risk Areas. It consists of:

- The possibility of limited skilled trade resources and supervision for project execution is one of the highest program risks. Currently the trades unions predict that there may be a total shortfall of approximately 50,000 personnel during the duration of the Darlington refurbishment. They have also identified poor progress in increasing the number of journeypersons in several trades. The current rate of

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

individuals moving from the apprenticeship program to become a journey person is 18% - 20%. It is recognized by all parties that this must improve. The Darlington VP of Execution is leading an initiative that includes the unions, OPG and its main contractors to address this potential shortfall.

- The potential that project leadership and specialized resources are not in place when required. There are a number of initiatives under development to reduce the significance of this risk. Refurbishment management is constrained through the need to implement the corporate policies and procedures that have been developed for operating facilities and small projects.
- The possibility of an insufficient number of Authorized Staff for both station and refurbishment needs. This is being addressed through a combination of increased number of candidates for the associated positions as well as challenging the extent of the need for such staff once the unit is defueled and isolated through the bulkhead.
- The potential of an insufficient number of qualified radiation protection coordinators to support project execution.

OPG refurbishment management is developing and implementing actions to ensure its leadership team is in place for the current outage and future leaders are identified and developed for the program's sustainability. However, the recent trend of key individuals leaving OPG or the project represents a degrading trend in this area. During this quarter a number of key individuals have left the project, including the Director of Operations and Maintenance (DOM) (became the Chief Nuclear Engineer), the Manager of Maintenance (retired) and the Manager of Restart (hired by a vendor). Movement of key, experienced personnel from the project is a risk not only because of the lost talent, but also because of the loss of project specific knowledge, including the basis of decisions and operating experience. In particular, this is the fourth DOM in the past two years.

**Performance of Campus Plan & Safety Improvement Opportunity Projects - YELLOW**

It is recognized within the OPG organization that the performance of the Campus Plan and Safety Improvement Opportunity (SIO) projects continues to be a challenge to OPG. The most important observations from this quarter are:

- The Joint Venture has received the contract for the D<sub>2</sub>O Storage Building project. The JV has challenged that certain aspects of the civil design do not meet code. If it validated by OPG, this will be rework due to poor quality that was accepted by refurbishment engineering. A schedule and cost estimate

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

has been presented to OPG and are currently under review. However, these will need to be revised if the civil design challenged is accepted. The decision to implement the contingency plan for the storage of Unit 2's heavy water will need to be initiated by the start of the fourth quarter.

- As stated in the challenge, the adverse trend in contractor safety continued through the second quarter. An adverse trend investigation has been completed, but the corrective actions have not been finalized. Interim actions to effectively prevent the adverse trend worsening have not been implemented.
- The majority of these projects have submitted estimates for RQE. The exceptions are EPG3, AHS and the D<sub>2</sub>O storage building.
- Visible progress is observed in the projects once the foundation has started. The initial prerequisites (day lighting for underground services, dewatering and caisson installation) were significantly more complicated and thus longer in duration than initially scheduled.
- Engineering continues as construction progresses in some projects, including the EPG3, AHS, CFVS and D<sub>2</sub>O storage building.

The current completion milestones and changes from the May report to the Ministry for these projects are identified in the following table.

Project	Need Date	Current Forecast	Float to Need Date (months)	Notes (changes highlighted in bold)
Auxiliary Heating Steam		Aug. 2015		This project is not tied to the start of Unit 2 refurbishment. <b>The vendor has a forecast to completion of November, 2015</b>
Heavy Water Storage and Drum Handling Facility	Feb. 2017	June 2016 (Partial) and May 2017 (full)	8	The partial is required to store Unit 2's heavy water. In addition, a contingency plan for Unit 2 water is under development. <b>The JV has been selected to complete the project. Final cost and schedule are under development.</b>
Holt Road Interchange Improvements	Oct. 2016	Dec. 2015	10	

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Project</b>	<b>Need Date</b>	<b>Current Forecast</b>	<b>Float to Need Date (months)</b>	<b>Notes (changes highlighted in bold)</b>
Electric Power Distribution	Sept. 2015	TBD	4	The Available for Service declaration was not performed in May. There currently is not a new date.
Operations Support Building Refurbishment		Sept. 2015		This project is not tied to the start of Unit 2 refurbishment.
Refurbishment Project Office	Oct. 2016	Sept. 2015	13	
Re-Tube & Feeder Replacement Island Support Annex	Oct. 2016	Nov. 2015	11	The forecast date has slipped 2 months.
3 <sup>rd</sup> Emergency Power Generator	Oct. 2016	Mar. 2016	7	<b>The contractor's schedule has the forecast completion as August 2016.</b>
Containment Filtered Venting System	Oct. 2016	May 2016	5	<b>The contractor's schedule has the forecast completion as July 2016.</b>
Fire Water and Emergency Cooling		November 2015 (partial)	1	The strategy for this project has significantly changed. The replacement of emergency service water piping will be installed during the fall VBO and fully completed during Unit 2 refurbishment. Backup fire pumps, which are included in this project's scope, will move the start of Unit 2 refurbishment to the completion of the refurbishment outage.
Powerhouse Steam Venting System	Oct. 16	Oct. 2015	12	
Shield Tank Overpressure Protection	April 2017	December 2015 for Unit 3	N/A	The remaining units are tied to specific outages. Unit 2 is to be completed during the refurbishment outage. Unit 3's has been moved from June 2015 to December 2015 as a result of the change in the VBO from spring to fall.
Re-tube Waste Processing Building	July 2017	Dec. 2016	7	
Re-Tube Waste Storage Building	April 2017	December 2016	4	The actual need date is tied to the RWPB, which is July 2017. <b>The contractor's schedule has the forecast completion as February 2017.</b>

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Project</b>	<b>Need Date</b>	<b>Current Forecast</b>	<b>Float to Need Date (months)</b>	<b>Notes (changes highlighted in bold)</b>
Used Fuel Dry Storage Building	Oct. 2016	December 2015	12	A decision was made not to continue this project during the coldest months, resulting in a change in forecast dates from October 2015 to December 2015.

The life-to-date costs for these projects, as of May month end, are \$524M, \$42M below plan. It is noted that there was a re-classification of a number of projects from the Refurbishment program to operating program. This represented about \$133M of cost reduction for Refurbishment.

As frequently stated in these reports, the Campus Plan and Safety Improvement Opportunity projects have had multiple issues in the establishment of cost estimates, the development of schedules, completion of engineering and the start of field execution, particularly related to building foundations.

Unit 2 Prerequisite Work

There is a large amount of work that needs to be completed at the station to support the start of the Unit 2 refurbishment outage. In addition to the visible Campus Plan and Safety Improvement Opportunity projects, other work that needs to be completed prior to the start of the unit 2 outage. These can be categorized as:

- **Fuel Handling Reliability Improvement Work.** There is a need to improve fuel handling equipment to support current operations and the defueling of the reactor. This work is being planned and executed by the station fuel handling organization. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 141.
- **Fuel Handling Work to support Unit 2 Refurbishment Outage.** In addition to the fuel handling equipment reliability improvement initiative, the station fuel handling organization is executing the work to support the Defueling project. An example is to have the Service Area Rehearsal Facility (SARF) returned to service to support the commissioning of defueling equipment in September 2015. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 41.
- **Station Ready for Refurbishment Work.** There is work that the station is responsible to complete that is required for the start of the unit 2

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

refurbishment outage. This is related to improving the health of key systems, such as containment vapour recovery systems. If this work is not accomplished prior to the outage it will need to be completed at the start of the outage. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 47.

- Refurbishment Organization Work. There is some work for which the refurbishment organization is responsible. This work must be coordinated with the station schedule and use station processes. The total number of Work Orders in this category currently identified for completion prior to the start of Unit 2 refurbishment is 242.

In addition, the Refurbishment Core Project has several projects that must be completed prior to the start of the Unit 2 refurbishment outage. Field execution of these projects is scheduled through 2015 and 2016. Most of these are associated with Islanding, Shutdown/Layup and Balance of Plant and are summarized in the following table.

Core Project	Project	Status
Unit Islanding	Negative Pressure Containment Modifications	Field execution through 2015 and 2016. This includes 4 engineering packages.
	Area Islanding Barriers	Planned for execution in Q3, 2016. This represents 4 engineering packages.
	EFADS, PAMS and CLRTS modifications	Starts in VBO and continues through 2016
Refurbishment Support Facilities	Non-contaminated maintenance workshops and offices	This contains 7 engineering packages. Scheduled for Q1 and Q2, 2016.
	Wireless Network Infrastructure	This contains 1 engineering package. Scheduled for Q4, 2015.
	Turbine Cargo Elevator	This contains 2 engineering packages. Scheduled for Q1 and Q2, 2016.
	Work Control Area and Permit Preparation	This contains 2 engineering packages. Scheduled for Q4, 2015 and Q1, 2016.
	Radiation Protection Offices and	This contains 2 engineering packages. Scheduled for Q1

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Core Project	Project	Status
	Teledosimetry	into Q3, 2016.
	Contaminated Shops, decontamination and contaminated scaffold storage area	This contains 1 engineering package, although likely separate areas. Scheduled for Q2 and Q3, 2016.
Shutdown/Layup/Services	Breathing Air System	This contains 3 engineering packages. Scheduled for Q1 and Q2, 2016.
	Service Air System	This contains 2 engineering packages. Scheduled for Q1 and Q2, 2016.
	Washrooms – install and tie-in	Scheduled for Q3, 2016

As can be seen, 2015 and 2016 will have the four identified groups of station work, the identified core projects and the Campus Plan & SIO projects that will require integration, coordination and support from the station. This will have to be done in conjunction with the fall Vacuum Building Outage, a spring Unit 4 outage and the on-line work required for the continued safe operation of the plant. This will be a vast challenge for all three organizations.

A specific focus of the Refurbishment organization (particularly the R&FR project) is the planning, engineering and construction of the Re-Tube Waste Processing Building (RWPB). Although not required for Unit 2 breaker open, it is required prior to the start of removal of feeders and fuel channels, it is being planned and executed by the RFR Joint Venture, and thus is the first example of field execution by the Refurbishment Organization. This project has had some of the same issues seen in the Campus Plan and SIO projects and that contributed to their cost increases and schedule delays. In response, refurbishment senior management has increased focus and oversight of this project starting in Q1. This oversight includes a weekly meeting with the Vice President, Execution and a weekly scorecard discussed on the Chief Nuclear Officer phone call. However, the project neither participates in the daily project Plan of Day meeting nor has the equivalent daily meeting or phone call with senior management. The project relies on the capability of the OPG project manager. This may be adequate for this project, but is not the approach for sustainability.

Refurbishment senior management is using the prerequisite projects as an opportunity to test the processes, infrastructure and organization prior to the full execution in October 2016. It is unclear if the RWPB project will be included in this pilot in order that the JV is exposed to the processes prior to breaker open.

Corrective Action Program and Use of Operating Experience – WHITE

The refurbishment Corrective Action Program (CAP) and Operating Experience program (OPEX) represent nuclear industry standards and well implemented. Particular strengths are the quarterly trend reports and the Corrective Action Review Board. Both of these are consistent with OPG and industry standards. The challenge for the refurbishment organization is the integration of all sources of quality and human performance information into a broader trending product. For operating nuclear plants, the main source of quality and human performance information is the Station Condition Reports (SCRs). However, for the project this is only a small component of the available information on quality and human performance. Additional sources are the audits and surveillances performed by Supply Chain, receipt inspections of parts and materials, project oversight logs, and the corrective action program results for each vendor. To identify a potential adverse trend before it becomes a significant issue will require improved capability to trend across projects, vendors and programs.

Oversight – WHITE

During the Definition Phase, refurbishment oversight focused on the projects (engineering, estimating and commercial compliance) and the independent oversight team (Modus/Burns & McDonnell) that reports to the Nuclear Oversight Committee of the OPG Board of Directors. In addition, there have been a number of internal audits by various oversight organizations. As refurbishment transitions to planning and field execution of the prerequisite projects, there will need to be an increasing focus on both field execution and the horizontal oversight required to identify potential cross-cutting issues. The initiation of the Performance Assurance Group is a good first step in this essential on-going review.

#### **4. Accomplishments and Progress**

The following accomplishments were achieved during the first second quarter of 2015:

- Life to date total cost of the project as of the end of May 2015 is \$1,889M, which is \$214M below the plan of \$2,103M.
- Tool Performance Guarantee testing for the Re-tube and Feeder Replacement (RFR) project was successfully completed.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The Joint Venture (JV) submitted its Class 2 (revision 0) estimate for the RFR project in May. The JV and OPG are going through a series of reconciliation meetings to close gaps between the JV's estimate and OPG's expectations. These gaps include the duration of critical path and thus the outage, the amount of project management support and thus cost, and the allocation of risks and thus JV contingency funding. The Class 2 (revision 1) estimate is expected by August 31<sup>st</sup>.
- The execution estimate and schedule for Unit 2 for the Steam Generator project has been submitted, with OPG review and acceptance.
- Considerable work was performed in the development of the Release Quality Estimate during the second quarter. This included the generation of cost estimates for more than 300 individual projects and 80 detailed schedules. The functional estimates were completed, with a peer team providing structured challenges in the areas of duplication of support, cost reductions for subsequent units and sharing specific services with the station. This effort resulted in reduction of the functional estimate of more than \$300M. The next steps for the completion of RQE include completion of the Class 2 (revision 1) for the RFR project and the development of contingency funding. KPMG is currently assessing the process for developing the RQE against industry standards. Their report will be issued at the end of July. In addition, they are conducting deep dives in the estimates for RFR, Balance of Plant and operations and Maintenance function. This will be used to assess the extent to which OPG complied with its processes.
- Collaboration meetings with Bruce Power continue to explore and implement collaboration opportunities.
- PSA agreements have been established with both unions (PWU and Society) for the life of the refurbishment project.
- OPG issued its Performance Report on Darlington Refurbishment in June. In addition, it held a successful open house of the Mock-up, with more than 2,000 attendees.
- Kiewit has been selected as the construction management partner to assist in active management and oversight of field activities. They supported OPG's Lower Mattagami Project.
- Darlington Refurbishment Project underwent a corporate Fraud Risk Assessment Audit, receiving an effective rating and no reportable findings identified.

**5. Refurbishment Program Challenges**

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Throughout the life of refurbishment program specific challenges have been, and will be, identified that in the belief of the Independent Advisor to the Minister of Energy should have actions by OPG Refurbishment Management to address them, before they become significant issues. The currently identified Refurbishment Program challenges are related to safety performance, the development of the Release Quality Estimate (RQE), the management of the engineering workload, and implementing concrete actions to address lessons learned from the Campus Plan and SIO projects.

Safety performance

The adverse trend in contractor and subcontractor safety performance in the Campus Plan and SIO projects continues and examples have been observed in Re-tube and Feeder Replacement (RFR) field activities. The adverse trend includes the continuation of the previously identified issue of moving vehicles hitting site objects, improper practices related to working at heights, and lifting and rigging. These poor safety practices cut across the ESMSA contractors, the RFR contractor and a subcontractor directly managed by OPG.

An adverse trend in contractor safety was identified and investigated during April and May. Actions to address the causes of the performance trend have not been fully finalized and implemented. There has been increased discussion between OPG and contractor management. There are several possible contributors to this adverse trend. One is that the amount of work performed by the ESMSA contractors and managed by the Projects and Modifications Organization has increased significantly in the past few years without a full understanding of the potential impact on each organization's capability. In addition, the requirements for construction of new buildings on a nuclear site were not fully appreciated, including the extensive use of subcontractors. Managing the commercial aspects of the large workload reduced the amount of time senior managers were in the field observing actual work. Corrective actions taken to date have largely focused on communications, reviewing supervisors' competence and stand downs to share incident information and lessons learned. These have a relatively short retention life.

Actions that have been effective at other facilities should be considered for this initiative. Some examples that have been used at nuclear plants are:

- Reduce the threshold for high risk work in order to increase the oversight of contractor activities. Possible examples include all lifts of heavy loads, vehicle manoeuvre in confined areas, tie-ins to station equipment, EPG3 work, and work at heights by subcontractors. In addition, consideration should be given to declaring medium risk work as described in the OPG risk management procedure that is performed by a contractor should be considered high risk.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Have the oversight manager for selected high risk work provide observations to a public meeting – such as the daily PCC Plan of the Day meeting.
- Have the lifting and rigging recommendations from WANO SOER 2008-1 be implemented by Projects and Modifications, and Refurbishment organizations.
- Provide observation and coaching training to contractor, projects and modifications, and refurbishment personnel who conduct field observations.
- Implement a paired coaching program that pairs project managers with contractor managers as well as managers with first line supervisors. In this way, performance standards can be directly reinforced by senior OPG and contractor management to field supervisors and workers. Have field supervisors debrief observations at the PCC Plan of the Day (POD) or other meeting.
- Increase the emphasis on quality pre-job briefings. On several occasions workers are provided a start of shift briefing and sent to work without an actual pre-job briefing. The characteristics of a good initial and update briefings are not well understood by many first line supervisors. Provide some fundamental training on pre-job briefings. In addition, conduct observations on pre-job briefings.
- Conduct observation blitzes of performance areas of concern. Potential topics include lifting and rigging, work at heights, work in trenches, use of flag persons and pre-job briefings. Assign a central group (such as refurbishment's Managed Systems Oversight group) to provide analysis, trending and reporting of results.
- Have the first line supervisor, rather than a contractor representative, present the human performance rapid response package at the PCC POD meeting to increase accountability.
- Coach workers and first line supervisors on observed safety practices (positive and negative) and incidents.

**Release Quality Estimate**

The development of the Release Quality Estimate (RQE) was the major focus of the refurbishment organization during the second quarter. Although there remains considerable work, the RQE will be ready for submission to OPG's Board in early October 2015.

The current status of the REQ elements is provided below.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- **RFR Class 2 Estimate.** The Joint Venture (JV) submitted a Class 2 estimate (revision 0) in early May. There are three major components to the estimate that are essential for RQE – schedule, cost and risk. Although OPG had reviewed many of the individual elements of the estimate prior to the submission, OPG and the JV had not reached agreement on most individual elements and this was the first opportunity for OPG to review the integrated and consolidated estimate (including cost, critical path schedule and risk). All three components of the Revision 0 submission were outside of OPG's planning basis, resulting in the need for detailed reviews and meetings between the JV and OPG. The Class 2 estimate (revision 0) as submitted by the JV is based on a P50 refurbishment outage duration of 1478 days. This was based on the JV's 'bottom-up' analysis. However, this duration is considerably more than OPG's goal of being better than Wolsong 1's performance (scaled up for 480 Darlington fuel channels versus 380 fuel channels) of 1212 days (which was their actual (P100) duration. This would require a P50 duration of about 1100 days. This resulted in a detailed review of each sequence to identify opportunities to reduce the duration. The main focus has been to identify sequence durations for which the JV was overly conservative in order to avoid hitting contractual disincentives. OPG has continued to work with the JV in obtaining a schedule that meets OPG's target by ensuring that the risks (in terms of days on the schedule) are held by the party most accountable to manage the risk.

In parallel with this detailed review of duration, the JV and OPG are performing similar analyses of the cost estimate and the allocation and monetization of risks. This review process will result in the JV submitting its Class 2 (revision 1) estimate in late August. Because of this late date, OPG has developed and is implementing a mitigation plan for the development of RQE by September 15<sup>th</sup>. This plan consists of:

- The JV will submit an updated Class 2 (Revision 0') estimate by July 15<sup>th</sup>, which will incorporate the 160 changes that have been agreed upon as a result of the on-going reviews and meetings.
- Contractual Amendments: OPG is working with the JV to develop a list of contract changes that will result in improvements to the cost and schedule, including changes intended to simplify the incentive/disincentive mechanism and ensure that risk is carried by the person best able to manage it. An agreement in principle on these proposed contract amendments will be complete by the end of July with approval of the contract amendments by August 20<sup>th</sup>.
- Detailed Estimate Review: OPG and the JV will work collaboratively to review and revise the Class 2 estimate by the end of August, by which

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

time the JV will submit the Class 2 estimate (Revision 1). OPG will in turn validate and adjust the RQE submission during the first week of September and finalize the RQE for submission by mid-September.

- OPG RQE Development: OPG will develop the RQE duration, cost estimate and contingency based upon the submitted estimate (revision 0'), and incorporating the reductions in price and schedule that are expected to result from the contract amendments and the detailed estimate review. . Upon receipt of the Class 2 estimate (Revision 1) from the JV at the end of August, OPG will make any necessary adjustments to its RQE submission.

It is worth noting that the Class 2 (revision 0) issues that are under discussion are consistent with the improvement opportunities identified by the OPG/JV RFR Expert panel. This panel identified opportunities in the size of the Project Management organization, allocation of risk and resulting contingency funds and an overly conservative duration for the RFR critical path. This refinement of the RFR Class 2 estimate will likely continue into the fall.

- **Project Estimates.** By the end of this quarter, the vendors of the projects have submitted over 95% of the cost estimates and schedules and those submitted have been reviewed by the responsible OPG project managers. This represented a total of 341 cost estimates and 80 schedules. This information is in the process of being reviewed by the RQE team for acceptance.
- **Functional Estimates.** Along with the RFR project, the OPG functions represent the largest cost component of the refurbishment program. With the exception of the maintenance function, this cost is strictly support and does not touch the plant. As a result it is easy to have increases that individually do not seem significant but the aggregate can result in a more significant contribution to the overall cost of the program. Refurbishment senior management established a Functional RQE Review Team to critically analyze the individual functional submissions for savings. As a result, an opportunity to save nearly \$300M was identified which will bring the functional RQE value in line with the 4D estimate.
- **Contingency Funds.** Now that the project and functional estimates have been submitted, it is possible to focus on risks and their monetization. A series of workshops have been scheduled during July to examine the risks associated with the projects, the functions and the program. From these workshops, RQE contingency will be developed in terms of cost uncertainty, schedule uncertainty and discrete risks in projects and functions. Unrealized risks associated with the Campus Plan and SIO projects will be included in the RQE contingency determination.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- **Assumptions and Bases.** The development of the RQE requires an understanding of its basis and associated project, functional and program assumptions. A basis item is a documented and approved condition, fact and/or strategy that describes how a cost estimate, schedule or other plan component was developed and documents the information used in support of RQE development. An assumption is a condition, item or information required in developing the program (or project/function) estimate that has yet to be completely defined and validated. Each assumption requires a validation plan. During the planning of the refurbishment program, a number of basis items and assumptions have been identified. During the development of RQE, these have been refined and modified, with additional ones identified. These will need to be finalized, with a summary report that clearly identifies the key basis items and assumptions for the refurbishment of the four Darlington units. The current date for this report is July 15<sup>th</sup>; however, this will continue to be updated through to the finalization of the RQE.
- **RQE Process.** The estimating processes used in the development of the estimates are based on AACE (Association for the Advancement of Cost Engineering) guidelines. Although there is a detailed plan to develop the RQE, it results in four major components – scope, schedule, cost and risk. These must be generated at both the project and function level and then integrated to provide the program product. To develop the program RQE, the inputs will be frozen as of July 9<sup>th</sup>. After that date any proposed changes must go through a documented change control process. The RQE process and key elements have a number of reviews in progress; including:
  - KPMG is performing an independent review of RQE. It contains two components – a review of the RQE processes and a review of their implementation through a deep dive in the RFR, Balance of Plant and Operations and Maintenance function estimates. The review of the RQE process has been completed with the report expected by the end of July. The conclusion of the review is that the RQE processes are consistent with industry practices and the effort is appropriate for a megaproject. A number of improvement opportunities are identified, but none impact the validity of the RQE.
  - Modus. Modus provides oversight on behalf of the OPG Board of Directors. They are monitoring the progress of the RFR JV Class 2 estimate and the RQE. They provide on-going recommendations to support the development of these products. Their focus is on the extent to which the process is aligned with the AACE guidelines and extent to which the results are defensible. Both of these are essential for an acceptable RQE.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- BRG (Berkeley Research Group) was hired by the JV to provide an on-going, independent review of the RFR Class 2 estimate. The review was performed through selected submissions. However, the timing of the submissions lagged the schedule of the reviewers, resulting in comments focusing on the process and limited assessment of the quality of the product. They have delayed their final report until late July.
- RFR Expert Panel. The JV and OPG jointly established an Expert Panel to review elements of the Class 2 submission during its development. Members of this panel had experience with the re-tube of CANDU reactors, specifically at Bruce and Pt Lepreau. They identified three areas in which further work was required to obtain a reliable estimate. They were the excessive size of the project management organization for the project, the extent of contingency funding for the project and long duration of critical path. These items are included in the extensive reviews and meetings between OPG and the JV.

In conclusion, OPG has several challenges to overcome in a short period of time to meet the RQE timeline. However, it is on course to provide a defensible upper bounding RQE.

**Management of Engineering Workload**

The challenge related to large engineering workload associated with the core refurbishment projects and the ability to complete design engineering with high quality by the May target date. This stretch target date was not made. However, the impact on RQE is not significant. The organization will again be challenged to meet its milestone of completing design engineering packages by August 15, 2015 (with some approved exceptions related to computer software and the Re-tube Waste Processing Building (RWPB)). This challenge is highlighted in the following table that shows progress through the month of June. As can be seen, the number of design engineering packages forecast to be approved after the August 15<sup>th</sup> milestone has increased from 54 in mid June to 70 by the end of June.

	<b>Data as of June 11</b>	<b>Data as of June 16</b>	<b>Data as of June 26</b>
<b>ECs complete</b>	90	96	104
<b>ECs Remaining</b>	162	156	151
<b>ECs beyond August 15 milestone</b>	55	54	70

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

	Data as of June 11	Data as of June 16	Data as of June 26
<b>ECs with finish Between August 15 and Dec. 2015</b>	25	23	37
<b>ECs finishing in 2016</b>	11	13	22
<b>ECs finishing in 2017</b>	0	0	3
<b>SCs without a finish date</b>	19	18	8

Refurbishment Engineering has taken several steps to drive the completion of design engineering packages; including:

- Implemented collaborative engineering by placing resident engineers at design agency locations to provide timely response to questions and requests.
- Increased the number of individuals with the Design Authority approval from 1 to 3.
- Established a daily engineering issue meeting to identify, assign responsibility for, and monitor the resolution of issues that prevent the completion of a design package.
- Have a weekly status meeting of status of engineering deliverables.
- Initiated regular executive reviews of the status of issue tracking files.

As previously stated, extending beyond the milestone will not have a significant impact on the quality of the Release Quality Estimate. Engineering has progressed sufficiently to allow for quality estimates. However, there are four potential areas that this delay can impact – cost of engineering, procurement of materials, generation of comprehensive work packages (CWPs), and quality of engineering.

The increased effort in collaborative engineering requires additional OPG and vendor resources and thus additional cost. Although the extent of the additional cost resulting from the current workload is not able to be separated, it is included in the overall costs for engineering provided in the RQE.

Refurbishment management recognizes the impact of late design engineering on the procurement of materials. They are in the process of implementing a Vendor Procurement Tracking and Forecasting tool. This will determine the date for Requests for Quotation and Purchase Orders are required to the support the scheduled work. It

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

will also track the material through all stages from requisition to installation. Specifically, the seven prerequisite projects that are scheduled for 2015/2016 have their long lead materials already purchased. The one project that is currently challenged in this area is the Breathing Air modification.

CWPs cannot be completed without the completion of engineering. As with the procurement of materials, this represents a more significant risk for the prerequisite projects that are planned for execution in the 2015/2016 period. And as with procurement, refurbishment management will need to closely track their completion.

However, the risk from this engineering challenge is the potential impact on the acceptance of engineering deliverables from design agencies that do not meet quality requirements. By its nature, any perceived time pressure to complete a large engineering workload in a short period of time introduces a challenge to maintain high levels of quality. This feature combined with the latent nature of engineering errors results in the need for effective implementation of a rigorous and high quality process for the acceptance of engineering design deliverables. The latent nature of engineering errors in approved designs refers to the fact that the consequences of these errors are not realized immediately. They are seen in construction, commissioning and too frequently during plant operation. As a result, the MOE Independent Advisor has identified the potential risk associated with engineering quality as an element of management of engineering workload through 2014.

A quality indicator has been developed for the use in this quarterly report to provide trends in quality, starting in Q4, 2014. The following table provides the results to date.

Engineering Quality Indicator =  $100 - 15 \times (\text{L1 events (rejection by external approving authority + rework after field installation)}) - 10 \times (\text{L2 events (rejection by internal approving authority + rework during field installation + other event free day reset)}) - 5 \times (\text{L3 events (other rework (greater than \$10K)})} + 1 \times (\text{GC (documented good catches prior to submission for OPG review to maximum of 10)})$ . The following values are used for the colour rating:

Green: >80

White: 65 – 79

Yellow: 50 – 64

Red: <50

Month	Index	Rating	Basis
-------	-------	--------	-------

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Q4/14	57	Yellow	
Q1/15	57	Yellow	
April 2015	35	Red	1 L1 event, 3 L2 events and 4 L3 events
May 2015	20	Red	1 L1 event, 5 L2 events, 3 L3 events
June 2015	70	White	1 L2, 4 L3
Q2/15	42	Red	

The Q2 indicator of 42 continues to represent a potential concern for quality of engineering.

Although refurbishment engineering understands the risk of latent errors in design engineering, there are opportunities to strengthen the OPG process to accept design agency products and the rigour of its implementation. Such opportunities include:

- Clearly identify designs that are high risk, infrequently performed or first time performed, and specify specific additional verification requirements for them. INPO generated an industry operating experience document related to such engineering (IER L1 14-20, Integrated Risk – Healthy Technical Conscience), particularly recommendation 3, which deals with vendors conducting engineering work for the owner. Several designs fall into this category; including, Emergency Power Generator 3 (EPG3), Containment Filtered Ventilation System (CFVS), D<sub>2</sub>O Storage Building, access ports for the Steam Generators, the digital controllers for the Turbine/Generator and fire pumps as additional supply to the Emergency Service Water system.
- Verification that the design is consistent with INPO/WANO important operating experience (SOERs and IERs). Designs that have such operating experience include EPG3, digital controllers, and intake cooling water. In addition, there are several SOERs that are of value for the operation, maintenance and monitoring of equipment that is in the operating state or lay-up during refurbishment. An efficient way to verify consistency with SOERs (both in terms of design modifications, operating and lay-up is to review the Darlington station's response to the recommendations to ensure that they are still valid during the refurbishment of the unit, and if not specific actions to meet the recommendations. For the INPO operating experience and recommendations on digital controllers, a review of the documents will need to be performed with a response to how the recommendations are met.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Clearly identify key assumptions, critical calculations and other key elements in the design of a high risk, infrequently performed or first time modification. State in the design acceptance documentation the specific oversight activities taken to ensure and validate the quality of the deliverables. This should include the items that were independently verified by refurbishment engineering and the individual's name that performed independent verification for OPG as well as validation of the design agency's process was satisfied.
- Identify which references in the Requirements Traceability Matrix (RTM) were independently reviewed by OPG and the name of the individual. This can be done for the critical requirements, assumptions and calculations.
- It is recommended that the WANO Technical Support Mission, planned for September 2015, be requested to include a review of the rigour of the OPG process and its implementation related to the acceptance of design agency deliverables for high risk, infrequently performed and first time designs in conjunction with its review of the implementation of the recommendation 3 of IER 14-020.

**Incorporating Lessons Learned from the Campus Plan and Safety Improvement and Core Projects**

During more than twenty-four months of observations, a number of lessons learned from the Campus Plan and Safety Improvement Opportunity (SIO) projects have been identified by the Independent Oversight Advisor. In addition, the experience from the management of the engineering workload, the generation of estimates and field execution on the mock-up and the Re-tube Waste Process Building provide more lessons, as well as reinforce the need to aggressively address certain previously identified lessons learned to prevent recurrence once breaker opens and the full refurbishment project is started.

The following Lessons Learned have a low likelihood of recurrence with the current processes and management focus:

a. Poor cost estimates

Through the Release Quality Estimate (RQE) process, OPG will have a good quality estimate of the costs for 4-unit refurbishment project. RQE is the cost estimate for the core projects, the functional areas and the campus plan/SIO projects. It will be submitted to the OPG Board for review and acceptance in October and then presented to the Ministry.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

The following Lessons Learned have a medium likelihood of recurrence without on-going management focus and successful completion of planned actions:

b. Completion of engineering prior to the start of field execution

Many of the Campus Plan and Safety Improvement Opportunities (SIO) projects started and continued field construction without the completion of detailed engineering. This continues for some important projects such as EPG 3, CFVS, D<sub>2</sub>O Storage Building and the Auxiliary Heating System. This has contributed to on-going revisions to costs and schedules. These projects demonstrate the consequences of not starting field execution before engineering is actually completed. This was previously identified by OPG refurbishment management as one of the major lessons learned from previous refurbishment and large nuclear projects. Engineering must be completed prior to the start of field execution. As a result, OPG established a milestone for the completion of engineering of August 2015. Even with the current challenges in managing the engineering workload, there is sufficient float to complete engineering for the projects being executed after Unit 2 breaker open.

The current challenge is for core refurbishment projects that are being executed prior to Unit 2 breaker open. The RWPB has started construction without completion of engineering or nuclear safety analysis. It is recognized that engineering has been done for the portions of procurement and construction that have started, but this is not the standard of engineering complete prior to start of construction that refurbishment management is striving. It is not surprising that cost and duration estimates have been revised on a number of occasions. The current cost estimate is \$108M and target completion date of December, 2016.

In addition, there are several shutdown/layup/services and support projects to be executed in 2015 and 2016, as prerequisites to breaker open. These include Breathing Air installation, Service Air installation, Negative Pressure Containment modifications and several facilities. The August 15<sup>th</sup> milestone for completion of engineering will not be met for some of these projects and this results in downstream impacts of the procurement of materials and generation of CWP's. Refurbishment management is initiating a plan to manage the impact of the late engineering.

c. Poor engineering and field execution schedules

Through the duration of the Campus Plan and Safety Improvement Opportunity projects, the organization has been plagued with inaccurate and unreliable

schedules for engineering and field execution. Reliable schedules are still being developed for some of these projects. There is a now requirement for detailed schedules as part of the gate review process. The core refurbishment projects now have schedules for the completion of design engineering. Level 3 execution schedules are to be included in the estimates for the RQE. As with the completion of engineering, the RWPB and prerequisite projects will be challenged to have reliable schedules for the completion of engineering and field execution.

d. Availability of parts when required

There have been some examples of difficulty in obtaining the parts to support field execution. This has resulted in some delays and in some cases the acquisition of parts from the OPG warehouse. Refurbishment management recognizes the risk associated with this issue and has initiatives to support the timely procurement of parts.

Refurbishment management recognizes the impact of late design engineering on the procurement of materials. They are in the process of implementing a Vendor Procurement Tracking and Forecasting tool. This will determine the date for Requests for Quotation and Purchase Orders are required to the support the scheduled work. It will also track the material through all stages from requisition to installation. This process will be used for the procurement of materials associated with the prerequisite projects. If the procurement action plan is implemented as intended, this risk will become low.

e. Quality and timeliness of Comprehensive Work Packages (CWPs)

Once engineering is complete, the information is converted to a Comprehensive Work Package (CWP) that is used for field execution. CWPs require the review of several disciplines; including operations and engineering. The vendors for the Campus Plan and SIO projects initially had problems meeting the station expectations to obtain timely approval of some execution CWPs. As a result, it was not uncommon to have the field execution delayed while waiting for the completion, review and approval of the CWP. In response to this problem, refurbishment operations and maintenance personnel have provided support in the generation and approval of CWPs.

The core refurbishment projects will require vendors to generate CWPs. Some of these may be reviewed and approved by OPG refurbishment and likely in

some cases station organizations. There is a refurbishment guideline for the generation of these CWPs (D-GUID-09701-10037). This document provides a good list of the items that need to be considered in the development of a CWP. However, it provides little guidance as to quality expectations and review requirements for CWPs. Currently OPG Subject Matter Experts are reviewing a number of CWPs. This procedure is currently under revision to provide additional guidance. The prerequisite projects will be the first test of the ability of the refurbishment organization to obtain timely and quality CWPs for field execution

f. Integration with the station work management process

Once the unit is isolated from the other units there will not likely be much of a need to interface with the station work management process. However, between the need to perform prerequisites in support of the start of the outage, the work to be coordinated prior to isolating the unit and the return of the unit to service at the end of refurbishment there will be a significant amount of integration with the station and its processes. The P&M organization initially had trouble integrating its work through the station's on-line and outage processes. This resulted in an overreliance on the use of scope injection, which frequently was rejected.

Several of the prerequisite projects will be scheduled through the station work management process as well as is the test of the refurbishment work management and control processes. The ability to integrate with the station will be improved once refurbishment work management organization understands and addresses the problems and issues that the Campus Plan and SIO projects had. The test period will identify weaknesses in this area.

g. Not effectively using OPG processes

There are a number of OPG processes which are required to be used by the ESMSA contractors, but have not been fully and effectively implemented. These include work management processes, work protection, work authorization, event free challenge process, lifting and rigging, etc.

The Refurbishment Execution organization has documented a Darlington Refurbishment Execution Strategy for contractor's use. It provides a comprehensive list of the processes that will be used during the refurbishment project. However, it does not provide when information is an OPG expectation or guidance. In addition, it is unclear the method by which OPG will approve vendor processes when it is specified such approval is required. Specifically it is unclear

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

if such approval is by the project or the subject matter expert and how that approval is documented. The test period will identify actual weaknesses.

The following Lessons Learned with high likelihood of recurrence without increased management focus and associated initiatives:

h. Coordination among contractors for common issues and processes

Several Campus Plan and SIO projects have had similar issues and problems, such as daylighting, dewatering, removal of contaminated soil, management of associated totes and unconditional release of materials. In general, rather than identify a lead organization or company for the management of such common processes, each project was left to its own to resolve the issues. This resulted in some delays, conflicts among contractors and likely some increase in costs.

For the core refurbishment projects, there will be common processes that will be used by multiple vendors; such as scaffolding, lifting and rigging, confined spaces, management of consumables, and FME, to name a few. A lack of coordination among contractors in such common processes increases the potential of delays, increased costs and issues. This coordination has begun in some areas. The execution strategy or other document does not provide guidance on such coordination to the vendors.

i. Effectiveness of PCC and POD meetings

The P&M's PCC and POD was not effective at meeting the objective of driving the Campus Plan and SIO projects to maintain schedule, to coordinate among projects, to prioritize issues and resources and to identify and resolve issues before they impact field execution. The meeting did significantly improve during first two quarters of 2015.

The prerequisite projects test period will have the PCC established and Plan of the Day meetings held. This will require the establishment of associated expectations, procedures and infrastructure.

It is noted that there is currently no daily status meeting for the current refurbishment work being executed – the RWPB. Also, since the P&M improvement initiative that started in early March, the RWPB has not been included in the P&M meeting.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

j. Requirements to restart work when stop work order is initiated

There have been events resulting in the stoppage of work. These have normally been associated with safety or environmental incidents. Normally, once the stop work has been issued, the P&M organization has struggled to identify what specific actions are required to be performed prior to restarting the work.

Refurbishment execution management recognizes the need for guidance on responding to incidents and returning to work in a controlled and timely manner. The project manager for the RWPB project has created a quick chart for the response to incidents. In addition, the Construction Execution group has produced a procedure for work stoppage, reporting and recovery. A number of tabletop exercises using this procedure should be done to ensure that it has sufficient detail and direction to ensure effective and timely response to stop work incidents.

k. Management of subcontractors

The ESMSA contractors have had issues with the performance of subcontractors in the engineering, procurement and field execution associated with the Campus Plan and SIO projects. Issues have included the delivery of engineering products in a timely manner, engineering quality problems, timely delivery of parts, some quality issues related to parts manufacture, field execution rework and safety performance.

The core refurbishment projects have had some similar issues, although with lower consequences. The Joint Venture (JV) has had some schedule and quality issues in tooling program. OPG project monitoring identified quality issues with one inspection technique associated with the Steam Generator project. ES Fox identified performance issues with the design agency for two services projects and replaced them with another company.

l. Performance of Contractors

[REDACTED]

[REDACTED] As with the management of subcontractors' performance, OPG is relying on accountability of the contractor, creation of the

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Vendor Leadership Forum and the execution construction organization's field presence as the strategy to address potential weaknesses by contractors. For core refurbishment projects, emphasis is being placed on having quality schedules and estimates for the completion of all aspects of the work and having the detailed schedules in place prior to a particular phase of the beginning.

m. Not responding to adverse trends in a timely and effective manner

These projects have had several, longstanding issues, starting with the D<sub>2</sub>O storage project, but also cost estimates, development of reliable schedules, completion of engineering, performance of subcontractors and interfacing with the station to execute field work. Many of these issues existed for several months – some years. The P&M organization has not been effective at identifying and addressing performance issues in a timely and effective manner in order to limit their impact on safety, quality, cost and schedule delays. This behaviour of not identifying and addressing performance issues is similar to the cause of the Pt LePreau calandria tube insertion production and quality event.

Refurbishment management's strategy to reduce this risk includes the following items:

- i. Establishing a meeting focus on performance against plan and the identification/resolution of issues.
- ii. The future creation of a project Change Control Board.
- iii. Creation of a Project Decision Making forum.
- iv. Formalizing the purpose and function of the 'contrarian' in the deliberations of important program and project decisions.
- v. Formalize the application and use of Event Free Challenge meetings for critical work.

These actions will support addressing this issue. However, there should be recognition and actions to improve the culture to drive issues to a more timely and effective resolution. The slow response to address the management of the large engineering backlog, the resolution of BOP and shutdown/layup/services contracts and the RWPB performance issues can be used to help refurbishment mid management understand the issue and the need for its reduction.

Opportunity to incorporate lessons learned

Refurbishment management has identified the opportunity to test several of its processes and infrastructure during the execution of the perquisite core projects that are scheduled prior to breaker open. This represents a valuable opportunity to understand the effectiveness of the implemented processes and to validate the extent to which these lessons have been addressed.

## **6. Status of Individual Projects**

The Darlington Refurbishment Program consists of seven individual projects and a number of infrastructure projects (also called Campus Plan) and Safety Improvement Opportunity projects:

- Re-tube and Feeder Replacement (RFR)
- Fuel Handling/Defueling (FH)
- Turbine Generator and Controls (TG)
- Steam Generator and Auxiliary Systems (SG)
- Balance of Plant (BOP)
- Islanding
- Shutdown, Layup and Services

The status of Campus Plan and Safety Improvement Opportunity projects is provided in the relevant section of the scorecard.

### **6.1 Re-tube and Feeder Replacement Project**

The Re-tube and Feeder Replacement (RFR) project represents the largest scope and cost component of the Darlington Refurbishment Project. The RFR project will define the project's critical path and thus duration. As demonstrated by the schedule delays, cost overruns and performance issues in previous CANDU refurbishment projects, the RFR project also represents the largest risk to the project being completed on schedule and on cost. The RFR project consists of the removal and replacement of 480 pressure tubes, 480 calandria tubes, 960 end fittings and 960 feeder pipes for each of the Darlington four units. This requires the development, testing, manufacturing and maintenance of specialized tooling; the generation and verification of specialized procedures; and the training of the staff that will perform the field work. The project also

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

includes the construction of a realistic reactor mock-up for the purposes of tooling testing, procedure verification and staff training.

The Q2 focus areas and status for the RFR project were:

- As stated in the RQE challenge, there is currently a detailed review of the JV's Class 2 (revision 0) and discussion to close its gap with OPG expectations related to outage duration, costs and contingency funds. Resolution is expected to occur for the JV submission of its Class 2 (revision 1) estimate by August 31.
- The design and construction of the Re-tube Waste Process Building (RWPB). This is covered in scorecard under Prerequisite projects.
- The testing of tooling performance and time durations for individual series were completed in Q2.
- Completion of design engineering for Unit 2 modifications. 26 of the 61 design engineering packages have been completed.
- Order and management of procurement of major reactor components and other materials for Unit 2's re-tube and feeder replacement. Procurement of the OSM (Owner Supplied Material) is the responsibility of the Joint Venture. The key components include feeder piping, end fittings, pressure tubes and calandria tubes. Manufacturers have been identified for each component and pre-production qualification manufacturing for each component by each manufacturer is in progress. Although there are some challenges in this demonstration, they do not represent a significant risk to the project. In addition, the Inspection and testing Procedures for their manufacturing are in progress.

The use of the tooling represents about 30% of RFR's critical path time. The remainder is the movement, set-up and dismantle of the tools and work platforms, or individual sequences. These will not be fully validated prior to the submission of the Class 2 estimate, but should be fully explored and optimized in the 18 months leading to the start of the RFR execution.

## **6.2 Fuel Handling/Defueling Project**

This project consists of two main subprojects – the defueling of the reactor to start the outage and the refurbishment of the fuel handling equipment and associated systems.

The defueling of the reactor represents the first critical path activity for the project. It is currently estimated that the duration for defueling the reactor will be 113 days. This

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

duration is based on a project report that makes a number of assumptions for success. Key assumptions include:

- The defueling will be conducted by station fuel handling operators around the clock, 7 days a week. The organization is currently obtaining sufficient qualified individuals to perform this work.
- The reliability of fuel handling equipment will be improved to support defueling with limited breakdown maintenance required.
- Testing and commissioning of tooling will be performed on available station equipment. This will require the return to service of the SARF (Service Area Rehearsal Facility), which the project has identified as currently at risk with a recovery plan.
- Sufficient maintenance resources to implement the current Preventive Maintenance Program and schedule for major overhauls, as well as support the defueling window. This has been identified as an at risk component of the plan.

The project has a Fuel Handling Defueling Readiness Plan that integrates the fuel handling equipment reliability improvement work with the work required to directly support the defueling of the reactor (such as SARF return to service and commissioning of tools on SARF).

The station has been successful in completing scheduled work to improve fuel handling equipment reliability. High reliability of the fuel handling systems is in order that the defueling project meets its objective of reactor defueling duration of 113 days.

	Jan – 15	Feb – 15	Mar – 15	April - 15	May - 15	June – 15
<b>ERI</b>	72	74	74	78	74	82

Equipment reliability improvements during the second quarter included:

- Power track upgrades continue, with the replacement of 810 feet of chain, 223 V-Groove wheels, and 20 rollers.
- Computer replacement project is 80% complete, with full completion in July.
- The FM Head program System Health has improved from Yellow to White.
- A reduction in the maintenance backlog to 60 work orders from 146 in February 2014.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

One risk associated with the project has been the ability to complete the testing and commissioning of tooling and procedures for defueling the reactor. The first set of tests is being performed at GE Hitachi (GEH-C) in Peterborough. The completion target for these has been revised from May 18<sup>th</sup> to July 10<sup>th</sup>. This represents a risk to the commissioning of the equipment on the Pressure Test Facility in August, 2015. In addition, commissioning of defueling equipment is planned to be performed on the SARF during Q4, 2015, with a contingency date of Q1, 2016.

To perform the commissioning on SARF, scheduled for September 2015, requires:

- The availability of a fuel handling trolley for the duration of commissioning.
- Sufficient verification and validation of the OPDATA software to permit commissioning on the SARF of the tooling. This will need to be provided by September 1, 2015.
- Rehabilitation and return to service of the SARF. This requires completion of a number of work orders by station staff.

The success of this project requires the coordination of work by the vendor (GEH-C), the refurbishment project team and the station. This coordination continued to improve during the second quarter.

### **6.3 Turbine/ Generator Project**

The scope of the Turbine/Generator includes:

- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of generator components (including generator stator rewind) and a number of generator auxiliaries,
- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of High Pressure (HP) and Low Pressure (LP) turbine components and a number of turbine auxiliaries;
- Moisture Separator Reheater (MSR): inspection, overhaul, and/or replacements of MSR internals and auxiliaries (e.g. strainers, valves);
- Turbine Control Upgrade: replacement of the obsolete analogue Steam Turbine Electronic Control (STEC) System, includes entire Turbine Supervisory System with modern design (digital system); and
- Generator Excitation Upgrade: replacement of the analog Generator Excitation system controls with a digital design and a set of additional Generator Excitation and Protection equipment to resolve obsolescence issues.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

A contract was awarded to Alstom for the design and delivery of the digital controllers as well as technical support during the execution of the project. The design work by Alstom is complete. It is noted that the digital controllers are not being included in unit 2's refurbishment outage. In addition, Alstom accomplished the following in Q2:

- TSSA pressure boundary registration has begun based on the approved design.
- Procurement of materials for Unit 2 outage is on schedule.
- Software qualification process for the digital controllers is in progress.

The TG engineering integration and field installation vendor (SNC/Aecon Joint Venture (JV)) submitted a Unit 2 Class 2 cost estimate and a level 5 schedule for field execution. It was accepted as noted by OPG. The Class 3 estimate and Level 4 schedule for the remaining units was submitted to OPG for acceptance. Because the Unit 2 refurbishment will not include the modifications designed by Alstom, the integration engineering packages have been delayed, and are scheduled to be completed by July 31, 2015.

This project is unique in that it includes one company (Alstom) providing the design and manufacture of equipment and technical expertise during the actual TG refurbishment and modifications, and one company (the Joint Venture) providing the interface engineering and the construction. This unique model requires increased oversight and integration by OPG and the project's senior management oversight committee, since the two companies are not fully integrated for the project.

There are 2 noteworthy risks for this project:

- Weaknesses in the replacement of analog controllers with digital controllers have resulted in several events in the industry both during commissioning and normal operation. This was the reason for OPG senior management to defer the introduction of digital controllers until the second unit's refurbishment, and back fit Unit 2 at a future outage. Although there is the opportunity to validate the design through the use of a simulator, it is not clear that these events (provided in INPO operating experience reports) have been studied during the design of the controllers and their integration with Darlington systems.
- Maintenance on the turbine, generator and stator systems is considered high Foreign Material Exclusion risk both because of the potential consequences of foreign material in the system when operating and the difficulty to retrieve foreign material, particularly in the generator and stator. OPG refurbishment will need to review these work plans for industry standards in the prevention of foreign material intrusion.

#### **6.4 Steam Generators**

The Steam Generator project consists of a series of modification and maintenance activities to fulfill the requirements of its Life Cycle Management Plan. The Engineer Procure Construct (EPC) contract has been awarded to a consortium of Babcock & Wilcox Canada and Candu Energy Inc. The project includes:

- Tube sheet waterlancing to address possible degradation from sludge accumulation. The DACVR meeting for Design Authority approval of the detailed design was successfully completed on March 10.
- Installation of access ports to improve secondary side inspection capabilities for future inspection outages. An enhanced COMS (constructability, operability, maintainability, safety) meeting was held on February 25, with no additional requirements specified.
- Primary side tube cleaning to improve overall thermal efficiency, increase neutron overpower margin and reduce radiation fields
- Divider plate leakage characterization to establish a baseline for cross flow between the cold and hot legs of the SGs
- Primary and secondary side ultrasonic, eddy current and visual inspections. These will be performed by the OPG Inspection, Maintenance Service organization.

With exception of installation of the access ports, the activities associated with this project are services performed during routine planned outages. There are two noteworthy risks that exist for this project:

- The tooling that is used for the waterlancing and primary side cleaning represent tooling entering systems that are required to be free of foreign material. Although designed to be fully intact, there is always the risk that a component may become loose and enter the primary side or secondary system. This would result in the need to develop and execute a recovery plan.
- The installation of 7 access ports into each steam generator represents cutting into a containment boundary. Although the contractor has successfully performed this installation at other plants, any time a containment boundary is modified is considered a risk.

#### **6.4 Balance of Plant Project**

The Balance of Plant (BOP) scope consists of plant modifications and maintenance work in the following areas:

- Pre-refurbishment work
- Safety and Control Systems
- Reactor component systems

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Conventional Systems
- Common Systems

During the second quarter, the project worked closely with contractors to develop the cost estimates, schedules and risk profiles needed to support OPG's RQE. Although there was a need to provide considerable support to have estimates and schedules aligned to meet OPG's needs, the contractors did provide deliverables that were of sufficient quality to be included in the RQE. In addition, this quarter included the continuation of detailed design engineering. A number of BOP projects have been approved to extend beyond the August 15<sup>th</sup> milestone. BOP management continues its routine performance reviews of the project bundles. This oversight has contributed to the ESMSA contractor taking timely action to address identified issues. It is noteworthy that the ESMSA contractor has identified and initiated corrective actions when engineering performance is not meeting expectations. OPG project management is kept informed of issues and proposed actions.

Although not currently a risk, operating experience has indicated that Balance of Plant work can become the critical path to restarting the unit if not effectively scheduled and managed. One action taken by refurbishment management to reduce this potential is to not have work scheduled after the critical path is 60% completed. Exceptions would be limited to work that can only be done in the conditions that are provided after 60% completion. Additionally, Refurbishment Execution will perform an additional detailed review of the BOP work to verify that there are robust plans in place to complete the work without effecting critical path.

## **6.5 Station Readiness Projects**

There are a number of core refurbishment projects that are critical to support the refurbishment of the unit, but do not provide refurbishment of equipment. These are:

- Islanding projects. These projects are required to establish the physical and administrative separation of the refurbished unit from the operating plant, as well as separate a number of common areas for the duration of the refurbishment outage.
- Shutdown/Layup projects. These projects are in place to shutdown and layup individual systems at different stages and for different durations through the unit's refurbishment outage. This is required to protect the systems against corrosion and other damage mechanisms when not in normal operation.
- Services projects. These projects provide the needed services to support the unit's refurbishment outage. Such services include electrical, breathing air, service air, instrument air, and water.

In general, the Islanding projects are making use of the other contracts that align with its work in the same or adjacent area. For example, the EPC contract for the installation and removal of the bulkheads has been awarded to the R&FR Joint Venture (JV). This is a sound decision since the JV has the most to gain from the timely installation of the bulkheads, there is elimination of coordination issues in the vault, and the required capabilities for the two projects are similar.

The strategy for the Shutdown/Layup and Services projects is the same as for the BOP projects (use of the ESMSA contractors). These projects are also using the same ESMSA contractor as selected for several of the Balance of Plant projects. As a result, the engineering strategy and weekly meetings described for the Balance of Plant also exist for these projects. As with the Balance of Plant, this focus provides the ESMSA the opportunity to take timely corrective action when engineering performance does not meet expectations. This has been done for both Breathing Air and Service Air projects.

## **7. Oversight of the Darlington Refurbishment Program**

Both OPG and the Ministry of Energy (MOE) understand the need for a successful refurbishment for the Province, the company and the industry. In line with that importance, the Minister of Energy established the role of independent advisor and OPG established the role of an external independent oversight team reporting to the OPG Board. This team consists of individuals from the companies Burns & McDonnell and Modus.

The OPG external independent oversight team issued its Q2, 2015 at the May Nuclear Oversight Committee meeting. The focus of the report was the refurbishment team's preparation of the Release Quality Estimate. The following observations were identified in the report:

- The independent oversight team's review of the status of RQE concluded that the major projects and functions, which comprise of 92% of the overall project cost, are tracking on time to 2-3 weeks late with RQE inputs, while BOP and SD/LU continue to struggle.
- At the time of their report, the JV had just submitted its Class 2 estimate for the RFR project. The report acknowledged that there was a significant amount of vetting to be done until the Class 2 estimates is acceptable. The Class 2 estimate represents modest gains from its Class 3 estimate. A major gap is the JV's conservatism toward potential OPG delays.
- The JV's proposal for the RWPB still had not met OPG's quality standards. The JV's latest schedule that has a completion date of December 2016. The report did

identify that the estimating process was progressing without the final resolution of the seismic requirements for the building.

- The report recognized that the initial functional estimates for RQE would be greater than the value provided in the 4D Cost Estimate and reductions were required.
- The independent team stated that engineering was progressing sufficiently to support the RQE. Concerns were expressed with progress of BOP, Shutdown/Layup and the JV's design work to support the procurement of key components.
- The report does state that the project's Engineering Dash Board has highlighted a quality adverse trend in the areas of using under-qualified resources, over-specification of engineered materials, and other short-cuts that could result in downstream changes.
- The report expressed its on-going concern with the ES Fox's capability to perform quality cost estimates and schedules and then to meet them. The report focuses on the vendor, while the MOE Independent Advisor has focused on OPG's performance related to management of its contractors.
- The report has identified improved support of the refurbishment project by the corporate support organizations.

These observations are similar to those made by the Independent Oversight Advisor (IOA). Two challenges identified by the IOA have not been mentioned by the OPG independent oversight team. The risk associated with quality of design engineering deliverables by design agencies has been a common theme within these reports. The refurbishment VP of Engineering held an engineering stand down in response to an increase in quality issues. The second challenge related to addressing lessons learned from the Campus Plan and SIO projects is recognized by the VP Execution.

## **8. Alignment with the Principles of the Long Term Energy Plan**

The MOE's 2013 Long Term Energy Plan identified seven principles by which it expects OPG and Bruce Power to follow in the development and execution of their respective units. OPG performance to these principles is good, as can be seen through the review of this section.

Principle 1: Minimize commercial risk on the part of ratepayers and government.

The majority of DNR contracts are fixed/firm price with the remaining tied to cost and schedule performance. Commercial individuals have been embedded on each project team

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

to manage commercial risk. Project scope has been defined to the component level, and detailed engineering will be completed prior to the start of construction. OPG has invested in a reactor mock-up and training facility, to perform full testing of the tools, processes and procedures, as well as train staff prior to performing work on the actual reactors. The contract with SNC/Aecon includes provisions for OPG to take over the tooling and the mock-up at the conclusion of the Definition Phase if the parties are unable to negotiate the target price contract for the Execution Phase.

Incentives in the RFR contract were established on the basis of four unit performance, allowing the RFR contractor to make-up cost overruns and schedule delays to the first unit on subsequent units. However, the LTEP prioritizes the importance of a successful Unit 2 refurbishment. This will need to be included in the target price for the RFR and TG projects.

Principle 2: Mitigate reliability risks by developing contingency plans that include alternate supply options if contract and other objectives are at risk of non-fulfillment.

One contingency action contributing to this principle is the decision to start the second unit after unit 2, rather than overlapping the units. In addition, the effort to improve the reliability of fuel handling equipment reduces the chance that fueling of the operating units will be reduced during the defueling of the refurbishment unit.

Principle 3: Entrench appropriate and realistic off-ramps and scoping.

Each contract has an off-ramp for termination. Reimbursement to contractors is limited to reasonably incurred costs. Each unit requires individual approval that provides well-defined off-ramps. The yearly release strategy and gating process for funding individual project initiatives has wide visibility and adherence within the DR Team. be done in drained/defueled state.

Principle 5: Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price.

Schedule accountability is built into each contract. The contractor is required to provide a detailed schedule for execution as an input into the Release Quality Estimate. Cost accountability is built into contracts to establish target cost and incentives/disincentives. Monthly project oversight meetings with OPG senior management and contractor senior management have improved oversight and contractor accountability. Quarterly CEO meetings reinforce this principle. OPG has chosen to perform the work in the Execution Phase on a target price basis which increases the contractors' transparency. This will enhance OPG's ability to resolve issues as they arise. This may result in OPG performing

specific work rather than use a contractor. For example, agreement could not be reached with a supplier of radiation protection services, resulting in OPG deciding to perform the services itself.

Principle 6: Make site, project management, regulatory requirements and supply chain considerations, and cost and risk containment the primary factors in developing the implementation plan.

Regulatory requirements were a primary input to the defined scope of the refurbishment outage and life extension projects. There is an agreement between the station and refurbishment on the condition that the unit will be turned over to the project and then returned to the station. The program is being managed in accordance with PM Institute standards and INPO project principles. The Release Quality Estimate process is using Association for Advanced Cost Engineering (AACE) best practices and is being monitored by KPMG. Risk management is recognized as a key element of success and the program is being well implemented.

One opportunity for improvement is the ability to identify and address adverse trends in performance in a timely and effective manner.

Principle 7: Take smaller initial steps to ensure there is opportunity to incorporate lessons learned from refurbishment including collaboration by operators.

To fully incorporate lessons learned from the first unit's (Unit 2) refurbishment, the second unit's (Unit 1) start has been delayed until the completion of the first unit. If appropriate, other units may be able to be delayed to continue this risk reduction. However, this will likely result in an overall increase in cost. To reduce risk for the first unit, the decision was made to install its digital controller in a future outage. To prevent the risk associated with single source suppliers of key reactor components, OPG has qualified second vendors for key components. This will help Bruce Power with an associated materials risk.

OPG and Bruce Power refurbishment management have met on three occasions to develop areas in which they can be mutually supportive. In addition, the engineering organizations have met to discuss opportunities to improve the efficiency and effectiveness of design engineering. The following are areas in which collaboration is being sought by senior management:

- a framework for collaboration
- Reviewing the significant work scope in each program
- Reviewing key performance and workplace challenges
- Reviewing planned trades work schedules

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Reviewing resource leveling strategies and likely high resource demand periods
- Reactor Defueling planning and tools
- Plans and Lessons Establishing learned on systems layups and drying of systems that are drained
- Modifying field work controls on defueled units
- Lessons learned on transitioning into and out of Refurbishment
- Plans for completing Balance of Plant work without impacting critical path
- Performance of RFR tools and value of full mock-up of the reactor
- Close out issues and unit return to service challenges

Darlington Refurbishment has completed a comparative review between its and Bruce's assumptions related to defueling the reactor and installation of bulkhead. Refurbishment execution management understands the bases for the differences in durations of these sequences.

## **9. State of Readiness**

The Nuclear Refurbishment program is fully into its Definition Phase to support the successful execution of Unit 2, starting in October 2016. There are several areas that provide confidence that the organization is on track for breaker open; including:

- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. There has been agreement with the CNSC on the Integrated Improvement Plan, with written acceptance tied to the Darlington operating license renewal process, scheduled in 2015.
- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The life extension work that is not included in the refurbishment outage will be performed by Projects & Modifications and the station.
- Although there is a challenge to meet the August milestone, engineering will be completed in sufficient time before breaker open to support downstream activities, such as order materials and generation of field execution instructions.
- The Release Quality Estimate is currently under development to meet its October 2015 milestone. The RQE will include the cost estimate for the four units, the Level 1 plan for the four units and Level 3 detailed schedule for Unit 2, the refurbishment outage scope for each unit and the execution strategy.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- A number of products to support the RQE will define several key areas for success, such as scope and responsibilities of functional departments, assumptions on the support needed for each project and responsibilities for the transition of the unit between Darlington Operations organization and refurbishment organization.
- The assembly of the execution organization has started. There is the commitment to hire a construction management company to support the execution phase.
- Contracts are in place for all projects to complete the engineering and develop the estimate (cost and schedule) required for the RQE.
- The Class 2 (revision 0) estimate for the Re-Tube and Feeder Replacement project was submitted in May. There is a significant gap between it and OPG's expectations related to schedule, cost and contingency funding. Reviews and meetings are in progress to close the gaps, with a submission of Class 2 (revision) targeted for August 31.
- The RFR full scale reactor mock-up has been valuable in the verification of tool designs and validation of Tooling Performance Guarantee (TPG) durations. Its value will increase during the refining of procedures for the reactor face series, and the training of re-tube face and feeder replacement personnel.
- With the unsuccessful negotiation for a contract for radiation protection services, OPG has decided to self perform this function. This capability is progressing.
- Pre-production qualification runs for the major reactor components are well in progress. OPG implemented the strategy to have two vendors qualified for each major component. This will provide OPG the ability to mitigate significant quality issues with one vendor, as well as provide Bruce Power with the same flexibility in procurement of these critical components.

Although OPG is making good progress towards breaker open readiness, there are a number of issues that once resolved will increase the comfort level for the execution of the project. These include:

- Probably the most significant need is for the refurbishment organization to demonstrate effective execution of field work in 2015 and 2016. During the second quarter Refurbishment Execution senior management established a Ready to Execute Plan. This plan includes the use of Refurbishment managed prerequisite projects to test the processes, infrastructure, organization and oversight that will be used in full refurbishment outage. This is an excellent opportunity to identify needed improvements prior to the start of full execution at

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

breaker open. The plan has 5 months to analyze performance and incorporate improvements prior to the October start of the full outage.

- Tied to execution is the fact some of the work is first time execution for the vendor, very infrequently performed or first of a kind. For example, this is the first time for the Joint Venture to execute a re-tube and feeder replacement, first time in a decade for B&W to clean the Darlington steam generators, first of a kind process for the handling and reduction of re-tube radioactive waste and some first of a kind turbine inspection at Darlington. Since refurbishments by their nature are infrequently performed, this is not a surprise. OPG has taken a number of actions to mitigate the associated risk – the most visible being the full-scale reactor mock-up. However, execution is significantly different than planning and the need for OPG to have effective oversight and the ability to identify and respond to degrading execution performance is emphasized.

OPG has the infrastructure and framework for execution of the outage. With the Ready to Execute Plan, the organization will monitor completion of prerequisite projects (including Campus Plan and SIO projects) and processes needed for the start of the Unit 2 outage, and test the processes, infrastructure, organization and oversight prior to the breaker open in order to implement desired improvements.

**1. Minister Summary**

This report provides the detailed quarterly review of trends, accomplishments and challenges related to the Darlington Nuclear refurbishment project. The project is reaching a critical phase, with completion of Definition Phase by yearend of 2015 and the start of execution of some core refurbishment projects. Between now and breaker open the refurbishment organization will be executing projects associated with the Re-tube Waste Processing building, refurbishment support facilities, services and shutdown/layout projects.

A number of achievements have been made in the progress towards being in a state of readiness for breaker open. This progress includes:

- Life to date total cost of the project as of the end of August 2015 is \$1,934M, which is \$214M below the plan of \$2,148M.
- The Release Quality Estimate has been developed with final reviews in progress for submission to the OPG Board by November 15, 2015. The RQE includes the cost estimate for the 4-units, including contingency, the detailed schedule for Unit 2 and the high level schedule for the other units, and the scope of the refurbishment outages.
- The Joint Venture (JV) submitted its revised Class 2 estimate (revision 1) for the RFR project and it has been accepted by OPG. Currently the JV and OPG are in discussions to resolve the gap in contingency funds to be assigned to the JV and completion of the contract amendment.
- The transition of the OPG Board's oversight from the Nuclear Oversight Committee to the Darlington Refurbishment Committee (DRC) has started, with its first meeting scheduled in August.
- Collaboration meetings with Bruce Power continue to explore and implement collaboration opportunities.
- OPG refurbishment management has declared success in meeting the August 15<sup>th</sup> milestone for completion of detailed design engineering. There remain 45 (17%) detailed engineering packages to be completed in 2015 and 2016. These packages were approved by execution and engineering vice presidents for completion after the milestone.

With the RQE being scheduled for submission in mid November, the focus of the refurbishment organization moves to demonstration of the readiness to execute the Unit 2 refurbishment outage. This demonstration is particularly important with the large

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

number of issues associated with the planning and execution of the Campus Plan and Safety Improvement (SIO) projects. Areas that need to be included in this demonstration include:

- The lessons learned from the Campus Plan and SIO projects need to be addressed in a manner that provides confidence that they will not be repeated during the refurbishment outage. These are grouped under three categories (planning, execution and organizational effectiveness) as described in the challenge Readiness to Execute Unit 2 Refurbishment. Refurbishment management has developed a Readiness to Execute plan that identifies and schedules the activities that need to be accomplished to provide this confidence. This plan includes a five month test period during which the processes, infrastructure and organization developed for the refurbishment outage will be validated and verified for effectiveness.
- Tied to execution is the fact some of the work is first time execution for the vendor, very infrequently performed or first of a kind. For example, this is the first time for the Joint Venture to execute a re-tube and feeder replacement, first time in a decade for B&W to clean the Darlington steam generators, first of a kind process for the handling and reduction of re-tube radioactive waste and some first of a kind turbine inspection at Darlington. Since refurbishments by their nature are infrequently performed, this is not a surprise. OPG has taken a number of actions to mitigate the associated risk – the most visible being the full-scale reactor mock-up. However, execution is significantly different than planning and the need for OPG to have effective oversight and the ability to identify and respond to degrading execution performance is emphasized.

The challenges that were identified in the second quarter continue to exist with some change in focus. These challenges represent performance trends that should be addressed to reduce the possibility of becoming significant issues.

**Contractor Safety Performance**

Projects and Modifications (P&M) management and the ESMSA vendors have initiated a number of actions in response to the increase in contractor safety events. These actions have contributed to improved contractor safety performance during the third quarter. This improvement is based upon a reduction in the number safety incidents, as well as field observations showing improved behaviours related to working at heights and lifting and rigging. The current challenge is to incorporate these actions to ensure sustained performance.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

**Release Quality Estimate**

The development of the Release Quality Estimate (RQE) has been the major focus of the refurbishment organization through 2015. Its submission to the OPG Board of Directors has recently been revised back to the original milestone of November 15, 2015 from an early target of October 15, 2015. This will provide additional time to complete refinements and challenges, as well as include the results of the KPMG reports on the process and its implementation.

**Summary of Preliminary Results.** There may be slight changes as a result of the reviews and challenges to be conducted in October. The current preliminary cost information is:

- Total Cost: \$10.6B (2015\$) including \$0.2B of incurred interest and \$12.8B with inflation and future interest
  - \$2.3B estimated spent to 2015 yearend
  - \$4.3B external Engineer, Procure, Construct (EPC) vendors
  - \$1.9B OPG functions and project management
  - \$0.2B insurance and CNSC costs
  - \$1.9B Contingency
- The contracts with the EPC vendors are a combination of Target Price (53%), Cost + Mark-up (33%) and Fixed Price (14%)
- The duration of the refurbishment of the four units is based upon each unit's critical path duration and extent of overlap between units. The schedule is summarized below.

Unit	Planned Start	Planned Finish	High Confidence Finish	High Confidence Duration (days)
2	10/15/16	8/15/19	2/15/20	1,218
3	9/15/19	6/15/22	4/15/22	1,217
1	1/15/21	10/15/23	6/15/24	1,157
4	7/15/22	4/15/25	2/15/26	1,127
4 unit	10/15/16	4/15/25	2/15/26	3,410

The planned duration for Unit 2 is 1,034 days. The high confidence duration of 1,218 days includes the contingency resulting from program risks and discrete risks associated

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

with the critical path.

The challenge section provides a summary of the status in each of the review areas for RQE.

**Management of Engineering Quality and Open Items**

With the OPG declaration of meeting the milestone for the completion of design engineering, there is the risk that quality issues, including a large number of engineering open items, may result in an increased demand and scope for field engineering, as well as delays and rework in construction execution. This risk has been identified for several quarters; specifically, the potential impact of the acceptance of engineering deliverables from design agencies that do not meet quality requirements. By its nature, any perceived time pressure to complete a large engineering workload in a short period of time introduces a challenge to maintain high levels of quality and an increase in the acceptance of engineering packages with open items to be completed. This feature combined with the latent nature of engineering errors results in the need for effective implementation of a rigorous and high quality process for the acceptance of engineering design deliverables. The latent nature of engineering errors in approved designs refers to the fact that the consequences of these errors are not realized immediately. They are seen in construction, commissioning and too frequently during plant operation.

**Ready to Execute Unit 2 Refurbishment Outage**

As stated above, refurbishment management's next critical step is to demonstrate that the organization is ready to execute the refurbishment of Unit 2. Refurbishment management has developed a Ready to Execute (RTE) Plan to have specific processes, infrastructures and organizations in place and validated for effectiveness prior to Unit 2 Breaker Open (start of the Unit 2 refurbishment outage). One important element to demonstrate readiness is the understanding and addressing of the lessons learned that plagued the Campus Plan and SIO projects. During more than thirty months of observations, a number of such lessons learned have been, and continue to be, identified by the Independent Oversight Advisor. In addition, the Vice President of Execution has requested that the refurbishment execution organization conduct a formal lessons learned review of the four projects that have had issues related to engineering, schedule, cost and quality (EPG3, D<sub>2</sub>O Storage, CFVS and AHS). These lessons learned can be divided into three general categories – preparations, execution and organizational effectiveness. The challenge section of this report reviews these lessons learned, identifies the level of risk and method by which OPG is addressing each, and

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

the process to assess the extent to which each is addressed.

## 2. Purpose of Report

This quarterly report provides a more detailed review and expansion of the monthly reports to the Ministry of Energy of OPG management's progress to plan and execute a successful refurbishment outage of the Darlington nuclear units. Success is defined as the preparation and execution of 100% of the correctly identified project scope safely, on schedule, within budget and with quality. It is the belief of the MOE's Independent Oversight Advisor that the Refurbishment Program Challenges that are identified in Section 5 deserve consideration by OPG Refurbishment management. It is the intention to identify such challenges when they represent an early trend rather than wait until they become a significant issue.

## 3. Darlington Nuclear Refurbishment Scorecard

### Darlington Nuclear Refurbishment Scorecard – September 2015

	Current Month	Previous Month	Trend	Notes
<b>Unit 2 Readiness for Breaker Open</b>				
Safety Performance and Preparations for Unit 2	x	x	↗	An improvement plan has been developed by OPG and ESMSA vendors.
Regulatory Approvals	✓	✓	→	The approval of the IIP is expected as part of the renewal of Darlington's operating license.
Risk Management	✓	✓	→	
Release Quality Estimate	x	x	→	The date for submission of the RQE to the Board has been moved to its original milestone of November 15, 2015.
Cost Management	✓	✓	→

Unit 2 Prerequisite Work	*	*	→	
<b>Learning and Oversight</b>				
Operating Experience & Corrective Action	✓	✓	→	
Oversight	✓	✓	↘	

**Basis for Scorecard Ratings**

**Safety Performance and Preparations for Unit 2– YELLOW**

The adverse trend in contractor worker safety performance in the Campus Plan and Safety Improvement Opportunities (SIO) projects was identified as a challenge in the Q2 report. This trend includes incidents involving lifting and rigging, work at heights and vehicle movement. In addition, the Joint Venture has had safety incidents while working at the mock-up and the Re-tube Waste Processing Building. During this past quarter, an improvement plan has been developed for the ESMSA contractors. It is discussed in the challenge on contractor safety performance.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

ALARA committee meetings continued during the third quarter. The establishment of an ALARA committee during the planning phase is an excellent practice. However, it has set the end of Q1, 2016 as the target for a Unit 2 ALARA plan. This late date will provide little opportunity to have the ALARA plan influence the projects both in terms of dose reduction techniques during the execution of Unit 2's refurbishment, as well as minimize source term and radiological hazards during post refurbishment operation.

Regulatory Approvals – WHITE

The CNSC provided a letter to OPG stating that the revised Integrated Implementation Plan (IIP) meets the intent of CNSC regulatory document RD-360. The CNSC staff accepts OPG's IIP Revision 001 with implementation of specific changes that were documented in the letter. The changes are required to be made in the document's revision for submission to the CNSC in support of the 2015 licensing renewal for the Darlington nuclear plant. The IIP represents OPG's commitment to the CNSC in response to findings of the Environmental Assessment and Integrated Safety Review.

Risk Management – WHITE

Q3's focus in risk management was the development of the contingency estimate for the Release Quality Estimate. This included discrete risks for the individual projects and the risks for the functions, and the broader Program risks. The results are provided in the RQE challenge. The Key Risk Areas and their status did not change during this quarter.

