**Program Objectives**

**Ref. Project Charter**  
D-PCH-09701-10102

**Principle Program Objectives**

1. Confirm feasibility of refurbishing Darlington NGS reactors
2. Plan and execute all work required to refurbish the Darlington units
3. Ensure the scope of the refurbishment outages will enable economic Top Decile operations of each unit for an additional 30 years, following post-refurbishment synchronization

**1.0 CS - Core Scope**

Core Scope directly supports the Program Objectives to ensure the success of Refurbishment.

**CS01 – Regulatory Improvements to meet current Standards**

- 1.01 Scope that is not optional in order to support the Station License and Regulatory Requirements.
- 1.02 Nuclear Refurbishment CNSC Commitments.
- 1.03 ISR / EA, IIP Regulatory Commitments.

**CS02 – Life Limiting Components**

- 1.04 Major component modification, repair or replacement that cannot survive operation for an additional 30 years
- 1.05 They could only be repaired or replaced under refurbishment outage plant condition (i.e. De-fuelled/dewatered)

**CS03 – Mandatory Support for Core Scope**

- 1.06 Must do in order to support execution of Core Scope.

**CS04 – Mandatory 'Construction Period' Outage Work**

- 1.07 Preventative Maintenance Work that would normally be executed during the time period during the Refurbishment Outage.
- 1.08 Mandatory Inspections that would normally be executed during the time period during the Refurbishment Outage.

**CS05 – Regulatory Improvements beyond current Standards**

- 1.09 Regulatory suggested improvements that are not required as per current codes and standards.

**2.0 SU - Sustaining – Non-Core Scope**

Sustaining Scope is not mandatory to execute the Refurbishment Outage and achieve the Program Objectives. It may provide long term benefits to the Darlington Site and stations outside the primary Program Objectives.

**SU01 – Sustaining Infrastructure**

- 2.01 Infrastructure upgrades required to sustain an additional 30 years of operations.
- 2.02 Work is listed as part of the Darlington Master Campus Plan and the Darlington Program Campus Plan Scope Statement. Is not part of, nor does it directly support core scope.

**SU02 – Station Upgrades**

- 2.03 Non-infrastructure station upgrades required to sustain an additional 30 years of operations. Is not part of, nor does it directly support core scope.

**SU03 – Equipment Renewal**

- 2.04 One time replacement at current end of component life (Nominal 30 years).
- 2.05 Replacement of obsolete components (criticality 1 + criticality 2).
- 2.06 Inspections to determine equipment condition not part of normal PM program.

**3.0 VE - Value Enhancing – Non-Core Scope**

Value Enhancing Scope is not mandatory to execute the Refurbishment Outage. There may be significant advantages to the station or to OPG by executing some value enhancing scope. It will primarily have an impact on the post-refurbishment time period. Value Enhancing scope would optimize (primarily) the cost efficiencies post-refurbishment and may help the Station meet efficiency targets (these are not Refurbishment targets). Value Enhancing scope could also provide cost or resource efficiencies during Refurbishment, but are not absolutely essential in completing the work.

**VE01 – Operations, Outage, Cost, Resource & Maintenance Efficiencies**

- 3.01 Scope can be proven to add value to the station operations in future by improving maintenance methods, saving costs on outages, optimizing resources or improving operations.
- 3.02 Replacement of components which due to scale of work makes economic sense.

**VE02 – Safety Improvements beyond Standards**

- 3.03 Station or Refurbishment suggested improvements that are not required as per current codes and standards.

**VE03 – Environmental Improvements beyond Standards**

- 3.04 Station or Refurbishment suggested improvements that are not required as per current codes and standards.

**VE04 – Infrastructure upgrades that are expected to increase efficiencies for the Refurbish Outage period only, but do not directly support Core Scope.**

- 3.05 Scope that can improve efficiencies during the refurbishment such as improved resource effectiveness, reduction of delays, improved site transportation/logistics.

**VE05 – Enhance Corporate Reputation**

- 3.06 Proposed scope that will/may enhance OPG's or Darlington Refurbishment Program's corporate reputation with Clarington, Ontario or other groups.

**4.0 PF - Performance Improvement – Non-Core Scope**

Performance Improvement Scope is non-core scope that supports the reduction of Unit backlog work orders or supports System Health targets beyond the condition at unit turnover to the Refurbishment Program management team.

**PF01 – Reduce Unit Backlog (non-core, most likely CM or EM work orders)**

- 4.01 Non-core work that will help reduce backlogs on Darlington Units.
- 4.02 Work may be required for unit start-up (i.e. you need the CM or EM equipment fixed to perform start-up of the unit). This may be mandatory to execute for unit condition, but is still not core scope.

**PF02 – Operator Work-Around (non-core)**

- 4.03 Non-core work that will remove a requirement for an Operator Work Around. Work may be mandatory for start-up, but is still not core scope.

**PF03 – Design Modifications (non-core) required to maintain operation of an existing non-life limiting component (likely a CM or EM backlog work order origin)**

- 4.04 Proposed modification may be required to continue operations of a system or component, but is not core scope and does not contribute in the greater '30 year' life span of the equipment or system.
- 4.05 May be required for Unit start-up if it is emergent.

**PF04 – Reliability Improvement**

- 4.06 Proposed scope has high likelihood of improving unit reliability and contributes to reducing unit forced loss rate and optimizing unit capacity factor.
- 4.07 Has caused an Equipment Reliability Reset.
- 4.08 Allows station to achieve Top Decile performance.
- 4.09 Supports outage improvements.

**DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

## Appendix E: Core Scope of the Darlington Refurbishment Program

### Refer to NK38-PLAN-01060-10003, Darlington NGS Refurbishment Project Reference Plan – Scope Definition

Core Scope of the Refurbishment Program will support the primary objectives of the Program. Core Scope is included in the Business Case Summary for the Program.

The following is a **brief** summary of the current documented major components of Core Scope.

- Replacement of all Fuel Channels (calandria tubes and pressure tubes)
- Replacement of all Feeders
- Balance of Plant life limiting components only where justified to support Program Objectives and support an economic business case
- Regulatory work required to be performed in order to extend the life of the station by an additional thirty years, as indicated in the CNSC approved Integrated Safety Report (ISR), Environmental Assessment (EA), and Integrated Implementation Plan (IIP).
- Work related to outage preparation, including development of tooling, mock-ups, training, unit islanding, installation of barriers, modifications, etc. to support the outage, and all planning activities related to items included in the scope of the Darlington Refurbishment Program.
- Infrastructure development to directly support the refurbishment outage
- Work Management work committed to be performed on the unit within the start and end date of that unit refurbishment outage.

Appendix K: MEMO: Value-Enhancing Investment at DNGS during Refurbishment

700 University Avenue, H7G5, Toronto, ON M5G 1X6

MEMORANDUM

April 12, 2013

MR. D. REINER  
Senior Vice President  
Nuclear Refurbishment

Value-Enhancing Investment at DNGS during Refurbishment

The Refurbishment of Darlington represents a significant milestone in the evolution of OPG. During the life of this project, we will see the cessation of coal (2014) and the potential end of operations at both Pickering A and Pickering B (2020). Both of these major events will lead to a significant shrinking of OPG's operations. At this time, there is no guarantee of New Nuclear becoming a reality, or a repowering of the Thermal sites. This downsizing of operations, and the need to be cost competitive going forward puts significant pressure on our ability to raise capital and to sustain operations over the long-term.

To minimize our capital requirements during the refurbishment outage and to make quality investments in the plant that support high quality, profitable operations going forward, I am proposing that the Refurbishment Project adopt more stringent criteria for assessment of sustaining, value-enhancing and performance improvement work that is to be included in the refurbishment outages. The criteria will apply to all scope that is not considered core scope as defined by the Scope Review Board governance.

The adoption of more stringent criteria on sustaining, value-enhancing and performance improvement initiatives during the refurbishment outage, would help to constrain scope to only those high value scope items that show a significant contribution to the bottom line. These more stringent criteria would include a hurdle rate of 9.5% (WACC) valued on the forecast System Economic Values and a simple payback period of six years, or 2 outage cycles.

Title:

# NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

## 1.0 BACKGROUND

*Change* is inevitable in a project. Well managed and controlled projects must manage change. A robust change management process provides guidance on how changes are assessed, implemented and reported on a project. This change manual will be reviewed and updated periodically to reflect the changing environment with respect to project controls tools.

## 2.0 PURPOSE

The primary purpose of Program Change Management is to control cost, schedule and scope changes against approved *baselines*, to manage the proper allocation of contingency funds, to document the nature and cause of changes and to analyse and minimize the impact to cost and schedule.

## 3.0 DIRECTION

### 3.1 Principles

- The *executing organization* will first attempt to mitigate the impacts of change by evaluating alternatives, such as reassigning resources to other available work, to mitigate the impact of change.
- Change is managed at the lowest level of the organization that has the authority to do so.
- Change that has a significant potential impact on project or program scope, cost and schedule is reviewed in detail and the recommended direction is approved at the appropriate level.
- The process balances flexibility and control.
- All changes are documented, tracked and included in relevant reports.
- Detailed evaluation of the impacts of the change takes place when necessary.
- Trends of changes are identified and followed up; the Station Condition Record (SCR) system is utilized when applicable.
- Only after the change is approved by the appropriate authority level, is the work assigned for action by the executing organization.
- Changes are not made solely for the purposes of correcting performance issues that are within the control of the work program owner.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>7 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

- Projects are re-baselined only when the cumulative effect of multiple Changes or a significant execution strategy Change renders the existing baseline no longer meaningful.

### 3.2 Definition of Change and Change Management

For the purposes of this procedure, a *change* is any deviation from an approved plan or procedure that results in a real or potential impact on program or project cost, schedule or scope.

*Change Management* is the Project Management process (including the supporting tool) that provides a framework to identify and record changes in cost, schedule and or scope against the approved baselines.

See Section 11.0 for a complete list of definitions for this procedure.

### 3.3 Program Baseline and Performance Measurement Baselines

The Change Control Process as defined in this document is performed from project inception through completion. The constraints of cost, schedule and scope must be continuously and rigorously managed either by rejecting or approving changes and subsequently incorporating approved changes into the revised *Program* and *Performance Measurement Baseline*, where applicable.

#### Program Baseline

The aggregate planning efforts during Definition Phase will converge to an overall Program Plan at Release 5, or Release Quality Estimate (RQE). This is the point when the majority of projects have sufficiently defined their execution strategies, cost, schedule and scope that will allow an overall Program Baseline to be set. The Program Baseline will be maintained as a high confidence estimate for all four units and project level changes assessed.

#### Performance Measurement Baseline

The Performance Measurement Baseline for Project and Functions is the cost, schedule and scope approved during the Release Quality Estimate (RQE) and Changes subsequently approved via this Change Management process. The Project Performance Measurement Baseline will be maintained and cost and schedule performance against the baseline monitored.

The use of Baseline in this document refers to the Performance Measurement Baseline.

## Manual

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

## 4.0 SCOPE

This document takes authority from N-STD-AS-0028 Project Management Standard and guidance from N-MAN-00120-10001-PC, Project Controls.

This Change Management process, illustrated in Appendix A, Change Process Flow, is for NR Funded and Darlington Outage Cyclical Maintenance work, including transfers in and out of the Program, is applicable to the following:

- Changes that occur between Gates to Projects already approved by the gating process and approved by the Gate Review Board (GRB), including scope transfers between Projects, Bundles or sub-Bundles;
- Changes to OPG functional work programs approved by the Functional Business Planning Release;
- Changes to contractual agreements between OPG and external contractors, suppliers or vendors when the change impacts project scope, cost or schedule;
- Changes in contracting or execution strategy;
- Engineering change control process outputs that impact project scope, cost or schedule;
- New/Changed Project Numbers;
- New/Changed Work Packages;
- Changes to *Work Breakdown Structure (WBS)*;
- Changes to project attributes, example Bundle or Sub-Bundle
- Changes to cost, schedule or scope that are approved by other governing documents or bodies, including the Project Decision Meetings, Options Review Boards, Regulatory Affairs or alternative localized decision making committees.
- Changes to scope and scope transfers agreed by both receiving PM and transferring PM.
- New scope, including scope funded by other methods (example AISC) if the work is being executed during the NR Execution Outage.
- Advancing or transferring funds that have not been released by the GRB in circumstances where the work must be performed prior to the next Gate and funding is required to proceed in order to control risk.
- Project and program contingency changes irrespective of value, either drawn or returned back to contingency.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>9 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Administrative updates to the Program Baselines as approved by senior management.

This Change Control process is **not** applicable to:

- Projects that have not yet been presented and approved by the Gate Review Board (GRB), i.e., projects for which there is no approved baseline.
- Changes to correct performance issues that are within the control of the work program owner, unless the change renders the existing baseline no longer meaningful
- Changes to budget amounts in closed accounting periods (changing historic data).

## 5.0 ORGANIZATION, ROLES AND RESPONSIBILITIES

All project team members are empowered and encouraged to identify and initiate the Change Control Process.

The OPG behaviours of “Say it, Do it, Simplify it, Think Top and Bottom Line, Integrate and Collaborate and Tell it as it is” apply to the change management process. Early identification of changes and their impacts and trends allow NR Management to focus attention on performance improvements, and drive the core behaviours.

### 5.1 Change Initiator

The Change Initiator, in conjunction with their manager, is responsible for reporting a change to cost, schedule or scope of their work. Anyone can be a change initiator. The Change Initiator contacts the P&C Lead for the executing organization for assistance with completion of the *Change Control Form* (CCF) N-FORM-11252.

### 5.2 Project Manager

The Project Manager (PM) is responsible for:

- Executing the full scope of project within constraints of working safely, meeting quality requirements, and performing within the approved schedule and budget.
- Reacting to change trends, taking corrective action and identifying and mitigating project risks.
- Limiting, controlling and recommending use or return of contingency.
- Managing contractors to control and mitigate increases to cost and delay to schedule.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>10 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

- Ensuring no commitment (including Project Change Directives (PCD), Project Change Authorizations (PCA), Consent to Proceed (CTP), or any other commercial commitment) is entered into with vendors or contractors, or into the approved baseline, prior to having sufficient budget and/or approval when necessary via a CCF.
- Assessing the impacts of changes to cost, schedule and risk as well as to commercial, union jurisdiction, safety and environment, work and radiation permits, decontamination, material handling and storage, change in resource, quality, other impacts if applicable and impacts to other projects.
- Providing all required data and supporting document for the CCF.
- Attend the Change Control Board to discuss and respond to questions for CCFs pending approval.
- Updating the Project Management Plan as a result of a change if required.

Within the context of the change management process, the PM has the ultimate accountability to ensure changes are fully documented via a CCF and approved by the appropriate authority level as outlined in Section 0 and that the processes documented within this procedure are adhered to.

### 5.3 Project Director

The Project Director is responsible for:

- Reviewing and challenging changes proposed by the PM that are within PM's approval authority.
- Challenging the Project Manager to find offsetting reductions to minimize cost increases.
- Recommending contingency changes to the appropriate contingency owners.

### 5.4 Unit Outage Manager

The Unit Outage Manager is responsible for:

- Ensuring new work orders are reviewed and urgent actions taken to protect the critical path schedule, while ensuring follow up with Project Managers to ensure baselines are maintained.
- Ensuring new work orders are assigned to Project Managers for acceptance of scope.
- Screening new scope through the Daily Work Screening process.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>11 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Referring new scope that is not accepted by the Project Manager during the Screening process to the CCB.
- Concurring that a CCFs requires use of the Fast Track process described in Section 7.4.3

### 5.5 Planning & Controls (P&C)

#### 5.5.1 Director, Planning and Controls, NR

The Director, Planning and Controls is responsible for:

- Establishing and setting the direction for Program Change Management activities for NR.

#### 5.5.2 Manager Project Controls, Cost & Change Management, NR

The Manager Project Controls, Cost & Change Management is responsible for:

- Establishing and managing the processes, guides, and tools necessary to facilitate successful implementation of Program Change Management process.
- Administration of the Program Change Control Board (PCCB) process.
- Reviewing CCF's for compliance with the principles and governance of this manual and providing feedback and coaching on requirements.
- Tracking and following up on requests made or actions assigned by the PCCB.

#### 5.5.3 P&C Leads

The P&C Leads are responsible for:

- Coordinating evaluation and disposition/approval of the change including routing the CCF to the appropriate functional department or subject matter expert to perform an independent evaluation of the impacts of the change.
- Assisting the PM with preparation of change documentation.
- Confirming impacted systems or tools are updated such as P6, the Master Project List (MPL), etc.
- Creating a SCR for adverse trends identified from change pattern analysis if applicable as defined in Section 6.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>12 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 5.5.4 P&C Cost/Schedule Analyst (CSA)

The P&C CSAs are responsible for:

- Supporting the P&C Leads in coordinating evaluation and disposition/approval of changes.
- Reviewing the CCF and supporting documentation to ensure compliance with the criteria set out in this procedure.
- Communicating disposition of the CCF to the stakeholders.
- Updating the cost management system.
- Maintaining the change register.

### 5.5.5 P&C Reporting Department

The P&C Reporting Department is responsible for:

- Providing monthly metrics including trend reports and reporting out of the Change Management process as required.

### 5.5.6 P&C Change Administrator

The Change Administrator is responsible for:

- Administration of the CCB process.
- Reviewing CCF's for compliance with the principles and governance of this manual and providing feedback and coaching on requirements.
- Analyzing CCF trends and presenting analyses to the CCB as required.
- Tracking and following up on requests made or actions assigned by the CCB.
- Following up on SCR actions related to this procedure and/or CCF trends.
- Providing an interface between the committees and boards in this Change Management process.