- Availability/Retention of Key Staff (remained as a Yellow risk)
- Cost and Estimating Management (remained as a Yellow risk)
- Completion of Unit 2 Prerequisites (remained as a Yellow risk)
- Regulatory Approvals (improved from a Yellow risk to a Green risk)
- Fuel Handling Reliability (remained as a Yellow risk)
- Vendor Performance (remained as a Yellow risk)
- Integrated Schedule Development (remained as a Yellow risk)
- Materials not Procured Prior to Lead Time Expiry (remained as a Yellow risk)
- Completion of Engineering (remained as a Yellow risk)
- Integration with External Organizations (remained as a Yellow risk)
- Support Staff Resourcing (this is a new key risk area regarding the availability and retaining specialty support resources to support the refurbishment project.)

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Now that the project has a good understanding of the risks and contingency, it needs to focus on managing the risks. This should include:

- Monitoring the progress of the mitigating actions for the identified risks.
- Identifying those risks that are very low probability but a significant impact and developing strategies.
- Developing response plans for issues that are likely to happen and which could result in higher consequence if not effectively managed. An example of such an issue is the response to a radiological event.

Release Quality Estimate (RQE) - YELLOW

Progress towards RQE has been a major refurbishment focus during 2015. The RQE has four major deliverables:

- The cost estimate for the refurbishment of four units, including contingency. This requires a detailed understanding of the basis and assumptions for the outages and the associated risks.
- A schedule for the four units – detailed for level 2 and high level for the remaining units. This also requires an understanding of the basis and assumptions for the outages and the associated risks.
- Confirmation of the scope of the project and specifically Unit 2. This not only includes the scope of the refurbishment outage but also the commitments to the CNSC tied to the unit's return to service but assigned to the station.
- The Execution Strategy for Unit 2. This includes many items that have not been effectively implemented during execution of the Campus Plan (CP) and Safety Improvement Opportunity (SIO) projects. These are described in the challenge for incorporating lessons learned from the CP and SIO projects.

The RQE has not completely gone through its review and challenge process within the refurbishment organization. This will be completed for the November submission to the Board. RQE status is provided in the Challenge section of this report.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Cost Management - WHITE

For the purpose of this scorecard, cost management has been separated from the risks associated with the basis and assumptions for the refurbishment project, which are captured under the RQE element. Life to date total cost of the project as of the end of August 2015 is \$1,934M, which is \$214M below the plan of \$2,148M.

Unit 2 Refurbishment Core Projects Readiness - WHITE

With the completion of design engineering and RQE submission in November, the core projects will need to focus on monitoring the procurement of parts, completion of Comprehensive Work Packages (CWPs) and assessing, and the management of the open engineering items remaining after the acceptance of design packages. These should be monitored through the weekly Project Schedule Review meeting. The effectiveness of the associated processes will be assessed during the test period that uses the prerequisite projects scheduled in 2016 prior to breaker open.

Unit 2 Execution Readiness - YELLOW

With the performance issues that have occurred during the Campus Plan and Safety Improvement projects, the refurbishment organization needs to demonstrate their readiness to execute to a high level of confidence. Management has developed a Readiness to Execute Plan, which includes a test period, for this purpose. Details are covered in the Challenge section of this report

Unit 2 Return to Service Readiness - WHITE

OPG refurbishment management recognizes the need to start the strategy to perform commissioning of systems and return the unit back to service upon the completion of each unit's refurbishment. This is seen in a Return to Service section reporting to the Refurbishment Director of Operations and Maintenance, as well as an associated functional management plan. It is expected that the Division of Responsibilities document that is currently under development will provide clarity of the responsibilities of refurbishment and station organizations.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Unit 2 Schedule Development - WHITE

With the completion of RQE, a detailed schedule has been developed for the critical path and placement of the other project bundle windows for the Unit 2 outage has been developed. The non-critical path schedule can be examined for opportunities for resource balancing and verification that there are no impacts on work in one location from work in another location.

Unit 2 Scope Control - WHITE

The scope for the Unit 2 refurbishment outage is well defined, and is controlled by an established process and Unit Scope Control Board. This controls both the addition and removal of work to the outage. It is expected that some scope addition will occur as a result of discovery work associated with the core projects, as well as corrective maintenance on components that are planned to be operating during the outage. Some of this work will need to be done, and the RQE contingency funds will recognize this reality. The work performed within the core refurbishment projects is not the only source of work to be performed during the outage period. Additional work will be done as a result of:

- The Unit 2 cyclic outage will be performed during the unit's refurbishment outage. Its scope includes corrective maintenance and preventive maintenance activities that are not included in the core refurbishment projects, but necessary for the continued health of the asset. The scope of this outage is in the process of being defined and controlled through a separate scope control process. Its scope and associated estimate are required to support the submission of the RQE.
- There will be a number of projects managed by Projects and Modifications that will be conducted during the refurbishment outage period. They are not associated with the refurbishment outage and thus will not be part of RQE. However, the scope of work needs to be fully defined and controlled to prevent impact on the core refurbishment project.
- Although not funded by the refurbishment project or part of its scope, the station organization has a number of work activities for which it is responsible and has a CNSC commitment for completion prior to Unit 2 start-up. These will be managed through established station processes.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Resource Management - YELLOW

The availability/retention of key project staff is identified as one of the program's Key Risk Areas. It consists of:

- The possibility of limited skilled trade resources and supervision for project execution is one of the highest program risks. With the slowdown in the economy, refurbishment management does not believe that this will be an issue for Unit 2. However, the risk will potentially increase with subsequent units, as a result of potential overlap with Bruce Power refurbishment project and any increase in infrastructure and industry projects.
- The potential that project leadership and specialized resources are **not** in place when required. There are a number of initiatives under development to reduce the significance of this risk. Refurbishment management is constrained through the need to implement the corporate policies and procedures that have been developed for operating facilities and small projects.
- The possibility of an insufficient number of Authorized Staff for both station and refurbishment needs. This is being addressed through a combination of increased number of candidates for the associated positions as well as challenging the extent of the need for such staff once the unit is defueled and isolated through the bulkhead.
- The potential of an insufficient number of qualified radiation protection coordinators to support project execution.

OPG refurbishment management is developing and implementing actions to ensure its leadership team is in place for the current outage and future leaders are identified and developed for the program's sustainability. However, this year's trend of key individuals leaving OPG or the project represents a degrading trend in this area. Movement of key, experienced personnel from the project is a risk not only because of the lost talent, but also because of the loss of project specific knowledge, including the basis of decisions and operating experience. In particular, this is the fourth DOM in the past two years.

Performance of Campus Plan & Safety Improvement Opportunity Projects - YELLOW

It is recognized within the OPG organization that the performance of the Campus Plan and Safety Improvement Opportunity (SIO) projects continues to be a challenge to OPG. The most important observations from this quarter are:

- The Joint Venture has challenged a number of aspects of the original engineering design of the D<sub>2</sub>O Storage Building that will require rework and

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

potential delays in field execution. These include certain aspects of the civil design that do not meet code and the redesign of pipe runs through the Heavy Water Management Building (HWMB). These designs had been accepted by OPG. Although these do not represent a significant impact on schedule, this is the beginning of the JV's involvement in the project. OPG has revised its contingency plan for the storage of Unit 2 water in the event that the D<sub>2</sub>O Storage Building is not ready. The plan is to have space made available in the HWMB for unit 2's water. This plan will be monitored to assess its readiness for October 2016.

- A number of design engineering quality issues, including not addressing open engineering items, impacted field execution in terms of quality, cost and schedule. These impacted a number of projects; including D<sub>2</sub>O Storage Building, EPG 3, AHS, BUS 55/56, RPO, CFVS, and RFRISA. The issues are provided in the engineering quality challenge.
- OPG's forecast of May 2016 for EPG3 is significantly more optimistic than the contractor's forecast of September 26, 2016. This is an example in which OPG accepted the design (October 2014) and design packages are still being developed and submitted to OPG for approval. The forecast for the completion of engineering is December 18, 2015. Currently OPG has committed that this project (as one of the Safety Improvement Opportunity projects) will be completed prior to the start of the Unit 2 refurbishment outage. This risk will need to be managed by OPG and effectiveness reported in this report.

The current completion milestones provided to the OPG Board in its August meeting challenges for these projects are identified in the following table.

Project	Need Date	Current Forecast	Float to Need Date (months)	Notes (changes highlighted in bold)
Auxiliary Heating Steam		Oct. 2015		This project is not tied to the start of Unit 2 refurbishment. <b>The current forecast represents a delay of 1 month since the previous update to the Board. The vendor has a forecast to completion of December, 2015</b>
Heavy Water Storage and Drum Handling Facility	Feb. 2017	June 2016 (Partial) and May 2017 (full)	8	The partial is required to store Unit 2's heavy water. In addition, a contingency plan for Unit 2 water is under development. <b>The JV's schedule to</b>

Project	Need Date	Current Forecast	Float to Need Date (months)	Notes (changes highlighted in bold)
Protection	2017	2015 for Unit 3		during the refurbishment outage. Unit 3's has been moved from June 2015 to December 2015 as a result of the change in the VBO from spring to fall.
Re-tube Waste Processing Building	July 2017	Dec. 2016	7	
Re-Tube Waste Storage Building.	July 2017	December 2016	7	<b>The contractor's schedule has the forecast completion as March 2017.</b>
Used Fuel Dry Storage Building	March 2016	December 2015	3	<b>The need date has been revised by OPOG from October 2016 to March 2016. The contractor's forecast for completion is March 30, 2016.</b>

The life-to-date costs for these projects, as of May month end, are \$601M, \$42M below plan.

Unit 2 Prerequisite Work

There is a large amount of work that needs to be completed at the station to support the start of the Unit 2 refurbishment outage. In addition to the visible Campus Plan and Safety Improvement Opportunity projects, other work that needs to be completed prior to the start of the unit 2 outage. These can be categorized as:

- Fuel Handling Reliability Improvement Work. There is a need to improve fuel handling equipment to support current operations and the defueling of the reactor. This work is being planned and executed by the station fuel handling organization. This work has progressed well during Q3, resulting in the health of all systems being declared as excellent (Green) or good (White)
- Fuel Handling Work to support Unit 2 Refurbishment Outage. In addition to the fuel handling equipment reliability improvement initiative, the station fuel handling organization is executing the work to support the Defueling project. This work has progressed well during Q3. Commissioning of tooling on the Service Area Rehearsal Facility (SARF) was completed in September 2015.
- Station Ready for Refurbishment Work. There is work that the station is responsible to complete that is required for the start of the unit 2

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

refurbishment outage. This is related to improving the health of key systems, such as containment vapour recovery systems. If this work is not accomplished prior to the outage it will need to be completed at the start of the outage.

- Refurbishment Organization Work. There is some work for which the refurbishment organization is responsible. This work must be coordinated with the station schedule and use station processes. There are a number of work orders to be completed during the VBO.

In addition, the Refurbishment Core Project has several projects that must be completed prior to the start of the Unit 2 refurbishment outage. Field execution of these projects is scheduled through 2015 and 2016. Most of these are associated with Islanding, Shutdown/Layup and Balance of Plant and are summarized in the following table.

Core Project	Project	Status
Unit Islanding	Negative Pressure Containment Modifications	Field execution through 2015 and 2016. This includes 4 engineering packages.
	Area Islanding Barriers	Planned for execution in Q3, 2016. This represents 4 engineering packages.
	EFADS, PAMS and CLRTS modifications	Starts in VBO and continues through 2016
Refurbishment Support Facilities	Non-contaminated maintenance workshops and offices	This contains 7 engineering packages. Scheduled for Q1 and Q2, 2016.
	Wireless Network Infrastructure	This contains 1 engineering package. Scheduled for Q4, 2015.
	Turbine Cargo Elevator	This contains 2 engineering packages. Scheduled for Q1 and Q2, 2016.
	Work Control Area and Permit Preparation	This contains 2 engineering packages. Scheduled for Q4, 2015 and Q1, 2016.
	Radiation Protection Offices and Teledosimetry	This contains 2 engineering packages. Scheduled for Q1 into Q3, 2016.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Core Project	Project	Status
	Contaminated Shops, decontamination and contaminated scaffold storage area	This contains 1 engineering package, although likely separate areas. Scheduled for Q2 and Q3, 2016.
Shutdown/Layup/Services	Breathing Air System	This contains 3 engineering packages. Scheduled for Q1 and Q2, 2016.
	Service Air System	This contains 2 engineering packages. Scheduled for Q1 and Q2, 2016.
	Washrooms – install and tie-in	Scheduled for Q3, 2016

As can be seen, 2015 and 2016 will have the four identified groups of station work, the identified core projects and the Campus Plan & SIO projects that will require integration, coordination and support from the station. This will have to be done in conjunction with the fall Vacuum Building Outage, a spring Unit 4 outage and the on-line work required for the continued safe operation of the plant.

A specific focus of the Refurbishment organization (particularly the R&FR project) is the planning, engineering and construction of the Re-Tube Waste Processing Building (RWPB). Although not required for Unit 2 breaker open, it is required prior to the start of removal of feeders and fuel channels, it is being planned and executed by the RFR Joint Venture, and thus is the first example of field execution by the Refurbishment Organization. This project has had some of the same issues seen in the Campus Plan and SIO projects that contributed to their cost increases and schedule delays. In response, refurbishment senior management has increased focus and oversight of this project starting in Q1. This oversight includes a weekly meeting with the Vice President, Execution and a weekly scorecard discussed on the Chief Nuclear Officer phone call. However, the project neither participates in the daily project Plan of Day meeting nor has the equivalent daily meeting or phone call with senior management. Because of the isolation of the management of this project, issues may not be identified to organizations (the station, Projects & Modifications or broader refurbishment) in a timely manner. For example, an adverse trend in vehicle contact with caissons was identified by the JV at an RFR Steering Committee meeting. There were no SCRs initiated and no discussion at the P&M Plan of the Day meetings.

Refurbishment senior management is using the prerequisite projects as an opportunity to test the processes, infrastructure and organization prior to the full execution in

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

October 2016. It is unclear if the RWPB project will be included in this pilot in order that the JV is exposed to the processes prior to breaker open.

**Corrective Action Program and Use of Operating Experience – WHITE**

The refurbishment Corrective Action Program (CAP) and Operating Experience program (OPEX) represent nuclear industry standards and well implemented. Particular strengths are the quarterly trend reports and the Corrective Action Review Board. Both of these are consistent with OPG and industry standards. The challenge for the refurbishment organization is the integration of all sources of quality and human performance information into a broader trending product. For operating nuclear plants, the main source of quality and human performance information is the Station Condition Reports (SCRs). However, for the project this is only a small component of the available information on quality and human performance. Additional sources are the audits and surveillances performed by Supply Chain, receipt inspections of parts and materials, project oversight logs, and the corrective action program results for each vendor. To identify a potential adverse trend before it becomes a significant issue will require improved capability to trend across projects, vendors and programs.

**Oversight – WHITE**

During the Definition Phase, refurbishment oversight focused on the projects (engineering, estimating and commercial compliance) and the independent oversight team (Modus/Burns & McDonnell) that reports to the Nuclear Oversight Committee of the OPG Board of Directors. In addition, there have been a number of internal audits by various oversight organizations. As refurbishment transitions to planning and field execution of the prerequisite projects, there will need to be an increasing focus on both field execution and the horizontal oversight required to identify potential cross-cutting issues. With the establishment of a Quality Surveillance Group there is some confusion with the roles and responsibilities associated with horizontal oversight. This will be assessed during the fourth quarter.

**4 Accomplishments and Progress**

The following accomplishments were achieved during the third quarter of 2015:

- Life to date total cost of the project as of the end of August 2015 is \$1,934M, which is \$214M below the plan of \$2,148M.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- The Release Quality Estimate has been developed with final reviews in progress for submission to the OPG Board by November 15, 2015. The RQE includes the cost estimate for the 4-units, including contingency, the detailed schedule for Unit 2 and the high level schedule for the other units, and the scope of the refurbishment outages.
- The Joint Venture (JV) submitted its revised Class 2 estimate (revision 1) for the RFR project and it has been accepted by OPG. Currently the JV and OPG are in discussions to resolve the gap in contingency funds to be assigned to the JV and completion of the contract amendment. These will permit the completion of the associated target price, which should be completed prior to submission of the RQE to the OPG Board.
- The transition of the OPG Board's oversight from the Nuclear Oversight Committee to the Darlington Refurbishment Committee (DRC) has started, with its first meeting scheduled in August.
- The replacement of Tom Mitchell as CEO has been announced. The new CEO, Jeff Lyash, has considerable utility, including nuclear, project management experience. This is a very good selection based on the importance of the Darlington refurbishment is to the health of OPG.
- Collaboration meetings with Bruce Power continue to explore and implement collaboration opportunities.
- OPG refurbishment management has declared success in meeting the August 15<sup>th</sup> milestone for completion of detailed design engineering. There remain 45 (17%) detailed engineering packages to be completed in 2015 and 2016. These packages were approved by execution and engineering vice presidents for completion after the milestone.
- A number of actions have been identified, with some started, to address the adverse performance in contractor safety related to the Campus Plan and Safety Improvement Opportunity projects. Improvement has been noted through the third quarter, with the need to have actions in place to ensure sustainability.

**5. Refurbishment Program Challenges**

Throughout the life of refurbishment program specific challenges have been, and will be, identified that in the belief of the Independent Advisor to the Minister of Energy should have actions by OPG Refurbishment Management to address them, before they become significant issues. The currently identified Refurbishment Program challenges are

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

related to contractor safety performance, the development of the Release Quality Estimate (RQE), the management of the engineering workload, and demonstrating the refurbishment organization will be ready to execute by Unit 2 breaker open.

**Contractor Safety performance**

As identified in the Q2 report to the Ministry, the adverse trend in industrial safety practices seen in the Campus Plan and SIO projects includes Re-tube and Feeder Replacement (RFR) field activities. The adverse trend includes moving vehicles hitting site objects, as well as an increase in the number of improper practices related to working at heights without fall protection and lifting and rigging. These poor safety practices cut across the ESMSA contractors, the RFR contractor and a subcontractor directly managed by OPG.

Projects and Modifications (P&M) management and the ESMSA vendors have initiated a number of actions in response to the increase in contractor safety events. These actions have contributed to improved contractor safety performance during the third quarter. This improvement is based upon a reduction in the number safety incidents, as well as field observations showing improved behaviours related to working at heights and lifting and rigging. The current challenge is to incorporate these actions to ensure sustained performance. The activities to support improved performance include:

- There were initial meetings with supervisors and managers from each of the three vendors (ES Fox, Black & McDonald (B&M), and the Joint Venture) used for P&M projects. The observed meetings were the first ones and as a result there was little discussion among field supervisors.
- There is a safety management team established with senior managers from ES Fox, B&M and P&M organizations.
- An initiative to have P&M and vendor managers observe and coach pre-job briefings was started in August, 2015. A review of the August records shows that these were done and they identified some areas for improvement. Observing pre-job briefing provides insight into the focus on safety by the execution team and its supervisor. The next step is to periodically conduct observations of the work discussed in the pre-job briefing to verify that the discussed precautions and requirements are addressed during execution.
- ES Fox initiated a Health, Safety, and Human Performance plan with objectives and targets, as well as improvement in the supervisor oral review board and assessment process.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- P&M and the contractors have initiated a poster program to support communication of safety issues.
- P&M has joined the Darlington station's campaign to reinforce human performance requirements and error reduction techniques. This includes a formal rollout of the 'Core 4' human performance program, which reinforces procedure use and adherence, pre-job and post-job briefings, verification practices and situational awareness.

An adverse trend in contractor safety was identified by OPG in February (SCR D-2015-04075) and investigated during April and May. A number of actions were identified to address the causes of the adverse trend. The following table shows the status of these actions.

Action	TCD	Status per action tracking	Notes
OPG ESMSA contractors complete and document two paired observations per month for each subcontractor for Q2, Q3 2015 and conduct quarterly trends.	9/30/15	Accepted	Although there is evidence that observations have been conducted by the ESMSA vendors, there is no evidence that these included with subcontractors.
OPG ESMSA contractors complete and document two paired observations per month for each foreman for Q2, Q3 2015 and conduct quarterly trends.	9/30/15	Accepted	Although there is evidence that observations have been conducted by the ESMSA vendors, there is no evidence that these included paired observations with foreman.
Communicate, monitor and reinforce the frequency of safety meetings as per corporate safety rules. Develop and implement meetings scripts for key meetings on the discussion of nuclear safety and oversight of high risk activities.	7/31/15	Notify	Observations of the Plan of the Day meeting show that the identification of high risk activities is identified with the name of an ESMSA oversight person. The lack of high risk jobs is not challenged. Follow-up on observations is not performed.
For current open level 2 causal evaluations, analyse the open actions and combine actions into a few initiatives for focus.	8/15/15	Complete	An analysis of events was conducted; however, actions from this analysis were not developed.
Conduct a joint CARB review in Q3 with Darlington CARB members to review P&M adverse trends for feedback on trends and recurrence actions.	9/30/15	Notify	A joint CARB meeting was conducted for the review of the common cause analysis from which this action was created. However, this specific meeting has not been held.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Action	TCD	Status per action tracking	Notes
OPG ESMSA contractors implement subcontractor management plans to address gaps in subcontractor human performance.	9/30/15	Accept	The two original ESMSA contractors developed safety and human performance plans early 2015. It is not clear if they have been revised based on the results of this investigation.
OPG ESMSA contractors to implement a field observation program that includes paired supervisory observations.	8/28/15	Sent	Both ESMSA contractors have had observation programs that include paired observations.
Implement a nuclear safety culture plan for projects and modifications.	9/25/15	Sent	There has been the rollout of the Core 4 program, as well as mandatory safety meeting program.
P&M Corrective Action Review Board (CARB) to implement the improvement initiative that was completed at Darlington and other sites.	12/15/15	Sent	This is intended to improve the effectiveness of Project and Modification's CARB meetings, and does impact the drive to improve contractor safety.

A review of these actions identified that some characteristics of successful initiatives to improve safety performance can be strengthened in the current improvement efforts. Examples for consideration include:

- It is common to increase the number of field observations (in addition to pre-job briefings) of medium and high risk activities. Frequently, to drive this increase management will lower the threshold for high risk activities.
- Establish a routine forum in which observations of these activities are discussed among managers and supervisors, including first line supervisors.
- It is common to have an initiative to improve the observation and coaching standards and performance of both the owner and contractor management who perform field observations.
- It is common to increase the emphasis on quality pre-job briefings. On several occasions workers are provided a start of shift briefing and sent to work without an actual pre-job briefing. The characteristics of a good initial and update briefings are not well understood by many first line supervisors. Provide some fundamental training on pre-job briefings. In addition, conduct observations on pre-job briefings.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- It is common to have the owner's organization conduct blitzes in areas of concern, in addition to management of the contractor.
- It is common to increase the engagement of first line supervisors in debriefing the lessons learned from human performance events. This is done by having them present at presentations to the station or project organization and/or present to their peers.

Although it will take awhile to demonstrate sustained performance in contractor safety, there are a number of areas that will provide increased confidence that the issue is being effectively addressed. Examples of such areas to provide increased confidence are:

- Confirmation that P&M and vendor managers have a good ability to conduct observation and coaching and a plan to improve any performance weaknesses.
- Confirmation that sufficient observations of high and medium risk activities (including pre-job briefings) are performed by vendor and OPG management.
- Confirmation that the results of observations and events are discussed with vendor field supervision and management on a regular basis.
- Because lifting and rigging is one of the areas of the adverse trend, confirm that the intent of WANO SOER 2008-1 recommendations is implemented by Projects and Modifications, and Refurbishment organizations.
- Confirmation that the actions identified in the adverse trend investigation report (SCR D-2015-04075) are being effectively addressed.

**Release Quality Estimate**

The development of the Release Quality Estimate (RQE) has been the major focus of the refurbishment organization through 2015. Its submission to the OPG Board of Directors has recently been revised back to the original milestone of November 15, 2015 from an early target of October 15, 2015. This will provide additional time to complete refinements and challenges, as well as include the results of the KPMG reports on the process and its implementation.

- **Summary of Preliminary Results.** There may be slight changes as a result of the reviews and challenges to be conducted in October. The current preliminary cost information is:
- Total Cost: \$10.6B (2015\$) including \$0.2B of incurred interest and \$12.8B with inflation and future interest

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- \$2.3B estimated spent to 2015 yearend
  - \$4.3B external Engineer, Procure, Construct (EPC) vendors
  - \$1.9B OPG functions and project management
  - \$0.2B insurance and CNSC costs
  - \$1.9B Contingency
- The contracts with the EPC vendors are a combination of Target Price (53%), Cost + Mark-up (33%) and Fixed Price (14%)
  - The duration of the refurbishment of the four units is based upon each unit's critical path duration and extent of overlap between units. The schedule is summarized below.

Unit	Planned Start	Planned Finish	High Confidence Finish	High Confidence Duration (days)
2	10/15/16	8/15/19	2/15/20	1,218
3	9/15/19	6/15/22	4/15/22	1,217
1	1/15/21	10/15/23	6/15/24	1,157
4	7/15/22	4/15/25	2/15/26	1,127
4 unit	10/15/16	4/15/25	2/15/26	3,410

The planned duration for Unit 2 is 1,034 days. The high confidence duration of 1,218 days includes the contingency resulting from program risks and discrete risks associated with the critical path.

The current status of the RQE elements is provided below.

- **Re-Tube & Feeder Replacement (RFR) Class 2 Estimate.** The Joint Venture (JV) submitted a Class 2 estimate (revision 10) on August 31, 2015. It is the result of a significant effort between the JV and OPG to resolve disagreements from the original Class 2 estimate submission provided in early May. This estimate represents a 'bottom-up' determination. There are three major components to the estimate that are essential for RQE – schedule, cost and risk. The class 2 target duration provided in the Class 2 estimate (revision 1) is 1,164 days for Unit 2. This duration is an input into OPG's RQE schedule and duration, and represents a good level of confidence for the duration of the R&FR critical path and a best guess for the duration of the critical path performed by OPG. The total project cost estimate execution in the JV's submission is \$2.71B. It is

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

noted that the higher cost estimate in the RQE itself is because it includes the work (such as tool development, manufacture and testing) completed during the Definition Phase.

OPG has accepted the JV's Class 2 estimate (revision 1) and it is currently the basis for the final execution contract for the R&FR project. The final contract is expected (and needed) for the OPG Board meeting of November 15, 2015.

- **Project Estimates.** Each project bundle generated an RQE package that was reviewed and challenged by senior refurbishment management. This package included the scope, cost estimate, duration and location in the outage of the project bundle(s), and discrete project risks. In general, there was not a significant amount of follow-up work. The following table provides the cost estimate for each bundle, as identified in the RQE bundle. These costs include EPC labour, parts and materials, OPG support and oversight, and contingency.

Project Bundle	Cost Estimate	Confidence Level	Notes
Re-tube & Feeder Replacement	\$3,725M	High	The basis for this estimate is the JV's bottom-up Class 2 estimate. As the main scope of work and the project that defines the majority of critical path duration, it has been under scrutiny for the past 30 months.
Turbine Generator	\$862M	Medium	There was a lack of recognition in the package of the risk associated with the commissioning of the new digital controller systems during the unit's return to service. The first unit this impacts is Unit 3, since the modifications are not being done during the Unit 2 outage. As a result of management challenge, the project team was assigned an action to increase the contingency for this risk.
Balance of Plant (BoP)	\$641M	Low	7 of 17 project bundles had discrepancies in man-hour estimates between the RQE estimate and the resource loading graphs of greater than 15%. The estimating exercise was done late (the contracts were awarded late) and thus mostly reflect a lower level of confidence compared to the

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Project Bundle	Cost Estimate	Confidence Level	Notes
			other projects. Planning is immature. The main vendor has had problems with accurate cost and schedule estimates for the Campus Plan and SIO projects. This has resulted in a high contingency in percentage terms.
Defueling, Fuel Handling and Special Projects	\$381M	High	The estimate is based on previous history with experienced vendors. During the Definition Phase this project has successfully overcome problems to meet milestones. This project has demonstrated good coordination among the project, vendor and station.
Shutdown/ Layup, Services and Refurbishment Support Facilities	\$397M	Low	As with the Bop, many of these projects have just started, with immature planning resulting in incomplete estimates. The main vendor has had problems with accurate cost and schedule estimates for the Campus Plan and SIO projects. This has resulted in a high contingency in percentage terms.
Steam Generator	\$144M	High	The majority of this work involves common inspection techniques and a previously- implemented cleaning process. There is one modification that has been successfully done at several facilities. Very experienced vendors.
Unit Islanding	\$145M	Medium	With the exception of the Button Modifications, there is good agreement between the RQE man-hours and resource loading analyses. The reason for medium confidence is that this is the first time evolution at Darlington for Unit 2.
Campus Plan and Safety Improvement Projects	\$700M	Low	The RQE challenge meeting was held behind closed doors and no package has been provided. The estimate is the value provided to

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Project Bundle	Cost Estimate	Confidence Level	Notes
			the OPG Board at its October 1 retreat. Low confidence is based upon the performance of the contracts to date.

The projects that have lower confidence (Bop and Shutdown/Layup) have management actions to improve the confidence as well as higher contingencies to offset the level of confidence.

- Functional Estimates.** Along with the RFR project, the OPG functions represent the largest cost component of the refurbishment program. The cost estimates for each function have been presented to, and challenged by, senior refurbishment management. The total cost estimate of the functions for the refurbishment of the four units is \$2.6B, including \$0.6B spent by 2015 yearend for the Definition Phase. Refurbishment management's intention was to develop a bounding estimate that incorporates all necessary roles and responsibilities. During the RQE review process, some minor gaps in responsibilities were identified. Cost estimates have been included in the total estimate for the functions. A Division of Responsibility document is to be completed by yearend as part of the Readiness to Execute Plan. This is essential for the final organizational structure and numbers for the functions. Management recognizes its challenge to ensure that there is sufficient support to and oversight of the EPC contractors while maintaining a cost-effective organization within the functions.
- Contingency Funds.** The total value for RQE contingency funds is \$1.9B. This value is a result of identified risks in projects, and the programs that cut-across projects, including risks to the schedule. Contingency evaluations, including review of management reserve, will continue through October and be finalized by the November submission date. The following table summarizes the distribution of the contingency.

Bundle/Type	Contingency (\$M 2015)	% of Total Contingency
Re-Tube & Feeder Replacement	317	17%
Turbine Generator	205	11%
Balance of Plant	166	9%
Fuel Handling, Defueling and	43	2%

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Special Projects		
Steam Generator	21	1%
Shutdown, Layup & Services	69	4%
Campus Plan & SIO	67	4%
Functions Total	69	4%
Program (Schedule risk, discrete program risk, cost uncertainty)	924	49%
<b>Total Contingency</b>	<b>\$1,879</b>	<b>100%</b>

It is noted that the total contingency is about 40% of the total value of the EPC contractors' estimate for execution (\$4,300M). This is consistent with the current contingency for Watts Bar construction project, and presumably will be benchmarked by KPMG in their review reports on the RQE process and its implementation.

- **Assumptions and Bases.** The development of the RQE requires an understanding of its basis, as well as associated project, functional and program assumptions. A basis item is a documented and approved condition, fact and/or strategy that describes how a cost estimate, schedule or other plan component was developed and documents the information used in support of RQE development. An assumption is a condition, item or information required in developing the program (or project/function) estimate that has yet to be completely defined and validated. Each assumption requires a validation plan. During the planning of the refurbishment program, a number of basis items and assumptions have been identified. During the development of RQE, these have been refined and modified, with additional ones identified. These will need to be finalized, with a summary report that clearly identifies the key basis items and assumptions for the refurbishment of the four Darlington units. The current date for this report is July 15<sup>th</sup>; however, this will continue to be updated through to the finalization of the RQE.
- **RQE Process.** The estimating processes used in the development of the estimates are based on AACE (Association for the Advancement of Cost Engineering) guidelines. The RQE process and key elements have a number of reviews in progress; including:
  - KPMG is performing an independent review of RQE. It contains two components – a review of the RQE processes and a review of their

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

implementation through a deep dive in the RFR, Balance of Plant and Operations and Maintenance function estimates. The process review report was issued on September 30<sup>th</sup> and thus not reviewed for this report.

- Modus provides oversight on behalf of the OPG Board of Directors. They are monitoring the progress of the RFR JV Class 2 estimate and the RQE. They provide on-going recommendations to support the development of these products. Their focus is on the extent to which the process is aligned with the AACE guidelines and extent to which the results are defensible. Their reports provide limited insight into the quality of RQE since they provided a mixture of oversight and consulting through the process.
- BRG (Berkeley Research Group) was hired by the JV to provide an on-going, independent review of the RFR Class 2 estimate. The review was performed through selected submissions. It is unclear of the status of the submissions and their actual use to support the RQE.
- RFR Expert Panel. The JV and OPG jointly established an Expert Panel to review elements of the Class 2 submission during its development. Members of this panel had experience with the re-tube of CANDU reactors, specifically at Bruce and Pt Lepreau. They identified three areas in which further work was required to obtain a reliable estimate - the excessive size of the project management organization for the project, the extent of contingency funding for the project and the long duration of critical path. These items were addressed in the JV's Class 2 estimate.
- **Conclusions:** The following conclusions are provided on the current status of the Release Quality Estimate:
  - The scope of the project has been defined for several quarters and, other than discovery work during the actual outage, is firm.
  - The total cost of \$10.6B (2015\$) or \$12.8B (including escalation and interest) includes the cost of planning and preparations, support facilities and SIO projects, other prerequisites, the project bundles, the functions and contingency. It is based upon a mixture of Class 2 to 4 estimates, but represents a high-confidence upper bound.
  - The duration of the Unit 2 outage is based on a bottoms-up critical path schedule. The planned duration is 1,084 days with a high confidence duration of 1,136 days. This compares well with the actual Wolsong 1 (W1) refurbishment outage duration of 839 days or corrected to 1,136

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

days when corrected by the author for design differences (mainly the number of fuel channels in a Darlington reactor (480) versus the 380 fuel channels in W1). This corrected value is different than provided by the JV as a result of not increasing the impact of the calandria tube sheet bore issues and using the actual times in the Unit 2 schedule for OPG start-up. The difference does not detract from the duration estimate.

- The high confidence duration of the four-unit refurbishment outage is 112 months. It is based on Unit 2's detailed schedule and high-level adjustments for the remaining units. The most significant risk to duration for the remaining units is the return to service of Unit 3 after the first installation of the digital controllers for the turbine generator and exciter.
- Although the basis and assumptions are captured in a database, they are not in a format that can be easily reviewed for completeness.
- The KPMG reports on the review of the RQE process used by OPG and its implementation was issued on September 30<sup>th</sup> and thus not reviewed for this report.
- OPG will be in a position to submit a credible RQE to its Board in mid November, 2015.

**Management of Engineering Quality and Open Items**

With the OPG declaration of meeting the milestone for the completion of design engineering, there is the risk that quality issues, including a large number of engineering open items, may result in an increased demand and scope for field engineering, as well as delays and rework in construction execution. This risk has been identified for several quarters; specifically, the potential impact of the acceptance of engineering deliverables from design agencies that do not meet quality requirements. By its nature, any perceived time pressure to complete a large engineering workload in a short period of time introduces a challenge to maintain high levels of quality and an increase in the acceptance of engineering packages with open items to be completed. This feature combined with the latent nature of engineering errors results in the need for effective implementation of a rigorous and high quality process for the acceptance of engineering design deliverables. The latent nature of engineering errors in approved designs refers to the fact that the consequences of these errors are not realized immediately. They are seen in construction, commissioning and too frequently during plant operation.

A quality indicator has been developed for the use in this quarterly report to provide trends in quality, starting in Q4, 2014. The following table provides the results to date.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Engineering Quality Indicator =  $100 - 15 \times (\text{L1 events (rejection by external approving authority + rework after field installation)}) - 10 \times (\text{L2 events (rejection by internal approving authority + rework during field installation + other event free day reset)}) - 5 \times (\text{L3 events (other rework (greater than \$10K))} + 1 \times (\text{GC (documented good catches prior to submission for OPG review to maximum of 10)})$ . The following values are used for the colour rating:

Green: >80

White: 65 – 79

Yellow: 50 – 64

Red: <50

Month	Index	Rating	Basis
Q4/14	57	Yellow	
Q1/15	57	Yellow	
Q2/15	42	Red	
July 2015	10	Red	0 L1 event, 4 L2 events, 6 L3 events
August 2015	65	White	1 L1, 2 L2, 2 L3
September 2015	40	Red	2 L1, 1 L2, 4 L3
Q3/15	38	Red	

The Q3 indicator of 38 continues to represent a potential concern for quality of engineering.

In addition to the above table of showing quality index, the challenge and associated potential risk is based on the following observations:

- It is an acceptable and common practice within OPG to accept a design package with open items in the design. There is no rigorous process to manage these open items to ensure they are addressed prior to the start of field construction.
- There are several Campus Plan and SIO projects that met their engineering complete milestone with open items for which there are impacts in field execution, resulting in delays and rework. Examples include Emergency Power

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Generator 3 (EPG3), Auxiliary Heating System (AHS), Containment Filtered Ventilation System (CFVS), D<sub>2</sub>O storage, and Re-Tube and Feeder Replacement Island Service Annex (RFRISA) building.

- Although OPG has responded to the IER 14-20 on Technical Conscience by the Institute of Nuclear Power Operations (INPO), there has not been a review of high risk, first-of-a-kind or first-in-awhile design agency work to validate the rigour and quality of the design agency and acceptance by OPG.
- The refurbishment Vice President of Engineering recently communicated his continuing concern about on-going quality issues, including open items, in the design agency products.
- There has not been a review to verify that designs have incorporated appropriate World Association of Nuclear Operators (WANO) and INPO significant operating experience recommendations.

Although refurbishment engineering understands the risk of latent errors in design engineering, there are opportunities to reduce the risk of impacting field execution as a result of design quality issues and unresolved open items. Examples of opportunities that would increase the confidence that engineering quality and open actions are being effectively managed are:

- Identify completed and in-progress designs that are high risk, infrequently performed (first in awhile) or first time performed. For each, specify additional verification and validation requirements. INPO generated an industry operating experience document related to such engineering (IER L1 14-20, Integrated Risk – Healthy Technical Conscience), particularly recommendation 3, which deals with vendors conducting engineering work for the owner. Several designs fall into this category; including, EPG3, CFVS, D<sub>2</sub>O Storage Building, access ports for the Steam Generators, the digital controllers for the Turbine/Generator and fire pumps as additional supply to the Emergency Service Water system.
- Consider including in the above verification and validation key assumptions, critical calculations and other key elements in the design. Include as an addendum to the design acceptance documentation the specific activities taken to verify and validate the quality of the deliverables. This should include the items that were independently verified by refurbishment engineering and the individual's name that performed independent verification for OPG as well as validation that the design agency's process was satisfied.
- Identify and document which references in the Requirements Traceability Matrix (RTM) were independently reviewed by OPG and the name of the individual. This can be done for the critical requirements, assumptions and calculations.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- Develop and implement a process to manage the engineering open items that need to be addressed prior to ordering equipment, prior to assessing and CWP development and prior to field execution. Have this process be monitored through the weekly Project Schedule Review meeting and have the closure accepted by the Design Authority.
- Verification that the design is consistent with INPO/WANO important operating experience (SOERs and IERs). Designs that have such operating experience include EPG3, digital controllers, and intake cooling water. In addition, there are several SOERs that are of value for the operation, maintenance and monitoring of equipment both in the operating state and in lay-up during refurbishment. An efficient way to verify consistency with SOERs (both in terms of design modifications, operating and lay-up) is to review the Darlington station's response to the recommendations to ensure that they are still valid during the refurbishment of the unit, and if not take specific actions to meet the recommendations. For the INPO operating experience and recommendations on digital controllers, a review of the documents will need to be performed with a response to how the recommendations are met.

**Ready to Execute Unit 2 Refurbishment Outage**

Once a reliable RQE estimate is submitted and accepted, the next critical step is to demonstrate that the organization is ready to execute the refurbishment of Unit 2. Refurbishment management has developed a Ready to Execute (RTE) Plan to have specific processes, infrastructures and organizations in place and validate for effectiveness prior to Unit 2 Breaker Open (start of the Unit 2 refurbishment outage). One important element to demonstrate readiness is the understanding and addressing of the lessons learned that plagued the Campus Plan and SIO projects. During more than thirty months of observations, a number of such lessons learned have been, and continue to be, identified by the Independent Oversight Advisor. In addition, the Vice President of Execution has requested that the refurbishment execution organization conduct a formal lessons learned review of the four projects that have had issues related to engineering, schedule, cost and quality (EPG3, D<sub>2</sub>O Storage, CFVS and AHS). These lessons learned can be divided into three general categories – preparations, execution and organizational effectiveness.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

**Lessons Learned Associated with Preparations**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes and Status
Poor quality of cost estimates contributes in exceeding estimates, requesting additional funds and uncertainty in the estimate at completion.	Low	The RQE process is designed to provide a reliable cost estimate and contingency funds for each project bundle and function.	The cost estimate and contingency for each project bundle and function is presented to and challenged by senior OPG management as part of the RQE process.	The RQE is still being finalized. There is increasing confidence that the final RQE cost estimate will represent a bounding estimate.
Poor quality of schedules contributes uncertainty in milestones, poor compliance with initial milestones, extended durations and uncertainty in available for service dates.	Low	The RQE process is designed to provide a reliable base schedule and contingency duration for both critical path and system windows.	The location of the project bundle window and its duration are presented to and challenged by senior OPG management as part of the RQE process.	The RQE is still being finalized. There is increasing confidence that the final RQE will provide both a reliable base duration and appropriate contingency for all four units. In addition, the detailed schedule is being developed in order to show the location and duration for each project bundle window and other activities required for the refurbishment outage.
Engineering was not completed prior to start of the project and in some cases quality issues contributed to construction issues and rework (both engineering and construction).	Medium	The refurbishment project had an engineering complete milestone of August 15, 2015.	Through a weekly review meeting, engineering was sufficiently complete for OPG to declare the milestone was met.	OPG declared the engineering complete milestone complete with 45 (17% of) engineering packages approved to be completed after the milestone. Some of these are associated with prerequisite projects (Breathing Air). There is the risk that this engineering will not be complete prior to the scheduled start of construction. In addition, CP and SIO had some construction delays and rework resulting from open engineering items and engineering quality problems.
Some problems with timely procurement of the correct parts and materials have contributed to schedule delays and cost increases.	Medium	Refurbishment has established and initiated a process to track the status of the procurement of parts and materials by vendors. It is to be implemented for Campus Plan and SIO projects.	This is currently monitored at the weekly Project Schedule Review Meeting. The scorecard has been identified and data is being collected.	Currently there are several sharp waterfalls in the work down curves and not all information has been included. There is a scorecard for the projects in the test period, providing good visibility.
The timely completion and the quality of some Comprehensive Work Packages and assessing have	Medium	Refurbishment has provided guidelines to vendors on CWP content	Refurbishment has established a Look Ahead team and	The Look Ahead process and team are important to ensure that all preparations are

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes and Status
contributed to schedule delays, quality of field execution, including rework and cost increases.		and provides collaborative support.	process to validate that CWPs, assessing and materials are sufficiently in place to start the work as scheduled. This process and the CWP process will be assessed during the test period.	complete prior to the execution of work. This will need to be effective for a successful refurbishment.
P&M has had problems with integrating its work through the station's on-line work management process, resulting in some delays in having work placed on the station schedule. This impacts the duration and cost of the impacted project.	Low	The mitigation of P&M work management issues has been the use of refurbishment work management, operations and maintenance personnel to support meeting station requirements. In addition, there is limited work during the refurbishment outage that needs to be coordinated through the on-line process.	Coordination through the station process on-line work management process will be assessed during the RTE test period.	Most of the work will not need integration with the schedule station. There will be work requiring integration at the beginning of the outage and return to service. This integration will be required during the prerequisite projects and assessed during the RTE rest period.

**Lessons Learned Associated with Execution**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes
There are a number of OPG processes which are required to be used by the ESMSA contractors, but have not been fully and effectively implemented. These include work management processes, work protection, work authorization, event free challenge process, lifting and rigging, and Foreign Material Exclusion.	Medium	Refurbishment has identified 14 processes for which vendors will use the OPG process. That confirms consistency in programs, but not their effective implementation.	Some of the processes will be used on the projects for the RTE test period. Some will have to be validated through tabletop exercises.	Having a set of common processes to be used by all contractors will ensure common standards, expectations, and procedures. It will not ensure consistent compliance to them. The effectiveness of their rollout and compliance will be assessed during the RTE test period.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes
The inability to effectively and efficiently address engineering issues during field construction has contributed to rework, schedule extensions and cost increases. The turnaround time for vendor engineering to address a field issue was frequently a week or more.	High		Performance of field engineering can be assessed during the RTE test period.	This is a lesson learned added in this quarter's report. It is a challenge acknowledged by the VP of Engineering. However the strategy to address it has not been clearly established and documented.
Several Campus Plan and SIO projects have had similar issues and problems, such as daylighting, dewatering, removal of contaminated soil, management of associated totes and unconditional release of materials. In general, rather than identify a lead organization or company for the management of such common processes, each project was left to its own to resolve the issues. This resulted in some delays, conflicts among contractors and likely some increase in costs.	Medium	Refurbishment management recognizes that there are processes that can have reduced cost and improved efficiency/effectiveness if one organization takes the lead. The opportunities need to be identified and a process implemented.	Some will be validated during the RTE test period. Others may be validated through tabletop exercises.	The strategy for common processes has not been clearly established. This will likely be included in the Construction Execution Strategy. This should also be included in the documentation for Division of Responsibilities.
The P&M's Project Control Centre (PCC) and Plan of the day Meeting (POD) meeting was not effective at meeting the objective of driving the Campus Plan and SIO projects to maintain schedule, to coordinate among projects, to prioritize issues and resources and to identify and resolve issues before they impact field execution. The meeting did improve during first two quarters of 2015.	Medium	The concept of a PCC has been accepted by refurbishment management. However, the details have not been finalized. The structure of a daily schedule review meeting (POD) has not been developed.	The effectiveness of the PCC and POD equivalent meeting will be assessed during the RTE test period.	The RTE plan has identified the use of a PCC and daily schedule reviews during the RTE test period.
There are common services that will need to be shared among the various project bundles and the station in a coordinated manner to ensure there is no impact on critical path, the ability to meet the service requirements and station targets. Examples include Active Liquid Waste (ALW), Breathing Air, Service Air, Temporary Power, Cranes (including Turbine Cranes) and storage locations within the station.	Medium	Refurbishment management has recognized the need to identify the need, capacity and coordination for most common services through the identification of a Single Point of Contact (SPOC). It is unclear if there is an identified SPOC for ALW and cranes.	There is likely limited opportunity during the RTE test period to validate the process. There will need to be a combination of field testing and tabletop testing.	Strategy and responsibilities have been developed for some (such as Breathing Air), but not as clearly defined for others (such as ALW). This needs to be clearly documented for all prior to the Unit 2 Breaker Open.
The P&M organization has not been effective at managing the ESMSA vendors in consistently meeting the	Medium	Refurbishment management has hired a consulting company	Initial validation will be assessed during the RTE test period.	It is important that refurbishment management demonstrates good

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes
high performance standards required for meeting safety, quality, cost and schedule goals.		(Kiewit) to support management of field execution and develop the capability within OPG.		performance in the management of contractor performance before the start of the Unit 2 refurbishment outage to provide the confidence that the contractors will perform to the required standards (safety, quality, schedule and cost).
The ESMSA contractors have had issues with the performance of subcontractors in the engineering, procurement and field execution associated with the Campus Plan and SIO projects. Issues have included the delivery of engineering products in a timely manner, engineering quality problems, timely delivery of parts, some quality issues related to parts manufacture, field execution rework and safety performance.	Medium	Refurbishment management has hired a consulting company (Kiewit) to support management of field execution and develop the capability within OPG.	Initial validation will be assessed during the RTE test period.	It is important that refurbishment management demonstrates good performance in the management of subcontractor performance before the start of the Unit 2 refurbishment outage to provide the confidence that that contractors will perform to the required standards (safety, quality, schedule and cost).
Campus Plan and SIO projects have not consistently been successful at having clean declarations of the completion of projects and acceptance of the Availability for Service by the station. This has contributed to missed milestones and some increased costs.	Medium	Refurbishment has developed a construction complete declaration (CCD) process and will follow OPG's Available for Service (AFS) process.	The effectiveness can be assessed during the RTE test period.	The effectiveness of the CCD and AFS processes will be monitored through the RTE test period and remaining prerequisite projects.

**Lessons Learned Associated with Organizational Effectiveness**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes
The Campus Plan and SIO projects have had problems with the correct number and capability of resources within the P&M organization to provide sufficient oversight and support to the contractors to have successful projects (where success is defined by safe, quality execution of projects on schedule and within budget).	Medium	Refurbishment senior management has identified as maintaining the leadership capability through the life of the project as a risk.		Management has identified construction execution management and oversight as a capability weakness and as a result has engaged Kiewit in a contract to provide support. The use of this contractor is under development. A review of capability of the other functions should be reviewed to ensure adequacy. Also the succession plan should be reviewed to ensure the project will be effectively staffed and

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes
				led through its life.
There have been events during field construction of Campus Plan and SIO projects resulting in the stoppage of work. These have normally been associated with safety or environmental incidents. Normally, once the stop work has been issued, the P&M organization has struggled to identify what specific actions are required to be performed prior to restarting the work.	Medium	Refurbishment has established a draft Work Stop/Start procedure to support timely resolution of stop work issues.	Validation will be made through a combination of tabletop exercises and actual stop work issues during the RTE test period.	The current version of the Start/Start procedure is not likely sufficient to cover likely scenario areas and be accepted by the station. This will be monitored through the tabletop validation exercises. The Division of Responsibility document may assist in this issue.
During refurbishment project there will be a number of technical decisions that will need to be made as a result of equipment inspections and/or equipment not meeting the desired performance level.	Medium			This is a recently identified lesson learned. The response to this OPG identified issue will be monitored for effectiveness. The Engineering Decision Making process is the default process to address this issue.
A common weakness in previous refurbishment projects as well as the Campus Plan and SIO projects is not identifying and addressing adverse performance trends prior to becoming a significant issue. This frequently results in safety and quality issues that result in schedule delays and cost overruns.	High	Refurbishment believes that this is addressed through the use of a contrarian at meetings, the formalization of the Event Free Challenge Meeting and the Change Control process. In addition, operational tools (Engineering Decision Making (EDM) and Operational Decision Making (ODM)) are available to the project.		If the adverse performance trend is identified, the current EDM and ODM processes would provide the correct challenges if used. However, the challenge is to identify the adverse trend sufficiently early so that it can be addressed prior to becoming an issue. This is a cultural characteristic and should be assessed through the first half of 2016. One test is the extent to which the organization develops a response plan for identified issues that it considers low probability and high consequence.
The current oversight model focuses on the individual projects. Although this provides good vertical oversight it does not provide senior management with the horizontal look to identify cross-cutting programmatic issues.	Medium	There is a plan to provide a quarterly report to the executive on the most significant cross-cutting issues for the project.	Validation of the new process and report is included as an activity in the RTE plan.	The plan to identify cross cutting issues is recently developed. Its implementation and response by the executive team will be monitored through the RTE test period.
With the changes being made to support a successful refurbishment project, there is the potential for divergence in the standards,	Medium	This is recognized by OPG and meetings on alignment have been initiated.		The implementation of alignment will be assessed through the Q4, with emphasis on impacts to contractors.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Lesson Learned	Risk to Refurbishment	Refurbishment Action	Refurbishment Validation	Notes
expectations, processes and field oversight between the Refurbishment and P&M organizations. Since both organizations are using the same contractors and workers, this leads to the potential for human performance errors resulting from confusion among workers and supervisors.				
Although there is a set of principles on the state of the unit as received from and returned to the station, there are a number of areas in which alignment is required between the project and station.	Medium			There are examples of good alignment, such as the initiative to improve fuel handling equipment reliability and commission defueling tools on station equipment. There are also areas of potential misalignment, such as the detailed condition of the unit when returned back to the station. The project's challenge is to identify the areas needing alignment and then obtain it.
A mega project such as the refurbishment of the Darlington units involves a large number of project and functional groups within the refurbishment organization, several vendors (primary and subcontractors), the station and organizations within the nuclear fleet and corporate organization. The challenge is to ensure that the required responsibilities and activities are completed with minimal duplication.	Medium	Refurbishment management has initiated a Division of Responsibilities to document all organizations that can impact refurbishment work and the associated activities.		This is a good initiative. Ideally it would have been completed as an input into RQE. Although it will not meet this timeline, sufficient work has been done to identify gaps and ensure the associated funding is included in RQE. It is to be completed by the end of the year, at which time components can be validated during the RTE test period.

**Ready to Execute Plan**

A key element of demonstrating that the refurbishment organization has the organization, processes, infrastructure, and facilities (the total of which is the capability) to execute the Unit 2 refurbishment outage is the validation of its capability through a combination of a test period and other methods (including tabletop exercises and independent reviews). This is recognized by senior refurbishment management and the associated activities are identified in the Readiness to Execute (RTE) plan. This plan represents a significant, but necessary, amount of work. The organization will be challenged to complete this work with the necessary quality to provide the desired

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

confidence. Although not resource loaded, the RTE activities are captured in a schedule. Milestone sheets are in the process of being completed.

The RTE plan includes a test period of 4.5 months (February – mid June, 2016). During this period a number of prerequisites projects can be used to assess the effectiveness of a number of the processes, the infrastructure and the execution organization. The projects currently scheduled to have field work performed during the test period include the RWPB, non-contaminated shops and work areas, work control area, service air, unit islanding associated isolations, some Vault Vapour Recovery System work, Negative Pressure Containment work, some fire protection work, radiation protection teledosimetry system, and decontamination shops. Although the test period will not involve all the vendors, combined with tabletop exercises and procedure reviews, it will provide sufficient validation of the processes, infrastructure and organization to assess the readiness of OPG to execute the refurbishment of Unit 2.

Conclusion

Although the Ready to Execute Plan has the right planning and execution elements, by itself it does not provide confidence in the organization's capability to perform the refurbishment project. The confidence is gained by its successful execution and validation of the processes, infrastructure and organization through the test period, tabletop exercises and independent reviews. In addition, the organizational effectiveness lessons learned are not likely to be tested during the test period. To support a high level of confidence that the refurbishment organization is ready to execute prior to Breaker Open, the following actions may be considered:

- Define success for the RTE Plan and test period.
- Identify which elements of the RTE Plan address lessons learned from Campus Plan, SIO and other nuclear projects. If there is a gap, create an action to address it or a basis for no action.
- Identify the elements of the RTE that will be validated through the test period and those that require another form of validation. Identify the method of validation (such as tabletop exercise and independent review) for each element not included in the test period.
- Verify that there are actions and validations to address the organizational effectiveness lessons learned.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**6. Status of Individual Projects**

The Darlington Refurbishment Program consists of seven individual projects and a number of infrastructure projects (also called Campus Plan) and Safety Improvement Opportunity projects:

- Re-tube and Feeder Replacement (RFR)
- Fuel Handling/Defueling (FH)
- Turbine Generator and Controls (TG)
- Steam Generator and Auxiliary Systems (SG)
- Balance of Plant (BOP)
- Islanding
- Shutdown, Layup and Services

The status of Campus Plan and Safety Improvement Opportunity projects is provided in the relevant section of the scorecard.

**6.1 Re-tube and Feeder Replacement Project**

The Re-tube and Feeder Replacement (RFR) project represents the largest scope and cost component of the Darlington Refurbishment Project. The RFR project will define the project's critical path and thus duration. As demonstrated by the schedule delays, cost overruns and performance issues in previous CANDU refurbishment projects, the RFR project also represents the largest risk to the project being completed on schedule and on cost. The RFR project consists of the removal and replacement of 480 pressure tubes, 480 calandria tubes, 960 end fittings and 960 feeder pipes for each of the Darlington four units. This requires the development, testing, manufacturing and maintenance of specialized tooling; the generation and verification of specialized procedures; and the training of the staff that will perform the field work. The project also includes the construction of a realistic reactor mock-up for the purposes of tooling testing, procedure verification and staff training.

The Q3 focus areas and status for the RFR project were:

- As stated in the RQE challenge, the Class 2 estimate was submitted by the Joint Venture (JV) on August 31 and was used in the RFR estimate for RQE.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- With the submission of the Class 2 estimate, the JV and OPG are completing negotiations to obtain the target price. There are three items to resolve for agreement on the target cost.
  - There is a fair gap in the value of contingency to be provided to the JV to manage their risks. This gap needs to be closed for RQE submission to the OPG Board to provide the confidence in the RQE.
  - There is a desire by the JV to have the assumptions that were agreed upon during the development of the Class 2 estimate formalized so they will not be changed in the future by OPG. This should not be an issue to address prior to RQE submission to the Board.
  - The Contract Amendment needs to be completed. This is mostly wording, with one item with monetary impact that needs agreement – the JV plan during periods that it is not working on RFR critical path activities.
- The Re-tube Waste Process Building (RWPB) estimate (cost, schedule and contingency) is in progress and the 'war room' process used for the Class 2 estimate has been established. This estimate should be completed by the end of October.
- The installation of the caissons for the RWPB is behind schedule. The JV has revised its schedule to bring the ground slab forward, removing caisson installation from critical path.
- As compared with other projects, the JV works relatively in isolation on the RWPB. As a result, the operating experience from this project is not shared in a timely manner with Projects & Modifications, the station and overall refurbishment organization. This was reported at the latest RFR Steering Committee meeting. An SCR was not initiated to communicate the lessons learned.
- Production tooling is entering the acceptance test phase with deliveries predominantly in 2015.
- Procurement of major reactor components and goods has had a schedule slippage, challenging the June 2016 milestone. Mitigating actions include the creation of a dashboard that highlights the risk for each component and the establishment of an OPG/JV 'war room' to resolve issues in a timely manner.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

**6.2 Fuel Handling/Defueling Project**

This project consists of two main subprojects – the defueling of the reactor to start the outage and the refurbishment of the fuel handling equipment and associated systems.

The defueling of the reactor represents the first critical path activity for the project. It is currently estimated that the duration for defueling the reactor will be 113 days. This duration is based on a project report that makes a number of assumptions for success. Key assumptions and their status include:

- The defueling will be conducted by station fuel handling operators around the clock, 7 days a week. The organization is currently obtaining sufficient qualified individuals to perform this work.
- The reliability of fuel handling equipment will be improved to support defueling with limited breakdown maintenance required. As of the end of Q3, the health of all fuel handling systems is either good (White) or excellent (Green). The Equipment Reliability Index at the end of Q3 was 81 against a target of 76. If the station executes the plan to sustain the equipment, it will be in a good position for high reliability during the defueling of Unit 2.
- Testing and commissioning of tooling will be performed on available station equipment. This was successfully accomplished on both the Pressure Test Facility (PTF) and the Service Area Rehearsal Facility (SARF). This supports the declaration of the tooling in Q1 2016.
- The engineering for the supporting software (OpData) was completed during this past quarter.
- Sufficient maintenance resources to implement the current Preventive Maintenance Program and schedule for major overhauls, as well as support the defueling window. This has been identified as an at risk component of the plan.

The project has a Fuel Handling Defueling Readiness Plan that integrates the fuel handling equipment reliability improvement work with the work required to directly support the defueling of the reactor.

The success of this project requires the on-going coordination of work by the vendor (GEH-C), the refurbishment project team and the station. This coordination continued to be very good during the third quarter.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

**6.3 Turbine/ Generator Project**

The scope of the Turbine/Generator includes:

- Steam Turbines and Turbine Auxiliaries: inspections, repairs, and/or replacements of High Pressure (HP) and Low Pressure (LP) turbine components and a number of turbine auxiliaries;
- Generator and Generator Auxiliaries: inspections, repairs, and/or replacements of generator components (including generator stator rewind) and a number of generator auxiliaries,
- Moisture Separator Reheater (MSR): inspection, overhaul, and/or replacements of MSR internals and auxiliaries (e.g. strainers, valves);
- Turbine Control Upgrade: replacement of the obsolete analogue Steam Turbine Electronic Control (STEC) System, includes entire Turbine Supervisory System with new digital system; and
- Generator Excitation Upgrade: replacement of the analog Generator Excitation system controls with a digital design and a set of additional Generator Excitation and Protection equipment to resolve obsolescence issues.

A contract was awarded to Alstom for the design and delivery of the digital controllers as well as technical support during the execution of the project. The design work by Alstom is complete. It is noted that the digital controllers are not being included in unit 2's refurbishment outage. In addition, Alstom accomplished the following in Q3:

- TSSA pressure boundary registration is in progress.
- The strategy for the deferral of Unit 2's digital controllers was finalized.

The TG engineering integration and field installation vendor (SNC/Aecon Joint Venture (JV)) had the following accomplishments in this quarter:

- Completion of design engineering.
- All CWP's for the Unit 2 outage have been submitted to OPG for review.
- The Unit 2 Class 2 cost estimate and a level 5 schedule for field execution have been accepted by OPG.
- The Class 3 estimate and Level 4 schedule for the remaining units have been accepted.

This project is unique in that it includes one company (Alstom) providing the design and manufacture of equipment and technical expertise during the actual TG refurbishment

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

and modifications, and one company (the Joint Venture) providing the interface engineering and the construction. This unique model requires increased oversight and integration by OPG and the project's senior management oversight committee, since the two companies are not fully integrated for the project.

There are 2 noteworthy risks for this project:

- Weaknesses in the replacement of analog controllers with digital controllers have resulted in several events in the industry both during commissioning and normal operation. This was the reason for OPG senior management to defer the introduction of digital controllers until the second unit's refurbishment, and back fit Unit 2 at a future outage. Although there is the opportunity to validate the design through the use of a simulator, it is not clear that these events (provided in INPO operating experience reports) have been studied during the design of the controllers and their integration with Darlington systems. Refurbishment senior management recognizes the risks associated with the commissioning of digital controllers and return to service, and has increased the contingency funds for the associated risk.
- Maintenance on the turbine, generator and stator systems is considered high Foreign Material Exclusion risk both because of the potential consequences of foreign material in the system when operating and the difficulty to retrieve foreign material, particularly in the generator and stator. OPG refurbishment will need to review these work plans for industry standards in the prevention of foreign material intrusion.

#### **6.4 Steam Generators**

The Steam Generator project consists of a series of modification and maintenance activities to fulfill the requirements of its Life Cycle Management Plan. The Engineer Procure Construct (EPC) contract has been awarded to a consortium of Babcock & Wilcox Canada and Candu Energy Inc. The project includes:

- Tube sheet waterlancing to address possible degradation from sludge accumulation. The DACVR meeting for Design Authority approval of the detailed design was successfully completed on March 10.
- Installation of access ports to improve secondary side inspection capabilities for future inspection outages. An enhanced COMS (constructability, operability, maintainability, safety) meeting was held on February 25, with no additional requirements specified.
- Primary side tube cleaning to improve overall thermal efficiency, increase neutron overpower margin and reduce radiation fields.
- Divider plate leakage characterization to establish a baseline for cross flow between the cold and hot legs of the SGs

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

- Primary and secondary side ultrasonic, eddy current and visual inspections. These will be performed by the OPG Inspection, Maintenance Service organization.

The following accomplishments were achieved during this past quarter:

- The 4-unit cost estimate and Unit 2 detailed schedule have been accepted by OPG.
- The vendor's Quality Assurance program is being aligned to agree with the requirements specified in the Purchase Order.
- The draft transportation analysis has been submitted to OPG.

With exception of installation of the access ports, the activities associated with this project are services performed during routine planned outages. There are two noteworthy risks that exist for this project:

- The tooling that is used for the waterlancing and primary side cleaning represent tooling entering systems that are required to be free of foreign material. Although designed to be fully intact, there is always the risk that a component may become loose and enter the primary side or secondary system. This would result in the need to develop and execute a recovery plan.
- The installation of 7 access ports into each steam generator represents cutting into a containment boundary. Although the contractor has successfully performed this installation at other plants, any time a containment boundary is modified is considered a risk.

## **6.5 Balance of Plant Project**

The Balance of Plant (BOP) scope consists of plant modifications and maintenance work in the following areas:

- Pre-refurbishment work
- Safety and Control Systems
- Reactor component systems
- Conventional Systems
- Common Systems

During the third quarter, the project worked closely with contractors to develop and submit the cost estimates, schedules and risk profiles needed to support OPG's RQE. Because of the delay in establishing the project contracts, the cost estimate and associated schedule were of less quality than for the other projects. However, OPG is confident that they are conservative, and will not be exceeded.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

Although not currently a risk, operating experience has indicated that Balance of Plant work can become the critical path to restarting the unit if not effectively scheduled and managed. One action taken by refurbishment management to reduce this potential is to not have work scheduled after the critical path is 60% completed. Exceptions would be limited to work that can only be done in the conditions that are provided after 60% completion. Additionally, Refurbishment Execution will perform an additional detailed review of the BOP work to verify that there are robust plans in place to complete the work without effecting critical path.

**6.6 Station Readiness Projects**

There are a number of core refurbishment projects that are critical to support the refurbishment of the unit, but do not provide refurbishment of equipment. These are:

- Islanding projects. These projects are required to establish the physical and administrative separation of the refurbished unit from the operating plant, as well as separate a number of common areas for the duration of the refurbishment outage.
- Shutdown/Layup projects. These projects are in place to shutdown and layup individual systems at different stages and for different durations through the unit's refurbishment outage. This is required to protect the systems against corrosion and other damage mechanisms when not in normal operation.
- Services projects. These projects provide the needed services to support the unit's refurbishment outage. Such services include electrical, breathing air, service air, instrument air, and water.

In general, the Islanding projects are making use of the other contracts that align with its work in the same or adjacent area. For example, the EPC contract for the installation and removal of the bulkheads has been awarded to the R&FR Joint Venture (JV). This is a sound decision since the JV has the most to gain from the timely installation of the bulkheads, there is elimination of coordination issues in the vault, and the required capabilities for the two projects are similar.

The strategy for the Shutdown/Layup and Services projects is the same as for the BOP projects (use of the ESMSA contractors). These projects are also using the same ESMSA contractor as selected for several of the Balance of Plant projects. As a result, the engineering strategy and weekly meetings described for the Balance of Plant also exist for these projects.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**7. Oversight of the Darlington Refurbishment Program**

Both OPG and the Ministry of Energy (MOE) understand the need for a successful refurbishment for the Province, the company and the industry. In line with that importance, the Minister of Energy established the role of independent advisor and OPG established the role of an external independent oversight team reporting to the OPG Board. This team consists of individuals from the companies Burns & McDonnell and Modus.

The OPG external independent oversight team issued its Q3, 2015 at the August Darlington Refurbishment Committee meeting. The focus of the report was the refurbishment team's preparation of the Release Quality Estimate. The following observations were identified in the report:

- The independent oversight team expressed concern that the RQE results may not be totally vetted as a result of revising the milestone for submission to the OPG Board from November 15 to October 15. Since the issuance of this report, the decision to revert back to the original milestone was made.
- The report expressed that a risk should be generated to incorporate the experience of the Campus Plan and SIO projects – that the definition of 'design complete' needs to include the vendor/supplier procurement information. This is aligned with the IOA's engineering challenge as related to ineffective management of open engineering items.
- The report expressed concern for the submission of the JV's Class 2 estimate. This was submission after the issuance of the report. However, the remaining risk is agreement of contingency funds given to the JV and completion of the contract amendment for an acceptable target price prior to submission of RQE to the OPG Board.
- The independent oversight team identifies the need for the functions to right-size, define roles and responsibilities and finalize the refurbishment assumptions as part of the Unit 2 check estimate.
- The report states that the process for the development of contingency is strong, but expressed concern that the compressed schedule (when the submission milestone was mid October, versus the current milestone of mid November) will result in a challenge to the proper formation of contingency.
- The independent oversight team expressed its on-going concern with the Campus Plan and SIO projects – specifically the D<sub>2</sub>O Storage Building, the Auxiliary Heating System and the 3<sup>rd</sup> EPG.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

These observations are similar to those made by the Independent Oversight Advisor (IOA). Two challenges identified by the IOA have not been mentioned by the OPG independent oversight team. The risk associated with quality of design engineering deliverables by design agencies has been a common theme within these reports. The refurbishment VP of Engineering held an engineering stand down in response to an increase in quality issues. The second challenge is related to the need for the refurbishment organization to demonstrate it is ready to execute prior to the start of Unit 2's Breaker Open.

**8. Alignment with the Principles of the Long Term Energy Plan**

The MOE's 2013 Long Term Energy Plan identified seven principles by which it expects OPG and Bruce Power to follow in the development and execution of their respective units. OPG performance to these principles is good, as can be seen through the review of this section. Changes from the previous quarter are minimal.

Principle 1: Minimize commercial risk on the part of ratepayers and government.

The majority of DNR contracts are fixed/firm price with the remaining tied to cost and schedule performance. Commercial individuals have been embedded on each project team to manage commercial risk. Project scope has been defined to the component level, and detailed engineering will be completed prior to the start of construction. OPG has invested in a reactor mock-up and training facility, to perform full testing of the tools, processes and procedures, as well as train staff prior to performing work on the actual reactors. The contract with SNC/Aecon includes provisions for OPG to take over the tooling and the mock-up at the conclusion of the Definition Phase if the parties are unable to negotiate the target price contract for the Execution Phase.

Incentives in the RFR contract were established on the basis of four unit performance, allowing the RFR contractor to make-up cost overruns and schedule delays to the first unit on subsequent units. However, the LTEP prioritizes the importance of a successful Unit 2 refurbishment. This will need to be included in the target price for the RFR and TG projects.

Principle 2: Mitigate reliability risks by developing contingency plans that include alternate supply options if contract and other objectives are at risk of non-fulfillment.

One contingency action contributing to this principle is the decision to start the second unit after unit 2, rather than overlapping the units. In addition, the effort to improve the reliability of fuel handling equipment reduces the chance that fueling of the operating units will be reduced during the defueling of the refurbishment unit.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Principle 3: Entrench appropriate and realistic off-ramps and scoping.

Each contract has an off-ramp for termination. Reimbursement to contractors is limited to reasonably incurred costs. Each unit requires individual approval that provides well-defined off-ramps. The yearly release strategy and gating process for funding individual project initiatives has wide visibility and adherence within the DR Team. be done in drained/defueled state.

Principle 5: Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price.

Schedule accountability is built into each contract. The contractor is required to provide a detailed schedule for execution as an input into the Release Quality Estimate. Cost accountability is built into contracts to establish target cost and incentives/disincentives. Monthly project oversight meetings with OPG senior management and contractor senior management have improved oversight and contractor accountability. Quarterly CEO meetings reinforce this principle. OPG has chosen to perform the work in the Execution Phase on a target price basis which increases the contractors' transparency. This will enhance OPG's ability to resolve issues as they arise. This may result in OPG performing specific work rather than use a contractor. For example, agreement could not be reached with a supplier of radiation protection services, resulting in OPG deciding to perform the services itself.

Principle 6: Make site, project management, regulatory requirements and supply chain considerations, and cost and risk containment the primary factors in developing the implementation plan.

Regulatory requirements were a primary input to the defined scope of the refurbishment outage and life extension projects. There is high level agreement between the station and refurbishment on the condition that the unit will be turned over to the project and then returned to the station. The program is being managed in accordance with PM Institute standards and INPO project principles. The Release Quality Estimate process is using Association for Advanced Cost Engineering (AACE) best practices and is being monitored by KPMG. Risk management is recognized as a key element of success and the program is being well implemented.

One opportunity for improvement is the ability to identify and address adverse trends in performance in a timely and effective manner.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Principle 7: Take smaller initial steps to ensure there is opportunity to incorporate lessons learned from refurbishment including collaboration by operators.

To fully incorporate lessons learned from the first unit's (Unit 2) refurbishment, the second unit's (Unit 1) start has been delayed until the completion of the first unit. If appropriate, other units may be able to be delayed to continue this risk reduction. However, this will likely result in an overall increase in cost. To reduce risk for the first unit, the decision was made to install its digital controller in a future outage. To prevent the risk associated with single source suppliers of key reactor components, OPG has qualified second vendors for key components. This will help Bruce Power with an associated materials risk.

Refurbishment management has recently incorporated several lessons learned from the Campus Plan and SIO projects into its Readiness to Execute Plan.

OPG and Bruce Power refurbishment management have met on three occasions to develop areas in which they can be mutually supportive. In addition, the engineering organizations have met to discuss opportunities to improve the efficiency and effectiveness of design engineering. The following are areas in which collaboration is being sought by senior management:

- a framework for collaboration
- Reviewing the significant work scope in each program
- Reviewing key performance and workplace challenges
- Reviewing planned trades work schedules
- Reviewing resource leveling strategies and likely high resource demand periods
- Reactor Defueling planning and tools
- Plans and Lessons Learned on systems layups and drying of systems that are drained
- Modifying field work controls on defueled units
- Lessons learned on transitioning into and out of Refurbishment
- Plans for completing Balance of Plant work without impacting critical path
- Performance of RFR tools and value of full mock-up of the reactor
- Close out issues and unit return to service challenges

## **9. State of Readiness**

The Nuclear Refurbishment program is fully into its Definition Phase to support the successful execution of Unit 2, starting in October 2016. There are several areas that provide confidence that the organization is on track for breaker open; including:

- Regulatory approvals have been received for the Environmental Assessment, Integrated Safety Review, and the Global Assessment Report. There has been

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

agreement with the CNSC on the Integrated Improvement Plan, with written acceptance tied to the Darlington operating license renewal process, scheduled in 2015.

- Scope for life extension and the work required to be performed during the refurbishment outage are defined and approved. The life extension work that is not included in the refurbishment outage will be performed by Projects & Modifications and the station.
- OPG declared success in meeting the August 15, 2015 milestone for the completion of design engineering. Although there remains a challenge with potential quality issues and the large number of open items, there is sufficient time before breaker open to support downstream activities, such as order materials and generation of field execution instructions.
- The Release Quality Estimate is near completion, with the final reviews to be completed before the November 15<sup>th</sup> submission to the OPG Board. The RQE includes the cost estimate for the four units, the Level 1 plan for the four units and Level 3 detailed schedule for Unit 2, the refurbishment outage scope for each unit and the execution strategy.
- A number of products to support the RQE will define several key areas for success, such as scope and responsibilities of functional departments, assumptions on the support needed for each project and responsibilities for the transition of the unit between Darlington Operations organization and refurbishment organization.
- The assembly of the execution organization has started. Kiewitt has been selected to provide support in construction management and oversight.
- Contracts are in place for all projects to complete the engineering and develop the estimate (cost and schedule) required for the RQE.
- The Class 2 (revision 1) estimate for the Re-Tube and Feeder Replacement project has been accepted by OPG. Resolution of contingency funds to the JV and completion of the contract amendment are required prior to RQE submission
- The RFR full scale reactor mock-up has been valuable in the verification of tool designs and validation of Tooling Performance Guarantee (TPG) durations. Its value will increase during the refining of procedures for the reactor face series, and the training of re-tube face and feeder replacement personnel.

Although OPG is making good progress towards breaker open readiness, there are a number of issues that once resolved will increase the comfort level for the execution of the project. These include:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Probably the most significant need is for the refurbishment organization to demonstrate effective execution of field work in 2015 and 2016. During the third quarter the Readiness to Execute Plan has been refined. This is an excellent opportunity to identify needed improvements prior to the start of full execution at breaker open. The plan has 5 months to analyze performance and incorporate improvements prior to the October start of the full outage.
- Tied to execution is the fact some of the work is first time execution for the vendor, very infrequently performed or first of a kind. For example, this is the first time for the Joint Venture to execute a re-tube and feeder replacement, first time in a decade for B&W to clean the Darlington steam generators, first of a kind process for the handling and reduction of re-tube radioactive waste and some first of a kind turbine inspection at Darlington. Since refurbishments by their nature are infrequently performed, this is not a surprise. OPG has taken a number of actions to mitigate the associated risk – the most visible being the full-scale reactor mock-up. However, execution is significantly different than planning and the need for OPG to have effective oversight and the ability to identify and respond to degrading execution performance is emphasized.

OPG has the infrastructure and framework for execution of the outage. With the Ready to Execute Plan, the organization will monitor completion of prerequisite projects (including Campus Plan and SIO projects) and processes needed for the start of the Unit 2 outage, and test the processes, infrastructure, organization and oversight prior to the breaker open in order to implement desired improvements.

# **Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program**

## **Transitioning from Definition Phase to Execution**

Mike White  
CALM Management Consulting, Inc.  
January 8, 2016

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**Table of Contents**

<b>1. Minister Summary</b>	<b>2</b>
<b>2. Purpose of Report</b>	<b>4</b>
<b>3. Completion of Definition Phase</b>	<b>4</b>
<b>4. Transition to Execution</b>	<b>17</b>

## **1. Minister Summary**

Previous quarterly reports provided a detailed quarterly review of trends, accomplishments and challenges related to the Darlington Nuclear refurbishment project. With the completion of the Definition Phase at 2015 yearend, the focus of the refurbishment project has transitioned into execution of its Ready to Execute (RTE) Plan.

A number of achievements have been made through the Definition Phase of the project; including:

- The Release Quality Estimate for the refurbishment of the four Darlington units was prepared and approved by the OPG Board of Directors. This included the estimated cost (including contingency) and duration for the defined scope of work for the four units.
- The OPG contracting strategy was developed and implemented. This contracting strategy is designed to retain vendors best qualified to perform the work contracted to them, while appropriately transferring risk and minimizing risk premium. The key risks are associated with safety, quality, cost overruns and schedule extensions. Of the \$12.8B high confidence total cost estimate of the Darlington Refurbishment Project, \$5.3B (including the \$0.8B spent to date) has or is to be spent by contractors for the engineering, planning, procurement and field execution of the five core refurbishment project bundles.
- OPG declared success in meeting the August 15, 2015 milestone for the completion of design engineering. However, this was accomplished with a large number of outstanding items for resolution. As stated in previous reports, the process to accept design agency deliverables may not be sufficiently rigorous to ensure high quality products. This risk has been realized in a number of projects, most recently the STOP (Shield Tank Overpressure Protection) project. The design was incorrect in assumptions regarding the size of the pressure pulse when switching pumps. This resulted in the field installation during the Unit 3 fall outage not being acceptable, removed from service, and the unit returned to service without the modification installed. The response to this event should include a review of the extent of condition and cause.
- OPG has received the required regulatory approvals for the refurbishment of the four units. This includes approval of the Environmental Assessment, the Integrated Safety Review that includes Component Condition Reports and the Global Assessment, and the Integrated

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Implementation Plan (IIP) that identifies and schedules any modifications, new systems, repairs, refurbishment and further inspections to address gaps in the Integrated Safety Review. In addition, OPG received a ten year license for the continued operation and refurbishment activities of Darlington Nuclear plant. This is a positive reflection of the high level of performance by Darlington.

- The Level 1 Plan for the execution of Unit 2 has been completed and basis for outage duration in the RQE. The planned critical path duration for Unit 2 is 1084 days, with high-confidence duration of 1218 days.
- The generation of field instructions (Comprehensive Work Packages) is on schedule.
- Procurement of Long Lead Materials and Tooling is progressing well. This includes the production of major reactor components (feeder pipes, pressure tubes, calandria tubes and end fittings) and the manufacturing of Re-tube and Feeder Replacement tooling.
- Campus Plan and Safety Improvement Opportunity Projects are continuing with field construction. There have been on-going problems with a number of these projects in their cost and schedule estimates, design engineering, procurement of materials and field execution. For a successful refurbishment outage, management needs to ensure that the lessons learned from these projects are fully understood and effectively addressed.
- There are several functions that support the planning and execution of the projects. During the Definition Phase the programs associated with these functions were developed and the organization and infrastructure obtained.

With the completion of the Definition Phase, the refurbishment organization's focus is demonstration of its readiness to execute the Unit 2 outage. A Ready to Execute plan has been developed with the activities that need to be successfully completed to demonstrate its ability to effectively execute the outage. The plan includes the completion of Campus Plan, Safety Improvement and Prerequisite projects, as well the development and validation of processes, infrastructure and organizational capability required for outage execution. Validation of some processes will be done through their implementation during a four-month Pilot

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

Test period. Processes that are not used during this period will require a combination of tabletop exercise challenges and challenge meetings.

## **2. Purpose of Report**

With the approval of the Release Quality Estimate (RQE) by the OPG Board of Directors, the refurbishment project is now focused on detailed preparations for Unit 2 execution in October, 2016. This report provides a review of the achievements associated with the Definition Phase and a status of, and the associated challenges with, the refurbishment organization's Ready to Execute (RTE) Plan. During the first three quarters of 2016, OPG will need to complete preparations to execute each core project, to complete several field projects and activities that are identified as prerequisites to the start of the Unit 2 outage and validate a large number of processes that will be used during refurbishment execution. The performance of these three paths to October will provide Refurbishment management, the OPG Board of Directors and the Ministry of Energy with a level of confidence in OPG's ability to execute the Unit 2 refurbishment outage safely, with quality, on schedule and within budget.

## **3. Completion of the Definition Phase**

From 2012 through to the end of 2015, OPG completed the Definition Phase of the project. The key deliverables associated with the Definition Phase included:

- Release Quality Estimate
- Development and Implementation of the Contracting Strategy
- Completion of Design Engineering
- Regulatory Approvals
- Unit 2 Level 1 Execution Schedule
- Comprehensive Work Packages

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Procurement of Long Lead Materials and Tooling
- Campus Plan and Safety Improvement Opportunity Projects
- Development of Functional Programs and Capability

**3.1 Release Quality Estimate**

The Release Quality Estimate (RQE) represents a significant deliverable of the Definition Phase. It encompasses the scope of the refurbishment project, the cost estimate, the duration and the risks for all four units. Although the development of the RQE package (cost, duration, risks and scope) was generated during this year, the preparations required for a rigorous and credible product started in 2008, with the initial technical reviews of critical station components, systems, and equipment. These reviews provided input into the initial planning and scope development that was the basis of the 2009 initial feasibility estimate. Since 2010, OPG has focused on completion of the detailed scope, selection of contractors, engineering, estimating and planning. The RQE was approved by the OPG Board of Directors at its November 2015 meeting. The elements of the RQE are summarized below.

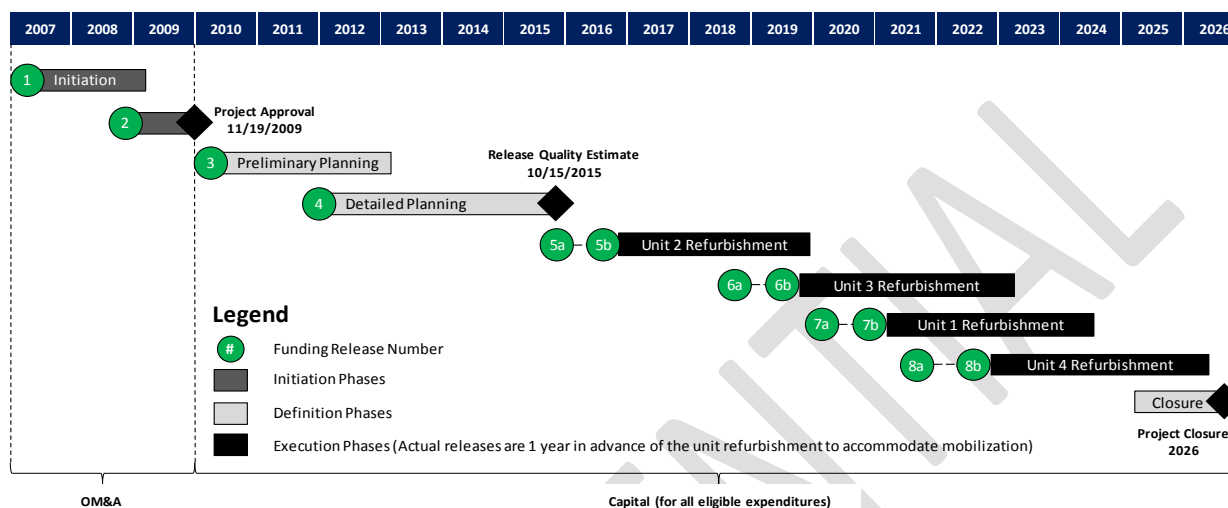

**Process:**

From the start of the refurbishment program, OPG was committed to have the RQE follow the Association for the Advancement of Cost Engineering International Recommended Practice (AACE IRP). This results in an estimate for cost (including contingency) and duration that has been based on sufficient planning and engineering to be considered reliable to a 90% confidence level (Class 3 estimate using the AACE classification terminology). The AACE-IRP is considered the best practice for the development of estimates for mega projects, such as the Darlington Refurbishment Project. Five cost estimate classes have been established by the AACE International to reflect the maturity of a project, starting with Class 5 for the feasibility of a project (representing 0% to 2% of project definition) to Class 1 for final check estimate (representing 70% to 100% of project definition). Class 3 represents the cost estimate that is appropriate for budget authorization and control.

The RQE includes the projected cash flow over the life of the four unit project and a funding release strategy that ensures a reconfirmation of the business case is undertaken at structured intervals prior to the release of the funds for the next unit. Funding for each unit is released in two parts; a planning phase release (12 to 18 months prior to the start of the unit outage) and an execution phase release (approximately 3 months prior to the start of the outage). This strategy is shown in the following diagram.

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

OPG's due diligence included a third-party (KPMG) independent review of the RQE process to assess the extent to which the final RQE product followed AACE recommended practices. The audit report concluded that OPG demonstrated knowledge of the AACE guidelines and appropriately applied them to the Darlington Refurbishment Project (DRP). They noted particular strengths in the estimate classification system, historical knowledge of risks and opportunities, risk management framework and processes for conducting quality reviews of vendor estimates.

**Scope:**

The scope of the project has been defined since the fourth quarter of 2013 and is firm. The scope is based upon a well-established process that assessed the condition of equipment and components and identified the need for replacement, modification, repairs or maintenance. The scoping also assessed the optimum time for completion of each identified scope of work – during the refurbishment project or during normal station operations. The scope includes Safety Improvement Opportunity projects specified by the nuclear regulator (CNSC) and prerequisite projects for facilities and systems to support the efficiency and effectiveness of the refurbishment execution. As with any refurbishment project, and actually every outage for an operating unit, there will be some discovery work identified when equipment is disassembled. This is included in the contingency for the refurbishment program. The scope of the refurbishment project is outlined below:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Re-tube and Feeder Replacement (R&FR) is the largest individual project and includes the replacement of the major reactor components, the development and production of the tooling associated with this replacement, the associated procurement of replacement reactor components, the testing and procurement of new tooling for the replacement on a constructed reactor mock-up, and the management of the resulting waste.
- Turbine Generator includes a large amount of inspections and maintenance (mostly routine but also some that are first of a kind at Darlington) on the turbines, generator and auxiliaries. Digital controllers will replace the current obsolete analog ones during the refurbishment outages for Units 3, 1 and 4. These have deferred for Unit 2 to a future outage to reduce the risk for the first unit.
- Defueling project includes the production and commissioning of tooling required for the initial defueling of the reactor.
- Fuel Handling project will overhaul the systems and equipment associated with fuelling the reactor during its life extension.
- Steam Generator project will conduct comprehensive inspections of the steam generators, cleaning of internals to maintain high thermal efficiency and the addition of access ports to support future outages.
- Balance of Plant includes bulk work on valves, electrical systems, heat exchangers, as well as a number of specialized projects to replace important reactor support components.
- A number of prerequisite projects to support the shutdown and layup of the unit, separating the refurbishment unit from the operating units and support facilities for execution.
- Campus Plan projects that are buildings and infrastructure facilities to support the refurbishment program that are managed by OPG's Projects & Modifications organization.
- The Safety Improvement Opportunity projects that are commitments to the nuclear regulator (CNSC) that further enhance nuclear safety and are required for continued operation. They are also managed by OPG's Projects & Modifications organization.

**Outage Duration:**

As with other elements of RQE, the duration of the refurbishment for four units was developed with the application of techniques that are consistent with the AACE recommendations. The process involved the following steps that required close collaboration between OPG project managers and vendors, with independent review by RQE process experts and challenges by senior refurbishment management:

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- A detailed definition of each critical path task and its duration. The majority of critical path consists of defueling the reactor, preparing the vault for work, removal and installation of fuel channels (end fittings, pressure tubes and calandria tubes) removal and installation of feeders, and returning the reactor to service (fuelling the reactor, perform commissioning and conduct a series of test at various power levels).
- Sufficient development of the schedule for non-critical path projects in order to know their durations and their location in the overall schedule.
- Individual schedules for the Unit 2 outage for each project and sub-project.

The planned duration of the Unit 2 outage is 1,084 days, with high-confidence duration of 1,218 days. This compares well with the actual Wolsong 1 (W1) refurbishment outage actual duration, after adjustment for the difference in reactor size and scope of work

The high confidence duration of the four-unit refurbishment outage is 112 months. It is based on Unit 2's detailed schedule and high-level adjustments for the remaining units using AACE recommended practice. Given the operating assumption that each unit can operate to 235,000 Effective Full Power Hour (EFPH), the schedule for the four units has been developed to have no idle time on operating units (that is, each unit will start its refurbishment outage prior to reaching 235,000 EFPHs).

Risk Management:

From an RQE perspective, the result of the risk management program is the contingency fund and its basis. The risk management program and its implementation has been assessed on an ongoing basis by the Independent Oversight Advisor, the Burns and McDonnell/Modus team (independent oversight for the OPG Board) and included in the KPMG audit of the RQE process. In all cases the current assessment is that OPG's risk management is sound, rigorous and consistent with industry practice.

Conclusion:

Based upon observations of the RQE development process, the associated management oversight and the third party assessment, it is believed that the RQE is appropriate and provides confidence that the Darlington Refurbishment Project can be completed within OPG's cost and duration estimates. The contingency included in the project estimate is sound and developed on a basis of a rigorous risk management program.

3.2 Contracting Strategy

During the Definition Phase OPG established and implemented a contract strategy for the project. This contracting strategy is designed to retain vendors best qualified to

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

perform the work contracted to them, while appropriately transferring risk and minimizing risk premium. The key risks are associated with safety, quality, cost overruns and schedule extensions. Of the \$12.8B high confidence total cost estimate of the Darlington Refurbishment Project, \$5.3B (including the \$0.8B spent to date) has or is to be spent by contractors for the engineering, planning, procurement and field execution of the five core refurbishment project bundles.

Given the unique nature and complexity of the program, operating experience of previous refurbishment projects, and contractor capability within Canada, OPG selected the multi-prime contractor strategy to balance cost, schedule, risk and quality. With this approach, OPG retains control over the management of overall program, while contracting out various specific scopes of work to contractors with expertise and resources to execute the work. In addition, OPG's contracting strategy is intended to fulfill the 2013 LTEP principles:

- Minimize commercial risk of ratepayers and government
- Mitigate reliable risks through contingency plans
- Entrenching appropriate and realistic off-ramps
- Hold contractors accountable to schedule and price
- Make site, project management, regulatory requirements, supply chain considerations and cost/risk containment the basis of the implementation plan.

The contracting strategy uses a combination of three contracting models for the five main refurbishment project bundles, summarized below:

<b>Contracting Model</b>	<b>Description</b>	<b>Advantages</b>	<b>Disadvantages</b>
Engineer-Procure-Construct (EPC)	Designers work under construction contractor; owner enters contract with single contractor.	Single point of accountability  Risk transfer to contractor	Higher cost due to risk transfer and resulting contingency carried by contractor
Extended Services Master Service Agreement	Time & Materials based EPC contracts directly awarded to preapproved contractors who earn a performance based fee	Develops expertise within a few contractors, while retaining the ability to perform secondary procurement competitions to ensure value for money.	Reduced supply base

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Contracting Model</b>	<b>Description</b>	<b>Advantages</b>	<b>Disadvantages</b>
Engineering Service and Equipment Supply Agreement	High Quality Contractor (typically the OEM) focuses on their expertise, which is supplying equipment and engineering services, but not field execution which can be performed by a different contractor.	Benefit from engineering expertise of specific contractor	Increased handoffs if used in conjunction with separate EPC contractor.

The contracting strategy has been implemented using a combination of pricing strategies to optimize cost and risk transfer. A principle of pricing is that as risk is transferred to the contractor there is a corresponding increase in cost as a result of a higher risk premium and increased control of work by the owner. The pricing strategies used by OPG for the project bundles, in order of increasing risk transfer to the contractor, are “Cost + Mark-up”, “Target Price” (generally, with both cost and schedule incentives and disincentives) and Fixed Price. It is noted that within these categories of pricing models, the details of the pricing model were tailored for each contract and scope of work, to provide the most appropriate incentive/disincentive regime and risk transfer for the relevant scope of work. The relative complexity, size and uncertainty for each project bundle resulted in OPG’s selection of contracting strategy and pricing model. This is summarized below.

<b>Project Bundle</b>	<b>Description</b>	<b>Complexity</b>	<b>Size</b>	<b>Uncertainty</b>	<b>Contract Model</b>	<b>Pricing Model</b>
RFR Bundle 1	1. Definition Phase work  2. Removal and replace 480 fuel channels and 960 feeder pipes	High	High	High	EPC	Target price
RFR Bundle 2	1. Construction of mock-up facility  2. Design and production of tooling	Medium	High	Low	EPC	Fixed Price
RFR Bundle 3	Procurement of owner supplied materials (reactor components) and other goods	Medium	Medium	Low	EPC	Cost + Mark-up

**Confidential Advice to the Minister of Energy**

**Commercially Sensitive**

<b>Project Bundle</b>	<b>Description</b>	<b>Complexity</b>	<b>Size</b>	<b>Uncertainty</b>	<b>Contract Model</b>	<b>Pricing Model</b>
TG Bundle 1	1. Field execution for inspections, repairs and retrofits of hardware and hydraulics  2. Installation of digital controllers	Medium	Medium	Low	EPC	Target Price
TG Bundle 2	Engineering support and supply of equipment	Low	Medium	Low	ESESA	Fixed Price
SG	Inspections and maintenance work	Low	Low	Low	EPC	Fixed Price
FH	1. Defueling of reactor core  2. Refurbishment of fuel handling equipment	Medium	Medium	Medium	ESESA, ESMSA, Self Perform, EPC	Fixed Price
BOP	Various equipment repair and replacement and system upgrades	Medium	High	Medium	ESMSA	Target Price (cost plus performance fee at risk)

The distribution of the contract breakdown is:

- Target Price 53%
- Cost + Mark-up 33%
- Fixed Price 14%

The Target Price model provides value for money for the contracts where risk is shared between owner and contractor. In this case OPG and the contractor agree on a Target Price (excluding profit, risk and overhead) and Target Schedule. A Fixed Fee is agreed upon to compensate for profit, risk and overhead. The Target Cost and Schedule are the basis for the incentive/disincentive program. In the establishment of the Target Cost, 'allowed costs' and 'disallowed costs' are mutually established. Disallowed costs are not paid by OPG. If the total allowed costs paid are outside a neutral band, incentives/disincentives are incurred. Similarly, schedule incentives/disincentives are paid if the work is completed before or after the Target Schedule.

If disincentives are payable, they reduce the Fixed Fee. A significant portion of the Fixed Fee is at risk if the maximum disincentive is reached – to the point that the contractor will lose part of its overhead. In addition, because it is a Target Price model, the contractor does not earn overheads on costs beyond the Target Cost.

As part of OPG's due diligence, Concentric Energy Advisors Inc. was retained in 2011 to provide an independent review of the commercial and contracting strategies for the five refurbishment core project bundles in terms of reasonableness and prudence. The five resulting reports (issued in late 2013 and early 2014) concluded that each commercial strategy is appropriate, reasonable and prudent, given specific caveats.

Conclusion:

Based upon observations of current contractor performance, contract development, risk transfer through the RQE process and the conclusions of the independent review of the commercial and contracting strategy, it is concluded that OPG's contracting strategy is aligned with the Ministry of Energy's 2013 LTEP principles; specifically, minimize commercial risk on part of ratepayers and government (Principle 1), require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price (Principle 5) and make site, project management, regulatory requirements and supply chain considerations and cost and risk containment the primary factors in developing the implementation plan (Principle 6).

3.3 Design Engineering

OPG declared meeting the milestone for the completion of design engineering in August 2015. In addition, the CNO milestones for the completion of design engineering were met for several of the Safety Improvement Opportunity (SIO) projects. Through 2014 and 2015, these reports have identified a risk associated with the potential impact of the acceptance of engineering deliverables from design agencies that do not meet quality requirements. This risk has been realized on several occasions through the execution of the Campus Plan and SIO projects. The latest example was the installation of the rupture disc required for the completion of the Unit 3 STOP project. The poor quality of design resulted in the work being stopped and rescheduled to a 2016 outage.

By its nature, any perceived time pressure to complete a large engineering workload in a short period of time introduces a challenge to maintain high levels of quality and an increase in the acceptance of engineering packages with open items to be completed. This feature combined with the latent nature of engineering errors results in the need for effective implementation of a rigorous and high quality process for the acceptance of engineering design deliverables. The latent nature of engineering errors in approved designs refers to the fact that the consequences of these errors are not realized

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

immediately. They are seen in construction, commissioning and too frequently during plant operation.

The previously identified challenge and associated potential risk is based on the following observations:

- It is an acceptable and common practice within OPG to accept a design package with open items in the design. There is no rigorous process to manage these open items to ensure they are addressed prior to the start of field construction.
- There are several Campus Plan and SIO projects that met their engineering complete milestone with open items for which there are impacts in field execution, resulting in delays and rework. Examples include Emergency Power Generator 3 (EPG3), Auxiliary Heating System (AHS), Containment Filtered Ventilation System (CFVS), D<sub>2</sub>O storage, and Re-Tube and Feeder Replacement Island Service Annex (RFRISA) building.
- Although OPG has responded to the IER 14-20 on Technical Conscience by the Institute of Nuclear Power Operations (INPO), there has not been a review of high risk, first-of-a-kind or first-in-awhile design agency work to validate the rigour and quality of the design agency and acceptance by OPG.
- The refurbishment Vice President of Engineering recently communicated his continuing concern about on-going quality issues, including open items, in the design agency products.
- There has not been a review to verify that designs have incorporated appropriate World Association of Nuclear Operators (WANO) and INPO significant operating experience recommendations.

There is opportunity to reduce the impact of this risk during the 2016 Ready to Execute phase of the project. This is discussed in Section 4.

**Conclusion:**

Meeting the design engineering milestone provides the opportunity to complete the downstream preparation activities (such as completion of field work instructions and procurement of materials) in sufficient time to support field execution. However, the large number of open items and some realized quality issues highlights a possible risk associated with the completed design engineering. There is sufficient time to reduce this risk.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**3.4 Regulatory Approvals**

OPG has obtained the necessary approvals from the CNSC to start the refurbishment. These included:

- Environmental Assessment. The approval of the Environmental Assessment included a commitment by OPG to complete a number of Safety Improvement Opportunity projects. The majority of these are committed to be completed prior to the start of Unit 2's refurbishment outage. They are managed by the OPG's Projects and Modifications organization.
- Integrated Safety Review and Global Assessment. This represented a major assessment of the condition of plant systems, equipment and components, as well as the rigor and effectiveness of plant processes, procedures and organizational structure. The Integrated Safety Review included a five set of Component Condition Assessments that documented the results of comprehensive set of inspections and analyses of performance of plant systems and components. Its approval is the first refurbishment project under the new CNSC requirements for plant life extension.
- Integrated Implementation Plan. One product of the Integrated Safety Review (mainly the Component Condition Assessments) is a plan for specific maintenance, replacement, upgrades and further inspections of components and equipment. This Integrated Implementation Plan (IIP) identifies both the scope of work to be completed during each unit's refurbishment outage and another scope of work that is to be completed during the overall life extension period, which ends after the first post-refurbishment outage of the last unit. Because of the complexity and duration of the project, it is recognized that there may be changes required to the IIP. Both the IIP and the process for such changes were approved by the CNSC in December, 2015.
- Darlington License Renewal. OPG applied for a 13-year license for Darlington Nuclear plant in 2015. Normally, licenses are provided by the CNSC on a five-year basis. In December, the CNSC issued a 10-year license. This is recognition by the CNSC of the current level of performance of Darlington plant and organization. This extended license will permit OPG to have one less major task during the majority of the refurbishment outage.

**Conclusions**

The regulatory approvals for the refurbishment project have been obtained.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

**3.5 Unit 2 Level 1 Execution Schedule**

Through 2015, the project developed and refined the execution schedule for Unit 2. The status as of the end of the year is the release of the Level 1, Rev. B version. The development of this revision required the development of detailed resource-balanced schedules (Level 3) from the contractors. These were submitted as input into the latest revision of the schedule. This schedule continues to provide high confidence in OPG's duration for the Unit 2 refurbishment outage that was provided in the Release Quality Estimate. It provides more detail in the critical path components and more detail in the non-critical path windows. The schedule has not been optimized for placement of these non-critical path windows to ensure compatibility with critical path and to ensure each is well protected from becoming critical path.

**3.6 Comprehensive Work Packages**

Comprehensive Work Packages (CWPs) are the field instructions to be used by the trades in the execution of refurbishment work. The CWPs are written by the contractor performing the work and reviewed and accepted by OPG operations and engineering. The CWPs include the hold points for quality inspections and required testing. The milestone for the completion and acceptance of the CWPs is March 2016. There will likely be some refinement during the on-going preparations until actual field use.

**3.7 Procurement of Long Lead Materials and Tooling**

An important component of the planning and preparations for the Unit 2 refurbishment outage is the procurement of parts, materials and tools. These are procured by the contractors responsible for the work, to OPG specifications. The focus during the Definition Phase was:

- OPG established a tracking system to monitor the status of parts and materials from identification of need to delivery to the designated warehouse. This requires close collaboration with the contractors to ensure accurate understanding of the current status.
- The identification, ordering and monitoring of manufacturing of long lead materials. These include, but not limited to, the major reactor components, such as feeder piping, pressure tubes, calandria tubes and end fittings.

- The development, prototype testing and production of tooling required for refurbishment projects. Although the majority of tooling is associated with the Re-tube and Feeder Replacement project, other projects require the use of tools for execution.
- Quality inspections and oversight of manufacturing contractors and sub-contractors. The industry has had problems with poor quality parts and materials, including fraudulent manufacturing and test results. The main contractor for each project has the responsibility to obtain the parts and materials to support field execution for the modification, repair or replacement. This usually involves procuring parts and materials from a subcontractor and ensuring that they meet the required quality level and specifications. This requires the contractor to execute a robust quality oversight program of the sub-contractor's quality program and implementation. As the owner, OPG must ensure that this overall process is robust and effectively implemented to ensure that installed components and equipment meet the standards required for continued safe and reliable operation.

### 3.8 Campus Plan and Safety Improvement Opportunity Projects

During the Definition Phase a number of projects were started to support the execution of the refurbishment project (Campus Plan projects) as well as to meet the commitments of the Environmental Assessment (Safety Improvement Opportunities). These projects are managed by OPG's Projects and Modifications organization. Issues related to these projects have been documented in reports to the Ministry since 2013. In 2015, the focus of these reports to the Ministry shifted from the performance of these projects to the effectiveness of the refurbishment project organization to understand and address the lessons learned from these projects. In response to these problems, refurbishment management developed a Ready to Execute plan that addresses several of these lessons learned.

### 3.9 Development of Functional Programs and Capability

A project of this magnitude requires a significant infrastructure and support organization. OPG recognized this and established organizations in the key functional areas; including project and controls, engineering, procurement, operations, maintenance, chemistry, safety (both conventional and radiological), corrective action program, risk management, operating experience, regulatory

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

affairs and contract management. These functions cut across and support all refurbishment projects. As a result of lessons learned from the Campus Plan and Safety Improvement Opportunity projects, these functions transitioned from strictly establishment of standards and oversight of contractors to a more collaborative approach with contractors. This is recognition that OPG will not have a successful refurbishment of the units without the contractors being successful, and the contractors need support in meeting the standards required for such a large and complex project in an operating nuclear power facility. This collaboration has been successful in improving contractor's performance in planning, estimating, scheduling and engineering.

Conclusion:

The refurbishment organization has met its main objectives for the Definition Phase of the Refurbishment Project, and has a plan to transition to the execution phase in October 2016.

**4.0 Transition to Execution**

With the completion and Board approval of the Release Quality Estimate (RQE) and the Definition Phase of the project, the organization's challenge is to be ready, and demonstrate it is ready for the October start of the Unit 2 refurbishment outage. Even with the success of the Definition Phase, including high level planning, readiness to execute will be a significant effort with a number of challenges. Refurbishment management has developed a Ready to Execute (RTE) plan to drive the physical work that represents prerequisites to the start of the outage as well as the development of the processes and organization infrastructure to effectively manage the execution of the outage. Some of these processes will be verified through a Pilot Test period that involves the execution of a number of prerequisite projects. Others will not have the opportunity to be verified through this Pilot Test period and will need to be validated in other ways, such as tabletop exercises and challenge meetings. The following list provides a number of the key deliverables and activities to demonstrate readiness to execute Unit 2 refurbishment outage.

- There will be a check estimate submission and OPG Board approval for the cost of Unit 2's refurbishment outage. This should be a relatively straight forward update of the RQE for unit 2 based on refinement of the outage schedule and resource requirements for execution of each project

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

and function. The milestone for approval of the Unit 2 check estimate is August 15, 2016.

- Each project will need to continue to prepare for outage execution. This includes the completion of field instructions (CWPs), procurement of materials, obtaining and training trades and completion of detailed schedule. This requires close collaboration between the refurbishment project and each contractor.
- The current Unit 2 execution schedule is a high level schedule (Level 1). It will need to be further developed to a detailed schedule (Level 3) that includes logic ties, prerequisites and resources. This again requires close collaboration and alignment among the refurbishment work management organization, contractors and each project. The milestone for the detailed schedule is August 31, 2016.
- It was recognized in 2015 that roles, responsibilities and accountabilities were not sufficiently defined at the lower levels to prevent confusion during execution. This has resulted in documenting these in a 'Division of Responsibilities' (DoR) document. Not only will the DoR document the roles and responsibilities within the Nuclear Refurbishment, but it will also define the interfaces among the project and its contractors, the station and corporate support organizations. A draft has been completed, with reviews and challenges in progress. The planned date for final issuance of the document is August 2016.
- There are several processes that need to be finalized and validated. Some of these will be validated through a four month Pilot Test period, while others will need to be validated through tabletop exercises and challenge meetings. Some of the more challenging ones are:
  - The strategy for obtaining alignment among contractors and OPG programs and processes is documented in the refurbishment Execution Strategy. Sections of this will be validated during the Pilot Test period, while other sections will require table top exercises and challenge meetings.
  - Verification that the work is ready to be executed when scheduled including proper work instructions, hold points identified, resources available, materials in place and prerequisites completed.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- Refurbishment construction execution organization plans to establish a collaborative and supportive approach to field execution with the contractors.
  - The processes to monitor and report daily progress. This usually involves updating the detailed schedule to show progress and a plan of the day meeting to review progress and plans.
  - The process to get field workers to the job site, including start of shift briefings, pre-job briefings, work authorization and work protection.
  - Response to field issues that stop work.
  - The physical establishment and operation of the Project Control Centre.
- As the start of the Unit 2 refurbishment approaches, work needs to progress on the specifications and processes associated with the commissioning of equipment and systems, process to determine systems are available for service, and the turnover of the unit back to the station.
  - Timely and effective decision making during project execution is essential to maintain the schedule, cost and quality. There will be events for which a decision that may impact schedule will be made to ensure quality. The process to identify and address adverse performance trends prior to them becoming an issue will need to be effective.
  - Although the design engineering milestone of August 15, 2015 was met, there is a risk that the number of open items combined with potential quality issues as seen in the SIO projects may result in engineering rework and resulting impacts on schedule and cost. This risk is not likely to impact the basis of the RQE for duration and costs.
  - Design engineering is not the only engineering activities that will need to be in place for the project. Several engineering activities will need to be conducted to support execution, such as responding to technical issues, responding to obsolete parts and the implementation of field changes. These will be used during the Pilot Test period.
  - The Pilot Test period will provide OPG with an assessment of several of the processes that are planned to be used during the refurbishment outage. This period has a number of small prerequisite projects that will be field executed. They include the installation of work areas (Work Control Area and Radiation Protection offices and monitoring area),

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

installation of shops and work areas, and the installation of service air system for increased capacity.

- There are several additional prerequisite projects that the need to be completed prior to the October start of the outage. Some of these are scheduled to be completed just prior to breaker open. These include maintenance and modifications to the vault vapour recovery system, installation of additional breathing air capacity, unit power distribution system modifications, steam generator recirculation skids, installation of other skids and the installation of barriers to designate the unit under refurbishment.
- The Projects and Modifications (P&M) organization has a number of Campus Plan (CP) and Safety Improvement Opportunity (SIO) projects in progress that will be challenged to meet their need date. These include the SIO Projects related to Containment Filtered Venting System, Emergency Power Generator #3, and Emergency Heat Sink, as well as the CP project - D<sub>2</sub>O storage building. In addition to monitoring progress, OPG will need to consider contingency plans in the event one or more is not completed.
- The finalization of system layout plans, as well as the processes for control of chemicals, foreign material exclusion and heat transport system start-up is essential for the health of the unit both during refurbishment and life extended operation. This should be completed prior to the start of the unit outage.
- There are several processes associated with field execution that require a final decision as to whether OPG's process will be used or the contractor's process. This work is in progress and several can be validated during the Pilot Test period.
- Performance metrics and reporting will have to be developed for the execution phase of the project. This will need to be in sufficient detail to permit analysis of potential issues. This work is in progress and several can be validated during the Pilot Test period.
- OPG's expectation is that each contractor will implement a robust problem identification and corrective action process. An effective process is required to identify and correct adverse performance trends before they become a significant issue. This work is in progress can be validated during the Pilot Test period.

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

- As the owner, OPG has the ultimate responsibility for the quality of field execution and resulting modifications, repairs and replacements. This is recognized by refurbishment management and a quality management program and organization has been started. This requires collaboration with the contractors to ensure that field work instructions include test and inspection hold points, including points requiring OPG to witness. This capability may be partially validated during the Pilot Test period.
- Human Performance, including the use of event free tools, has been an important program within the nuclear industry for more than 25 years. The principles and techniques are well engrained within operating nuclear plant organizations. However, it is not fully engrained within projects and contractors organization. Refurbishment management recognizes the need for high levels of human performance is required for safe, quality work. A contractor's human performance program initiative has been started.
- In addition to human performance, effective first line supervision of field execution is essential for a successful refurbishment project. This is recognized by OPG refurbishment management, who have initiated a supervisory training program for contractors' supervisors. Training will be co-delivered by OPG and the contractors. The qualification process will include an Oral Review Board administered by the contractors and monitored by OPG. Although the program will not be fully implemented for the Pilot Test period, the effectiveness of field supervision can be assessed.
- The process for tracking and reporting the status of procurement will have the opportunity to validate its effectiveness during the Readiness to Execute period of January through September.
- There are several lessons learned from the problems incurred during the planning and execution of the Campus Plan and Safety Improvement Opportunity projects. These have been identified in the most recent reports to the Ministry. Some of them are addressed in the Ready to Execute Plan. There should be a review of all lessons learned to identify the associated risk to the successful execution of the refurbishment project and for those that are not addressed, a mitigation plan or acceptance of the risk should be documented.

**Conclusion:**

OPG refurbishment management has a Ready to Execute plan that includes the elements for Unit 2 refurbishment execution. The extent to which the plan is

***Confidential Advice to the Minister of Energy***

***Commercially Sensitive***

effectively implemented will provide a significant input as to the the level of confidence that the organization is adequately ready to execute a successful refurbishment outage.

CONFIDENTIAL

## Attachment 28

### Ontario Power Generation Darlington Nuclear Refurbishment (DNR) Findings Nuclear Oversight (2014-2016)

Audit/ Assessment Title	Finding	Management Actions	Risk Rating*
<b>Audits</b>			
2014-018 Environment Program  May 15, 2014	Governance Changes have not been fully implemented with the new Centre-led Environmental Management System. The Environmental Program Management Plan referenced in the Refurbishment - Project Environmental Management Plan could not be found in OPG's electronic record system.	Review governance affected by the change to center led and initiate the required changes. Ensure references within documents are connected to appropriate issued procedures and not the obsolete versions. All actions found to be complete.	3
2016-001 Health & Safety Management System Program  July 8, 2016	Requirements of the Safe Work Planning process have not been effectively implemented. Safe Work Plans prepared by DNR contractors did not always address: <ul style="list-style-type: none"> <li>• emergency response for jobs working at height</li> <li>• individual hazards on Safe Work Planning</li> </ul>	Revise governance to simplify and clarify the current safe work process and identify and implement changes to the affected Nuclear Safety related documents. This will include but is not limited too Pre-job Briefing and Post-Job Debriefing. Actions on track, TCD Mar 2017.	3
2016-004 Equipment Reliability  June 30, 2016	Some DNR staff with their qualifications not fully documented in OPG's qualification tracking software system were performing the role of System Engineer without written evidence of oversight by fully qualified mentors.	The training of existing System Engineers are on target, this assignment is initiated to review and update the existing training plan for all staff working in both DNR-Sys departments. This action was completed in 2016/08/12.	3

**Attachment XX**

**Ontario Power Generation  
Darlington Nuclear Refurbishment (DNR) Findings  
Nuclear Oversight (2014-2016)**

<b>Audit/ Assessment Title</b>	<b>Finding</b>	<b>Management Actions</b>	<b>Risk Rating*</b>
2016-014 Environmental Management  May 20, 2016	Gaps were identified in contractors' environmental awareness and Environmental Management Plans at DNR. The Project Manager's assessment of the Environmental Aspects and potential Environmental Impacts were not properly documented for some projects. This assessment is to be integrated into the contractor's Environmental Management Program which provides the Project Manager with an understanding of the environmental risks of the project.	Initiate document change to ensure that DNR leadership staff complete Nuclear Refurbishment Awareness training. Initiate paired observations with Construction Execution and Field Support to support improvements to environmental awareness prior to breaker open. Submit environmental recommendations and revision inputs to Construction Execution and Field Support to improve observations walk-down. Actions on track, TCD Dec 2016.	3
2016-015 Conduct of Maintenance  July 25, 2016	Gaps exist in DNR Foreign Material Exclusion (FME) work planning and reporting. DNR FME work orders were inappropriately set to ready with no holds to indicate FME planning was still in-progress. The work order tasks did not contain the FME information and instructions required to set the tasks to ready status. Additionally, prerequisite DNR FME work reports did not meet the work reporting requirements for FME.	FME single point of contact to create a presentation reviewing FME requirements and expectations. Roll out to Assessing and planning departments to both OPG and contract staff.  Actions on track, TCD Oct 2016	3
2016-020 Work Management  June 24, 2016	DNR prerequisite work completion is not meeting target. A Memorandum of Understanding between Darlington Nuclear Generating Station and DNR supersedes some governance requirements and documents agreed to variances. Specifically, the agreement directs that the above mentioned prerequisites should not be treated as normal outage prerequisites and provides an allowance for bundled T-meetings. Although completion of Nuclear Refurbishment prerequisite work prior to the Unit two breaker open has averaged less than 50% compliance to schedule there has been improvement observed. Recent performance of up to 78% completion notes a trend toward the 90% compliance target.	Implement a periodic meeting to review upcoming work weeks for outage pre-reqs. Begin reporting of Refurbishment pre-req Dashboard Develop and communicate Refurbishment indicators, data metrics gap.  All actions found to be complete.	3

**Attachment XX**

Darlington Nuclear Refurbishment (DNR) Findings  
Nuclear Oversight (2014-2016)**

<b>Audit/ Assessment Title</b>	<b>Finding</b>	<b>Management Actions</b>	<b>Risk Rating*</b>
2016-029 DNR Conduct of Engineering  August 16, 2016	OPG has accepted two pressure boundary Technical Specifications prepared by the vendor for the Feeder Assembly without specifying some information required for inspections and measurements.	Confirm Control Notices placed on current revisions of affected comprehensive work packages capture outstanding reviewer comments from the technical specification compliance review. Confirm final revisions of affected comprehensive work packages contain adequate detail for measurements and address audit report findings. Actions to be completed by 2017/02/15.	3
	OPG has accepted some Inspection and Test Plans for the EPG3 project, which do not specify clearly the characteristics to be inspected, acceptance criteria and inspection procedures.	Review audit report in conjunction with the CNSC Type II Reactive Inspection findings for compliance to code and governance. Action to be completed by 2016/11/25.	3
<b>Assessments</b>			
2014-200 Darlington Nuclear Refurbishment Engineering Activities  July 31, 2014	The implementation of the Change Management Plan has gaps that may represent a risk to the success of the plan. Amongst those gaps, there are critical activities that are late (some by more than 4 weeks when compared to the original plan) or haven't started yet and these include: "Contractors to input their level 3 schedules into P6" and "Projects and Modification to execute Project Change Authorization for each DNR project requiring Contractor to produce new schedules based on the new engineering strategy".	Create metrics in order to gauge the success of the Collaborative Approach. The action is arising from the "Assessment on Refurbishment Changed Contractor Interfaces" and the "DNR Engineering Status Review" memo which found that reliable metrics were not yet available. Action was completed on 2014/10/31.	3
	Actions identified in the memo "Level 1 Plan for Managing the Emerging Risks Related to Increasing Refurbishment Engineering Project Costs" are past their target completion dates. These actions may impact the effectiveness of the change management plan, specifically Collaborative Front End Planning and One Time Scope Approval.		

**Attachment XX**

**Ontario Power Generation  
Darlington Nuclear Refurbishment (DNR) Findings  
Nuclear Oversight (2014-2016)**

<b>Audit/ Assessment Title</b>	<b>Finding</b>	<b>Management Actions</b>	<b>Risk Rating*</b>
2014-204 Darlington Performance Assessing – DNR Work Management  December 19, 2014	This performance based assessment has found a number of issues where the current system processes and behaviours are not fully effective. Weak process implementation early in the scheduling process is resulting in work compression and non-compliances close to execution. Weak adherence to scheduling and milestone discipline results in late injection of work. This, in addition to work not executed on-time, is creating delays which contribute to a rising bow-wave. This poses risk for Refurb to come in on time while meeting budget and scope. Additionally, metrics quality is currently such that these issues are somewhat obscured.	Issue a set of Pre-Refurbishment Project Metrics. Metrics may include: Scope Phase Assessments, Group Breakdown Graphs, Assessments, Scope Variance, Prerequisite Schedule Development, Schedule Development, Group Breakdown Graphs, Pre-Req Workdown, Pre-Req, Daily Completions, and Pre-Req Graph Data. Roll out “Adherence Manager’s Briefing Card” to all project staff to ensure understanding of expectations and schedule requirements. All actions found to be complete. Effectiveness review found actions effective in resolving the identified issue.	3
2015-202 Darlington Nuclear Refurbishment Chemistry  August 18, 2015	DNR Chemistry requirements and contractors accountabilities have not been effectively communicated to contractors working on DNR projects. a) The Contract/Owner Interface Requirements documents and oversight plans do not provide contractors with the necessary information on the DNR Chemistry Program requirements. b) Project Managers are not effectively and consistently ensuring that contractors are aware of the DNR Chemistry Program requirements during the execution phase. c) The DNR Chemistry organization did not identify the gaps related to the DNR Chemistry Program requirements in the applicable DNR Projects.	Supply Chain to complete document change request. The purpose of this change is to include chemistry and environment requirements in the applicable documents. Action was completed on August 22, 2016.	3

**Attachment XX**  
  
**Ontario Power Generation**  
**Darlington Nuclear Refurbishment (DNR) Findings**  
**Nuclear Oversight (2014-2016)**

<b>Audit/ Assessment Title</b>	<b>Finding</b>	<b>Management Actions</b>	<b>Risk Rating*</b>
2015-205 DNR – Engineering  August 24, 2015	There are risks to the completion of engineering change design packages as per schedule. The assessment has identified the following risks to meeting the current work down curve as per the plan: <ul style="list-style-type: none"> <li>• Quality and schedule issues exist in engineering change design packages;</li> <li>• Collaborative approach has not been fully effective;</li> <li>• There is governance weakness with collaborative approach;</li> <li>• Engineering change completion rate for the first two months of 2015 was low.</li> </ul>	Carry out a self-assessment on engineering status to: (i) determine the validity of reported engineering forecasts. (ii) determine the impact to Release Quality Estimate and Unit 2 execution for the engineering changes that have missed the completion milestone. Action was completed on 2015/08/07.	3
2015-321 Human Performance Follow-up  December 18, 2015	The assessment has determined that the corrective action plans for the Human Performance Audit have resulted in improvements. Specifically DNR organization has been attending the Darlington station Human Performance committee meetings. Suggest that DNR become a quorum member to this committee for further improvement.	Review Human Performance Program Guideline, and Nuclear Peer Team Terms of Reference. Ensure alignment and consistency in the requirements for Human Performance Peer team meetings, site Working Committee and Steering Committee meetings with respect to DNR involvement. Actions on track, TCD Dec 2016	3
2016-208 Pressure Boundary Darlington Refurbishment  August 5, 2016	The Retube and Feeder Replacement Project has not identified and documented how the requirements for the operation and maintenance of Pressure Boundary systems in the Refurbishment Waste Processing Building will be met and implemented. None of the documents reviewed by the assessment clearly define the interface, accountabilities and responsibilities between OPG and Joint Venture for future operation and maintenance of Pressure Boundary systems in the Refurbishment Waste Processing Building during the life of the DNR Project.	Prepare a Memorandum of Understanding that shows what steps are required for Joint Venture to obtain the required qualifications to operate the Refurbishment Waste Processing Building (scheduled for July 2017). Action due on 2017/02/28.	3

**Internal Audits on Darlington Nuclear Refurbishment (“DNR”)**  
**Period: January 1, 2014 to September 30, 2016**

Audit Title/ Reporting Date	Finding	Management Action Plan	Risk Rating
	In reviewing the sampled invoice for Defueling reimbursable costs, IA noted that one individual was charged under an E4 rate, which is not an approved contract rate. The identification of an invalid labour rate prompted a review of all invoices for reimbursable work, which started in 2015. It was then reported that invalid E4 and E7 rates were also charged in two other invoices. In total, reimbursable work on the Defueling project was overcharged by approximately \$2,000 out of \$2.1M paid to date.		
16-09 DNR Onboarding (March 29, 2016)	<p><b>Some contract employees were working and granted IT access prior to being security cleared.</b></p> <p>OPG contract employees are contractually required to comply with OPG’s Clearance Process (PROC-0119), which requires clearance for:</p> <ul style="list-style-type: none"> <li>• All contractors working at OPG sites, and;</li> <li>• Requiring access to OPG IT assets.</li> </ul> <p>Through data analysis of the Nuclear Onboarding System (“NOS”), a sample of 50 OPG contract employees was selected to confirm that they had obtained security clearance prior to working on OPG jobs. Audit testing noted four exceptions:</p> <ul style="list-style-type: none"> <li>• Three individuals were working before they had obtained their required security clearance, one of whom has been billing OPG since 2011; and</li> <li>• Two individuals (one of which was included in the three above) had access to a key IT system (i.e. Asset Suite) prior to being security cleared.</li> </ul>	<p>Management has sent out communications to DNR staff to reinforce security clearance requirements for contractors. Management will also formally re-communicate with contractors the importance of obtaining security clearance before any OPG work begins including granting access to AS7 or the OPG LAN.</p> <p>Action Plan Status: Closed</p>	Moderate

### Nuclear Oversight Rolling Audit Schedule Q3 2016 – Q3 2017

The Nuclear Oversight Rolling Audit Schedule is a 5 quarter rolling schedule.

#### Changes Since Last Revision

NO-2016-009 Pandemic Planning – Moved to 2017

NO-2016-031 DNR – Emergency Preparedness – Removed from audit schedule. Will now be an Assessment.

NO-2017-022 DNR – Engineering Change Control – Changed to Engineering Change Control / Design Management

#### Audits Added:

NO-2017-009 Environmental Qualification

NO-2017-011 Conduct of IMS

NO-2017-012 Pressure Boundary Program

NO-2017-015 Conduct of Engineering: Design Authority

NO-2017-019 Projects & Mods

NO-2017-020 Conduct of Engineering: Research & Technology

Blue Bars: Ops, Mtce & Cross Functional Programs. Team Senior Manager Leonard Erb  
Red Bars: Engineering Programs Team Senior Manager Herminia Román

**Board Staff Interrogatory #73**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-11, Attachment 3

In her report, Dr. Galloway refers to numerous documents that she reviewed but which are not included as part of the application evidence. Therefore, please provide copies of the following, which are referred to on the indicated page of the reference:

- a) Integrated Reporting Plan (pages 10 and 68)
- b) Project Oversight Standard (pages 36 and 42)
- c) Project Management Standard (page 42)
- d) Records of Interviews (numerous references)
- e) Program specific policies and procedures (page 43)
- f) Planning and Controls Program Management Plan (page 56)
- g) Risk Register (page 63)
- h) Nuclear Projects Risk Management manual (page 65)
- i) Readiness to Execute Plan (page 71)

**Response**

The following response has been prepared by Pegasus-Global Holdings:

As requested, the following documents for each reference are attached. Attachments 1 through 9 correspond to parts a) through i) of the interrogatory, respectively:

Attachment 1: Integrated Reporting Plan (May 11, 2016)

Attachment 2: Project Oversight Standard (N-STD-AS-0030 R001A)

Attachment 3: Project Management Standard (N-STD-AS-0028 R002)

Attachment 4: Please see L-4.3-1 SEC-22

# Darlington Refurbishment Program

Reporting  
May 11, 2016

## BEHAVIOURS

- Say It, Do It
- Simplify It
- Think Top and Bottom Line
- Integrate and Collaborate
- Tell It As It Is

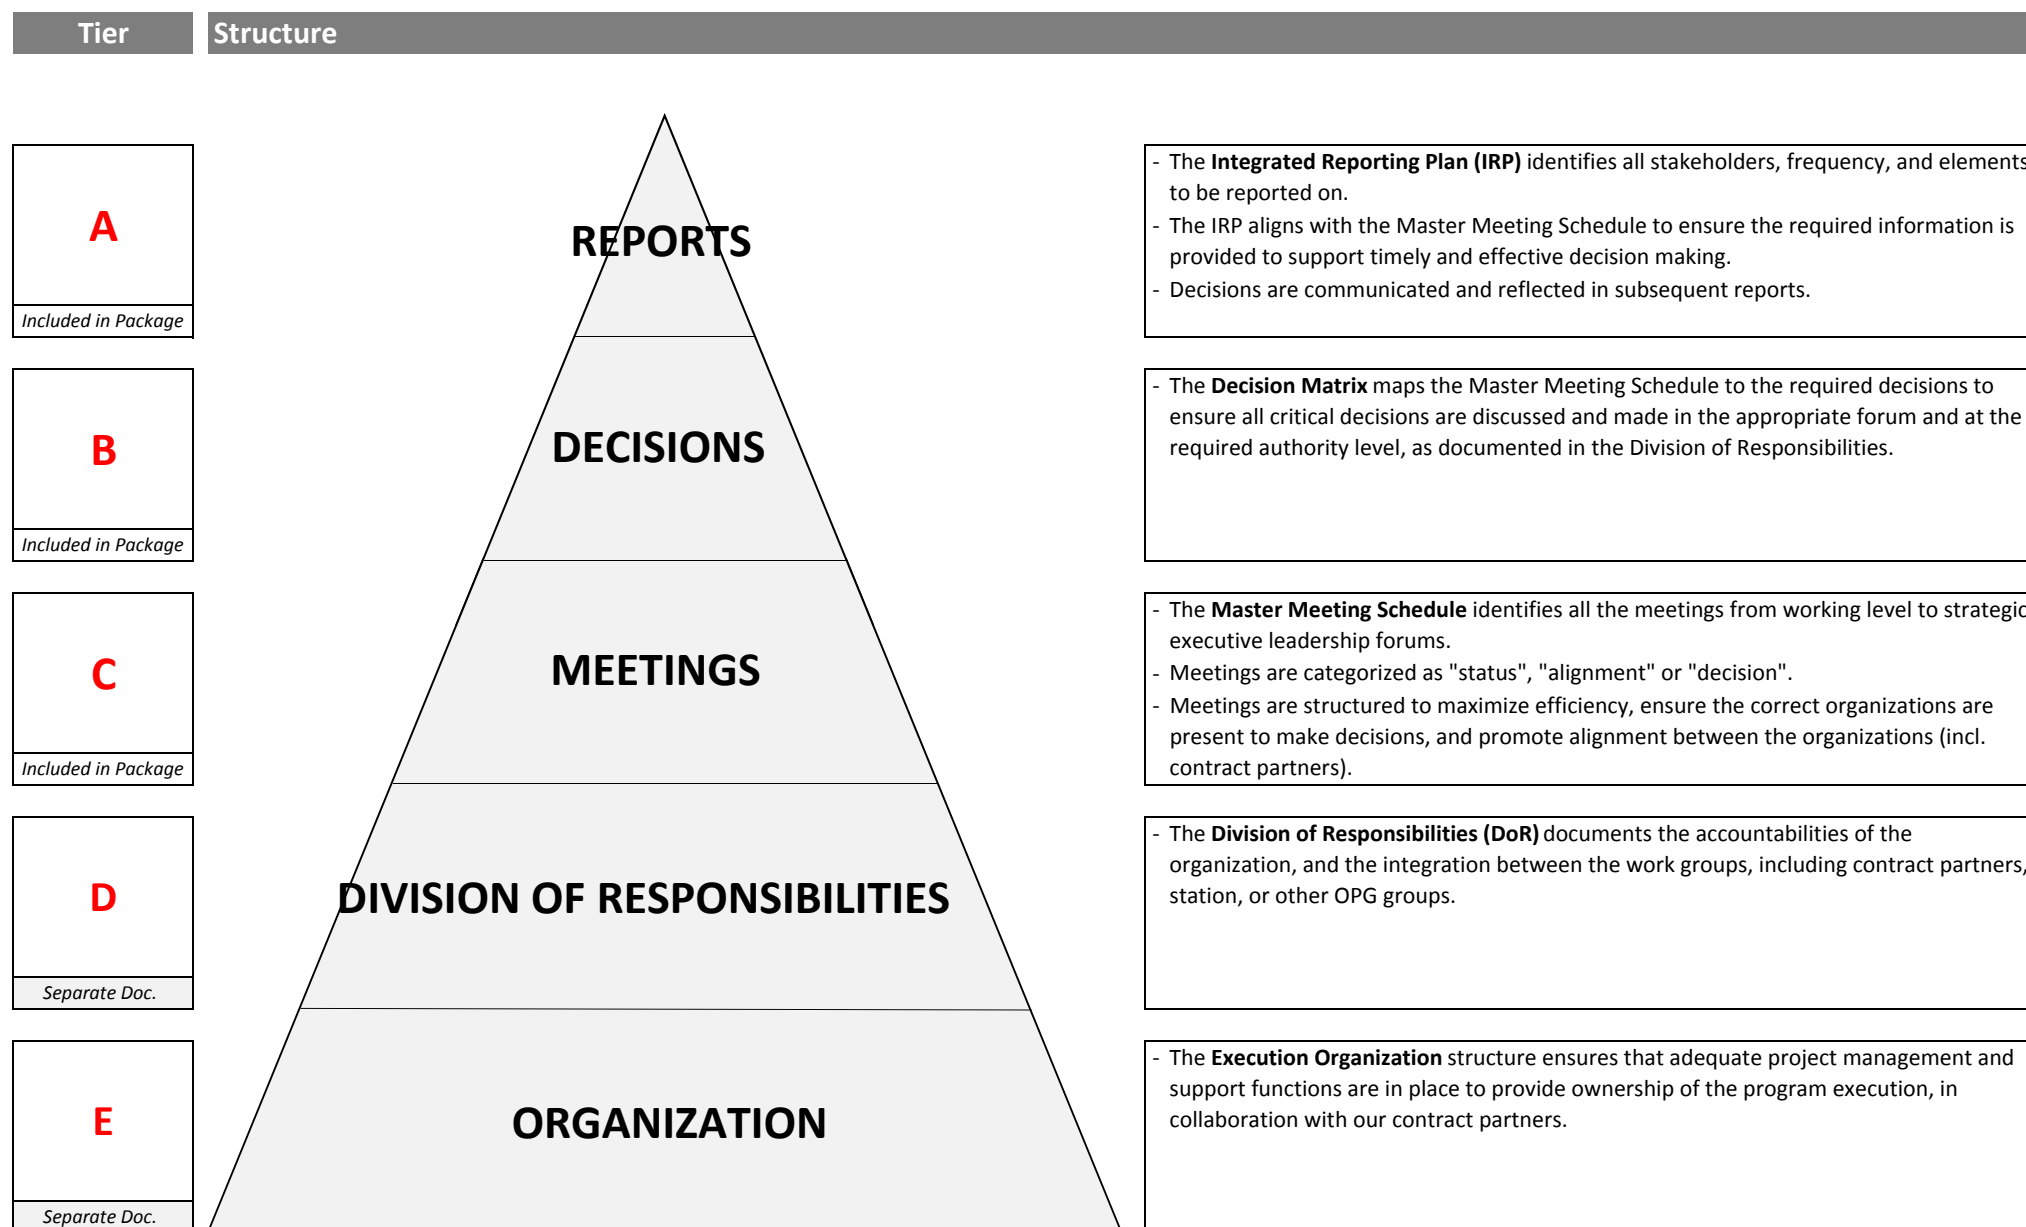

**VALUES** ▪ SAFETY ▪ INTEGRITY ▪ EXCELLENCE ▪ PEOPLE & CITIZENSHIP ▪

## SECTION 1: INTEGRATED REPORTING PLAN

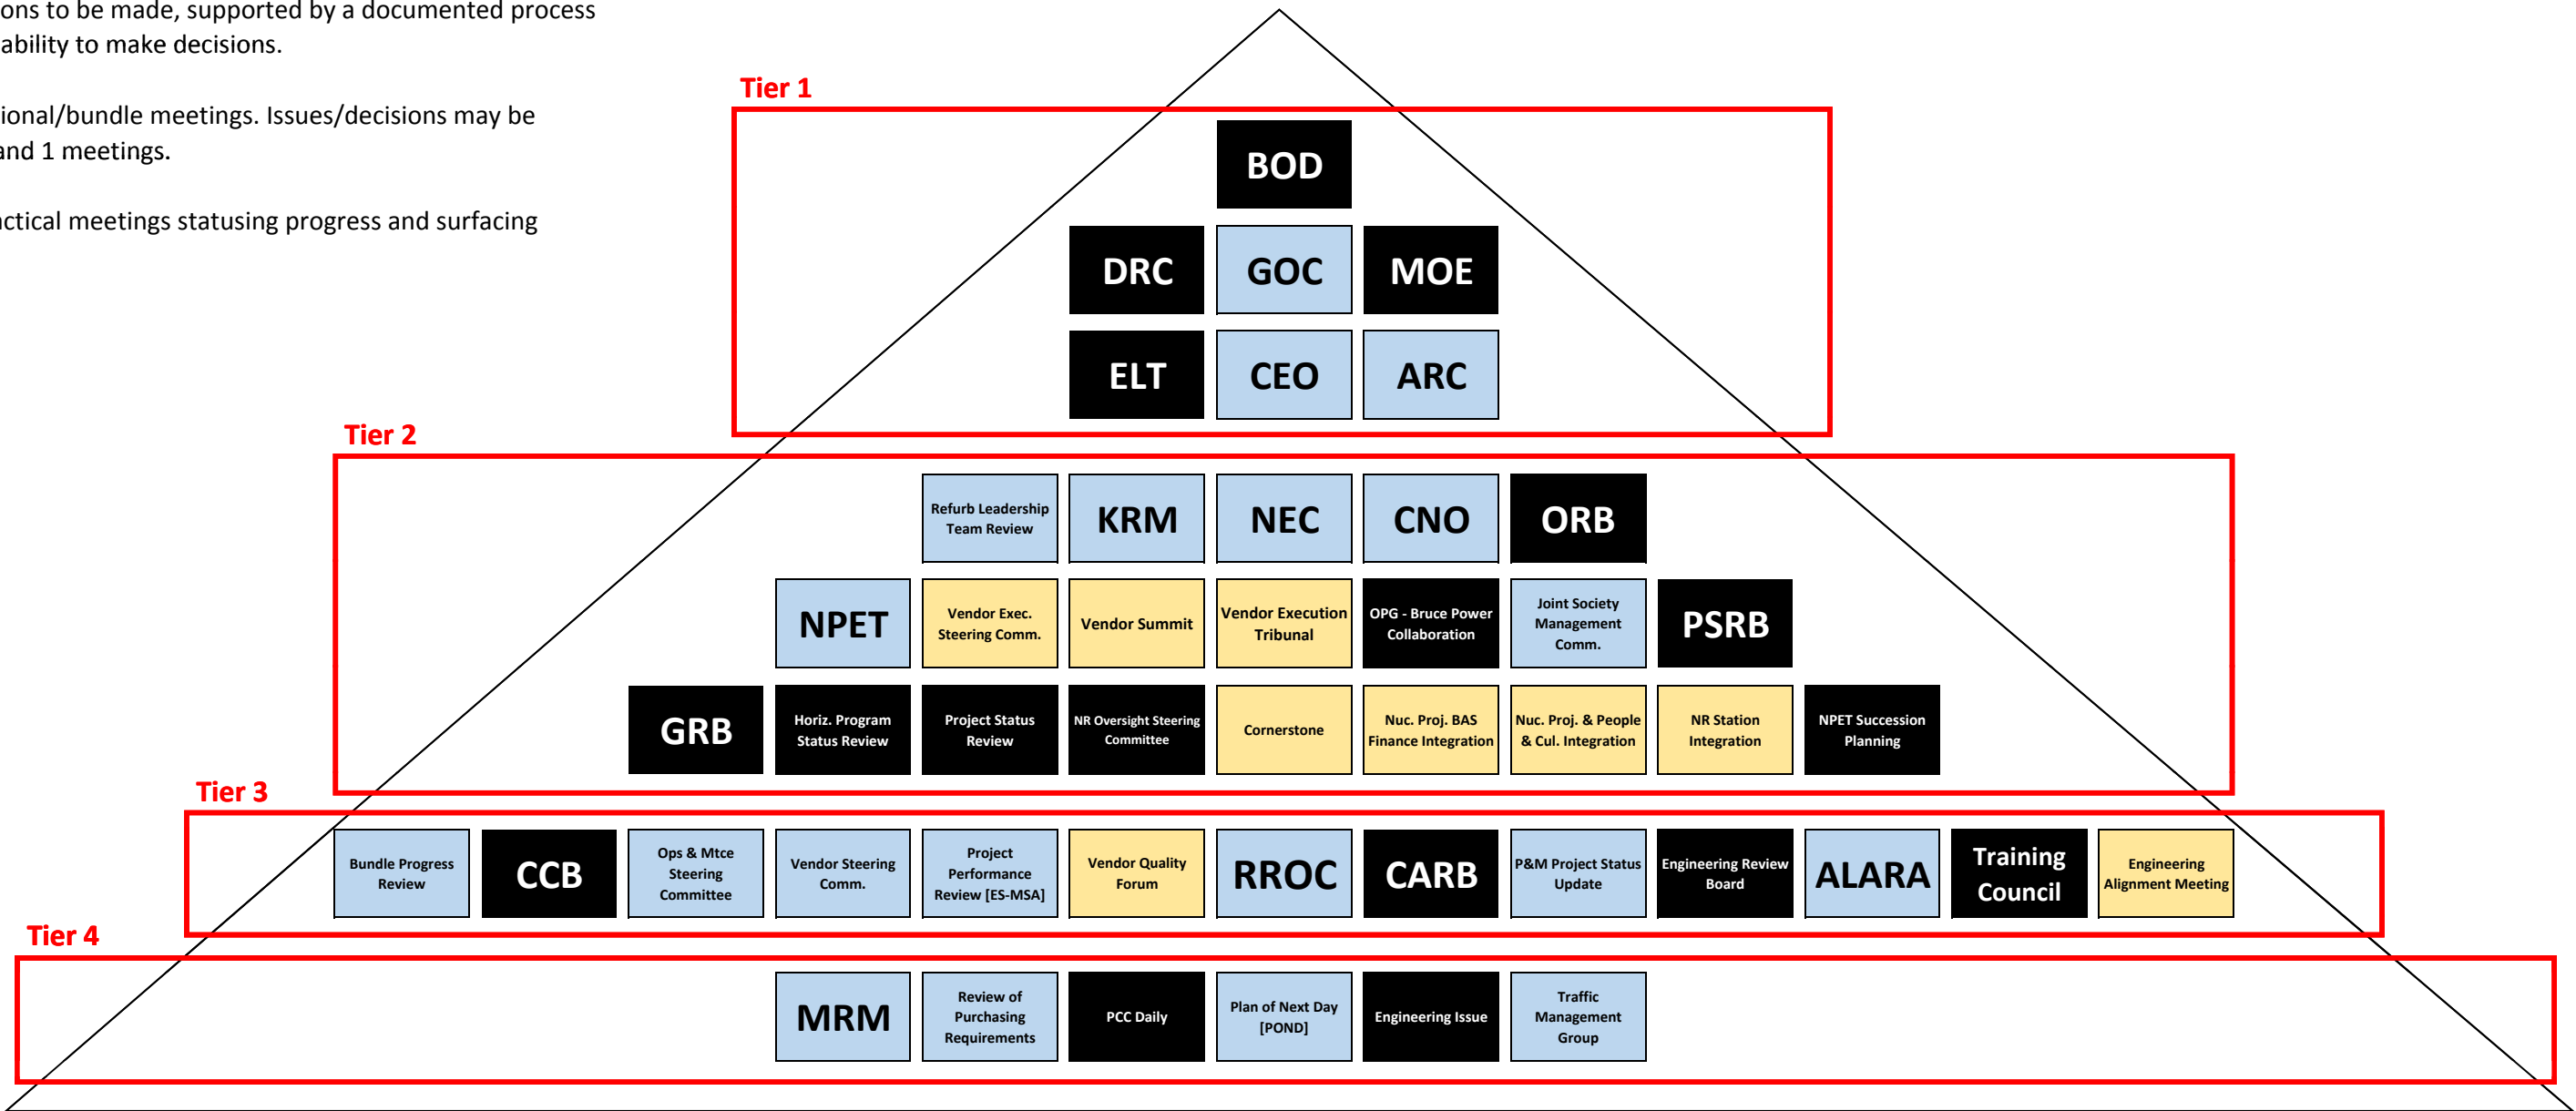

The Master Meeting Structure Tiers:

**Tier 1** - Strategically driven - focuses on strategic direction/decision making, major project risks and significant barriers impacting the safety, quality, cost and schedule objective.

**Tier 2** - Process Driven - An information/communication forum with the potential for decisions to be made, supported by a documented process that facilitates the ability to make decisions.

**Tier 3** - Cross functional/bundle meetings. Issues/decisions may be elevated to Tier 2 and 1 meetings.

**Tier 4** - Working/tactical meetings statusing progress and surfacing issues.

Text	Blue: Meeting is to provide information on the status of NR Program.
Text	Gold: Meeting is to ensure alignment between work groups, including contract partners, station, or other OPG groups.
Text	Black: Core meetings required to facilitate decision making.

**Note: The following meetings have not been included but are occurring: Face to Face Meetings, Pre-Req Working Meeting, Direct Report Meetings, Vendor Project Review Meetings and Field Walk Downs, SCR Screening Meetings**

Tier	Priority Meetings *	Key Reports	Actions / Decisions resulting from Report/Meeting	Decision Makers

# Nuclear Standard

## TITLE

**PROJECT OVERSIGHT STANDARD**

## AUTHORIZATION

SINGLE POINT OF CONTACT:

~~D. Popovic~~ D. Stiers

Director, ~~Projects and Modifications~~ Management Systems Oversight, Nuclear Projects

DOCUMENT OWNER:

~~A. Robb~~ M. Timberg

VP, ~~Projects and Modifications~~ Project Assurance & Contract Management, Nuclear Projects

## DOCUMENT RELATIONSHIP

Applicability:

All of Nuclear

Receives Authority from:

N-PROG-AS-0007, Project Management Program

Document is Related to Pressure Boundary ☐

Document Requires CNSC Notification ☐

## PURPOSE

This standard provides the criteria and behavioral requirements for Project Oversight and the key elements for oversight of projects executed in Ontario Power Generation – Nuclear (OPG-N). Project oversight is an important aspect of project management which is used to ensure project deliverables and objectives are achieved.

## DATES (YYYY-MM-DD)

### Title: PROJECT OVERSIGHT STANDARD

## 1.0 DIRECTION

This standard provides the Project Oversight principles and requirements to be applied to projects initiated and/or executed within OPG-N. Oversight is the independent assessment necessary to ensure OPG and project objectives are achieved. It is distinct from the in-line and normal quality assurance and control process. Oversight is applicable but not limited to:

- Safety
- Quality
- Cost and schedule performance
- Solution effectiveness
- Value for money
- Regulatory and environmental compliance
- Human performance
- Project planning
- Engineering
- Procurement, suppliers and contractors
- Installation and construction activities

Oversight is based on a proactive and graded, risk based approach. The means by which the different executing organizations implement this standard may vary based on business requirements and taking into consideration the risk profile and complexity considerations of the particular project being undertaken.

### 1.1 Key Oversight Elements

- (a) Oversight shall be performed throughout the project lifecycle.
- (b) The extent and frequency of oversight shall be applied strategically using a graded approach based on project complexity, risks, and performance. The level of oversight shall be modified to reflect the current project performance and changes in the risk profile. Examples where increased levels of oversight may be required include:
  - Project areas that include new processes or technology
  - Activities of high consequence to safety, quality, cost or schedule
  - Critical evolutions or changes

Title:  
**PROJECT OVERSIGHT STANDARD**

- Where suppliers are new or have performed less than expected on current and previous projects
  - Fabrication by sub-contractors
  - Where nuclear safety or operation may be impacted
  - Project areas with evidence of negative trends, e.g. cost, schedule, safety or quality performance.
- (c) Oversight shall be applied proactively in a manner that allows for early detection of potential issues and effective implementation of corrective actions. Methods of proactive oversight may include:
- Communicating and establishing expectations and targets
  - Conducting regular status meetings
  - Look ahead planning and strategizing
  - Conducting challenge and preparedness meetings
  - Performing direct observation, surveillance and assessments
  - Using trend analysis and performance metrics
  - Tracking and resolving issue
  - Prompt escalation of issues
- (d) Oversight shall be applied in a manner that respects contract terms and conditions. It does not direct the work of suppliers who are performing under their own approved management system. Oversight results shall be communicated to stakeholders through the pre-approved designated authority for the oversight.
- (e) Oversight shall be applied to the portfolio or program of projects as well as to individual projects. The portfolio or program oversight shall be conducted in a manner that ensures:
- communication, coordination and integration between projects in order to establish and understand the interrelationships
  - overall portfolio safety, quality, cost and schedule performance
  - a higher degree of oversight for large projects and programs that include multiple projects.
- (f) The oversight strategy, roles and responsibilities shall be documented in a project oversight plan. The oversight plan shall be reviewed and updated when required to meet the project objectives in alignment with project and supplier performance.

### Title: PROJECT OVERSIGHT STANDARD

- (g) The Project Manager should develop the oversight plan with stakeholder input and shall:
  - (1) Direct and execute the overall project oversight.
  - (2) Obtain the necessary resources to execute the oversight.
- (h) Oversight results that include corrective actions shall be documented and communicated to the appropriate project stakeholders.
- (i) Lessons learned are used for continuous improvement.

## 1.2 Project Oversight Process

Detailed process instructions, guides, work aids and good practices for all key elements of project oversight in OPG-N are provided in various documents which have been independently developed and implemented.

The following instructions have been -written to assist Project Managers and contract owners implement the requirements of N-STD-AS-0030 Project Oversight Standard (governance), N-STD-AS-0032 Oversight of Supplemental Personnel (governance), and the guidelines presented within the following documents:

N-MAN-09701-10002, Nuclear Refurbishment Project Oversight.

N-INS-09701-10007, Project Oversight Planning and Implementation

N-INS-00120-10026, Supplemental Personnel oversight

N-GUID-01920-10000, Guideline for Engineering Oversight

N-GUID-09701-10022, Supply Chain Oversight

N-GUID-09701-10120, Guideline for Construction Oversight

[N-GUID-00120-10008, Contractor Management Process](#)

N-INS-09701-10007, Project Oversight Planning and Implementation is primarily intended to assist with the development of the Project Oversight Plan (POP) particularly for obtaining consistency on format and content. This is essential when recognizing that there are various groups executing projects across OPG Nuclear. It is imperative that consistency in format and minimum content is required specifically because of, the variation in project cost, complexity, duration and risk, and user groups such as Inspection and Maintenance Services (IMS), Station Engineering and Project & Modifications(P&M).

[N-GUID-00120-10008, Contractor Management Process, identifies the minimum process requirements for monitoring a contractor during the field execution of contracted work at Ontario Power Generation Nuclear \(OPGN\).](#)

In addition, oversight departments charged with ensuring that adequate oversight is being applied on projects require consistency and some minimum standard for POP's in order to

measure application of governance and foster continuous improvement through the analysis of oversight results.

The Oversight process documents are available on the OPG intranet through "PowerSearch" or as an E-Manual under the Nuclear Projects webpage.

## 2.0 ROLES AND ACCOUNTABILITIES

### Vice President - Nuclear Projects Oversight

The Vice-President - Nuclear Projects Oversight, acts as the Program Owner for oversight and sets direction, monitors compliance, and assesses effectiveness in accordance with N-STD-AS-0030 Project Oversight Standard,. This is also described in the Nuclear Refurbishment Project Oversight Guide, N-MAN-09701-10002. Nuclear Projects Oversight supports the project teams in the development of their Project Oversight Plans (POPs) and the associated tools, including training, as required.