### 5.5.7 P&C NR Estimating

The P&C NR Estimating department are responsible for:

- Reviewing and/or validate estimating basis of submitted changes including the estimate class and accuracy and completing CCF input in Section 2.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>13 of 41</b>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 5.6 NR Controllership

NR Controllership is responsible for:

- Deciding the correct accounting determinations and project funding sources.
- Reviewing the change register including selected review of individual CCFs (Finance Assurance).

### 5.7 Functional Departments

Functional Department processes are governed by their functional procedures; however when changes in functional work impacts NR project cost, schedule or scope baselines the Change Management process applies. Example:

- To draw contingency when a contract change (an amendment, PCD, PCA or CTP) is required for additional scope, a CCF must be raised and approved prior to updating the vendor contract and commencing work.

Functional Department Managers' budgets released through the business planning release process are governed by this Change Management process if the change meets the criteria detailed under section 6.0. For the purposes of this procedure, Functional Managers hold the same accountabilities as a Project Manager.

### 5.8 Subject Matter Experts

Depending on the nature of a change, a Subject Matter Experts (SME) may be requested to provide written feedback and recommendations on a proposed change. SME's can be anyone with the specialized knowledge or experience to provide additional analysis and recommendations.

SME's provide an independent assessment of the impacts of change for consideration by the approving authority.

### 5.9 New Work Screening Committee

The Director Unit Outage is responsible for the New Work Screening process. Chaired by the Project Control Centre (PCC) Manager, the New Work Screening Committee is comprised of:

#### Required Attendees:

Operations  
Work Management  
Planning & Controls  
Maintenance  
Engineering  
Finance  
CPAAC Member

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>14 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

Optional Attendees:  
Representative from Regulatory Affairs

All proposed scope additions, deletions or changes will be screened by the New Work Screening Committee prior to being released to the Project Manager to execute with the following being considered:

- Confirm if the work order requires an outage to execute, if no outage is required the work will be rejected.
- Determine if the new work is considered to be operations or maintenance work and if Operations or Maintenance agrees to accept the work, the work order can be approved into scope and a CCF will be submitted if required.
- Determine if the work is to be executed by a Project, and if the project owner accepts the work, the work order can be approved into scope and the Project submit a CCF if required.
- Determine if an Action Request from Regulatory Affairs and ensure the screening process is followed with Operations or Maintenance or a Project accepting the work.
- Work Orders removed from scope with greater than 1,000 hours will be reviewed to determine if an action needs to be assigned by the Screening Committee for the Project to initiate a CCF to reduce budget.

If the Screening Committee can't come to an agreement on an owner for the work then the person / group sponsoring the work (typically the SCF initiator) will prepare a CCF and the CCB will assign the work to Project. Once the Project is assigned, the project will finalize the CCF and obtain appropriate approval.

Action items arising from the Screening Committee will be recorded in the Risk Management and Oversight Tool (RMO) using Meeting Source "New Work Screening Committee".

### 5.10 Change Control Board

Chaired by the Vice President, Refurbishment Execution, the Change Control Board (CCB) is a diverse group of individuals who are responsible for making the ultimate decision regarding project changes. The CCB considers the implications of changes that exceed a Project Managers authority, approves Tier 3 Milestone changes and refers significant new or changed scope to the Project Decision Meeting or if deemed necessary obtain concurrence of the Program Scope Review Board (PSRB) or Program Change Control Board (PCCB). See NK38-CORR-09071-0591482 for the Terms of Reference for the CCB.

Note that staffing and resource changes are not within the authority of the CCB. The CCB needs to assess these requests and either reject the change or recommend the change for approval to the PCCB.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>15 of 41</b>

Title:

### **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

Action items arising from the CCB will be recorded in the RMO Tool using Meeting Source "Change Control Board".

When the need arises for urgent approval of a CCF, a fast track process to allow CCB members to vote via email has been developed, see Section 7.4 Decision.

#### **5.11 Project Decision Meeting (PDM)**

When significant new or changed scope requires a decision as to whether or not it should be included in the NR Program or be moved to Darlington Station for processing through their change management process, a Project Decision Meeting (PDM) will be held.

The chair of the PDM is the Vice President, Refurbishment Execution (or delegate) along with senior representatives from Refurbishment Operations & Maintenance and Station Engineering.

Meeting participants will consider the appropriateness and implications of adding new scope. The following considerations should be made when evaluating the proposed scope:

- The scope requires the reactor to be de-fueled/de-watered.
- The scope could significantly exceed normal outage durations.
- The scope could significantly extend normal outage durations.
- The scope has other overriding long term operational impacts to the Station.

If the PDM decides that the proposed change warrants further work by the NR Program, a sponsor will be designated to create a DRAS as appropriate.

#### **5.12 Options Review Board (ORB)**

In cases where there are multiple potential options to address new scope, and the option set does not provide a clear preferred option, an Options Review Board (ORB) will review each option and decide which will be pursued. The ORB is responsible for making an informed and business-conscious decision. The ORB is administered by NR Execution.

The ORB is chaired by the Vice President, Refurbishment Execution along with senior representatives from Operations and Maintenance, Engineering, Planning and Controls, Execution, Supply Chain, Finance and External Oversight.

The ORB is empowered to make decisions to progress work toward full definition. Cost implications require a CCF and approval via this Change Management Process.

#### **5.13 Program Change Control Board**

The PCCB, Chaired by the Vice President Planning and Controls is convened to approve significant Program level cost and schedule changes. The PCCB also approves all Program Contingency draws or returns and impacts to Tier 1 and 2

Milestones. See NK38-CORR-09071-0591416 for the Terms of Reference for the PCCB. The PCCB approves OPG staffing and resource changes.

Action items arising from the PCCB will be recorded in the RMO Tool using Meeting Source "Program Change Control Board".

## 6.0 CHANGE MANAGEMENT PROCESS

### 6.1 Change Decision Criteria

The Change *decision criteria* utilize GREEN, YELLOW, RED labels to identify the level of impact the change has on the project baseline, and consequently the level of approval required. The criteria are noted in the diagram below:

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R001</b>	<b>17 of 41</b>

Title:

### **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

Separate schedule criteria based on durations are not laid out as it is assumed that all schedule changes/delays will be translated to cost based on the *project burn rate* and the cost criteria applied.

#### **6.1.1 Green Changes**

GREEN changes are addressed within the level of authority of the project/function, an example is a change to contractor field execution work where an agreed alternate arrangement has been developed by the executing organization; a CCF will be entered for a GREEN change and will be tracked for trends. Green changes update the project forecast, but not the baseline. Green changes will be reviewed to ensure that they are accurately labelled as Green. For RFP approvals, Finance will accept an approved GREEN CCF as authorization for PO increases.

Adverse trends will be monitored by the Project Managers to ensure action is taken to correct, and submitted a RED CCF when required.

For small projects where the two percent threshold is not material, the Senior Vice President Execution has the authority to override the percentage and approve the change up to \$100K. Section 1 of the CCF completed with the amount initialled by the Senior Vice President Execution.

#### **6.1.2 Yellow Changes**

YELLOW changes are addressed within the level of authority of the Project Manager and Director within the envelope of the latest approved project's baseline. YELLOW changes will go through rigorous review and evaluation. YELLOW changes do not change the overall control budget. YELLOW changes can facilitate re-planning of future work within the same project budget (example cash flows). If there is an impact to field work, a scope change or a change in contracting, procurement or executing strategy the CCF is considered RED and must be approved by the CCB. The principles of not changing past and not changing solely for the purposes of correcting performance issues within the control of the project will be strictly enforced.

#### **6.1.3 Red Changes**

RED changes have a material impact on the Gate approved cost, schedule or scope. These include fundamental changes to Contracting Strategy, Procurement Strategy, Execution Strategy or Design Requirements and require a contingency draw or return. RED changes will go through rigorous review and evaluation. All scope changes, additions or transfer requests are considered to be RED changes that require significant review for impacts. All contingency draws are considered RED changes. The material cost impact threshold is considered:

<b>Projects &amp; Functions, the lower of</b>	<b>\$5M</b>	<b>10%</b>	<b>of the current approved baseline budget</b>
---	-------------	------------	--

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>18 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

The material schedule threshold is considered a revision to any of the Tier 1, 2 or 3 milestones as listed below (refer to N-MAN-00120-10001-SHT-06: Nuclear Refurbishment- Milestone Definition Framework):

Milestone	Description	Example
Program Tier 1	Milestones that are commitments to the Board or decisions at Board Level	Release Quality Estimate, and Unit Start/Finish Dates
Program Tier 2	Critical Impact Milestones normally documented in Phased based Program Business Case Summaries per Release Strategy	CNSC Approval of ISR
Program Tier 3	Program Controls, including the NR AIP Milestones and NR AIP Scorecard, Milestones that manage the health of the Program and keep it on track	All Projects Scope Freeze/Detailed Engineering Finished

Program Tier 1 and 2 Milestone schedule delays require approval by the PCCB.  
Program Tier 3 Milestone schedule delays require approval of the CCB.

Schedule impacts that do not impact on Tier 1, 2, or 3 milestones may also be considered to be a Red change if the cost impact of a delay reaches one of the cost thresholds listed above when taking the project burn rate into account.

The Schedule Change Control process is governed by N-MAN-00120-10001: SCH-11, DR Schedule Management Plan for Integrated Level 3 Execution.

Decision Type	Contingency				
	Impacts Forecast	Impacts Baseline or Cash Flow	Program	Project	Management Reserve
<b>GREEN</b>	Y	N	N	N	N
<b>YELLOW</b>	Y	MAYBE	N	N	N
<b>RED</b>	Y	MAYBE	Y	Y	Y

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>19 of 41</b>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 6.2 Change Classification

The Initiator will choose a *Change Classification* from a drop down list. The following is a list of change classifications:

Classification			
1	Scope - OPG	9	Quality & Conformance - OPG
2	Scope - Vendor	10	Quality & Conformance - Vendor
3	Resources/Materials - OPG	11	Safety - OPG
4	Resources/Materials - Vendor	12	Safety - Vendor
5	Process & Communication - OPG	13	External Influence Nuclear Refurbishment
6	Process & Communication - Vendor	14	Refurb Program Strategy & Integration
7	Contract Management - OPG	15	Estimate Change - OPG
8	Contract Management - Vendor	16	Estimate Change - Vendor

Individual changes may not have an immediate significant impact on cost, schedule, or scope but they may be symptomatic of a larger problem that may cause more significant impacts in the future or may affect other projects. For example delay in or unavailability of a field service such as radiation protection, scaffolding or permitry may not cause a significant impact for one particular case if alternate work arrangement is possible; however future similar service issues could have much larger impacts if this trend continues and the systematic issues go unresolved.

Change classifications are assigned to all levels of changes to facilitate reporting on trends. Change classifications also have potential commercial implications related to contractor changes or claims.

### 6.3 Change Type

There are three (3) basic *Change Types*: *Forecast Change*, *Budget Change* and *Schedule Change*. The table below contains details of which categories are updated depending on the type of change:

Change Type				Contingency		
	Impacts Forecast	Impacts Schedule	Impacts Scope	Program	Project	Mgmt. Reserve
Forecast Change	Y	MAYBE	N	N	N	N
Budget Change	MAYBE	MAYBE	MAYBE	MAYBE	MAYBE	MAYBE
Schedule Only Change	N	Y	N	N	N	N

## Manual

Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>20 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 6.4 Contingency Changes

The development of contingency amounts and time-phased planning and monitoring of contingency forecasts are governed by the Risk Management and Cost Management Sections respectively using N-MAN-00120-10001: RISK, Nuclear Projects Risk Management.

The Program Change Management process provides the structured framework and the mechanism to document, review and approve “draw” or “return” of contingency funds.

To facilitate tracking contingency usage, unused contingency must be returned to program contingency account using a CCF; it cannot be transferred between projects or bundles. The process of returning contingency does not apply to an underrun or savings realized on completed work.

Note that schedule contingency/float shall be reviewed for the impact on critical path, reference procedure N-MAN-00120-10001: SCH, Nuclear Projects Schedule Management.

The contingency management process for the DRP is incorporated in the project controls framework and focuses on early identification of risks and trends, active mitigation, forecasting, and contingency adequacy reviews in order to proactively manage the project estimate at completion.

Whenever possible, drawdown of contingency will be avoided by effectively managing and mitigating risks and trends including the use of favourable variances identified through project cost forecasting. When a risk or trend cannot be fully mitigated a drawdown of contingency will occur.

The following controls will be incorporated into the process for managing the drawdown of contingency:

All project changes, including scope, cost, and schedule, will be documented, reflected in the risk register and reviewed and dispositioned by the CCB.

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R001</b>	<b>21 of 41</b>

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

**6.4.1 Project Contingency**

Source	Approver	Approval Threshold
Estimating Uncertainty – Projects	SVP Refurbishment Execution	100%
Critical Path Schedule to Medium Confidence	SVP Refurbishment Execution	To 50% Consumption
	SVP Nuclear Projects	50% to 100% Consumption
Critical Path Schedule to High Confidence Duration	CNO and CEO	100%
Discrete Project Risks	SVP Nuclear Projects	100%

(1) Includes \$42 Million for Facility and SIO Projects

**6.4.2 Program Contingency**

Source	Approver	Approval Threshold
Estimating Uncertainty – Functions	SVP Nuclear Projects	100%
Discrete Program Risks	CNO and CEO	100%

All program contingency changes, including scope, cost, and schedule, will be documented, reflected in the risk register and reviewed and dispositioned by the CCB and PCCB.

In addition to the above approvals, the following controls will be implemented:

Any discrete risk resulting in an allocation of contingency greater than \$40 Million will require CNO and CEO approval. This aligns with the Organizational Authority Register (OAR) requirement for in-budget project investments.

Notification will be provided to the CNO and CEO on contingency draw downs that impact multiple units.

Any contingency allocation requiring CNO and CEO approval also requires CFO approval.

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Any low probability high consequence event that is outside the contingency determined for the project (e.g. Force Majeure, significant labour disruption, an international Fukushima Type Event) will be escalated to the DRC for approval. This may result in a revision to the DRP Business Case.

#### 6.4.3 Management Reserve

Management Reserve funding approval, if it becomes necessary, will require resubmission of the NR business case to the Board of Directors prior to approval in a CCF.

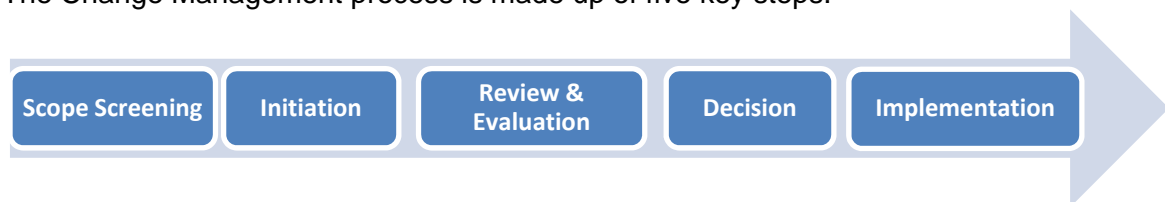

#### 6.5 CCF Approval Authority Level

The CCF approval authority level is based on the cumulative change impact of all GREEN, YELLOW AND RED CCFs, not incremental change. When a project is re-baselined, the cumulative approvals of remaining contingency apply to the re-baselined value and not to the original project baseline value. Example:

	Incremental Change	Cumulative Change	Total	Growth	Authority Level
Project Baseline			\$6,000,000		
CCF #1	\$550,000	\$550,000	\$6,550,000	9%	within PM Authority, <10% or \$5M of Project or Functional Baseline
CCF #2	\$400,000	\$950,000	\$7,500,000	15%	not within PM Authority, >10% or \$5M of Project or Functional Baseline

#### 7.0 CHANGE MANAGEMENT STEPS:

The Change Management process is made up of five key steps:

See Appendix D, Process Overview.

#### 7.1 Screening, Scope Changes/Additions

All proposed scope changes and additions initiated by creation of a new Work Order or work request will be screened daily by the New Work Screening Committee. The process of screening scope is further defined in Appendix B. The Project Manager accepts the scope change and initiates a CCF if required based on the criteria of this procedure for approval at the CCB. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>23 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB. In cases where there are multiple potential options to address new scope, the ORB will review the options and decide which will be pursued.

## 7.2 Initiation

The initiator starts the process with a CCF. Refer to Appendix E for an example of a CCF with instructions for completing the form.

For GREEN changes, the initiator completes Section 1 of the CCF. Section 1 provides the minimum information required to register a change for trending. GREEN changes are reviewed and if agreed to be GREEN go directly to Implementation. The output of Implementation for a GREEN change is trending metrics.

For RED or YELLOW changes, the initiator completes **all** Sections of the CCF, **no blank fields will be accepted**.

All required data on the CCF must be completed and the following supporting documents are required as applicable:

- Business rationale or justification for the requested change.
- Technical supporting documents if applicable.
- Cost Estimates prepared by OPG and/or Contractors in sufficient detail to allow review, including hours, rates, quantities and assumptions. Contractor estimates are reviewed and validated by P&C Estimating Department.
- Identify the change impact on project interest and include in the cost estimate.
- A resource loaded schedule with affected activities and Critical Path impacts listed if applicable.
- Identify impacts to the Work Breakdown Structure (WBS) including to the overall Program WBS if applicable.
- Identify impacts to the Risk Register, including listing any additional risks, closed risks, changes in impacts on probability, schedule and cost and mitigating actions required.
- A listing of the Work Packages affected by the proposed Change in the required in the following format:

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Work Package ID	Work Package Title	Original Budget	Approved Changes	Control Budget	Pending Changes	Control Budget + Pending Changes

- Identify impacts to Contingency.
- Identify the impact to the Project Life Cycle Estimate at Completion (EAC), provide a definitive EAC and compare to the Control Budget.
- Any other relevant supporting documents that facilitate review and evaluation of the change.