### Project Manager

The Project Manager is accountable for the following:

- Ensure adequate oversight is planned and implemented for the project.
- Develop and implement the Project Oversight Plan (POP)
- Engage and utilize the support of the functional groups in the development and implementation of the POP.
- Determine and resource the project oversight team (functional & support group representation) and how they will function.
- Document the expectations around communicating (internal and with vendor) and on the importance of sharing critical oversight results in an expeditious manner.
- Communicate expectations around oversight effort (full time, part time, twice a week, etc).
- Hold recurring meetings with the project team to review oversight results and revise the POP as required.

### Functional Support Organization Managers:

The functional organizations, in accordance with approved RACI (Responsibility, Accountability, Consultation, Information) documentation, are accountable to identify the oversight to consider for inclusion in the POP. They are also accountable to provide additional and or specialized resources to execute the plan when requested by the Project Manager.

Title:  
**PROJECT MANAGEMENT STANDARD**

### 1.0 DIRECTION

This standard provides the criteria, expected behaviours and output requirements for the successful and timely execution of all projects in Ontario Power Generation – Nuclear (OPG-N). It describes the Project Management attributes and methodology required to manage projects throughout the project life cycle.

The requirements for effective management of a project are dependent on the level of risk inherent to the project. Projects are managed using a graded, risk based approach.

Portfolio or Program Management is the management of a set of projects coordinated to achieve strategic level objectives and benefits. Projects executed as part of a Portfolio or Program should implement additional levels of integration and oversight within the context of this standard.

Projects are initiated, funded, and executed by many different groups and organizations within OPG-N

All staff within OPG-N that work on projects will apply the criteria, methodology and good practices described in this standard for all project management activities.

Detailed process instructions, guides, work aids and good practices for all key elements of project management in OPG-N are stored in the controlled documents module of Asset Suite and can also be accessed via N-MAN-00120-10001 which is available on the OPG intranet through “PowerSearch” or as an E-Manual under the Nuclear Projects webpage.

### 1.1 Project Management

Project Management is the discipline of planning, organizing, securing, and managing resources to bring about the successful completion of specific project goals and objectives. It is the application of a methodical and iterative approach for guiding a project from start to finish. It incorporates tools and processes to plan, execute, monitor, control and close-out project activities to ensure all project requirements are met.

Managing a project typically includes:

- (a) Identifying and documenting project requirements and deliverables to satisfy the project needs and objectives including key constraints, risks and assumptions.
- (b) Providing graded, risk based oversight of the project team, supporting departments, contractors, and suppliers.
- (c) Addressing the various needs, concerns, and expectations of stakeholders.
- (d) Developing project plans, estimates and schedules.

## Nuclear Standard

Internal Use Only		
Document Number:	N-STD-AS-0028	
Revision:	R002	
Usage Classification:	Information	Sheet Number: N/A
Page:	5 of 17	

Title:

## PROJECT MANAGEMENT STANDARD

- (e) Developing funding and contracting strategies.
- (f) Monitoring, reporting, communicating, and controlling project performance.
- (g) Documenting and managing project risks, identifying mitigating actions to eliminate or reduce the risk and implementing corrective measures.
- (h) Planning, managing and directing the project execution.
- (i) Managing and controlling project changes and priorities.
- (j) Incorporating operating experience and lessons learned.
- (k) Balancing competing project constraints including the following:
  - Scope
  - Schedule
  - Cost/Budget
  - Resources
  - Risks
  - Value for money.

1.1.1 The Project Manager has the overall accountability for the project and project management and shall use a graded, risk based approach when selecting the type and detail for Project Management processes and tools. The required level of Project Management and controls are a function of the project risk, complexity, duration, expected cost and project phase.

1.1.2 All work performed during a project shall:

- (a) Maintain safety and quality as the overriding priority.
- (b) Be executed by staff who are competent for the type of work.
- (c) Be executed in phases. Progression from one phase to the next is approved at a *Decision Gate* where project progress and performance is reviewed by management and validated to ensure project requirements and objectives are being satisfied.
- (d) Use as required the guides, instructions, forms and good practices for the specific project management area that are provided in the project management manual N-MAN-00120-10001 and further described in the project management e-manual available on the Project Management Intranet web page.

## 1.2 Project Phases and Decision Gates

Consistent with industry best practices, project development, execution and close-out is broken into Project Phases separated by *Decision Gates*. The gated concept provides points in the development and execution of the project for management decision to stop, rework or

## Nuclear Standard

Revision:	R002	
Usage Classification:	Information	Page:
Sheet Number:	N/A	6 of 17

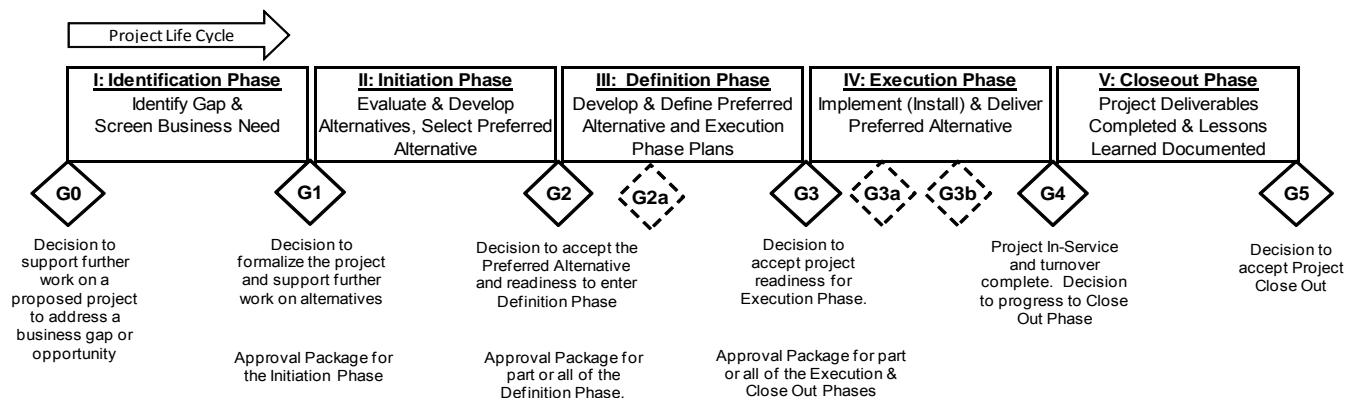

### Title: PROJECT MANAGEMENT STANDARD

proceed. It controls progression approvals and shall be used to manage the project through the project life cycle. This process requires that projects meet a consistent expectation of quality and performance. At each *Decision Gate*, the current phase deliverables and project performance are reviewed together with the plan and deliverables for the next phase(s).

1.2.1 The project life cycle typically consists of the following five phases:

- Identification phase
- Initiation phase
- Definition phase
- Execution phase
- Close Out phase.

Figure 1, Project Phases and Associated Decision Gates, illustrates the typical project phase and *decision gate* relationship.

**Figure 1: Project Phases and Associated Decision Gates**

**Note:** There may be additional *Decision Gates* (e.g. G2a, G3b) within a project phase depending on project risk, funding release and execution strategy, and organization's process. *Decision Gates* may be revisited when priorities or strategies change. In specific instances some projects will not be required to go through certain Gates. These projects will document why certain Gates are not applicable to their project.

A project proposal begins at *Decision Gate 0*. During the period prior to Gate 0, a business gap, need or opportunity has been identified by the initiating organization. The Gate 0 decision is primarily focused on confirming strategic alignment and intended benefits with the initiating organization and OPG-N business objectives.

## 1.3 Identification Phase

The Identification Phase begins after Gate 0 and ends at Gate 1. The objective of the Identification Phase is to build the initial business case for the project. The Identification

## Nuclear Standard

Revision:	R002	
Usage Classification:	Information	Sheet Number: N/A
Page:	7 of 17	

Title:

### PROJECT MANAGEMENT STANDARD

Phase includes assessment of the business need, gap or opportunity and preparation of Gate 1 supporting documents to support further work on proposed solutions.

1.3.1 The Identification Phase deliverables typically include:

- (a) Preliminary project scope, objectives, Sponsor, stakeholders and accepting organization identified.
- (b) Initial project assumptions & constraints documented.
- (c) Project Charter or equivalent created.
- (d) Executing organization and Project Manager identified.
- (e) Work for the next phase(s) defined and planned, complete with an estimate and schedule.
- (f) Applicable Gate 1 *Approval Package* to support the initiation of the project.

## 1.4 Initiation Phase

The project Initiation Phase begins after Gate 1 and ends at Gate 2. The objective of the Initiation Phase is to evaluate viable alternatives and develop the scope of the preferred alternative to a point where there is confidence that all major elements of scope are accounted for. The Gate 2 supporting documents are prepared to summarize the alternatives analysis and rationale for recommending the preferred alternative so that an informed decision to continue or cancel the project can be made.

1.4.1 The Initiation Phase deliverables typically include:

- (a) Alternative options evaluated and a preferred alternative recommended.
- (b) Initial scope description and requirements
- (c) Identification of engineered equipment and services
- (d) Initial project contracting strategy.
- (e) Preliminary Risk Assessment and mitigating plans.
- (f) Initial total project cost estimate and schedule for the preferred alternative.
- (g) Work for the next phase(s) defined and planned, complete with a detailed estimate and schedule.
- (h) Project management plans and supporting documents.

Usage Classification:	Information	Sheet Number: N/A
		Page: 8 of 17

Title:  
**PROJECT MANAGEMENT STANDARD**

- (i) Applicable Gate 2 *Approval Package* to support the definition of the project.

### 1.5 Definition Phase

The Definition Phase starts at Gate 2 and ends at Gate 3. The objective of the Definition Phase is to define the project and demonstrate readiness for execution. This includes actions to further define the scope of the preferred alternative, including the completion of preliminary engineering or modification planning and Execution Phase planning. This phase may also include the completion of detailed engineering, and preparations for construction/installation field work.

#### 1.5.1 Definition Phase deliverables typically include:

- (a) Final scope description and requirements.
- (b) Preliminary engineering complete.
- (c) Sufficient detailed engineering to determine quantities of bulk materials required
- (d) Risk Assessment and mitigating plans
- (e) Regulatory Approvals identified and received or pending.
- (f) Refined total project cost estimate and schedule.
- (g) Work for next phase(s) defined and planned.
- (h) Applicable Gate *Approval Package* with updated project plans to support the next phase(s) including Gate 3 approval to begin the Execution Phase.

### 1.6 Execution Phase

The project Execution Phase includes the main construction/installation and commissioning work. It may also include completion of detailed engineering and procurement.

#### 1.6.1 Execution Phase deliverables typically include:

- (a) Pre-installation and commissioning readiness.
- (b) Quality Plan.
- (c) Safety Plan.
- (d) Regular reporting on project safety, quality, schedule and budget.
- (e) Installation and Commissioning Work Plans (if applicable).

## Nuclear Standard

Page:	9 of 17	

### Title: PROJECT MANAGEMENT STANDARD

- (f) Installation and Commissioning Execution Packages.
- (g) Installation/construction, inspection/testing and commissioning complete.
- (h) Project Close Out phase planned.
- (i) Operations and Maintenance documentation updated.
- (j) Next *Approval Package* with updated plans and schedule, if applicable, for a multi-unit/phase project.
- (k) Available for Service (AFS) or Operations Acceptance approved (Gate 4).
- (l) Gate 4 approval to begin Close Out Phase.

## 1.7 Close Out Phase

The Close Out Phase is the last phase in the project life cycle and includes the final actions to complete all activities and formally finish and close out the project. This phase should be completed as quickly as possible after final AFS in order to minimize project costs.

### 1.7.1 Close Out Phase deliverables typically include:

- (a) Completion of any outstanding actions/deficiencies from final AFS and Gate 4.
- (b) Project financials finalized and closed.
- (c) Remaining project materials dispositioned as spares, surplus or obsolete.
- (d) New and affected drawings updated, approved and issued.
- (e) Records and documents filed.
- (f) Information Managed Systems updated.
- (g) Lessons Learned captured and documented.
- (h) Regulatory actions dispositioned and/or completed as needed.
- (i) Action tracking assignments completed and closed.
- (j) Completion and approval of project close out report (Gate 5).

## 1.8 Key Project Management Elements

Each executing organization shall have graded, risk based processes to incorporate the key Project Management elements.

## Nuclear Standard

Internal Use Only		
Document Number: N-STD-AS-0028		Revision: R002
Usage Classification: Information	Sheet Number: N/A	Page: 10 of 17

Title:

### PROJECT MANAGEMENT STANDARD

The key Project Management elements include the following items:

- Safety
- Scoping
- Estimating
- Resource planning
- Risk management
- Scheduling
- Cost management
- Procurement and contract management
- Communication
- Quality management
- Project oversight
- Project controls.

The ability to influence the outcome and success of a project is greatest at the front end of the project lifecycle. The key Project Management elements shall be applied in a manner that minimizes the likelihood of encountering issues during the execution of the work. As the project progresses and matures, the planning products should be further developed and refined to reflect the latest project information.

The products of the key Project Management elements are summarized in a Project Management Plan. Any other elements unique to a particular project should also be specified in the plan.

#### 1.8.1 Safety

Safety, including nuclear safety, radiological safety, environmental safety and conventional safety, is an overarching element in project management. Safety impacts people, quality, costs and schedule.

Each project shall consider safety in the planning, managing, controlling and execution of project deliverables.

#### 1.8.2 Scoping

Project scoping involves defining the project objectives and deliverables based on business requirements, assumptions, constraints and value for money.

- (a) Each project shall have a well defined project scope in order to produce an accurate estimate and schedule.
- (b) The inputs to determining the project scope should include but are not limited to:
  - Project Charter or equivalent

		Page: 11 of 17

Title:

### PROJECT MANAGEMENT STANDARD

- Project stakeholders
- Station/System Health Reports
- Station Engineering (system engineer)
- Design Basis and Design Requirements
- Facilitated workshops and Value Engineering
- Regulatory requirements
- Field Walk Downs
- Lessons Learned (internal and external)
- OPEX and SCRs
- Governance
- Challenge and COMS meetings
- Risk mitigating plans.

- (c) There shall be a process and plan to deal with scope changes. Project scope changes shall be managed and strictly controlled, with the impacts thoroughly understood, as they have the potential to affect the project risks, cost, schedule and stakeholders. Project scope changes require approval from the project sponsor or the applicable authorization authority appropriate for the project. If changes are significant the project may need to be re-evaluated.

#### 1.8.3 Estimating

Estimating is the process of quantifying the funding and resources required to complete the relevant project activities to achieve project objectives. An accurate cost estimate leads to a more precise project schedule and budget which forms the basis for project decisions, value and performance. Each project shall have a cost estimate and:

- Each project should create a cost estimate which includes the documentation of assumptions, constraints, class of the estimate along with the cost range, deliverables, and other relevant information that the estimate is based on.
- Estimating should be repeated for each project phase and should become more refined and accurate as the project scope and details mature.
- Estimating should be performed to determine the cost of changes including the addition of project scope.
- The estimate for the next immediate project phase should be of sufficient detail and accuracy to ensure thorough resource planning and cost control.

#### 1.8.4 Resource Planning

Resource planning includes identifying the quantity and type of resources required for the successful completion of project deliverables.

## Nuclear Standard

Title:

### PROJECT MANAGEMENT STANDARD

- (a) The Project Manager shall ensure that qualified personnel, equipment and material are available at each stage of the project, in order to meet the oversight, schedule, quality and technical requirements.
- (b) Resource planning shall be graded and risk based and should be used as an input to develop the contracting and procurement strategies, and project schedule.

#### 1.8.5 Risk Management

Risk Management is the process used to identify, manage and control project risks throughout the project lifecycle.

- (a) The Project Manager shall ensure that project risk management is executed thoroughly to decrease the likelihood of unexpected issues occurring and adversely impacting the project and stakeholders.
- (b) Risk Management includes:
  - Identification and analysis of project risks
  - Mitigation and/or avoidance of risks through preventive action planning and execution
  - Determining the budget and schedule contingency required for residual risks
  - Developing risk contingency plans to deal with residual risks that may materialize
  - Monitoring and controlling risks throughout the project lifecycle.

#### 1.8.6 Cost Management

Cost management includes the processes related to assessing and managing the actual cost of deliverables against the budget baseline. The budget or cost baseline is based on the resource loaded project schedule. Cost management includes:

- (a) Establishment of the budget or cost baseline.
- (b) Monitoring the status and trend of cost performance.
- (c) Implementing corrective actions as required.
- (d) Managing the use of contingency funding required to manage project risks.
- (e) Forecasting future budget requirements.
- (f) Managing required budget changes.

Title: <b>PROJECT MANAGEMENT STANDARD</b>
--

### 1.8.7 Scheduling

The project schedule outlines the deliverables and activities, their interrelationship and execution sequence. It is the main planning and monitoring tool used to communicate the execution of project deliverables.

Scheduling includes:

- (a) Identification of key activities including their start and finish date, duration and resources.
- (b) Activities that are deliverable based and communicate what needs to be done.
- (c) The sequence and logical interrelationship of activities and milestones.
- (d) Identification and optimization of the critical path.
- (e) Regular monitoring and updating to track performance and initiate corrective action for schedule threats.
- (f) Look ahead planning and strategizing to identify and manage priorities, opportunities, and threats.
- (g) The inclusion and management of float in the schedule.

### 1.8.8 Procurement and Contract Management

Projects shall manage contracts and suppliers in accordance with N-STD-AS-0029, Contract Management Standard.

### 1.8.9 Communication

The project manager shall ensure that proper and effective communication practices are used throughout the project life cycle. This is to ensure that all project team members, stakeholders, contractors and suppliers understand the deliverables and are working with the required and most recent information.

The communication requirements include:

- (a) Maintaining alignment between team members and stakeholders.
- (b) Timely distribution and control of information, documentation and changes.
- (c) Communicating targets and expectations.
- (d) Regular project team planning and progress meetings.
- (e) Informing stakeholders of project progress, risks and changes.

- (f) Expediting support and issue resolution.
- (g) Reporting on project performance.

### 1.8.10 Quality Management

Quality management processes are required to control human performance, engineering, work planning, materials, and field work, in order to meet the requirements of the project.

- (a) Each project shall define what quality program is to be used in the project's quality plan.
- (b) The quality plan includes the methods that will be used to measure the project actual performance against the defined quality requirements.
- (c) The project quality plan should demonstrate the following elements where applicable:
  - (1) Quality planning to determine the type and frequency of internal and external quality standards and monitoring required for project success.
  - (2) Quality Assurance to plan a systematic pattern of means and actions designed to provide confidence that items or services will meet specified requirements and perform satisfactorily in service. These include quality systems, instruction, training, qualification and checklists.
  - (3) Quality Control processes to ensure that specified requirements are met through monitoring, inspections, testing, examinations or verifications. This includes the documentation of non-conformances and corrective actions.

Refer to N-STD-AS-0031, Field Engineering Standard, for projects using OPG-N's quality program.

### 1.8.11 Project Oversight

Projects using a contractor's or vendor's quality management system shall implement oversight in accordance with N-STD-AS-0030, Project Oversight Standard.

### 1.8.12 Management of Supplemental Personnel

Supplemental personnel are vital to the success of Nuclear Projects and OPG-N. They fill an important gap created by insufficient resources or skills of OPG-N employees.

N-STD-AS-0032, Oversight of Supplemental Personnel provides the oversight principles and requirements to be applied to work packages initiated and/or executed within OPG by supplemental personnel.

### Title: PROJECT MANAGEMENT STANDARD

#### 1.8.13 Project Controls

- (a) Projects shall have control processes established to support key project management elements including but not limited to:
  - (1) Planning support.
  - (2) Monitoring of key project performance indicators (i.e. metrics).
  - (3) Schedule and cost variance and indicator analysis.
  - (4) Forecasting of project costs and schedule.
  - (5) Risk management.
  - (6) Project reporting to communicate project health and facilitating oversight.
  - (7) Contingency development and control.
  - (8) Safety and quality monitoring and reporting.
  - (9) Change management.
  - (10) Document control and records management.
- (b) Project performance shall be measured, on a regular basis, in comparison to the baseline deliverables and milestones approved in the applicable project gate *Approval Package*.
- (c) The monitoring and reporting of key performance indicators shall allow for the detection of at risk deliverables and support the direction of any corrective actions needed to recover performance. Analysis and corrective action shall support consideration of both project performance and business planning.
- (d) Changes to scope, cost, and schedule shall be managed and controlled through the applicable executing organization process.

## 2.0 ROLES AND ACCOUNTABILITIES

### Project Manager

The project manager is accountable for the following for all assigned projects:

- Initiating, planning, executing, controlling, and closing project management processes
- Setting and managing the project team priorities and ensuring that the assigned projects are supported and executed per the approved Business Case Summaries and Project Management Plans.
- Ensuring that all project activities are carried out safely, integrated into site work planning, and executed in accordance with the standards and processes established under the Nuclear Projects program in the areas of scope management, schedule management, cost management, quality management, resource management,

### Title: PROJECT MANAGEMENT STANDARD

communications management, risk management, procedures/contract management, and project oversight

- the establishment of project reporting metrics and effective processes to reliably collect information ensuring that project reports are produced in a timely and accurate manner to support project management requirements and project information is communicated to all stakeholders

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

**Approval Package** is a general term for a prescribed assembly of documentation prepared by the Project Manager and submitted for approval at a *Decision Gate*. The *Approval Package* forms the basis for authorizing authority consideration and subsequent approval for the project to proceed to the next phase. The content, structure, and rigor of the *Approval Package* will vary at each *Decision Gate* depending on a number of factors including organizational process, scope and complexity of the project and project stage.

**Decision Gate** is a management hold and review point in the Project Life Cycle where project attributes such as readiness, quality, value, risks and funding requests may be reviewed prior to approval of project advancement to the next phase or stage.

**Engineered Equipment** is equipment requiring application-specific technical specifications to meet the performance requirements for the project.

### 3.2 Abbreviations and Acronyms

<b>AFS</b>	Available For Service
<b>COMS</b>	Construction Operations Maintenance Safety stakeholder review process
<b>OPEX</b>	Operating Experience
<b>OPG</b>	Ontario Power Generation
<b>OPG-N</b>	Ontario Power Generation - Nuclear
<b>SCR</b>	Station Condition Record

## 5.0 REVISION SUMMARY

This is an **intent** revision.

- Compliance date and Exceptions revised.
- General revisions to the entire document to update and be consistent with N-PROC-AS-0007.
- Extensive revisions to section 1.0 Direction
- Bullet (g) modified in section 1.1
- Added bullet (d) to section 1.1.2
- Corrections to section 1.8.10 clarify between plan and program.

## **DARLINGTON REFURBISHMENT PROGRAM STRUCTURE**

### **1.0 PURPOSE**

The purpose of this document is to set the framework for the Darlington Refurbishment Program Management Plans (PgMPs) which describe how the Darlington Refurbishment Program meets the intent of OPG's Nuclear Management System while establishing program-specific requirements.

Darlington Refurbishment Program Management Plans are designed to provide assurance that all aspects of the Program (e.g. engineering, procurement, construction, turnover, and program life cycle phases) will be conducted in accordance with the requirements of:

- Canadian Standards Association Standard N286-05, Management System Requirements for Nuclear Power Plants;
- Canadian Nuclear Safety Commission's Regulatory Document RD-360, Life Extension of Nuclear Power Plants;
- N-CHAR-AS-0002, Nuclear Management System; and
- OPG Corporate and Nuclear governance.

Darlington Refurbishment Program Management Plans integrate requirements from other Management System standards for health, safety, environment, security, economics and quality and is defined to meet the principle that safety is the paramount consideration guiding all decisions and actions.

### **2.0 DIRECTION**

Owners of Darlington Refurbishment PgMPs are to follow the minimum structure and content requirements specified in this document to ensure consistency across the entire suite of Darlington Refurbishment PgMPs.

#### **2.1 Darlington Refurbishment Program Management Plans**

Darlington Refurbishment Program Management Plans are accessible to all staff that have access to OPG's Information Management System through Asset Suite. They can also be accessed through PowerSearch or on the Darlington Refurbishment SharePoint Team Site which are both linked to Asset Suite.

##### **2.1.1 Darlington Refurbishment Program Framework**

The hierarchy of Darlington Refurbishment Program documents is shown in Figure 1 below.

Title:

## **DARLINGTON REFURBISHMENT PROGRAM STRUCTURE**

As shown in the above figure, the top tier document of the Darlington Refurbishment Program is D-PCH-09701-10000, Darlington Refurbishment Project Charter. The 2<sup>nd</sup> tier documents consist of this document and the remaining PgMPs in the form of sheets to NK38-NR-PLAN-09701-10001. The 3<sup>rd</sup> tier documents (not shown in the framework) include documents such as Manuals, Guides, Instructions, Plans, Contractor/Owner Interface Requirements and Forms which are considered "Process Support Controlled Documents" as defined in NK38-MAN-09701-10006, "Nuclear Refurbishment - Requirements For Process Support Controlled Documents".

The Darlington Refurbishment Program also makes extensive use of Corporate and Nuclear Line of Business management system documents where applicable.

### **2.1.2 Program Management Plans**

The Darlington Refurbishment PgMPs stipulate function-specific requirements and processes for Darlington Refurbishment project execution.

The PgMPs are meant to convey how employees working within the Darlington Refurbishment Program will do their work while meeting the intent of the existing OPG Management System.

The structure and minimum content requirements for PgMPs are as follows:

#### Section 1.0, Purpose

- A clear and concise description of the fundamental intent or focus of the Program Management Plan.
- Limit rationale, background and process details.

#### Section 2.0, Program Requirements

This section is the most important section of the PgMP and should be considered a "roadmap" which conveys how employees working within the Darlington Refurbishment Program will meet the Program's requirements.

- Identify and briefly describe any Nuclear, Corporate, or other business unit governance, governance support and non-governance documents that provide implementing details for requirements, activities and processes described by the PgMP.
- State requirements which have been mandated by Darlington Refurbishment Functions for Darlington Refurbishment Projects to follow as part of contract development and project execution.
- Include a figure illustrating the entire PgMP framework, including implementing and interfacing documents.
- Specify the performance indicators or monitoring activities that are necessary to ensure the overall PgMP requirements are met.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0001</b>		Revision Number: <b>R001</b>		Page: <b>9 of 11</b>	

Title:

### **DARLINGTON REFURBISHMENT PROGRAM STRUCTURE**

#### Section 3.0, Roles & Accountabilities

- Identify and provide a high-level summary of accountabilities for Manager level (Stratum IV) or higher positions or roles concerning the accomplishment of activities related to the implementation of the document.
- Do not:
  - Duplicate actions, activities or tasks already covered by Section 2.0 of the PgMP.
  - Use personal names.

#### Section 4.0, Definitions & Acronyms

##### **Definitions**

- If there are no definitions, state "None".
- Limit each definition to one or two sentences.
- Place definitions in alphabetical order.
- Do not define:
  - Generic terms if the dictionary definition conveys the meaning of a term.
  - Terms commonly used within the applicable business area.
  - Organizational positions or roles.

##### **Acronyms**

- If there are no acronyms, state "None".
- List acronyms used within the document along with their expanded forms.
- Place acronyms in alphabetical order.

#### Section 5.0, References

- Only list those documents the user **needs** to use in conjunction with the PgMP.
- Identify each reference document number and title in alpha-numeric order. Do not include revision numbers.

### **2.1.3 Project Management Plans**

Project Management Plans (PMPs) describe how a specific project will develop its scope and execute the work. When Darlington Refurbishment Project Teams are developing or revising their PMPs they will reference relevant sections from applicable PgMPs.

### **2.2 Darlington Refurbishment PgMPs and Owners**

The following table summarizes the various Darlington Refurbishment PgMPs and their owners.

## **3.0 ROLES AND ACCOUNTABILITIES**

### **3.1 Director, Refurbishment Management System Oversight**

Is the document owner and is accountable for its definition and implementation.

### **3.2 Darlington Refurbishment Function Teams**

Are accountable for ensuring that PgMPs and subtier documents owned by the Function Team are in compliance with existing Management Systems and that any gaps are resolved to meet the needs of the Darlington Refurbishment Program.

### **3.3 Darlington Refurbishment Project Teams**

Are accountable for the development and maintenance of project-specific Project Management Plans.

Are accountable for executing projects to PgMP requirements and for providing input to PgMP owners if any gaps or incompatibilities exist.

Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

### 1.0 PURPOSE

The Purpose of the Darlington Refurbishment Program (DRP) Charter is to establish and communicate the expectations of the Senior Vice President (SVP), Nuclear Projects regarding the management of the Darlington Refurbishment Program (DRP).

The expectations of the SVP, Nuclear Projects are aligned with and expand on the Nuclear Management System established and communicated under OPG-POL-0032, Safe Operations Policy; N-POL-0001, Nuclear Safety Policy; and N-CHAR-AS-0002, Nuclear Management System.

This document, in conjunction with the referenced policies, programs, standards and other controlled documents, establishes the overall Management framework of the DRP that assures that all aspects of DRP work and activities are of the required quality throughout all phases of the DRP.

### 2.0 BACKGROUND

OPG's nuclear facilities are ageing and there is a need to assess and make recommendations with respect to the feasibility of continuing to operate these stations beyond the current predicted end-of-service life dates. Current high confidence estimates, based on Darlington pressure tubes fitness for service, predict that the Darlington Nuclear Generating Station (DNGS) reactors will reach the end of their current operating lives between 2018 and 2020 (based on 210,000 Effective Full Power Hours).

The Fuel Life Channel Extension has evaluated the ability to extend the end-of-service life dates by an additional three years (to 235,000 Effective Full Power Hours) allowing OPG to unlap the first unit refurbishment and commence the final unit's refurbishment prior to the final unit reaching its extended end-of-service life.

The Plant Life Extension Project group was established in February 2006 to undertake feasibility studies for refurbishing and extending the life of the nuclear units at the Pickering and Darlington sites. The organization's name was changed to Nuclear Generation Development in December 2006 and to Nuclear Refurbishment in November 2008.

OPG Senior Management, with approval by the Board of Directors and Shareholder, has tasked Nuclear Refurbishment (NR) with assessing the feasibility of refurbishing DNGS to enable operations for an additional 30 years or more.

Due to the unique requirements associated with a refurbishment outage and the large scope of the project, it is recognized that additions and modifications to the normal Ontario Power Generation Nuclear (OPGN) processes are required to ensure that the refurbishment is completed in a safe, timely, economic manner and to the required quality expectations. NR will implement and follow appropriate processes to ensure successful completion of each phase of the project.

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>7 of 18</b>
Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

### 3.0 SCOPE

This charter is applicable to all aspects of the NR business and includes the organizations and functions<sup>1</sup> involved in completing all program work associated with the refurbishment of the DNGS. The program management processes are applicable to all of the projects within the DRP and to all of the parties supporting and contributing to these projects. The process support documents<sup>2</sup> framework implemented within the Darlington Refurbishment Program is described in Appendix A, Darlington Refurbishment Program.

### 4.0 DIRECTION

#### SVP, Nuclear Projects – Expectations for the Darlington Refurbishment Program

As personnel within NR and organizations and functions<sup>1</sup> supporting the DRP, we have the responsibility to conduct ourselves in a manner which places safety, our core values, and effective business management at the forefront of our priorities. We clearly understand our roles and accountabilities and focus our efforts on providing results which meet or exceed expectations. Our strategic directions and business activities contribute to positioning our company to provide maximum value to the Province of Ontario while at the same time understanding that the safe, reliable, cost-effective generation of electricity must be the central focus of our operation.

Many of our responsibilities have a direct impact on the future of OPG's nuclear line-of-business. The decisions we make and the manner in which the DRP is executed will be done such that all available options are evaluated in a business-like manner ensuring risks are clearly understood and appropriate management systems are established to ensure execution according to plan. This charter is applicable to the organization and functions involved in DRP.

The DRP will perform work in accordance with the managed systems defined in OPG-POL-0032, Safe Operations Policy, N-POL-0001, Nuclear Safety Policy, N-CHAR-AS-0002, Nuclear Management System and this charter.

Our mission is the successful refurbishment of Darlington Nuclear: Safely, On time, On budget, with 100% of scope completed, and to the quality expected within a Nuclear station.

The Director, Management System Oversight is responsible for interpreting the requirements of this Charter and its sub-tier documents.

#### *SVP, Nuclear Projects*

<sup>1</sup> OPG has adopted a matrix organization design with centre-led functions supporting operating business units. The *centre-led functions* are generally accountable for developing and maintaining functional excellence, setting standards, and providing cross-company services. Please refer to OPG-POL-0033, OPG Business Model, which lists all the operating units and functions.

<sup>2</sup> For a definition of "process support documents" refer to NK38-MAN-09701-10006.

Document Number: <b>D-PCH-09701-10000</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>8 of 18</b>
Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

### 4.1 Program Deliverables

The NR organization has been established with the responsibility of assessing and making recommendations with respect to the feasibility of refurbishment and continuing to operate the nuclear generating stations beyond the current predicted end of life and executing all activities associated with refurbishment.

For DNGS, NR will undertake the DRP, in phases as authorized by OPG Management, the OPG Board of Directors, and the Shareholders to:

- Assess the feasibility of refurbishing Darlington and operating it for an additional 30 years or more,
- Fully define refurbishment scope,
- Execute front-end planning including cost and schedule development and a full risk assessment,
- Manage the pre-outage planning and preparation activities for the refurbishment outage,
- Execute the refurbishment outage(s),
- Return the refurbished nuclear unit(s) to Nuclear Operations, and
- Manage refurbishment closeout.

### 4.2 DRP Objectives

The principal objective of the DRP is to:

- Confirm the business case for the refurbishment of DNGS,
- Obtain the approvals for the business case, and
- Plan and execute the refurbishment in order to enable continued operations of DNGS for an additional 30 years or more

Subsidiary objectives needed to ensure the principal objective is achieved are as follows:

- Obtain the necessary corporate, government and regulatory approvals (e.g., Environmental Assessments, Integrated Safety Review, and Integrated Improvement Plan) for refurbishment in a timely and cost effective manner.
- Establish regulatory certainty, to the degree possible, for the refurbishment program and subsequently bound the uncertainty prior to submitting the recommendation to the OPG Board.
- Complete timely and comprehensive technical studies and a plant condition assessment to determine the appropriate refurbishment scope.

## Charter

Internal Use Only		
Document Number: <b>D-PCH-09701-10000</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>9 of 18</b>
Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

- Implement appropriate contract and procurement strategies to execute the work and obtain all required materials in advance of the refurbishment outage.
- Implement appropriate processes for each phase of work for the refurbishment program.
- Complete engineering and detailed refurbishment outage planning in order to finalize the refurbishment program scope, cost, and schedule.
- Form the DRP team that will manage the execution of the DNGS units' refurbishment.
- Execute the refurbishment outage in a managed and controlled fashion that results in meeting the safety, quality, cost and schedule projections.
- Provide adequate and accurate information to all OPG Management, the Board of Directors, and the Shareholder, in order to obtain the phased based funding for the refurbishment program.

## 5.0 DRP SCOPE

During the Refurbishment phase, major components in each reactor will be inspected, serviced, and replaced. The key refurbishment activities will include:

- Pressure tube, calandria tube, and feeder replacement
- Steam Generator inspection, maintenance, and cleaning
- Turbine Generator refurbishment including replacement of the control system
- Valve Rehabilitation/replacement
- Flux Detector and Adjuster Rod Replacement
- Auxiliary Shutdown Heat sink Upgrades
- Electrical System Rehabilitation
- Safety improvement upgrades including installation of an third Emergency Power Generator, a Containment Filtered Venting System, and a Powerhouse Steam venting system.
- Upgrades to existing site infrastructure to support the refurbishment activities.

A Program Scope Review Board with supporting governance was put in place to approve the scope of the DRP. The technical scope for the DRP was initially confirmed in May 2012. Since that time, as a result of engineering studies and analysis, results of planned inspections, and completion of regulatory submittals including the Integrated Safety Review (ISR) and the Environmental Assessment (EA), scope has been finalized.

A Change Control Board with supporting governance has been established to manage the cost, schedule, and scope changes. If there is significant new or changed scope, approval will be required through the PSRB.

The project scope includes four phases and is subdivided into five main execution bundles. The four phases includes lead in, removal, inspection & installation and lead out. The five bundles

## Charter

Internal Use Only		
Document Number: <b>D-PCH-09701-10000</b>		Usage Classification: <b>N/A</b>

Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

include Retube & Feeder Replacement, Steam Generators, Turbine Generators, Fuel Handling and Balance of Plant<sup>3</sup>. There are number of Facilities & Infrastructure and Safety Improvement Opportunity projects which are being executed as pre-requisites to the refurbishment scope.

## 6.0 DRP PROGRAM MANAGEMENT PROCESSES

As a Canadian nuclear operator, OPG is regulated by the Nuclear Safety and Control Act and Regulations through the Canadian Nuclear Safety Commission (CNSC) which issues OPG a Power Reactor Operating Licence (PROL). One of the conditions in the PROL is for OPG to meet the requirements of Canadian Standards Association (CSA) N286, Management System Requirements for Nuclear Power Plants, in managing all aspects of nuclear activities. The DRP will perform work in accordance with this charter which is developed following the principles of N-POL-0001, Nuclear Safety Policy and N-CHAR-AS-0002, Nuclear Management System, and meets the requirements of CSA N286.

N-PROG-AS-0007, Project Management, and its associated implementing standards, provide the principles and requirements for planning, organizing, executing, and controlling resources to ensure safe and effective execution and completion of projects. Safety and quality shall be the overriding priority and will not be compromised for cost or schedule.

The DRP also takes into consideration the CNSC's Regulatory Document, RD-360, Life Extension of Nuclear Power Plants, providing guidance on requirements for refurbishments and the need for the licensee to prepare a Project Execution Plan (PEP). Similarly, N-STD-AS-0028, Project Management Standard, also requires a Project Management Plan be prepared.

The DRP charter supporting processes to execute the refurbishment program activities for DNGS were developed utilizing the Project Management Institute's (PMI) Program Management format. This consists of a suite of Program Management Plans (PgMPs), as described in Section 5.1, and Project Management Plans (PMPs), as described in Section 5.2. This suite of PgMPs and PMPs are equivalent to the PEP.

The DRP charter supporting processes and their link to the N-CHAR-AS-0002, Nuclear Management System is shown in Appendix A.

### 6.1 Program Management Plans (PgMPs)

PgMPs describe the high-level processes that will deliver the program benefits (these are business level requirements including strategies for management, oversight, and execution, not technical design requirements) and they take their authority from this program charter.

The purpose of the PgMP is to:

<sup>3</sup> Balance of Plant is managed as 4 sub-bundles: Shutdown and Layup, Refurbishment Support Facilities, Unit Islanding, and Balance of Plant Refurbishment which includes valves, electrical upgrades, etc.

## Charter

Internal Use Only		
Document Number: <b>D-PCH-09701-10000</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>11 of 18</b>
Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

- Ensure that all key issues relevant to the successful execution of the Program are identified, defined and understood at the earliest possible stage.
- Provide the DRP team members, end users, line authority and stakeholders with a common understanding of the program and the planned method of execution.
- Provide a reference to OPGN governance and refurbishment specific process support controlled documents for the DRP.

The level of detail in the PgMPs is consistent with each phase of the Project, based on the time frame. The documents will initially focus on the definition and preliminary planning phases and provide fewer details around the later phases. In addition to the items above, the PgMPs provide:

- Direction on project controls.
- Direction on managing risk.
- Direction on document management processes that are not included in governing documents.

PgMPs are intended to be living documents. They will be reviewed and updated as necessary during the definition and execution phases of the DRP, nominally every 12 months.

Each PgMP is assigned to a functional owner who is responsible for developing and maintaining their PgMP in consultation with the Director of Management System Oversight.

The PgMPs are all listed as individual sheets under NK38-NR-PLAN-09701-10001 and available through Asset Suite.

Additional PgMPs or related documents (e.g. commissioning plan), including those that may be required per the CNSC's Regulatory Document – RD360, may be added to the suite of documents at any time during program execution.

## 6.2 Project Management Plans (PMPs)

The PMPs describe how a specific project (or bundle) in the DRP will develop and execute its work scope and how it will operationalize the program processes to deliver a successful project (these are business level requirements, not technical design requirements).

**Note:** Where a project will follow a Program process exactly as written, it is sufficient to confirm and reference the Program document in the Project Management Plan.

The DRP has organized the identified and approved scope into projects or project bundles for the purposes of initiating the work and providing staff to execute the initial conceptual planning. As planning progressed, projects and/or project bundles were merged and/or shifted into different project bundles as per N-MAN-00120-10001-SCH-04, Nuclear Refurbishment Program Work Breakdown Structure Guide.

## Charter

Internal Use Only		
Document Number: <b>D-PCH-09701-10000</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>12 of 18</b>
Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

Each project, within the ‘bundle’ will have a PMP developed as per N-MAN-00120-10001-GRB, Nuclear Projects - Gated Process.

### 7.0 DRP RESOURCING

The SVP, Nuclear Refurbishment with support from the SVP, Darlington Nuclear Generating Station will establish the organization and resources necessary for successful completion of the DRP. Internal resources, complemented by externally available expertise will be used to execute the scope of work.

### 8.0 DRP FUNDING

During the initiation phase of the DRP, the funding, which was from the OM&A stream, was obtained and managed through the OPG business planning process.

After successful completion of the initiation phase and following the OPG Board of Directors approval of the DRP, a capital project has been created and funding will be requested and released in phases based on successful completion of key work programs and program milestones in accordance with an approved release strategy that is documented in the DRP’s Business Case.

In the definition phase, OPG developed a detailed cost estimate (budget) for all of the work associated with Darlington’s refurbishment. This was approved by OPG’s Board of Directors in November 2015 and forms the overall control budget for which cost performance will be measured.

### 9.0 DRP CONTRACTING STRATEGY

The DRP is a multi-phase project made up of individual projects of various sizes. As part of the Definition Phase, OPG developed an overall commercial strategy (the “Commercial Strategy”) and separate contracting strategies for all major project work packages, taking into account factors such as the nature and scope of the work, the vendor marketplace, and any potential long term commercial arrangements. Each contracting strategy results in a recommendation on the most suitable sourcing approach, contract structure and pricing mechanism for that specific work package.

The Commercial Strategy sets out an overall commercial framework with guiding principles for establishing and maintaining commercial relationships with third parties to support the DRP. The Commercial Strategy is a multi-prime contractor model in which there is more than one prime contractor working on the DRP. The owner has a separate contract with each prime contractor. Each prime contractor is responsible for the completion of the work under its particular contract, but not for the entire DRP. The owner is the integrator between the prime contractors and is responsible for the entire DRP. Under this model OPG retains project management responsibility and design authority for the DRP.

## Charter

Internal Use Only		
Document Number: <b>D-PCH-09701-10000</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>13 of 18</b>
Title: <b>DARLINGTON REFURBISHMENT CHARTER</b>		

To execute the work, OPG retains a number of contractors who are responsible for major project work packages. To guide OPG in project oversight and contracting activities, OPG has engaged external technical and project management experts to assist with the overall project management. The benefits of this model are that OPG retains control over the entire DRP, including the deliverables, costs and schedule. Retaining control by OPG is important given the scale, technical complexity and integrated nature of the DRP. OPG will also be able to assign risks to the party that is best able to manage the risk and mitigate its impact on the DRP. This will provide OPG with a better balance between the transfer of risk and the costs of the contractor services.

## 10.0 DRP SCHEDULE

Refurbishment timing is developed as part of the DRP definition and front end planning process and based on the following elements:

- Risk/uncertainty in technical life limits for major components,
- Lead time for obtaining regulatory certainty and acquiring tooling and materials necessary for the refurbishment,
- Value of energy and capacity and impact on OPG's revenue, market share, and sustainability, and
- Industry capability to execute the refurbishment, given timing of other refurbishments or new nuclear projects and taking into consideration effective risk management strategies.

As part of Definition Phase, OPG has integrated all vendor schedules, determined the critical path for the project and created a schedule that covers all four units. OPG evaluated risks for each segment of the schedule, determined the amount of contingency required to deliver the project, and produced a high confidence schedule. The high confidence duration for each unit outage is 37 to 40 months. The schedule begins with the Darlington Unit 2 outage in October 2016. Unit 2 is expected to be substantially complete before the Unit 3 start to allow effective lessons learned implementation. It will take up to 113 months to complete refurbishment of all four reactors. Based on the current assumptions that each of the Darlington units will operate to 235,000 Effective Full Power Hours (EFPH), this schedule results in no idle time on operating units.

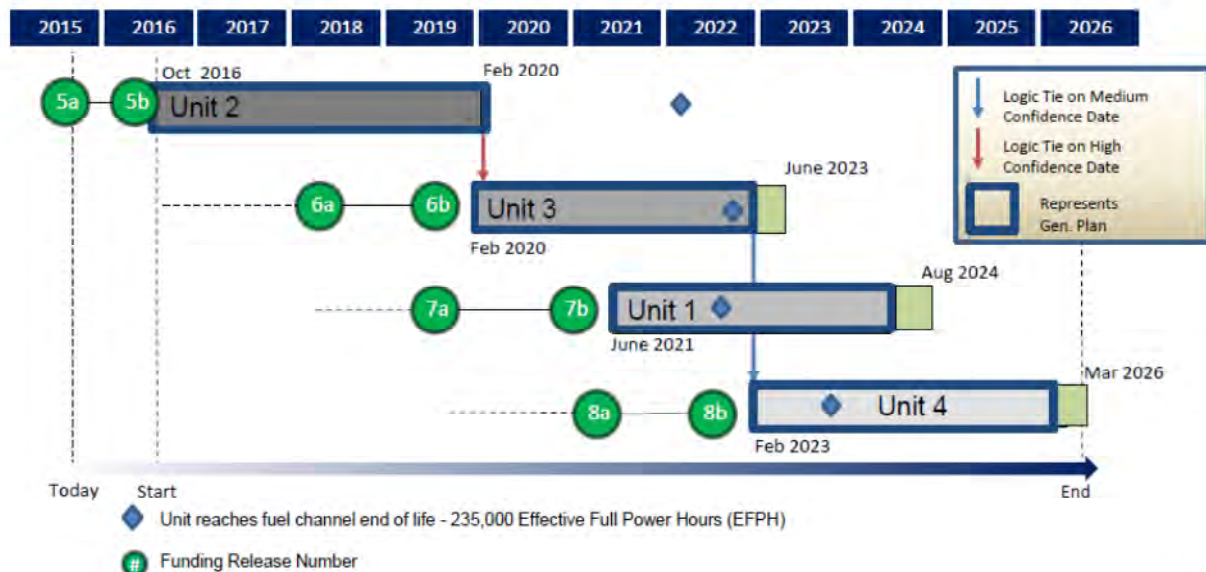

OPG has established a release strategy that provides opportunities to review project performance prior to allowing the project to proceed to the next phase. Funding will be released on a unit by unit basis in accordance with the release strategy shown, this is also aligned to the principles outlined in the December 2013 Ministry of Energy's Long Term Energy Plan (LTEP).

## Charter

Internal Use Only		
Document Number:	Usage Classification:	
<b>D-PCH-09701-10000</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>14 of 18</b>

Title:

### DARLINGTON REFURBISHMENT CHARTER

This schedule was accepted by OPG's Board of Director's in November 2015 and the Execution phase of the project was formally launched in January 2016. This high confidence schedule, which includes contingency, assumes the first unit outage will commence in October 2016 with each unit lasting 37 to 40 months. The release strategy is also defined, with a unit specific release for assessing and readiness work followed by a request for full release of funds to execute the outage work. For Generation planning, OPG assumed the high confidence 40 month schedule for the first unit and the medium confidence schedule for the subsequent units.

## 11.0 DRP ASSUMPTIONS AND RISKS

A formal Risk Management process has been implemented for the DRP. Risks are actively identified and managed, and reported on a routine basis. All key assumptions are also managed in a central database and form the basis of planning as well as risk management.

Key risks within the program include:

**Cost and scheduling related Risks** - There is a risk to the costs and timelines for refurbishment due to other nuclear projects that may be occurring simultaneously i.e. other major CANDU projects in Canada.

**Resource Risk** – There is a risk is that labour may not be available at the time of the DRP due to the other potential nuclear programs taking place in the same time frame.

**Lessons Learned** – Operating Experience from other mega projects and lessons learned from the Pickering Refurbishment planning activities should be factored into the planning of the DRP.

Title:		
<b>DARLINGTON REFURBISHMENT CHARTER</b>		

## 12.0 ROLES AND ACCOUNTABILITIES

**SVP, Nuclear Projects** approves this Refurbishment Program Charter and acts as the DRP Sponsor at the corporate level. The SVP, Nuclear Projects and the associated leadership team is responsible for developing the program scope, obtaining regulatory certainty, developing the program estimates and obtaining program approval and phase based releases of funds, and establishing the refurbishment program organization to plan and execute the DRP.

**SVP, Refurbishment Execution** is accountable for the execution of the refurbishment outages in accordance with this Charter.

**SVP, Darlington Nuclear Generating Station** is responsible for the life cycle of the facility and is, therefore, a vital partner for the input and confirmation of the adequacy of the proposed refurbishment program. The SVP, Darlington Nuclear Generating Station, is responsible for planning the scope and schedule for shutdown or continued operation of the Darlington units.

**The Chief Nuclear Engineer** is responsible for the life cycle of the Steam Generators, Feeders, Fuel Channels, and Reactor Components and determines the Predicted End of Service Life dates. This is the critical input for confirming the adequacy of the refurbishment program and continued operation scope and schedule for these components.

### Design Authority

- Design Authority for the Refurbishment Program resides with the Director, Refurbishment Engineering in accordance with N-STD-MP-0024, Engineering and Design Authority.
- Design Authority for the Darlington Waste Management Facility, where waste from refurbishment may be stored as well as on-going dry storage of used fuel, resides with the Manager, Nuclear Waste Engineering and Design Authority, Nuclear Waste Management Division in accordance with N-STD-MP-0024, Engineering and Design Authority.

### Nuclear Refurbishment - Organization Structure

See Appendix B for the current NR organizational structure. This organizational chart provides a high level overview of the NR organization and also identifies the key functions and roles that provide direct service or support to the Refurbishment Program. All associated role documents are documented in the series N-MAN-08131-10000.

<b>OPGN</b>	Ontario Power Generation Nuclear
<b>PgMP</b>	Program Management Plan
<b>PMP</b>	Project Management Plan
<b>PSRB</b>	Program Scope Review Board
<b>SVP</b>	Senior Vice President

## **14.0 DEFINITIONS**

**Program:** The Darlington Refurbishment activities are being managed, consistent with Project Management Institute (PMI) practices, as a program. A program is a group of related projects and program activities that are managed in a coordinated way to obtain program level benefits not achievable individually; i.e. for Refurbishment to be successful, all of the related projects must be successful.

**Project:** A project refers to a set of scope(s) of work or temporary endeavour being performed within the overall Darlington Refurbishment Program. The Project, also referred to as a Project Bundle, may include multiple EPC contracts plus OPG Oversight and Integration Work in order to achieve DRP results or to deliver the required service. Examples include the Re-tube and Feeder Replacement Project and the Steam Generator Refurbishment Project.

Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

## 1.0 INTRODUCTION

### 1.1 Objective

This document establishes the Earned Value Management (EVM) methodology for Nuclear Refurbishment (NR) as a management tool for program and project planning and control.

The intended audience of this manual is all staff involved in NR work, including OPG, direct work contractors and their major sub-contractors.

### 1.2 Guidance

Earned Value Management is a standard project management technique for quantifying and measurement of project progress performance. It not only provides comparison of actual costs against that budgeted, but also allows continual analysis of progress achieved against that planned throughout the project timeline and across individual tasks at the Control Account/Work Package level.

In other words, the project (or a Control Account/Work Package) “earns” progress as work steps are completed thus allowing management to implement strategies should the project (or a Control Account/Work Package) track “off-plan”.

EVM provides necessary incentive mechanisms to project teams and contractors; it also provides effective approaches to assess program/project progress and cost status, and is the basis for a more precise forecast for time and cost control during schedule implementation.

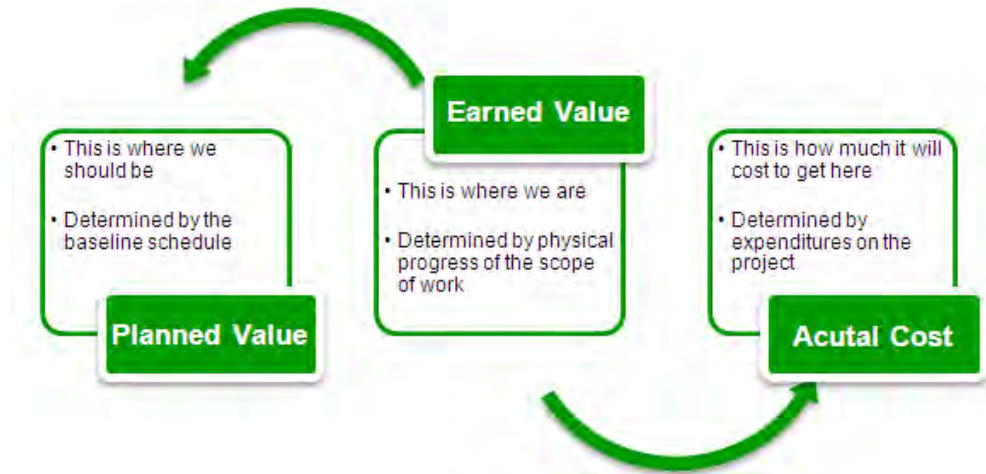

In order to conduct Earned Value Analysis, three components are needed; Planned Value to be earned, Earned Value (physical progress percent complete against budgeted value) and Actual Costs (from finance/ accounting or contractor invoices and accruals). Earned Value Process Summary is described below:

## Manual

Internal Use Only		
Document Number:	Usage Classification:

Sheet Number:	Revision Number:	Page:
<b>SCH-07</b>	<b>R002</b>	<b>6 of 39</b>

Title:

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 1.3 Purpose

Earned Value Management benefits are well identified by major industry key players, such as:

- EVM provides a sound basis for problem identification, corrective actions and management re-planning as may be required. It provides for early identification of performance trends and variances from the management plan and allows management decision making while there is adequate time to implement effective corrective actions (ANSI/EIA-748-B Earned Value Management Systems).
- Earned Value is a commonly used method of performance measurement. It integrates project scope, cost and schedule measures to help the project management team assess and measure project performance and progress (PMI – A Guide to the Project Management Body of Knowledge).

Utilizing Earned Value Management methodologies and tools allow:

- The integration of scope, schedule and cost.
- Assessment of past and current performance.
- Comparison of progress against plan.
- Assessment of trends over time.
- Early identification of issues and allow the development of mitigation or recovery plans.
- Project teams to provide improved forecasts of future performance.

## 2.0 DEFINITIONS

Refer to Project Controls Definitions for definitions used in the development of and within the Darlington Nuclear Generation Refurbishment Program Project Controls governance documents and manuals.

Additionally, a comprehensive list of P&C definitions is maintained by the NR Project Controls to provide program-wide read access, which is amended on a more frequent basis.

## Manual

Title:
<b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>

### 3.0 PROCESS

The EVM process can be summarized under three major phases as below:

- EVM Planning
- EVM Monitoring
- Change Management

#### 3.1 EVM PLANNING

3.1.1. **Scope Definition** – OPG projects define scope, Refer to Scope Manual N-MAN-00120-10001/ SCOPE and NK38-INS-09701-10001

3.1.2. **Prepare WBS and Define Control Accounts/Work Packages:** The WBS will represent all of the work to be completed. It will form the basis for developing project schedule, resource estimation, performance measurement, management control and reporting. As the program progresses from one phase to another, WBS will be reassessed. If the program requirement changes, the WBS will evolve with the program. Establishing WBS Standard structure and guideline is first deliverable under this subject:

WBS Standard Structure/Guideline	
Responsible Organization	Manager – PMO – Scheduling
Key Output	WBS Guideline

Project and Functional managers are accountable for preparing standard WBS structure for use in all bundles.

Detailed WBS Defining All Work Packages	
Responsible Organization	Project Managers Functional Managers
Key Output	Detailed WBS define all work packages

Detailed WBS preparation includes:

- Preparing detailed WBS following WBS Guidelines to break the work to the lowest possible work packages (WP) based on defined scope
- Establish WP Numbering system (refer to NR standard WBS)

Title:

### REFURBISHMENT EARNED VALUE MANAGEMENT

- Issue Rev 0 of WBS

Define Control Account: Control Account can be understood as a group of related Work Packages that can be completed by a unique organization in a continuous time window. Refer to WBS Guideline N-MAN-00120-10001/SCH-05

- 3.1.3. **Prepare CBS:** NR Program is utilizing Activity Based Cost (ABC) and practically defined Work Breakdown structure is considered as Cost Breakdown Structure (CBS).
- 3.1.4. **Prepare Estimate by WP:** Based on WBS/CBS, prepare resources cost for every work package for Project Manager Approval.

Prepare Estimate by WP	
Responsible Organization	Estimating Group Project Managers Functional Managers
Key Output	Prepare estimate for every Work Package

- 3.1.5. **Prepare WBS Dictionary and get Manager's Approval:** The WBS dictionary defines the work scope represented in each element of WBS.

Prepare WBS Dictionary and get Manager's Approval	
Responsible Organization	Project Managers Functional Managers
Key Output	WBS Dictionary for all associated work packages

WBS Dictionary mainly contains the following:

- Summary scope description
- Deliverables

### REFURBISHMENT EARNED VALUE MANAGEMENT

- Estimate data resources/dollars
- Assumptions/Constraints
- Baseline schedule for the CA/WP
- Earning Rules

3.1.6. **Establish Rules of Credit:** In order to establish the Earned Value, the achieved progress must be assessed for each scheduled element and entered into the Cost Management System (this can be thought of as the “earned value”).

Establish Rules of Earning	
Responsible Organization	Project/Functional Manager
Key Output	Rules of earning guideline

- There are 3 basic methods for determining schedule progress (percent complete) and they should be selected and recorded in the WBS Dictionary for each Work Package (Level 3 activities progress contribution into their associated Work Package and Work Packages progress contribution into their associated control account should also be defined under Rules of Credit):
  - Discrete Effort – Discrete tasks are those tasks which are quantifiable to individual work products or predetermined tangible measurement. Techniques utilized for discrete efforts are:
    - Fixed Formula – 0/100, 50/50, 25/75 etc. With this method, x% of work is credited as complete for the measurement period in which the work begins, regardless of how much work has actually been accomplished. Remaining % is credited when the work is completed. Fixed formula techniques are most effectively used on small, short-duration task (typically less than two reporting periods)
    - Units Complete (Physical % Complete) – physical quantity count converted into a percent. Hours are often used for labour tasks such as engineering deliverables or

Title:

### REFURBISHMENT EARNED VALUE MANAGEMENT

installation Work Packages, (For example, for a total fuel channels of 480 if we complete the removal of 48 then the physical % complete would be 10% for the fuel channel removal Work Package).

- Valued Milestone (Steps) – It involves predetermined percent complete based on internal milestones within the Work Package. That value is earned as the milestones are completed (generally applicable to Fixed Price or Procurement Work Packages). This method is sometimes called weighted milestones.
- Level 3 activities progress contribution into their associated Work Package and Work Packages progress contribution into their associated control account should also be defined under Rules of Credit.
- Apportioned Effort – Apportioned effort is work for which the planning and progress are tied to other efforts. The budget for the apportioned account will be time-phased in relation to the resource plans for the base account(s). Status and the taking of earned value are driven by the status on the base account(s). If the base account(s) are on schedule, the apportioned account will be on schedule and an appropriate amount of value will be earned.
  - For example, Non-Manual Construction Support could be evaluated at 90% of the composite percent complete of all direct construction Work Packages. The final 10% would be earned when the paperwork closeout at the end of the project is complete (which is generally after the craft is gone).
- Level of Effort (LOE) – LOE is work scope of a general or supportive nature for which performance cannot be measured or is impracticable to measure. Resource requirements are represented by a time-phased budget scheduled in accordance with the time that the support will likely be needed. The earned

## Manual

Title:
<b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>

value is earned by the passage of time and is equal to the budget scheduled in each time period. The performance data provided is simply a comparison of budget to actual cost. For LOE  $SPI = 1$ ;  $EV = PV$  and  $CPI = EV/AC$ .

- 3.1.7. **Baseline Schedules:** Please refer to the Program Schedule Management Procedure, NK38-PLAN-09701-10067-0004, for the definition of Baseline Schedules. Responsibilities and deliverables are as follow:

Level 3 Baseline Schedules Preparation	
Responsible Party	Project Managers Function Managers
Key Output	Baseline schedules

- Gate Submission Baseline, the Level 3 baseline schedules will be finalized with resource loaded (labour/quantity) and approved by management.
- In order to set up the project and its work package in planned values the Cost Control group must be provided with the following:
  - Work Package number
  - Work Package title
  - Work Package owner
  - Work Package baseline early start date
  - Work Package baseline early finish date
  - Work Package monthly resources distribution

Baseline Schedule Approval	
Responsible Party	Manager – PMO – Scheduling
Key Output	Review and approve L3 Schedule Baseline for use Ensure alignment with guidelines and procedures

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 3.2 EVM Monitoring

3.2.1. Calculating Earned Value, collecting Actual Costs, Schedule Performance Index (SPI) and Cost Performance Index (CPI), Cost and Schedule Variances by Work Package are supposed to be performed under monitoring phase.

3.2.2. **Progressing:** Level 3 Schedule activities would get progressed based on their physical progress (i.e. comparing physical quantity of complete work vs. physical quantity of scope), progress values from Level 3 activities contribute into their associate Work Package progress as per defined and documented earning rules.

Progressing	
Responsible Party	Contractors/Project Managers
Key Output	Percent Progress for every WP

- Every WP is represented by many activities in the Level 3 Schedule to cover the scope of work/resource loaded to an agreed level of RBS and based on the established rules of earning
- Physical % complete will be calculated by Level 3 activities rolled into the WP level
- In some cases progress may be calculated in a dedicated progress measurement/monitoring system and then input into the Level 3 activities (This assumption should be document as part of Earning Rules).

Title:

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 4.0 GRAPHS, FORMULAS, AND DEFINITIONS

**AC (or ACWP):** Actual cost of work performed to date; the actual costs charged against the activities

**PV (or BCWS):** Budgeted cost of work scheduled to date (planned value); the total baseline costs budgeted for the activities scheduled or planned

**EV (or BCWP):** Budgeted cost of work performed to date (earned value of accomplished work)

**BAC:** Budget at completion; BCWS at end of project, or original budget + changes

**ETC:** Estimate to Complete

**EAC:** Estimate at Completion

$$EAC = AC + ETC$$

**CV:** Cost Variance

$$CV = AC - EV$$

**CPI:** Cost Performance Index  
=  $EV / AC$

**SV:** Schedule Variance  
=  $EV - PV$

**SPI:** Schedule Performance Index  
=  $EV / PV$

**VAC:** Variance at Completion (Projected Variance)  
=  $EAC - BAC$

Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

### 5.0 ANALYSIS AND MEANINGS

The Earned Value analysis is conducted by creating the Planned Value, calculating Earned Value, collecting Actual Cost, calculating the CPI, SPI, Cost Variance (CV) and Schedule Variance (SV).

The following are quick indicators:

- $CPI > 1$  indicates that the project is progressing under budget
- $CPI < 1$  indicates that the project is progressing over budget
- $SPI > 1$  indicates that the project is progressing ahead of schedule
- $SPI < 1$  indicates that the project is progressing behind schedule

Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

### 6.0 CHANGE MANAGEMENT

The Performance Measurement Baseline will only be changed for Directed Changes. Directed Changes should be reflected in both Cost and Schedule at the same time if they affect both. Directed Changes may be issued to cover variances so great that they impact the ability to obtain a meaningful measure of performance. Approval process will follow the workflow as per the change management process.

Refer to the Project Controls Plan, N-MAN-00120-10001-PC.

- The Cost Control group will lead the Change Management Process; the Scheduling group will support running “what-if” scenarios and assess schedule impacts (Original Baselines should always be retained and new baseline should get populated).
- Once the change is approved, it will be implemented to both cost and schedule baselines.

## 7.0 P6 – PROLIANCE INTERFACES

- Proliance is the software for managing Planned Values, Cost Control, Earned Values plus performing analysis on each work package and control account level.
- SPI/CPI shall be calculated at the Work Package level where Actual Cost is collected. Cost reports and earned value can be rolled to various levels according to the WBS/CBS.
- Percent complete shall be calculated for every work package using Level 3 schedule and earning rules.

### 7.1 Initial Setup of the Plan

- 7.1.1. Level 3 schedules shall represent every work package in the WBS contributing into Earned Value Management.
- 7.1.2. Level 3 schedules shall be resource loaded with labour and quantity according to the predefined resource library.
- 7.1.3. After completing baseline schedules; the following will be generated from by the Project Cost and Schedule Analysts:
  - 7.1.3.1. Early Start/Early Finish date for every work package in the WBS.
  - 7.1.3.2. Monthly labour distribution for Early Plan (Planned Values per Work Packages by units).
  - 7.1.3.3. Level 3 schedules shall not contain any cost values or cost calculation or cost related activities (such as escalation or interest).
  - 7.1.3.4. Planned Values (PV)/Budgeted Cost for Work Scheduled (BCWS) for every work package shall be calculated and transferred to Proliance according to WBS/CBS. This will ensure that Planned Values (PV)/Budgeted Cost for Work (BCWS) are available on units and equivalent cost and roll up to the overall project.

### 7.2 Monitoring and Calculating SPI/CPI

- 7.2.1. Level 3 schedules shall be updated under P6 and on agreed frequencies and lead to Earned Value calculations.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>Reference</b>

Title:

### **REFURBISHMENT EARNED VALUE MANAGEMENT**

- 7.2.2. Level 3 schedules shall be integrated and percent complete and status will be calculated for every work package.
- 7.2.3. Work packages percent progress, forecast early date, and forecast finish dates from Level 3 schedules shall be obtained and transferred to Proliance.
- 7.2.4. Actual Cost will collected through Nuclear Financial Reporting and Analytics (NFRA) and stored under Proliance.

### **7.3 P6 / Proliance Change Management**

- 7.3.1. Scope, Cost, and Schedule changes shall be recorded in Proliance (Budgets, Planned Values, earning Rules, etc.).
- 7.3.2. All changes except pure cost related changes shall be implemented in P6.

## 8.0 EARNED VALUE MEASUREMENT GUIDELINES

In EVM, the progress of all work must be measured. Measuring project performance is a complex task involving many interrelated and progressive steps. The key to performance measurement is the objective assessment of work in progress. Measuring the amount of work scope completed is planned at the task level in conjunction with the performance measurement baseline. An EV technique is selected for each task based on temporal and physical quantities. Objective measurement of physical progress on tasks with tangible outcomes is superior to other all other measurements. Tasks that can be completed in one progress-reporting period require only one measurement and are preferred. Tasks that span several reporting periods should be measured objectively with milestones representing intermediate, tangible outcomes. Appendixes subsections provide the guidelines for measuring the project progress objectively.

### Earned Value Management Guidelines

## 9.0 TOOLS

Earned Value will be managed by the following systems:

- Primavera P6 – Scheduling, Resourcing and Progress Updating
- Proliance – Planned Value, Actual Costs, Earned Values and Forecasts
- BI Tool –Reporting, CPI/SPI , Forecasting, Budget, Actual

### 9.1 Primavera P6

- 9.1.1. The original program baseline schedule will be developed by the respective teams based on the latest funding release, resource requirement, and timeline.
- 9.1.2. The project baseline schedule for each project will be developed by OPG at gate using the standard Work Package fragnets.
- 9.1.3. The above baseline may be revised on agreement of the contract schedule with the appropriate EPC contractor. The EPC contractor's schedule must roll up to the work packages included in the project baseline schedule.
- 9.1.4. Project teams shall update each of the work packages with the progress achieved based on the established Earning Rules.
- 9.1.5. A progress values will be developed on a cyclical basis to transfer work package attributes and progress information to Proliance.

### 9.2 Proliance

- 9.2.1. The Original Program Budget and Planned Value will be developed by the Program P&C Department, based on information developed by the projects in the development of the Original Program Schedule Baseline.
- 9.2.2. The Control Budget and Planned Value for each project will transferred to Proliance, developed by the respective projects for their scope of work which, will comprise:
  - 9.2.2.1. Work Packages for Work that has been approved under latest fund release.
  - 9.2.2.2. Work Packages for future Work at Control Account level.
  - 9.2.2.3. Work Packages schedule information and progress information will be uploaded from Primavera P6 on a cyclical basis.

### 9.3 BI Tool

9.3.1. The BI Tool will use data from both Primavera and Proliance to develop required reports for:

9.3.1.1. Project Performance (CPI, SPI)

9.3.1.2. Cost and Schedule Planned and Actual Data

9.3.1.3. Forecasts

9.3.1.4. Risks

9.3.1.5. Other related information.

### Darlington Refurbishment Program

### Earned Value Process – Rev00 – Planning Assessing Phase

All values are guidelines to be finalized between contractor and OPG upon Level 3 Schedule Approval. WBS, earned value (EV) percentages, and EV analysis frequency are to be agreed upon. L3 Schedule shall be resource loaded.

#### Set the Planned Value (PV) in Primavera/Proliance

##### WBS Structure/Other

- Step 1**
- Create WBS/Control Account for each MEC.
  - Create WBS/Work Package for each MEC
  - EC related activities should be under each Work Package

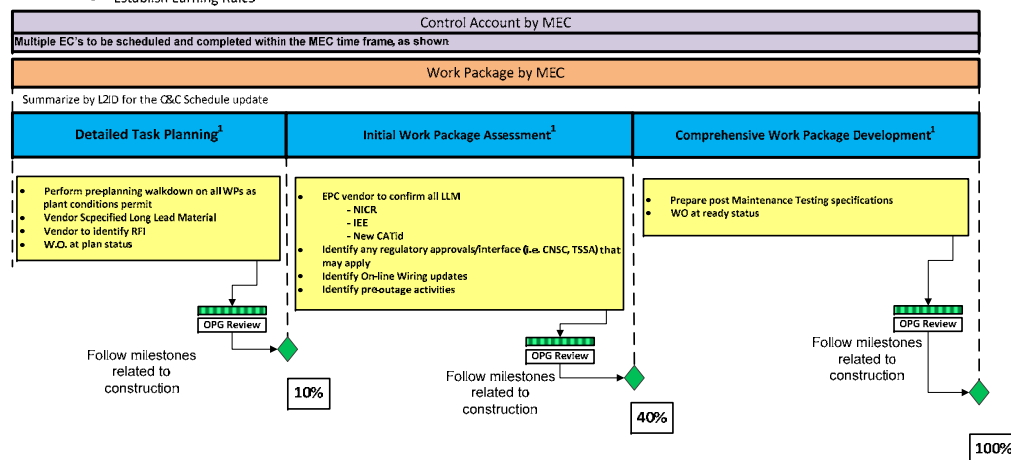

- Step 2**
- Estimate total Hours/Dollars by Work Package
  - Establish Earning Rules

##### Primavera

- Step 3**
- Load WBS Summary with Total Budget hours (VUL)
  - Contractor prepares Detailed L3 Schedule including OPG interfaces.

##### Proliance

- Step 4**
- Establish BCWS dollars.
  - Establish Earning Rules (use generic template). Need adaption for each PO.

#### Earning Rules for Planning Assessing

(Percentages to be agreed upon submittal of L3 Schedule)

ONE MEC	One WP per MEC	100%	Detailed Task Planning	
			Initial Work Package Assessment	40%
			Comprehensive Work Package Development	100%

#### Monitor the Progress – Calculate SPI/CPI

##### Oncore/TEMPUS

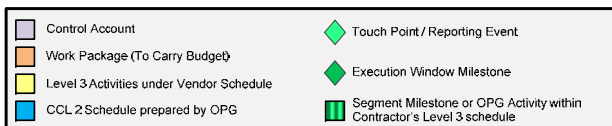

- Setup TEMPUS & Oncore with Work Package #
- Collect Actual spent by Work Package

##### Primavera

- Update the schedule with status and calculate % complete based on earning rules
- Project CSAs to prepare status and % complete by Work Package to Proliance

##### BI Reporting

- SPI/CPI will be calculated for every Work Package

  - Establish Earning Rules

##### Primavera

- Step 3**
- Load WBS Summary with Total Budget hours (VUL)
  - Contractor prepares Detailed L3 Schedule including OPG interfaces.

##### Proliance

- Step 4**
- Establish BCWS dollars.
  - Establish Earning Rules (use generic template). Need adaption for each PO.

- Vendor's Manufacturing Work Packages will be defined as per its strategies and requirements.
- Vendor's Material Delivery Work Packages will be defined as per its strategies and requirements.

#### NOTE:

Material/Equipment Delivery to Site Milestone (from Vendor's Schedules) needs to be linked into all associated "Execution Windows" Readiness Milestones

Control Account	Touch Point / Reporting Event
Work Package (To Carry Budget)	Execution Window Milestone
Level 3 Activities under Vendor Schedule	Segment Milestone or OPG Activity within Contractor's Level 3 schedule
CCL 2 Schedule prepared by OPG	

#### Earning Rules for Vendor Procurement

(Percentages to be agreed upon submittal of L3 Schedule)

LLM Procurement	100%	WPXX: Procurement LLM Materials by PO	60%
		WPXX: Procurement LLM Materials by PO	100%
Non-LLM Procurement	100%	WPXX: Procurement Non-LLM Materials by PO	75%
		WPXX: Procurement Non-LLM Materials by PO	100%
Manufacturing Equipment	100%	WPXX: Manufacturing Equipment/Material	50%
		WPXX: Manufacturing Equipment/Material	100%
Material/Equipment Delivery to Site	100%	WPXX: Material/Equipment Delivery	45%
		WPXX: Material/Equipment Delivery	100%

#### Monitor the Progress – Calculate SPV/CPI

##### Oncore/TEMPUS

- Setup TEMPUS & Oncore with Work Package #
- Collect Actual spent by Work Package

##### Primavera

- Update the schedule with status and calculate % complete based on earning rules
- Project CSAs to prepare status and % complete by Work Package to Proliance

##### BI Reporting

- SPV/CPI will be calculated for every Work Package

### 1.0 PURPOSE

This guide defines the processes, including the interface to approved tools and source systems, used to execute Cost Management within the Nuclear Refurbishment Program. This manual takes authority from N-MAN-00120-10001-PC, Project Controls.

Cost Management includes the processes required to enable projects to be completed within approved budgets. The purpose of this manual is to establish the requirements in undertaking those activities.

Cost management is comprised of the following processes:

- (a) Cost Management Planning – The process that establishes the policies, procedures, and documentation for planning, managing, expending, and controlling project costs.
- (b) Cost Estimating – The process of developing an approximation of the monetary resources needed to complete project activities.
- (c) Cost Budgeting – The process of aggregating the estimated costs of individual activities or work packages to establish an authorized cost baseline.
- (d) Funding – The process of providing the financial resources to meet the time-phased cash needs of the project. Funding is an importance part of the cost budgeting process.
- (e) Cost Monitoring and Control – The process of monitoring the status of the project to update the project costs and manage changes to the cost baseline.
- (f) Forecasting – The process of estimating or predicting the project's future based on knowledge and information available at the time of the forecast. Forecasting is an important element of cost monitoring and control.
- (g) Cost Performance Reporting – The physical or electronic representation of cost performance information compiled in project/program documents, intended to generate decisions, actions, and awareness. This information is generated during the cost monitoring and control process.

### 2.0 COST MANAGEMENT PLANNING

Cost Management planning is the process that establishes the policies, procedures, and documentation for planning, managing, expending, and controlling project costs.

Detailed Cost Management planning shall be performed as part of the overall Project Management (PM) planning process.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>5 of 29</b>

The Cost Management Plan will define how the team will estimate the project cost, prepare and present a project budget, control project costs, as well as document the review and approval requirements for the cost management processes.

Definitions of the terms used in cost management are contained in Section 6.1 of this document.

### 2.1 Organization, Roles and Responsibilities

The organization responsible for cost management activities as well as individual roles and responsibilities are contained in Appendix A.

### 2.2 Cost Management Planning Parameters

Cost Management planning shall establish and document the following as a minimum:

- (a) Control Thresholds – Variances between actual and/or forecast performance and the baseline plan in excess of 5% should be investigated to determine the cause and develop a corrective action plan.
- (b) Control Accounts – Control accounts shall be established for Work Breakdown Structure (WBS) elements at a level consistent with maintaining effective control of the project scope-budget-cost-schedule using Earned Value Management (EVM) techniques. in accordance with N-MAN-00120-10001-PC-09, Earned Value Management.
- (c) Work/Planning Packages and Activities - Each control account shall contain one or more work packages (WP). Each work package may contain a number of activities. Except for functional areas and Cost Only WP, no more than 15% of the total project value shall normally be comprised of Level of Effort (LOE) work packages.
- (d) Reporting Period – Reporting periods shall be monthly and shall be based on the OPG fiscal calendar. During high periods of activity such as during execution, more frequent reporting may be required.
- (e) Earned Value Management (EVM) – As a minimum, EVM shall be performed at the work package level. The EVM measurement techniques to be used for each work package shall be documented and in accordance with N-MAN-00120-10001-PC-09, Earned Value Management.
- (f) Escalation – Adjustments for escalation due to inflation shall be established in consultation with Finance. They shall be tracked and reported in separate Cost Only WPs. Cost Only WPs are not included in EVM.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>6 of 29</b>

- (g) Interest – Adjustments for interest costs shall be established in consultation with Finance. They shall be tracked and reported in separate Cost Only WPs. Cost Only WPs are not included in EVM.

## 2.3 Cost Management Tools

Proliance is the project Cost Management System tool. Proliance is a web-based application, accessible in the office or on site and enabling real-time communication. Using Microsoft's .NET application framework, it integrates with other systems, including NFRA.

The relationship between Proliance and other OPG business systems is shown in Figure 1. The source systems for cost management data are shown in Table 1.

**Table 1. Source Systems for Cost Management Data**

Tools	Data
Proliance	Cost-Only Work Packages, Planned Value, Earned Value, and Forecast
Primavera 6	Work Packages, Schedules, Physical Percent Complete, WBS
NFRA	Actual Costs

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>7 of 29</b>

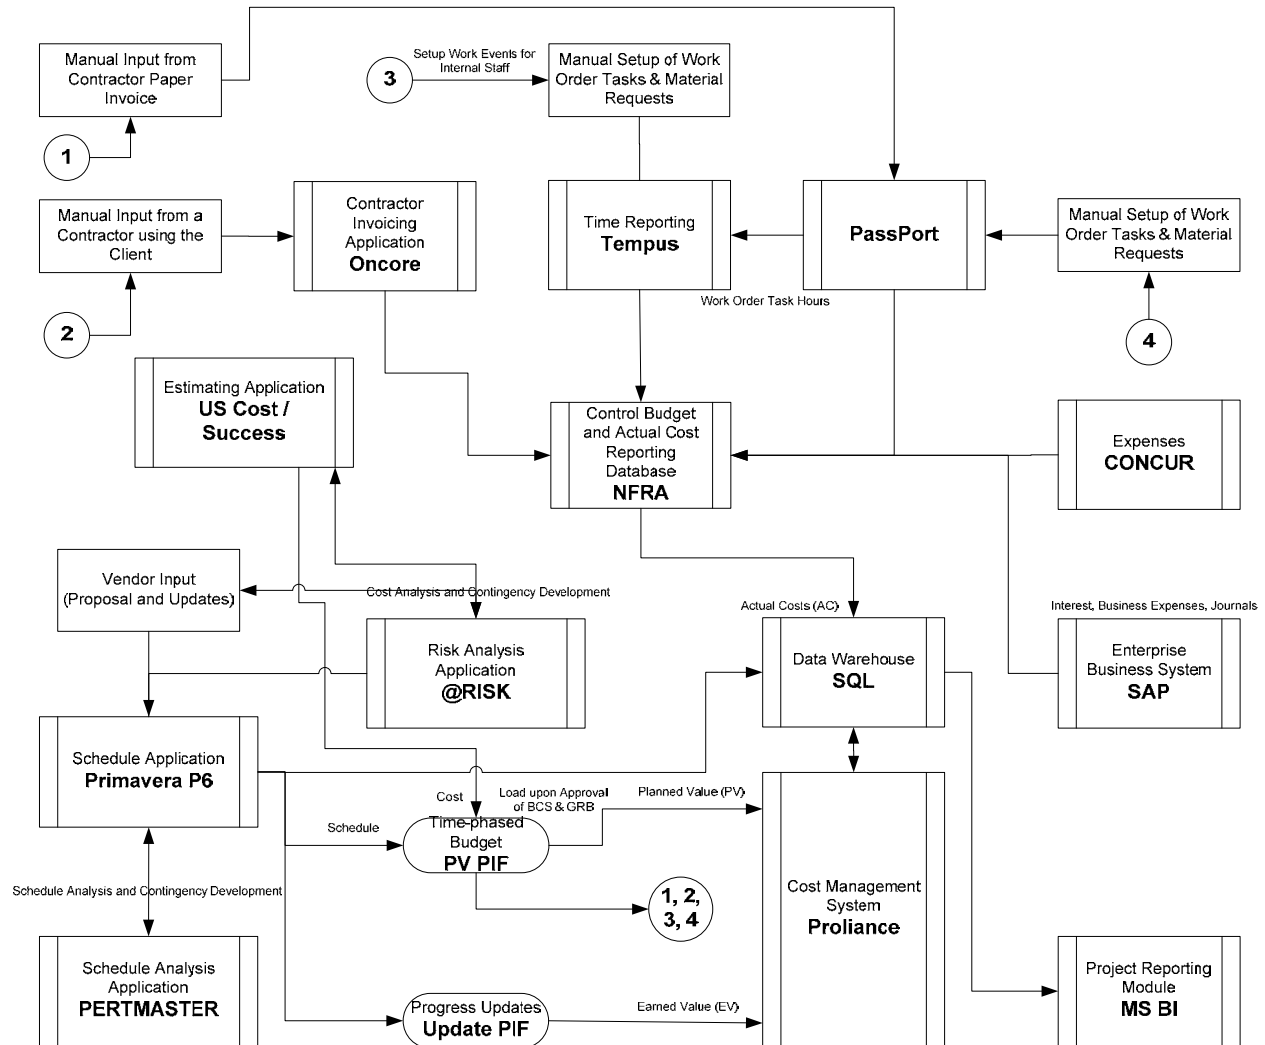

Primavera P6 is the source of all scheduling data. NFRA is the source of all actual costs (including data from Oncore, Tempus, and PassPort). Proliance Import Files (PIF) are custom formatted Excel spreadsheets that are used to import data into Proliance. Scheduling data is exported from Primavera P6 into the PIF.

Microsoft BI has been selected as the Project/Program Reporting tool. It pulls data from Proliance via the data warehouse to generate the Project/Program cost reports.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>9 of 29</b>

### 2.4 Cost Management Outputs

Information obtained through Cost Management shall be used for the following purposes:

- (a) Contingency management, in accordance with N-MAN-00120-10001-RISK-05, Risk Management.
- (b) Cost performance reporting, in accordance with Section 5.5, Cost Performance Reporting.
- (c) Schedule performance monitoring in accordance with N-MAN-00120-10001-SCH, Schedule Management.
- (d) Financial reporting, in accordance with FIN-PROC-PA-013.
- (e) Development of cost data for future use in estimating and business planning etc.

### 3.0 COST ESTIMATING

Cost estimating is the process used to determine the total cost of labour, materials, equipment, fees, and other resources, required for the execution of a project or part of a project. Estimates are also used to evaluate changes, alternatives, and what-if scenarios to assist in decision making. An accurate cost estimate leads to a more precise project schedule and budget which forms the basis for project planning decisions, value and performance monitoring and control.

The Basis of Estimate (BOE) documents the parameters and scope used in support of developing the estimate and also includes the complete estimate details and breakdown. The BOE breakdown shall follow the approved WBS to support the funding and budgeting processes.

All estimates shall be performed in accordance with N-MAN-00120-10001-EST, Cost Estimating.

### 4.0 COST BUDGETING

Cost Budgeting is the process of developing time-phased costs of individual activities or work packages to establish an authorized cost baseline.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>10 of 29</b>

### 4.1 Funding

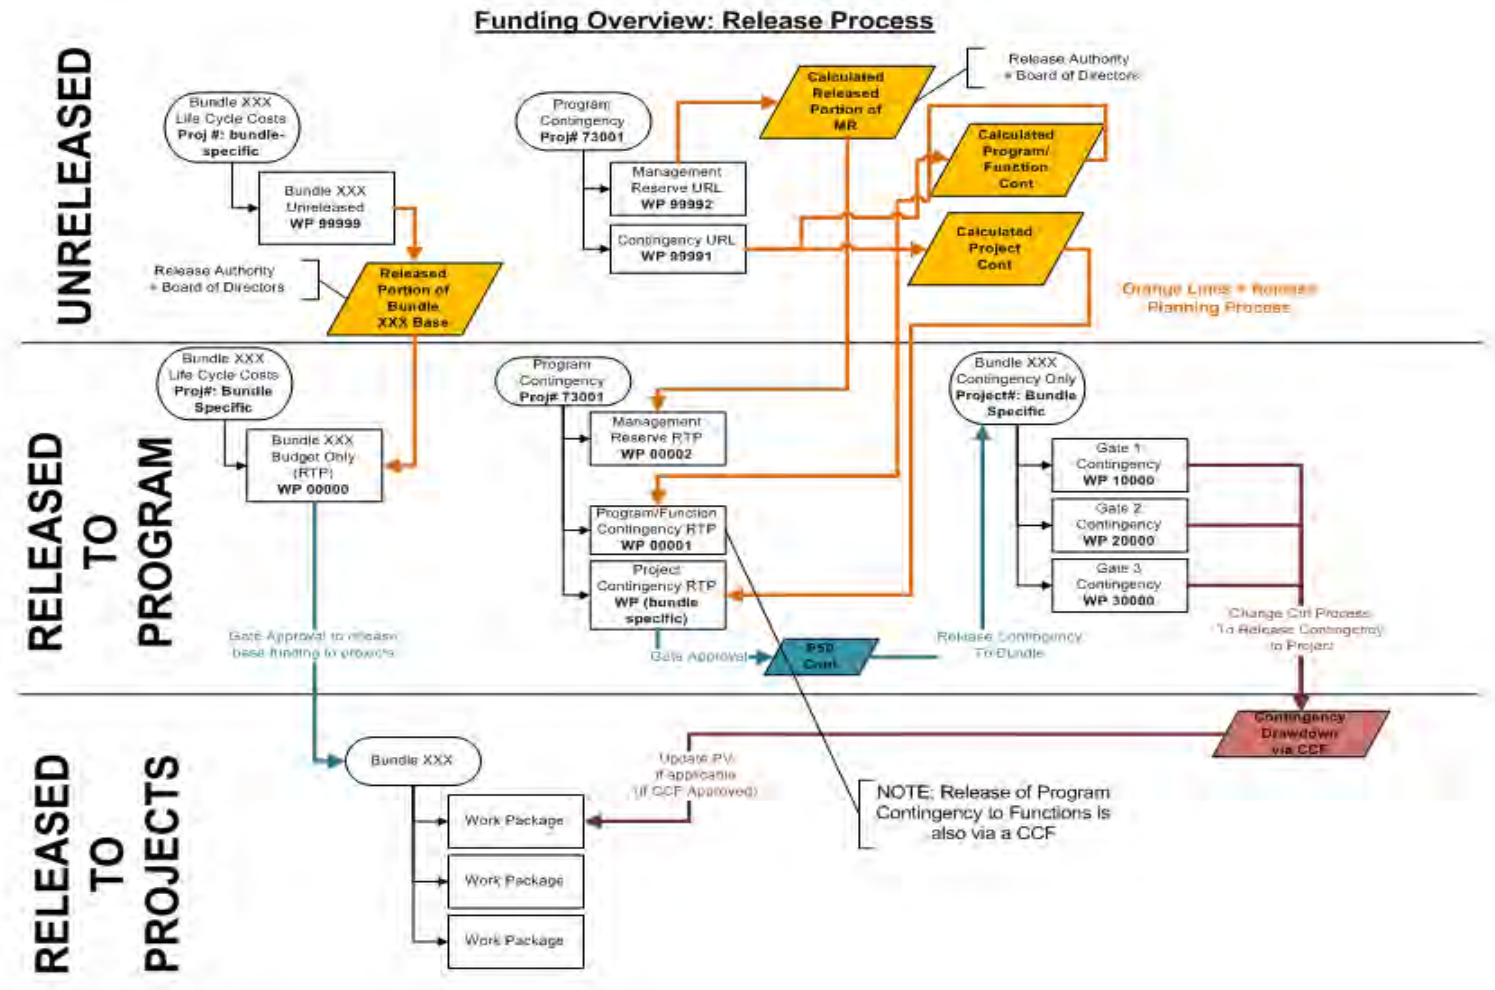

Funding provides the financial resources to finance a need, program, or project. Funding is approved by the OPG Board of Directors (BOD) in the form of Program Funding Releases.

An overview of the Funding Release Process is shown in Figure 2.

Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>11 of 29</b>

Figure 2. Funding Release Process Overview

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>12 of 29</b>

The aggregated cost estimates form the basis of the Program Funding Release submission to the BOD and once approved become the Original Budget (OB). Original Budget funding for the release period will be allocated directly to functional groups upon release approval. Project funding will be allocated from the program via the Gated Process and the Gate Review Board in accordance with N-MAN-00120-10001-GRB. Estimated funding requirements for the program life cycle beyond the current release will be documented as unreleased funds at the Bundle and/or project and functional levels.

Program releases will also establish program level Contingency and Management Reserve funding. Project level Contingency funding may be allocated within the Definition and Execution phases via the Gated Process. Contingency funding at all levels is based on known risks. Management Reserve funding is set based on “unknown-unknowns” that could impact the viability of the program. NR guidance and strategies for managing Contingency and Management Reserve are defined in N-MAN-00120-10001-RISK-05, Nuclear Refurbishment – Contingency Development and Management. Release of Contingency and Management Reserve funding will be controlled via the change control process as described in N-MAN-00120-10001-PC-12.

### 4.2 Control Budget

Once funding is approved at the project and/or functional levels, budget information is loaded into the Proliance cost tool. Budget information is loaded at the Work Package level such that initially:

$$OB = CB = AF = FC$$

Where each of the above is a summary column in Proliance representing:  
OB = Original Budget, which serves as the original baseline and remains unchanged for the life of the project.

CB = Control Budget, representing the current baseline and Planned Value (PV) for the Work Package.

AF = Approved Funding, representing the current approved cost envelope for the Work Package.

FC = Forecast, representing the projected cost of the Work Package, including any pending changes yet to be approved.

## 5.0 COST MONITORING AND CONTROL

Cost Monitoring and Control is the process of gathering, accumulating, analysing, forecasting, reporting and managing the costs on an ongoing basis. Nuclear Refurbishment will utilize Proliance for the effective cost management of all programs and projects.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>13 of 29</b>

### 5.1 Cost Control

Cost Control is the process of measuring progress and monitoring performance against plans; measuring variances from authorized budgets, and allows effective action to be taken to optimize costs.

Nuclear Refurbishment utilizes Earned Value Management (EVM) as the fundamental process for evaluating the overall health of schedule and cost. As such, Proliance, and the associated reports generated from the cost tool, are configured to provide all elements of an Earned Value Management System. These include:

- Planned Value (PV) is (in cost terms) the current Control Budget assigned to the work.
- Earned Value (EV) is the dollar value of work performed in terms of the approved budget assigned to the work.
- Actual Cost (AC) is the dollar amount actual cost incurred as recorded in the OPG financial source system (NFRA).
- Schedule Performance Index (SPI) is the ratio of EV to PV.
- Cost Performance Index (CPI) is the ratio of EV to AC.
- Cost Variance (CV) is the difference between EV and AC.
- Budget Variance (BV) is the difference between PV and AC.
- Schedule Variance (SV) is the difference between EV and PV.

It is incumbent upon the entire team to fully and diligently participate in cost control activities. These activities will be accomplished through the use of formal cost monitoring and reporting procedures. Cost Control is a line-owned function facilitated through the Planning and Controls team. The Cost Control functions described above shall be executed via the following activities:

(a) Measuring progress:

- (1) Measuring physical progress for earned value assessment.
- (2) Updating progress (i.e. percent complete) in the P6 schedules.
- (3) Updating progress in Proliance.
- (4) Ensuring actual costs are collected in the appropriate cost or control accounts.
- (5) Ensuring accruals are captured in the actual costs.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>14 of 29</b>

- (6) Identifying incorrect, inappropriate, or unauthorized charges and implementing corrective actions to rectify.
- (b) Reviewing progress;
  - (1) Gathering all commitments and payments.
  - (2) Monitoring commitments against budgets.
  - (3) Identifying and analyzing variances.
  - (4) Identifying and analyzing trends.
  - (5) Identifying items requiring corrective action (i.e. unfavourable variances and trends).
- (c) Reporting progress: Prepare and distribute status data (e.g. PV, EV, AC, variances, forecasts, and trends) and corrective action plan status as detailed in Section 5.5 of this document.
- (d) Taking corrective action: Initiate any corrective action and recovery plans required to mitigate and resolve identified issues. If warranted, change requests shall be initiated as detailed in Section 5.4 of this document.

## 5.2 Forecasting

Forecasting is the process of estimating or predicting the project's future based on knowledge and information available at the time of the forecast.

Forecasting is performed by analyzing the work performed against the work planned, identifying trends, analysing remaining the work, and determining the impact of performance on the estimated cost and schedule going forward.

Forecasting cost shall take into consideration the committed costs, the actual execution efficiency of the work performed, and the planned efficiency for the remaining work.

The Project Manager is accountable for having the forecast updated as necessary to reflect the latest status and expected performance of the project. Effective forecasting can be achieved when experience and objective judgement are applied together with consideration of risks and the usage of quantitative forecasting techniques, such as Earned Value technique.

All forecasts shall be performed in accordance with N-MAN-00120-10001-PC-14, Nuclear Refurbishment - Forecasting.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>15 of 29</b>

### 5.3 Change Control

Changes to functional and project Performance Measurement Baselines (PMB) will be managed via a formal control process as described in N-MAN-00120-10001-PC-12, Change Management.

### 5.4 Invoice Management

OPG-PROC-0051 specifies and documents the processes, principles and responsibilities for payment of vendor invoices.

FIN-PROC-AP-011 outlines the line responsibilities for invoice approval, defines accountabilities of Account Payment and Supply Chain in support of the line's accountabilities in this process.

FIN-PROC-AP-006 defines the processes, principles, responsibilities, and documents to be utilized in determining approvals required and supporting documents for progress payments. The Procedure establishes the general requirements including governing rules, supporting documentation, and condition to reject or revise a Progress Payment.

FIN-PROC-AP-010 defines the processes, principles, responsibilities, and documents to be utilized in determining approvals required and supporting documents for holdback payments.

### 5.5 Cost Performance Reporting

Cost Performance Reporting is the process of reporting the costs on an ongoing basis. OPG Nuclear Projects will utilize Microsoft Business Intelligence (BI) as the report generation tool for all programs and projects.

This section details the requirements for cost performance reporting. Overall reporting requirements are contained in N-MAN-00120-PC, Project Controls.

#### 5.5.1 Report Planning

The Director, Planning and Control, NR shall establish the cost reporting requirements structured according to WBS.

Cost reporting shall:

- (a) Encompass the entire program and project scope, including activities that are the responsibility of contracting companies.
- (b) Enable the following:

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>16 of 29</b>

- (1) Definition of the process for formally identifying the basis for cost, schedule, and performance reporting.
- (2) Specification of the expectations for documents required to establish cost and progress reporting.
- (3) Documentation of the need for a standard set of reports.

The cognizant PM shall provide the information necessary to establish status of the work (including the WBS), provide explanations of the causes of variance from the baseline plan, and propose changes to address the variance (typically for those > 5%).

### 5.5.2 Report Development

Following approval, Cost Management shall perform the following:

- (a) Establish a cost progress review and reporting process to provide a set of reports with the information necessary for the Project Managers, Project Management Office and contracting companies to understand the status of the work.
- (b) Update reporting of cost to show actual progress and performance achieved against the baseline, inclusive of approved or pending changes.

Definitions of the terms used in this section are contained in Section 6.1 of this document.

As a minimum, the following data shall be summarized and reported at the project and functional area level;

- Project/Functional Area WBS Code And Description
- For the Current Period (CP)
  - PV, EV, AC, CPI, SPI
  - Cost Variance (CV)
  - Budget Variance (BV)
- For Life to Date (LTD)
  - PV, EV, AC, CPI, SPI
  - CV, BV
- At Completion (Gate) and At Completion (Phase)

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>17 of 29</b>

- BAC, EAC, VAC

As a minimum, the following WP data shall be summarized at the project or function level and reported;

- LTD
  - PV, EV, AC, CPI, SPI
  - CV
- At Completion (Gate)
  - Original Budget (OB)
  - Directed Changes (DC)
  - Scope Transfers (ST)
  - Control Budget (CB) which is the BAC
  - Funding Variance (FV)
  - Approved Funding (AF)
  - Estimate At Completion (EAC)

Depending on the audience, the above information may be viewed for the Current Period, At Completion (Gate), At Completion (Release), At Completion (Life Cycle), or Life To Date.

### 5.5.3 Performance Reporting Process

The project team shall seek input from scope budget holders, Finance Department, Supply Chain, and contracting companies, to update the cost report based on observed progress, change approvals, and commitments. This information shall be received in a form that facilitates data entry into the cost management systems.

The project team shall use the information received to update the cost management systems and perform the following:

- (a) Assess the earned value of completed work.
- (b) Validate the actual costs of delivered work and services that have been imported into Proliance from NFRA.
- (c) Update the value of contractor invoices approved for payment, and calculate accrual balance.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>18 of 29</b>

- (d) Identify the value of change orders not yet approved, and any future commitments that are forecast to be required.
- (e) Maintain the current budget through budget transfers and contingency drawdown.
- (f) Identify the variances between current budgets and forecasts.
- (g) Update the risk management system (including contingency drawdown) based on actual activity.
- (h) Update the cash-flow forecast to reflect actual spending to date.
- (i) Track the amount of committed cost, scope, and responsibilities.

### 5.5.4 Outputs from Cost Performance Reporting

Project Reporting shall issue reports monthly and provide NR Project Teams and Project Stakeholders with summarized and detailed information such that project performance and status may be determined and corrective action taken.

During the Project Execution phase, Project Reporting shall issue additional project reports weekly.

Reports shall enable an understanding of (at a minimum) the following:

- (a) Cost and schedule performance against the baseline plan.
- (b) Forecast performance, including EAC.
- (c) Cost and schedule variance explanations (typically for those > 5%).
- (d) Required actions from identified corrective action plans and mitigation strategies.

## 6.0 DEFINITIONS AND ACRONYMS

### 6.1 Definitions

**Accrual** is the value of work completed and eligible for payment but not yet included on an invoice.

**Actual Costs (AC)** is the realized costs incurred for the work performed during a specified time period.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>19 of 29</b>

**Approved Funding (AF)** consists of the Control Budget (CB) plus all approved Funding Variances (FV).

**Budget at Completion (BAC)** is the sum of all budgets established for the work to be performed.

**Budget Variance (BV)** is the difference at a given point in time between the Actual Costs (AC) and Planned Value (PV) (i.e.  $BV = AC - PV$ ).

**Change** is a modification from the approved Performance Measurement Baseline (PMB).

**Committed Costs** is value of work purchased, but not yet paid for.

**Contingency** is an amount added to an estimate to allow for items, conditions, or events for which the state, occurrence, or effect is uncertain and that experience shows will likely result, in aggregate, in additional costs. Some of the items, conditions, or events for which the state, occurrence, and/or effect is uncertain include, but are not limited to, planning and estimating errors and omissions, minor price fluctuations (other than general escalation), design developments, and changes within the scope, risk response, and variations in market and environmental conditions. It is typically estimated using statistical analysis or judgment based on past asset or project experience. Contingency **excludes**:

- (a) Major scope *changes* such as *changes* in end product specification, capacities, building sizes, and location of the asset or project.
- (b) Extraordinary events such as major strikes and natural disasters.
- (c) **Management Reserves.**
- (d) Escalation and currency effects.
- (e) Changes in scope or major social or natural events such as war, strikes, floods or earthquakes.

Contingency is generally included in most estimates, and is expected to be expended, see *Management Reserve*.

**Contingency Drawdown** is the method by which the contingency fund is used.

**Contracting Companies** are organizations external to Nuclear Refurbishment working on a Nuclear Refurbishment project under a contractual arrangement (includes Engineer-Procure-Construct Contracts at an agreed-to level of detail).

**Control Budget (CB)** consists of the OB plus the sum of all approved Directed Changes (DC) and Scope Transfers (ST) (i.e. PMB changes). It is also known as the Budget at Completion (BAC).

Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>20 of 29</b>

**Cost Performance Index (CPI)** is a measure of the cost efficiency of budgeted resources expressed as the ratio of Earned Value (EV) to Actual Cost (AC).

**Cost Variance (CV)** is the difference at a given point in time between the Actual Costs (AC) and Earned Value (EV) (i.e.  $CV = AC - EV$ ). It should be noted that PMI defines this term as  $CV = EV - AC$  and hence the sign would be different.

**Deliverable** is any unique product, result, or capability to perform a service that is required to be produced to complete a process, phase, or project.

**Directed Changes (DC)** constitutes re-baselining, and is generally caused by situations beyond the control of the budget/work program owner that renders the existing baseline obsolete. An approved DC will result in changes to the Control Budget (CB) of the appropriate function or project as well as equal and opposite changes to the appropriate contingency account CB.

**Earned Value (EV)** is the measure of work performed expressed in terms of the budget authorized for that work.

**Estimate at Completion (EAC)** is the expected total cost of completing all work expressed as the sum of the actual costs to date and the estimate to complete. It represents the responsible Project Manager's estimate of the cost at completion of the current release, gate, and the entire Project Lifecycle including all pending (i.e. unapproved) funding change requests plus the impact of undocumented funding impacts based on managerial judgment.

**Estimate to Complete (ETC)** is the expected cost to finish all remaining work.

**Forecast** is the project team's estimate of the most likely outcome for a given element of the project (e.g. cost forecast, schedule forecast etc.).

**Forecast Trends (FT)** are Budget Owner forecast estimates of future **anticipated** changes to Approved Funding levels. Such changes are documented for management forecasting and do not impact budgets. They are reflected in the Estimate at Completion (EAC) column of the cost management system.

**Funding Variance (FV)** is an approved change that does not meet the DC criteria but requires a change in funding requirements. A FV will result in changes to the Approved Funding (AF) of the appropriate function or project as well as equal and opposite changes to the appropriate contingency account AF.

**Management Reserve** is an amount added to an estimate to allow for discretionary management purposes outside the defined scope of the project, as otherwise estimated. Use of management reserve requires a change to the project scope and cost baseline. (Contrast with contingency funds that are used for items within the project's approved scope.)

**Original Budget (OB)** is the approved funding established by the release or Gated Process. Original Budgets cannot be altered for the period in which they apply.

## Manual

Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>21 of 29</b>

**Pending Changes (PC)** consists of all changes proposed changes but not yet approved.

**Performance** is the comparative ratio between the planned rate of progress and the actual rate of progress.

**Performance Measurement Baseline (PMB)** is the approved, integrated scope-schedule-cost plan for the work against which project execution is compared to measure and manage performance. The PMB includes contingency, but excludes management reserve.

**Planned Value (PV)** is the authorized budget assigned to scheduled work.

**Scope Transfer (ST)** is the reallocation of scope, and its associated budget, from one work package to another. The net variance is always zero.

**Schedule Performance Index (SPI)** is a measure of schedule efficiency expressed as the ratio of Earned Value (EV) to Planned Value (PV).

**Trend** is a non-random variance of actual performance from that which was planned. Analysis of performance measurements is required to determine if an observed performance variance is a trend (i.e. predictable), or a random outcome (i.e. unpredictable), and that determination will influence subsequent control actions and forecasts.

**Variance** is the nominal differential between earned, planned, actual, and forecast performance.

**Variance at Completion (VAC)** is the difference between the BAC and EAC.

**Work Breakdown Structure (WBS)** is the hierarchical decomposition of the work to be carried out to accomplish the objectives and create the required deliverables. It is a tool used to define and group a project's discrete work elements (or tasks) in a way that helps organize and define the total work scope of the project.

**Work Package (WP)** is the work defined at the lowest level of the Work Breakdown Structure (WBS) for which cost and duration can be estimated and managed.

### Appendix A: Cost Management Roles and Responsibilities

The following accountability model has been selected and is in use on the Darlington Nuclear Refurbishment project. It details the responsibilities and accountabilities throughout the life cycle of a scope of work, from the Darlington Scope Request (DSR) to the declaration of Ready for Service (RFS).

- (a) The guiding philosophy behind the project revolves around the Project Manager having the ultimate accountability for delivering a successful project. That said, an accountability model showing the Project Manager accountable for each and every element of the project would do little to communicate the width and breadth of effort required to perform the complete scope of work.

The **RAPID** model (as shown in Figure A.1) is used to describe who in the organization has the primary role in making **Recommendations**, establishing **Agreement**, **Performing** the work once decided, providing **Input** to the decision, and being accountable to make that **Decision**.

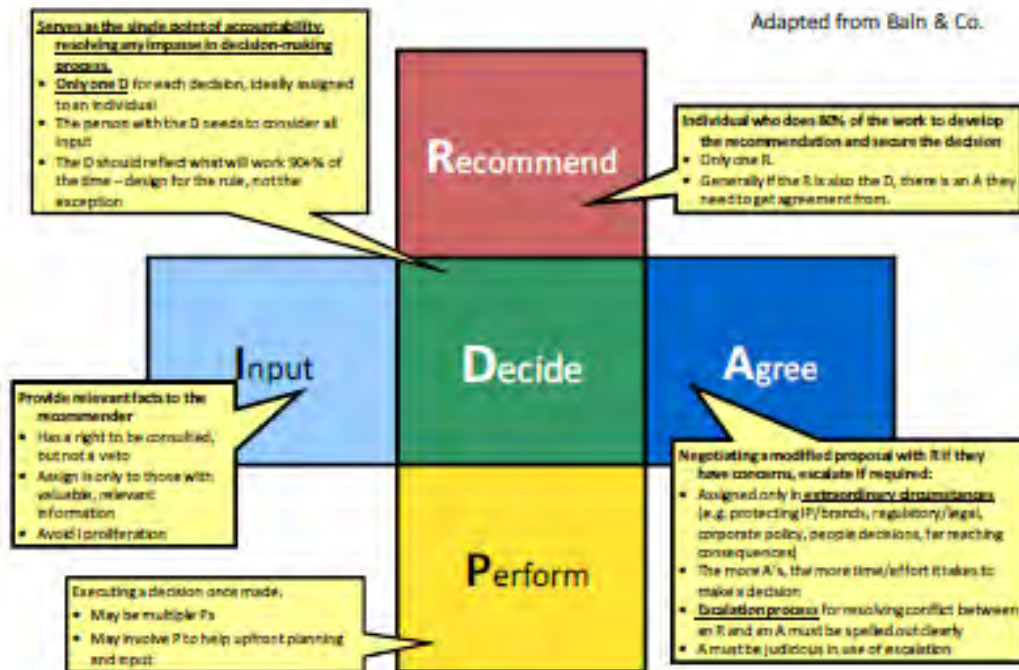

It is important to understand that with this model the Recommender is the role that is primarily responsible for the element of scope and that the primary accountability resides with the role of the Decider.

It is also important to note that this model is centred on each of the elements and their associated responsibilities and accountabilities. The model does not abdicate fundamental accountabilities as defined by the Internal Responsibility System, Chain of Command, Governance, and Delegated Authorities.

## Manual

**Figure A.1. RAPID Accountability Model**

- Input (I):** Provide relevant facts to the Recommender.
- Recommend (R):** Provide data and analysis based on research and stakeholder management.
- Agree (A):** Negotiate modified proposal with Recommender with ability to veto and escalate.
- Decide (D):** Single point of accountability; bringing decision to closure; implementing decision.
- Perform (P):** Executing the decision promptly and effectively.

### A.1.0 PRIMARY ROLES

#### A.1.1 Director, Planning and Controls, NR

Establishes and sets direction for cost management and project reporting activities for NR and support organizations to ensure activities, deliverables, and costs are controlled and appropriate information is reported.

#### A.1.2 Manager, Project Control and Reporting, NR

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>27 of 29</b>

Manage the operation of the cost management and project reporting systems to provide appropriate outputs.

Establish the processes, guides, and tools necessary to facilitate the successful implementation of the direction herein.

### A.1.3 NR Directors and Managers

Manage approved budgets for projects and functions and ensure costs are appropriately charged to the right budget item.

Provides updates to the cost management and reporting processes as required to meet project reporting cycles.

Review cost reports and take corrective action in accordance with established thresholds.

### A.2.0 COST MANAGEMENT RESPONSIBILITIES

Specific responsibilities for the cost management processes detailed in this document are contained in Table A.1.

Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 1.0 BACKGROUND

*Change* is inevitable in a project, well managed and controlled projects must manage change. A robust change management process provides guidance on how changes are assessed, implemented and reported on a project. This change procedure will be reviewed and updated periodically to reflect the changing environment with respect to project controls tools, including the implementation of a new cost management tool, workflows and an *Integrated Data Base* (IDB).

### 2.0 PURPOSE

The primary purpose of Program Change Management is to control cost, schedule and scope changes against approved *baselines*, to manage the proper allocation of contingency funds, to document the nature and cause of changes and to analyse and minimize the impact to cost and schedule.

### 3.0 DIRECTION

#### 3.1 Principles

- The *executing organization* will first attempt to mitigate the impacts of change by evaluating alternatives, such as reassigning resources to other available work, to mitigate the impact of change.
- Change is managed at the lowest level of the organization that has the authority to do so.
- Change that has a significant potential impact on project or program scope, cost and schedule is reviewed in detail and the recommended direction is approved at the appropriate level.
- The process must balance flexibility and control.
- All changes are documented, tracked and included in relevant reports.
- Detailed evaluation of the impacts of the change takes place when necessary.
- Trends of changes are identified and followed up; the Station Condition Record (SCR) system is utilized when applicable.
- Only after the change is approved by the appropriate authority level, the work is assigned for action by the executing organization.
- Changes are not made solely for the purposes of correcting performance issues that are within the control of the work program owner.

## Manual

Title:

### **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

## **3.2 Definition of Change and Change Management**

For the purposes of this procedure, a *change* is any deviation from an approved plan or procedure that results in a real or potential impact on program or project cost, schedule or scope.

*Change Management* is the Project Management process (including the supporting tool) that provides a framework to identify and record changes in cost, schedule and or scope against the approved baselines.

See Section 11.0 for a complete list of definitions for this procedure.

## **3.3 Program Baseline and Performance Measurement Baselines**

The Change Control Process as defined in this document is performed from project inception through completion. The constraints of cost, schedule and scope must be continuously and rigorously managed either by rejecting or approving changes and subsequently incorporating approved changes into the revised *Program* and *Performance Measurement Baseline*, where applicable.

### **Program Baseline**

The aggregate planning efforts during Definition Phase will converge to an overall Program Plan at Release 5, or Release Quality Estimate (RQE). This is the point when the majority of projects have sufficiently defined their execution strategies, cost, schedule and scope that will allow an overall Program Baseline to be set. The Program Baseline will be maintained as a high confidence estimate for all four units and project level changes assessed as part of the Gated Process.

### **Performance Measurement Baseline**

The Performance Measurement Baseline is the Project cost, schedule and scope approved during the Gated Process for Project and Bundle Releases. The Performance Measurement Baseline for Functions is the Functional work cost, schedule and scope approved during the business planning release process. The Project Performance Measurement Baseline will be maintained and cost and schedule performance against the baseline monitored.

The use of Baseline in this document refers to the Performance Measurement Baseline.

Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 4.0 SCOPE

This document takes authority from N-STD-AS-0028 Project Management Standard and guidance from N-MAN-00120-10001-PC, Project Controls.

This Change Control Process (refer to Appendix A, Change Process Flow) for NR Funded work including transfers in and out of the Program, is applicable to the following:

- Changes that occur between Gates to Projects already approved by the gating process and approved by the Gate Review Board (GRB), including scope transfers between Projects, Bundles or sub-Bundles;
- Recording changes to Projects approved by the GRB at Gates post Gate 3.
- Changes to OPG functional work programs approved by the Functional Business Planning Release;
- Changes to contractual agreements between OPG and external contractors, suppliers or vendors when the change impacts project scope, cost or schedule;
- Engineering change control process outputs that impact project scope, cost or schedule;
- New/Changed Project Numbers when the baseline is impacted;
- New/Changed Work Packages when the baseline is impacted;
- Changes to *Work Breakdown Structure (WBS)* when the baseline is impacted;
- Approved Funding variances to baseline cost, schedule or scope.
- Changes to cost, schedule or scope that are approved by other governing documents or bodies, including the Project Decision Meetings, Options Review Boards, or alternative localized decision making committees.
- Management Reserve draws.
- Project, bundle and program contingency changes irrespective of value, either drawn or returned back to contingency.
- Advancing or transferring funds that have not been released by the GRB in circumstances where the work must be performed prior to the next Gate and funding is required to proceed in order to control risk.
- Administrative updates to the Program Baselines as approved by senior management.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>9 of 40</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

This Change Control process is **not** applicable to:

- Projects that have not yet been presented and approved by the Gate Review Board (GRB), i.e., projects for which there is no approved baseline.
- Changes to correct performance issues that are within the control of the work program owner.
- Changes to budget amounts in closed accounting periods (example, changing history).
- Project *forecast* updates unless the update results in a change to project baselines.

## 5.0 ORGANIZATION, ROLES AND RESPONSIBILITIES

All project team members are empowered and encouraged to identify and initiate the Change Control Process.

The OPG behaviours of “Say it, Do it, Simplify it, Think Top and Bottom Line, Integrate and Collaborate and Tell it as it is” are applied in the change management process. Early identification of changes and their impacts and trends allow NR Management to focus attention on performance improvements, and drive the core behaviours.

### 5.1 Change Initiator

The Change Initiator, in conjunction with their manager, is responsible for reporting a change to cost, schedule or scope of their work immediately. Anyone can be a change initiator. The change Initiator completes all relevant sections of the *Change Control Form* (CCF) N-FORM-11252.

### 5.2 Project Manager

The Project Manager (PM) is responsible for:

- Executing the full scope of project within constraints of working safely, meeting quality requirements, and performing within the approved schedule and budget.
- Reacting to change trends, taking corrective action and identifying and mitigating project risks.
- Limiting, controlling and recommending use or return of project contingency.
- Managing contractors to control and mitigate increases to cost and delay to schedule.
- Ensuring no commitment (including Project Change Directives (PCD), Project Change Authorizations (PCA), Consent to Proceed (CTP), or any other

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>10 of 40</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

commercial commitment) is entered into with vendors or contractors, or into the approved baseline, prior to having sufficient budget and/or approval when necessary via a CCF.

- Providing all required data on the CCF and the required supporting documents for YELLOW and RED CCFs.
- Assessing the impacts of changes to cost, schedule and risk as well as to commercial, union jurisdiction, safety and environment, work and radiation permits, decontamination, material handling and storage, change in resource, quality, other impacts if applicable and impacts to other projects.
- Approving YELLOW changes and recommending to the Director changes involving project contingency draws.
- For *Scope Transfer* changes both receiving PM and transferring PM will recommend to the Director/Change Control Board (CCB). All scope transfers are considered RED changes.
- Updating the Project Management Plan.

Within the context of the change management process, the PM has the ultimate accountability to ensure changes are fully documented via a CCF and approved by the appropriate authority level as outlined in Section 6.0 and that the processes documented within this procedure are adhered to.

### 5.3 Project Director

The Project Director is responsible for:

- Reviewing and challenging changes proposed by the PM that are within PM's approval authority.
- Approving YELLOW changes in cases involving project (Director or Bundle owner as applicable) contingency draws.
- Recommending changes to the CCB that are outside Project authority.

### 5.4 Unit Outage Manager

The Unit Outage Manager is responsible for:

- Ensuring new work orders are reviewed and urgent actions taken to protect the critical path schedule, while ensuring follow up with Project Managers to ensure baselines are maintained.
- Ensuring new work orders are assigned to Project Managers for acceptance of scope.

**Manual**

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>

Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Screening new scope through the Daily Work Screening process.
- Referring new scope that is not accepted by the Project Manager to the Project Decision Meeting.

**5.5 Planning & Controls (P&C)**

**5.5.1 Director, Planning and Controls, NR**

The Director Planning and Controls is responsible for:

- Establishing and setting the direction for Program Change Management activities for NR.

**5.5.2 Manager Project Controls, Cost Management, NR**

The Manager Project Controls, Cost Management is responsible for:

- Establishing and managing the processes, guides, and tools necessary to facilitate successful implementation of Program Change Management process.

**5.5.3 P&C Leads**

The P&C Leads are responsible for:

- Coordinating evaluation and disposition/approval of the change including routing the CCF to the appropriate functional department or subject matter expert to perform an independent evaluation of the impacts of the change.
- Assisting the PM with preparation of change documentation.
- Creating a SCR for adverse trends identified from GREEN change pattern analysis if applicable as defined in Section 6.
- Assessing if the change requires immediate action where delay in approving the CCF has further adverse impact on cost and expedites immediate action if required.

**5.5.4 P&C Cost/Schedule Analyst (CSA)**

The P&C CSAs are responsible for:

- Supporting the P&C Leads in coordinating evaluation and disposition/approval of changes.
- Reviewing the CCF and supporting documentation to ensure compliance with the criteria set out in this procedure.
- Communicating disposition of the CCF to the stakeholders.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>12 of 40</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Updating the cost management system.
- Maintaining the change register.

### 5.5.5 P&C Reporting Department

The P&C Reporting Department is responsible for:

- Providing monthly metrics including trend reports and reporting out of the Change Management process.

### 5.5.6 P&C Senior Process Specialist (Cost)

The P&C SPS Cost is responsible for:

- Administration of the CCB process.
- Reviewing CCF's for compliance with the principles and governance of this procedure and providing feedback and coaching on requirements.
- Analyzing CCF trends and presenting analyses to the CCB as required.
- Tracking and following up on requests made or actions assigned by the CCB.
- Following up on SCR actions related to this procedure and/or CCF trends.
- Providing an interface between the committees and boards in this Change Management Process.

## 5.6 NR Controllership

NR Controllership is responsible for:

- Deciding the correct accounting determinations and project funding sources.
- Reviewing the change register including selected review of individual CCFs (Finance Assurance).

## 5.7 Functional Departments

Functional Department processes are governed by their functional procedures; however when changes in functional work impacts NR project cost, schedule or scope baselines the Change Management process applies. Example:

- To draw contingency when a contract change (an amendment, PCD, PCA or CTP) is required for additional scope, a CCF must be raised and approved prior to updating the vendor documentation and contract and commencing work.

## Manual

Internal Use Only		
Document Number:	N-MAN-00120-10001	
Usage Classification:	N/A	
Sheet Number:	PC-12	Revision Number: R000
Page:	13 of 40	

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Functional Department Managers' annual budgets released through the business planning release process are governed by this Change Management process if the change meets the criteria detailed under section 6.0 below. For the purposes of this procedure, Functional Managers hold the same accountabilities as a Project Manager.

#### 5.8 Subject Matter Experts

Depending on the nature of a change, a Subject Matter Experts (SME) may be requested to provide written feedback and recommendations on a proposed change. SME's provide an independent assessment for consideration by the approving authority.

#### 5.9 New Work Screening Committee

The Director Unit Outage is responsible for the New Work Screening process. Chaired by the Project Control Centre (PCC) Manager, the New Work Screening Committee is comprised of:

##### Required Attendees:

Operations   Work Management   Planning & Controls   Maintenance

##### Optional Attendees:

Engineering   Finance   CPAAC Member

All proposed scope changes will be screened by the New Work Screening Committee prior to being released to the Project Manager to execute. The Project Manager confirms the correct project has been assigned and raises a CCF upon acceptance for approval based on the Decision Criteria. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB. Appendix B describes the screening requirements and process.

#### 5.10 Change Control Board

Chaired by the Vice President, Refurbishment Execution, the Change Control Board (CCB) is a diverse group of individuals who are responsible for making the ultimate decision regarding project changes. The CCB considers the implications of changes that exceed a Project Managers authority, approves Tier 3 Milestone changes and refers significant new or changed scope to the Project Decision Meeting or if deemed necessary obtain concurrence of the Program Scope Review Board (PSRB) or Program Change Control Board (PCCB). See Appendix C for the Terms of Reference for the CCB.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>14 of 40</b>

Title:

### **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

#### **5.11 Project Decision Meeting**

When significant new or changed scope requires a decision as to whether or not it should be included in the NR Program or be moved to Darlington Station for processing through their change management process, a Project Decision Meeting (PDM) will be held.

The chair of the PDM is the Vice President, Refurbishment Execution (or delegate) along with senior representatives from Refurbishment Operations & Maintenance and Station Engineering.

Meeting participants will consider the appropriateness and implications of adding new scope. The following considerations should be made when evaluating the proposed scope:

- The scope requires the reactor to be defueled/dewatered.
- The scope could significantly exceed normal outage durations.
- The scope could significantly extend normal outage durations.
- The scope has other overriding long term operational impacts to the Station.

If the PDM decides that the proposed change warrants further work by the NR Program, a sponsor will be designated to create a DRAS as appropriate.

#### **5.12 Options Review Board**

In cases where there are multiple potential options to address new scope, and the option set does not provide a clear preferred option, an Options Review Board (ORB) will review each option and decide which will be pursued. The ORB is responsible for making an informed and business-conscious decision. The ORB is administered by NR Execution.

The ORB is chaired by the Vice President, Refurbishment Execution along with senior representatives from Operations and Maintenance, Engineering, Planning and Controls, Execution, Supply Chain, Finance and External Oversight.

The ORB is empowered to make decisions which progress work toward full definition. Cost implications require a CCF and approval via this Change Management Process.

#### **5.13 Program Change Control Board**

The PCCB, Chaired by the Director Planning and Controls is convened to approve significant Program level cost and schedule changes. The PCCB also approves all Program Contingency draws or returns and impacts to Tier 1 and 2 Milestones. See Appendix C for the Terms of Reference for the PCCB.

Manual

Internal Use Only

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

## 6.0 CHANGE MANAGEMENT PROCESS

### 6.1 Change Decision Criteria

The Change *decision criteria* utilize GREEN, YELLOW, RED labels to identify the level of impact the change has on the project baseline, and consequently the level of approval required. The criteria are noted in the diagram below:

LEVEL	LIMIT	FLOW		
<b>GREEN</b>	the lower of: <\$100K or 2% of the Baseline or Equivalent schedule delay multiplied by the project burn rate	Consequences can be addressed by the Executing Organization with the Project Manager's agreement	Change Review	Entered for Trending and Reporting
<b>YELLOW</b>	the lower of: <\$5M or 10% of the Baseline or Project Contingency or Equivalent schedule delay multiplied by the project burn rate	Consequences can be Addressed within Approved Baseline and Contingency and within Project Manager's Authority	Change Review, Evaluation & Recommendation	PM and Director CCB/PCCB for information
<b>RED</b>	the lower of: >\$5M or 10% of the Baseline or Bundle Contingency or Program Contingency or Tier 1, 2, 3 Milestone Impacted or All Scope Transfers	Significant Program Level Consequences	Change Review, Evaluation & Recommendation	CCB for Bundle Contingency and Tier 3 Milestone Delays PCCB for Program Contingency and Tier 1 & 2 Milestone Delays

The cost percentages noted are the percentages of the approved funding released by the last Gate or annual business planning and all subsequent CCF's.

Separate schedule criteria based on durations are not laid out as it is assumed that all schedule changes/delays will be translated to cost based on the *project burn rate* and the cost criteria applied.

## Manual

Internal Use Only

Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>16 of 40</b>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 6.1.1 Green Changes

GREEN changes are addressed within the level of authority of the project/function (within the approved purchase order value). An example is a change to contractor field execution work where an agreed alternate arrangement has been developed by the executing organization; a CCF will be entered for a GREEN change and will be tracked for trends. Green changes will be reviewed to ensure that they are accurately labelled as Green. Adverse trends will be reported to Project Managers to ensure action is taken to correct, and re-submitted as YELLOW or RED when required.

Individual GREEN changes may not have an immediate significant impact on cost, schedule, or scope but they may be symptomatic of a larger problem that may cause more significant impacts in the future or may affect other projects. For example delay in or unavailability of a field service such as radiation protection, scaffolding or permitry may not cause a significant impact for one particular case if alternate work arrangement is possible; however future similar service issues could have much larger impacts if this trend continues and the systematic issues go unresolved.

### 6.1.2 Yellow Changes

YELLOW changes are addressed within the level of authority of the Project Manager and Director within the envelope of the latest approved project's baseline and contingency. YELLOW changes will go through rigorous review and evaluation. YELLOW changes do not require CCB approval, but will be reported to the CCB and PCCB who may request additional information or approval. YELLOW changes will be tracked for trends.

### 6.1.3 Red Changes

RED changes have a material impact on the Gate approved cost, schedule or scope, or fundamental changes to Contracting Strategy, Execution Strategy or Design Requirements or intent regardless of cost impact. RED changes will go through rigorous review and evaluation. RED changes may require a revised Gate submission per N-MAN-00120-10001; GRB Nuclear Projects Gated Process in lieu of this process if the Director NR P&C deems it necessary. All scope transfer requests are considered to be RED changes that require significant review for impacts.

The material cost impact threshold requiring a revised Gate submission or RED CCF is considered:

Projects, the lower of	\$5M	10%	of the current approved baseline budget
NR Functions, the lower of	\$5M	10%	of the annual business planning release

## Manual

Internal Use Only		
Document Number:	N-MAN-00120-10001	
Usage Classification:	N/A	
Sheet Number:	PC-12	Revision Number: R000
Page:	17 of 40	

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

The material schedule threshold is considered a revision to any of the Tier 1, 2 or 3 milestones as listed below (refer to N-MAN-00120-10001-SHT-06: Nuclear Refurbishment- Milestone Definition Framework):

Milestone	Description	Example
Program Tier 1	Milestones that are commitments to the Board or decisions at Board Level	Release Quality Estimate, and Unit Start/Finish Dates
Program Tier 2	Critical Impact Milestones normally documented in Phased based Program Business Case Summaries per Release Strategy	CNSC Approval of Integrated Safety Review (ISR)
Program Tier 3	Program Controls, including the NR Annual Incentive Plan (AIP) Milestones and NR AIP Scorecard, Milestones that manage the health of the Program and keep it on track	All Projects Scope Freeze/Detailed Engineering Finished

Program Tier 1 and 2 Milestone schedule delays require approval by the PCCB.  
Program Tier 3 Milestone schedule delays require approval of the CCB.

Schedule impacts that do not impact on Tier 1, 2, or 3 milestones may also be considered to be a Red change if the cost impact of a delay reaches one of the cost thresholds listed above when taking the *project burn rate* into account.

The Schedule Change Control process is governed by N-MAN-00120-10001: SCH-11, DR Schedule Management Plan for Integrated Level 3 Execution.

## 6.2 Change Classification

The Initiator will choose a *Change Classification* from a drop down list. The following is a list of change classifications:

Classification			
1	Scope - OPG	8	Contract Management - Vendor
2	Scope - Vendor	9	Quality & Conformance - OPG
3	Resources/Materials - OPG	10	Quality & Conformance - Vendor
4	Resources/Materials - Vendor	11	Safety - OPG
5	Process & Communication - OPG	12	Safety - Vendor
6	Process & Communication - Vendor	13	External Influence Nuclear Refurbishment
7	Contract Management - OPG	14	Refurbishment Program Strategy & Integration

*Change classifications* are assigned to all levels of changes to facilitate reporting on trends in situations. Change classifications also have potential commercial implications related to contractor changes or claims.

## Manual

Internal Use Only		
Document Number:	N-MAN-00120-10001	
Usage Classification:	N/A	
Sheet Number:	PC-12	Revision Number: R000
Page:	18 of 40	

### Title: NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

## 6.3 Change Type

There are three (3) basic *Change Types*: *Directed Changes*, *Scope Transfers* and *Funding Variances*. The PM will request the type of change depending on the funding being requested. P&C will recommend acceptance of the Change Type chosen. Definitions for the three Change Types are included in Section 11.0 Acronyms and Definitions.

The table below contains details of which categories are updated in the baseline depending on the type of change:

Change Type	Schedule Impacts			
	Baseline Start Date	Baseline Finish Date	Forecast Start Date	Forecast Finish Date
<i>Directed Change</i>	Update if applicable	Update if applicable	Update if applicable	Update if applicable
<i>Scope Transfer</i>	Update if applicable	Update if applicable	Update if applicable	Update if applicable
<i>Funding Variance</i>	No Update	No Update	No Update	No Update
Change Type	Cost Impacts			
	Original Budget	Baseline (Planned Value PV)	Approved Funding (AF) Variance	Forecast
<i>Directed Change</i>	No Update	Update PV and BAC	Update: AF = PV	Update
<i>Scope Transfer</i>	No Update	Update PV and BAC	Update: AF = PV	Update
<i>Funding Variance</i>	No Update	No Update	Update	Update

## 6.4 Contingency Changes

The development of contingency amounts and time-phased planning and monitoring of contingency forecasts are governed by the Risk Management and Cost Management Sections respectively using N-MAN-00120-10001: RISK, Nuclear Projects Risk Management.

The Program Change Management process provides the structured framework and the mechanism to document, review and approve "draw" or "return" of contingency funds for projects or functional groups.

To facilitate tracking contingency usage, unused contingency must be returned to program contingency account using a CCF; it cannot be transferred between projects or bundles. The process of returning contingency does not apply to an underrun or savings realized on completed work.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>19 of 40</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Note that schedule contingency/float shall be reviewed for the impact on critical path, reference procedure N-MAN-00120-10001: SCH, Nuclear Projects Schedule Management.

#### 6.4.1 Project Contingency

Draws from **Project** contingency for cost increased within the Project Manager's authority are considered to be YELLOW changes that require a CCF prepared by the Project Manager recommending the use of contingency; and approved by the Project Director. Project Contingency is held in a contingency work package in the project when project contingency exists and is based on the discrete risks established and controlled by the Project Manager. Schedule contingency is not allocated at the Project Contingency level.

#### 6.4.2 Bundle Contingency

Draws from **Bundle** contingency for cost or schedule are considered to be RED changes based on the Decision Criteria and require a CCF prepared by the Project Manager, recommended by the Bundle owner to the CCB for approval where cost or schedule contingency exists. For contingency draws where the Bundle does not have cost or schedule contingency, or it is not sufficient, the CCF must be elevated to the PCCB.

#### 6.4.3 Program Contingency

Draws from and returns to **Program** contingency for cost are considered to be RED changes and require a CCF prepared by the Project Manager and approved by the CCB and the PCCB. The PCCB will ensure that the required approvals for draws from Program contingency are obtained (i.e., SVP Nuclear Projects or CEO). The PCCB will also evaluate Program draws and, if necessary, escalate a required draw from Management Reserve to the CEO and, where necessary, the Darlington Refurbishment Committee/Board.

#### 6.4.4 Management Reserve

Draws from and returns to **Management Reserve** are considered to be RED changes and require a CCF prepared by the Project Manager and approved by the PCCB once required CEO or Darlington Refurbishment Committee/Board approvals have been obtained.

# Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>20 of 40</b>

Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>
--

## 6.5 CCF Approval Authority Level

The CCF approval authority level is based on the cumulative change impact, not incremental change. When a project is re-baselined, the cumulative approvals of remaining contingency apply to the re-baselined value and not to the original project baseline value. Example:

	Incremental Change	Cumulative Change	Total	Growth	Authority Level
Project Baseline			\$6,000,000		
CCF #1	\$550,000	\$550,000	\$6,550,000	9%	within PM Authority, <10% or \$5M of Project or Functional Baseline
CCF #2	\$400,000	\$950,000	\$7,500,000	15%	not within PM Authority, >10% or \$5M of Project or Functional Baseline

## Manual

Usage Classification:	N/A	
Sheet Number:	PC-12	Revision Number: R000
Page:	21 of 40	

Title:  
**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

### 7.0 CHANGE MANAGEMENT STEPS:

The Change Management process is made up of five key steps:

See Appendix D, Process Overview.

### 7.1 Screening, Scope Changes/Additions

All proposed scope changes and additions initiated by creation of a new Work Order or work request will be screened daily by the New Work Screening Committee. The process of screening scope is further defined in Appendix B. The Project Manager accepts the scope change and initiates a CCF if required based on the criteria of this procedure for approval at the CCB. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB. In cases where there are multiple potential options to address new scope, the ORB will review the options and decide which will be pursued.

### 7.2 Initiation

The initiator starts the process with a CCF. Refer to Appendix E for an example of a CCF with instructions for completing the form.

For GREEN changes, the initiator completes Section 1 of the CCF. Section 1 provides the minimum information required to register a change for trending. GREEN changes are reviewed and if agreed to be GREEN go directly to Implementation. The output of Implementation for a GREEN change is trending metrics.

For RED or YELLOW changes, the initiator completes all Sections of the CCF.

All required data on the CCF must be completed and the following supporting documents as applicable are required for RED and YELLOW level CCFs.

- Business rationale or justification for the requested change.
- Technical supporting documents if applicable.
- Cost Estimates prepared by OPG and/or Contractors in sufficient detail to allow review, including hours, rates, quantities and assumptions. Contractor estimates are reviewed and validated by OPG estimators.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>22 of 40</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

- A resource loaded schedule with affected activities and Critical Path impacts listed if applicable.
- Identify impacts to the *Work Breakdown Structure (WBS)* including to the overall Program WBS if applicable.
- Identify impacts to the Risk Register, including listing any additional risks, closed risks, changes in impacts on probability, schedule and cost and mitigating actions required.
- A listing of the *Work Packages* affected by the proposed Change in the required *Proliance Import File (PIF)* format.
- Identify impacts to remaining Contingency.
- Identify the impact to the Project Life Cycle Estimate at Completion (EAC), provide a definitive EAC and compare to the approved Gate Budget.
- Any other relevant supporting documents that facilitate review and evaluation of the change.

## 7.3 Review and Evaluation

The CCF is reviewed to ensure that an adequate amount of information and backup to fully support the proposed change is included as listed in Section 7.2 and that all required fields of the CCF are completed and correct.

The evaluation of the impacts of change on the project is integral to the success of the Change Management Process. If required, the CCF is routed to the appropriate functional department or subject matter experts to perform an independent evaluation of the impacts of the change. Impacts that must be independently evaluated are:

- Cost
- Schedule
- Basis of Estimate and Estimate at Completion
- Risk

The evaluation will also review in detail for compliance to this procedure.

The key outputs of the Review and Evaluation of a CCF are:

- Independent written feedback regarding the identified impacts.
- Recommend action to the approving authority.

Outputs of evaluation are attached to the CCF as backup documentation.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>23 of 40</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 7.4 Decision

The core expectation of this procedure is that change is managed at the lowest level of the organization that has the authority to do so and that change that has a significant potential impact on project or program scope, cost and schedule is reviewed in detail and the recommended direction is approved at the required level. Approval is based on the decision criteria applied in section 6.1.

#### Change Control Board:

The CCB is Chaired by the Vice President, Refurbishment Execution (or delegate) and scheduled as/when required. CCB Terms of Reference are provided in Appendix C.

The CCB approves draws from Project or Bundle Contingency and Tier 3 Milestone schedule impacts.

Based on input from the Review and Evaluation phase, the CCB Chair may decide that the change should proceed through the gate process for approval where significant change to the base assumptions exists. The CCB may also refer a change for additional approval as required.

#### Program Change Control Board:

The Program Change Control Board (PCCB) Chaired by the Director, Planning and Controls is scheduled as/when required. The PCCB convenes to approve significant Program level cost and schedule changes that require additional approval.

The PCCB approves draws from Program Contingency and Tier 1 and 2 Milestone schedule impacts.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>24 of 40</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 7.5 Implementation

The final decision and disposition of a CCF will be communicated in writing to all stakeholders listed on the CCF. The status of a CCF will be changed to "implemented" once all actions are completed.

The following systems and tools shall be updated, as applicable:

ACTION	RESPONSIBLE
Budget cost and cash flow ("PV") baseline	NR P&C Cost Management Section
Schedule baseline plan in Primavera P6	NR P&C Schedule Management Section
Risk Management and Oversight (RMO) database	NR P&C Risk Management Section
Project Management Plans	Project Managers, or designate
Contracts/Purchase Orders with Suppliers	Supply Chain
Update Change Register	NR P&C Cost Management Section
Update IDB Data Sets	Data Stewards

## Manual

Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>25 of 40</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 8.0 CHANGE REGISTER

A Change Register will be maintained by the P&C Cost Management Section to record the sources of change, track and monitor status and provide inputs for key change related metrics.

The following are maintained in the Change Register:

- (a) CCF Number
- (b) Date Received
- (c) Change Title
- (d) Project Number
- (e) Project Title
- (f) Schedule impact number of days
- (g) Cost impact in \$ CAD
- (h) Change Classification
- (i) Change Level (GREEN, YELLOW, RED)
- (j) Change Type (DC, FV, ST)
- (k) Contingency Draw Source of Funds (Project, FI&P, SIO, Bundle or Core Program)
- (l) CSA or P&C Lead contact name
- (m) Change Initiator
- (n) Name of Approving Authority
- (o) Approval Date
- (p) Approval Status (Pending, Rejected, Approved, Implemented)
- (q) Date CCF Record Submitted to OPG Records
- (r) Proliance PIF Reference #
- (s) Comments

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>26 of 40</b>

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

## 9.0 METRICS AND REPORTING

The data compiled in the Change Register will be used to generate Program and Project metrics. These metrics will be generated on a monthly basis and include statistics such as:

- (1) Number initiated
- (2) Number Approved
- (3) Number Rejected
- (4) Cost Impact (\$)
- (5) Schedule Impact (days)
- (6) Change Classification Trends by Decision Criteria
- (7) Contingency budgets drawn percentage
- (8) Remaining Contingency value
- (9) CCF Cycle Time (received by P&C Lead date to approval date)

The CCB will receive weekly metrics on YELLOW and RED CCFs and trends for GREEN CCFs, the PCCB will receive monthly metrics on YELLOW and RED CCFs and trends for GREEN CCFs. PM's will receive monthly trend metrics on GREEN CCFs.

A Station Condition Report (SCR) shall be created for adverse trends identified from GREEN change pattern analysis if applicable. The intent of the SCR is to put in place corrective actions that are consistent with the consequences involved.

## 10.0 CCF DOCUMENTATION FLOW

Pending implementation of the automated tool for Change Management, CCF's will be submitted to the P&C Lead and the P&C CSA for disposition of the CCF. The nominal timing of the CCF process for non-urgent CCF's is two weeks from initiation to approval. The quality and completeness of the CCF and supporting documents is essential for timely approval.

All CCFs will be entered into the Change Register. GREEN CCFs will be confirmed GREEN and will then be saved in the P&C Sharepoint site. YELLOW and RED CCFs will be routed to the P&C Leads and/or P&C CSA who will send to subject matter experts when required, they will then be saved in the P&C Sharepoint site post final disposition by the appropriate level of authority. All CCFs will be uploaded as official records.

# Manual

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 11.0 DEFINITIONS

A comprehensive listing of P&C Terms, Acronyms and Definitions are provided in N-MAN-00120-10001 PC-16. Acronyms and definitions used in this document are summarized below.

Term/ Acronym	Definition
Baseline	See Performance Measurement Baseline
Change	For the purposes of this procedure, a change is any deviation from an approved plan or procedure that results in a real or potential impact on project or program cost or schedule.
Change Classification	Used to differentiate the reasons for a change to facilitate trending analysis.
Change Control Form (CCF)	Change Control Form N-FORM-11252; used to document changes for trending and approval purposes.
Change Management Process	Change Management is the Project Management process (including the supporting tool) that provides a framework to identify and record changes in cost, schedule and or scope against the approved baselines.
Change Type	There are three (3) basic Change Types: <i>Directed Changes</i> , <i>Scope Transfers</i> and <i>Funding Variances</i> , see individual definitions in this section.
Comprehensive Work Package (CWP)	A CWP is a collection of all necessary information required to complete the field implementation of construction work. It provides a systematic approach to completing the installation while taking into account nuclear, conventional, radiological and environmental safety.
Decision Criteria	RED, YELLOW or GREEN labels applied to differentiate the severity of a change so that the right risk-based change management controls are applied.
Directed Change (DC)	A Directed Change constitutes a change to the Program or Project Baseline and is generally caused by situations beyond the control of the work program owner. Examples are: <ul style="list-style-type: none"> <li>• Addition or deletion of scope;</li> <li>• Imposed on the project by NR management with direction to implement (e.g. un-lapping of unit outages).</li> <li>• Major change in execution or contracting strategies;</li> <li>• Cumulative effect of multiple non-Directed Changes renders the existing baseline no longer meaningful.</li> <li>• A Gate Release</li> </ul>
Executing Organization	The Project Team, OPG Function or Contractor's organization executing the scope of work.
Forecast	Forecast represents the projected cost of the Work Package, including any pending changes yet to be approved.

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R000</b>	Page: <b>28 of 40</b>

Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>
--

Term/ Acronym	Definition
Funding Variance (FV)	A Funding Variance is a change that does not meet the criteria of Directed Change but requires a change in funding requirements. An approved funding variance will result in changes to the Approved Funding (AF) of the appropriate function or project only. Approved Funding automatically updates the Estimate at Completion (EAC). This type of change allows a drawdown of contingency to fund over-expenditures and allows Purchase Order values to be increased; however no re-baseline takes place.
Integrated Data Base (IDB)	IDB is Nuclear Refurbishment's data repository where integration and mapping occur. Information is pulled into IDB for the purpose of integration, mapping, data quality analysis, data integrity, and reporting.
Performance Measurement Baseline (PMB)	The Performance Measurement Baseline is the Project scope, cost and schedule approved during the Gated process for Project and Bundle Releases The approved budget and schedule allocated to Work Packages indicate cost and schedule performance which will be measured against Current Budget in the Proliance Cost Management System and the Project Baseline Schedule. The Performance Baseline will be established for both Cost and Schedule: <ul style="list-style-type: none"> <li>• Project Performance Baseline – Will be established at each Gate.</li> <li>• Functional Performance Baseline – Will be established at each Release</li> </ul> The Performance Measurement Baseline will not include: <ul style="list-style-type: none"> <li>• Contingency</li> <li>• Management Reserve</li> </ul>
Program Baseline	The aggregate planning efforts during Definition Phase will converge to an overall Program Plan at Release 5, or Release Quality Estimate (RQE). This is the point when the majority of projects have sufficiently defined their execution strategies, cost, schedule and scope that will allow an overall Program Baseline to be set. The Program Baseline will be maintained and actual cost versus budget monitored.
Proliance Import File (PIF)	Proliance Import File is a specifically formatted excel spreadsheet that contains work packages and budget change details being requested via the CCF. It is required to upload the changes into Proliance Cost Database upon CCF implementation.
Program Integrated Master Schedule (PIMS)	The Program integrated Master Schedule is the Level 1 schedule controlled by OPG senior management and contains all control accounts from all projects, OPG functional as well as for program management work.
Program Milestone Schedule (PMSS)	The Program Milestone Schedule is the Level 0 schedule controlled by OPG senior management.
Program Tier 1 Milestone	Program tier 1 milestones are milestones that are commitments to the Board or decisions at Board Level.
Program Tier 2 Milestones	Program tier 2 milestones are milestones that are critical to the Program, normally documented in Phased based Program BCS's per Release Strategy.
Program Tier 3 Milestones	Program tier 3 milestones are milestones that manage the health of the Program and keep it on track
Project burn rate	The cost a project incurs on a daily or weekly basis as a result of overheads, direct expenses (e.g. equipment rental) and labour.

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

Term/ Acronym	Definition
Program Work Breakdown Structure (PWBS)	The Program Work Breakdown Structure is a hierarchical decomposition of the entire scope of work to be executed by the program team to accomplish the program deliverables.
Scope	Within the context of this document scope refers to the data sets that are used to manage projects and the Darlington Refurbishment Program. These include for example, Darlington Scope Requests, Engineering Changes, Work Orders, <i>Comprehensive Work Packages</i> , Construction Completion Declarations (CCDs).
Scope Transfer (ST)	A Scope Transfer is the transfer of scope and associated budget and schedule from one project to another either between bundles, or sub-bundles for the intent of re-planning already approved scope of work. These changes have no cost impact and will lead to a change in the baseline. Scope Transfers to cover over or under-run to budget are not permitted. Transfers of historic budgets are not permitted.
Work Breakdown Structure (WBS)	A hierarchical decomposition of the total scope of work to be carried out by the project team to accomplish the project objectives and create the required deliverables. The main purpose is to breakdown the scope of work into more controllable components and to identify responsible organizations for the completion of all components.

Title:  
**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

### Appendix B: Scope Change/Addition Screening Process

For the purposes of this document, "Project Manager" represents the Project Manager, Maintenance or Functional Manager who holds the budget to execute the work.

During Refurbishment execution, all requests for new scope will be handled through Asset Suite through the OMS Work Order Approval Process. A New Work Screening Committee (Screening Committee) will review work requests on a frequency depending on the volume received and categorize the work as to either execute during the Refurbishment outage or deferred as post-breaker close work.

For all types of new work orders not linked to current projects, consideration of the impacts of union jurisdictional issues and the Chestnut Park Accord Addendum (CPAA) work assignments should be made, reference file NK38-CORR-09701-0408278-T10. The CPAA Committee is available to assist with this impact assessment (contact Dan Smith dan.smith@OPG.com).

#### 1.1 Emergent Work

##### Non-Project Emergent Work

Emergent work categorized as Refurbishment by the Screening Committee and accepted by the Project Manager will be added to OMS and dispositioned by the Outage Manager as being an Available for Service requirement. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB.

##### New Work Team - Fix It Now (FIN)

If the emergent work requires immediate action due to station conditions, the Outage Manager (pre-breaker open) or the PCC (post-breaker open) will assign the work to the FIN Team.

The FIN team is a multi discipline team that reports to Director of NR Operations & Maintenance, which will support the Unit Director. The team will act as "first responders" for emergent work on the unit where repairs are required on Operating Systems not in the control of an EPC vendor.

Work Orders for urgent work generated from the FIN process must be accepted by the Project Manager the next business day. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Work Orders that cannot be completed by FIN process will be prioritized, planned and integrated with appropriate windows in the outage schedule with the acceptance of the Project Manager.

## Manual

Page:	33 of 40	

### Title: NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

#### Project Emergent Work

Individual projects will manage their own project schedule and plan in P6, but these plans will interface with the Outage execution integrated schedule.

Additional work may be added to scope though the Screening Committee, CCB or PDM. The work must be characterized (mandatory or nice-to-have) based on work in progress, schedule and cost. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance.

## 1.2 Cyclical Outage

The Cyclical portion of the Refurbishment will be executed by the Refurbishment organization using Asset Suite and will follow the Refurbishment Planned Outage Management milestones and planning process.

#### Cyclical Scoping

Cyclical scoping will require a collaborative effort of Station & NR Engineering, Operations, Maintenance and Work Control. Accountability is maintained by Unit Director (NR Work Control). The Cyclical Scope selection will include the following:

##### Must Do:

- Station License or Regulatory Requirements.
- Testing/inspections required for normal shutdown and start-up of the Unit.
- Mandatory Inspections due during the Outage Period.

##### Need or Want To Do:

- Life Cycle Management inspections or Maintenance as required to facilitate RTS (Return to Service) expectations.
- Preventative Maintenance, Deficient Maintenance (DM) and Corrective Maintenance (CM) Work Orders as requested to achieve RTS expectations. These will be a subset of: PRL (Plant Reliability List) Work to Improve Unit Reliability, Reduce Forced Loss Rate, Station Cycle Plan Support and Operating Backlog Targets Support.
- Cyclical outage scoping strategy will consider scope that can be proven to add value to the station operations in future by improving maintenance method saving costs on outages, optimizing resources or improving operations. Replacement of components which due to scale of work makes economic sense.
- Operator Burden and Operator Work-Around elimination.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R000</b>	<b>34 of 40</b>

### Title: **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

This work is assigned to the Project Manager by the Screening Committee. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

**Note:** The cyclical scoping process cannot be used to circumvent the CCF or DSR/DRAS process.

#### Cyclical Schedule

The Unit Director is accountable for the preparation of cyclical schedules that will include all cyclical outage approved scope (Operations & Maintenance work orders, from breaker open to closed, required to allow operation until the next planned outage, D2221).

The cyclical outage schedule will include Operations I RTS detailed shutdown and return to service activities. Additionally, this schedule shall be reviewed for horizontal and vertical integration with the IL3 (Integrated Level 3) and CCL2 (Coordination and control level 2) schedule. Refer to N-MAN-00120-10001-SCH-11 (Darlington: Schedule Management Plan for Integrated Level 3 Execution) for more details on IL3.

The cyclical outage scoping process is initiated following the last planned outage prior to the start of the unit as per the Work Management Ownership Transfer Plan (NK38-PLAN-09701-10113-WM-01).

### **1.3 Major Scope**

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB. In cases where there are multiple potential options to address new scope, the ORB will review the options and decide which will be pursued.

Major program scope changes referred to the PSRB by the CCB or PDM follow the Darlington Nuclear Program Scope Control, NK38- INS-09701-10001.

### **1.4 New Projects and Station Sponsored Work**

During the time period when NR is the scheduling authority, the Station may desire to have work (new scope) performed on the unit. Since there is only one schedule to perform work in the Refurbishment unit, all Station or Projects & Modifications work groups must ensure their tasks are approved and shown on the Refurbishment schedule once approved.

New scope identified at the Screening Committee requires a scope sponsor who prepares a CCF for approval at the CCB. Significant new or changed scope will be referred by the CCB to the PDM and if approved a DRAS for budget approval by the PSRB is required. In cases where there are multiple potential options to address new scope, and that option set does not provide a clear

Title:  
**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

preferred option, an Options Review Board (ORB) will review each option and decide upon which of the options will be pursued.