The CCF is a stand-alone document subject to audit and significant scrutiny, all documentation must be attached.

### 7.3 Review and Evaluation

The CCF is reviewed to ensure that an adequate amount of information and backup to fully support the proposed change is included as listed in Section 7.2 and that all required fields of the CCF are completed and correct. The evaluation of the impacts of change is integral to the success of a Project.

If required, the CCF is routed to the appropriate functional department or subject matter experts to perform an independent evaluation of the impacts of the change. Impacts that must be evaluated are:

- Cost
- Schedule
- Scope
- Basis of Estimate
- Estimate at Completion
- Risk

Project or vendor basis of estimates must be evaluated by the P&C Estimating Department. For estimates less than \$500K, allow two working days for review. For estimates greater than \$500K or of a complex nature, allow five working days. NR Estimating complete the "Estimate Review" section of the CCF.

Other Impacts to consider, but not limited to, are:

- Nuclear Safety
- Conventional Safety
- Environmental
- Union Jurisdiction
- Commercial
- Design

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>25 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Work and Radiation Permits
- Decontamination
- Material Handling and Storage
- Work support activities

The key outputs of the Review and Evaluation of a CCF are:

- Independent written feedback regarding the identified impacts.
- Recommend action to the approving authority.

Outputs of evaluation are attached to the CCF as backup documentation.

### 7.4 Decision

The core expectation of this procedure is that change is managed at the lowest level of the organization that has the authority to do so and that change that has a significant potential impact on project or program scope, cost and schedule is reviewed in detail and the recommended direction is approved at the required level. Approval is based on the decision criteria applied in section 6.1.

#### 7.4.1. Change Control Board

The CCB is Chaired by the Senior Vice President, Nuclear Refurbishment (or delegate) and scheduled as/when required. The CCB may also refer a change for additional approval as required. The CCB approved change within their authority. The CCB recommend to the PCCB OPG staffing and resource changes.

#### 7.4.2. Program Change Control Board

The Program Change Control Board (PCCB) Chaired by the Vice President, Planning and Controls is scheduled as/when required. The PCCB convenes to approve significant Program level cost and schedule changes that require additional approval. The PCCB approve OPG staffing and resource changes.

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

#### 7.4.3 CCF Fast Track Process

Due to the nature of construction projects and the need to process urgent changes that impact field work, a Fast Track process exists for urgent CCF's:

Step	Description	Responsible	Notes
1	Prepare CCF and Supporting Documentation	Project Manager	The Fast Track CCB processes will require quality CCF form, with supporting documents.
2	Assess if fast track process is required	Planning & Control Lead	Criteria for Fast Track: - Immediate impact to field work - Is not caused by poor planning
3	Concur that the fast track process is applicable.	Unit Director (Work Control)	Email: Project, Unit Director, Copy Change Administrator
4	If #3 = NO, CCF will be submitted via the regular CCB process and schedule	Planning & Control Lead	Register for next CCB
	If #3 = YES, Review CCF for quality, then prepare for a email-based voting process.	Change Administrator	Voting email to CCB members, copy Project Manager to respond to questions.
5	CCB Vote	Change Control Board	Upon approval, the results will be communicated and the change recorded in cost management system.

It should be noted that the Project Control Centre (PCC) has the authority to approve changes in the field in emergency situations and the change paperwork will be submitted after the fact.

Expectation is that turn-around time for fast track is to be less than 5 business days.

#### 7.5 Implementation

The final decision and disposition of a CCF will be communicated to all stakeholders listed on the CCF. The status of a CCF will be changed to "approved" once all actions are completed.

## Manual

Internal Use Only

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

The following systems and tools shall be updated, as applicable and verified updated by the P&C Lead:

ACTION	RESPONSIBLE
Budget cost and cash flow ("PV") baseline Proliance	NR Cost Management Section
Schedule baseline plan in Primavera P6	NR Schedule Management Section
Risk Management and Oversight (RMO) database	NR Risk Management Section
Project Management Plans	Project Managers, or designate
Contracts/Purchase Orders with Suppliers	Supply Chain
Update Change Register	NR Cost Management Section
Update IDB Data Sets	Data Stewards

## 8.0 CHANGE REGISTER

A Change Register will be maintained in the Cost Management system by the P&C Cost Management Section to record the sources of change, track and monitor status and provide inputs for key change related metrics.

The following are maintained in the Change Register:

- (a) Change Identification
- (b) Date Initiated
- (c) Change Type
- (d) Resultant Change Status
- (e) Action By (Submitter, Approver, Rejecter)
- (f) Approve/Reject Comments
- (g) Disposition Date (date approved or rejected)
- (h) Cost
- (i) Total Milestone Variance Days

## Manual

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>28 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 9.0 METRICS AND REPORTING

The data compiled in the Change Register will be used to generate Program and Project metrics. Metrics will be generated on a monthly basis and include statistics such as:

- (1) Number initiated
- (2) Number Approved
- (3) Number Rejected
- (4) Change Classification Trends
- (5) Contingency Drawn Percentage
- (6) Remaining Contingency value
- (7) CCF Cycle Time

A Station Condition Report (SCR) shall be created for adverse trends identified from GREEN change pattern analysis if applicable. The intent of the SCR is to put in place corrective actions that are consistent with the consequences involved.

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 10.0 DEFINITIONS

A comprehensive listing of P&C Terms, Acronyms and Definitions are provided in N-MAN-00120-10001 PC-16. Acronyms and definitions used in this document are summarized below.

Term/ Acronym	Definition
Baseline	See Performance Measurement Baseline
Change	For the purposes of this procedure, a change is any deviation from an approved plan or procedure that results in a real or potential impact on project or program cost or schedule.
Change Classification	Used to differentiate the reasons for a change to facilitate trending analysis.
Change Control Form (CCF)	Change Control Form N-FORM-11252; used to document changes for trending and approval purposes.
Change Management Process	Change Management is the Project Management process (including the supporting tool) that provides a framework to identify and record changes in cost, schedule and or scope against the approved baselines.
Comprehensive Work Package (CWP)	A CWP is a collection of all necessary information required to complete the field implementation of construction work. It provides a systematic approach to completing the installation while taking into account nuclear, conventional, radiological and environmental safety.
Decision Criteria	RED, YELLOW or GREEN labels applied to differentiate the severity of a change so that the right risk-based change management controls are applied.
Executing Organization	The Project Team, OPG Function or Contractor's organization executing the scope of work.
Forecast	Forecast represents the projected cost of the Work Package, including any pending changes yet to be approved.
Integrated Data Base (IDB)	IDB is Nuclear Refurbishment's data repository where integration and mapping occur. Information is pulled into IDB for the purpose of integration, mapping, data quality analysis, data integrity, and reporting.
Performance Measurement Baseline (PMB)	<p>The Performance Measurement Baseline is the Project scope, cost and schedule approved during the Gated process for Project and Bundle Releases</p> <p>The approved budget and schedule allocated to Work Packages indicate cost and schedule performance which will be measured against Current Budget in the Cost Management System and the Project Baseline Schedule.</p> <p>The Performance Baseline will be established for both Cost and Schedule:</p> <ul style="list-style-type: none"> <li>Project Performance Baseline – Will be established at each Gate.</li> <li>Functional Performance Baseline – Will be established at each Release</li> </ul> <p>The Performance Measurement Baseline will not include:</p> <ul style="list-style-type: none"> <li>Contingency</li> <li>Management Reserve</li> </ul>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Term/ Acronym	Definition
Program Baseline	The aggregate planning efforts during Definition Phase will converge to an overall Program Plan at Release 5, or Release Quality Estimate (RQE). This is the point when the majority of projects have sufficiently defined their execution strategies, cost, schedule and scope that will allow an overall Program Baseline to be set. The Program Baseline will be maintained and actual cost versus budget monitored.
Program Integrated Master Schedule (PIMS)	The Program Integrated Master Schedule is the Level 1 schedule controlled by OPG senior management and contains all control accounts from all projects, OPG functional as well as for program management work.
Program Milestone Schedule (PMSS)	The Program Milestone Schedule is the Level 0 schedule controlled by OPG senior management.
Program Tier 1 Milestone	Program tier 1 milestones are milestones that are commitments to the Board or decisions at Board Level.
Program Tier 2 Milestones	Program tier 2 milestones are milestones that are critical to the Program, normally documented in Phased based Program BCS's per Release Strategy.
Program Tier 3 Milestones	Program tier 3 milestones are milestones that manage the health of the Program and keep it on track
Project burn rate	The cost a project incurs on a daily or weekly basis as a result of overheads, direct expenses (e.g. equipment rental) and labour.
Program Work Breakdown Structure (PWBS)	The Program Work Breakdown Structure is a hierarchical decomposition of the entire scope of work to be executed by the program team to accomplish the program deliverables.
Scope	Within the context of this document scope refers to the data sets that are used to manage projects and the Darlington Refurbishment Program. These include for example, Darlington Scope Requests, Engineering Changes, Work Orders, <i>Comprehensive Work Packages</i> , Construction Completion Declarations (CCDs).
Work Breakdown Structure (WBS)	A hierarchical decomposition of the total scope of work to be carried out by the project team to accomplish the project objectives and create the required deliverables. The main purpose is to breakdown the scope of work into more controllable components and to identify responsible organizations for the completion of all components.

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

## Appendix B: Scope Change/Addition Screening Process

For the purposes of this document, "Project Manager" represents the Project Manager, Maintenance or Functional Manager who holds the budget to execute the work.

During Refurbishment execution, all requests for new scope will be handled through Asset Suite through the OMS Work Order Approval Process. A New Work Screening Committee (Screening Committee) will review work requests on a frequency depending on the volume received and categorize the work as to either execute during the Refurbishment outage or deferred as post-breaker close work.

For all types of new work orders not linked to current projects, consideration of the impacts of union jurisdictional issues and the Chestnut Park Accord Addendum (CPAA) work assignments should be made, reference file NK38-CORR-09701-0408278-T10. The CPAA Committee is available to assist with this impact assessment (contact Dan Smith dan.smith@OPG.com).

### 1.1 Emergent Work

#### Non-Project Emergent Work

Emergent work categorized as Refurbishment by the Screening Committee and accepted by the Project Manager will be added to OMS and dispositioned by the Outage Manager as being an Available for Service requirement. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB.

#### New Work Team - Fix It Now (FIN)

If the emergent work requires immediate action due to station conditions, the Outage Manager (pre-breaker open) or the PCC (post-breaker open) will assign the work to the FIN Team.

The FIN team is a multi discipline team that reports to Director of NR Operations & Maintenance, which will support the Unit Director. The team will act as "first responders" for emergent work on the unit where repairs are required on Operating Systems not in the control of an EPC vendor.

Work Orders for urgent work generated from the FIN process must be accepted by the Project Manager the next business day. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Work Orders that cannot be completed by FIN process will be prioritized, planned and integrated with appropriate windows in the outage schedule with the acceptance of the Project Manager.

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R00</b>	Page: <b>34 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

#### Project Emergent Work

Individual projects will manage their own project schedule and plan in P6, but these plans will interface with the Outage execution integrated schedule.

Additional work may be added to scope though the Screening Committee, CCB or PDM. The work must be characterized (mandatory or nice-to-have) based on work in progress, schedule and cost. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance.

#### **1.2 Cyclical Outage**

The Cyclical portion of the Refurbishment will be executed by the Refurbishment organization using Asset Suite and will follow the Refurbishment Planned Outage Management milestones and planning process.

#### Cyclical Scoping

Cyclical scoping will require a collaborative effort of Station & NR Engineering, Operations, Maintenance and Work Control. Accountability is maintained by Unit Director (NR Work Control). The Cyclical Scope selection will include the following:

##### Must Do:

- Station License or Regulatory Requirements.
- Testing/inspections required for normal shutdown and start-up of the Unit.
- Mandatory Inspections due during the Outage Period.

##### Need or Want To Do:

- Life Cycle Management inspections or Maintenance as required to facilitate RTS (Return to Service) expectations.
- Preventative Maintenance, Deficient Maintenance (DM) and Corrective Maintenance (CM) Work Orders as requested to achieve RTS expectations. These will be a subset of: PRL (Plant Reliability List) Work to Improve Unit Reliability, Reduce Forced Loss Rate, Station Cycle Plan Support and Operating Backlog Targets Support.
- Cyclical outage scoping strategy will consider scope that can be proven to add value to the station operations in future by improving maintenance method saving costs on outages, optimizing resources or improving operations. Replacement of components which due to scale of work makes economic sense.
- Operator Burden and Operator Work-Around elimination.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R00</b>	Page: <b>35 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

This work is assigned to the Project Manager by the Screening Committee. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

**Note:** The cyclical scoping process cannot be used to circumvent the CCF or DSR/DRAS process.

#### Cyclical Schedule

The Unit Director is accountable for the preparation of cyclical schedules that will include all cyclical outage approved scope (Operations & Maintenance work orders, from breaker open to closed, required to allow operation until the next planned outage, D2221).

The cyclical outage schedule will include Operations I RTS detailed shutdown and return to service activities. Additionally, this schedule shall be reviewed for horizontal and vertical integration with the IL3 (Integrated Level 3) and CCL2 (Coordination and control level 2) schedule. Refer to N-MAN-00120-10001-SCH-11 (Darlington: Schedule Management Plan for Integrated Level 3 Execution) for more details on IL3.

The cyclical outage scoping process is initiated following the last planned outage prior to the start of the unit as per the Work Management Ownership Transfer Plan (NK38-PLAN-09701-10113-WM-01).

### 1.3 Major Scope

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB. In cases where there are multiple potential options to address new scope, the ORB will review the options and decide which will be pursued.

Major program scope changes referred to the PSRB by the CCB or PDM follow the Darlington Nuclear Program Scope Control, NK38- INS-09701-10001.

### 1.4 New Projects and Station Sponsored Work

During the time period when NR is the scheduling authority, the Station may desire to have work (new scope) performed on the unit. Since there is only one schedule to perform work in the Refurbishment unit, all Station or Projects & Modifications work groups must ensure their tasks are approved and shown on the Refurbishment schedule once approved.

New scope identified at the Screening Committee requires a scope sponsor who prepares a CCF for approval at the CCB. Significant new or changed scope will be referred by the CCB to the PDM and if approved a DRAS for budget approval by the PSRB is required. In cases where there are multiple potential options to address new scope, and that option set does not provide a clear

Title:

### **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

preferred option, an Options Review Board (ORB) will review each option and decide upon which of the options will be pursued.

#### **1.5 Decision Escalation (Appeal) Process**

In the situation where a scope addition or change has been rejected by the Project Manager, a request can be made to escalate the decision to the CCB and PDM.

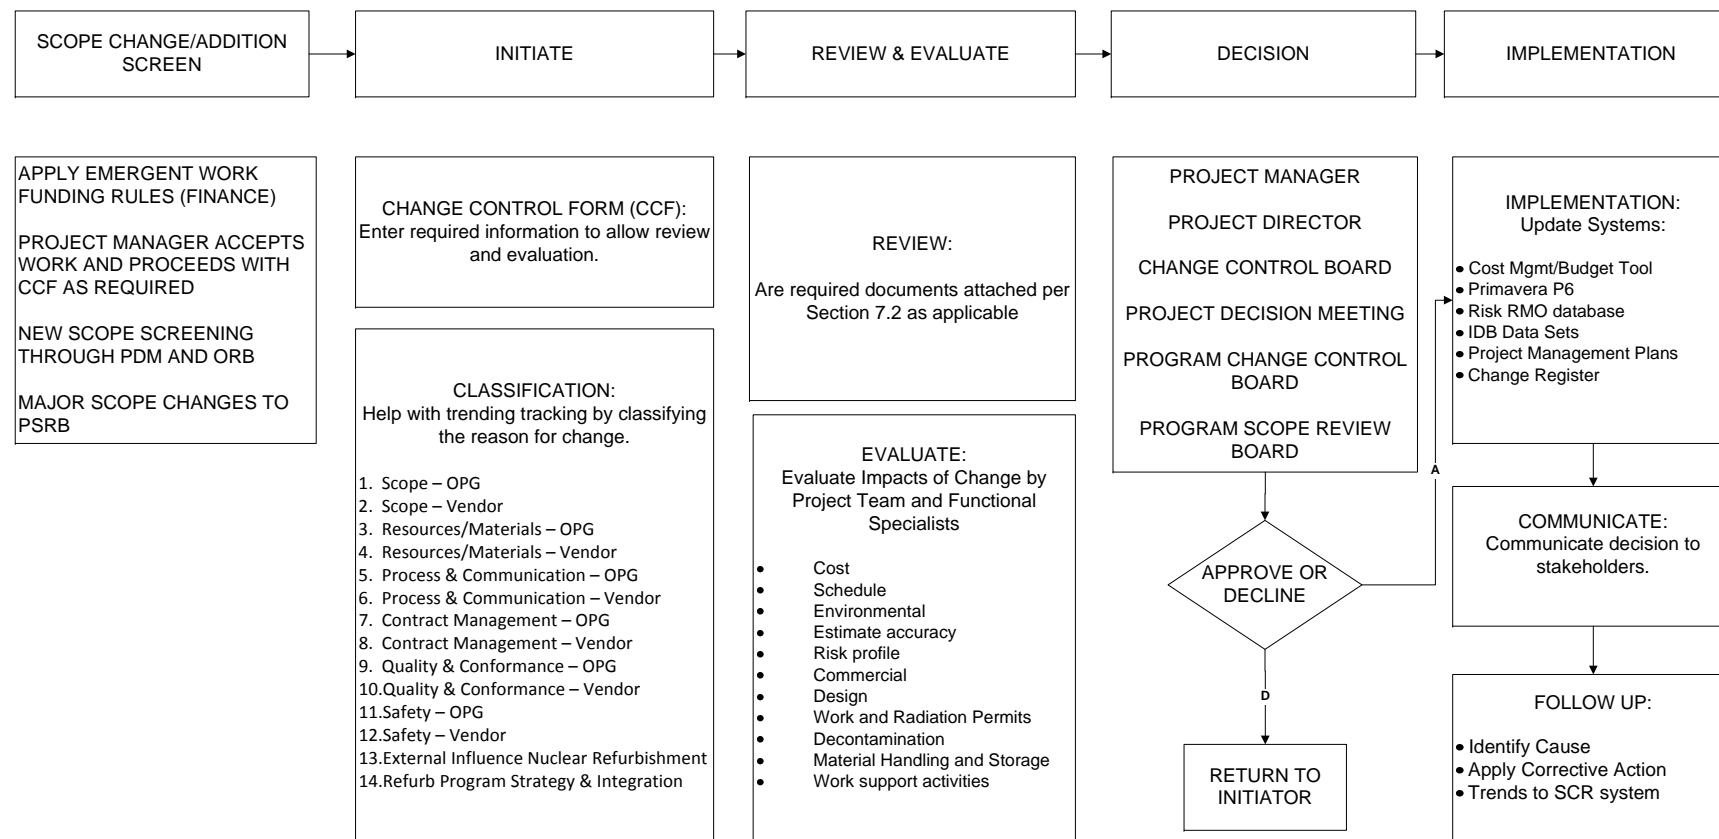

In the situation where a scope addition or change has been rejected by the CCB, a request can be made to escalate the decision to the PSRB. In such cases, a written request by the Sponsor must be made to the Chair of the PSRB with rationale. The PSRB chair will arrange an ad hoc PSRB meeting to consider the request.