### 1.5 Decision Escalation (Appeal) Process

In the situation where a scope addition or change has been rejected by the Project Manager, a request can be made to escalate the decision to the CCB and PDM.

In the situation where a scope addition or change has been rejected by the CCB, a request can be made to escalate the decision to the PSRB. In such cases, a written request by the Sponsor must be made to the Chair of the PSRB with rationale. The PSRB chair will arrange an ad hoc PSRB meeting to consider the request.

## Manual

Title:  
**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

### Appendix C: Terms of Reference for the CCB & PCCB

#### Change Control Board:

**Mission:** To consider the implications of changes that exceeds a Project Manager's and Project Director's authority. To reject or approve changes assessed to have acceptable cost and schedule implications.

#### Membership

##### Quorum Members:

- VP, Refurbishment Execution (or delegate) Chair
- Director, Refurbishment Engineering
- Director, Refurbishment Operations & Maintenance
- Director Planning & Controls NR (or delegate)
- Director Unit Outage, NR
- Director Nuclear Projects Controllershship

##### Non-quorum Members:

- P&C Change Administrator
- P&C Support Staff as required
- Other subject matter experts may be invited by the Chair for issue-specific input

##### Approval:

- VP, Refurbishment Execution

#### Process

A quorum is the Chair and three members noted in the membership list, including the lead of the organization impacted by the change (example, if an Engineering change, the Engineering Director must be at the CCB meeting). The PM may also be invited to attend depending of the nature of the change. This quorum represents the minimum breadth of expertise that must be present to represent the full range of stakeholder interests.

The CCB will convene at a frequency dependant on the volume of changes received, and may be required to convene on an urgent basis if the evaluation of a change warrants.

The P&C Change Administrator will summarize the conclusions for presentation to the CCB. The P&C Change Administrator will maintain a list of actions arising from the CCB and provide follow-up reporting to the CCB.

Based on the change review and evaluation input, the CCB may decide that the change should proceed through the gate process for approval, for significant new or changed scope refer the change to the PDM for assessment, refer the change to the PSRB or refer the change to the PCCB. Otherwise if the change is brought to the CCB, the following outcomes are possible. The change is approved, requires more information or is rejected.

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

### Program Change Control Board:

**Mission:** To consider the implications of changes that exceeds the CCB's authority and/or to approve Program Contingency draws. To reject or approve changes assessed to have acceptable cost and schedule implications and where required, elevate for CEO for approval and Management Reserve assessments.

### Membership

#### Quorum Members:

- Director Planning & Controls NR, Chair
- SVP, Nuclear Refurbishment
- VP, Nuclear Finance
- VP, Assurance
- VP, Engineering, Nuclear Refurbishment
- VP, Refurbishment Execution
- VP, Operations and Maintenance

#### Non-quorum Members:

- P&C Change Administrator

#### Approval:

- Director Planning & Controls NR

### Process

A quorum is the Chair and four members noted in the membership list. This quorum represents the minimum breadth of expertise that must be present to represent the full range of stakeholder interests.

The PCCB will convene at a frequency dependant on the volume of changes received, and may be required to convene on an urgent basis if the evaluation of a change warrants.

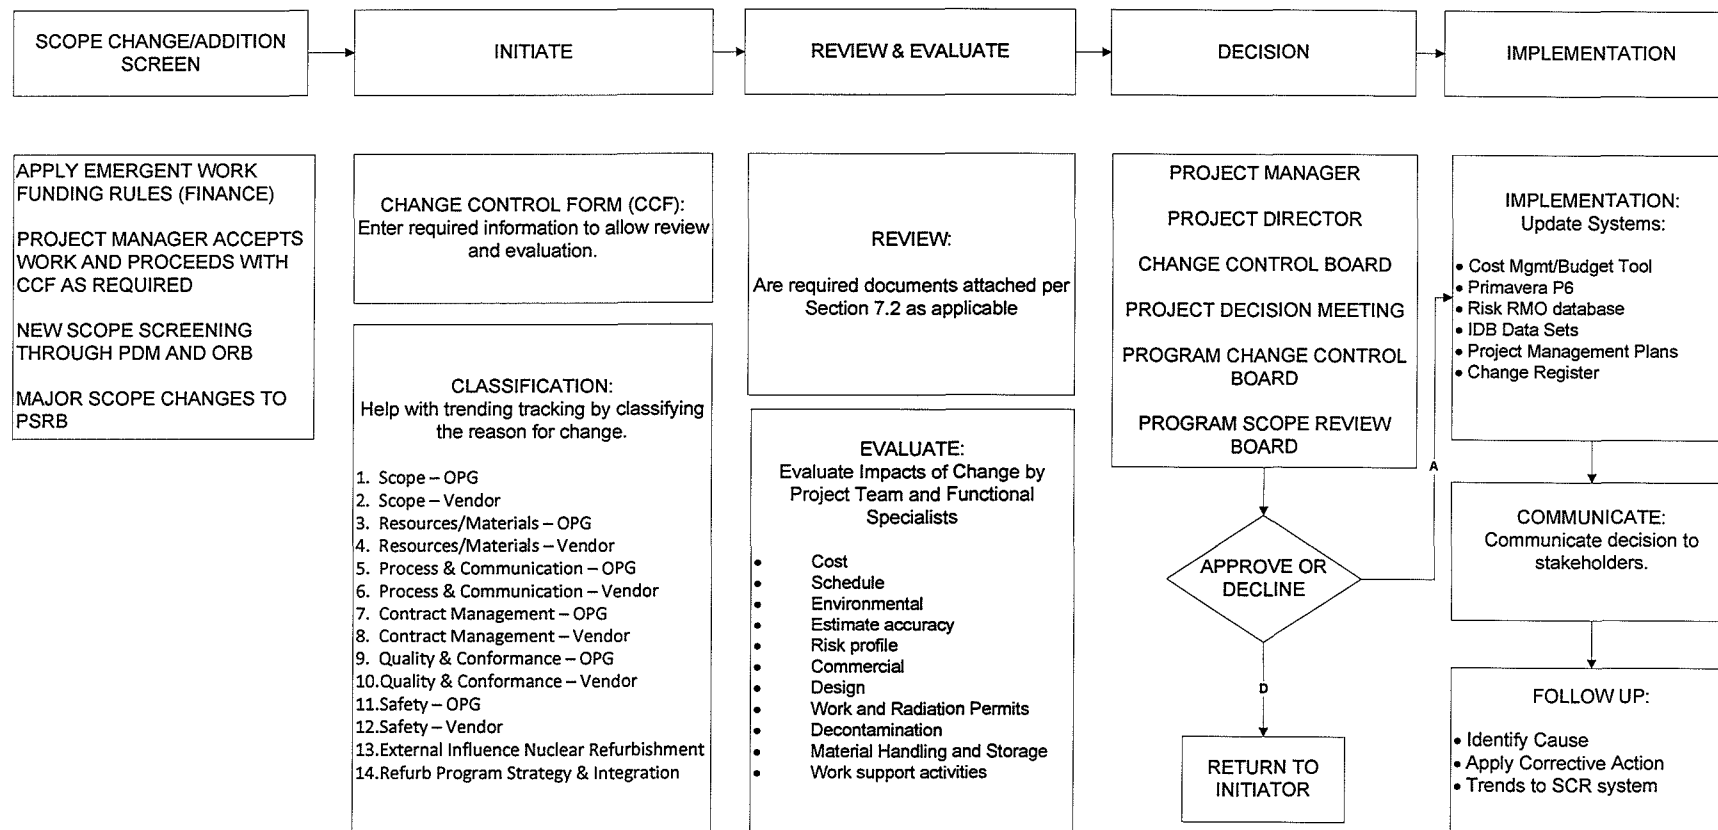

The P&C Change Administrator will summarize the conclusions for presentation to the PCCB. The P&C Change Administrator will maintain a list of actions arising from the PCCB and provide follow-up reporting to the PCCB.

### Revision Summary

Revision Number	Date	Comments
R006	2014-10-22	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to incorporate the processes for Darlington Station owned non-IIP DSRs, and PSRB transition.</p> <ul style="list-style-type: none"> <li>• Addition of Section 2.1, 2.2, 2.3 for PSRB transition</li> <li>• Addition of HoS N/A.1, N/A.2, N/A.3, N/A.4</li> <li>• Removed HoS 4</li> <li>• Clarification of HoS 05 and 10</li> <li>• Rewording of HoS 4.1, 4.2 4.3, 4.4, 3 and 90</li> <li>• Rewording of 4.17.4: Requirement to Progress HoS</li> <li>• Updated diagram in section 4.1</li> <li>• Section 4.3 : DSR (Not Refurb) and Non-IIP</li> </ul>
R005	2013-12-10	<p>Revised and issued by Nuclear Refurbishment, Work Control to reflect current practices and incorporate DCR 0120354. This is an intent revision. Due to extensive changes, revision bars are not used.</p> <p>ISR flag in 3.2 – scope categorization paragraph and any other mentions in the body of this document have been removed.</p> <p>Section 4.6 PSRB, clarified role of PSRB secretary from “whom will ensure that all decisions are recorded within a scope database.” to “whom will ensure that all decisions are implemented in a timely manner.”</p> <p>The following has been added:</p> <ul style="list-style-type: none"> <li>• HoS 03, 04.1, 04.2, 04.3 and 04.4</li> <li>• Appendix B, questions concerning parts</li> <li>• Appendix K, attached a copy of the mentioned memo</li> <li>• GAR/IIP tracking</li> <li>• Migration of a draft DSR to the live database</li> <li>• Intent vs. non-intent changes</li> <li>• DSR status</li> <li>• DSR type</li> <li>• Initiating work requests from DSR line items</li> </ul>
R004	2012-12-12	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to Incorporate the requirement for Cost Benefit Analysis to accompany any new proposed scope post May 11, 2011 Major Scope Freeze Milestone, add the Life Cycle of a DSR, Screening and Funding committee quorum clarification. Scope Change Section added. Document numbers updated to align with Business Transformation initiative 2012.</p>
R003	2012-04-30	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to Incorporate revised Appendix A, Appendix B, added Appendix C (Scope Decision Matrix), added Appendix H (Scope Hierarchy) Added Appendix J (Scope Decision Matrix Summary Table), and references to the Integrated Safety Review (ISR) and DRAS processes. Incorporated NK38-GUIDE-09701-10012 Guide to Scope Health Definition Planning into this instruction section 7.</p>
R002	2010-12-23	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to Incorporate Screening and Funding Committees additions and governance alignment changes.</p>
R001	2010-06-30	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls</p>
R000	2009-04-29	<p>Initial Issue.</p>

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>5 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

### 1.0 BACKGROUND

The Program Scope Review Board (PSRB) reviews and approves proposed additions or deletions of major program level scope for refurbishment of the Darlington Nuclear Generating Station (DNGS) as described in the Darlington Refurbishment Program – Program Scope Review Board - Terms of Reference (NK38-PLAN-09701-10003), DNGS Refurbishment Project Reference Plan – Scope Definition (NK38-PLAN-01060-10003) and in accordance with the Darlington Refurbishment Program Charter (D-PCH-09701-10000).

The process of identification of Program scope and the management of scope changes is described in this instruction and applies to all phases of the Darlington Refurbishment Program. This will ensure that the proposed additions and/or deletions have undergone a thorough assessment based on the return on investment, impacts on plant safety, reliability, project schedule and cost, program resourcing, regulatory requirements and environmental impacts. Refurbishment scope is maintained in the Darlington Scope Request (DSR) database.

Scope in the Darlington Refurbishment Program will support the Darlington Refurbishment Principle Program Objectives:

- (a) Confirm feasibility of refurbishing DNGS reactors
- (b) Plan and execute all work required to refurbish the Darlington units
- (c) Ensure the scope of the refurbishment outages will enable economic operations of each unit for an additional 30 years post-refurbishment.

Refer to Program Structure and Summary Management Plan, NK38-PLAN-09701-10067 Sht: 0001, for an overview of the Program and NK38-PLAN-09701-10067 Sht: 0002, Refurbishment Program Scope Management Plan, identifies how the program scope will be defined, managed and controlled throughout the Darlington Refurbishment program.

### 2.0 DIRECTION

This instruction applies to all staff performing or supporting the identification and definition of scope related to the Darlington Refurbishment Program. This instruction describes the process for submission and approval of scope additions by the Darlington Refurbishment Program Scope Review Board (NK38-PLAN-09701-10003). Scope changes and deletions will also follow the process outlined in this instruction.

Rigorous identification and control of the Darlington Refurbishment Outage Program scope and execution is essential to successful completion of the refurbishment on budget and on schedule and shall be based on the following principles:

- Project safety and defense-in-depth is maintained

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>6 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- Established Dose Targets are not exceeded
- Appropriate Program and Project work is completed
- Project schedule is not extended unnecessarily and recovery plans are developed as required
- The Program costs do not unnecessarily exceed budget
- Planning and integration with key work management areas of the company (outage and online Darlington schedules)
- Reasonable contingencies are in place for unforeseen circumstances that may arise, i.e. discovery work, during the Darlington Refurbishment Program
- Identify, prioritize, track and mitigate risks associated with the project.

For the purpose of supporting this scope control instruction, the Refurbishment Program scope will include core scope and non-core scope. Scope categories are chosen by the scope initiator and confirmed by the technical screening and funding committees and approved by the PSRB. Scope categories are used to ensure the correct work is accepted into scope with clear justification to support the Program Objectives. Once scope is accepted into the Program, the scope must still follow the Gate Review Board approval process for funding and scope management, in accordance with Nuclear Projects – Gated Process (N-MAN-00120-10001-GRB). Refer to Appendix G of this document for a flowchart of Refurbishment Scope Review Process.

### 2.1 Transition to Ad-Hoc PSRB Meetings

As of May 2014, the quarterly PSRB and Funding Committee Review will be replaced with Ad-Hoc meetings. The NR Project Planning and Controls will have the responsibility in scheduling the need-based PSRB and setting up the agenda.

## 3.0 SCOPING PRINCIPLES

### 3.1 Darlington Refurbishment Objectives

The goal of the refurbishment project is to extend the service life of the units by an additional 30 years of post-refurbishment operations. Refurbishment will involve an outage for replacement of life-limiting components, as well as maintenance or replacement of other components which can be most effectively done during the refurbishment outage period.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>7 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

### 3.1.1 Primary Objectives

- Successful refurbishment of Darlington Station Life Limiting Components in order to allow Darlington to operate for 30 years beyond the current predicted end of service life.
- The Refurbishment Project will return the unit in better condition than which it was received.
- A successful refurbishment project requires delivery of all core and approved non-core scope within the timeline and budget established in the Release Quality Estimate and as documented in the project Business Case Summary (BCS).
- Project cost and schedule as well as post-refurbishment performance goals are met with quality, because they will come under extreme scrutiny due to the high profile nature of this project and its impact on OPG's reputation.
- Where scope is approved by PSRB, NR (Nuclear Refurbishment) may recommend inclusion of scope to pre-refurbishment station outage.
- The Refurbishment Program must ensure that all scope is known and is executable.

### 3.1.2 Secondary Objectives

- Refurbishment will assess the scope and overall economics of the program, with consideration of the following:
  - Hardened Backlog
  - 10 Year Investment Program
  - Minor Modification Program
  - Margin Management Plan
  - System Health and Lifecycle management plans
  - System Available for Service (SAFS)/Ready for Service (RFS) process with respect to plant status and operational burdens.
  - Outage Improvement Initiatives
- Support the station vision by delivering value enhancing station improvements (non-core scope).

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>8 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- The amount of non-core scope executed during the refurbishment outage will be based on priority of work, and cost benefit assessment. This scope will be optimized to minimize the risk to the refurbishment critical path schedule, and overall project costs.
- All non-core scope must meet strict financial hurdle rules prior to consideration i.e. 9.5% discount rate and 6 year payback (per memo from Chief Financial Officer). Refer to Appendix K for a copy of the memo.

## 3.2 Scope Categorization

All scope is categorized as core scope (CS) or non-core scope (NCS). All core scope will be linked back to the program objectives and non-core scope will be categorized to control and monitor types of scope added and deleted from the Program. Refer to Appendix D of this document for a chart of all scope categories and their description.

### 3.2.1 Core Scope

Consists of work that must be done to achieve the Primary Objective. Core scope will determine the critical path for the refurbishment outage and sets the lower boundary for the cost estimate. Refer to Appendix E of this document for a brief summary of the current document major components of core scope. Core scope includes:

- **Regulatory scope** – Scope that supports station license and regulatory requirements (not optional), as agreed with the regulator and documented in the Integrated Improvement Projects based on Environmental Assessment, Integrated Safety Review and other activities such as Global Assessment which do not require Economic Assessment.
- **Station Life Limiting Components** – modification, repair, or replacement of station life limiting components that must be replaced in order to support the primary objective to allow DNGS to operate for 30 years beyond the current predicted end of service life. This includes items which have an asset class tied to station life and can only be done in a drained and defuelled state. Examples include: Calandria Tubes, Pressure Tubes and Feeders.
- **Component Upgrades** – work to upgrade components, which have a high station priority that can only be done during an extended refurbishment outage with units in a drained/defueled state. Examples include LISS (Liquid Injection Shutdown System) nozzle inspections & repairs, Shutoff Rod guide tubes, and Calandria vessel inspections and repairs.
- **Programmatic work** – Typically performed online or in a normal station outage that must be done in the refurbishment period in order to maintain station licence, including mandatory preventive maintenance, inspections, etc.
- **Prerequisite Scope** – Inspections to determine refurbishment scope and Modifications/upgrades that must be done before refurbishment starts to meet

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

production requirements to enable a successful refurbishment. This includes islanding modifications and fueling machine upgrades.

- **Facilities & Infrastructure Plan** – construction of facilities and improvements to the infrastructure to support the refurbishment. See Scope Exclusions (3.2.4) below for exceptions.

### 3.2.2 Non-Core Scope

Consists of work that will be performed in the refurbishment period if it has no impact on the projects Core Scope critical path, does not add risk to the successful completion of core scope, and where cost or resource efficiencies and station priority warrant the work to be executed in the refurbishment period. A Business Case Assessment Summary (BCS) or Decision Record Analysis Summary (DRAS; N-FORM-11390) demonstrating the economic advantage; including risk management and/or reliability improvement, and priority of completing this work during, pre-, during or post-refurbishment will be required to gain approval.

Non-Core scope may include:

- **Safety Improvement Opportunities** – Safety or Environmental improvements beyond standard that provide benefits to the station in terms of increased reliability and/or lower operating costs some of which is documented in the Integrated Safety Review and Safety Factors Reports.
- **Station Improvement Opportunities** – Station improvements that provide benefits to the station in terms of increased reliability and/or lower operating costs, and where it is economically beneficial to OPG to perform the work in the refurbishment period.

### 3.2.3 Facilities & Infrastructure

Facilities & Infrastructure and Campus Plan projects, to support post-refurbishment operations will be funded by the Darlington Refurbishment program. The Darlington Site Infrastructure Co-ordination Committee will prioritize projects to be executed within this funding envelope.

### 3.2.4 Scope Exclusions

The following items are specifically excluded from the scope of Darlington Refurbishment Project:

- Operations and Maintenance work required to be performed to maintain the plant outside of the refurbishment outage window.
- Tritium removal facility improvements, upgrades, or replacements.
- Spare components, either capital or inventory (Other than per ECC (Engineering Change Control) )

- New Maintenance Facility

## 4.0 PROCESS

Management of the Refurbishment Outage and the complexity over a long period of time will be a key factor in the success of the overall Program. The PSRB will approve the selection of only the correct scope to achieve success of the Program on schedule and within budget.

The Scope Management Process for the Darlington Refurbishment Program is graphically represented in Appendix A. This diagram represents (primarily) the Program Scope Review Board process and the Major Scope decision process. Approval of the further evolution of Major Scope is approved by the Gate Review Board (As per the Gated Process, N-MAN-00120-10001-GRB).

All work requested to be included in the scope of the Darlington Refurbishment Program must be initiated in the Darlington Scope Request database. Scope will originate from several areas of the Program, including the Environmental Assessment and Integrated Safety Review actions, Plant Condition Assessment, including Aging Management recommendations (through Component Condition Assessment's), infrastructure projects, Station Work Management requirements and Station Improvement Initiatives. Considering each scope origin, the scope request information originates in different forms and must be requested in a common format for the Program to control the scope. The Darlington Scope Request database for the Refurbishment Program will be the format in which DSR Line Items are submitted.

Once requested in the database, the scope will be processed accordingly through the database for consideration in the technical screening and funding committees and at one of the PSRB meetings.

Post Major Scope Milestone completion (May 2011) all proposed non-core scope will require a cost benefit analysis (i.e. BCS or DRAS) and project schedule impact review accompanying the DSR. Refer to Developing and Documenting Business Cases (OPG-STD-0076) for BCS process and Nuclear Refurbishment Actions, Issues, Decisions, and Key Assumptions Management (N-MAN-00120-10001-RISK-07) for DRAS process.

### 4.1 DSR life cycle

The DSR will go through a number of transitions from creation to reconciliation against a Work Order at 24 months before each unit's outage, and to close out as illustrated in the diagram below. A DSR starts as a high level thought and progresses from identification stage to the definition stage; depending on how well the scope is known and understood.

There will be five closeout reports, one per unit, as well as a final close out at the end of the project. The DSR managed in the DSR database is the currency of scope control until 24 months prior to the Refurbishment Outage (RO-24) at which time the

Title:

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

currency will change to Work Orders managed in the Outage Management System (OMS). The reconciliation report will be complete by the RO-12 (Unit OMS Work Order Scope Freeze Milestone).

## 4.2 DSR database

The term DSR refers to a Darlington Scope Request line item. The DSR database is the source of scope control for the Darlington Nuclear Refurbishment Project. It is available on the project management section of the Darlington Refurbishment web page.

Refurbishment scope is maintained in the DSR data base. Scope management will be integrated into the Refurbishment program information management system through various processes; examples include schedules, contracts, scope of work documents, budgets and business plans. Scope information management shall follow approved OPG, Nuclear and Refurbishment governance, including, but not limited to, N-PROG-AS-0006, Records and Document Control.

Title:

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.2.1 DSR initiation**

It is intended for anyone to be able to initiate a DSR. To initiate a DSR, open DSR database and follow on screen instructions; if unsure, STOP and ask the DSR database administrator for help. During the DSR creation, the scope initiator will be required to categorize the scope (outlined in Appendix D) and select a DSR type (outlined in Appendix J).

All scope requested in the Darlington Scope Request database must be supported by a Stratum Level 4 sponsor. The sponsor's electronic signature will be required at the time of scope request prior to review at any of the scope review boards. Post Major Scope Milestone completion (May 2011) all new proposed scope will require a cost benefit analysis (i.e. BCS or DRAS) and project schedule impact review accompanying the DSR. After PSRB approval, the DSR database administrator will migrate the initiated draft DSR into the live database and send out an email notification to the PMs (Project Managers) of completion.

If a new DSR is created through an administrative DRAS (does not change scope; i.e. part of an approved DSR is moved to a new DSR with an approved status) and does not require PSRB approval, the signed and issued DRAS can be brought to the DSR database administrator to have the new DSR migrated to the live database.

The PM will need to input a change request to give the newly migrated DSR (at minimum) a title, status, bundle and health. The PM must also review and update any effected work orders.

### **4.3 Scope hierarchy**

The scope hierarchy is a method of ranking the DSR line items in the DSR database to establish priority using Scope Type, Risk Rank, Prerequisite Indicator and Economic Valuation. The Scope Hierarchy is further detailed in Appendix H.

### **4.4 Technical Screening Committee**

After major scope has been requested and sponsored in the DSR database, a Technical Screening Committee will review the requests. The committee will review a specific list of requirements including Core and None Core designations to ensure the scope request is adequately prepared for the PSRB. The technical screening committee will be led by the Vice President (VP), Nuclear Refurbishment Engineering.

The committee will make technical acceptance recommendations on specific scope items to the Refurbishment Funding Committee and the PSRB.

The Screening Committee Chair and Quorum is as follows:

**Chair:** Vice President, Nuclear Refurbishment Engineering

**Quorum Required (Voting Members):**  
Vice President, Nuclear Refurbishment Engineering

Title:

### **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

Director, Operations and Maintenance, Darlington  
Director, Operations and Maintenance, Nuclear Refurbishment  
Director, Engineering, Darlington

Technical Screening Committee meetings require all quorum members or empowered delegates present.

See Appendix C for decision matrix to be used as a guideline by the Technical Screening Committee to make technical acceptance recommendations.

#### **4.5 Funding Committee**

After Major Scope has been requested and sponsored in the DSR database, and the Technical Screening Committee has recommended the proposed scope addition the Funding Committee will make funding stream recommendations. The Funding Committee will be led by the Director, Nuclear Refurbishment Planning and Controls.

The Funding committee will make funding recommendations on specific scope items to the PSRB.

The Funding Committee Chair and Quorum is as follows:

**Chair:** Director, Nuclear Refurbishment Planning and Controls

#### **Quorum Required** (*Voting Members*):

Director, Nuclear Refurbishment Planning and Controls  
Director, Business Support, Darlington  
Director, Asset Planning and Integration  
Controller, Nuclear Refurbishment

The Funding Committee meetings require all quorum members or empowered delegates present.

See Appendix F for funding matrix to be used as a guideline by the Funding Committee to make decisions.

#### **4.6 Program Scope Review Board**

The PSRB shall be a senior cross-functional board with representation from the site and supporting business units. The review board shall consist of voting members and nonvoting members. Non-voting members are scope sponsors or advisors in the Board. All scope presented at the PSRB should be supported by at least one sponsor among the Board membership. This is to ensure that there is support for the scope that is requested and knowledge of the scope that is requested at each meeting. The PSRB voting members will strive to arrive at a consensus for all scope requests. The Director of Planning and Control, Nuclear Refurbishment shall be the Chairperson of the PSRB and will designate a secretary to the PSRB whom will ensure that all

## Instruction

Internal Use Only		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>14 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

decisions are implemented in a timely manner. Required quorum for PSRB meetings shall be all of the voting members. In the event of the unavailability of the individual specified below, the Board member may delegate the meeting attendance to an empowered delegate.

The Program Scope Review Board Chair, Quorum and non-voting members are as follows:

**Chair:** Director, Planning and Controls, Nuclear Refurbishment

**Quorum Required** (*Voting Members*):

SVP or Deputy VP, Darlington Nuclear  
SVP, Nuclear Refurbishment  
SVP, Nuclear Engineering and Chief Nuclear Engineer

**Non-Voting Members of the PSRB** (*Sponsors & Advisors*):

VP, Engineering, Nuclear Refurbishment  
VP, Execution, Nuclear Refurbishment  
VP, Corporate Business and Investment Planning  
VP, Science & Tech, or Director, Eng Services  
Director, Operations & Maintenance, Darlington Nuclear  
Director, Operations & Maintenance, Nuclear Refurbishment  
Director, Engineering, Darlington Nuclear  
Director, Engineering, Nuclear Refurbishment  
Director, Work Management, Darlington Nuclear  
Director, Planning and Control, Nuclear Refurbishment  
Director, Investment Management, Nuclear Finance  
Director, Commercial Projects and Facilities  
Director, Business Support Director, Darlington Nuclear

**Note:** The VP, Science and Technology and Director, Engineering Services shall be responsible for scope recommendations within their respective areas of responsibility and attend as appropriate.

In order to record a decision at the PSRB, consensus must be reached between the three (3) Voting Members. This applies to scope approvals and rejections. The PSRB Voting Members will strive to meet the meeting objective of reaching consensus on all scope items during the meeting or by requesting additional information to be provided by the scope sponsors and initiators, in order to support a decision.

## 4.7 Scope Challenge

The scope is challenged a number of times throughout the scoping process. It is challenged at the Technical Screening Committee meeting, financially at the Funding Committee meeting and finally as part of the PSRB, requested scope will be scrutinized to determine whether it must be completed in the Refurbishment Outage and whether it adversely affects the refurbishment outage(s) cost and schedule.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>15 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

For each scope request, the PSRB will utilize a list of questions that will challenge the scope initiator to support justification. These questions will address necessity, business need, risk and impact on cost and schedule (Appendix B). Appendix C shows a Scope Flow Decision Matrix which also will be used to validate and challenge the scope. Following approval of Major Scope by the PSRB for inclusion in refurbishment (Refurb) scope, the scope is formally added to the DSR database as Approved. If scope has not been approved, rejection justification will be formally recorded and the scope will be set to "Not Refurb" in the database indicating that it is not part of the refurbishment project and will follow Darlington's normal processes for evaluation.

### **Scope Challenge Meeting** (Prior to Gate 1 and 3 of the Gated Process N-MAN-00120-10001-GRB)

As per N-MAN-00120-10001-GRB, Nuclear Projects Gated Process there is a requirement for a Review of Scope to reassess and confirm need. This is accomplished through a Scope Challenge Meeting. The meeting is chaired and led by the Project Manager who owns the work being proposed to progress the project through the next decision Gate. For each DSR, the PM will utilize the Scope Decision Matrix (Appendix C) to justify / challenge the scope. The PM will complete the summary table in Appendix I and present to the Scope Challenge meeting Quorum for challenge of content and methodology. The completed table confirming recommendations will be submitted with the documents for the Gate Review Board Meeting (N-MAN-00120-10001-GRB). A DRAS will be completed as required and presented at next PSRB.

The Scope Challenge Meeting members are as follows:

**Presenter / Chair:** Project Manager, Nuclear Refurbishment Execution

**Quorum:** Vice President, Nuclear Refurbishment Engineering  
Director, Operations and Maintenance, Nuclear Refurbishment  
Director, Project & Controls, Nuclear Refurbishment

**Advisors:** Director, Nuclear Safety, Nuclear Refurbishment  
Director, Engineering, Nuclear Refurbishment

## 4.8 DSR Changes

If the DSR has not been through Gate 1 of the Gated Process (N-MAN-00120-10001-GRB), i.e. funding not yet allocated for this project, changes are requested through the change control form (change request) within the DSR database. Contact DSR Database Administrator for assistance.

If one of the PM's has been to Gate 1 for the DSR requesting funding, then a Change Control Form (N-FORM-11252) must be completed and approved prior to any DSR database changes.

DSR Change process:

## Instruction

Internal Use Only		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>16 of 50</b>

Title:

### **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

- For scope changes, DRAS completed by Project Manager and approved by PSRB
- If at or past (funding) gate 1, complete N-FORM-11252 prior to any DSR database changes
- Change control form Initiated in DSR database by an individual
- Change control form concurred (electronically signed) by Project Manager and appropriate stakeholders.
- For intent changes, the change control form also needs to be approved by System Engineering Manager, Nuclear Refurbishment.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

**Note:** At this time, the DSR Database Administrator is a WCTL (Work Control Team Leader) working for the NR Outage Manager.

#### **4.9 Decision Record and Analysis Summary (DRAS)**

Decision records are critical in maintaining an auditable trail of the NR Program changes, including changes in strategy, regulatory interactions, technology, resource, scope, etc. These important decisions should be validated by the appropriate authority to ensure alignment across all NR organizations. Refer to N-MAN-00120-10001-RISK-07, Nuclear Refurbishment Actions, Issues, Decisions, and Key Assumptions Management for full DRAS process. If a DRAS affects DSRs, then the follow the steps in section 4.8, DSR change process.

#### **4.10 DSR Database change request**

Changes to an approved DSR (before gate 1) are requested using the change control form in the DSR database with supporting document (i.e. DRAS), for auditable trail. DSR change control form is an electronic form found in the DSR database in the DSR menu, called "Request change to DSR info". When the form opens up, select the correct DSR and enter your proposed changes in the blue fields on the right of the original DSR. The specific approval is dependent on what is being changed, i.e. intent or non-intent.

This electronic method of change control which allows an individual to propose a change which will then be approved by the Project Manager. The time, date, and LAN ID associated with the change are all recorded in the DSR database.

##### **4.10.1 Intent Change process**

Changes in Scope, context or title of a DSR are considered intent changes.

- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

### 4.10.2 Non-Intent Change process

Fixing spelling errors or splitting one DSR into multiple DSRs (which doesn't change scope or context) are considered a non-intent change and does not require engineering approval.

- Change control form completed in DSR database by the Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by appropriate stakeholders.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.

**Note:** If unsure, default to intent change or contact DSR database administrator.

### 4.11 DSR Ownership Change

- Change control form completed in DSR database by Sending Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by Receiving Project Manager, Nuclear Refurbishment
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.

**Note:** If one of the PM's has been to Gate 1 for the DSR requesting funding, then a Change Control Form (N-FORM-11252) must be completed and approved prior to any DSR database changes.

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.12 DSR GAR (Global Assessment Report) and IIP (Integrated Implementation Plan) Tracking**

NR Engineering is responsible to identify DSRs committed in the GAR/IIP. NR Engineering will input change requests and the DSR database administrator will ensure the changes reflect approved documentation. All work orders generated from IIP identified DSR line items will require regulatory tracking in AssetSuite.

### **4.13 DSR (Not Refurb) and Non-IIP**

Darlington Generation Station is responsible to use the current station processes to monitor, track and close the work per the following governances and processes.

- N-PROC-MP-0060: Aging Management Process
- N-PROC-MA-0024: System Performance Monitoring
- N-GUID-01510-10001: Site Component Health and Engineering Program Health Reporting Process
- N-PROC-MA-0097: Equipment Reliability Implementation

### **4.14 DSR status**

DSR Status	Description
Approved	PSRB approved scope for the Darlington Refurbishment Project.
Cancelled	Work that will not be completed by the station or Refurbishment organization.
Closed	All work, actions and reports have been completed.
Not Refurb	DSR is not part of the refurbishment project and will follow Darlington's normal processes for evaluation.
Not Required	Contingency work that has been analyzed and determined to be not required, usually due to a report, analysis or inspection results.
Superseded	The DSR's scope is covered by another existing or new DSR. Superseded to station AR, ASIC project, PM, etc for Non-IIP Station owned DSR.

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.15 Initiating work requests from DSR items**

Detailed work orders will be required during the Detailed Planning phase. D-GUID-09701-10013, Initiating Work Request for DSR Items, helps establish the correct nomenclature and sufficient level of detail used when initiating the work request.

When Unit, SCI, Device, Scope of Work and Unit condition information is known, the DSR line item is ready to initiate a work request, as per N-PROC-MA-0008, Work Initiation and Prioritization.

### **4.16 Work Requests to Work orders**

Work Control SPOC reviews submitted work requests for N-PROC-MA-0008 compliancy, assigns appropriate attributes/tags and approves the work request to a work order.

### **4.17 Health of Scope (HoS)**

#### **4.17.1 Background**

The Darlington Nuclear Refurbishment scoping strategy includes a Health of Scope grouping number representative of the work required to progress a DSR from the identification stage to the definition stage. Each DSR in the DSR database has been categorized with a Health of Scope number identifying how well the scope is known and understood. A unit suffix has been added to HoS 04 and the newly created HoS N/A. Therefore each unit will need to be dispositioned for every DSR. This will enable a better history of the DSR when doing the DSR closure report for each unit. The target is to get Health of Scope to 04.X (work orders have been input on X unit) or N/A.X (work orders will not be input on X unit). This will enable the work to have sufficient clarity that it can enter into the Work Management processes (ECC, work order etc.) at RO-24 (OMS Work Order Scope Definition Complete Milestone).

#### **4.17.2 Health of Scope number definitions:**

HOS	Definition
0	New items which have not been assigned a Health of Scope by the Project Manager. The expectation is that the HoS is assigned within 2 weeks after the PSRB approval.
03	No further work required on DSR.
N/A.1	This DSR line item will not generate work orders on Unit 1 and does not require any other work orders to support Unit 1's Refurb Outage.
N/A.2	This DSR line item will not generate work orders on Unit 2 and does not require any other work orders to support Unit 2's Refurb Outage.
N/A.3	This DSR line item will not generate work orders on Unit 3 and does not require any other work orders to support Unit 3's Refurb Outage.
N/A.4	This DSR line item will not generate work orders on Unit 4 and does not require any other work orders to support Unit 4's Refurb Outage.

Document Number:	Usage Classification:	
<b>NK38-INS-09701-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R006</b>	<b>20 of 50</b>

Title:

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

04.1	All Work Orders that this DSR requires on Unit 1 and to support Unit 1's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.2	All Work Orders that this DSR requires on Unit 2 and to support Unit 2's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.3	All Work Orders that this DSR requires on Unit 3 and to support Unit 3's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.4	All Work Orders that this DSR requires on Unit 4 and to support Unit 4's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
05	DSR is adequately known such that it is ready for Work Order to be input on all Units (Scope of work and unit condition known).
10	Work is known at the component / MEL level (unit, SCI and Device known).
20	Work is known at the system or project level but not component
30	Actions to implement selected, may be a component strategy across many systems. Options developed and preferred selected at system level (potentially many systems).
40	Analyze the completed report to determine actions / path forward. Required assessments or analysis have been completed and issue, priority, constraints and success criteria are understood.
50	Further assessment is required to build a report for analysis to understand the identified issue before the scoping process can begin. At this point the extent, the impacts, the significance, nor the potential resulting actions are known
60	Pure engineering or procedures with no likely field work (i.e. provide CNSC with a report, update procedure, etc). Activities identified as pure engineering or requiring documentation update will be planned by the responsible functional organizations and will be scheduled in the functional organization schedule ensuring that the deliverables meet the timelines identified in the overall Project Integrated Master Schedule.
90	DSR recommended to be removed from NR scope and will not be executed in Nuclear Refurbishment. DSR will be removed from NR scope, pending PSRB approval. The expectation is that the Project Manager who owns the Scope Health 90 item will have the DRAS completed and approved 14 days prior to the next SRB and communicated to the NR Outage Manger for inclusion and scope removal approval at the next SRB.

Note: Any required unit 0 work will be tagged with the unit requiring the implementation.

### 4.17.3 HoS change process

- Change request initiated in DSR database
- Change request approved by the Project Manager, Nuclear Refurbishment
- Change request concurred (electronically signed) by appropriate stakeholders
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

**Note:** HOS 90 scope removals approved by SRB at next scheduled meeting.

### 4.17.4 Requirements to Progress HoS

This section identifies deliverables required to take a DSR from the Identification phase to Definition phase at a system level through identifying examples of deliverables for each category.

#### **Health of Scope 50 to 40**

Review the scope for the need to prepare an assessment for further analysis. Deliverables to move DSR to 40 may include:

- Nuclear Safety Assessments/Analysis
- Detailed system assessments
- Code gap analysis
- Reliability assessments
- Life Cycle Management plan
- Material/fatigue analysis

To obtain these deliverables an in-house resource may be assigned or a contracting strategy developed and an outside vendor used. The assessments, plans, analysis should end in recommendations that lead to a better understanding of the issue identified in the DSR. At this point the DSR is considered to be HoS 40.

#### **Health of Scope 40 to 30 or 20 if only 1 System or Project**

Review results of the assessments and identify if DSR requires a modification to the plant, maintenance on a system (i.e. repair, replace) inspection or test. Identify options and select preferred to resolve the DSR issue. Steps to progress to 30 may include the following:

- New DSR presented to PSRB for approval
- Prepare and process DRAS form N-FORM-11390 as per N-PROC-LE-0008 if required to either progress DSR or close the item.
- Prepare EDM (Engineering Decision Making Meeting) materials and hold EDM if required to progress complex scope issues as per N-GUID-01900-10001, if EDM agrees with potential scope then generate ECR (Engineering Change Request)
- Prepare Project Gate documents as per N-MAN-00120-10001-GRB.

Title:

### **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

- Prepare Conceptual Study/Report as required identifying potential options to address the problem/needs statement. May be prepared by Refurbishment, OSS (Owner Support Services) or EPC (Engineer, Procure, Construct) vendors.
- Generate inspection requirements or plans to support planning of recommended testing or inspections

Additional assessment or analysis may be required to further define the options where the initial assessment cannot conclusively recommend a path forward to resolve the DSR. In this case the DSR Health of Scope is returned to 50 for further assessment.

#### **Health of Scope 30 to 20**

Work scope should be defined at a system level. Inspections and Conceptual studies may define a need for further scope to be added into the project, contingencies should be planned for by this time and high risk contingency items should progress through the gated process as required if the inspection work cannot be done until a later date. Activities to progress to 20 may include:

- Options developed and preferred selected at system level.
- Prepare Project Gate documents as per N-MAN-00120-10001-GRB

#### **Health of Scope 20**

Work is known at the system or project level but not component. Initiation Phase complete, the following activities can begin:

- Generate a project charter or needs statement for potential modifications to be implemented outside of the Darlington Refurbishment organization.
- Identify non-modification work recommended in the assessments and contact Nuclear Refurbishment WCTLs to input work request for the work, if DSR item issue can be resolved through execution on non-modification work the DSR item can be reclassified as 5 in the Health of Scope
- Develop Preliminary Design Requirements for potential modifications where scope has been adequately defined
- Definition Phase begins. System or project scope is defined. ECR can be generated (ECR identifying problem statement for potential modifications as per N-PROC-MP-0090)
- Sufficient information available to begin to prepare preliminary and detailed design scope of work for EPC RFP (Request for Proposal)
- Long lead items identified

#### **Health of Scope 20 to 05**

## Instruction

Internal Use Only		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>23 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

Unit, SCI, Device, Scope of Work and Unit condition is known for the DSR and is ready to initiate work requests, as per N-PROC-MA-0008, Work Initiation and Prioritization. Detailed work orders will be required during the Detailed Planning phase. D-GUID-09701-10013, Initiating Work Request for DSR Items, helps establish the correct nomenclature and sufficient level of detail used when initiating a work request from a DSR. It is expected that once ECR's are approved, conceptual design options are identified and preliminary design requirements are prepared. The EPC contracts can then be issued where the contractor will further define the work and ensure that work order planning is completed. Work will be managed via the Gated Process (N-MAN-00120-10001-GRB).

### **Health of Scope 05 to 03 or 04.X or N/A.X**

Work have been input for unit X (04.X) or work orders will not be input for unit X (N/A.X). This requires each unit to be dispositioned for every DSR, which creates a better history for DSR closure reports. If there is no work required for DSR, it can go to HoS 03.

## **4.18 Scheduling**

Darlington Refurbishment Project Managers are accountable to identify the deliverables required to progress DSRs through the Scope Health Definition levels to Health of Scope 03 or 04.X or N/A.X. P6 schedule activities will be created for the deliverables that progress a DSR to HOS 03 or 04.X or N/A.X. The Project Managers will update and maintain the health of scope rating of the DSR in the DSR database.

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

### 5.0 DSR DATABASE DEFINITIONS

<b>Acct_Org</b>	Accountable Organization
<b>Add_Info</b>	Additional information
<b>APP_ISR</b>	Indicates that the DSR is included in the Integrated Safety Review (ISR)
<b>Bundle</b>	Work Grouped by Project Manager area of responsibility (i.e. Balance of Plant [BOP], Fuel Handling [FH]) translates to Complex code on the work order.
<b>CCA</b>	Component Condition Assessment Number
<b>CONTINGENCY</b>	Contingency Flag
<b>Cost_Element</b>	Category from original Darlington Refurbishment Business Case to which the cost is allocated
<b>Cost_Estimate</b>	Cost estimate
<b>Description</b>	Description of work encompassed by the DSR (usually from CCA)
<b>DSR</b>	DSR related to the Line item
<b>DSR_Init</b>	DSR initiator (LAN ID)
<b>Dsr_Line</b>	DSR Line Item Number
<b>Ex_Owner</b>	Execution Owner by name
<b>Fog</b>	Functional Outage Grouping
<b>FUN_STR</b>	Funding Stream i.e. Station funded or Refurb funded, etc.
<b>Gate</b>	Last Gate of the Gate Review Process the DSR has passed through
<b>Grouping</b>	Health of Scope indicator
<b>Economic Evaluation</b>	Indicator of completion of the economic evaluation (Y=yes economic evaluation completed, N=no economic evaluation not completed, Not Required= economic evaluation not required; i.e. HOS 60 DSRs and Core Scope DSRs)
<b>Hierarchy</b>	Priority Ranking of DSRs
<b>Inspection</b>	Indicator that an inspection is required
<b>Item</b>	DSR Line item number
<b>Meet_Date</b>	SRB meeting date
<b>Not_Refurb_Reason</b>	Reason for the scope being rejected by PSRB and not included in the Refurbishment of Darlington
<b>Prereq_Type</b>	Categories for Prerequisite work. (The scope bucket may be non Pre-req but have some pre outage Work Orders)
<b>Priority</b>	Not Used at This Time
<b>PSRB_Sponsor</b>	Manager level or higher who sponsors the scope for consideration by PSRB

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

### B.2.0 NON -CORE SCOPE (NCS)

#### B.2.1 Sustaining (SU) - Non - Core Scope

Sustaining Scope is not mandatory to execute the Refurbishment Outage and achieve the Program Objectives. It may provide long term benefits to the Darlington Site and stations outside the primary Program Objectives. All Non-core Scope requires economic justification (i.e. DRAS).

Category		Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>SU01</b>	Sustaining Infrastructure	<ul style="list-style-type: none"> <li>Infrastructure upgrades required to sustain an additional 30 years of operations.</li> <li>Work is listed as part of the Darlington Master Campus Plan and the Darlington Program Campus Plan Scope Statement</li> <li>Is not part of, nor does it directly support core scope.</li> </ul>	Q. Can the work be executed after Refurbishment is complete without impacting ongoing plant operations?	<ul style="list-style-type: none"> <li>Salt Shed</li> <li>Heavy Vehicle Storage Building</li> <li>Boiler House</li> <li>Lakeshore Garage</li> <li>Gas Bottle Storage</li> </ul>
			Q. What is the economic benefit to refurbishment or to the continued operation of DNGS for an additional 30 years?	
			Q. What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	
			Q. Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>SU02</b>	Station Upgrades	<ul style="list-style-type: none"> <li>Non-infrastructure station upgrades required to sustain an additional 30 years of operations.</li> <li>Is not part of, nor does it directly support core scope.</li> </ul>	Q. Can the work be executed after Refurbishment is complete without impacting ongoing plant operations?	<ul style="list-style-type: none"> <li>New or improvements to permanent stairway, lifting device, floor grating, access hatches.</li> <li>Logistics improvements to loading bays, cafeteria, walkways</li> </ul>
			Q. What is the economic benefit to refurbishment or to the continued operation of DNGS for an additional 30 years?	
			Q. What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	
			Q. Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>SU03</b>	Equipment Renewal	<ul style="list-style-type: none"> <li>One time replacement at current end of component life</li> </ul>	Q. Would the refurbishment core scope still be possible to execute without this scope / infrastructure?	<ul style="list-style-type: none"> <li>Steam Turbines and Turbine Auxiliaries: Main Lube Oil Pump</li> </ul>

### B.2.2 Value Enhancing (VE) - Non - Core Scope

Value Enhancing Scope is not mandatory to execute the Refurbishment Outage. There may be significant advantages to the station or to OPG by executing some value enhancing scope. It will primarily have an impact on the post-refurbishment time period. Value Enhancing scope would optimize (primarily) the cost efficiencies post-refurbishment and may help the Station meet efficiency targets (these are not Refurbishment targets). Value Enhancing scope could also provide cost or resource efficiencies during Refurbishment, but are not absolutely essential in completing the work. All Non-core Scope requires economic justification (i.e. DRAS).

Category	Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>VE01</b>	Operations, Outage, Cost, Resource & Maintenance Efficiencies	<ul style="list-style-type: none"> <li>Scope can be proven to add value to the station operations in future by improving maintenance methods, saving costs on outages, optimizing resources or improving operations.</li> </ul>	<ul style="list-style-type: none"> <li>Outage Heat Sink modification expected to reduce outage durations post-refurbishment.</li> <li>Modification to enable a valve to be replaced with a new design instead of repairing a valve.</li> <li>Modification to allow specified maintenance to be completed at-power rather than during an outage condition.</li> <li>Technically required work which is known to extend outage duration or incur greater dose in regular outages and makes an economic case to include in the Refurbishment Program.</li> </ul>
		<p><b>Q.</b> Has a clear explanation been provided as to why the expected impacts/ savings (e.g. OM&amp;A costs, planned outage time, forced loss rate, operator work around, dose reduction, etc) are defensible and attributable to this specific scope of work?</p>	
		<p><b>Q.</b> Has a review been done to ensure that the expected savings/impacts of this scope of work have not already been included in other proposed work scope?</p>	
		<p><b>Q.</b> Have all major stakeholders (and potentially an independent 3rd party) validated the expected savings/ impacts?</p>	
		<p><b>Q.</b> Have all potential post-project implementation costs been included?</p>	
		<p><b>Q.</b> Have required infrastructure and support work costs been included?</p>	
		<p><b>Q.</b> What is the Cost of parts and labour? Is it economically beneficial to do</p>

Assuming Economic Benefit (i.e. DRAS)  
and Doability]
  
```

**Program Objectives**

**Ref. Project Charter**  
D-PCH-09701-10102

**Principle Program Objectives**

- Confirm feasibility of refurbishing Darlington NGS reactors
- Plan and execute all work required to refurbish the Darlington units
- Ensure the scope of the refurbishment outages will enable economic Top Decile operations of each unit for an additional 30 years, following post-refurbishment synchronization

**1.0 CS - Core Scope**

Core Scope directly supports the Program Objectives to ensure the success of Refurbishment.

**CS01 – Regulatory Improvements to meet current Standards**

- 1.01 Scope that is not optional in order to support the Station License and Regulatory Requirements.
- 1.02 Nuclear Refurbishment CNSC Commitments.
- 1.03 ISR / EA, IIP Regulatory Commitments.

**CS02 – Life Limiting Components**

- 1.04 Major component modification, repair or replacement that cannot survive operation for an additional 30 years
- 1.05 They could only be repaired or replaced under refurbishment outage plant condition (i.e. De-fuelled/dewatered)

**CS03 – Mandatory Support for Core Scope**

- 1.06 Must do in order to support execution of Core Scope.

**CS04 – Mandatory 'Construction Period' Outage Work**

- 1.07 Preventative Maintenance Work that would normally be executed during the time period during the Refurbishment Outage.
- 1.08 Mandatory Inspections that would normally be executed during the time period during the Refurbishment Outage.

**CS05 – Regulatory Improvements beyond current Standards**

- 1.09 Regulatory suggested improvements that are not required as per current codes and standards.

**2.0 SU - Sustaining – Non-Core Scope**

Sustaining Scope is not mandatory to execute the Refurbishment Outage and achieve the Program Objectives. It may provide long term benefits to the Darlington Site and stations outside the primary Program Objectives.

**SU01 – Sustaining Infrastructure**

- 2.01 Infrastructure upgrades required to sustain an additional 30 years of operations.
- 2.02 Work is listed as part of the Darlington Master Campus Plan and the Darlington Program Campus Plan Scope Statement. Is not part of, nor does it directly support core scope.

**SU02 – Station Upgrades**

- 2.03 Non-infrastructure station upgrades required to sustain an additional 30 years of operations. Is not part of, nor does it directly support core scope.

**SU03 – Equipment Renewal**

- 2.04 One time replacement at current end of component life (Nominal 30 years).
- 2.05 Replacement of obsolete components (criticality 1 + criticality 2).
- 2.06 Inspections to determine equipment condition not part of normal PM program.

**3.0 VE - Value Enhancing – Non-Core Scope**

Value Enhancing Scope is not mandatory to execute the Refurbishment Outage. There may be significant advantages to the station or to OPG by executing some value enhancing scope. It will primarily have an impact on the post-refurbishment time period. Value Enhancing scope would optimize (primarily) the cost efficiencies post-refurbishment and may help the Station meet efficiency targets (these are not Refurbishment targets). Value Enhancing scope could also provide cost or resource efficiencies during Refurbishment, but are not absolutely essential in completing the work.

**VE01 – Operations, Outage, Cost, Resource & Maintenance Efficiencies**

- 3.01 Scope can be proven to add value to the station operations in future by improving maintenance methods, saving costs on outages, optimizing resources or improving operations.
- 3.02 Replacement of components which due to scale of work makes economic sense.

**VE02 – Safety Improvements beyond Standards**

- 3.03 Station or Refurbishment suggested improvements that are not required as per current codes and standards.

**VE03 – Environmental Improvements beyond Standards**

- 3.04 Station or Refurbishment suggested improvements that are not required as per current codes and standards.

**VE04 – Infrastructure upgrades that are expected to increase efficiencies for the Refurbish Outage period only, but do not directly support Core Scope.**

- 3.05 Scope that can improve efficiencies during the refurbishment such as improved resource effectiveness, reduction of delays, improved site transportation/logistics.

**VE05 – Enhance Corporate Reputation**

- 3.06 Proposed scope that will/may enhance OPG's or Darlington Refurbishment Program's corporate reputation with Clarington, Ontario or other groups.

**4.0 PF - Performance Improvement – Non-Core Scope**

Performance Improvement Scope is non-core scope that supports the reduction of Unit backlog work orders or supports System Health targets beyond the condition at unit turnover to the Refurbishment Program management team.

**PF01 – Reduce Unit Backlog (non-core, most likely CM or EM work orders)**

- 4.01 Non-core work that will help reduce backlogs on Darlington Units.
- 4.02 Work may be required for unit start-up (i.e. you need the CM or EM equipment fixed to perform start-up of the unit). This may be mandatory to execute for unit condition, but is still not core scope.

**PF02 – Operator Work-Around (non-core)**

- 4.03 Non-core work that will remove a requirement for an Operator Work Around. Work may be mandatory for start-up, but is still not core scope.

**PF03 – Design Modifications (non-core) required to maintain operation of an existing non-life limiting component (likely a CM or EM backlog work order origin)**

- 4.04 Proposed modification may be required to continue operations of a system or component, but is not core scope and does not contribute in the greater '30 year' life span of the equipment or system.
- 4.05 May be required for Unit start-up if it is emergent.

**PF04 – Reliability Improvement**

- 4.06 Proposed scope has high likelihood of improving unit reliability and contributes to reducing unit forced loss rate and optimizing unit capacity factor.
- 4.07 Has caused an Equipment Reliability Reset.
- 4.08 Allows station to achieve Top Decile performance.
- 4.09 Supports outage improvements.

**Accepted**

**Conditional Acceptance**  
Assuming Economic Benefit (i.e. DRAS) and Doability

**Conditional Acceptance**  
Assuming Economic Benefit (i.e. DRAS) and Doability

Title:
<b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>

## Appendix E: Core Scope of the Darlington Refurbishment Program

### Refer to NK38-PLAN-01060-10003, Darlington NGS Refurbishment Project Reference Plan – Scope Definition

Core Scope of the Refurbishment Program will support the primary objectives of the Program. Core Scope is included in the Business Case Summary for the Program.

The following is a **brief** summary of the current documented major components of Core Scope.

- Replacement of all Fuel Channels (calandria tubes and pressure tubes)
- Replacement of all Feeders
- Balance of Plant life limiting components only where justified to support Program Objectives and support an economic business case
- Regulatory work required to be performed in order to extend the life of the station by an additional thirty years, as indicated in the CNSC approved Integrated Safety Report (ISR), Environmental Assessment (EA), and Integrated Implementation Plan (IIP).
- Work related to outage preparation, including development of tooling, mock-ups, training, unit islanding, installation of barriers, modifications, etc. to support the outage, and all planning activities related to items included in the scope of the Darlington Refurbishment Program.
- Infrastructure development to directly support the refurbishment outage
- Work Management work committed to be performed on the unit within the start and end date of that unit refurbishment outage.

Appendix K: MEMO: Value-Enhancing Investment at DNGS during Refurbishment

700 University Avenue, H7G5, Toronto, ON M5G 1X6

MEMORANDUM

April 12, 2013

MR. D. REINER  
Senior Vice President  
Nuclear Refurbishment

Value-Enhancing Investment at DNGS during Refurbishment

The Refurbishment of Darlington represents a significant milestone in the evolution of OPG. During the life of this project, we will see the cessation of coal (2014) and the potential end of operations at both Pickering A and Pickering B (2020). Both of these major events will lead to a significant shrinking of OPG's operations. At this time, there is no guarantee of New Nuclear becoming a reality, or a repowering of the Thermal sites. This downsizing of operations, and the need to be cost competitive going forward puts significant pressure on our ability to raise capital and to sustain operations over the long-term.

To minimize our capital requirements during the refurbishment outage and to make quality investments in the plant that support high quality, profitable operations going forward, I am proposing that the Refurbishment Project adopt more stringent criteria for assessment of sustaining, value-enhancing and performance improvement work that is to be included in the refurbishment outages. The criteria will apply to all scope that is not considered core scope as defined by the Scope Review Board governance.

The adoption of more stringent criteria on sustaining, value-enhancing and performance improvement initiatives during the refurbishment outage, would help to constrain scope to only those high value scope items that show a significant contribution to the bottom line. These more stringent criteria would include a hurdle rate of 9.5% (WACC) valued on the forecast System Economic Values and a simple payback period of six years, or 2 outage cycles.

A handwritten signature in dark ink, appearing to read "Donn Hanbidge".

Donn Hanbidge

Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

### 1.0 DIRECTION

#### 1.1 Objective

The objective of this Guide is to outline the purpose and provide instructions on the management of Milestone definitions for Nuclear Refurbishment, within the Darlington (DN) Refurbishment Program.

The success of the Refurbishment program is highly dependent on timely completion of deliverables and achievement of milestones.

All phases will be controlled by Program Milestones (Tier 1,2,3). Adherence to milestone timelines and definitions is essential to ensure a successful Refurbishment. Each project will also have Milestones (Tier 4 and 5)

#### 1.2 Purpose

This Guide will standardize the framework for developing Darlington Refurbishment Milestone definitions.

The purpose of this Guide is to provide Darlington Nuclear Refurbishment staff and support organizations with knowledge of:

- Milestone Tier Structure
- Milestone Numbering Nomenclature
- Common Milestone Definition Template
- Milestone Completion Progress Monitoring
- Quality Requirements for Milestone Deliverables
- Milestone Closeout and Document Retention Requirements

#### 1.3 Intended Audience

The Darlington Refurbishment Program as documented in the DN Refurbishment Program Integrated Master Schedule NK38-PLAN-00300-10000, including all projects within the program.

All Milestones will be identified with a Milestone Tier Structure in accordance with Section 3.1 below.

## Manual

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>6 of 31</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

## 2.0 MILESTONE DEFINITION REQUIREMENTS

### 2.1 Tier 1, 2 & 3 Requirements

Individual Milestone Definitions in accordance with the requirements of this manual are required for all Milestones identified as Tier 1, Tier 2, and Tier 3.

Tier 1, 2 & 3 are at the NR Program Level and represents Key Program Control Milestones

Each project/ functional schedule, as a minimum, shall have the following program reportable (elevated Tier 3) milestones

- i. Detailed design complete
- ii. Scope Health progress to 20
- iii. Request for proposal
- iv. Contract (s) award
- v. Long Lead Material Identified
- vi. Start of Installation
- vii. Commissioning Start
- viii. Available for Service
- ix. Any project or functional specific milestone that has important consequences for the Program i.e. EDM for Refueling

### 2.2 Tier 4 & 5 Requirements

Tier 4 and Tier 5 Milestones are at a Project/ Functional Bundle level and requirements will be identified at the project level following the Task Instruction: DNG Refurb—Standard Projects Milestone List, N-MAN-00120-10001-SCH-02. A sample of Standard Milestones Listing completed with associated Milestone Tier coding Structure is shown in Appendix “B”

### 2.3 NR AIP Milestones Requirements

NR AIP Milestone is referring to Nuclear Refurbishment Program AIP level milestones.

A Milestone Definition Template (D-FORM-10762) is required for each identified NR AIP Milestone.

NR AIP Milestones should be identified at least as Tier 3 reportable milestones.

### 2.4 NR AIP Scorecard Definition Requirements

The Milestone Definition Template (D-FORM-10762) is required for each NR AIP Scorecard definition as outlined in the NR AIP Scorecard list. Included on the template will be the requirements for the NR AIP scorecard completion signoff.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>7 of 31</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

### 2.5 Milestone Schedules Structure

The Project/ Functional Bundles Milestones Schedules structure (including milestone P6 coding process) will be followed as described in the “DR Program P6 Schedulers User Guide” N-MAN-00120-10002-SCH-08

### 2.6 Readiness to Execute Plan Milestones (RTE)

Readiness to Execute Plan is in support of tracking all processes, tools, and deliverables to ensure readiness for execution phase.

The RTE plan consists of a series of significant milestones leading up to the start of the DNRU2 Outage. These milestones are mainly Tier 4 and Tier 5 with some being Tier 1, 2 or 3. Due to their importance, RTE T4 & 5 milestones will be controlled with slightly more rigor than other T4 & 5 milestones.

RTE Tier 1, 2, 3 milestones follow the same processes as other Tier 1, 2, 3 milestones.

The completion and approval process diagram (4.1.5 – RTE Process Diagram) should be followed for Tier 4 and Tier 5 only.

## 3.0 PROCESS

### 3.1 Milestone Tier Structure

There will be Milestones at the Program level and Gates/Projects Milestones (per Gated Process N-MAN-00120-10001-GRB & N-MAN-00120-10001-SCH-02) at the Project level.

The relationship between Program Milestones and the Gated Process is shown in Appendix A.

Milestone Reporting Tier Structure is required to identify Key Program Control Milestones and to easily identify the level in the Organization that the Milestone is reportable to and the Approval Level required for any deviation to the Milestone

#### (1) Program Tier 1 - Commitments to the Board

- Reportable to: EVP Nuclear Refurbishment
- Definition: Milestones that are commitments to the Board or decisions at Board Level.
- Example: RQE Release Quality Estimate, and Unit Start/Finish dates

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>8 of 31</b>

Title:

### NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

- (2) **Program Tier 2 – Critical Impact**
  - Reportable to: SVP Nuclear Refurbishment
  - Definition: Milestones that are critical to the Program, normally documented in Phased based Program BCS's per Release Strategy.
  - Example: CNSC Approval of ISR
- (3) **Program Tier 3 – Program Controls, including the NR AIP milestones and NR AIP Scorecard.**
  - Reportable to: SVP Direct Reports
  - Definition: Milestones that manage the health of the Program and keep it on track
  - Example: All Projects Scope Freeze/Detailed Eng. Finished
- (4) **Project Tier 4 – Project Gates**
  - Reportable to: VP Refurbishment Execution (or delegate)
  - Definition: Project Gates (checkpoints of project preparation progress at which funding is released for the next phase).
  - Example: G0 Project Scope Approval, G3 Definition Phase.
- (5) **Project Tier 5 – Standard Project Milestones & Project Manager Milestones**
  - Reportable to: Project Manager
  - Definition: Milestones that are within the gated process and are specific to the project life cycle.
  - Example: Turbine Generator Project Charter Approved (CHR), Management Plans completed, Project Long Lead Materials

## 3.2 Milestone Numbering Nomenclature

### 3.2.1 PIMS Milestones

The Activity ID from the Program Schedule (PIMS) will be assigned as the Major Milestone number.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>9 of 31</b>

Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>
---

Same Activity ID will be used to identify the specific record number when filling D-FORM-10762 –Program Milestone Definition, or D-FORM-10763- Program Milestone Recovery Plan.

The Schedule Activity ID coding is as follow:

Activity ID Coding	Code Description
RG	Regulatory Key Dates
RL	Program Release Dates
CP	Campus Plan Dates
RP	Unit 0 Outage Preparation Key Dates
OP	Unit “*” Outage Preparation Key Dates
U”*”	Unit “*” Outage Key Dates
CL	Program Close out Key Dates

### 3.2.2 Elevated Tier 3 Milestones

The Activity ID from the Project/ Functional Bundles Schedule will be assigned as the Major Milestone number.

The Project/ Functional Bundles Schedules Activity ID coding structure will be followed as described in the “DR Program P6 Schedulers User Guide”. N-MAN-00120-10002-SCH-08.

### 3.2.3 NR AIP Milestones

The Activity ID from the Program/Project will be assigned as the NR AIP Major Milestone number.

### 3.2.4 NR AIP Scorecards

If the NR AIP Scorecard Measure is a combination of more than one schedule Activity IDs, or has an arbitrary background other than the schedule, the AIP scorecard nomenclature will illustrate the AIP measure description.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>10 of 31</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

### 3.3 Milestone Definition Template

The Milestone Definition Template (D-FORM-10762) is required for Tier 1, Tier 2, & Tier 3 Milestones only. Included on the template will be the requirements for the Milestone Completion signoff. Instruction on how to fill in D-FORM-10762 is shown in Appendix E.

### 3.4 Milestone Completion Progress Monitoring

Timely and quality completion of milestones is critical for executing Darlington Refurbishment on schedule.

In order to ensure quality and timely completion of Milestones, the following formal monitoring process is required to manage/control/review/report completion progress of all Tier 1,2 &3 milestones.

All Tier 4 & 5 milestones will be managed by the individual project manager through the normal project management process. The project management process will interface with this process when it impacts a Tier 1,2 or 3 milestone.

#### 3.4.1 Milestone Definition Signoff

The Milestone owners will signoff agreement to the definition of the milestone.

The signoff will be included on the Milestone Definition template D-FORM-10762 Part "A".

#### 3.4.2 Milestone Success Plan Presentation

Prior to the Milestone due date the Milestone owner will present, at the monthly program review meeting, their plan specifying how they will satisfy the requirement for a quality and timely completion of the Milestone.

The milestone success plan presentation should be done 3, 6 or 9 months prior to Milestone TCD date. (Refer to D- FORM-10762 Part "A")

A template for the Success Plan Presentation is shown in Appendix "C"

#### 3.4.3 Milestone Recovery and Mitigation Plans Requirements

Recovery or mitigation plans are required whenever the variance from plan is significant enough that completing a milestone within the committed timeframe and with quality, is at risk. The distinction between a recovery plan and mitigation plan is below.

Recovery Detailed plan that supports full recovery of the milestone within the

## Manual

Internal Use Only

Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>11 of 31</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

Plan: committed time frame.

Mitigation Plan: Detailed plan that identifies how commitments within milestone will be achieved, however outside of the committed time frame. I.e. milestone will be missed.

Milestones identified as Tier 1, 2, or 3 require recovery or mitigation plans documented within D-FORM-10763. Instruction on how to fill in D-FORM-10763 is shown in Appendix F.

Where milestone recovery is not possible, and a mitigation plan has been initiated, a change in the milestone date may be required. Changes to Tier 1, 2, or 3 milestones commitments are required to follow the Change Control process and mitigation plan should be attached.

### 3.4.3.1 Recovery and mitigation plans shall address the following:

- Original milestone completion date
- Target date by which full recovery will be completed
- Description of why the Milestone became challenged
- Course of action to recover the Milestone including responsible individuals and due for actions
- Successor milestones that are affected and the impact.

### 3.3.4.2 Approval of the milestone recovery and mitigation plans will be consistent with milestone tier structure approval (Section 3.1).

### 3.4.3.3 A summary of the milestone recovery and mitigation process is shown in Appendix D”.

## 3.4.3 Milestone Change Control Process

In the event that the timely completion of the identified Tier 1, 2 or 3 milestone is in jeopardy a Milestone Recovery Plan should be followed as described under item 3.4.3

In order to cancel a Tier 1, 2 & 3 milestone the Change Control process has to be followed as described in N-MAN-00120-10001-PC-01.

## Manual

Title:

### NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

In the event that a Tier 1, 2 or 3 milestone is following the cancelation process, the milestone recovery form N-FORM -10723 shall be attached to the Change Control Form N-FORM-11252 as per N-MAN-00120-10001-PC-01.

Tier 4 & 5 milestones will be managed by the individual project manager through the normal project management process.

### 3.5 Quality Requirements for Milestone Completion

Completion of all the Program Milestones (Tier 1 to Tier 3) must be supported by a suitable quality verification process. Depending on the type of Milestone and the deliverables associated with completion, quality verification may be comprised of any one or more of the following:

- (a) Demonstration that preparation, review and approval of supporting deliverables have been controlled by an existing managed system (e.g. OPG/OPGN/DR governance, other Quality Assurance methods or processes adopted by OPGN/DR for conducting its business)
- (b) Demonstration that preparation, review and approval of supporting deliverables have been vetted or validated through other established work processes and practices in OPGN/DR, which may take the form of internal memos, presentations to and agreements from relevant stakeholder, minutes of meetings etc.
- (c) Demonstration that the quality of supporting deliverables has undergone independent, third-party verification.
- (d) Successful outcome from a Challenge Meeting or Challenge Process solely conducted for verifying adequate completion of a milestone against a pre-established set of expectations/success criteria agreed to between the milestone owner and the receiving stakeholder(s).

The requirement for a Challenge Meeting or Challenge Process will be embedded in each specific Milestone Definition.

Agreement to Milestone completion needs to be obtained from the organization accepting the deliverables. This ensures that the deliverable provided is useable by the organization that needs to complete the next activity.

### 3.6 Milestone Completion, Closeout and Document Retention Requirements

A Milestone shall not be declared complete until all requirements have been successfully completed or dispositioned. Completion needs to be fully documented and needs to be auditable.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>13 of 31</b>

Title:

### NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

To ensure this, Milestone Closeout needs to be documented; a signed Darlington Refurbishment Signoff for Milestone Completion identifying the deliverables/documents that were completed will be presented at the monthly program review meeting.

If a Challenge Meeting is identified for a Milestone, this form will be presented at the Challenge Meeting.

Darlington Refurbishment Signoff for Milestone Completion signoff will be included as “Part B” on the Milestone Definition Template D-FORM-10762.

## 4.0 APPROVAL PROCESS

### 4.1 Routing and Authorization

The initiator shall complete all the section of the milestone templates form as required. Major steps on the routing and authorization process are as follows:

#### 4.1.1 Milestone Definition D-FORM-10762 Part A

- Owner Complete Milestone Definition Template D-FORM-10762 Part A
- Milestone Definition D-FORM-10762 (Part A) Signed by the Owner
- Route the signed D-FORM-10762 (Part A) to P&C Scheduling Department
- P&C SPOC Reviews D-FORM-10762 (Part A) for completeness & return to owner
- Milestone owner file D-FORM-10762 (Part A) in Asset Suite by forwarding PDF to DNG Doc Mgmt

Milestone owner retain original D-FORM-10762 for completion of Part B

#### 4.1.2 Milestone Definition D-FORM-10762 Part B

- Milestone Owner Success Plan Presentation (Item 3.4.3 from N-MAN-00120-10001-SCH-06)
- Milestone Owner completes all identified milestone requirements
- Milestone Completion D-FORM-10762 (Part B) issued by Owner
- Milestone Owner sends D-FORM-10762 (Part A & B) to RPET for recommendation to close
- RPET provides recommendation to close
- Milestone Owner sends D-FORM-10761 (Part A & B) to Director Project & Control for approval

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R003</b>	Page: <b>14 of 31</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

- Milestone Owner sends a copy of the approved D-FORM-10762 (Part A & B) to P&C Scheduling Department
- Milestone Owner file the final approved D-FORM-10762 (Part A&B) in Asset Suite by forwarding PDF to DNG Doc Mgmt

### 4.1.3 Milestone Recovery / Mitigation Plan D-FORM-10763

- Milestone Owner completes Milestone Recovery / Mitigation Plan D-FORM-10763
- Milestone Owner sends D-FORM-10763 to RPET for recommendation to close
- RPET provides recommendation to close
- Milestone Owner sends D-FORM-10763 to Director Project & Control for approval
- Milestone owner file D-FORM-10763 in Asset Suite by forwarding PDF to DNG Doc Mgmt
- Milestone Owner completes Change Control Form (CCF) as per N-MAN-00120-10001-PC-01
- Route the signed D-FORM-10763 and approved CCF to P&C Scheduling Department
- P&C Scheduling Department updates the Level 1 Schedule

### 4.1.4 Approval process Diagram

For approval process the attached completion and approval process diagram should be followed.

### Appendix B: Standard Milestone Listing

#### Darlington Refurbishment Standard Milestones Codes

Standard Milestone Listing						Milestone Tier Structure						
* = Milestones may be required more than once in the project baseline schedule. ** = Refer to Outage Milestones in N-PROC-MA-0013 (Planned Outage Management)						1 = Commitments to the Board (SVP Nuclear Refurbishment Milestone) 2 = Critical Impact (SVP Nuclear Refurbishment Milestone) 3 = Program Controls (SVP Direct Reports Milestones) 4 = Project Gates & Main Project Team Milestone (VP Refurbishment Execution) 5 = Project Milestone within Gates (Project Manager Milestones)						
Order	Milestone Type	Milestone Code	Notes	Milestone Title	Description and Use	Milestone Tier Structure Code	Associate Program Milestones for Reference	Milestone Completion Criteria	Responsibility	Mandatory Y/N	Project Life Cycle Phase	
1	Finish	CDL		Conceptual Design Complete	Completion of conceptual design activities to determine alternatives/options and recommendation of a preferred alternative.	5		All conceptual studies and reports pertaining to preparation of Modification Outline have been accepted by OPG.	• Owner: Engineering • Support: Vendor/Project	Y	Initiation	
2	Finish	GR1		Gate G1 Approval	Gate G1 approval for Refurb. projects.	4		Initiation Phase Approval (Refurb).	• Owner: Project • Support: PMO	Y	Initiation	
3	Finish	GR2		Gate G2 Approval	Gate G2 approval for Refurb. projects.	4		Definition Phase Approval (Refurb).	• Owner: Project • Support: PMO	Y	Definition	
4	Finish	GR3		Gate G3 Approval	Gate G3 approval for Refurb. projects.	4		Unfused Execution Phase Approval (Refurb).	• Owner: Project • Support: PMO	Y	Execution	
5	Finish	GR4		Gate G4 Approval	Gate G4 approval for Refurb. projects.	4		Unfused Project Closeout Phase Approval (Refurb).	• Owner: Project • Support: PMO	Y	Closeout	
6	Finish	GR5		Gate G5 Approval	Gate G5 approval for Refurb. projects.	4		Final Project Closeout Phase Approval (Refurb).	• Owner: Project • Support: PMO	Y	Closeout	
7	Finish	SR		Required For Proposal	All documentation required to initiate the contract procurement process have been issued.	3		• Key terms and conditions have been developed and accepted by legal • All required Engineering documents (e.g. PDR, spec) are issued • Supplier work is issued	• Owner: Supply Chain • Support: Project/Legal	Y	Definition	
8	Finish	EPC	Predecessor to MS-11 **	Award Contracts / PO Issued	All EPC contracts have been awarded. Purchase Orders are adequately funded to cover the agreed upon contract value. Milestone applicable for a unit or a planned outage. Individual associated Tier 5 milestones might be identified at lower level in the schedule.	2		• S-100M-10029 has been approved by appropriate level of O&M and PO is issued in Support. • EPC vendor has been given charging path for the services rendered to OPG.	• Owner: Supply Chain • Support: Project/Legal	Y	Definition	
9	Finish	DCA		Design Contracts Awarded / PO Issued	PO issued and approved in Support	4		• EPC vendor has been given charging path for the services rendered to OPG.	• Owner: Project • Support: Vendor	Y	Definition	
10	Finish	ICA		Installation Contracts Awarded / PO Issued	PO issued and approved in Support	4		• EPC vendor has been given charging path for the services rendered to OPG.	• Owner: Project • Support: Vendor	Y	Initiation	
11	Finish	PCA		Procurement Contracts Awarded / PO Issued	PO issued and approved in Support	4		• EPC vendor has been given charging path for the services rendered to OPG.	• Owner: Project • Support: Vendor	Y	Definition	
12	Finish	DCS		Preliminary Design Completed	Preliminary Design is complete for review against the criteria provided in the gated Process. Design is responsible for this milestone.	5		The approved Modification Outline, the issued Design Plan, the issued Design Requirements, and the issued Design Release Plan must be attached to the Master EC record. A forecast for the required Project Design resources and the schedule for the remainder of the project has been documented.	• Owner: Engineering • Support: Vendor/Project	Y	Definition	
13	Finish	LLT		Long Lead Time Materials Identified	EPC contractor to provide list and description of materials that potentially have equal or greater than 24 months lead time for delivery from the time OPG approval has been granted to proceed with purchase. Milestone applicable for a unit or a planned outage. Individual associated Tier 5 milestones might be identified at lower level in the schedule.	3	U2 OP2040 U1 OP2040 U2 OP2050 U1 OP2050 U2 OP2060 U1 OP2060	Supply Chain to identify / generate new CATT's and determine Q level for low lead materials	• Owner: Project • Support: Vendor	N	Initiation	
14	Finish	PST	Predecessor to MS-11 **	Work Identified in Support	Phase 1 assessment of Work Orders in Support is complete.	4	U2 OP2015 U1 OP2015 U2 OP2015 U1 OP2015 U2 OP2015 U1 OP2015	Vendor to identify: • 100% of approved work orders • Tasks for support work groups • Regulatory approvals • Where possible, required modifications, pre/post required work and revisions to procedures • 80% of Material Regulations	• Owner: Project • Support: Vendor	Y	Definition / Execution	
15	Finish	WPI	Predecessor to MS-20 **	Work Plans Issued	Contractor work plan has been authorized by OPG for use.	5		• All required signatures have been obtained • User classification is identified • Process for intent and non-intent changes is identified	• Owner: Project • Support: Vendor	Y	Execution

Darlington Refurbishment  
Standard Milestones Codes

Order	Milestone Type	Milestone Code	Order	Milestone Title	Description and Use	Milestone Tier Structure Code	Associate Program Milestones for Reference	Milestone Completion Criteria	Responsibility	Planning Y/H	Project Life Cycle Phase
1	Plan	PCA	10	Work Package Assessment Completed and Readiness Feedback to Field	Person has advised CPM construction Manager (construction in field) construction Work Package	4	101 CP2020 102 CP1070 103 CP3070 104 CP4070	<ul style="list-style-type: none"> <li>Ordered additional work order tasks in previous past phase 1 as required</li> <li>Submitted their requests (PCOs) to Operations for priority needs</li> <li>Obtained approval for Status Control Tags where possible</li> <li>Inspection and Test Plans have been submitted by ANS for use</li> </ul>	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project/Doc</li> </ul>	1	Execution
2	Plan	SCD	11	Design Complete	Detailed design normally an Engineering Change Package (ECP) or vendor equipment release is complete, approved, and issued. This includes drawings and regulatory approvals. The release may include a single unit, multiple units, or other packages of work as approved in the Engineering Change modification system. This milestone date should be aligned with the Engineering Department Key Milestone Milestone applicable for a unit or a planned outage. Individual associated Tier 3 milestones might be identified at lower level in the schedule.	3	101 AP130 102 CP2020 103 CP1050 104 CP3020 105 CP4020	No documentation required to authorize the Design Engineering Change (including updates to the AEs (Other Equipment List (OEL) of Materials) spare parts list, and catalogue (SL) has been issued. Notes may be on a "turn to build" basis. A forecast for the required Project Design Resources and the schedule for the remainder of the project has been documented. Note: In order to proceed at this milestone date, Design requires confirmation of both major equipment purchase orders being issued to vendors and the design schedule.	<ul style="list-style-type: none"> <li>Owner: Engineering</li> <li>Support: Vendor/Project</li> </ul>	1	Definition
3	Plan	REC	12	Material / Equipment Available	Equipment/Materials are available for Just in Time delivery	5		Delivery date and shipping location have been reviewed and accepted by CPM construction Manager in accordance with agreed upon manufacturing strategy.	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project</li> </ul>	1	Execution
4	Plan	SCD	13	Start of Installation	Milestones to track the start of installation in construction which includes removal. Milestone applicable for a unit or a planned outage. Individual associated Tier 3 milestones might be identified at lower level in the schedule.	3		Readiness Installation Tasks have been set to working.	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project</li> </ul>	1	Execution
5	Plan	POC	14	Finish of Installation	Milestones to track the finish of installation in construction which includes removal.	4		Readiness Installation Tasks have been set to finished.	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project</li> </ul>	1	Execution
6	Plan	CHS	15	Commissioning Start	Milestone required for commissioning start. Milestone applicable for a unit or a planned outage. Individual associated Tier 3 milestones might be identified at lower level in the schedule.	3		Readiness Commissioning Tasks have been set to working.	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project/DOH</li> </ul>	1	Commissioning
7	Plan	CHS	16	Commissioning Finish	Milestone required for commissioning finish.	4		Readiness Commissioning Tasks have been set to finished.	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project/DOH</li> </ul>	1	Commissioning
8	Plan	APS	17	Available for Service and/or Ready for Service Completed	System Readiness has been turned over to Operations and is available for service. For Maintenance type projects where available for service does not apply, the Ready for Service should be used. Milestone applicable for a unit or a planned outage. Individual associated Tier 3 milestones might be identified at lower level in the schedule.	3		APS Acceptance: A meeting is held for APS. If acceptance is required at the meeting, then APS Acceptance has been met. If the meeting is held and APS is NOT accepted, then the milestone is not active. If the meeting is moved, and APS is accepted when the meeting is held then APS Acceptance has been met. Design RUS (APS Date - 20%) Support is required prior to and during outage. SCD Approval and Commissioning results accepted. POI complete and APS accepted.	<ul style="list-style-type: none"> <li>Owner: Construction</li> <li>Support: Vendor/Project/DOH</li> </ul>	1	Commissioning
9	Plan	SHO	18	SL Close-out Completed	Verification that Design SL is closed-out within the 6 months of the APS. (Change close out of the project.)	3		All account to issue that design documents and close Readiness Design SL. All action tracking items are set to complete with the associated roles in governance.	<ul style="list-style-type: none"> <li>Owner: Engineering</li> <li>Support: Vendor/Project</li> </ul>	1	Closeout
10	Plan	SHO	19	Close-out Completed	Milestone to identify the completion of close-out activities, or to close-out a specific unit. (Financial close out of the project.)	4		Project Close-out activities are complete and Project Close Report issued for approval.	<ul style="list-style-type: none"> <li>Owner: Project</li> <li>Support: Vendor/Construction</li> </ul>	1	Closeout
11	Plan	SHO	20	MOC Requirement Met	Milestone for tracking history of the Environment Requirements. Include action tracking number in activity description.	3		Action Tracking item is complete and closed.	<ul style="list-style-type: none"> <li>Owner: Project</li> <li>Support: Engineering/Operations/Vendor</li> </ul>	1	Definition / Execution
12	Plan	SHO	21	MOC Requirement Met	Milestone for tracking history of labour requirements (e.g. Status of Project, Project SDC). Include action tracking number in activity description.	3		Action Tracking item is complete and closed.	<ul style="list-style-type: none"> <li>Owner: Project</li> <li>Support: HR (HR PMO/Construction/Vendor)</li> </ul>	1	Definition / Execution
13	Plan	SHO	22	Project on Functional Manager Milestone	User defined Milestone for Project on Functional Team specific tracking. Use this as an interim milestone to track specific progress not already identified in the listing.	3		Project on Functional Team met the intended criteria of PMO specific Milestones.	<ul style="list-style-type: none"> <li>Owner: Project</li> </ul>	1	Any phase is applicable
14	Plan	SHO	23	CHS/Regulatory Compliance Met	Milestone for tracking Reg. Ch. Include Action Tracking number in activity description.	4		Documents have been reviewed to confirm completion. Action Tracking item is closed in Readiness.	<ul style="list-style-type: none"> <li>Owner: Reg Affairs</li> <li>Support: Project/Engineering/Vendor</li> </ul>	1	Definition / Execution
15	Plan	SHO	24	CHS/Regulatory Compliance Met	Milestone for tracking Reg. Ch. Include Action Tracking number in activity description.	4		Documents have been reviewed to confirm completion. Action Tracking item is closed in Readiness.	<ul style="list-style-type: none"> <li>Owner: Reg Affairs</li> <li>Support: Project/Engineering/Vendor</li> </ul>	1	Definition / Execution
16	Plan	SHO	25	Plan Complete Milestone	Plan Complete Milestone. This milestone will identify the final completion of the entire plan.	4		Project Closure Report has been approved.	<ul style="list-style-type: none"> <li>Owner: Project</li> <li>Support: Vendor</li> </ul>	1	Closeout
17	Plan	SHO	26	Inspection Complete	Milestone for tracking when inspection(s) are complete.	3		Inspections complete and signed documents have been issued.	<ul style="list-style-type: none"> <li>Owner: Project</li> <li>Support: Vendor</li> </ul>	1	Any phase is applicable

Title:

**NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK**

**Appendix D: DNG Refurb – Program & Project Milestones Recovery / Mitigation Process**

**DNG Refurb – Program & Project Milestones Recovery and Mitigation Process**

The following provides summary instructions on the process of documenting and managing the recovery and mitigation plans for program and project milestones that are at risk.

**Program Milestones – Tier 1, 2, or 3**

**Process Description:**

- In the event that the timely and quality completion of a tier 1,2, or 3 milestone is in jeopardy, a milestone recovery or mitigation plan using D-FORM-10763 is required
- In the event that the milestone recovery is not possible, and a mitigation plan has been initiated, a change in the milestone date may be required. Changes to Tier 1, 2, or 3 milestones commitments are required to follow the Change Control process and mitigation plan should be attached.

**Accountability:**

Who	What	When
Milestone Owner	Follow the Program Milestone Recovery and Mitigation Plan Requirements as per N-MAN-00120-10001-SCH 06 using D-FORM-10763 form.	Completion of the Major Milestone in jeopardy
CSA	Support Milestone Owner in Developing Milestone Recovery and Mitigation Plan and associated Change Control Form (if required)	Completion of the Major Milestone is in jeopardy and when the milestone date is not recoverable

**Process**

- Milestone Owner complete Milestone Recovery and Mitigation Plan D-FORM-10763
- Milestone Owner Route D-FORM-10763 to P&C Director and obtain approval
- Milestone Owner file D-FORM-10763 in passport by forwarding PDF to DNG Doc Mgmt
- If milestone is not recoverable, Milestone Owner may be required to complete Change Control Form (CCF) as per N-MAN-00120-10001-PC01
- Milestone Owner route the signed D-FORM-10763 and approved CCF to P&C Scheduling Department
- P&C updates the PIMS Schedule

**Application**

- All Program Milestones – Tier 1, 2, or 3

Manual

Title:

**NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK**

**Appendix D: (Continued)**

**Project Milestones – Tier 4 or 5**

**Process Description:**

- Project milestone changes will be managed by strictly following the NR Change Control Process outlined on N-MAN-00120-10001-PC01-“Cost & Schedule Change Control” Procedure.
- Project milestone owners may be requested by senior management to document milestone recovery and mitigation plans using D-FORM.

**Accountability:**

Who	What	When
Project Manager	Follow the NR Change Control Process outlined on N-MAN-00120-10001-PC01	Completion of the Project Milestone is in jeopardy
CSA	Support Project Managers in completing Change Control Form	Completion of the Project Milestone is in jeopardy

**Process**

As per N-MAN-00120-10001-PC01

- Project Manger complete Change Control Form (N-FORM-11252).
- Route the approved Change Control Form to P&C SPOC.
- Project assigned CSA updates the Project Schedule.

**Application**

- All project Milestones – Tier 4 or 5

Appendix E: (Continued)

*\*Please refer to N-MAN-00120-10001-SCH-06, Nuclear Refurbishment – Milestone Definition Framework*

ID	Section	What is this?
1	Record Number	The standard record number begins with NK38-ref-09701-xxxxxx - this cannot change. The xxxxxx portion of the record number shall be the Activity ID assigned in the P6 schedule
2	Milestone Number	This shall be the Activity ID assigned in the P6 Schedule
3	Milestone Description	This shall be the Activity Name from the P6 Schedule
4	Milestone Type	Milestone type shall be identified as either Program or AIP Scorecard
5	Tier Structure	This is the milestone tier, as determined in the Milestone Tier Structure Process (Section 3.1 of the manual): Tier 1 - Reportable to EVP Nuclear Refurbishment; Tier 2 - Reportable to SVP Nuclear Refurbishment; Tier 3 - Reportable to SVP Direct Report
6	Unit	This is the Unit the Milestone Definition Form Relates to. The form defaults to "All". If the form only relates to one unit - please specify.
7	Milestone Owner	Please specify the individual and their position
8	Signature	Requires Milestone Owner's signature
9	Date	The date the Milestone Definition Form was signed
10	Milestone TCD	This is the milestone completion date, as established in the P6 Schedule by BL Project Finish
11	Milestone Success Plan Presentation Due Date	This will be the Milestone TCD date minus 3, 6, or 9 months. For example, a milestone with a TCD of November1, 2013, would have a presentation date of August 1, 2013 if three months were subtracted. See section 3.4.2 of the manual.
12	Milestone Definition	Describe the milestone and includes any supporting governance. Identify any supporting departments / directors, if applicable.
13	Milestone Requirements	Identify reference to any process, letters, documents, transmittals in support of milestone completion.

14	Performance Indicator	Identify the performance indicators (metrics, WDC, etc) to indicate progress.
15	Milestone Predecessor (s)	List any milestone predecessors, if applicable. Ensure to use proper P6 Activity IDs from P6.
16	Milestone Successor (s)	List any milestone successors, if applicable. Ensure to use proper P6 Activity IDs from P6.
17	Milestone Completion	Check off one Status: <b>G</b> - Shows that the milestone was completed on time as indicated by the initial TCD; <b>R</b> - Shows that the milestone was completed on time based on a recovery plan; <b>N</b> - Shows that the milestone was removed through the approved CCF process.
18	Milestone Deliverable Met	Indicate how your department met each of the requirements of the Milestone Definition. Provide details, PASSPORT Documents, signed letters etc. Indicate Challenge Process used.
19	Final Signatures	This form shall be signed by the Owner of the Milestone; Shall be Recommended to Close by the appropriate line RPET Member, and Final approved by the Director, Planning and Controls

Note: This form can also be used for NR AIP Scorecard Definition requirements. For details, please contact P&C Scheduling Departments

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>5 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

## 1.0 OVERVIEW

In order to sufficiently prepare and efficiently implement the Darlington Nuclear Refurbishment Program, a multi level scheduling approach is applied, including

- Level 0: Program Milestone Schedule
- Level 1: Program Integrated Master Schedule
- Level 2: Program Coordination & Control Schedules
- Level 3: Project Detailed Production Schedules

The Darlington Refurbishment Program Milestone & Integrated Master Schedule (PMIMS, NK38-PLAN-00300-10000) is the preamble of the Program Level 0 Schedule and Program Level 1 Schedule, and it describes

- The Program Milestone Dates and Owners
- The Responsibility Allocation and Control Accounts
- Assumptions
- Alignment with station and planned outages

All Project Bundles and functional groups have Control Accounts (Level 1 Activities) shown on the Program Level 1 Schedule. These Control Accounts are further broken down to Work Packages (Level 2 Activities) in Program Level 2 Schedules.

The Level 1 Activities (Control Accounts) in the Program Level 1 Schedule and Level 2 Activities (Work Packages) in Program Level 2 Schedules are logically tied to relevant Program Milestones, where applicable.

The PMIMS Revision 3 has been developed with current contracting strategies for each project bundle. Once a contract is awarded, an assessment against the Program Milestones will be performed. Program Milestones are re-evaluated when necessary and on an annual basis.

## 2.0 DESCRIPTION

The Darlington Refurbishment Program Integrated Master Schedule Revision 0 (R000) was approved in December 2010, Revision 1 (R001) was approved in January 2012, and Revision 2 (R002) was approved in January 2014.

Revision 3 (R003) is required based on the following changes,

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-00300-10000</b>		Usage Classification:
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>6 of 21</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

- The unit refurb outage sequence order identified in the Darlington Life Extension Model shows the unit sequence order being unit 2, unit 1, unit 3 and unit 4. Based on current planning assumptions, a different unit order has been confirmed by OPG and is now Unit 2, Unit 3, Unit 1 and Unit 4. This change has been formally communicated with CNSC. Please refer to **Darlington Refurbishment – Unit Outage Sequence Update** (File: NK38-00531 P, CD#: NK38-CORR-00531-17008);
- This new sequence order has no impact on the planned unit outage dates associated with the Nuclear Refurbishment Program also identified in the Darlington Life Extension Model;
- Every refurb outage is broken into 4 segments: Lead-in Segment, Removal Segment, Inspection & Installation Segment and Lead-out Segment, so that the project teams will focus on the specific segment, and integration can be achieved segment by segment;
- Accordingly, segmentised Outage Preparation Milestones are added and they are documented in NK38-MAN-09701-10005, Nuclear Refurbishment Planned Outage Management.

The PMIMS Revision 3 documents have been updated to reflect these changes and to provide additional details as the planning phase is further developed.

### 3.0 RESPONSIBILITY ALLOCATION

Following the matrix structure of the Darlington Refurb Program Work, the responsibility allocation is stated as,

Project Bundles	Scope of Work	Responsible	Accountable
<b>R&amp;FR</b>	<ul style="list-style-type: none"> <li>Tooling for R&amp;FR</li> <li>Mock-up &amp; Training for R&amp;FR</li> <li>Retube and Feeder Replacement work</li> </ul>	Project Manager	VP, Refurb Execution
<b>Turbine Generator</b>	<ul style="list-style-type: none"> <li>TG Engineering Services and Equipment Supply work</li> <li>TG Minor Procurement and TG Refurb Construction work</li> <li>TG Inspections and Repairs</li> </ul>	Project Manager	VP, Refurb Execution
<b>Steam Generator</b>	<ul style="list-style-type: none"> <li>SG EPC Contract work, including Primary Side Cleaning, SG Water Lancing, SG Access Port, SG Tube and Divider Inspections and SG Minor Projects</li> <li>SG Inspections and Repairs</li> </ul>	Project Manager	VP, Refurb Execution
<b>Fuel Handling &amp; Defueling Bundle</b>	<ul style="list-style-type: none"> <li>Defueling Preparations</li> <li>Fuel Handling Refurb</li> <li>Fuel Handling Specialised Projects</li> </ul>	Project Manager	VP, Refurb Execution
<b>Balance of Plant</b>	<ul style="list-style-type: none"> <li>BOP Common Systems Refurb</li> <li>BOP Nuclear Systems Refurb</li> <li>BOP Conventional Systems Refurb</li> </ul>	Project Manager	VP, Refurb Execution
<b>Islanding</b>	<ul style="list-style-type: none"> <li>Bulkhead &amp; Containment Isolation</li> <li>Barriers Project</li> <li>Islanding Pre-Outage Modifications</li> <li>Islanding Outage Modifications</li> </ul>	Project Manager	VP, Refurb Execution
<b>Shutdown, Layup and Services</b>	<ul style="list-style-type: none"> <li>Unit Takeover from the Station</li> <li>Unit Shutdown</li> <li>Shutdown Pre-Req. Modifications</li> <li>Shutdown Outage Mods.</li> <li>Unit Layup Services</li> </ul>	Project Manager	VP, Refurb Execution

<b>Functional Work</b>	Described in NR Program Management Plans	NP Division Directors	SVP, Nuclear Refurb

#### 4.0 PROGRAM PHASES

10 Phases were defined for the Darlington Nuclear Refurbishment Program as follows, for financial release purposes.

- Phase 1: Program Initiation Phase, 2007-2008
- Phase 2: Program Approval Phase, 2008-2009
- Phase 3: Preliminary Planning Phase, 2009-2011
- Phase 4: Detailed Engineering & Refurb Scope Definition Phase, 2012-2014
- Phase 5: Outage Preparation Phase, 2014-2015
- Phase 6: Unit 2 Refurb Outage Phase/U2 Release Quality Estimate, 2015-2019
- Phase 7: Unit 3 Refurb Outage Phase/U3 Release Quality Estimate, 2018-2023
- Phase 8: Unit 1 Refurb Outage Phase/U1 Release Quality Estimate, 2020-2024
- Phase 9: Unit 4 Refurb Outage Phase/U4 Release Quality Estimate, 2021-2025
- Phase 10: Program Closure Phase, 2024-2026

## Plan

Document Number: <b>NK38-PLAN-00300-10000</b>		Usage Classification:
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>10 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

**Note:** this diagram shows only Definition Phase and the 4 Unit Refurb Execution Phases.

## 5.0 PROGRAM MILESTONE DEFINITIONS

As per N-MAN-00120-10001-SCH-06, each individual milestone definition sheet is issued as a record in AssetSuite.

Program Milestone Definitions of PMIMS Revision 3 can be found in PowerSearch and AssetSuite via using the Milestone ID with "NK38-REF-09701-" pre-fix as the record number.

For the Program Milestones and Key Dates, please refer to Appendix B.

## 6.0 ALIGNMENT WITH STATION PLANNED OUTAGES AND OPERATING WORK PROGRAM

### 6.1 Pre-Refurb Work in Station Planned Outages

There are pre-refurb work activities that must be completed in the Darlington planned outages leading up to Refurb. It is the responsibility of the Nuclear Refurb Team to identify these Work Orders and ensure scope rationalization is provided prior to Planned Outage scope freeze. *Planned Outage Management* (N-PROC-MA-0013) will be followed.

### 6.2 Pre-Refurb Work in the On-Line Work Schedule

There is work that can be completed in Darlington's on-line program (IPG). This work is being integrated into the IPG work program, following the *Integrated On-Line Work Schedule* (N-PROC-MA-0022).

<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

## 7.0 ASSUMPTIONS

The Program Integrated Master Schedule (R003) is based on the following assumptions,

- EPC Contractors will undertake the major work nuclear refurbish work while OPG establishes a team to oversight and support the refurb work.
- OPG will undertake cyclical maintenance work and unit commissioning & start-up.
- There will be no resource demand conflict due to other nuclear stations' refurb program/projects, i.e., the major contractors will have sufficient resources to complete the work for NR Program.
- There will be no further strategic change on the sequence of the four Unit Outages, as described in detail in Section 2.0 and Section 4.0.
- PIMS is developed in a progressive elaboration approach. The Level 1 Activities in the PIMS are originally *instructive version*, and they become *control version* when the relevant work is released and the contractors' detailed schedule is summarised and baselined.

For detailed assumptions and risks of each project bundle, please refer to Nuclear Refurbishment Actions, Issues, Decisions and Key Assumptions Management (N-MAN-0120-10001-RISK-07).

# **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

## **1.0 INTRODUCTION**

### **1.1 Purpose**

This document describes the Integrated Level 3 Darlington Refurbishment Schedule Management Plan (SM Plan). The purpose of the SM Plan is to provide guidance on how to develop, manage, and control the Integrated Level 3 Execution Schedule throughout the Refurbishment Execution life cycle. This covers the preparation and management of the execution plan from Breaker Open to Breaker Closed, including the integration of readiness activities.

### **1.2 Scope**

The SM Plan identifies the process and procedures used to manage the schedule during the course of the Darlington Refurbishment Outage Execution. In addition to defining the schedule development approach, the plan defines who is responsible for tracking and reporting schedule progress, how schedule updates are received and incorporated, how variances and changes will be addressed, and how to baseline the schedule. The plan describes the project's schedule management tool. The plan also addresses the four execution segments, work types and work groups, taking into account Operation Authority, Nuclear Safety, Permit Strategy and Return to Service requirements.

### **1.3 Level 3 Schedule Development Timeline**

The development of the Integrated Level 3 Execution Schedule will be iterative process with many inputs provided at diffident times. List and timeline of major revisions, deliverables and milestones required before the level 3 execution schedule is fully integrated is provided in Appendix F: Timeline of Critical Inputs Required for Development of IL3E Schedule

### **1.4 Guiding Principles**

Establishing an accurate and realistic schedule is a critical planning step for a project/outage. The schedule is the main planning tool used to understand and communicate the status, interrelationships and dependencies among project activities and deliverables.

Schedule detail must be developed at an appropriate level to allow the project team to coordinate the work and communicate the plan, monitor project progress and cost performance, and use the data to make accurate forecasts, strategize and plan upcoming work.

The Integrated Level 3 Execution Schedule will:

- Be all inclusive of all work to be done during the execution window (all work groups)
- Be prepared and updated by the individual work groups and monitored by the Master Scheduler
- Be hours based
- Be one network (longest path) in a single P6 database
- Be resource loaded (histograms and work list tool) (user defined - examples; SDS qualified CT, Pipefitter Welder, BM Rigger, BM Welder)
- Be coded to roll up to the Level 2
- Be baselined

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>6 of 36</b>

Title:

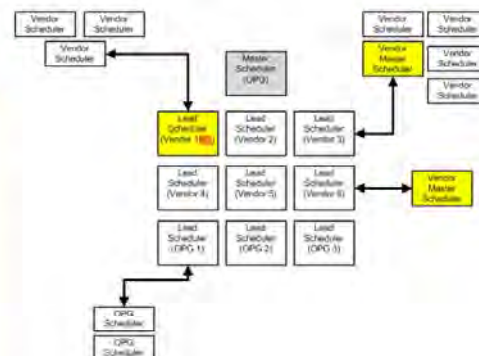

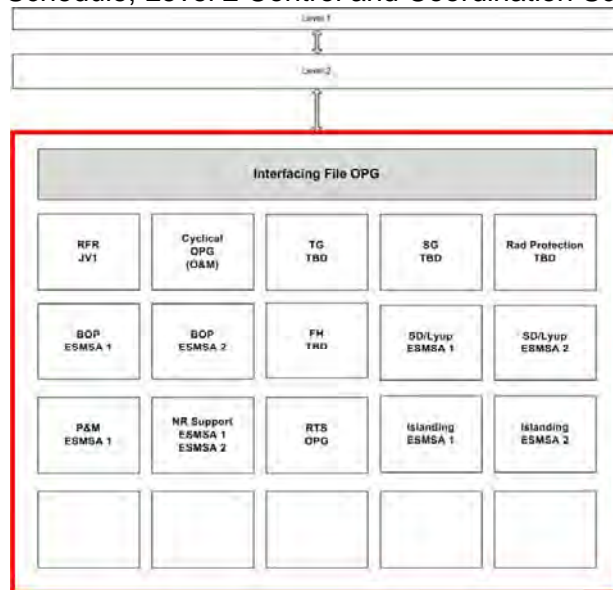

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Have all integration activities (hand-offs) between work groups logically tied through an interface file under control of the Master Scheduler and subject to schedule change rules
- Contain appropriate detail to support Release Quality Estimate (RQE)
- Show support activities for all work groups (See Task Breakdown Table, Section 5.2)

There will be one P6 scheduling database controlled and managed by OPG. All work groups (OPG and vendor work groups) will work in the same P6 instance

- An OPG Assigned Master Scheduler is responsible to control and manage the unified P6 schedule.
- A Lead Scheduler will be assigned by each work group and will follow schedule process direction from the OPG Master Scheduler
- The work group Lead Scheduler has authority to update and revise his work group's schedule within the protocols specified by the Master Scheduler
- The Master Scheduler takes his direction from the Unit Director and Outage Manager

The structure of the schedule will include Milestones, Level 1 Program Integrated Master Schedule, Level 2 Control and Coordination Schedule and Level 3 Execution schedule

**Methodology:** Owner performing the role of General Contractor to integrate multi prime EPC and Owner directed resources for a multi year project.

**Bundle → Sub Bundle → File / Vendor (commercially independent)** working in owners P6 able to calculate Critical Path @L3 and fully integrated via OPG interfacing file.

**ESMSA Lead Scheduler may direct more than one bundle (commercially independent)**

## 2.0 PARTICIPANTS

### 2.1 Roles and Responsibilities

During the definition phase, OPG's role was that of the Design Authority and Project Manager. The Execution phase adds the role of General Contractor, Owners Engineer, and License Holder / Controlling Authority of a power reactor.

During the execution of the Darlington Refurbishment, OPG's role during execution includes the following:

- Shut down, de-fuel and lay-up the unit

## Manual

<b>SCH-11</b>	<b>R000</b>	<b>7 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Maintain control of the island/plant
- Ensure all aspects of safety are adhered to
- Perform Cyclical ,FIN and Contact Partner Support Work/Rehab
- Construction coordination & integration
- Schedule analysis and optimization
- Configuration control/management
- Commission and restart the unit
- Quality Oversight

Schedule-related responsibilities of staff and stakeholders involved in managing and controlling the project schedule are noted as follows:

#### **Responsibilities:**

- Director Planning and Controls – will approve the project's Schedule Management Plan. Responsible to establish and publish reports and metrics in support of Unit Director and other project stakeholders. Assign the Master Scheduler in order to provide the infrastructure required for the schedule development.
- Unit Director – will approve baseline schedule, and any significant changes through the schedule change control process. The Unit Director is ultimately responsible for the schedule and to complete the project according to the schedule. Accountable for unit scope management process. Accountable for development and implementation of Project Control Center (PCC) command and control processes. Accountable to identify report requirements and interpret/analyze reports and metrics. Accountable to establish and implement readiness review process.
- Outage Manager – Accountable for affirming, documenting and communicating all decisions relating to establishing and executing the critical path. Will be responsible for development of the Schedule. Accountable for identifying risks to the schedule and determining the appropriate risk management strategy. Accountable for work integration. Accountable for unit and segment forecasts. Responsible for managing outage scope. Responsible to implement PCC command & control process. Will review reports and metrics to identify and counteract schedule deviations. Responsible to implement readiness review process.
- Work Control Section Manager and Work Control Team Leaders – will be responsible for developing detailed logic for the execution of assigned outage work windows. Responsible to identify and resolve work integration issues within assigned work scope. Will identify to Project Managers any interfacing logic issues which might impact on a projects cost and/or schedule. Will document system window logic assumptions and assist Outage Manager with decision support information as required to help resolve project interface issues. Will identify risks and establish risk mitigation plans as appropriate.
- Project Manager – will oversee, provide input to the schedule and review schedule status reports provided by the Lead Scheduler. The Project Manager will also evaluate time-risk recommendations from the Lead Scheduler to avoid schedule issues. Accountable for project schedule and cost. Accountable for project readiness.
- Functional Managers – will notify the Unit Director and Lead Scheduler of workload changes that may affect the schedule. The Functional Manager will also review and approve time estimates provided by staff for the schedule.

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Work Group (OPG or Contractors) - Accountable for work quality. Responsible for developing detail schedule. Responsible for work cost. Responsible for work readiness. Responsible for work execution. Responsible to status the work. Will provide accurate time estimates for the beginning and completion of work as well as status reports on the achievement of those times. Will manage their internal activities to the timely accomplishment of the schedule, of which status shall be reported regularly notifying the Unit Director of potential or actual schedule variances. Will ensure resources are utilized efficiently and effectively such that down time is minimized and identify opportunities to utilize resources more effectively to the benefit of the project.
  - Master Scheduler – will report functionally to the Unit Director and will be accountable for the development of the unit and segment schedules. Will provide critical path analysis. Will integrate the work for the segment and unit schedule while managing and controlling the L3 interface file. Will publish reports and metrics on the work. Will raise upwards any integration or scheduling conflicts for resolution. Gives direction to Lead Schedulers on schedule logic and integration. Will maintain the scheduling tool and supporting documentation. The Master Scheduler will make recommendations to the Outage Manager to avert schedule variances that may adversely affect the project critical path, budget or expenditures
  - Lead Scheduler (Work Group) – Will develop unit and segment schedules for the work group. Will provide critical path analysis for the work group. Will integrate the work for the segment and unit schedules for the work group. Will status the schedule activities per work group's direction. Will publish reports and metrics for the work group
- Quality Assurance – will periodically audit scheduling practices to validate compliance with this Schedule Management Plan.

## 3.0 SCHEDULE DEVELOPMENT PROCESS

The schedule development process is comprised of multiple development steps. Each step taken generates a schedule subcomponent that can stand alone to inform the project team of that aspect of the final schedule. When integrated, it forms the basis for the approved working version of the final schedule known as the Baselined Schedule. Figure 1 depicts the order and the individual products generated during the schedule development process.

**Figure 1 - Schedule Development Process**

### 3.1 Create Level 1 Schedule (PIMS-C)

The Level 1 Schedule is a visual representation of anticipated critical activities, milestones, and interfaces across the entire project/outage. Level 1 schedule is the Program Integrated Master Schedule (PIMS) that contains execution windows in the Refurbishment. Each Unit Outage will have its own PIMS. The Unit 2, Level 1 is called PIMS-C. It is developed by OPG during the Definition Phase to provide the project teams and Contractors with the earliest possible view of

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>9 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

project's most critically timed activities. At this stage, the date for a critical activity may not be known, but the visual representation of the activity among all the activities on the chart will enable the team to conceptualize the relative flow of important events.

The PIMS displays both the project's expected flow of critical activities as well as the vertical integration of related deliverables from other existing or pending contracts. It displays what OPG is responsible for in parallel with the Contractor's responsibilities. It sets a clear expectation early on of critical timing between project deliverables and key events.

See Appendix C: Overview of Unit 2 -Darlington Nuclear Refurbishment Program

PIMS-C will be updated according to the schedules' milestones. With each progressive revision, more knowledge and optimization of the schedule will be incorporated. The nomenclature of the revisions will be Revision 'A' schedule, Revision 'B' schedule, Revision 'C' schedule and Revision 'O'. Revision 'O' will be the final revision before Breaker Open. In support of the Release Quality Estimate, an RQE revision will be issued. This revision will come after Rev B and incorporate the best available input from all stakeholders.

### **3.2 Outage Segments**

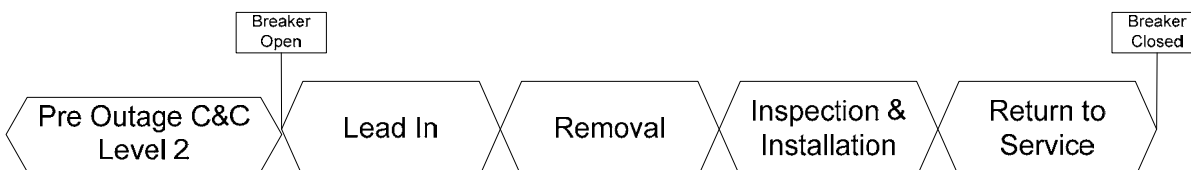

Due to duration of each Refurbishment Outage, there are complexities and data management considerations that are greater than previous outages or projects. In order to manage the volume of data in a logical fashion, Outage segmentations have been established. The segments were developed from the following rule set:

1. Segment needs to be big enough to have its own P6 project
2. Segment needs to be small enough not to threaten P6 capability with respect to the number of activities that can be in a single P6 file
3. Segment needs to be complex enough to warrant its own handling team
4. The end point for a Segment should be a natural logic node which marks the completion of a large number of activities. It may mark a major transition e.g. OPG to vendor, vendor to vendor work program, vendor to OPG. The intent is to minimize the number of activities that are carried from one phase to another in order to limit the number of interfacing milestones to only those required. To the extent possible work will be scheduled within a segment.

The benefits of breaking the Outage into Segments include:

- Maintain schedule integrity while reducing complexity
- Allows Planning & Scheduling Basis change
- Appropriate level of detail
- Strong reporting model
- Reporting frequency
- Establishes Integration Points (work horizon)
- Enables close-out of a P6 node

The segments are Lead in, Removal, Inspection & Installation and Return to Service

## DARLINGTON REFRUBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

### 3.3 Create Work Breakdown Structure (WBS)

The Darlington Refurbishment uses a deliverable-oriented work breakdown structure (WBS) to best reflect the scope of project (Reference WBS Guide NK38-GUID-09701-10006). The WBS is created by breaking down the project's main deliverable – e.g. Refurbishment of Unit 2 – into its sub components using a hierarchical -tree format and will be developed in parallel with L1 execution windows and aligned with work sequence. The upper levels of the WBS breakdown the deliverables into Control Accounts while the lower levels of the WBS depict the Work Package and activities and tasks.

Example of how the standard WBS has been implemented is in Appendix D

**Figure 3 – General Work Breakdown Structure**

## Manual

Title:

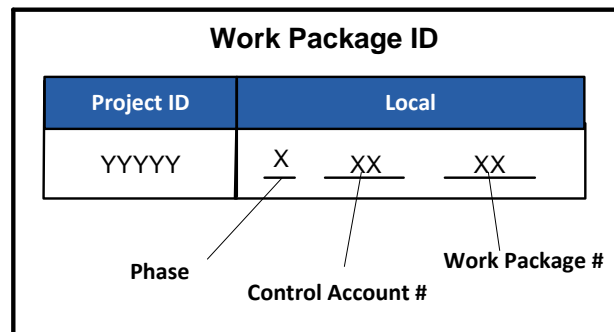

# DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

## 3.3.1 WBS Element Numbering Methodology

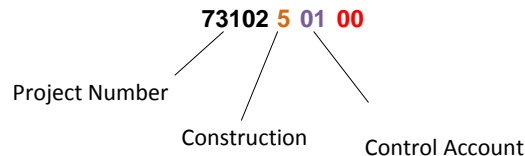

In order to successfully implement the Multi Level Scheduling Model we will utilize the WBS functionality in P6 to allow progress on lower level activities to roll up through the WBS to Work Packages and Control Accounts. To facilitate this structure and to create traceability between the WBS and the schedule and to distinguish between levels, all boxes on the WBS, known as “elements” will be numbered using the methodology shown in Table 1

**Table 1. Element Numbering Methodology**

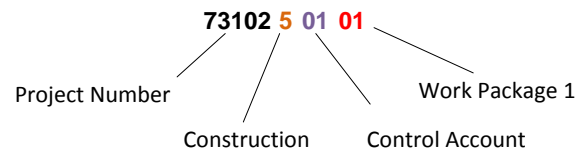

WBS Elements	WBS Path
NR Program	NR
Bundle BOP	NR.BP
Sub-Bundle Nuclear System	NR.BP.NS
EPC Contract 1	NR.BP.NS.01
Unit 2	NR.BP.NS.01.U2
Project 73592	NR.BP.NS.01.U2.73592
Construction	NR.BP.NS.01.U2.73592.5
Control Account 50100	NR.BP.NS.01.U2.73592.5.01
Work Package 50101	NR.BP.NS.01.U2.73592.5.01.01
Level 3 Activities	NR.BP.NS.01.U2.73592.5.01.01....

### Level 1 Schedule: Control Account - Activity ID

### Level 2 Schedule: Work Package - Activity ID

## 3.4 Create Resource Breakdown Structure

The Resource Breakdown Structure will be based on the Crew codes in Asset Suite 7. Crew codes will be used to estimate resources and provide resource demand curves. All level 3 activities will be resource loaded. Labour will be identified in hours. Commodities such as Pressure Tubes or Control Vales can also be included in the RBS. Common critical equipment such as the Turbine Hall Crane will also be included in the RBS in order to identify conflicts in requirements. All tasks identified in the L3 schedule will be estimated to identify resource requirements so that a resource histogram of the work identified in the L3 can be produced. Each contractor will be accountable to produce a resource histogram for Level of Effort work such as work performed in contractor shops and supervision. Total resource histograms will be a sum of the detailed tasks and the LOE estimates.

Full list of resources can be found on SharePoint: [Resource Breakdown Structure](#).

Title:

### DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

### 3.5 Create and Integrate Schedule

The WBS serves as the outline structure for the schedule. The Execution Windows serve as identification of the unit condition which allows work to be scheduled safely and integrated. A coding structure in P6 will include a code for each Execution Window within the Outage Segments and all the Systems that are part of the Refurbishment.

The intersection of the WBS, Systems and the Execution Windows allows the schedule to be sorted and viewed by any combinations of these elements.

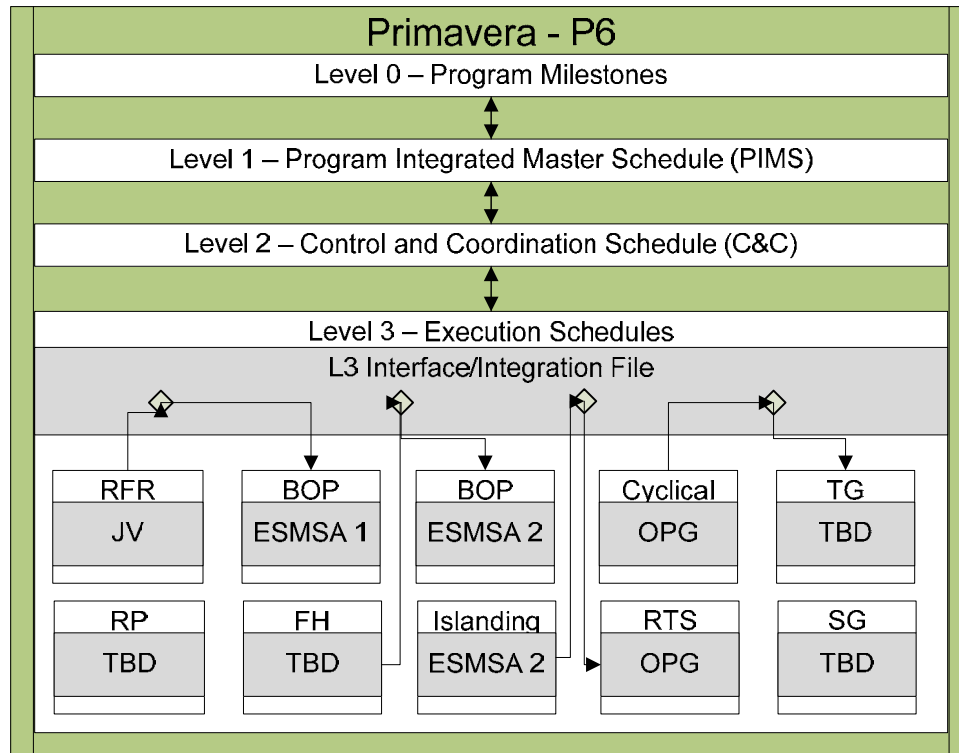

As part of the Multi Level Scheduling Model, NR Refurbishment will have different levels of the schedules that are integrated and aligned with each other using WBS Summaries, Activity Codes and Milestones, as described below:

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>13 of 36</b>

Title:

### **DARLINGTON REFRUBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

#### Level 0 – Program Milestones

- Program Milestones schedule including Program Release Milestones, Regulatory Milestones, Outage Preparation Milestones, and Outage Execution Milestones
- Level 1 execution schedule will be logically tied with Program Milestones

#### Level 1 - Program Integrated Master Schedule (PIMS-C: First Unit Outage)

- Level 1 execution schedule will be broken up by Outage Segments, Systems and RTS Phases/Nodes, following the standard WBS structure
- Master Scheduler will work with the vendor's Scheduling Leads to create the high level Control Accounts, based on the logic and execution windows defined by the Outage Manager
- Each Control Account will be a WBS Summary activity to allow roll ups from the Level 2 and Level 3 schedules
- Each Unit will have a separate PIMS P6 file
- PIMS will go through multiple revisions as more detail information becomes available. Revision '0' will be the final revision before Breaker Open.

#### Level 2 - Control and Coordination Schedule (C&C)

- Each Work Group/Vendor will develop number of Level 2 execution activities called Work Packages
- Work Package will be used to integrate schedule and cost, and for Earn Value Management
- All level 3 activities will roll up to Work Packages using the standard WBS, to allow progress tracking at a higher level
- Change Control is done at the Work Package level
- Level 2 will be used to manage float

## Manual

<b>SCH-11</b>	<b>R000</b>	<b>14 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

#### Level 3 – Detailed Execution Schedule

- All activities will be developed and updated in a single P6 instance, controlled and managed by OPG
- Activities will be created using standard WBS and broken into Segments and Systems
- Activities will be hourly based, resource loaded, and less than one week in duration. Longer duration activities will require additional monitoring mechanism (e.g. Work-Down Curve)
- All activities will roll up to Level 2 Work Packages using the WBS structure
- Activities will be generated using 2 methods:
  - o Manual Input by the Scheduling Leads
  - o Automatic upload of Work Orders from AS7 where each activity ID will be a Work Order and Task number.
- Each Level 3 P6 file will be owned and managed by a single Work Group/Vendor
- Standard P6 templates will be utilized to communicate the scheduling requirements for similar work across different Work Groups
- Activity Code dictionaries, resource codes and calendars will be established in OPG P6 instance and used by all the work groups
- All activities will be coded with the window segment and the system (SCI)

#### Level 3 Interface/Integration File

- All the integration activities (hand-offs) between Work Groups/Vendors will be logically tied through Interface Milestones
- The Interface Milestones will be created by the Master Scheduler and each Scheduling Lead will create logic ties between the milestones and their activities
- All the interfaces within the same Work Group will have direct ties between L3 activities
- Milestones will be created using standard WBS and broken into Segments and Systems

#### **3.5.1 Date, Sequence, and Link Activities**

There are four types of dependencies (logical relationships) used to create links between schedule tasks. The Finish to Start dependency is more commonly used for scheduling the Darlington Refurbishment.

- **Finish-to-Start (FS):** The initiation of the successor activity depends upon the completion of the predecessor activity.
- **Finish-to-Finish (FF):** The completion of the successor activity depends upon the completion of the predecessor activity.
- **Start-to-Finish (SF):** The completion of the successor activity depends upon the initiation of the predecessor activity.
- **Start-to-Start (SS):** The initiation of the successor activity depends upon the initiation of the predecessor activity.

Tasks are linked together and sequenced to identify the relationships between deliverables, sub-deliverables, activities, tasks, and subtasks. The following rules should be applied when creating task dependencies:

Tasks are linked together and sequenced to identify the relationships between activities. The following rules should be applied when creating task dependencies:

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>15 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

Tasks are linked together and sequenced to identify the relationships between activities. The following rules should be applied when creating task dependencies:

- All tasks shall have at least one successor and one predecessor so there are no unlinked tasks.
- Start and Finish dates should not be entered when creating new tasks.
- For purposes of modeling the critical path, all dependencies should be linked to a detail task or deliverable and not to a summary task.
- Early dates (the earliest date on which a task can start or finish) are calculated in the forward pass of time analysis.
- Late dates (the latest date on which a task can start or finish) are calculated using backward pass time analysis.
- Constraints will be applied sparingly (only when required) in order to maintain a flexible, realistic schedule.

#### **3.5.2 Risk Estimate Duration**

To identify the time- risk associated with a critical or near critical activity or task, the Darlington Refurbishment and/or contractor staff should apply the Program Evaluation and Review Technique (PERT).

The formula is:  $PERT\ mean = (O + 4ML + P) \text{ divided by } 6$

Where:

O = Optimistic estimate

ML = Most likely estimate

P = Pessimistic estimate

The project team member performing the task will provide variables O, ML, and P to calculate an optimistic, most likely and pessimistic estimate that can be utilized in the Monte Carlo simulation. A schedule for both the most likely and the pessimistic will be maintained and risk mitigation strategies will be documented in the Risk Plan for those tasks on the critical path (Reference Risk Process N-PROC-LE-0017).

#### **3.5.3 Duration Guidelines**

As a general rule, the basis for resource estimation will be in hours. The task duration will also be in hours. Tasks of significant duration should be broken down into shorter duration tasks if possible to permit accurate assessment of work progression or they need to be supplemented with a metric/work down curve to identify status.

Standard resource calendars will be used in P6. All vendors and OPG will use the same suite of calendars.

#### **3.5.4 Validate Schedule**

##### Horizontal Schedule Review

A horizontal schedule review of the sequence of scheduled activities and logic ties is performed to ensure prerequisites or constraints are satisfied, including, but not limited to:

- Shutdown safety (e.g., redundant systems available, appropriate heat sink configurations).

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>16 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Logical constraints (e.g., preparation work complete, isolations).
- Alignment of conventional equipment to support planned electrical evolutions.
- Satisfaction of required plant conditions (e.g., system pressure, temperature, and configuration).
- Confirmation that any operating or functional test (as-found test) required for PM WOs with an operability test required attribute are scheduled prior to the actual PM.

#### Vertical Schedule Review

A vertical slice of activities scheduled to be executed concurrently is reviewed to ensure the following:

- (1) Maintain Shutdown reactor safety (e.g., aggregate work/risk does not impair ability to control power, cool fuel or contain reactivity below an acceptable level).
- (2) Following the publication of Rev C Schedule's we will perform a risk analysis of WOs causing elevated risk.
- (3) Formulate oversight contingency or compensatory actions to mitigate both risk and possible duration extensions.
- (4) System conflicts do not exist that preclude completion of work as planned (e.g., conventional equipment alignments support planned electrical evolutions).
- (5) Sufficient resources are available (e.g., manpower, equipment, location) to complete the schedule as planned. This should include the evaluation of external resource commitments to other outages or projects.

Prior to the Reactor Safety Challenge Meeting an independent schedule review shall be completed to ensure defense in depth has been maintained throughout the outage.

- (1) The review should ensure that shutdown safety is maintained and shutdown risks are minimized.
- (2) The review should be completed by an independent licensed individual that has not been involved in the planning and preparation of the outage (e.g. a Fleet Peer).
- (3) Any outstanding actions from the independent review should be documented and reviewed at the Reactor Safety Challenge meeting.]

### **3.5.5 Integrate Schedules**

An Integrated Level 3 Schedule is created after contract award and prior to Breaker Open. OPG and the Vendor will each prepare their schedules for integration into a single schedule - the Level 3. The Level 3 is the combined list of deliverables and tasks to be completed by OPG and Vendor, logically tied with defined duration. The combined schedule is based on OPG's Project WBS and the Vendor's scope of work.

The following steps are necessary to create the Integrated Multi-Level Scheduling Structure:

1. OPG will define all the Program Milestones based on the committed dates and create Level 0 Schedule
2. Outage Manager will define high level execution windows and system groupings for execution based on the Program Milestones, that will be represented as Control Accounts in Level 1 Schedule
3. Vendor will build a detail Level 3 schedule based on the Program Milestones and Control Accounts defined by OPG. Level 3 schedule will follow the standard WBS and will have all the mandatory activity codes like System, Equipment, Location, Unit, Work Order, MEC/EC Number etc. (See Scheduling Guide for full list of mandatory codes)
4. Vendor will summarize the Level 3 Schedules into Level 2 activities called Work Packages

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SCH-11</b>	Revision Number: <b>R000</b>	Page: <b>17 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

5. Master Scheduler will work with the vendors to integrate and align the Level 2 activities within the Control Accounts, refining the structure of Level 1 schedule based on the contractual commitments, constraints, coordination with other work groups and additional information that were not available during the initial planning phase
6. Master Scheduler will work with the vendors to identify and integrate any interfaces between Work Groups using the Level 3 Interface P6 File

The resulting Integrated Level 3 will be reviewed and approved by Unit Director after which it will be baselined.

Appendix E shows how multiple levels of the schedules are integrated together

### **3.6 Baseline Schedule**

Prior to commencing outage work and after OPG's schedule and the Vendor Contractor's schedule are integrated, reviewed, and approved, the schedule will be baselined.

Prior to breaker open, the Integrated Level 3 schedule will be going through multiple revisions as we develop and incorporate additional details. With each revision, we will create a new baseline. The plan is to have 4 major revisions: Revision 'A', 'B', 'C' and Revision 'O'. Revision 'O' will be the final revision before Breaker Open.

In support of the Release Quality Estimate, an RQE revision will be issued. This revision will come after Rev B and incorporate the best available input from all stakeholders.

To baseline the Integrated Level 3 schedule, the Master Scheduler saves the approved version in P6 and stores a copy in the project repository. New baseline dates are uploaded to the BI Reporting Engine, to be reflected on all the standard reports.

After Revision 'O', the baseline will be re-established only upon scope change as approved through the Change Control Process.

# DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

## 4.0 SCHEDULE CONTROL CENTER (SCC)

To facilitate the collaboration between OPG and the Vendors in order to develop an Integrated Level 3 schedule, we are creating a Schedule Control Center (SCC) Room. This room will be located in a close proximity to the Project Controls Center (PCC), and will be equipped with multiple OPG workstations connected to a single P6 instance.

Each vendor will supply a Lead Scheduler who will be co-located with other vendors in the SCC room. Lead Schedulers will take direction from a Master Scheduler on how to develop and integrate their individual Level 3 schedules.

Everyone will be working in one P6 environment, using one set of standard codes, calendars and resource dictionaries. The environment will be supported by IT and a dedicated P6 administrator, who will managed security and code libraries based on the requirements set by the Master Scheduler.

All the Level 3 schedule updates should be coordinated from the SCC room to ensure the integrity of the integrated schedule and based on the PCC requirements.

SCC room will have Break Out areas for problem solving and meetings. There should also be access to flow sheets, area diagrams and SOW documents for reference.

Access to Asset Suit 7 will be available to the Vendors so they can status the work. The BI solution hosted on the OPG network will provide live reports to monitor schedule development and progress.

## DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

### 5.0 SCHEDULING DEVELOPMENT TOOL

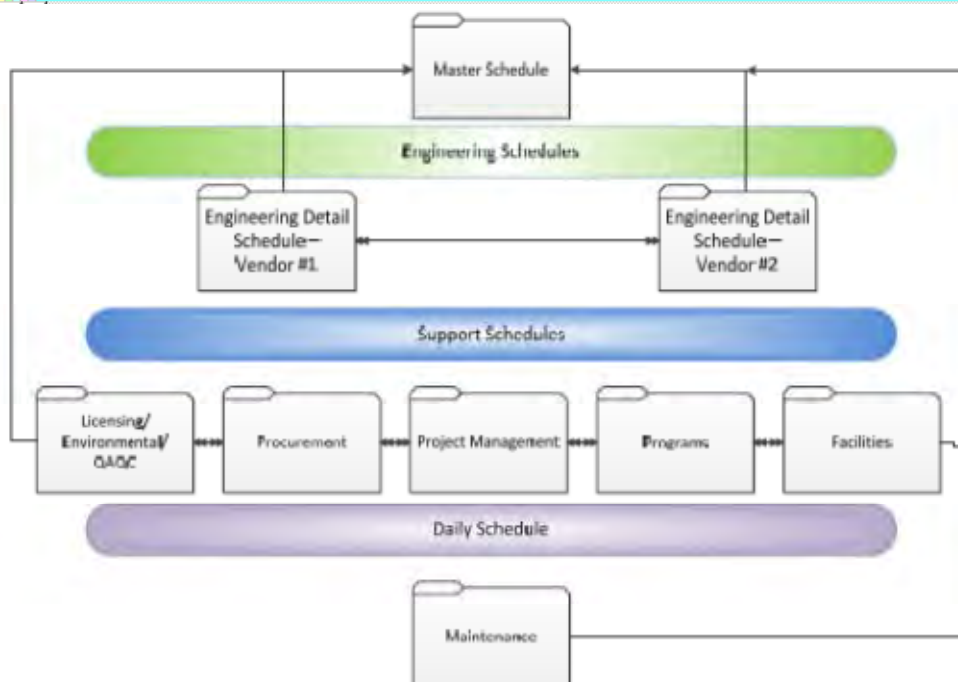

Primavera P6 will be used as the schedule development tool. Activities generated in the schedules will be downloaded from Asset Suit 7 (AS7) or they will be manually created based on the standard P6 templates/fragments.

#### 5.1 Scheduling Development Tool Description

Schedule data is compiled and updated in a scheduling tool to depict the time-sequenced flow of tasks, the actual work progress, and what remains to be completed. P6 is the standard schedule development tool used at OPG. P6 will interface with Work Management Tool (Asset Suit 7), Cost Management Tool (Proliance) and Estimating application (US Cost).

## 5.2 Task Breakdown

The development of a Level 3 Schedule that integrates the schedules of numerous contractors including some OPG work groups requires a degree of standardization. An analysis process has been used to determine what user groups will need to be in the schedule and the results are shown in Task Breakdown Table. OPG and contractors are expected to use this table to establish the tasks that will appear in the Level 3 schedule.

### 5.2.1 How to use Task Breakdown Table

What belongs in the schedule? - The table identifies a number of possible tasks (e.g. submit PC1, Prepare permit) in a subject area (e.g. Work Protection). The next three columns are labeled Always, Sometimes, and Never.

Always means always. For reasons that have to do with plant status control, management of critical and near-critical path, resource assignment etc, we have determined that these tasks must be in the schedule and must be shown at level 3.

Never means never. If, for reasons of its own, a contractor wishes to include these activities in its own P6 schedule they are at liberty to do so, but they must be coded so that they are NOT brought into the OPG layouts of P6 in which tasks are being integrated. OPG is conscious of the need to limit the total tasks brought into the project in order to ensure the manageability of project updates, and hence we will not be including "never" tasks in our schedule.

Sometimes has the following interpretation:

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>21 of 36</b>

Title:

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

A “sometimes” task may be included in the schedule because contractor’s scheduler needs it there for internal coordination purposes or

A “sometimes” tasks may be brought into the schedule at the request of the OPG Master Scheduler or Work Control Team Leader (WCTL) to facilitate broader scale coordination of work. Normally the requirement to add additional tasks will be identified in Task Analysis Meetings (TAMs) as system window logic is being established.

The next three columns in the table are labeled Direct P6, AS7 and Either. These labels describe how activities get into P6. There are two means available for a contractor to populate the P6 schedule with the tasks as defined above. The first is to directly inject the task into P6. The second is to add the task to the Work Order in Asset Suite 7(AS7) through the use of the assessment functions of that program. Most tasks can be placed into the P6 schedule using either method and contractors are encouraged to use whichever is most effective. A small number of exceptions are identified in table below.

## 6.0 SCHEDULE INPUT MONITORING

### 6.1 Compare Schedule Status to Time Status Reports

Level 3 schedules will be resource loaded with hours for OPG and Vendor work. The total hours loaded at Level 3 activities will be rolled up to Level 2 (Work Package). Total hours will be compared to the estimates done at the Work Package level and all the Actual hours will be collected at this level using financial systems called Tempus and Oncore.

BI (Business Intelligence) Reports will be available to compare plan hours versus actual hours. The SPI and CPI will be calculated at the Work Package level and when issues are identify at Level 2, more detail analysis of Level 3 activities will be initiated. Level 2 and 3 activities will also be monitored against a baseline to identify any work that is not progressing as planned or is ahead of schedule so we can take advantage of the early completion or initiate a recovery plan as required.

### 6.2 Monitor Vendor's Schedule

Schedule health and integrity will be monitored on level 3 schedules developed by all the Work Groups. Standard scheduling templates with minimum number of activities and all the mandatory codes for different work types will be provided. BI reports will be developed to monitor the compliance.

ACUMEN FUSE application will be used to analyze schedule quality and look for issues like missing logic, hard constrains, negative float, number of lags or areas where there is insufficient level of detail, before vendors schedules are integrated within the Program Integrated Master Schedule (PIMS)

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

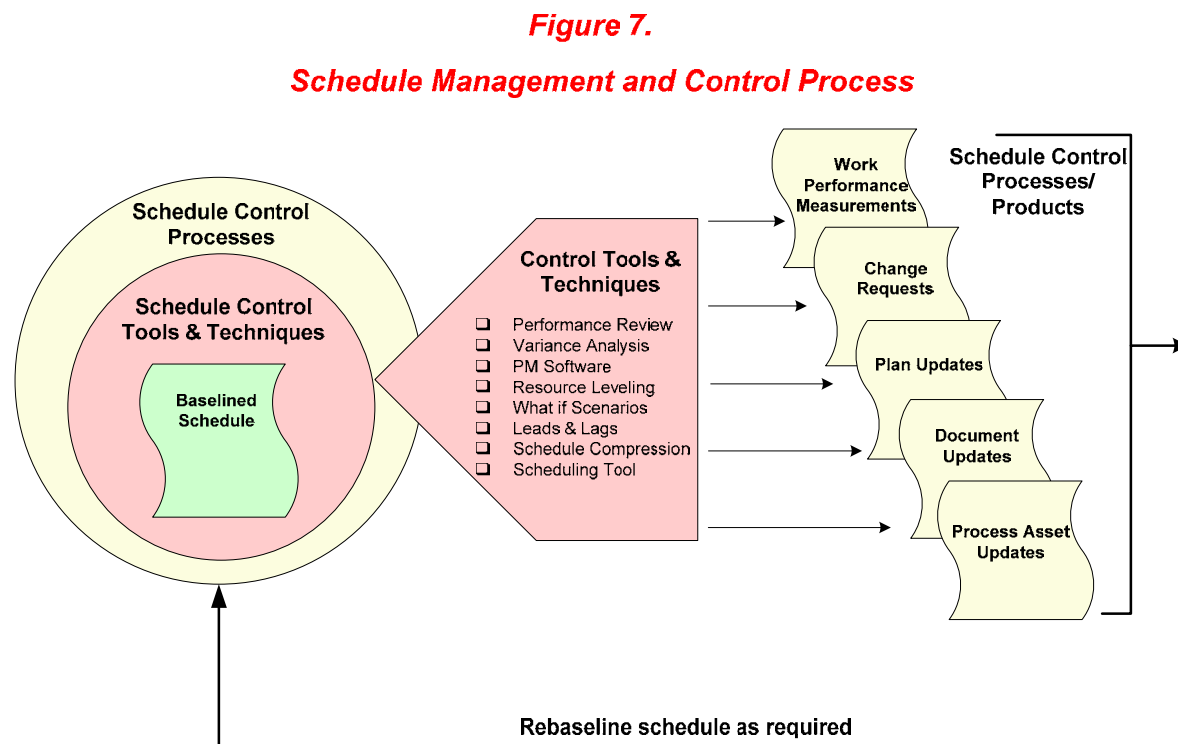

Monitoring vendor's schedules will be ongoing activity and all the issues will be communicated through Master Scheduler to the Lead Schedulers located in the SCC room. It will be Master Scheduler's responsibility to ensure that all the corrective actions have been resolved in a timely manner and that both Outage Manager and Unit Director are aware of the issues.

## **7.0 SCHEDULE MANAGEMENT AND CONTROL**

Schedule management and control begins when the Level 3 is first baselined. This initial baseline establishes the project's scope and sets the expectation for how and when the scope will materialize. Any proposed changes to the scope will drive a schedule change management process. At this point, changes happen only if there is a change in requirements.

Schedule control addresses anticipating or correcting schedule variance. To do this, control tools and techniques are used to detect and forecast serious deviations from the baseline.

Figure 7 depicts a high-level representation of the schedule management and control process used by the Darlington Refurbishment.

As actual completion dates are monitored against the baseline, control tools and techniques are applied to anticipate, avoid, and mitigate time loss as well take advantage of extra time due to early completions.

## **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

### **7.1 Schedule Control Techniques**

Schedule control processes serve to minimize schedule changes. Control techniques are designed to reveal the status of the schedule and suggest corrective action to bring the project back on schedule. A number of techniques will be used on Level 3 schedules developed by OPG and contractors. For a list of Schedule Control Techniques that will be used in the Darlington Refurbishment see Appendix B