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 1.0 PURPOSE

This document provides the required guidance in planning and conducting quality surveillance activities for the Darlington Refurbishment Program (DRP). It is prepared as part of implementing the Darlington Refurbishment Program Quality Plan (NK38-NR-PLAN-09701-10001). The Quality Plan takes its authority from the Darlington Refurbishment Program Charter (D-PCH-09701-10000), which is linked to the Nuclear Management System.

Quality surveillance will be performed to provide added assurance that the completion of activities at different phases of the project such as Shutdown Lay-up, Engineering, Construction, Commissioning, "Available for Service", Unit Readiness, and Closeout meets the specified requirements. It also assures configuration management oversight is maintained throughout the project phases. Surveillance includes activities performed as part of Engineering Modifications as well as Non-Modification activities such as Maintenance and Inspection.

Quality surveillance activities will be performed utilizing a **graded risk based approach** that will focus on:

- 1) Safety significant items
- 2) Regulatory items (including Safety Improvement Opportunities (SIOs), and Integrated Implementation Plan (IIP), and
- 3) Other production and reliability project items

The following set of principles will be applied on the selection of surveillance activities:

1. Review of work conducted by Contractors based on Contractor performance.
2. Review of nuclear safety significant items and Regulatory items such as Licence Conditions Handbook (LCH) requirements.
3. Review of items critical to Operation.
4. Review of both Contractor and OPG performed work.
5. Review of completed and in-progress items to show rate of progress and configuration management.
6. Validation of Quality Management Guidelines.
7. Review of modification and non-modification work.
8. Review of IIPs, SIOs, and Environment Assessment items.

## Guideline

<b>Internal Use Only</b>		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>8 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

Currently there are several governing and supporting documents associated with the DRP that discuss oversight and oversight plans in different functional areas. For example:

- N-STD-AS-0030, Project Oversight Standard
- N-MAN-09701-10002, Nuclear Refurbishment Project Oversight
- N-INS-09701-10007, Project Oversight Planning and Implementation
- N-GUID-09701-1000, Guideline for Engineering Oversight
- N-GUID-09701-09701-10120, Guideline for Construction Oversight
- N-MAN-01983-10000, Field Engineering Quality Control Manual.
- N-LIST-01300-10000, Bounded Document Set
- N-COI-00120-00001, Contractor /Owner Interface Requirements for Nuclear.
- N-GUID-09701-10022, Supply Chain Oversight.

The above documents discuss surveillance activities as part of respective Project Oversight Plans. To ensure compliance and completeness of key requirements throughout each phase of DRP, a continuous quality surveillance process is required as described in this guide.

A schematic of the Darlington Refurbishment Program (DRP) Quality Surveillance Planning and Execution process is given in Figure 1.

## 2.0 ROLES AND RESPONSIBILITIES

### 2.1 Director Quality Management

- a) Responsible for ensuring the quality and management system requirements for the Darlington Refurbishment Program (DRP) are executed and completed.
- b) Responsible for ensuring quality surveillance is performed during each phase of DRP to obtain project completion assurance.
- c) Responsible for providing assurance through the quality surveillance activities that Project Completion Assurance is obtained through each phase.
- d) Can escalate and implement corrective actions for critical issues.
- e) Responsible for the interfaces with other DRP internal and external assessment activities to coordinate and optimize the required quality surveillance activities for DRP.
- f) Responsible for establishing metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.
- g) Can direct specific quality surveillance activities based on risk, Lessons Learned and OPEX.
- h) Oversee management of records of changes to the units during refurbishment.

### 2.2 Quality Surveillance Staff

Staff assigned to the DRP Quality Management department will comprise of functions related to:

- Quality Engineering
- Procurement and Supply Chain Oversight
- Field Execution
- Performance Reporting
- Records

This staff will perform the following quality surveillance activities within the Quality Management department.

- a) Identify the Quality Surveillance needs for the DRP considering the risks based on issued identified, history of past performance, issues identified in Issue

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>11 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

Tracking File, performance trend, the integrated DRP schedule etc., and discuss with the Director Quality Management Director and Functional Managers

- b) Input the scheduled Quality Surveillance activities into the DRP Integrated schedule as per concurrence by the Director Quality Management.
- c) Prepare Quality Surveillance Plan including completing the required checklist for the specific Quality Surveillance identified in the schedule for execution.
- d) Perform Quality Surveillance as discussed in this guide, document results, identify non-conformances or deviations from expected performance identified in Engineering Deliverables, Comprehensive Work Plans, Purchase Orders, and Inspection Requirements.
- e) Prepare Surveillance Reports, and discuss with Quality Management Director and the Functional Managers to finalize the Quality Surveillance Reports.
- f) Carry out trend analysis periodically and discuss with the Director Quality Management.

## Guideline

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 3.0 QUALITY SURVEILLANCE PROCESS

Quality surveillance activities for the DRP will be planned and carried out from the “Concept to Return to Service” of key systems or Engineering Changes. The need for quality surveillance plans, and the extent of surveillance activities will be determined based on the graded risk approach and principles identified in section 1.0 to the key product deliverables during the different phases of the project.

The primary objective of the Quality Surveillance activities is to ensure appropriate documents and records are maintained and retrievable to ensure **configuration control** is maintained through all phases. **Figure 2** provides an overview of the configuration management requirements at different phases of the project as identified through N-LIST-01300-10000, Bounded Document Set, and the product deliverables at each phase of the project, including any additional deliverables per Project COIR document N-COI-00120-00001.

A risk based graded approach will be used to identify specific needs for quality surveillance activities using the following priorities as applicable to Darlington Refurbishment Project:

1. Safe Return to Service
2. Regulatory items.
3. High Risk Items (using graded approach as discussed in 5.0),
4. Low Risk Items that need to be covered by surveillance because of past performance or other factors.

**Appendix- A** provides an overview of the different phases of the refurbishment project, related processes in each of the phases, and the key deliverables during those phases.

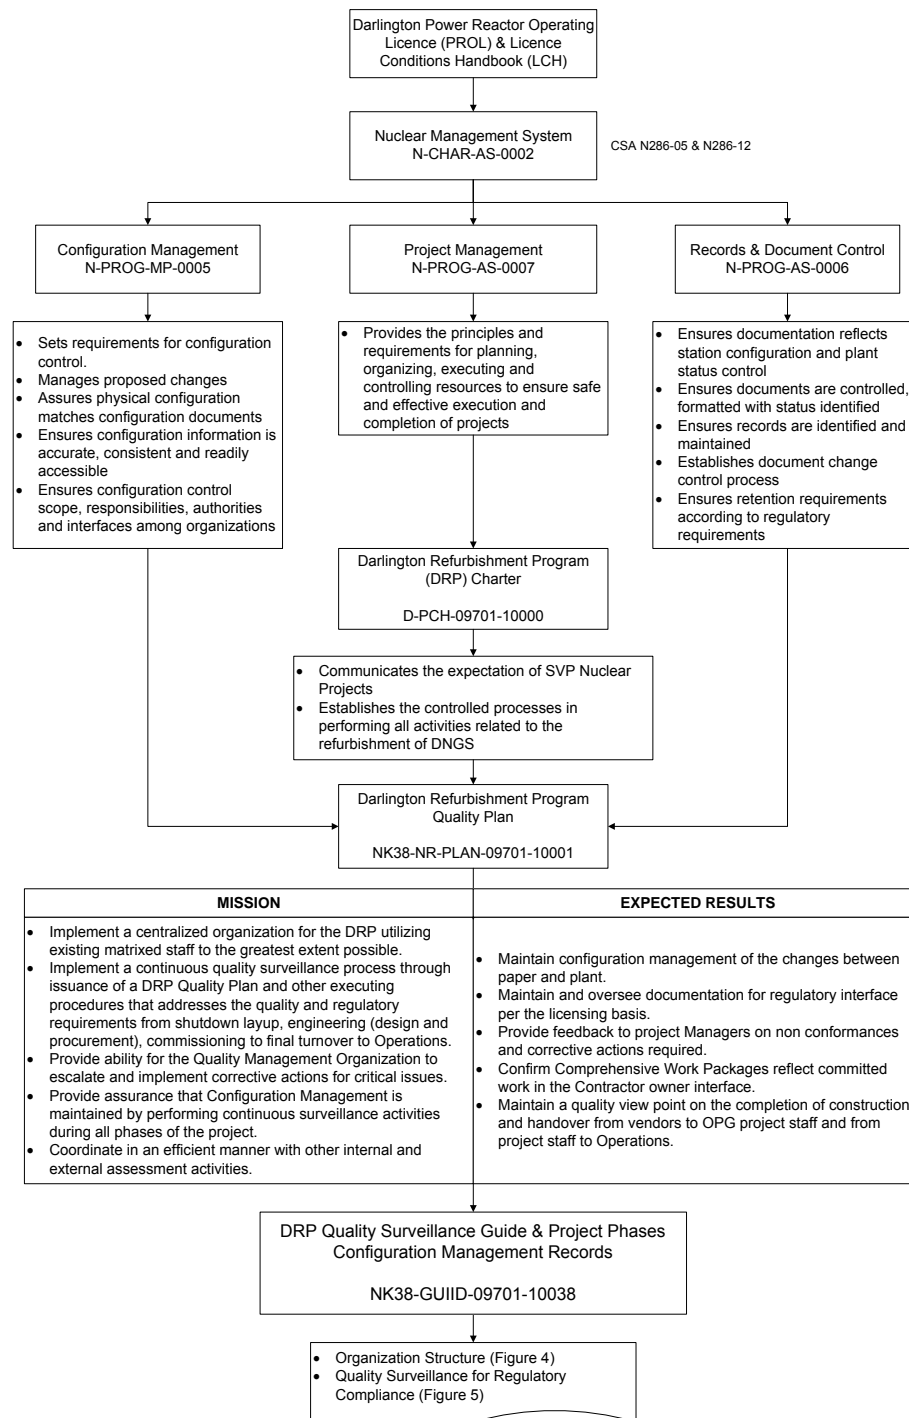

**Appendix- B** provides a comprehensive list of the Configuration Management documents and records as identified in the Bounded Documents set (N-LIST-01300-10000), the Contractor Owner Interface Requirements (COIR), and key process deliverables at each of the project phases.

### 4.0 PLANNING AND SCHEDULING QUALITY SURVEILLANCE

- 1) Integrated DRP schedule will be the basis for developing an integrated Quarterly Quality Surveillance Plan. The Integrated DRP Schedule is expected to include key surveillance activities based on the following:
  - i. Regulatory Commitments (CNSC, Ministry of Energy, Ministry of Labour, TSSA etc.
  - ii. Inspection & Test Plans that lists specific tests and inspections that may have to be witnessed or identified as a Hold Points.
  - iii. Hold Points and Witness Points as identified in documents such as COIR, and the schedule of upcoming key activities, and
  - iv. Other project related activities that require Quality Surveillance.
- 2) Inputs to the Quarterly Quality Surveillance Plan will include:
  - i. Common issues highlighted through performance reporting
  - ii. Impact on Safety and Quality
  - iii. Schedule milestones and related activities
  - iv. Availability of resources; skills, training, staff vacations, base numbers
  - v. Operating Experience and lessons learned
- 3) The Quality Surveillance Plan will be reviewed and updated on a monthly basis, with a 90 days look ahead and accomplishments in the last 90 days. The Quality Surveillance Manager will arrange to populate planned Quality Surveillance activities in the Integrated DRP schedule as a plan and will arrange to update activities based on progress achieved.

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 5.0 PREPARING FOR QUALITY SURVEILLANCE

- 1) Personnel assigned to perform quality surveillance should be qualified and familiar with the process for performing the task to be evaluated. **Appendix- C** discusses the training and qualifications requirements and the desired traits for the quality surveillance personnel to perform surveillance. Specialized expertise required, if any, is to be obtained within the Nuclear Refurbishment (NR) organization or using external expertise as may be required. Respective functional organizations may also identify subject matter experts to participate in the team.
- 2) The Quality Surveillance Evaluator(s) (QSEs) conducting the surveillance should, as appropriate:
  - Review the quality surveillance schedule, monitor the scheduled work for the surveillance, and plan the surveillance.
  - Obtain and review the specific references, governing documents, report and records that pertain to the activity considered to be observed. This may include documents identified as deliverables in the Contractor Owner Interface Requirements (COIR) documents or other governing documents associated with engineering deliverables. It would also include self-assessments and SCRs related to the topic of surveillance. The table provided in **Appendix-B** lists the Configuration Management documents and the records as identified in the Bounded Document set, the Contractor Owner Interface Requirements and the key process deliverables at each of the project phases. These could help in choosing the product deliverable(s) for doing quality surveillance.
  - Key points to consider when developing checklist for surveillance during the different phases are discussed in **Appendix-D**.
  - Prepare a quality surveillance checklist making use of the standard checklist template and examples provided in this guide. The Quality Surveillance Checklist is expected to identify the requirements, acceptance criteria, and other items to be evaluated depending on the product deliverables / activities selected for surveillance. Review of checklists prepared/used earlier may be useful in the context.
  - Reference the documents for the quality surveillance, including revision numbers, on the checklist.
  - Obtain comments and assistance, as appropriate, during the preparation of the quality surveillance checklist, from the functional area experts, and as advised by the Manager Quality Surveillance.
- 3) The assigned QSE shall prepare a checklist before performing the quality surveillance and documenting the observations. A checklist should not limit the quality surveillance activities coverage. The QSE should observe activities, review

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

documents/ records and note down observations on the performance aspects related to the surveillance activity.

- 4) Assigned QSE should prepare a Surveillance Plan as identified in **Appendix-E**. The Surveillance Plan should be reviewed and approved by the Quality Surveillance Manager.

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>17 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 6.0 PERFORMING QUALITY SURVEILLANCE

- 1) QSE should observe activities, review documentation, inspect hardware, etc., to ensure compliance with the specified technical and administrative requirements and to verify whether the performance requirements were met. QSEs should use the surveillance checklist prepared for documenting the observations.
- 2) QSE should document, the results of the surveillance observations in sufficient detail to ensure that the record clearly reflects who was contacted, what was observed, when it was observed or reviewed, and what results were identified.
- 3) QSE should make sure that the results of each quality surveillance check will include, as appropriate, an evaluation of:
  - (a) The conformance of the activity or item to its quality requirements and objectives.
  - (b) The adequacy of the work or QA practices observed and the effectiveness of the results. When required, additional observations should be made or take up follow-up surveillances.
  - (c) Likely causes and recommendations for improvement, and the need for initiating Station Condition record (SCR) as required.
  - (d) The need to schedule follow-up reviews/surveillance for evaluation of identified issues.
- 4) QSE should spend adequate time in the area where the activities occur and document observations required for developing or supporting the conclusions from the surveillance.

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>18 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 7.0 REPORTING QUALITY SURVEILLANCE RESULTS

- 1) QSE should prepare a quality surveillance report summarizing the surveillance activities performed. It should be posted in the Risk Management and Oversight (RMO) tool and will include items such as the performance area covered by the Quality Surveillance, key issues observed, and actions taken. Details are discussed in **Appendix-F**.
- 2) QSE should discuss the surveillance observations with the Quality Surveillance Manager and the interfacing /functional organization(s) to identify corrective actions as required.
- 3) QSE should discuss the QS report with the Quality Management Director and obtain concurrence before finalizing and obtaining the necessary signatures.
- 4) QSE will analyze the surveillance data and observations to identify any trends or areas for improvement.