Schedule Planning Analysis takes place early in the project when the WBS is formulated. The scheduling team will use P6 to run What-if Scenarios to align the project owner's vision of the project with the likely timeframe for completion. What-if Scenarios will again be run when a new completion date must be determined as a result of a requested change to the WBS during the course of the project...

### **7.2 Schedule Control Products**

Schedule Control Products such as Work Performance Measurement Data, Change Requests, Plan Updates, Process Asset Update, and Project Document Updates will result from applying schedule control techniques.

Planning and Controls (P&C) will facilitate the development of these products but it will be the Bundle/Project Team's responsibility to prepare, review or update the product and take the necessary correct actions, e.g. To submit a Change Request or to review the Performance Reports or to update the Schedule Baseline.

### **7.3 Schedule Change Request Process**

Schedule changes may be driven by unanticipated work, new scope or when forecast is so far from the baseline that all the monitoring tools are no longer providing meaningful information. The change control process will be done at the Work Package level. If schedule analysis reveals an unfavorable impact to Work Package End Date or total resource hours projected, then a work Package Change Control process will be initiated.

Change Control process specifies different thresholds when a proposed change is considered an approved variance, a baseline change or full re-baseline of the schedule. Different levels of approves are required, based on the type of change.

Every change request will be reviewed to evaluate impact on Program Milestones, downstream activities, interfaces with other work groups and resource requirements.

The Master Scheduler monitors the Level 3 by reviewing and incorporating updates on a weekly basis. The Schedule Change Management Process is applied when:

- New tasks or deliverables cause baseline milestones or Work Package End Date to slip
- The project scope is changed
- A new constraint impacts the planned delivery date of the final project deliverable
- A directed change has occurred

### **7.4 Update Schedule**

Level 3 schedules will be updated daily or weekly during the execution phase based on the Outage Segment requirement. Asset Suite 7 tasks will be updated automatically with an interfaces process. Activities created manually will be updated by the Lead Schedulers sitting in the SCC room. Daily updates will include actualizing activities and entering percent complete.

## Manual

<b>SCH-11</b>	<b>R000</b>	<b>27 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

The Data Date will be moved as required to support the process of generating integrated T-0 schedule.

Based on the daily status updates in Level 3 schedules, the Master Scheduler will analyze the schedule accuracy, float, extra time and overruns with respect to impact on interfaces across work group or execution windows within segments.

#### **7.5 Establish New Schedule Baseline**

Prior to breaker open, the Integrated Level 3 schedule will be going through multiple revisions as we develop and incorporate additional details. With each revision, we will create a new baseline. Revision '0' will be the final revision before Breaker Open and that will be the baseline for execution.

After Breaker Open, in order to change the baseline, work group will have to follow the Change Control Process. Once the change is approved as baseline change and all the impacts on downstream activities have been analyzed, effected baseline will be restored and updated in P6.

Every time a baseline is updated, a copy of the baseline is retained in P6 before any changes are made.

#### **7.6 Archive Schedule Change Support Materials**

A Change Control Form (CCF) is required for any change request. Supporting documentation and analysis is assembled by the project teams and submitted for review to Planning & Controls group. All the information is stored in SharePoint and recorded in Change Control Log. See the Change Control procedure to get the full list of requirements.

### **8.0 SCHEDULE STATUS REPORTING**

NR Refurbishment will use the BI Reporting solution for all the reporting requirements. The BI reports are located on the OPG network in the SharePoint environment. P6 data, including current schedules and the baseline schedules, will be downloaded every night into the BI data warehouse.

All the reports required in the BI will be defined and developed prior to Breaker Open. Existing reports used during outages will be leveraged and new reports will be created based on Refurbishment requirements and industry standards/practices/templates.

#### **8.1 Monthly Project Reports**

Schedule status reporting is accomplished via four monthly reports:

- Project Master Schedule (Gantt Chart)
- Monthly Project Report (Internal and External)
- Sponsor Monthly Project Report
- Contractor Dashboards
- Bundle Dashboards

#### **8.2 Monthly Metrics and Trend Analysis**

Reports that specifically detail the status of the schedule including completion status of tasks, activities, deliverables, and milestones as compared to the baselined plan include:

- Planned vs. Actual Task Completions

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SCH-11</b>	Revision Number: <b>R000</b>	Page: <b>28 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Estimate to Complete (ETC)
- Critical Path Analysis

#### **8.3 Weekly Metrics and Trend Analysis**

- Weekly CNO Package
- Schedule Adherence Report
- Schedule Variance by Activity
- New tasks added (or deleted) since last reporting period
- Outage Segment Dashboard
- Project Dashboards

#### **8.4 Daily Reports and Metrics**

- Break Plan
- Plan of the day
- T-0 Plan
- List of tasks that were completed or not completed

#### **8.5 Schedule Oversight Reports**

Reports used to analyze current status and identify potential or actual issues include:

- Project Milestone and Deliverables Reports
- Task Lead Oversight Reports
- Oversight Reports
- Tasks with Negative Float Reports
- Contractual Product Status Reports
- Late or At Risk Task Reports

### **9.0 SCHEDULE CLOSING**

P6 production database will be monitored by P6 administrator who will ensure that the number of active activities do not cause any performance issues. Completed schedules representing early phases of the projects/segments will be archived. Historical data will be available through custom solution.

#### **9.1 Closing Reports**

The Schedule Manager will provide input into the final schedule-related reports generated by the IPOC. These reports include:

- Post Implementation Evaluation Report (PIER)
- Federal Closeout Report

#### **9.2 Archive Schedule Data and Tools**

Archived activities will be in another P6 instance available for review and analysis. Custom P6 Viewer that combines information from two separate P6 instances will be available. Archived schedules will also be available in XER format.

BI Data Warehouse will have all archived and active schedules available for reports and metrics.

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

**Appendix A: Glossary & Acronyms**

ACRONYM/TERM	DESCRIPTION
Archive	An Archive is a secure repository of Configuration Items often stored offsite for additional security. Archiving is a process of storing Configuration Items in a secure manner. The purpose of archiving is to provide recoverability to a past state. Although the process for creating an archive is similar to that of taking a baseline, the method of storage for both is different. Whereas baselines are maintained in easily accessible media for reference during the project lifecycle, archives are stored on secure media.
Baseline (also: Project Schedule Baseline)	Approved project schedule that serves as the basis for measuring and reporting schedule performance.
Change	Change and clarifications to any configured item including operational requirements and contract requirements.
Change Control	The tracking and management of proposed changes to an item's format, content, version and/or configuration. Change control applies to many different project office functions (e.g. requirements management, project management, quality management, contract management, etc.) as well as contractor delivered products.
Sub-Contractor	The external service provider that will develop, or otherwise supply a service to or component of a project deliverable. (See Vendor)
Deliverable	A work product produced by a contractor or consultant in accordance with the terms of their contract. It is measureable, tangible, verifiable outcome, result, or item that must be produced to complete a project or part of a project.
ETC	Estimated Time to Complete
FSR	Feasibility Study Report
Integrated Level 3	A schedule of tasks to be completed by both the Vendor and OPG staff.
IT	Information Technology
Managers	The Department staff that oversee other department staff and are generally responsible for workload management.
Milestone	Identifiable point in a project or set of activities that represents a reporting requirement or completion of a large or important set of activities.
Vendor	The contractor who has primary responsibility for developing or integrating the given system, or the primary contractor performing work on the system.
Project Management Body of Knowledge (PMBOK)	Information Technology project management supported by a discipline and a formal body of knowledge that defines a project from inception to implementation.

Title:

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

ACRONYM/TERM	DESCRIPTION
Project Participant	Individuals that are either dedicated project staff or individuals that provide executive level sponsorship and support.
Project Schedule	Time-sequenced plan to accomplish activities or tasks used to direct and control project execution. Usually shown as a milestone chart, Gantt or other bar chart, or tabular listing of dates.
Project Work Breakdown Structure (Project WBS)	The Project WBS is a hierarchical tree diagram that depicts the first three levels of the work breakdown structure beginning with level 1 that shows the project's main deliverable (the final system) followed by level 2 – the major deliverables that make up the level 1 deliverable, followed by level 3 – sub-deliverables to the major deliverables. "Deliverable" may be a contracted deliverable of major work product.
Request for Proposal (RFP)	The RFP used to solicit proposals from the bidding community based on a set of defined requirements. The requirements may be general in nature allowing the bidders to propose a solution and the specific products to be used. The RFP describes the problem requirements, contractual terms, and required format for the proposal responses. The RFP also includes the specific criteria which will be used to evaluate the received proposals. The project works with DGS to ensure the RFP meets all appropriate state guidelines and regulations.
Resource Breakdown Structure (RBS)	A hierarchical structure of resources by resource category and resource type. The RBS may be organized by functional organizations.
Schedule Management	The process of developing, managing, and controlling the project schedule or integrated master schedule.
Stakeholder	(1) Individuals and/or groups who are involved in or may be affected by project activities. (2) The people who have a vested interest in the outcome of the project.
System Implementation	System implementation includes the activities of the project office and Vendor to deploy the new system into the target environment or production. This includes but is not limited to, the installation of equipment, the installation of software, the rollout of new or modified business processes, and the delivery of supporting documentation. Implementation is complete upon system acceptance by the department's maintaining organizations, and when the system is deemed "In production". Since the project may be developed, implemented, and transitioned in iterations, these processes may be repeated and overlap between iterations.
Work Breakdown Structure (WBS)	A deliverable-oriented hierarchical grouping of project elements that organizes and defines the total scope of the project. Each descending level represents and increasingly detailed definition of the project work.

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

**Appendix B: Schedule Control Techniques**

<b>Technique</b>	<b>Definition</b>
Performance Reviews	Performance reviews measure, compare, and analyze schedule performance such as actual start and finish dates, percent complete, and remaining duration for the work in progress.
Scenario Analysis	Allows decision makers to explore the implications of several alternative future states thus avoiding the danger of single-point forecasts. Conducted in a nonthreatening group setting, participants express beliefs, challenge assumptions, and alter their viewpoints to ultimately arrive at a strategic direction that is flexible and will remain so as actual events unfold.
Forward-Pass Analysis	Calculation of early start dates and early finish dates for uncompleted portions of all network activities. Determined by working forward through the network logic from the project's end date.
Backward-Pass Analysis	Calculation of late finish dates and late start dates for uncompleted portions of all network activities. Determined by working backward through the network logic from the project's begin date.
Bottom-Up Estimating	Cost, work, or resource estimate derived by first estimating the project's individual elemental tasks at the lower levels of the WBS and then aggregating those estimates at successively higher levels of the WBS. For cost estimates, the project manager typically includes indirect costs, general, and administrative expenses, profit, and any reserves when calculating the total project cost. This form of estimating is more accurate than making one large estimate.
Top-down Estimating	Approximating the size (duration and cost) and risk of a project (or phase) by looking at the project as a whole and comparing it to previously performed similar projects. The comparison may be made directly using "analogous estimating," through an algorithm as in "parametric estimating," or from the memory of estimating experts. Upon establishing an overall estimate for the project, sub-divide the estimate down through the levels of the WBS, for example, development will be 50% of the total, testing will be 25% etc; then sub-divide development and testing into their components and so on.
Critical Path Method	Predicts project duration by analyzing the sequence of activities (network path) that has the least amount of scheduling flexibility (i.e. float). Early dates are calculated by a forward pass using a specified start date. Late dates are calculated by a backward pass starting from a specified completion dated (usually forward pass's calculated early finish date for the project.)
Monte Carlo Simulation	A technique in which the project team leader or project team computes and/or quantifies the complete and total project cost and/or project schedule a number of times through the use of input values that have been selected at random through the careful utilization of probability distributions or potential costs and/or potential durations. The purpose of utilization of the Monte Carlo analysis is for the sake of calculating a defined distribution scenario of possible total costs associated with the project as well as a range or possible completion dates of the project.
Resource Histogram	Vertical bar chart used to show resource consumption and availability by time period. Also called, resource loading chart.
Resource Leveling	1) Practicing a form of network analysis in which scheduling decisions (start and finish dates) are driven by resource management issues such as limited

Title:

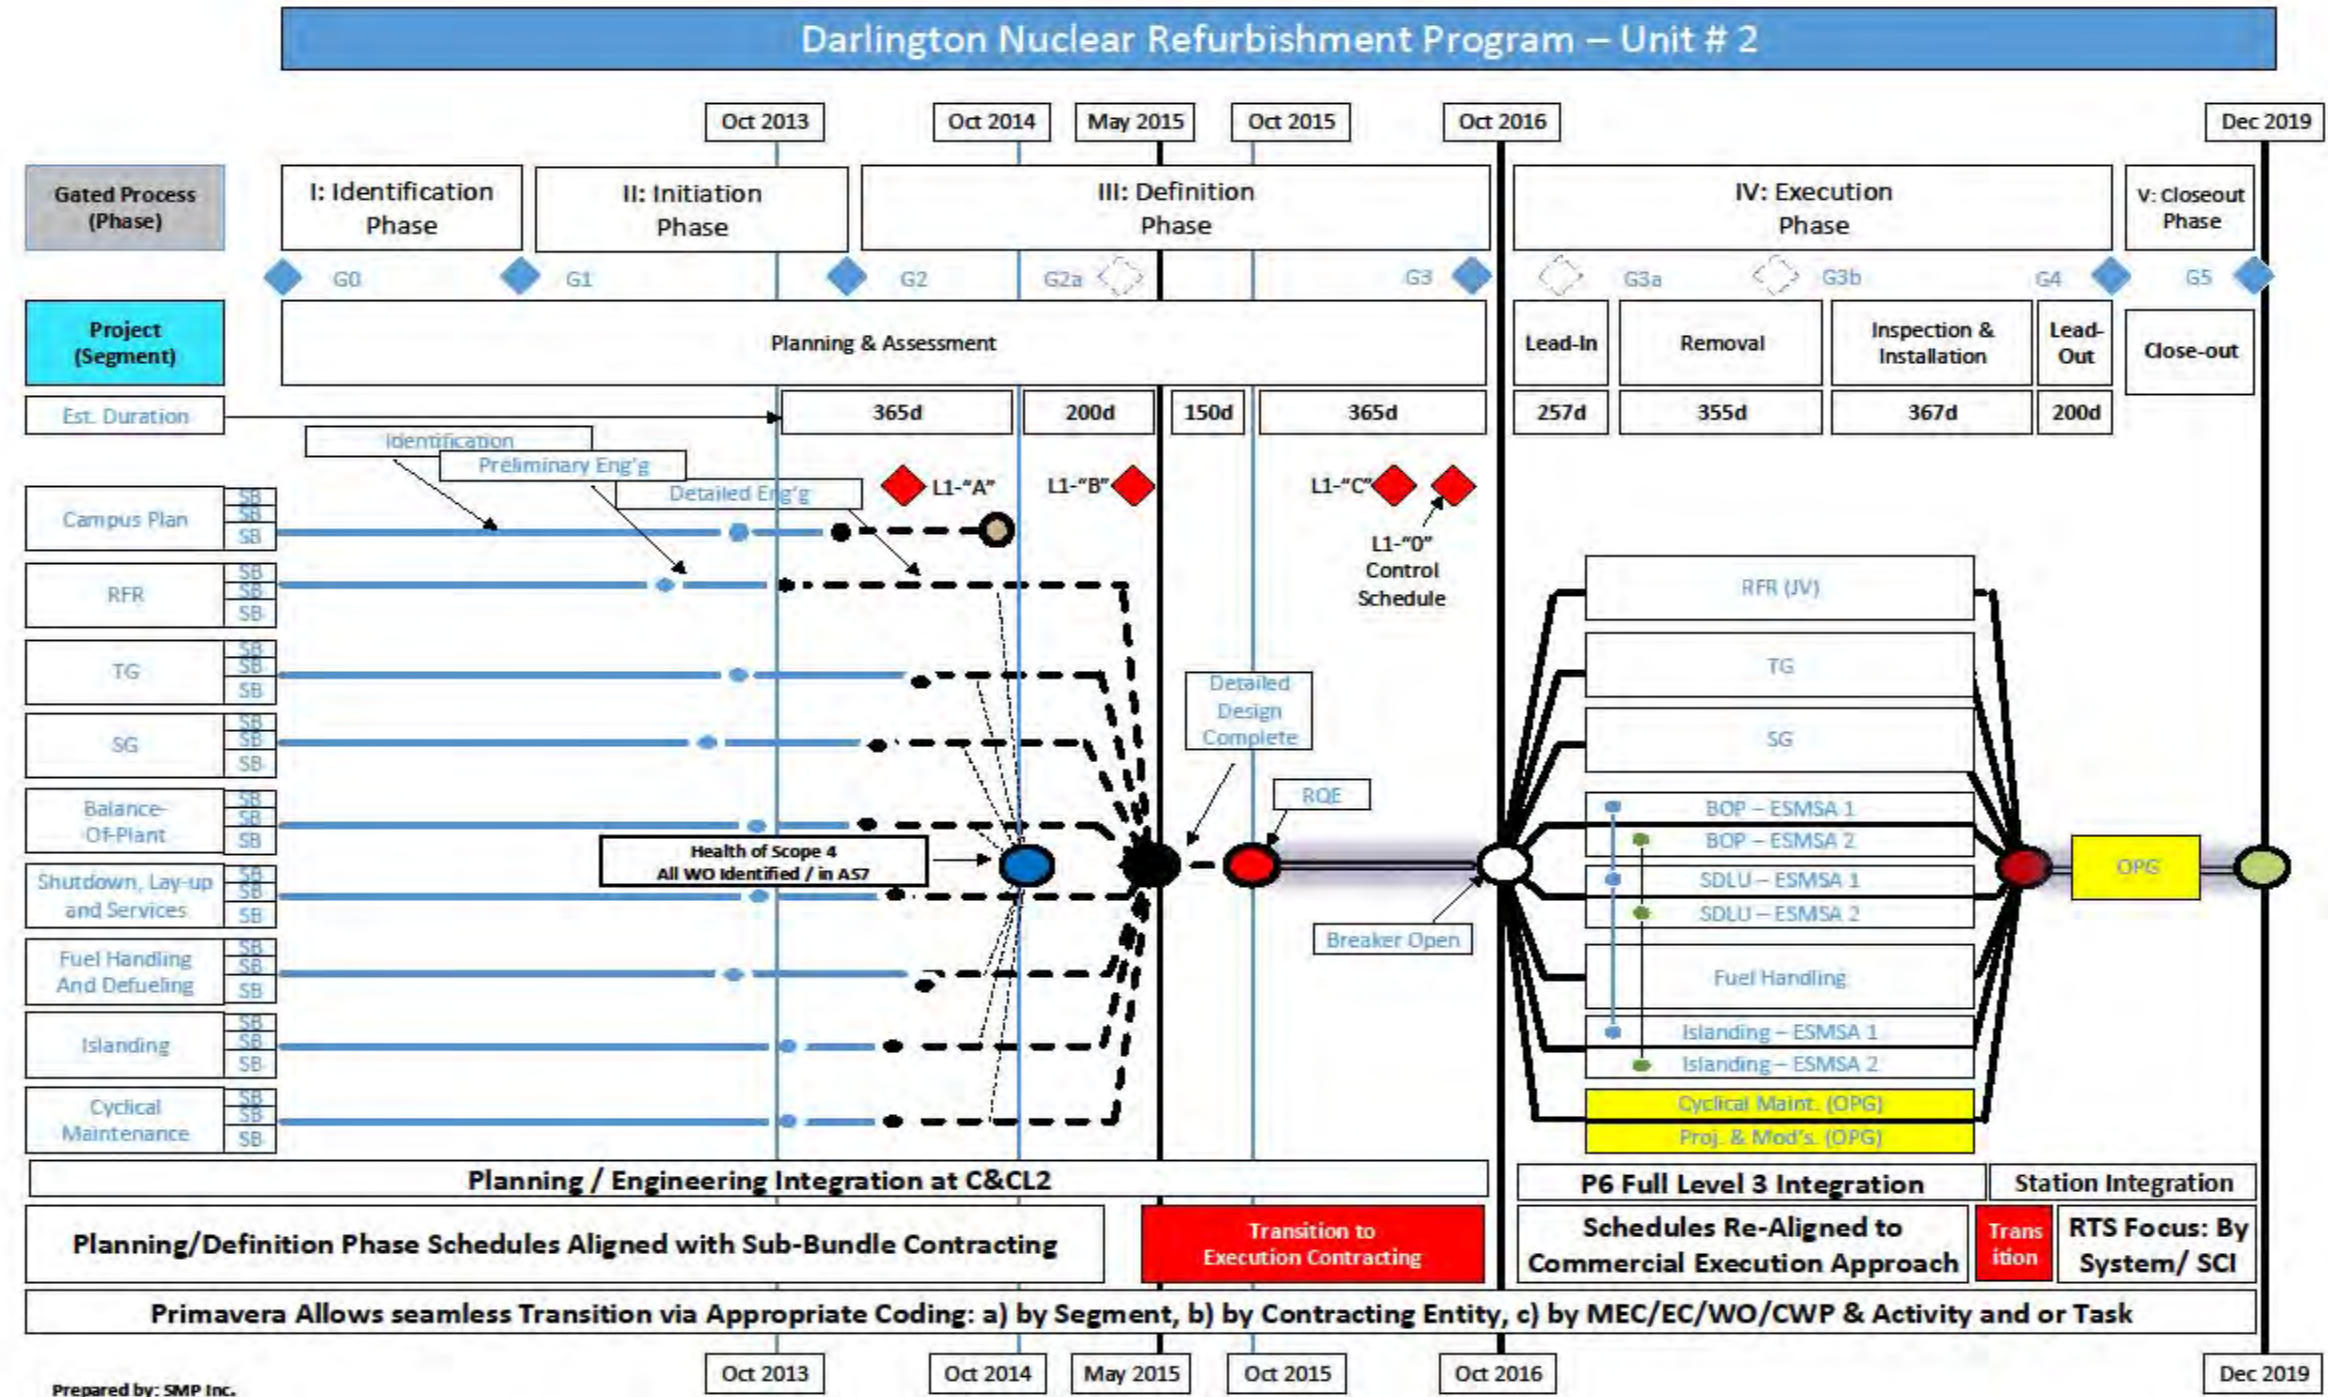

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

Technique	Definition
	resource availability or changes in resource levels.  2) Evening out the peaks and valleys of resource requirements so that a fixed amount of resources can be used over time.  3) Ensuring that a resource is maximized but not used beyond its limitations.
Variance Analysis	The goal is to determine the causes of a variance (that is to say, the difference between an expected result and an actual result).
Schedule Compression	Shortening of the schedule without reducing the project scope. Often requires an increase in project cost.
Crashing	Taking action to decrease the total project duration by adding resources (human and material) to the project schedule without altering the sequence of activities. The objective is to obtain the maximum duration compression for the least cost.
Fast Tracking	Compressing the project schedule by overlapping activities normally performed in sequence, such as Design and Build/Construction.
Free Float & Total Float (or Slack)	Free float is the amount of time an activity can be delayed without delaying the early start of any immediately succeeding activities. Also called, secondary float. Total float is the amount of time an activity from its early start without delaying the project end date. Derived by subtracting the early start from the late start or the early finish from the late finish and may change as the project progresses and as changes are made to the project plan. Also called slack, float, and path float.
Adjust Leads and Lags	Lead: A modification of a logical relationship that allows an acceleration of the successor activity such as when a task has a finish-to-start dependency with a ten-day lead, the successor activity can start ten days before the predecessor activity has finished. Lag: A modification of a logical relationship that directs a delay in the successor activity such as when a task has a finish-to-start dependency with a ten-day lag, the successor activity cannot start ten days after the predecessor activity has finished. Adjusting leads and lags is used to find ways to bring project activities that are behind into alignment with the plan.

Title: <b>NUCLEAR REFURBISHMENT COST ESTIMATE</b>		

## 1.0 OVERVIEW

This document is written under the authority of Nuclear Projects Cost Estimating N-MAN-00120-10001-EST. It provides an overview of the requirements and processes to be followed when planning, developing, reviewing, approving Class IV and Class V cost estimates for projects of Nuclear Refurbishment (NR), and obtaining an accurate and realistic assessment of the likely cost of a project.

This manual establishes the practice in which NR will align with other OPG organizations, recognized industry standards, and common practices as recommended by industry groups such as the Association of the Advancement of Cost Engineering International ("AACEI"). This manual aligns the development of project estimates and its requirements to each phase (or gate) of a project as documented in Nuclear Projects - Gated Process N-MAN-00120-10001-GRB.

This manual details the Gate 0/Gate 1, Class IV and Class V estimating requirements and the support group estimates required.

Gate 2/Gate3, Class II and Class III will be prepared by the EPC Vendors. For estimating requirements see N-MAN-00120-10001-EST-03 – Nuclear Refurbishment – Estimate Oversight, Review and Validation.

Compliance to this manual is mandatory for all projects executed or funded by Nuclear Refurbishment program, with exception to projects executed by Projects and Mods.

## 2.0 ROLES AND RESPONSIBILITIES (per Appendix "C")

### 2.1 Definition – Project Estimator

The Project Estimator is the group, the individual, or the 3<sup>rd</sup> Party Estimator who prepare the estimate to the defined scope of work per Nuclear Refurbishment project requirements.

### 2.2 NR Execution – Project Management

- Identify deliverables and requirements in P6 for estimating support, 6 months before the estimate is due for Gate 0 and Gate 1, or 3 months before the estimate review and validation is due for Gate 2, 3 and onwards.
- Validate the accuracy of approved scope description (in DSR, CCA, AR, etc) and its original inputs to the approved scope description.
- Provide the Project Estimator with validated project scope documents, contract strategy, engineering design report and details, etc as needed for the progression of the gate, per agreed work breakdown structure (WBS). The detailed project documents and engineering information are listed in the Appendix A: Estimate Input Checklist per Estimate Classification and NR Project Gates.
- Coordinate and act as SPOC among engineering, reactor safety, supply chain, operation and maintenance, to provide project information to support estimating.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>6 of 22</b>
Title: <b>NUCLEAR REFURBISHMENT COST ESTIMATE</b>		

- Ensure the scope, strategy clarification and alignment is reached between the estimators and project management team, and reflected in Basis of Estimate (BoE) for final approval.
- Develop WBS and the WBS dictionary, and lead its approval in accordance with NR WBS standard.
- Communicate information and decisions relative to construction labour agreements, shift plan, labour strategy, allowance, etc.
- Support estimate's development, revision and approval to meet key milestone, project schedule, and gate requirements.
- Further define the estimate template with Project Estimators per the level of details in estimate
- Review cost presentations for project direct cost, project indirect and overhead cost.
- Review and approve the estimate for Gate 0 &1, or estimate review/validation report for Gate 2, 3 and onwards.

### 2.3 NR Planning and Controls - Estimating

- Provide the manuals and task instructions to estimator, CSA, engineers, and project managers etc. to support project estimating.
- Prepare program level estimates to meet program needs, and consolidate the projects' estimates to support Release Quality Estimate as defined in NK38-PLAN-09701-10235.
- Validate and approve the required estimate accuracy based on Gate requirements as defined in Nuclear Refurbishment Gated Process N-MAN-00120-10001-GRB, jointly with NR Execution- Project Management.
- Ensure the estimate is developed, revised and approved to meet key milestones, project schedule, and gate requirements.
- Assign the Project Estimator to develop the Class IV, Class V estimate per the requirements from NR execution - project management.
- Coordinate use of third-party estimating service, where required and/or applicable, including periodic reviews of their performance and estimating standards.
- The primary role is to develop/approve estimates to support projects for Gate 0 and 1. (As identified in N-MAN-00120-10001-EST03 the primary role is shifted to provide oversight to EPC Vendors, validate and review their estimates to support Gate 2, 3 and onwards, as the EPC contractors are further involved with project development).
- To support Gate 0 and 1, prepare estimate package with BoE (Basis of Estimate), for Gate Review Board as described in Nuclear Refurbishment Gated Process N-MAN-00120-10001-GRB, or Program Scope Review Board ("PSRB") per N-MAN-00120-10001-SCOPE-05: Darlington Refurbishment Program – Scope Review Instruction. (To support Gate 2, 3 and onwards, provide oversight to EPC Vendors, review and validate estimates and BoE prepared by the EPC Vendors, for the scope fullness and properness for the estimating data and methodology – as detailed in N-MAN-00120-10001-EST03 and EST-04).
- Utilize estimating tools for preparing estimate, and provide access to estimate tools and database to project members as needed.
- Develop estimate benchmarking analysis as needed.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>7 of 22</b>

Title:  
**NUCLEAR REFURBISHMENT COST ESTIMATE**

- Keep audit ready records of relevant information regarding each estimate prepared or reviewed.

### 2.4 NR Planning and Controls – Costing and Scheduling

- Provide the Project Estimator with incurred cost of activities already executed for the project.
- Provide the Project Estimator with an updated schedule of activities and key milestones.
- Understand all details of the estimate report and be prepared to use it for budget preparation.
- Working with the Project Estimator, cost and schedule analyst will update the schedule with the appropriate resources, identify resource histograms and analyze peaks and valleys. Also, the cost and schedule analyst will develop the cashflow based on estimate cost.

### 2.5 NR Planning and Controls - Risk Management:

- Provide updated risk register for estimating.
- Lead structured analysis of project estimate for risk/contingency evaluation per N-MAN-00120-10001-RISK-05: Nuclear Refurbishment - Contingency Development and Management.

### 2.6 Major Nuclear Projects Controllership

- Provide escalation factors, capitalized interest calculation methods and standard OPG labour rates to project estimating team.
- Provide guidance and assistance in calculation of NR project/program escalation and capitalized interest.
- Provide guidance to project team for the eligibility of project indirects and overhead cost in the estimate.
- Provide overall finance guidance and support for reviewing total project cost estimate, as required.
- Verify Capital vs. O&M cost for NR Project/Program.

## 3.0 ESTIMATE TYPES

Estimates may be required for a variety of reasons. The typical requirement for the estimates is to support project progression and the gated process.

The estimates can also further facilitate other functional groups and its deliverables as follows:

- Estimate can be used to support annual business planning for NR program funding request (Program Releases, RQE).

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>8 of 22</b>

### Title: NUCLEAR REFURBISHMENT COST ESTIMATE

- Estimate can be used to facilitate the preparation of DRAS and its NPV calculation to support the scope progression and final scope approval from SRB.
- Estimate can be used to facilitate the procurement or contracting processes, to set up baseline budget for vendor quotation or bidding.
- Estimate review reports will be used to support NR Execution – Project Management and others for bid evaluation, vendor selection or negotiation.
- Estimate can be further processed for budgeting, and cashflow preparation by the NR Project Controls – Costing and Scheduling

## 4.0 ESTIMATING PROCESSES

There are four major phases in developing an estimate. They are estimate planning, estimate developing, estimate reviewing, and estimate approving. These estimating processes will be repeatedly implemented to support each Gate per gated process N-MAN-00120-10001-GRB. The detailed estimating activities for each phase and gated processes are in Appendix C: Estimating activities and gated processes.

### 4.1 Estimate Planning

NR Planning and Controls – Estimating determines the AACEi classification, timeline, and deliverables of an estimate. They also determines who will be accountable to produce the estimate and when the estimate will be conducted, and how the estimate will be prepared and presented. Also, it will plan the level of accuracy and classification that the estimate is required based on the project gate per N-MAN-00120-10001-GRB: Nuclear Projects - Gated Process.

NR Planning and Controls – Estimating decides which group or individual will estimate different parts of the project scope. It shall decide whether to do the estimate internally in OPG vs. Externally (via 3<sup>rd</sup> party estimator).

NR Planning and Controls – Estimating develops brief schedule for estimate delivery or review dates, based on different pieces of project scope progress, and stage of project (gate) with concurrence of the project manager. Estimating milestones must be in accordance with the overall NR Program Master Integrated Schedule (“PIMS”).

NR Planning and Controls – Estimating approves the level of accuracy for estimate based on available project information and engineering progress. This is to ensure that the estimate requirement is aligned with stage of project (gate).

NR Planning and Controls – Estimating verifies the grouping of major scope items via WBS definition, to facilitate estimate development and review.

Unique estimate ID to each estimate will be provided by NR Planning and Controls - Estimating Team to track and record the estimate and its revision.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>9 of 22</b>
Title: <b>NUCLEAR REFURBISHMENT COST ESTIMATE</b>		

### 4.2 Estimate Developing

Following the Nuclear Projects - Gated Process (N-MAN-00120-10001-GRB), each project will provide required project plans and procedures to support the estimate preparation. Detailed list of documents that NR Execution – Project Management needs to provide to the estimators are listed in Appendix A: Estimate Input Checklist per Estimate Classification and NR Project Gates

The Project Estimator will prepare the estimate to the defined scope of work per Nuclear Refurbishment project requirements. The Project Estimator is assigned by NR Planning and Controls – Estimating to support each NR project and the Gated process.

To support the Gate 0 and Gate 1 effort, the Project Estimator will:

- Achieve and document scope clarification and ensure there is alignment with project execution – project management team, via estimate developmental or clarification meetings.
- Prepare estimate and develop the Estimate Basis in parallel, and clearly outline any deviation or exclusions in estimate.
- Prepare estimate breakdown based on approved project WBS and Code of Accounts NK38-REF-09701-0389661.
- Prepare estimate based on the agreed project estimating template (Appendix B: Sample estimate templates).
- Use estimating tools and databases as directed by NR Planning and Controls- Estimating to prepare the estimate. The estimate shall be structured in consideration of data migration to P6 or other project control tools.
- Ensure estimate and estimate class input into NR project scope control database.
- Develop backups for the estimate calculation details for reviews or audits.

For support to Gate 2, 3 and onwards, the requirements are identified in N-MAN-00120-10001-EST03

#### 4.2.1 Estimate Basis Freeze

Generally, all the estimate basis or project information supporting the estimate or estimate review/validation will be frozen 1 month before the estimate due date. Only minor project changes or information updates that are received by the estimator 2 weeks before the estimate due date, will be incorporated into the estimate and estimate review and validation.

#### 4.2.2 Basis of Estimate

The Project Estimator shall prepare the Basis of Estimate (as detailed in N-MAN-00120-10001-EST04) in parallel with the development of the estimate.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>10 of 22</b>
Title: <b>NUCLEAR REFURBISHMENT COST ESTIMATE</b>		

### 4.2.3 Estimate Allowance and Contingency

The definitions for allowance and contingency, and the contingency calculation methods for estimate are laid out in N-MAN-00120-10001-RISK-05: Nuclear Refurbishment - Contingency Development and Management.

NR Project Risk Management group shall undertake a structured analysis of the project estimate to establish program level contingency and management reserves.

### 4.2.4 Estimate Escalation and Interest

Project escalation and capitalized interest will be calculated at the project level with support from Major Nuclear Projects Controllership, once the project estimate is developed.

### 4.2.5 Estimate Report Package

As a minimum, this report will include the following documents:

- Basis of estimate
- Cost estimate details
- Cost estimate summary (incl. indirect cost estimate) by Code of Account per WBS and project release gate-
- Estimate key quantities and validation report
- Location and difficulty factors applied in the estimate

### 4.2.6 Estimate Revision

Estimate shall be revised to reflect approved major changes (scope, government policies, working conditions, etc) per project requirement or Refurbishment Program requirement and direction.

Estimates shall be revised when the project or Refurbishment program proceeds to the next gate in accordance with Nuclear Projects - Gated Process (N-MAN-00120-10001-GRB).

## 4.3 Estimate Reviewing

Estimate reviews are intended to ensure that project objectives are met. Estimate reviews validate technical details of the scope of work and verify that the correct processes have been followed during estimate development.

Depending on project's complexity, an estimate may require one or more reviews.

- Scope Review and Quantity Check: The quantity review assesses estimate detail to confirm that it has been completely and correctly quantified per the scope document. The project team reviews scope and quantity details for each direct cost account. This is a key review that requires agreement and alignment on the total package by all attendees.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>11 of 22</b>
Title: <b>NUCLEAR REFURBISHMENT COST ESTIMATE</b>		

- Project Team Review: This review achieves project team agreement on the estimate basis, scope, and overall completeness of the project. The Project Estimator organizes and leads the review challenge meeting. The quorum can include the Project Manager, Project Engineer/Lead, Construction Coordinator, Cost and Schedule Analyst, and Section Manager Project Planning.

### 4.3.1 Estimate Benchmarking

The Project Estimator shall prepare the Estimate Review Report, which summarizes and compares several key benchmark ratios and factors versus historical (and sometimes estimated) values from similar projects. The key benchmark criteria shall be discussed and agreed between Project Estimator and project team. The goal is to ensure that key metrics from the estimate are in line with the same metrics from similar projects. If there is a large discrepancy, it must be explainable by the particular circumstances of the estimated project versus the similar completed projects. Also, the lessons learned on similar types of estimate shall be reviewed.

### 4.3.2 Estimate Reconciliation

When it is not the first estimate, or not the first gate for the project, reconciliation between current estimate and previously published estimate is required. It will compare the variance in quantities and cost for labour, material, and equipment by Code of Accounts or WBS. It is to show the estimate development from previous approved estimate (or BCS).

### 4.4 Estimate Approving

Responsible manager of NR Program Estimating Team and NR project's responsible project manager shall be the first to approve estimates for his/her responsible scope of work.

Depending on the size of project scope and estimate cost, the manager, director, and VP from the responsible execution department or business units may be required to approve the estimate.

## 5.0 ESTIMATE CLASSES AND NR PROJECT GATES

The Association for the Advancement of Cost Engineering International ("AACEi") has developed an estimate classification standard, which defines the estimate "quality" based on the input information used. The AACEi classification system has been adopted for this standard to provide a more uniform basis for decision makers to assess the level of confidence that they can place in an estimate based on a documented level of project definition.

## 8.0 DEFINITIONS AND ACRONYMS

### 8.1 Definitions

**AACEi** – the Association of the Advancement of Cost Engineering International is the largest organization serving cost management professionals. It is the recognized technical authority in cost and schedule management for programs, projects, products, assets, and services.

**Allowances** - are included in estimates for items that are known, but for which the requirements are undefined. An allowance is a cost assumption which must be made because of incomplete information, quantities or design.

**Analogous Estimating** - An estimating technique that uses the values of parameters, such as scope, cost, budget, and duration or measures of scale such as size, weight, and complexity from a previous, similar activity as the basis for estimating the same parameter or measure for a future activity.

**Basis of Estimate** – Required component of the cost estimate, as recommended by AACE International. This document defines the scope of the project and ultimately becomes the basis for change management. A well-written BOE will clearly and concisely state the purpose of the estimate being prepared, the project scope, pricing basis, allowances, assumptions, exclusions, cost risks and opportunities, and any deviations from standard practices.

**Contingency** - the amount of money or time needed above the estimate to reduce the risk of project overruns of project objectives to a level acceptable to the organization (Project Management Institute Project Management Body of Knowledge). Refer to N-MAN-00120-10001-RISK-05: Nuclear Refurbishment - Contingency Development and Management.

**Code of Accounts** – a numbering system used to uniquely identify each element of the work breakdown structure, and to monitor project costs by categories. It is a coded index which methodically structured to support cost management (estimating, accounting, reporting), planning and scheduling.

**Estimate Classification** – maps the phases and stages of project cost estimating together with a generic maturity and quality matrix. The level of project definition determines the estimate class.

**Factored Estimate** - is an estimate prepared through the use of factoring costs from capacity, cost or some other measure of a known parameter, i.e. and estimate based on the cost of a similar facility of a different size (capacity).

**Indirect Costs** - (1) in construction, all costs which do not become a final part of the installation, but which are required for the orderly completion of the installation and may include, but are not limited to, field administration, direct supervision, capital tools, startup costs, contractor's fees, insurance, taxes, etc;(2) In manufacturing, costs not

Sheet Number: <b>EST-01</b>	Revision Number: <b>R001</b>	Page: <b>16 of 22</b>
Title: <b>NUCLEAR REFURBISHMENT COST ESTIMATE</b>		

directly assignable to the end product or process, such as overhead and general purpose labor, or costs of outside operations, such as transportation and distribution. Indirect manufacturing cost sometimes includes insurance, property taxes, maintenance, depreciation, packaging, warehousing and loading. In government contracts, indirect cost is often calculated as a fixed percent of direct payroll cost.

**Monte Carlo Method** - a simulation technique, by which approximate evaluations are obtained in the solution of mathematical expressions, so as to determine the range or optimum value. The technique consists of simulating an experiment to determine some probabilistic property of a system or population of objects or events by use of random sampling applied to the components of the system, objects, or events.

**Overhead** - a cost or expense inherent in the performing of an operation, ie, engineering, construction, operating or manufacturing, which cannot be charged to or identified with a part of the work, product or asset and, therefore, must be allocated on some arbitrary base believed to be equitable, or handled as a business expense independent of the volume of production. Plant overhead is also called factory expense.

**Parametric Estimating Method** - In estimating practice, describes estimating algorithms or cost estimating relationships that are highly probabilistic in nature (i.e., the parameters or quantification inputs to the algorithm tend to be abstractions of the scope). Typical parametric algorithms include, but are not limited to, factoring techniques, gross unit costs, and cost models (i.e., algorithms intended to replicate the cost performance of a process of system). Parametric estimates can be as accurate as definitive estimates.

**Take-Off** - is a specific type of quantification that is a measurement and listing of quantities of materials from drawings in order to support the estimate costing process and/or to support the material procurement process.

## 8.2 Acronyms

AACEi	-The Association of the Advancement of Cost Engineering International
AISC	- Asset Investment Screening Committee [this doesn't appear in the document]

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

### Revision Summary

Revision Number	Date	Comments
R006	2014-10-22	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to incorporate the processes for Darlington Station owned non-IIP DSRs, and PSRB transition.</p> <ul style="list-style-type: none"> <li>• Addition of Section 2.1, 2.2, 2.3 for PSRB transition</li> <li>• Addition of HoS N/A.1, N/A.2, N/A.3, N/A.4</li> <li>• Removed HoS 4</li> <li>• Clarification of HoS 05 and 10</li> <li>• Rewording of HoS 4.1, 4.2 4.3, 4.4, 3 and 90</li> <li>• Rewording of 4.17.4: Requirement to Progress HoS</li> <li>• Updated diagram in section 4.1</li> <li>• Section 4.3 : DSR (Not Refurb) and Non-IIP</li> </ul>
R005	2013-12-10	<p>Revised and issued by Nuclear Refurbishment, Work Control to reflect current practices and incorporate DCR 0120354. This is an intent revision. Due to extensive changes, revision bars are not used.</p> <p>ISR flag in 3.2 – scope categorization paragraph and any other mentions in the body of this document have been removed.</p> <p>Section 4.6 PSRB, clarified role of PSRB secretary from “whom will ensure that all decisions are recorded within a scope database.” to “whom will ensure that all decisions are implemented in a timely manner.”</p> <p>The following has been added:</p> <ul style="list-style-type: none"> <li>• HoS 03, 04.1, 04.2, 04.3 and 04.4</li> <li>• Appendix B, questions concerning parts</li> <li>• Appendix K, attached a copy of the mentioned memo</li> <li>• GAR/IIP tracking</li> <li>• Migration of a draft DSR to the live database</li> <li>• Intent vs. non-intent changes</li> <li>• DSR status</li> <li>• DSR type</li> <li>• Initiating work requests from DSR line items</li> </ul>
R004	2012-12-12	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to Incorporate the requirement for Cost Benefit Analysis to accompany any new proposed scope post May 11, 2011 Major Scope Freeze Milestone, add the Life Cycle of a DSR, Screening and Funding committee quorum clarification. Scope Change Section added. Document numbers updated to align with Business Transformation initiative 2012.</p>
R003	2012-04-30	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to Incorporate revised Appendix A, Appendix B, added Appendix C (Scope Decision Matrix), added Appendix H (Scope Hierarchy) Added Appendix J (Scope Decision Matrix Summary Table), and references to the Integrated Safety Review (ISR) and DRAS processes. Incorporated NK38-GUIDE-09701-10012 Guide to Scope Health Definition Planning into this instruction section 7.</p>
R002	2010-12-23	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls to Incorporate Screening and Funding Committees additions and governance alignment changes.</p>
R001	2010-06-30	<p>Revised and issued by Nuclear Refurbishment, Planning and Controls</p>
R000	2009-04-29	<p>Initial Issue.</p>

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>5 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

## 1.0 BACKGROUND

The Program Scope Review Board (PSRB) reviews and approves proposed additions or deletions of major program level scope for refurbishment of the Darlington Nuclear Generating Station (DNGS) as described in the Darlington Refurbishment Program – Program Scope Review Board - Terms of Reference (NK38-PLAN-09701-10003), DNGS Refurbishment Project Reference Plan – Scope Definition (NK38-PLAN-01060-10003) and in accordance with the Darlington Refurbishment Program Charter (D-PCH-09701-10000).

The process of identification of Program scope and the management of scope changes is described in this instruction and applies to all phases of the Darlington Refurbishment Program. This will ensure that the proposed additions and/or deletions have undergone a thorough assessment based on the return on investment, impacts on plant safety, reliability, project schedule and cost, program resourcing, regulatory requirements and environmental impacts. Refurbishment scope is maintained in the Darlington Scope Request (DSR) database.

Scope in the Darlington Refurbishment Program will support the Darlington Refurbishment Principle Program Objectives:

- (a) Confirm feasibility of refurbishing DNGS reactors
- (b) Plan and execute all work required to refurbish the Darlington units
- (c) Ensure the scope of the refurbishment outages will enable economic operations of each unit for an additional 30 years post-refurbishment.

Refer to Program Structure and Summary Management Plan, NK38-PLAN-09701-10067 Sht: 0001, for an overview of the Program and NK38-PLAN-09701-10067 Sht: 0002, Refurbishment Program Scope Management Plan, identifies how the program scope will be defined, managed and controlled throughout the Darlington Refurbishment program.

## 2.0 DIRECTION

This instruction applies to all staff performing or supporting the identification and definition of scope related to the Darlington Refurbishment Program. This instruction describes the process for submission and approval of scope additions by the Darlington Refurbishment Program Scope Review Board (NK38-PLAN-09701-10003). Scope changes and deletions will also follow the process outlined in this instruction.

Rigorous identification and control of the Darlington Refurbishment Outage Program scope and execution is essential to successful completion of the refurbishment on budget and on schedule and shall be based on the following principles:

- Project safety and defense-in-depth is maintained

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>6 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- Established Dose Targets are not exceeded
- Appropriate Program and Project work is completed
- Project schedule is not extended unnecessarily and recovery plans are developed as required
- The Program costs do not unnecessarily exceed budget
- Planning and integration with key work management areas of the company (outage and online Darlington schedules)
- Reasonable contingencies are in place for unforeseen circumstances that may arise, i.e. discovery work, during the Darlington Refurbishment Program
- Identify, prioritize, track and mitigate risks associated with the project.

For the purpose of supporting this scope control instruction, the Refurbishment Program scope will include core scope and non-core scope. Scope categories are chosen by the scope initiator and confirmed by the technical screening and funding committees and approved by the PSRB. Scope categories are used to ensure the correct work is accepted into scope with clear justification to support the Program Objectives. Once scope is accepted into the Program, the scope must still follow the Gate Review Board approval process for funding and scope management, in accordance with Nuclear Projects – Gated Process (N-MAN-00120-10001-GRB). Refer to Appendix G of this document for a flowchart of Refurbishment Scope Review Process.

### 2.1 Transition to Ad-Hoc PSRB Meetings

As of May 2014, the quarterly PSRB and Funding Committee Review will be replaced with Ad-Hoc meetings. The NR Project Planning and Controls will have the responsibility in scheduling the need-based PSRB and setting up the agenda.

## 3.0 SCOPING PRINCIPLES

### 3.1 Darlington Refurbishment Objectives

The goal of the refurbishment project is to extend the service life of the units by an additional 30 years of post-refurbishment operations. Refurbishment will involve an outage for replacement of life-limiting components, as well as maintenance or replacement of other components which can be most effectively done during the refurbishment outage period.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>7 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

### 3.1.1 Primary Objectives

- Successful refurbishment of Darlington Station Life Limiting Components in order to allow Darlington to operate for 30 years beyond the current predicted end of service life.
- The Refurbishment Project will return the unit in better condition than which it was received.
- A successful refurbishment project requires delivery of all core and approved non-core scope within the timeline and budget established in the Release Quality Estimate and as documented in the project Business Case Summary (BCS).
- Project cost and schedule as well as post-refurbishment performance goals are met with quality, because they will come under extreme scrutiny due to the high profile nature of this project and its impact on OPG's reputation.
- Where scope is approved by PSRB, NR (Nuclear Refurbishment) may recommend inclusion of scope to pre-refurbishment station outage.
- The Refurbishment Program must ensure that all scope is known and is executable.

### 3.1.2 Secondary Objectives

- Refurbishment will assess the scope and overall economics of the program, with consideration of the following:
  - Hardened Backlog
  - 10 Year Investment Program
  - Minor Modification Program
  - Margin Management Plan
  - System Health and Lifecycle management plans
  - System Available for Service (SAFS)/Ready for Service (RFS) process with respect to plant status and operational burdens.
  - Outage Improvement Initiatives
- Support the station vision by delivering value enhancing station improvements (non-core scope).

## Instruction

Internal Use Only		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>8 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- The amount of non-core scope executed during the refurbishment outage will be based on priority of work, and cost benefit assessment. This scope will be optimized to minimize the risk to the refurbishment critical path schedule, and overall project costs.
- All non-core scope must meet strict financial hurdle rules prior to consideration i.e. 9.5% discount rate and 6 year payback (per memo from Chief Financial Officer). Refer to Appendix K for a copy of the memo.

## 3.2 Scope Categorization

All scope is categorized as core scope (CS) or non-core scope (NCS). All core scope will be linked back to the program objectives and non-core scope will be categorized to control and monitor types of scope added and deleted from the Program. Refer to Appendix D of this document for a chart of all scope categories and their description.

### 3.2.1 Core Scope

Consists of work that must be done to achieve the Primary Objective. Core scope will determine the critical path for the refurbishment outage and sets the lower boundary for the cost estimate. Refer to Appendix E of this document for a brief summary of the current document major components of core scope. Core scope includes:

- **Regulatory scope** – Scope that supports station license and regulatory requirements (not optional), as agreed with the regulator and documented in the Integrated Improvement Projects based on Environmental Assessment, Integrated Safety Review and other activities such as Global Assessment which do not require Economic Assessment.
- **Station Life Limiting Components** – modification, repair, or replacement of station life limiting components that must be replaced in order to support the primary objective to allow DNGS to operate for 30 years beyond the current predicted end of service life. This includes items which have an asset class tied to station life and can only be done in a drained and defuelled state. Examples include: Calandria Tubes, Pressure Tubes and Feeders.
- **Component Upgrades** – work to upgrade components, which have a high station priority that can only be done during an extended refurbishment outage with units in a drained/defueled state. Examples include LISS (Liquid Injection Shutdown System) nozzle inspections & repairs, Shutoff Rod guide tubes, and Calandria vessel inspections and repairs.
- **Programmatic work** – Typically performed online or in a normal station outage that must be done in the refurbishment period in order to maintain station licence, including mandatory preventive maintenance, inspections, etc.
- **Prerequisite Scope** – Inspections to determine refurbishment scope and Modifications/upgrades that must be done before refurbishment starts to meet

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

production requirements to enable a successful refurbishment. This includes islanding modifications and fueling machine upgrades.

- **Facilities & Infrastructure Plan** – construction of facilities and improvements to the infrastructure to support the refurbishment. See Scope Exclusions (3.2.4) below for exceptions.

### 3.2.2 Non-Core Scope

Consists of work that will be performed in the refurbishment period if it has no impact on the projects Core Scope critical path, does not add risk to the successful completion of core scope, and where cost or resource efficiencies and station priority warrant the work to be executed in the refurbishment period. A Business Case Assessment Summary (BCS) or Decision Record Analysis Summary (DRAS; N-FORM-11390) demonstrating the economic advantage; including risk management and/or reliability improvement, and priority of completing this work during, pre-, during or post-refurbishment will be required to gain approval.

Non-Core scope may include:

- **Safety Improvement Opportunities** – Safety or Environmental improvements beyond standard that provide benefits to the station in terms of increased reliability and/or lower operating costs some of which is documented in the Integrated Safety Review and Safety Factors Reports.
- **Station Improvement Opportunities** – Station improvements that provide benefits to the station in terms of increased reliability and/or lower operating costs, and where it is economically beneficial to OPG to perform the work in the refurbishment period.

### 3.2.3 Facilities & Infrastructure

Facilities & Infrastructure and Campus Plan projects, to support post-refurbishment operations will be funded by the Darlington Refurbishment program. The Darlington Site Infrastructure Co-ordination Committee will prioritize projects to be executed within this funding envelope.

### 3.2.4 Scope Exclusions

The following items are specifically excluded from the scope of Darlington Refurbishment Project:

- Operations and Maintenance work required to be performed to maintain the plant outside of the refurbishment outage window.
- Tritium removal facility improvements, upgrades, or replacements.
- Spare components, either capital or inventory (Other than per ECC (Engineering Change Control) )

## Instruction

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- New Maintenance Facility

## 4.0 PROCESS

Management of the Refurbishment Outage and the complexity over a long period of time will be a key factor in the success of the overall Program. The PSRB will approve the selection of only the correct scope to achieve success of the Program on schedule and within budget.

The Scope Management Process for the Darlington Refurbishment Program is graphically represented in Appendix A. This diagram represents (primarily) the Program Scope Review Board process and the Major Scope decision process. Approval of the further evolution of Major Scope is approved by the Gate Review Board (As per the Gated Process, N-MAN-00120-10001-GRB).

All work requested to be included in the scope of the Darlington Refurbishment Program must be initiated in the Darlington Scope Request database. Scope will originate from several areas of the Program, including the Environmental Assessment and Integrated Safety Review actions, Plant Condition Assessment, including Aging Management recommendations (through Component Condition Assessment's), infrastructure projects, Station Work Management requirements and Station Improvement Initiatives. Considering each scope origin, the scope request information originates in different forms and must be requested in a common format for the Program to control the scope. The Darlington Scope Request database for the Refurbishment Program will be the format in which DSR Line Items are submitted.

Once requested in the database, the scope will be processed accordingly through the database for consideration in the technical screening and funding committees and at one of the PSRB meetings.

Post Major Scope Milestone completion (May 2011) all proposed non-core scope will require a cost benefit analysis (i.e. BCS or DRAS) and project schedule impact review accompanying the DSR. Refer to Developing and Documenting Business Cases (OPG-STD-0076) for BCS process and Nuclear Refurbishment Actions, Issues, Decisions, and Key Assumptions Management (N-MAN-00120-10001-RISK-07) for DRAS process.

### 4.1 DSR life cycle

The DSR will go through a number of transitions from creation to reconciliation against a Work Order at 24 months before each unit's outage, and to close out as illustrated in the diagram below. A DSR starts as a high level thought and progresses from identification stage to the definition stage; depending on how well the scope is known and understood.

There will be five closeout reports, one per unit, as well as a final close out at the end of the project. The DSR managed in the DSR database is the currency of scope control until 24 months prior to the Refurbishment Outage (RO-24) at which time the

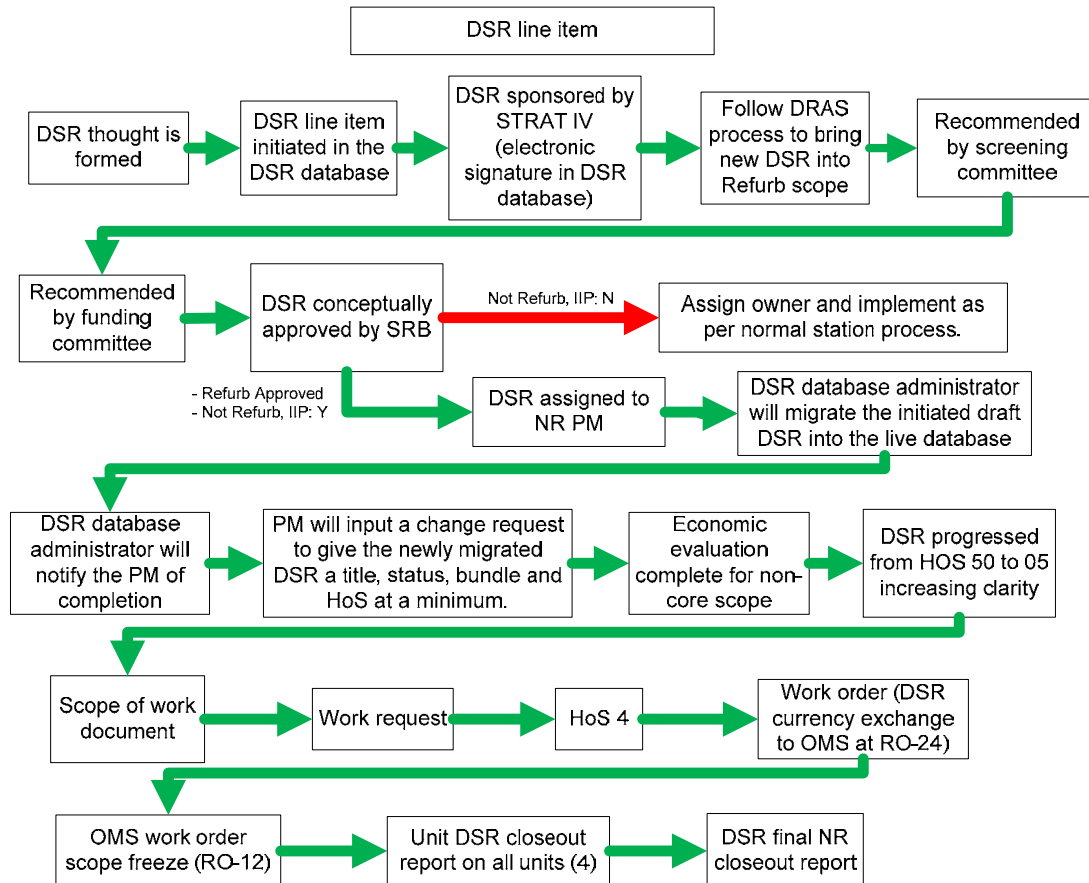

## Instruction

<b>N/A</b>	<b>R006</b>	<b>11 of 50</b>

Title:

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

currency will change to Work Orders managed in the Outage Management System (OMS). The reconciliation report will be complete by the RO-12 (Unit OMS Work Order Scope Freeze Milestone).

## 4.2 DSR database

The term DSR refers to a Darlington Scope Request line item. The DSR database is the source of scope control for the Darlington Nuclear Refurbishment Project. It is available on the project management section of the Darlington Refurbishment web page.

Refurbishment scope is maintained in the DSR data base. Scope management will be integrated into the Refurbishment program information management system through various processes; examples include schedules, contracts, scope of work documents, budgets and business plans. Scope information management shall follow approved OPG, Nuclear and Refurbishment governance, including, but not limited to, N-PROG-AS-0006, Records and Document Control.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>12 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

### 4.2.1 DSR initiation

It is intended for anyone to be able to initiate a DSR. To initiate a DSR, open DSR database and follow on screen instructions; if unsure, STOP and ask the DSR database administrator for help. During the DSR creation, the scope initiator will be required to categorize the scope (outlined in Appendix D) and select a DSR type (outlined in Appendix J).

All scope requested in the Darlington Scope Request database must be supported by a Stratum Level 4 sponsor. The sponsor's electronic signature will be required at the time of scope request prior to review at any of the scope review boards. Post Major Scope Milestone completion (May 2011) all new proposed scope will require a cost benefit analysis (i.e. BCS or DRAS) and project schedule impact review accompanying the DSR. After PSRB approval, the DSR database administrator will migrate the initiated draft DSR into the live database and send out an email notification to the PMs (Project Managers) of completion.

If a new DSR is created through an administrative DRAS (does not change scope; i.e. part of an approved DSR is moved to a new DSR with an approved status) and does not require PSRB approval, the signed and issued DRAS can be brought to the DSR database administrator to have the new DSR migrated to the live database.

The PM will need to input a change request to give the newly migrated DSR (at minimum) a title, status, bundle and health. The PM must also review and update any effected work orders.

### 4.3 Scope hierarchy

The scope hierarchy is a method of ranking the DSR line items in the DSR database to establish priority using Scope Type, Risk Rank, Prerequisite Indicator and Economic Valuation. The Scope Hierarchy is further detailed in Appendix H.

### 4.4 Technical Screening Committee

After major scope has been requested and sponsored in the DSR database, a Technical Screening Committee will review the requests. The committee will review a specific list of requirements including Core and None Core designations to ensure the scope request is adequately prepared for the PSRB. The technical screening committee will be led by the Vice President (VP), Nuclear Refurbishment Engineering.

The committee will make technical acceptance recommendations on specific scope items to the Refurbishment Funding Committee and the PSRB.

The Screening Committee Chair and Quorum is as follows:

**Chair:** Vice President, Nuclear Refurbishment Engineering

**Quorum Required (Voting Members):**  
Vice President, Nuclear Refurbishment Engineering

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

Director, Operations and Maintenance, Darlington  
Director, Operations and Maintenance, Nuclear Refurbishment  
Director, Engineering, Darlington

Technical Screening Committee meetings require all quorum members or empowered delegates present.

See Appendix C for decision matrix to be used as a guideline by the Technical Screening Committee to make technical acceptance recommendations.

### 4.5 Funding Committee

After Major Scope has been requested and sponsored in the DSR database, and the Technical Screening Committee has recommended the proposed scope addition the Funding Committee will make funding stream recommendations. The Funding Committee will be led by the Director, Nuclear Refurbishment Planning and Controls.

The Funding committee will make funding recommendations on specific scope items to the PSRB.

The Funding Committee Chair and Quorum is as follows:

**Chair:** Director, Nuclear Refurbishment Planning and Controls

**Quorum Required** (*Voting Members*):

Director, Nuclear Refurbishment Planning and Controls  
Director, Business Support, Darlington  
Director, Asset Planning and Integration  
Controller, Nuclear Refurbishment

The Funding Committee meetings require all quorum members or empowered delegates present.

See Appendix F for funding matrix to be used as a guideline by the Funding Committee to make decisions.

### 4.6 Program Scope Review Board

The PSRB shall be a senior cross-functional board with representation from the site and supporting business units. The review board shall consist of voting members and nonvoting members. Non-voting members are scope sponsors or advisors in the Board. All scope presented at the PSRB should be supported by at least one sponsor among the Board membership. This is to ensure that there is support for the scope that is requested and knowledge of the scope that is requested at each meeting. The PSRB voting members will strive to arrive at a consensus for all scope requests. The Director of Planning and Control, Nuclear Refurbishment shall be the Chairperson of the PSRB and will designate a secretary to the PSRB whom will ensure that all

## Instruction

Internal Use Only		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>14 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

decisions are implemented in a timely manner. Required quorum for PSRB meetings shall be all of the voting members. In the event of the unavailability of the individual specified below, the Board member may delegate the meeting attendance to an empowered delegate.

The Program Scope Review Board Chair, Quorum and non-voting members are as follows:

**Chair:** Director, Planning and Controls, Nuclear Refurbishment

**Quorum Required** (*Voting Members*):

SVP or Deputy VP, Darlington Nuclear  
SVP, Nuclear Refurbishment  
SVP, Nuclear Engineering and Chief Nuclear Engineer

**Non-Voting Members of the PSRB** (*Sponsors & Advisors*):

VP, Engineering, Nuclear Refurbishment  
VP, Execution, Nuclear Refurbishment  
VP, Corporate Business and Investment Planning  
VP, Science & Tech, or Director, Eng Services  
Director, Operations & Maintenance, Darlington Nuclear  
Director, Operations & Maintenance, Nuclear Refurbishment  
Director, Engineering, Darlington Nuclear  
Director, Engineering, Nuclear Refurbishment  
Director, Work Management, Darlington Nuclear  
Director, Planning and Control, Nuclear Refurbishment  
Director, Investment Management, Nuclear Finance  
Director, Commercial Projects and Facilities  
Director, Business Support Director, Darlington Nuclear

**Note:** The VP, Science and Technology and Director, Engineering Services shall be responsible for scope recommendations within their respective areas of responsibility and attend as appropriate.

In order to record a decision at the PSRB, consensus must be reached between the three (3) Voting Members. This applies to scope approvals and rejections. The PSRB Voting Members will strive to meet the meeting objective of reaching consensus on all scope items during the meeting or by requesting additional information to be provided by the scope sponsors and initiators, in order to support a decision.

## 4.7 Scope Challenge

The scope is challenged a number of times throughout the scoping process. It is challenged at the Technical Screening Committee meeting, financially at the Funding Committee meeting and finally as part of the PSRB, requested scope will be scrutinized to determine whether it must be completed in the Refurbishment Outage and whether it adversely affects the refurbishment outage(s) cost and schedule.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>15 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

For each scope request, the PSRB will utilize a list of questions that will challenge the scope initiator to support justification. These questions will address necessity, business need, risk and impact on cost and schedule (Appendix B). Appendix C shows a Scope Flow Decision Matrix which also will be used to validate and challenge the scope. Following approval of Major Scope by the PSRB for inclusion in refurbishment (Refurb) scope, the scope is formally added to the DSR database as Approved. If scope has not been approved, rejection justification will be formally recorded and the scope will be set to "Not Refurb" in the database indicating that it is not part of the refurbishment project and will follow Darlington's normal processes for evaluation.

### **Scope Challenge Meeting** (Prior to Gate 1 and 3 of the Gated Process N-MAN-00120-10001-GRB)

As per N-MAN-00120-10001-GRB, Nuclear Projects Gated Process there is a requirement for a Review of Scope to reassess and confirm need. This is accomplished through a Scope Challenge Meeting. The meeting is chaired and led by the Project Manager who owns the work being proposed to progress the project through the next decision Gate. For each DSR, the PM will utilize the Scope Decision Matrix (Appendix C) to justify / challenge the scope. The PM will complete the summary table in Appendix I and present to the Scope Challenge meeting Quorum for challenge of content and methodology. The completed table confirming recommendations will be submitted with the documents for the Gate Review Board Meeting (N-MAN-00120-10001-GRB). A DRAS will be completed as required and presented at next PSRB.

The Scope Challenge Meeting members are as follows:

**Presenter / Chair:** Project Manager, Nuclear Refurbishment Execution

**Quorum:** Vice President, Nuclear Refurbishment Engineering  
Director, Operations and Maintenance, Nuclear Refurbishment  
Director, Project & Controls, Nuclear Refurbishment

**Advisors:** Director, Nuclear Safety, Nuclear Refurbishment  
Director, Engineering, Nuclear Refurbishment

## 4.8 DSR Changes

If the DSR has not been through Gate 1 of the Gated Process (N-MAN-00120-10001-GRB), i.e. funding not yet allocated for this project, changes are requested through the change control form (change request) within the DSR database. Contact DSR Database Administrator for assistance.

If one of the PM's has been to Gate 1 for the DSR requesting funding, then a Change Control Form (N-FORM-11252) must be completed and approved prior to any DSR database changes.

DSR Change process:

Title:

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

- For scope changes, DRAS completed by Project Manager and approved by PSRB
- If at or past (funding) gate 1, complete N-FORM-11252 prior to any DSR database changes
- Change control form Initiated in DSR database by an individual
- Change control form concurred (electronically signed) by Project Manager and appropriate stakeholders.
- For intent changes, the change control form also needs to be approved by System Engineering Manager, Nuclear Refurbishment.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

**Note:** At this time, the DSR Database Administrator is a WCTL (Work Control Team Leader) working for the NR Outage Manager.

### **4.9 Decision Record and Analysis Summary (DRAS)**

Decision records are critical in maintaining an auditable trail of the NR Program changes, including changes in strategy, regulatory interactions, technology, resource, scope, etc. These important decisions should be validated by the appropriate authority to ensure alignment across all NR organizations. Refer to N-MAN-00120-10001-RISK-07, Nuclear Refurbishment Actions, Issues, Decisions, and Key Assumptions Management for full DRAS process. If a DRAS affects DSRs, then the follow the steps in section 4.8, DSR change process.

### **4.10 DSR Database change request**

Changes to an approved DSR (before gate 1) are requested using the change control form in the DSR database with supporting document (i.e. DRAS), for auditable trail. DSR change control form is an electronic form found in the DSR database in the DSR menu, called "Request change to DSR info". When the form opens up, select the correct DSR and enter your proposed changes in the blue fields on the right of the original DSR. The specific approval is dependent on what is being changed, i.e. intent or non-intent.

This electronic method of change control which allows an individual to propose a change which will then be approved by the Project Manager. The time, date, and LAN ID associated with the change are all recorded in the DSR database.

#### **4.10.1 Intent Change process**

Changes in Scope, context or title of a DSR are considered intent changes.

Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>17 of 50</b>

Title:

### **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

- For scope changes, DRAS completed by Project Manager and approved by PSRB
- Change control form completed (quoting DRAS number) in DSR database by the Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by Engineering Project Manager, Nuclear Refurbishment
- For intent changes, the change control form also needs to be approved by System Engineering Manager, Nuclear Refurbishment.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

#### **4.10.2 Non-Intent Change process**

Fixing spelling errors or splitting one DSR into multiple DSRs (which doesn't change scope or context) are considered a non-intent change and does not require engineering approval.

- Change control form completed in DSR database by the Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by appropriate stakeholders.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.

**Note:** If unsure, default to intent change or contact DSR database administrator.

#### **4.11 DSR Ownership Change**

- Change control form completed in DSR database by Sending Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by Receiving Project Manager, Nuclear Refurbishment
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.

**Note:** If one of the PM's has been to Gate 1 for the DSR requesting funding, then a Change Control Form (N-FORM-11252) must be completed and approved prior to any DSR database changes.

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.12 DSR GAR (Global Assessment Report) and IIP (Integrated Implementation Plan) Tracking**

NR Engineering is responsible to identify DSRs committed in the GAR/IIP. NR Engineering will input change requests and the DSR database administrator will ensure the changes reflect approved documentation. All work orders generated from IIP identified DSR line items will require regulatory tracking in AssetSuite.

### **4.13 DSR (Not Refurb) and Non-IIP**

Darlington Generation Station is responsible to use the current station processes to monitor, track and close the work per the following governances and processes.

- N-PROC-MP-0060: Aging Management Process
- N-PROC-MA-0024: System Performance Monitoring
- N-GUID-01510-10001: Site Component Health and Engineering Program Health Reporting Process
- N-PROC-MA-0097: Equipment Reliability Implementation

### **4.14 DSR status**

DSR Status	Description
Approved	PSRB approved scope for the Darlington Refurbishment Project.
Cancelled	Work that will not be completed by the station or Refurbishment organization.
Closed	All work, actions and reports have been completed.
Not Refurb	DSR is not part of the refurbishment project and will follow Darlington's normal processes for evaluation.
Not Required	Contingency work that has been analyzed and determined to be not required, usually due to a report, analysis or inspection results.
Superseded	The DSR's scope is covered by another existing or new DSR. Superseded to station AR, ASIC project, PM, etc for Non-IIP Station owned DSR.

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.15 Initiating work requests from DSR items**

Detailed work orders will be required during the Detailed Planning phase. D-GUID-09701-10013, Initiating Work Request for DSR Items, helps establish the correct nomenclature and sufficient level of detail used when initiating the work request.

When Unit, SCI, Device, Scope of Work and Unit condition information is known, the DSR line item is ready to initiate a work request, as per N-PROC-MA-0008, Work Initiation and Prioritization.

### **4.16 Work Requests to Work orders**

Work Control SPOC reviews submitted work requests for N-PROC-MA-0008 compliancy, assigns appropriate attributes/tags and approves the work request to a work order.

### **4.17 Health of Scope (HoS)**

#### **4.17.1 Background**

The Darlington Nuclear Refurbishment scoping strategy includes a Health of Scope grouping number representative of the work required to progress a DSR from the identification stage to the definition stage. Each DSR in the DSR database has been categorized with a Health of Scope number identifying how well the scope is known and understood. A unit suffix has been added to HoS 04 and the newly created HoS N/A. Therefore each unit will need to be dispositioned for every DSR. This will enable a better history of the DSR when doing the DSR closure report for each unit. The target is to get Health of Scope to 04.X (work orders have been input on X unit) or N/A.X (work orders will not be input on X unit). This will enable the work to have sufficient clarity that it can enter into the Work Management processes (ECC, work order etc.) at RO-24 (OMS Work Order Scope Definition Complete Milestone).

#### **4.17.2 Health of Scope number definitions:**

HOS	Definition
0	New items which have not been assigned a Health of Scope by the Project Manager. The expectation is that the HoS is assigned within 2 weeks after the PSRB approval.
03	No further work required on DSR.
N/A.1	This DSR line item will not generate work orders on Unit 1 and does not require any other work orders to support Unit 1's Refurb Outage.
N/A.2	This DSR line item will not generate work orders on Unit 2 and does not require any other work orders to support Unit 2's Refurb Outage.
N/A.3	This DSR line item will not generate work orders on Unit 3 and does not require any other work orders to support Unit 3's Refurb Outage.
N/A.4	This DSR line item will not generate work orders on Unit 4 and does not require any other work orders to support Unit 4's Refurb Outage.

Document Number:	Usage Classification:	
<b>NK38-INS-09701-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R006</b>	<b>20 of 50</b>

Title:

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

04.1	All Work Orders that this DSR requires on Unit 1 and to support Unit 1's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.2	All Work Orders that this DSR requires on Unit 2 and to support Unit 2's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.3	All Work Orders that this DSR requires on Unit 3 and to support Unit 3's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.4	All Work Orders that this DSR requires on Unit 4 and to support Unit 4's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
05	DSR is adequately known such that it is ready for Work Order to be input on all Units (Scope of work and unit condition known).
10	Work is known at the component / MEL level (unit, SCI and Device known).
20	Work is known at the system or project level but not component
30	Actions to implement selected, may be a component strategy across many systems. Options developed and preferred selected at system level (potentially many systems).
40	Analyze the completed report to determine actions / path forward. Required assessments or analysis have been completed and issue, priority, constraints and success criteria are understood.
50	Further assessment is required to build a report for analysis to understand the identified issue before the scoping process can begin. At this point the extent, the impacts, the significance, nor the potential resulting actions are known
60	Pure engineering or procedures with no likely field work (i.e. provide CNSC with a report, update procedure, etc). Activities identified as pure engineering or requiring documentation update will be planned by the responsible functional organizations and will be scheduled in the functional organization schedule ensuring that the deliverables meet the timelines identified in the overall Project Integrated Master Schedule.
90	DSR recommended to be removed from NR scope and will not be executed in Nuclear Refurbishment. DSR will be removed from NR scope, pending PSRB approval. The expectation is that the Project Manager who owns the Scope Health 90 item will have the DRAS completed and approved 14 days prior to the next SRB and communicated to the NR Outage Manger for inclusion and scope removal approval at the next SRB.

Note: Any required unit 0 work will be tagged with the unit requiring the implementation.

### 4.17.3 HoS change process

- Change request initiated in DSR database
- Change request approved by the Project Manager, Nuclear Refurbishment
- Change request concurred (electronically signed) by appropriate stakeholders
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

**Note:** HOS 90 scope removals approved by SRB at next scheduled meeting.

### 4.17.4 Requirements to Progress HoS

This section identifies deliverables required to take a DSR from the Identification phase to Definition phase at a system level through identifying examples of deliverables for each category.

#### **Health of Scope 50 to 40**

Review the scope for the need to prepare an assessment for further analysis. Deliverables to move DSR to 40 may include:

- Nuclear Safety Assessments/Analysis
- Detailed system assessments
- Code gap analysis
- Reliability assessments
- Life Cycle Management plan
- Material/fatigue analysis

To obtain these deliverables an in-house resource may be assigned or a contracting strategy developed and an outside vendor used. The assessments, plans, analysis should end in recommendations that lead to a better understanding of the issue identified in the DSR. At this point the DSR is considered to be HoS 40.

#### **Health of Scope 40 to 30 or 20 if only 1 System or Project**

Review results of the assessments and identify if DSR requires a modification to the plant, maintenance on a system (i.e. repair, replace) inspection or test. Identify options and select preferred to resolve the DSR issue. Steps to progress to 30 may include the following:

- New DSR presented to PSRB for approval
- Prepare and process DRAS form N-FORM-11390 as per N-PROC-LE-0008 if required to either progress DSR or close the item.
- Prepare EDM (Engineering Decision Making Meeting) materials and hold EDM if required to progress complex scope issues as per N-GUID-01900-10001, if EDM agrees with potential scope then generate ECR (Engineering Change Request)
- Prepare Project Gate documents as per N-MAN-00120-10001-GRB.

Title:

### **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

- Prepare Conceptual Study/Report as required identifying potential options to address the problem/needs statement. May be prepared by Refurbishment, OSS (Owner Support Services) or EPC (Engineer, Procure, Construct) vendors.
- Generate inspection requirements or plans to support planning of recommended testing or inspections

Additional assessment or analysis may be required to further define the options where the initial assessment cannot conclusively recommend a path forward to resolve the DSR. In this case the DSR Health of Scope is returned to 50 for further assessment.

#### **Health of Scope 30 to 20**

Work scope should be defined at a system level. Inspections and Conceptual studies may define a need for further scope to be added into the project, contingencies should be planned for by this time and high risk contingency items should progress through the gated process as required if the inspection work cannot be done until a later date. Activities to progress to 20 may include:

- Options developed and preferred selected at system level.
- Prepare Project Gate documents as per N-MAN-00120-10001-GRB

#### **Health of Scope 20**

Work is known at the system or project level but not component. Initiation Phase complete, the following activities can begin:

- Generate a project charter or needs statement for potential modifications to be implemented outside of the Darlington Refurbishment organization.
- Identify non-modification work recommended in the assessments and contact Nuclear Refurbishment WCTLs to input work request for the work, if DSR item issue can be resolved through execution on non-modification work the DSR item can be reclassified as 5 in the Health of Scope
- Develop Preliminary Design Requirements for potential modifications where scope has been adequately defined
- Definition Phase begins. System or project scope is defined. ECR can be generated (ECR identifying problem statement for potential modifications as per N-PROC-MP-0090)
- Sufficient information available to begin to prepare preliminary and detailed design scope of work for EPC RFP (Request for Proposal)
- Long lead items identified

#### **Health of Scope 20 to 05**

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>23 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

Unit, SCI, Device, Scope of Work and Unit condition is known for the DSR and is ready to initiate work requests, as per N-PROC-MA-0008, Work Initiation and Prioritization. Detailed work orders will be required during the Detailed Planning phase. D-GUID-09701-10013, Initiating Work Request for DSR Items, helps establish the correct nomenclature and sufficient level of detail used when initiating a work request from a DSR. It is expected that once ECR's are approved, conceptual design options are identified and preliminary design requirements are prepared. The EPC contracts can then be issued where the contractor will further define the work and ensure that work order planning is completed. Work will be managed via the Gated Process (N-MAN-00120-10001-GRB).

### **Health of Scope 05 to 03 or 04.X or N/A.X**

Work have been input for unit X (04.X) or work orders will not be input for unit X (N/A.X). This requires each unit to be dispositioned for every DSR, which creates a better history for DSR closure reports. If there is no work required for DSR, it can go to HoS 03.

## **4.18 Scheduling**

Darlington Refurbishment Project Managers are accountable to identify the deliverables required to progress DSRs through the Scope Health Definition levels to Health of Scope 03 or 04.X or N/A.X. P6 schedule activities will be created for the deliverables that progress a DSR to HOS 03 or 04.X or N/A.X. The Project Managers will update and maintain the health of scope rating of the DSR in the DSR database.

## 5.0 DSR DATABASE DEFINITIONS

<b>Acct_Org</b>	Accountable Organization
<b>Add_Info</b>	Additional information
<b>APP_ISR</b>	Indicates that the DSR is included in the Integrated Safety Review (ISR)
<b>Bundle</b>	Work Grouped by Project Manager area of responsibility (i.e. Balance of Plant [BOP], Fuel Handling [FH]) translates to Complex code on the work order.
<b>CCA</b>	Component Condition Assessment Number
<b>CONTINGENCY</b>	Contingency Flag
<b>Cost_Element</b>	Category from original Darlington Refurbishment Business Case to which the cost is allocated
<b>Cost_Estimate</b>	Cost estimate
<b>Description</b>	Description of work encompassed by the DSR (usually from CCA)
<b>DSR</b>	DSR related to the Line item
<b>DSR_Init</b>	DSR initiator (LAN ID)
<b>Dsr_Line</b>	DSR Line Item Number
<b>Ex_Owner</b>	Execution Owner by name
<b>Fog</b>	Functional Outage Grouping
<b>FUN_STR</b>	Funding Stream i.e. Station funded or Refurb funded, etc.
<b>Gate</b>	Last Gate of the Gate Review Process the DSR has passed through
<b>Grouping</b>	Health of Scope indicator
<b>Economic Evaluation</b>	Indicator of completion of the economic evaluation (Y=yes economic evaluation completed, N=no economic evaluation not completed, Not Required= economic evaluation not required; i.e. HOS 60 DSRs and Core Scope DSRs)
<b>Hierarchy</b>	Priority Ranking of DSRs
<b>Inspection</b>	Indicator that an inspection is required
<b>Item</b>	DSR Line item number
<b>Meet_Date</b>	SRB meeting date
<b>Not_Refurb_Reason</b>	Reason for the scope being rejected by PSRB and not included in the Refurbishment of Darlington
<b>Prereq_Type</b>	Categories for Prerequisite work. (The scope bucket may be non Pre-req but have some pre outage Work Orders)
<b>Priority</b>	Not Used at This Time
<b>PSRB_Sponsor</b>	Manager level or higher who sponsors the scope for consideration by PSRB

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

<b>Risk_Rank</b>	Risk Ranking per Risk Governance (N-MAN-00120-10001-RISK)
<b>SCI</b>	System Component Identification number
<b>Scope_Owner</b>	Nuclear Refurbishment Project Manager who owns the scope Execution and Planning
<b>Scope_Bucket</b>	Darlington Refurb Window for Execution of the Scope (i.e. Pre-req means work execution is completed prior to Refurb)
<b>SCOPE_TYPE</b>	Scope type (Refer to Appendix D)
<b>Status</b>	DSR Status, Refer to section 4.13 of this document.
<b>SUB_Bundle</b>	Smaller work grouping of a Bundle (i.e. Safety Systems is a sub bundle of BOP)
<b>TEC_REC1</b>	Technical Screening Committee Recommendation
<b>Title</b>	DSR Title
<b>Type</b>	Work type, i.e. regulatory, campus plan, technical, etc.
<b>Unit</b>	Darlington Unit
<b>WBS</b>	Work Breakdown Structure ID

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

### B.2.0 NON -CORE SCOPE (NCS)

#### B.2.1 Sustaining (SU) - Non - Core Scope

Sustaining Scope is not mandatory to execute the Refurbishment Outage and achieve the Program Objectives. It may provide long term benefits to the Darlington Site and stations outside the primary Program Objectives. All Non-core Scope requires economic justification (i.e. DRAS).

Category		Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>SU01</b>	Sustaining Infrastructure	<ul style="list-style-type: none"> <li>Infrastructure upgrades required to sustain an additional 30 years of operations.</li> <li>Work is listed as part of the Darlington Master Campus Plan and the Darlington Program Campus Plan Scope Statement</li> <li>Is not part of, nor does it directly support core scope.</li> </ul>	Q. Can the work be executed after Refurbishment is complete without impacting ongoing plant operations?	<ul style="list-style-type: none"> <li>Salt Shed</li> <li>Heavy Vehicle Storage Building</li> <li>Boiler House</li> <li>Lakeshore Garage</li> <li>Gas Bottle Storage</li> </ul>
			Q. What is the economic benefit to refurbishment or to the continued operation of DNGS for an additional 30 years?	
			Q. What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	
			Q. Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>SU02</b>	Station Upgrades	<ul style="list-style-type: none"> <li>Non-infrastructure station upgrades required to sustain an additional 30 years of operations.</li> <li>Is not part of, nor does it directly support core scope.</li> </ul>	Q. Can the work be executed after Refurbishment is complete without impacting ongoing plant operations?	<ul style="list-style-type: none"> <li>New or improvements to permanent stairway, lifting device, floor grating, access hatches.</li> <li>Logistics improvements to loading bays, cafeteria, walkways</li> </ul>
			Q. What is the economic benefit to refurbishment or to the continued operation of DNGS for an additional 30 years?	
			Q. What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	
			Q. Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>SU03</b>	Equipment Renewal	<ul style="list-style-type: none"> <li>One time replacement at current end of component life</li> </ul>	Q. Would the refurbishment core scope still be possible to execute without this scope / infrastructure?	<ul style="list-style-type: none"> <li>Steam Turbines and Turbine Auxiliaries: Main Lube Oil Pump</li> </ul>

Title:

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

Category	Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
	(Nominal 30 years). <ul style="list-style-type: none"> <li>Replacement of obsolete components</li> <li>Inspections to determine equipment condition not part of normal PM program.</li> </ul>	<p><b>Q.</b> What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?</p> <p><b>Q.</b> Are the parts:</p> <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	<ul style="list-style-type: none"> <li>Main Condensate System: LP Heaters</li> <li>Fuel Handling Inverters Replacement</li> <li>Turbine Control Upgrade</li> </ul>

### B.2.2 Value Enhancing (VE) - Non - Core Scope

Value Enhancing Scope is not mandatory to execute the Refurbishment Outage. There may be significant advantages to the station or to OPG by executing some value enhancing scope. It will primarily have an impact on the post-refurbishment time period. Value Enhancing scope would optimize (primarily) the cost efficiencies post-refurbishment and may help the Station meet efficiency targets (these are not Refurbishment targets). Value Enhancing scope could also provide cost or resource efficiencies during Refurbishment, but are not absolutely essential in completing the work. All Non-core Scope requires economic justification (i.e. DRAS).

Category	Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>VE01</b>	Operations, Outage, Cost, Resource & Maintenance Efficiencies	<ul style="list-style-type: none"> <li>Scope can be proven to add value to the station operations in future by improving maintenance methods, saving costs on outages, optimizing resources or improving operations.</li> </ul>	<ul style="list-style-type: none"> <li>Outage Heat Sink modification expected to reduce outage durations post-refurbishment.</li> <li>Modification to enable a valve to be replaced with a new design instead of repairing a valve.</li> <li>Modification to allow specified maintenance to be completed at-power rather than during an outage condition.</li> <li>Technically required work which is known to extend outage duration or incur greater dose in regular outages and makes an economic case to include in the Refurbishment Program.</li> </ul>
		<p><b>Q.</b> Has a clear explanation been provided as to why the expected impacts/ savings (e.g. OM&amp;A costs, planned outage time, forced loss rate, operator work around, dose reduction, etc) are defensible and attributable to this specific scope of work?</p>	
		<p><b>Q.</b> Has a review been done to ensure that the expected savings/impacts of this scope of work have not already been included in other proposed work scope?</p>	
		<p><b>Q.</b> Have all major stakeholders (and potentially an independent 3rd party) validated the expected savings/ impacts?</p>	
		<p><b>Q.</b> Have all potential post-project implementation costs been included?</p>	
		<p><b>Q.</b> Have required infrastructure and support work costs been included?</p>	
		<p><b>Q.</b> What is the Cost of parts and labour? Is it economically beneficial to do</p>