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>19 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 8.0 ACTIONS RESULTING FROM SUVEILLANCE

Station Condition Records (SCRs) may be initiated based on the nature of issue(s) observed and in accordance with N-PROG-RA-0003 Corrective Action Program, N-PRC-RA-0022, Processing Station Condition Records and other supporting documents.

When an issue is identified with concern that may require potential escalation, elements of escalation process similar to the one identified for audits in N-PROC-RA-0129, Elevation and Escalation should be applied as required.

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### 10.0 TRENDING

- 1) The Darlington Refurbishment Quality Surveillance data and observations will be used to determine if there are any adverse trends based on issues identified.
- 2) Study of issues will include project specific observations, Engineering Procurement Construction/ Engineering Master Service Agreement (EPC/ESMSA) contractor specific observations, as well as patterns and trends if any observed along the different phases of the project.
- 3) Results from the above will be discussed with the OPG management for actions as appropriate to address adverse trends to quality.

## Guideline

## 11.0 DEFINITIONS & ACRONYMS

### 11.1 Definitions

***Audit*** is a planned and documented activity performed to determine by investigation, examination, or evaluation of objective evidence, the adequacy of and compliance with established procedures, instructions, drawings, and other applicable documents, and the effectiveness of implementation. An audit should not be confused with surveillance or inspection activities performed for the sole purpose of process control or product.

***Inspection*** is the act of looking at something closely, or evaluation of a product deliverable to determine compliance with specified requirements.

***Oversight*** is a set of activities including audits, assessments, and surveillances carried out to confirm that products and services are delivered to the specified requirements. Oversight includes the use of tools intended monitor, check and confirm.

***Quality Surveillance*** is the act of observing activities or reviewing documentation to verify conformance to specified requirements and to evaluate their adequacy and effectiveness. It is ongoing monitoring and verification of status of conditions, methods, procedures, and products, and analysis of associated records to ensure that established requirements are being complied with. Quality Surveillance is different from Quality Audit and Inspection activities. American Society for Quality (ASQ) Quality Surveillance Handbook prepared by the Nuclear Energy identifies the difference using the context of taking a snapshot using camera with different lenses.

- An audit uses a wide angle lens
- An inspection uses a close-up lens
- A Quality Surveillance uses a standard lens

### 11.2 Acronyms

ASQ	American Society for Quality
CNSC	Canadian Nuclear Safety Commission
COIR	Contractor Owner Interface Requirements
DRP	Darlington Refurbishment Program
EPC	Engineering Procurement Construction
ESMSA	Engineering Services Master Services Agreement
OPG	Ontario Power Generation
QS	Quality Surveillance

### **DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE**

## **Appendix C: Quality Surveillance Personnel Qualification & Training**

Quality Surveillance Evaluator (QSE) should be familiar with the surveillance process covered in the NR Quality Plan and the NR Quality Surveillance Guide. N-JTA-901-00011, Comprehensive Training Needs Analysis for Quality Management Performance Reporting for Darlington Refurbishment discusses training required with reference to N-TQD-901-00001, Nuclear Refurbishment Training and Qualification. Also the following are other training items if not included in the JTA or N-TQD.

1. Nuclear General Employee Training (NGET) Qualification # 2834
2. Introduction to CANDU CBT (PEL # 3520)
3. Self-study to have adequate familiarity with the Engineering Change Control Process and Design Management (N-PROC-MP-0090)
4. Self-study to get familiarised with the Managed System Governance framework and how to identify governing and supporting documents on specific topics (N-PROC-AS-0001)
5. Self-study to have familiarity with the SCR process and Action Tracking System module of Asset Suite (N-PROC-RA-0022, and N-PROC-AS-0019)
6. Self-study to gain an understanding of the self-assessment process (N-PROC-RA-0097)
7. Self study of Inspection and Test Plan processes as applicable to the different phases of the project.
8. Self-study of Supply Chain processes such as the ones on Receiving Inspection, and Source Surveillance
9. Orientation Training to get familiarized with the Darlington Refurbishment Quality Surveillance Process (NK38-GUID-09701-10038).
10. Review of RMO Tool per N-GUID-09701-10123, Nuclear Projects Risk Management and Oversight Tool, as well as the Frequently Asked Questions (FAQ) document associated with it.

Following traits or characteristics are recommended to identify as an effective Quality System Evaluator.

- a) **Communication skills** required to communicate findings and recommendations as applicable
- b) **Credibility and respect.** The effectiveness of the quality surveillance depends strongly on the credibility and respect the functional area personnel may have for the person performing surveillance.
- c) **Objectivity:** Ability to focus on the task assigned and be objective in the evaluation.
- d) **Ability to make decision / judgement:** Ability to make a judgement conforming requirements.
- e) **Ability to deal with people effectively:** Ability to address a confrontational issue or elevate to the appropriate line management.
- f) **Ability to take constructive criticism:** Use of constructive criticism to improve the surveillance observations.
- g) **Ability to listen:** The Surveillance person to be attentive to the person speaking, by being a good listener.

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>40 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

- h) **Ability to ask questions:** asking the right question at the right time and in the proper manner

**Ability to observe and make evaluations:** The person performing surveillance must have good observation skills and be able to make intelligent evaluations.

<b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

## Appendix D: Preparing and Developing Quality Surveillance Checklists during the Different Phases

### A General tips while preparing for Quality Surveillance

Preparation of surveillance checklist is considered the most important part of surveillance preparation. Given below are some tips to be considered for Quality Surveillance.

- Items to be verified are identified from the review of documents in preparation of the surveillance. These documents could include applicable governing documents, procedure for the product activity being covered by the surveillance.
- Items to be verified based on the performance history, problems identified earlier etc.
- Items to be verified based on the critical process activities involved in the specific engineering product, and their acceptance criteria
- Items to be verified as evidence of quality planning, as applicable to the specific engineering process /product
- Items to be verified as evidence of in-process quality control
- Items to be verified as evidence of corrective actions and preventive actions and their effectiveness
- Items to be verified as evidence of having complied with the applicable code requirements
- Use of OPEX and lessons learned as applicable to activity being covered by surveillance
- Any other items identified during the preparation for Quality surveillance.

Note: When verifying evidence of each element for compliance. Make sure that observations are based on a representative sample.

### B Quality Surveillance activities during Design:

As identified in N-GUID-01920-10000 , Guideline for Engineering Oversight, in-process engineering review and release for further work occurs at the following hold points:

- Engineering Mobilization Hold Point
- Design Plan Hold Point
- COMS Hold Point
- 40% and 85% Design Review, as identified in Design Plan
- Independent Technical Review / Design Challenge Hold Point (as identified in the Mod Out Line)
- Design Completion Assurance Hold Point (DCAVR)
- EC Release Hold Point
- Construction Completion Declaration Hold Point
- Available for Service Hold Point

## Guideline

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-GUID-09701-10038</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R000</b>	<b>42 of 66</b>

Title:

### **DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE**

While the above reviews as part of activities during the above hold points provide for quality checks as part of the process, specific quality surveillance checks are to be taken periodically to confirm compliance with applicable requirements making use of the following:

- (i) The Designer's ECC Job Aid (N-FORM-11443), and N-PROC-MP-90 with its supporting Guide document.
- (ii) QA records as identified in N-PROC-MP-0090, Modification Process are listed below:

<b><u>QA Record (description)</u></b>	<b><u>Associated Form / Template</u></b>	<b><u>Remarks / Filing Instructions</u></b>
EC Modification Records. (Also known as EC Bookmarked Records such as MODs, NICR..)	Not Applicable	Index in Asset Suite Records Management Module
Change Paper Documents. (Examples are Mod packages, Engineering Drawings, Bill of Materials, Technical Specifications, )	<i>(Eng documents with the Change Paper stamp and associated signatures of preparer, verifier and Approver)</i>	File in Design EC Modification Records ( in Records Management Module)
TMOD Removal / Extension Form	N-FORM-10005	File in EC Modification Records
COMS Stakeholder Declaration	N-FORM-10007	As per N-PROC-MP-0083. (Indexed in Asset Suite and book marked in Master EC)
Controlled Document Request Form if used to revise an existing EC	N-FORM-10027	Refer to N-PROC-MP-0090 Records table for details
Turnover Declaration	N-FORM-10091	File in Master EC Mod Records, (in Records Mgmt Module)
Human Factors Worksheet	N-FORM-10221	Attached to Master EC
Fire protection Impact Evaluation ( <i>Note: Fire Protection 3<sup>rd</sup> Party Report when evoked will also be a QA record</i> )	N-FORM-10287	File with Mod Outline EC Modification Records
CNSC Approvals and Notification Screening	N-FORM-10369	File with Mod Outline in EC Modification Records
Environmental Impact Worksheet	N-FORM-10422	File with Mod Outline in EC Modification Records
Software categorization Checklist	N-FORM-19445	File with EC Modification Records
Software categorization Results	N-Form-10446	File with EC Modification Records
Pressure Boundary Designer's Checklist	N-FORM-10528	File with EC Modification Records
Reactor Safety Designer's Checklist	N-FORM-10529	File with Design Scoping Checklist in EC Modification Records
Chemistry Design Change	N-FORM-10560	File with Mod Outline in EC

<u><b>QA Record (description)</b></u>	<u><b>Associated Form / Template</b></u>	<u><b>Remarks / Filing Instructions</b></u>
Code Compliance Verification Checklist for VSIDS Nuclear valve Spec	N-FORM-11616	Indexed in Asset Suite Records Management
System Classification List	N-FORM-10250	Completed Form is filed as a Controlled Document Module
Code Classification / Registration Approval and Exemptions	N-FORM-11003	Filed as a Record in Asset Suite / Records Module. <i>Cross-referenced to the associated SCL that is issued as a Controlled Doc.</i>
Updated Darlington Design Manual	N-TMP-10189	Indexed in Asset Suite Controlled Documents Module. (Before closeout).

Specific quality surveillance activities may be selected based on the issues identified through SCRs, self-assessments, or other project oversight activities. Such quality surveillances should focus on looking for evidence that demonstrates compliance to key requirements as applicable to the specific product deliverable(s), their preparation, review and verification, or the records management as applied to them. For every Quality Surveillance, a Surveillance Plan with applicable checklist will be developed. An example of a Design Change Package checklist for Design Completion Assurance is provided in **Appendix G**.

- C Quality Surveillance/ Oversight activities by Refurbishment Supply Chain** are carried out by the Nuclear Refurbishment Supply Chain organization following the process described in N-GUID-09701-10022, Supply Chain Oversight.

The current focus of NR Supply Chain Oversight is the following:

- Procurement Planning
- Bid Evaluation
- Selection of sub-contractors by a Supplier
- Review of procurement documents before release
- COIR Clauses related pre award and post award activities
- Manufacturing process
- Post delivery/Materials management

Activities selected for oversight/surveillance are selected from

- (i) The Schedule of various procurement activities
- (ii) Witness Points identified on ITP by Contractor/ OPG.

Based on the NR Management needs, surveillance activities other than the ones mentioned above may be taken up as directed by NR Management.

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>45 of 66</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

### D Quality Surveillance activities during Lay-Up

Quality Surveillance during lay-up will verify compliance to the requirements identified in the lay-up plans and lay-up Technical Requirements, and the specific Lay-up Requirements Traceability Matrix.

A Quality Surveillance checklist will be prepared using the lay-up plans for the specific system. A sample checklist is provided in **Appendix H**.

### E Quality Surveillance activities during Construction/ Field Execution:

Field Execution Completion Assurance /Quality Surveillance organization is expected to conduct quality surveillance using the related processes and available checklists as discussed in the Governing and supporting documents such as the ones listed below:

- N-MAN-01983-10000, Field Engineering Quality Control Manual
- N-GUID-01983-10000, Field Engineering Guide to Planning and Assessing Work
- N-GUID-01983-10002, Guide to Field Engineering Design Interface and Support
- N-GUID-01983-10004, Field Engineering Quality Control Mechanical
- N-GUID-01983-10005, Field Engineering Quality Control Electrical and Control
- N-GUID-01983-10003, Field Engineering Quality Control Civil
- N-GUID-09701-10120, Guideline for Construction Oversight

A Quality Surveillance checklist for Comprehensive Work Packages and for verifying Construction Completion are provided in **Appendix-I** and **Appendix-J**

#### Note:

The checklist for the specific situation would vary and will be based on the type of equipment and the work carried out, including verification of completed Inspection and Test Plan.

Detailed Quality Surveillance Checklists will be prepared based on the Inspection and Test Plans for the work execution of the specific job and the referenced documents.

It will include checking the completion and verification of ITP activities to meet the specified criteria as well as evidence of having recorded the required details to demonstrate compliance applicable to witness and hold points.

#### For Non-Modification Jobs:

In the case of non-modification jobs such as Maintenance Predefines, and other rehabilitation jobs, inspection and test plans referenced in the work package or the task instructions identified in the Work Order task instructions will be used.

*Additional Quality surveillance may be carried out by the Refurbishment Quality Management Organization on a sample basis making use of the checklists being used by Field Execution organization.*

### F Quality Surveillance during Commissioning

Specific checklist for use with Commissioning will be prepared making use of the following:

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE</b>		

- NK38-NR-PLAN-09701-10001- Sheet 3, Darlington Refurbishment Return to Service Program Management Plan

The system specific Commissioning Specifications and Commissioning Reports prepared in accordance with N-INS-00960-10000, Detailed Commissioning Specifications and Commissioning Reports. A generic Checklist is provided in **Appendix K**:

### **G Quality Surveillance at AFS**

Depending on whether the system (i) remained in normal service with no modification or component replacement (ii) was placed in a desired lay-up or shutdown state according to operating procedures (iii) was modified, the checks to be conducted would vary. While the Quality Surveillance checklists for a specific system AFS would be prepared considering the above and the specifics as applicable to the system, a generic checklist for the situation when the system was modified is given in **Appendix L**.

### **H Quality Surveillance at Unit Readiness**

Sample checklist for quality surveillance at Unit Readiness is given in **Appendix M**: Once the related processes documents are finalized, this draft sample checklist will be updated incorporating input from Refurbishment Operations.

### **J Quality Surveillance during Closeout.**

Quality Surveillance during Closeout will be mostly with respect to documents that are required and resulting from the Engineering and Field Execution processes that lead to final stage of Closeout.

Surveillance activities will be planned and carried out involving the respective functional organizations and involving the Records Management Personnel. Checklists as applicable to the context will be prepared based on the focus of surveillance. A generic sample checklist is discussed in **Appendix N**.

### Appendix F: Quality Surveillance Reporting Template

Details from Quality Surveillance are to be documented in the Oversight part of the Risk Management and Oversight (RMO) tool covering the following items and the fields available in the RMO tool.

- Date(s) on which the surveillance was performed, location,
- Identification of the QSE(s), who conducted the quality surveillance
- Description of the activity observed
- Summary of observations (Summary Report)
- Key issues: Concise statements on issues observed and findings, if any
- Station Condition Record # (if applicable)

Note: Refer to N-GUID-09701-10123, Nuclear Projects Risk Management and Oversight (RMO) Tool, and the associate document, Frequently Asked Questions and Answers.

## DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

### Appendix G: Surveillance Checklist for Detailed Engineering Design Packages (Design Completion Assurance Checks)

Date:

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Remarks / Evidence to check</u>
		Yes	No	Not Applicable	
<b><u>Master EC Package: General</u></b>					
1	Modification Design Requirement	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Prepared in accordance with N-INS-00700-10007
2	Mod Out Line (N-FORM-10958), Along with the required Forms, applicable (listed below)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Completed with the required signatures.
2 a	Design Scoping Checklist N-FORM-10959, (completed with signatures)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	As part of MEC, (updated with each released Design EC, when several DEC's are involved and released at different times.)
2 b	Document Scoping Checklist N-FORM-10521.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	(Same as above)
2 c	Prestart Health & Safety Review – N-FORM-10853. (completed with signatures)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable.
2d	Pressure Boundary Designers Checklist N-FORM-10528	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable. If it is clearly known as PB related package the use of checklist may not be required.
2 e	CNSC Approval & Notification Screening (N-FORM-10369)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable, as identified in the Design Scoping Checklist
2 f	Chemistry Design Change checklist (N-FORM-10560)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable.
2 g	Fire Protection Impact Evaluation (N-FORM-10287)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable.
2 h	Environment Impact Worksheet N-FORM-10422	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable
2 i	Reactor safety Designer's checklist N-FORM-10529	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	As applicable
2 j	Human Factor Level of Activity Determination (N-FORM-10580)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	As applicable
3	Design Plan updated with DA approval.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	In accordance with N-PROC-MP-0074, with required signatures.
4	Value Engineering Report	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	As applicable, based on accepted deviations or already completed by OPG as part of MDP Package.

## Guideline

Title:

### DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Remarks / Evidence to check</u>
		Yes	No	Not Applicable	
5	Evidence of having done COMS review (including Enhanced COMS as required)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for evidence through completed N-FORM-10007, complying with applicable requirements.
6	Deviations to COIR (to ensure these were used as required while approving the package)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable. Check with PO Files through NR Supply Chain, if required.
7	Staff Qualification Evidence. As per accepted practice such as Staff qualification matrix signed by the QA Manager with a signed covering letter stating all engineers engaged have P. Eng and have completed the training required for the respective role.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
8	Issue Tracking File updated with justifications for issues still outstanding for DEC's approved and released	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Updated with all information such as responsible person, TCDs etc. In the case of MECs with several DEC's, and being released at different times, focus on open issues related to released ECs.
9	Completed Requirement Traceability Matrix	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
10	Approval /Acceptance of MEC and DEC packages in Asset Suite by DTL and Section Manager	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	For EPC / ESMSA prepared packages, contractor's Section Manager approves and OPG Section Manager Accepts.
11	Design Completion Assurance Letter as evidence of DA Approval for every release (if done by Design Agency) Note: this is also identified under each Design EC, to make sure there was one covering that DEC.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If the design was by OPG, Design Authority Release in Asset Suite, in attribute panel. In case several releases involving different DEC's, there should be evidence for each such release covering all the DEC's approved..
12	CNSC Code Classification Approvals / Notifications/Exemption (N-FORM-11003)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	If applicable depending on the package
<b><u>Design ECs</u> – Mechanical</b>					
1	The DEC Change Paper package The whole package listing of all affected documents, (ADL) drawings, followed by each of the documents with the required Change Paper stamp by the contractor's staff and acceptance by OPG (on the cover page)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Note: The package is posted with the RDL documents and used as the authorized design package during installation. Posted in Records Module of Asset Suite. {DSGN-xxxxx. (the DEC#)}

## DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

### Appendix I: Sample Checklist to do Surveillance on Comprehensive Work Package

(Depending on the specific package, separate checklists for different part of the CWP may be used)

Date:

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Evidence to check/Observations</u>
		Yes	No	N/A	N/A – Not Applicable
1	The CWP contains all information required to execute the job. Level of details adequate to facilitate coordination and control.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	A ck check to verify if it meets the requirement of (i) What, (ii) Who, (iii) How, (iv) Why and (v) When.
2	The CWP is reviewed by Knowledgeable persons as identified in the respective COIR	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Appropriate review by knowledgeable persons as identified in the COIR.
3	Skills and qualifications required for the trades are identified	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	It should contain a record of reference to a database that documents the actual worker qualifications.
4	Detailed work instructions (DWI) provides step by step detailed instructions and for critical tasks required verification sign-off points are identified.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	DWI for critical tasks may have verification sign off points , and in some cases duplicate the verification, witness points in the ITP
5	CWP lists Construction Completion Declaration with walk-down with a detailed checklist as applicable.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
6	CWP includes Drawings, Flow diagrams, and referenced procedures	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	It is an expectation that important steps in referenced procedures are listed in the CWP
7:	CWP includes Bill of Materials, Material Requests, Material Traceability, EC reference etc	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
8	The CWP has details such as Job Safety Analysis, and Contingency Plans as applicable	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
9	CWP lists and copy of all required authorizations for permit strategy if required by the complexity and extent of work	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
10	CWP has a separate section for Pressure Boundary materials including storage and FME requirements	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
11	CWP lists Rigging and Lifting Plans	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	

## Guideline

Internal Use Only		
Document Number: <b>NK38-GUID-09701-10038</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>58 of 66</b>

Title:

### DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Evidence to check/Observations</u>
		Yes	No	N/A	N/A – Not Applicable
12	CWP lists Material Receiving, Storage and preservation as required	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
13	CWP has Measuring & Test Equipment and tooling requirements	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
14	The Inspection and Test Plan prepared as part of work execution meets applicable requirements, for Pressure Boundary (PB) as well as non-PB jobs. <i>Note: (i) Key point to note is that the ITP lists the inspections, tests, and verifications for the product or services specified in the contract, to demonstrate quality is built/requirements are met during execution.</i>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Refer to procedural documents such as N-INS-01913.11-10006, as well as ITP requirements identified in QA standards such as Z 299.0. The verification also to include if the ITP was reviewed and accepted as identified in the COIR.
	Note: (i) In case welding jobs are involved, appropriate checklist with specific checks applicable to the type of welding, and welding material/consumable control will be included. (ii) The Construction completion/work execution checklist will also include control of material during fabrication and up to installation.				

#### Note:

Detailed Quality Surveillance Checklists will be prepared based on the Inspection and Test Plans for the work execution of the specific job.

It will include checking the completion and verification of ITP activities to meet the specified criteria as well as evidence of having recorded the required details to demonstrate compliance applicable to witness and hold points.

In the case of non-modification jobs such as Maintenance Predefines, and other rehabilitation jobs, inspection and test plans referenced in the work package or the task instructions identified in the Work Order task instructions will be used.

Oversight / Surveillance elements/checks discussed in documents such as N-GUID-09701-10120, Guideline for Construction Oversight, N-GUID-01983-10004, Field Engineering Quality Control Mechanical, N-GUID-01983-10005, Field Engineering Quality Control Electrical and Control, N-INS-01983.1-100014 Field Engineering Material Control during Installation, and N-INS-09701-10007, Project Oversight Planning & Implementation will be used as appropriate to the specific work execution in the field.

## DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

### Appendix J: Sample Checklist to do Surveillance on Construction Completion

(Reference: N-GUID-09701-10021-Nuclear Refurbishment Construction Completion Declaration)

Date:

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Evidence to check/Observations</u>
		Yes	No	N/A	N/A – Not Applicable
1	The executing organization had developed the scope (boundaries and contents) of the Construction Completion Declaration (CCD) prior to executing work on a system. <i>(Also check and confirm the MOD and Non-MOD CCDs are not mixed.)</i>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Evidence of the number of CCDS and the list of applicable Comprehensive Work Packages (CWPs) etc. Note: <i>For MOD CCD the executing organization is the contractor and in the case of Non Mod CCD, the executing organization is Maintenance or the contractor to whom assigned.</i>
2	Construction Completion Declaration Walk down checklist has been completed and documented using N-FORM-11526	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Evidence of preparing the walk down by a team that includes Project Engineer (MTL) and representatives of Contractor, Operations, Maintenance, DTL, and others as required.
3	The results from the CCD Walk down (deficiencies) have been documented in N-FORM-11525, and it contains tracking mechanism for those	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	The tracking mechanism provides for tracking actions to fix deficiencies to completion. (Check evidence of having completed)
4	Executing Organization has prepared the CCD Package using N-FORM-11527	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	It is in line with guidelines discussed in N-GUID-09701-10021
5	For MOD CCDs the DTL has checked and confirmed the Field Initiated Changes (FICs) have been incorporated	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for evidence of confirming the installed changes are as per approved Design.
6	For CCDs where the Executing Organization is a Contractor the OPG MTL has confirmed that the completion of work in the field and completion of a walk down	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for evidence
7:	The System Engineer has confirmed that all CWPs and WOs defined in CCD Package are complete and available in Asset Suite or VenDM.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for evidence
8	The System Engineer has confirmed that Non Conformance Reports and Station Condition Records are complete and corrective actions	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for evidence

## Guideline

## DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

### Appendix K: Sample Checklist to do Surveillance at Commissioning

(Reference: N-INS-00960- 10000, Detailed Commissioning Specifications and Commissioning Reports)

Date:

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Evidence to check/Observations</u>
		Yes	No	N/A	N/A – Not Applicable
1	The Detailed Commissioning Specifications are prepared in sufficient detail to permit a commissioning responsible party to: (i) understand the operating parameters and requirements that must be verified (ii) understand the purpose of specified commissioning tests (iii) understand how to perform the required tests (iv) produce a commission report	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Based on observations and feedback from those doing the Commissioning.
2	The DCS document provides details in a manner that enables commissioning responsible party to execute the commissioning activities based solely on the DCS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Based on observations and feedback from those doing the Commissioning.
3	The DCS was reviewed by the responsible Design Engineer and DCS is issued in Asset Suite as a Controlled document	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for Evidence
4	The Commissioning Report (CR) generated is for each DCS at completion of commissioning to record results achieved in reference to the DCS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for Evidence. CR refers to the specific DCS. CR documents any deviations from design requirements and proposed follow-up actions to rectify deficiencies
5	CR preparer identifies deviations reported during commissioning. It includes (i) deviations such as alternate test methods employed (ii) Tested System Structure or Component (SSC) function and design parameters which do not meet design requirements (iii) SSC functional and design parameter inadequacies which impact operation of interfacing SSCs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Check follow-up actions required have been identified for items (ii) and (iii) with TCDs using Issue Tracking File
6	CR has been accepted by Design, and issued in Asset Suite.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look For evidence
<p>Note: The above is a generic surveillance checklist. Additional checks would be included as appropriate checklists identified for the specific commissioning</p>

## DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

### Appendix L: Sample Checklist to do Surveillance for System AFS

(Reference: NK38-INS-009701-10005, Nuclear Refurbishment System Available for Service)

**Note:** While the specifics of checks/verifications would depend on whether the system (i) remained in normal service with no modification or component replacement (ii) was placed in a desired lay-up or shutdown state according to operating procedures (iii) was modified, the checks to be conducted would vary, a generic checklist for the situation when the system was modified is given below.

Date:

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Evidence to check/Observations</u>
		Yes	No	N/A	N/A – Not Applicable
1	All changes made for lay-up (TCRs, TMODs) are reversed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
2	System walk-down completed by NR Operations, NR Maintenance, NR System Performance Monitoring as per N-FORM-11521.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
3	System alignment checks completed by NR Operations as identified in N-STD-OP-0014 RTS Alignment checks.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
4	System walk-down by the responsible NR System Engineer was completed (System AFS Walk-down) using N-FORM-11521.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Make sure there is evidence of having checked that the physical plant reflects the changes implemented in respective Drawings and other related documents.
5	Detailed Restart Specification (DRS) document was developed and executed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
6	Detailed Commissioning Specifications (DCS) was prepared and executed.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	As part of commissioning
7	As part of start-up, ensure parameters are within the expected range.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
8	System availability was confirmed through the AFS declaration process and SAFS declaration approved by the NR-DOM	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
9	RTS System walk-down was completed as identified in N-FORM-11521 SAFS Walk-down checklist.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Making sure operations Flow-sheet consistent with tagging in the field, field equipment, Power Supply Lists, Air Supply Lists, and Master Equipment List.
10	NR System Engineer performs Eng walk-down confirming that System Performance Monitoring Plan (PSMP) and non-SPMP walk-downs have been developed and implemented	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

## DARLINGTON REFURBISHMENT PROGRAM QUALITY SURVEILLANCE GUIDE

### Appendix N: Sample Checklist to do Surveillance for NICR/EC Closeout

(Reference: N-GUID-00700-10000)

*Note: While the specific checks for specific situation would vary based on type of MOD, a generic checklist for Closeout is given below.*

Date:

	<u>Surveillance Checks</u>	<u>Evidence Available?</u>			<u>Evidence to check/Observations</u>
		Yes	No	N/A	N/A – Not Applicable
1	All open items (Design,/NICR EC) are completed within six months of AFS or Operations Acceptance	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
2	Equipment Minor Revision information update have been launched. MTL has ensured the assignments have been accepted within 7 days	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
3	Design Change, Field Initiated Changes and minor field initiated changes are completed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	It may require the AFS or Operations Acceptance except in the case of administrative changes.
4	All action items are tracked in the system until resolution, including open items and affected document updates.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Carry out appropriate searches in the system. (MTL has reviewed Design/NICR EC open items from design, installation, commissioning, and AFS and verified they are completed.)
5	Equipment Minor revisions have been launched including equipment deletion.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Look for evidence including D078 and D030 panel.
6	Equipment abandoned in place has been labelled as required and Operations have been informed.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Make note of Power connection, pressure, and potential safety issues.
7	Newly installed equipment have the MEL record operations status set to Active	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Verify evidence in the system
8	DE has ensure spare parts were in place prior to AFS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
9	MTL has communicated the surplus parts and abandoned equipments to Supply Chain.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Make sure abandoned equipments have been labelled as appropriate.
10	DE has completed the "MEL Updated" milestone	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
11	Verify status of EC to "Modified" has been done after final AFS or final Operations acceptance.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Check all "Y" flagged ADL items have been flagged for update and all TPARs have been submitted.

## 1.0 PURPOSE

The purpose of this Quality Plan (QP) is to address the quality requirements as they relate to the Darlington Refurbishment Program (DRP) per D-PCH-09701-10000, Darlington Refurbishment Project Charter. The objective of this QP is to outline the continuous quality surveillance that will be conducted to address the quality and regulatory requirements through all of the DRP phases, provide assurance that project completion assurance is obtained and to interface with the project staff and regulator.

This QP provides a link between the Ontario Power Generation's (OPG) Nuclear Management System and the quality systems of the contractors engaged in the DRP. Figure 1 depicts the overall quality management system hierarchy as implemented in OPG.

Work performed for the DRP will be subject to additional quality surveillance to ensure requirements of the Darlington Refurbishment Program Charter (D-PCH-09701-10000) are met. See Figure 2.

The preparation, approval, issue, distribution and revision of this QP is in accordance with OPG's Nuclear Management System. This QP, referenced OPG processes and Refurbishment procedures collectively meet the applicable requirements of CSA Standards and ISO (the International Organization for Standardization).

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

## 2.0 REQUIREMENTS

### 2.1 Background

OPG senior management, with approval by the OPG Board of Directors and Shareholders tasked Nuclear Refurbishment with assessing the feasibility of refurbishing Darlington Nuclear Generating Station (DN GS) to enable operation for an additional 25 to 30 years.

Based on the conclusion that the refurbishment of DN GS is feasible and makes good business sense, OPG established contracts with a number of Contractors. Contracted activities include:

- Engineering (design and maintenance)
- Procurement
- Construction

OPG will also perform the above activities and conduct all required commissioning and return to service activities associated with the DRP.

### 2.2 Objectives

The objectives of the DRP are:

- i. Refurbish the Darlington Nuclear Generation Station to extend its operational life 25 to 30 years.
- ii. Complete preparations for the Refurbishment planned outages as follows:
  - Unit 2 - October 2016
  - Unit 3 - October 2019
  - Unit 1 - March 2021
  - Unit 4 – October 2022
- iii. Complete all Refurbishment Outages within the planned period with appropriate consideration to all aspects of the management of the facility including health, safety, environment, security, economics, quality and regulatory compliance.
- iv. Complete the DRP within the planned budget as approved by the OPG Board of Directors.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R000</b>	Page: <b>9 of 25</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

- v. Complete all Refurbishment Outages with zero lost time accidents or restricted work injuries.

DRP requirements are:

- i. Refurbishment activities will be conducted in accordance with applicable federal, provincial and OPG requirements.
- ii. All refurbishment deliverables shall meet applicable Canadian Nuclear Safety Commission (CNSC) licensing requirements.
- iii. Environmental releases will be minimized and acceptable under all normal, abnormal and accident conditions in accordance with approved requirements.
- iv. Personnel exposures will be As Low as Reasonably Achievable (ALARA) through all phases (i.e., design, construction, commissioning, available for service and unit readiness) in accordance with Radiation Protection requirements.
- v. An integrated project schedule will be developed and maintained through the entire life of the DRP to ensure project design, verification, licensing, purchasing, fabrication, installation, construction, testing, commissioning and turnover activities are completed as scheduled.
- vi. The QP will be implemented to ensure all elements of the overall DRP are carried out as required and additional surveillance is conducted on the Refurbishment work.

## 2.3 Policy

To ensure refurbishment is completed in a safe, timely, economic sound manner and to the required quality expectations, the DRP implements the Darlington Refurbishment Program Charter (D-PCH-09701-10000) to perform work in accordance with the managed systems defined in:

- OPG-POL-0033, OPG Business Model,
- N-POL-0001, Nuclear Safety Policy,
- N-CHAR-AS-0002, Nuclear Management System.

All DRP project work will be conducted under the authority of OPG consistent with the licensing basis and in accordance with the OPG Nuclear Management System.

## 2.4 Licence Requirements

Per the Darlington Nuclear Generating Station Nuclear Power Reactor Operating Licence (PROL), the licensee is required to implement and maintain a management

## Plan

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

system in accordance with Canadian Standards Association (CSA) Standard N286, Management System Requirements for Nuclear Facilities. Figure 3 provides an overview of the regulatory requirements, project governance, and project executable processes.

For each Licence Condition (LC) in the PROL, the Licence Conditions Handbook (LCH) provides mandatory compliance verification criteria that the licensee must follow to meet the conditions in the licence, operational limits and information regarding delegation of authority and applicable version of documents referenced in the licence.

N-LIST-08130-10023, CSA N286-05 to OPGN Governance Cross Matrix provides a mapping of OPG Nuclear (OPGN) governance to CSA N286-05 to demonstrate the quality program compliance.

## 2.5 Organization

### 2.5.1 Project Organization

The Darlington Refurbishment Project Organization structure is described in the DRP Charter (D-PCH-09701-10000).

### 2.5.2 Project Quality Management Organization

The Project Quality Management Organization is depicted in Figure 4. This group will perform the following:

- Develop, maintain and implement a DRP Quality Plan that ensures the quality and management system requirements for the DRP are executed and completed.
- Establish and execute a project Quality Management Organization that:
  - a. Monitors, observes and performs continuous quality surveillance on each phase of DRP as a matrixed organization.
  - b. Provides assurance through the continuous quality surveillance activities that Project Completion Assurance is obtained.
  - c. Can escalate and implement corrective actions for critical issues.
  - d. Interfaces with other DRP internal and external independent assessment activities to coordinate and optimize the required quality surveillance activities for DRP.
- Establish metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.
- Oversee management of records of changes to the units during refurbishment.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R000</b>	Page: <b>11 of 25</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

### 2.6 Personnel Capability

This work will be implemented by utilizing qualified OPG staff, contractors and subcontractors in accordance with N-TQD-901-00001, Nuclear Refurbishment Training and Qualification Description.

OPG has contracted a number of Engineering, Procurement and Construction Contractors for portions of the project scope. Consistent with OPG-POL-0033, OPG Business Model, all Contractors are on OPG's Approved Supplier's List (ASL).

### 2.7 Project Interfaces

The refurbishment project interfaces will occur between various organizations and contractors. The project shall develop a project execution plan, specific procedures, instructions, and guides, etc. to control the interfaces.

Interfaces will occur between:

- Refurbishment Project Team
- Darlington Station Organization
- OPG Nuclear Engineering
- Contractors
- Regulator (CNSC, TSSA, MOE, MOL etc.)
- Other utilities (Bruce Power, New Brunswick Power, etc.)

In accordance with the Contract Agreement, interface requirements between OPG and the Contractor are outlined in the Contractor Owner Interface Requirements (COIR). The following lists the key COIR documents associated with the DRP:

- N-COIR-00120-0001, Contractor Owner Interface Requirements for Nuclear
- NK38-DAI-09701-10008, Retube Feeder Replacement Project Contractor Owner Interface Requirements
- N-DAI-00150-10000 (Draft), Contractor/Owner Interface Requirements for Nuclear<sup>1</sup>

Any deviations to the interface agreement will be processed in accordance with OPG Nuclear Management System.

Table 1 outlines the contractors supplying services related to the DRP.

<sup>1</sup> This document was issued for bid purposes only.

## 2.8 Documentation and Data Control

### 2.8.1 Records and Documentation Control

OPG's process for management of nuclear records and documents throughout their life cycle is addressed in N-PROG-AS-0006, Records and Document Control.

The intention is to use existing OPG processes as required. Quality Records prepared by the Contractor will be provided to OPG in accordance with the Contract Agreement. Vendor technical documents will be processed according to N-PROC-MP-0078, Specification Review, Acceptance and Use of Vendor Technical Documents.

### 2.8.2 Information Management

The OPG process for management of OPG's information is addressed in OPG-PROG-0001, Information Management.

## 2.9 Business Planning

OPG-POL-0033, OPG Business Model defines how OPG operates its business. The business planning framework to ensure compliance with OPG Nuclear Management System is identified in N-PROG-AS-0005, Business Planning. This program ensures organization alignment and defines desired results in sufficient detail to support accountability, and ensures constrains, the availability of resources, and business risks are adequately addressed.

## 2.10 Communication

Communication of this plan will be implemented in accordance with the Darlington Refurbishment Program Charter (D-PCH-09701-10000).

## 2.11 Design and Development

The framework for assurance that design and procedure changes are consistent with the plant design and licensing bases is outlined in N-PROG-MP-0009, Design Management.

The process for plant modification from the engineering change request through installation, commissioning and closeout is defined in N-PROG-MP-0001, Engineering Change Control.

The Contractor will conduct design, modification, installation, support commissioning and closeout activities in accordance with the contract agreement.

## Plan

Internal Use Only

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

### 2.12 Materials Management (including identification and traceability)

For material procured by OPG to meet the DRP scope requirements, the general identification and traceability control is provided in OPG-PROG-0009, Items and Services Management.

For materials procured by the Contractor, the requirements for material identification, shipping and traceability are in accordance with the Contract Agreement.

### 2.13 Corrective Action

The process to ensure that deficiencies, nonconformance, weakness with a process, document or service or conditions that adversely impact, or may adversely impact plant operation, personnel, Nuclear safety, the environment or equipment and component reliability are promptly identified and corrected is addressed in N-PROG-RA-0003, Corrective Action.

This program also provides the process to ensure in-house and external Operating Experience (OPEX) evaluation and assessment including actions to improve plant safety and reliability. Effective self-assessment and benchmarking process are also implemented by this program to promote continuous performance improvement.

Contractors will manage corrective actions in accordance with the Contractor Agreement.

### 2.14 Monitoring and Measurement

Work plans generated from Contractors and OPG, testing requirements, regulatory interface etc. are monitored with sufficient verification and validation to meet project requirements as outlined in this plan (see Section 2.14 for additional details).

### 2.15 Independent Assessments

N-PROG-RA-0010, Independent Assessments provides the processes for performing comprehensive and critical evaluation of all activities affecting Nuclear facilities (i.e., independent assessments performed by Nuclear Oversight and Nuclear Safety Review Board). The Program is owned and implemented on behalf of the Chief Nuclear Officer (CNO) by the Assurance Organization under OPG Business Model, OPG-POL-0033.

External assessments are also performed by groups outside of OPG such as WANO, CNSC, Ministry of Labour (MOL), Ministry of Environment (MOE) etc.

### 2.16 Quality Surveillance

The Project Quality Management Organization will conduct continuous quality surveillance activities on the Refurbishment projects during the following phases (See Figure 5):

### 3.0 ROLES AND ACCOUNTABILITIES

This QP identifies the Director, Quality Manager's role and responsibilities. Further details of project team roles and responsibilities are contained in approved role documents, project execution plan and other project documents.

Contractors will manage responsibilities in accordance with their contract agreement.

#### 3.1 Director, Quality Management

- Responsible for ensuring the quality and management system requirements for the DRP are executed and completed.
- Responsible for ensuring continuous quality surveillance is performed during each phase of DRP.
- Responsible for providing assurance through the quality surveillance activities that Project Completion Assurance is obtained.
- Can escalate and implement corrective actions for critical issues.
- Responsible for the interfaces with other DRP internal and external assessment activities to coordinate and optimize the required quality surveillance activities for DRP.
- Responsible for establishing metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.
- Can direct specific quality surveillance activities to prevent incidences based on risk and OPEX.
- Oversee management of records of changes to the units during refurbishment.

### RETUBE FEEDER REPLACEMENT PROJECT CONTRACTOR/OWNER INTERFACE REQUIREMENTS

## 1.0 INTRODUCTION

### 1.1 Scope

This Interface Requirements (IR) outlines the specific responsibilities and interfaces between OPG and the SNC Lavalin-Aecon Joint Venture ("the Contractor") while performing activities in support of the Retube Feeder Replacement (RFR) Project for the Darlington Refurbishment.

### 1.2 Purpose

The purpose of the IR is to facilitate the successful implementation of the RFR Project by ensuring that Engineering, Procurement, and Construction activities are in conformance with OPG and other regulatory requirements.

### 1.3 Safety

Safety is the paramount priority when conducting any business activity in OPG Nuclear.

Safety includes Nuclear, Conventional, Environmental, and Radiological safety aspects. Our business needs to comply with all applicable Federal and Provincial regulatory requirements.

## 2.0 DESCRIPTION

### 2.1 Process

This IR is to be used for any work conducted under the RFR project.

Specific work packages including modifications, replacement and repair activities may be required to use only some portions of this document. These will be documented in a deviation list (see section 2.5), signed by OPG and the contractor. Contractor steps may not apply to all work and are illustrative to support the OPG/Contractor Interface Requirements. The items in this IR are intended to outline the interface with OPG and the Contractor, and may or may not be sequential or reflective of business processes within OPG.

A gap analysis (NK38-REP-09701-10121) was completed to determine what processes and procedures under the Contractor's quality assurance program were deemed equivalent to OPG standards and requirements. Those processes and procedures acceptable to OPG are cited in Sections 3 and 4. A summary of both OPG and SLN-A governance has been provided in section Appendix A. Sections 3 to 5 of this document details typical deliverables or items related to projects where there is an OPG/Contractor interface in the delivery of work.

### 2.2 Contractor Responsibilities

The Contractor shall have and maintain full working knowledge of OPG's Design and Configuration Management standards and procedures to ensure that design basis and plant configuration management standards are maintained throughout the project life cycle.

The Contractor has responsibility for maintaining accuracy of technical content and compliance with the Contractor's Quality Assurance Program and Project Quality Assurance Plan.

## Contractor/Owner Interface Agreement

Revision: <b>R002</b>	Page: <b>8 of 62</b>

Title:

### RETUBE FEEDER REPLACEMENT PROJECT CONTRACTOR/OWNER INTERFACE REQUIREMENTS

#### 2.2.1 Governing Procedures

All design packages will be performed in accordance with the Contractor's Quality Assurance Program, the Scope of Work which includes OPG Specification for each project, and any related Engineering Plans as defined in this IR.

All modifications will follow OPG Risk Based Modification Process N-PROC-MP-0090, with the exception of Category 1, 2, 3 and 4 Tooling engineering and Mock-ups engineering. With respect to procurement activities, in case of conflict, the provisions in Exhibit 2.11- Procurement Work, shall take precedence over the interface requirements set out in this document.

Category 1 Tooling tie-ins to the station follow N-PROC-MP-0090.

Category 1, 2 and 3 Tooling follows N-PROC-MP-0105.

Category 1, 2, 3 and 4 Tooling will follow Tooling Quality Design Plan NK38-DP-31110-10001 and are not subject to these interface requirements.

Mock-ups engineering will follow the Contractor's Quality Assurance Program and Project Quality Assurance Plan (SLN 509407-000-00D00-38QP-0001).

Tooling design will follow the requirements set out in section 4.6 of NK38-DR-31110-10000 (Contract Exhibit 1.1 (hhhhhhh) - Tooling Design Requirements).

Mock-up design will follow the requirements in Darlington Energy Complex (DEC) Mockup Scope of Work (Schedule 1.1 (oo) -Mock-Ups Scope of Work within Contract Exhibit 1.1 (www) - Mock-Ups Contract).

The Preparer, Verifier, and Approver of the Design Packages must be qualified to the Contractor's quality assurance program.

#### **OPG Enterprise Asset Management - Asset Suite 7 (Formerly PassPort)**

Asset Suite will remain as a repository for EC changes and to control modification packages as per the CNE Directive.

Population of Asset Suite will not be sequential with modification progression. Rather only relevant Asset Suite panels will be populated as needed to progress work and maintain configuration management (per N-GUID-08133-10072). The Contractor will be required to populate the relevant Asset Suite panels at the end of the following modification phases:

- At the start of **Scoping** to register Master ECs.
- At the end of **Modification Planning** to populate Master ECs, register Design ECs and flag the Associated Document List (ADL)/Associated Equipment List (AEL).
- At the end of **Design Completion** and prior to **Available for Service** to incorporate all field, and non-intent changes.
- Prior to **Closeout** to launch the AEL, and populate closeout related panels.

A scanned version of the approved Master EC Binder and/or Design Package shall be uploaded to VenDM. When the opportunity arises to populate Asset Suite, the EC packages shall be attached to the RDL of the relevant Master or Design EC.

Approval of the EC resides with the scanned copies of the packages in VenDM or Asset Suite.

Title:  
**RETUBE FEEDER REPLACEMENT PROJECT  
CONTRACTOR/OWNER INTERFACE REQUIREMENTS**

### 2.2.2 Professional Engineers of Ontario (PEO)

The Contractor shall comply with the Professional Engineers Act, R.S.O. 1990 and any applicable regulations and guidelines.

### 2.3 OPG Roles and Accountabilities

OPG shall appoint single points of contact for project related work utilizing this document.

**NOTE:** OPG does not accept accountability for the accuracy of technical content of any document produced by the Contractor, including verifications of any assumptions regarding existing condition of the equipment/system interfacing with the new modification.

OPG roles / accountabilities as defined in sections 3 to 5 of this document are defined as follows:

#### (1) Review

Review means that when stated in the Design Plan or in the approved IR document or in the agreement between OPG and Contractors, a signed copy of the specific Engineering Document will be transmitted to OPG for comments, and an acknowledgment of receipt is to be recorded by the Contractor.

An OPG review is to ensure that the deliverable satisfies the project scope & design requirements, and procedural compliance to the specified governance within this IR. OPG reserves the right to conduct a further detailed review of the deliverable if OPG feels necessary.

#### (2) Accept

Accept means that the document or deliverable is suitable for its intended use, and meets process, format and content per Section 3.0, 4.0, and 5.0 as required for its input into the OPG's Enterprise Asset Management System (Asset Suite).

#### (3) Authorize

Means to permit or allow the use of the engineering product by others.

#### (4) Support

As applicable, Support means to lend the Contractor verbal and process guidance by:

- Attending and contributing at meetings.
- Participating in discussions and providing informal undocumented comments.

#### (5) Approve

### **RETUBE FEEDER REPLACEMENT PROJECT CONTRACTOR/OWNER INTERFACE REQUIREMENTS**

- (a) Engineering Approval is conducted by the Contractor under the Contractor's QA program. Approval of engineering design documentation may require a Professional Engineer's (P. Eng) signature and seal. Such approval means taking professional design responsibility for the engineering document. P. Eng. Signature requirements are specified in N-LIST-01300-10000, Bounded Document Set.
- (b) OPG or Design Authority (DA) approval shall be performed by OPG to signify OPG's acceptance that the product(s) is prepared, reviewed, and verified by competent persons and that appropriate processes/procedures including codes and standards were applied. In addition, the approval shall ensure that the document or deliverable is suitable for its intended use, and meets process, format and content requirements as required for its input into the OPG Records Management system.
- (c) Director of Operations & Maintenance (DOM) approval signifies the deliverable has no significant impact on Plant Operations and License obligations (e.g., Safety, Environmental, Production etc.).
- (d) OPG shall be actively involved and have ownership of the development of the Modification Design Requirements and Commissioning Specifications for OPG approval.

## **2.4 Forms and Template Revisions**

It is expected the Contractor will retrieve the latest version of OPG forms, templates and procedures etc. at the beginning of each Contractor activity.

If a revision to an EC or document is required, the forms and templates originally used in preparation of the initial EC or initial document shall not need to be updated to the most current form or template revision unless required to do so by the Design Authority.

## **2.5 Deviations from the IR**

Deviations from this IR will be documented via N-FORM-11070, the Scope of Work or Applicable Master EC Package.

APPENDIX B: PROCUREMENT ASSET SUITE TEMPLATE

In addition to the following table, Contractor to also prepare/approve and submit to OPG details of evaluation of Cat Ids. These details may include but not limited to “PE Request Log Disposition” (Asset Suite Panel Q102), “PE Safety Basis Summary” (Asset Suite Panel Q120), “PE Item Equivalency Evaluation and Configuration” (Asset Suite Panel Q150). Copies of templates for these panels will be provided by OPG.

### APPENDIX C: PROCUREMENT PLAN TEMPLATE

The Procurement Plan shall be prepared and include the Owner or Contractor Specified Materials and Services procurement activities. The Procurement Plan shall be based upon the Contractor's qualified procurement program.

The plan may include, but not limited to, the following elements:

1. Executive Summary
2. Background Information
3. General Description of Product/Services
4. Technical and Regulatory Requirements
5. Historical and Future OPG Usage
6. Vendor/Marketplace Capabilities & Supply Restrictions
7. Existing OPG/Vendor Relationships
8. Bidder Prequalification
9. Competitive Tendering
10. Evaluation/Negotiation & Contract Award
11. Subcontract Management
12. Scheduling.
13. Staffing and Succession Plans
14. Source Surveillance
15. Concessions and Exceptions
16. Sourcing Strategy
17. Success Criteria
18. Risks and Mitigations
19. Commercial/Contractual Requirements
20. Contract Administration Considerations
21. Quality Assurance
22. Quality Control
23. Expediting
24. Transportation/logistics,
25. Site Receipt of Goods, Warehousing
26. Claims Resolution
27. Invoice Approval
28. Contract Closeout
29. Post Contract Considerations
30. References

CONTRACTOR/OWNER INTERFACE REQUIREMENTS**

### APPENDIX D: NON-CONFORMANCE POST-INSTALLATION REPORTING

The Contractor shall submit a notification on company letterhead endorsed by Senior Quality Management addressing the following as a minimum:

- (a) A clear description of the defect or non-conformance.
- (b) An assessment on the impact of the defect or non-conformance to the product form, fit or function. Also address the potential impact on safety if known.
- (c) Identify OPG CatID numbers(s) that are affected including OPG PO and line item numbers, ship date, quantity, manufacturer product identification / traceability (i.e. serial number, lot number, batch number, manufacturing date, etc.).
- (d) Immediate short term actions to be taken to remedy the situation at OPG (address the availability of replacement item(s) and delivery time lines).
- (e) Long term corrective action plan to address the root cause for the defect or non-conformance, including completion / implementation commitments.

Contractor to submit notification by email to: [scgs.suppliers@opg.com](mailto:scgs.suppliers@opg.com)

Title:  
**RETUBE FEEDER REPLACEMENT PROJECT  
CONTRACTOR/OWNER INTERFACE REQUIREMENTS**

### APPENDIX E : OPG APPROVED SUPPLIER LIST

(a) **Use of OPG's ASL.**

Subject to the other requirements of the Agreement, the Contractor will be able to utilize vendors on OPG's Approved Supplier List (ASL). All vendors which are active on OPG's ASL are maintained up to date and their qualification is current. OPG's ASL is maintained using OPG's QA Program.

OPG will provide to the Contractor a list of vendors qualified on OPG's ASL periodically or as requested by the Contractor. The list will contain the following information: the Asset Suite Vendor Code, Vendor name, supplier web page – when available, Quality level (QL1 or QL3), qualification result (SAT or UNSAT), detailed scope of qualification, including scope restrictions, if the vendor has Corrective Actions issued or restrictions and warnings (only Yes or No – no additional details), qualification effective date and expiry date, scope of supply – manufacturer, services, distributor, etc, Pressure Boundary (PB), non PB flag, and quality standard used. The Contractor may use the list for the sole purpose of work to be performed for OPG.

Vendors on OPG's ASL may be used by the Contractor only if the Contractor determines that the information provided is sufficient and meets the requirements of the applicable standards and the Contractor's own quality program. The Contractor is responsible to use the vendors on OPG's ASL only for the specific purpose(s) for which they have been approved on OPG's ASL. The Contractor is solely responsible for taking all necessary actions to ensure that its sub-suppliers have the technical and quality assurance capability for the scope of work they are utilized for, and the ability to provide the required product or service. This includes obtaining assurance that the sub-suppliers have an appropriate and effective quality program implemented in accordance with the Contractor's own quality program and applicable standards requirements.

The use of vendors on OPG's ASL does not preclude or limit in any way the Contractor's responsibility for and obligation to provide OPG with quality parts and services meeting all requirements under the Agreement.

(b) **Use of sub-contractors not on OPG ASL**

If the Contractor's requirement is not satisfied by vendors on the OPG's ASL, or the scope of qualification for a vendor on OPG's ASL needs to be changed, the Contractor shall submit to OPG notification to use a new sub-contractor when required as identified below:

(i) **A submittal to OPG is required for the use of sub-Contractors only when:**

The contractor acts a procurement organization as per CSA N286-05 for the purchase of items and services:

- For QL1 and QL3 items only when a quality program is specified
- For QL1 and QL3 items, when the specified quality program is for CSA Z299.3 or higher (e.g. CSA Z299.1/2/3, NCA 3800 Material Organizations)

## Contractor/Owner Interface Agreement

Internal Use Only	
Document Number: <b>NK38-DAI-09701-10008</b>	
Revision: <b>R002</b>	Page <b>62 of 62</b>

Title:  
**RETUBE FEEDER REPLACEMENT PROJECT  
CONTRACTOR/OWNER INTERFACE REQUIREMENTS**

- When a primary CSA N286-05 engineering, procurement or construction is subcontracted in its entirety

**(ii) A submittal to OPG is not required for sub-contractors:**

- When the contractor purchase materials/ components following a CSA Z299 program as part of their manufacturing process (i.e. the contractor is the manufacturer or the manufacturer of record)
- When there is no quality program specified
- When the specified quality program is CSA Z299.4 or ISO 9001
- Service suppliers (other than those primary N286-05 engineering, procurement, or construction service suppliers identified above in (i))
- Software suppliers
- Related to the Mock-up Scope of Work
- Tooling Suppliers

The Contractor shall evaluate, audit as appropriate, and approve the new supplier, according to the Contractor's own quality program. When a submittal to use a supplier is required, the Contractor shall provide the audit report, checklist, corrective action requests and certificates to OPG. The Contractor should assist OPG in providing business justification as to why OPG should accept using these potential Sub-Contractors.

When a submittal is not required, the Contractor shall maintain the audit report and checklists according to their own quality program requirements and provide it to OPG upon request.

Title:

## **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

### **1.0 PURPOSE**

The Planning and Controls Program Management Plan provides a strategic overview of the various processes and project management activities within the Planning and Controls organization. These processes, in compliance with N-STD-AS-0028 Project Management Standard, are applicable to all projects funded by the Darlington Refurbishment Program (DRP).

### **2.0 PROGRAM REQUIREMENTS**

The Project Planning and Controls Department is an integral part in preparations for the refurbishment program by establishing a solid project management and controls environment to build and support the organization. P&C established, and continues today, following industry best standards for project management to ensure that the latest strategies for effective project management are utilized.

#### **2.1 Scope**

Defining project scope is a critical step to project success as it establishes the basis for project cost, schedule, risk management, contracts, and decisions. Improved scope detail leads to improved estimate and schedule accuracy. As part of the front end planning of the Darlington Refurbishment program, the program will undergo an evolution of scope development. Scope will be presented at a fairly high level (Major Program Level Scope) during the Preliminary Planning phase of the project. During the Detailed Planning phase, the scope will evolve into Master Engineering Changes (MEC's), Design Engineering Changes (DEC's) and detailed work orders (Developmental Scope). Finally, once the work is developed at the detailed level, Refurbishment Cyclical Outage work will be controlled at the Outage Unit execution level and be managed as ongoing work management

N-MAN-00120-10001-SCOPE, Nuclear Projects Scoping Process, outlines the scope principles and requirements for Darlington Refurbishment Program (DRP). The scoping process is integrated with the project phases and gating process. The scope of work for the next project phase should be well defined compared to the scope for the balance of the project in future phases. The scoping process, particularly developing and defining the scope, is a continuous process in the project lifecycle.

#### **2.2 Schedule**

Establishing an accurate and realistic schedule is a critical planning tool for a project. The schedule is the main planning tool used to understand and communicate how a project will be executed and includes the interrelationships and dependencies among project activities and deliverables, and the status of the work. The schedule is critical to properly strategize, plan and prepare for upcoming project work, to determine

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>6 of 22</b>

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

resource requirements, to understand how work is progressing and to apply corrective actions as required.

N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management, outlines scheduling management principles and requirements for DRP which are applicable to both OPG project teams within the DRP and to contractors whom are performing work for DRP. Schedules are to be developed with inputs from all stakeholders and are monitored and updated throughout the project lifecycle. Schedule detail must be developed at an appropriate level to allow the project team to communicate the plan, monitor project progress and as an input into cost performance metrics in order to make accurate forecasts and to strategize and plan for upcoming work.

DRP uses a multi level schedule structure (L0, L1, L2 and L3) and a standardized Work Breakdown Structure in accordance with best practices. The Program Milestones for Darlington Refurbishment are identified and maintained in the Program Integrated Master Schedule (PIMS). The schedule is maintained regularly and activities are tracked to a baseline. Variances are tracked, reported and mitigating and/or recovery plans developed when required. Critical path to Breaker Open and Breaker Open to Breaker Closed are identified, monitored and reviewed for potential impacts.

The Control & Coordination schedule (CCL2) is the level of detail that integrates all program work for all units and all bundles. The work packages, (the lowest level in the WBS structure) are represented in the CCL2 schedule by at least 1 activity and tied to the level 1 milestone schedule. All activities in the CCL2 schedule are logically tied according to the sequence of work. The Darlington Nuclear Refurbishment Co-Ordination & Control Schedule guide is currently under development.

Functional Schedules are prepared in accordance to the Functional Schedule guide (currently under development).

Contractors prepare schedules in accordance with N-MAN-00120-10001-SCH-09, Nuclear Projects Scheduling Requirements from EPC Contractors. Level 3 schedules are integrated and aligned to CCL2 and the PIMS. Vendors will self perform their schedule updates and maintenance with oversight from the OPG Master Scheduler.

The integrated Level 3 Schedule provides further breakdown of the work below the work package level and shows all interfaces and shared resources between contractors and OPG. All activities in the level 3 schedules are logically tied according to the sequence of work and summarized to the CCL2 activity level.

Milestones are baselined in accordance with N-MAN-00120-10001-SCH-06, Nuclear Refurbishment Milestone Definition Framework. The Milestones are grouped by tiers based on the authority to approve changes.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>7 of 22</b>	

Title:

## **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

### **2.2.1 Schedule Update and Monitoring**

On a regular basis according to the reporting cycle plan, all Level 3 Schedules shall be updated by the person or group who is performing the work (i.e. contractors or OPG). As a product of these updates, schedule progress at the Work Package level for all scheduled work is translated into the cost management system for the purposes of calculating earned value.

The progress data is verified and reviewed by OPG. Once reviewed, a variance analysis is produced to provide reasons for any schedule slippages and to determine necessary corrective action/recovery plans when needed. A critical path analysis is also produced using level 3 schedule details.

On a regular basis, according to the reporting cycle plan, all CCL2 schedules are updated by OPG based on contractor's level 3 schedules and an overall program critical path is produced.

### **2.2.2 Schedule and Cost Integration**

The Work Package is the lowest level of the WBS that integrates cost and schedule. Once the schedule updates are progressed and statused by work package, the physical percent complete, actual start, actual finish, forecast start and forecast finish is prepared and integrated into the cost system used for earned value calculation (Proliance) in accordance with N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management.

### **2.2.3 Schedule Reporting**

When the monthly updating cycle is complete, all schedules /layouts are posted in SharePoint and accessed by all OPG staff through the Scheduling Link. Reporting requirements will be established based on the phase of the Program and the nature of the work being performed by the vendor.

## **2.3 Cost Management**

Cost management includes the processes required for planning, managing, recording, and controlling costs at the program and project/function levels within approved budgets.

The Program's cost management process is defined in N-MAN-00120-10001-PC, Project Controls, with detailed guidance established below the manual level in the areas of cost management, change control, and forecasting.

Program level budgets are established via Program Releases. Funding for the current release period is allocated directly to functional groups (both DRP and Centre-led) upon release approval. Project funding is allocated from the program via the Gated Process and the Gate Review Board in accordance with N-MAN-00120-10001-GRB, Nuclear Projects Gated Process.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>8 of 22</b>

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

Estimated funding requirements for the program life cycle beyond the current release are documented as unreleased funds at the project and functional levels.

Program releases will also establish program level Contingency and Management Reserve funding. The program strategies for managing Contingency and Management Reserve are detailed in Sections 2.4 and 2.5 of this document. Release of Contingency and Management Reserve funding is controlled via the change control process as described in sections 2.3.3.

The program has established and will maintain a systematic and hierarchical Cost Breakdown Structure (CBS) that identifies all the Control Accounts used by the Program. The CBS mirrors the Program Work Breakdown Structure (WBS) and includes cost only elements not contained in the WBS (e.g. Contingency, Interest). Each Control Account contains one or more Work Packages (WP). Budgets for all work are established at the WP level and associated actual costs are collected at the WP level to support cost performance monitoring.

The program life cycle funding, budgets, forecasts and incurred costs are recorded, tracked, and managed within the Proliance cost management tool.

### **2.3.1 Earned Value Management**

Earned Value Management methodology, as defined in N-MAN-00120-1000-SCH-07, Nuclear Refurbishment Earned Value Management is utilized as the primary architecture for cost management. Planned Value (PV) is established at the Work Package level, recorded as a dollar value in Proliance, and rigorously controlled via the Change Management practices as outlined in Section 2.3.3. Earned Value (EV) is derived via schedule progress and recorded as a dollar value in Proliance. Actual Cost (AC) is exported from the financial ledger (NFRA) to Proliance at the Work Package level.

Standard earning rules are defined for all phases of work (Engineering, Procurement and Construction) and shall be rolled out to each contractor before baselining the Level 3 schedule.

### **2.3.2 Estimating**

Cost estimating is the process of determining the expected total cost of labour, materials, equipment, professional fees, and other resources required for the execution of a project. Detailed guidance on estimating for Darlington Refurbishment is provided in N-MAN-00120-10001-EST, Nuclear Projects Cost Estimating.

Project cost estimates for Engineer/Procure/Construct scopes of work are prepared internally to support the following processes:

- EPC contract Request for Proposal (RFP) and bid evaluation
- Program life cycle and release planning

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0002</b>		Revision Number: <b>R001</b>		Page: <b>9 of 22</b>	

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

In addition, once EPC vendor contracts are in place, internal estimating expertise is utilized to:

- Review vendor Estimate Plans
- Provide independent review and validation of vendor Class 4/3/2/1 estimates supplied to OPG as projects progress from definition through execution phases

### **2.3.3 Change Management**

Change Management is the Project Management tool used to identify and record the effect of changes to the *baseline* and impacts on scope of work, costs, and schedules in DRP. This helps to maintain the integrity of the project *baseline* and manage *funding* requirements.

In accordance with N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management, the **Project Infrastructure Master Schedule (PIMS)** establishes the cost and performance *baseline* for managing DRP Projects. Manual N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management provides the principles to be followed in establishing cost and schedule change control for DRP projects as they are developed.

Cost and schedule alignment is maintained via the change control process outlined in N-MAN-00120-10001-PC-01, Nuclear Refurbishment Cost and Schedule Change Control.

Changes are rigorously identified, categorized, and recorded in the Proliance cost management tool in order to effectively maintain project and program baselines and track cost performance against approved plans and budgets.

### **2.3.4 Performance Measurement**

Cost performance is measured using standard industry metrics at the program, project, and functional levels. Utilizing the Earned Value data structure, the following standard metrics are calculated from the Proliance cost management tool and reported via the Business Intelligence (BI) reporting tool:

- **Schedule Performance Index (SPI):** SPI is a measure of progress achieved compared to planned progress (EV/PV).
- **Cost Performance Index (CPI):** CPI is a measure of the value of work completed compared to actual cost incurred (EV/AC).
- **Cost Variance:** The difference between the budgeted value of work performed and the actual cost of that work. (AC - EV).
- **Budget Variance:** The difference between the budgeted value of work planned and the actual cost of work performed. (AC - PV).

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>10 of 22</b>	

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

Cost performance is monitored for various program periods, including life-to-date (LTD), life cycle, current gate, and annual release. Standard BI reports are produced at the program and project levels for these periods.

SPI, CPI, and variance metrics are all past-performance oriented. The program also utilizes forecasts at the program and project levels against approved life cycle estimates in order to proactively assess future success and take early corrective action where required.

## 2.4 Risk

N-MAN-00120-10001-RISK, Nuclear Projects Risk Management Process, provides direction on risk management; ensuring risks are identified, assessed, analyzed for risk response, and monitored to a robust and consistent standard to ensure that project objectives are achieved.

Risk management provides projects with forward-looking actions and metrics to reduce the likelihood and minimize the impact of undesirable events during the project life cycle. The goal of risk management is to remove obstacles to project success before they occur in order to minimize their consequential effect on project costs, schedule, quality, and safety targets.

Proactive risk management is used to understand the characteristics of the risk, how to manage them, and plan for *contingency* based on the *residual risks*. As such, risk management can have a significant impact on the financial health of the project.

N-MAN-00120-10001-RISK-04, Nuclear Refurbishment Risk Management, provides guidance on how to use the risk register to identify, update and close risks in the program and project risk registers. It also defines the Darlington Refurbishment risk assessment criteria and scales, risk assessment heat map and minimum risk review frequency. It sets the expectations for preparing Project Risk Management Plans (RMP) by contractors and refurbishment projects. Risks that only apply to the contractor are the responsibility of the contractor to manage. Oversight is provided by OPG to ensure an effective RMP is in place.

### 2.4.1 Risk Register Administration

- (a) Program RADAR, the DRP program risk register, is managed by the Risk Section, P&C. It contains risks that apply to the entire DRP program and risks that are related to the DRP Functions, e.g. Planning and Control, Supply Chain, etc.
- (b) Project RADAR, the DRP project risk register, is managed by each individual bundle in Project Execution. It contains risks that apply to project work within a bundle, e.g. Balance of Plant, Fuel Handling, etc.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0002</b>		Revision Number: <b>R001</b>		Page: <b>11 of 22</b>	

Title:

## **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

### 2.4.2 Risk Reporting

(a) As part of the monthly reporting cycle, risks are reported in:

- Top Risks from each Bundle and Function in the Monthly Quad Charts
- Key DRP Program Risks

**Note:** For each risk being reported on quad charts or program risk reports, the following information should be communicated:

- Risk ID
- Risk Title
- Risk Description
- Risk Response Strategy and Status
- Current Risk Score
- Post-Risk Response Risk Score
- Target Completion Date of reaching Post-Risk Response Risk Score

(b) The following reports are communicated to senior management:

- Top DRP Risks reported quarterly in the Nuclear Oversight Committee (NOC) and Executive Advisory Committee (EAC) reports.
- Key Program risks are reported to ERM using the BURSA template. See OPG-PROC-0094, Enterprise Risk Management Report.
- Risks that are jointly being addressed by the Darlington Station and DRP are presented and discussed on a quarterly basis at the Darlington & Darlington Refurbishment Common Risk Challenge Meeting.

### 2.5 Contingency

N-MAN-00120-10001-RISK-05, Nuclear Refurbishment Contingency, Development and Management, provides direction for contingent funds development. For the purposes of contingency determination, projects utilize quantitative analysis based on their identified risks.

Contingency development is an integral part of estimating, scheduling and risk management processes. Contingent funds to address uncertainties in a project should be proportionate to the project size, duration and complexity, risk exposure and tolerance, organization's prior experience with the work, and confidence levels set by management. At DRP, there are two main classifications of contingent funds to address different types of uncertainties – contingency and management reserve.

Contingency at DRP is further sub-divided into Project Contingency and Program Contingency to address uncertainties in project bundles and functional groups, respectively. It is not intended for changes in scope or extraordinary major social or natural events such as war, strikes, flood and earthquakes, which are addressed by Management Reserve.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>12 of 22</b>	

Title:

## **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

### **2.6 OPEX**

Darlington Refurbishment Operating Experience (OPEX) will be managed in accordance with OPG Nuclear N-PROC-RA-0035, Operating Experience Process. This identifies, evaluates, and takes action based on internal and external industry lessons learned in order to improve project and plant safety, reliability and performance.

In addition, N-MAN-00120-10001-RISK-06, Nuclear Refurbishment Processing Operating Experience, and Key Lesson Learned, provides guidance on the process to integrate relevant Project and Contract Management OPEX and Key Lessons Learned into the planning and execution phases of the Darlington Refurbishment program.

This will enable the NR program to use the above lessons learned information to improve project planning and execution phases, their processes, procedures, training, and system/equipment design to the fullest.

DRP OPEX SPOC creates specific communication to various stakeholders in the organization monthly and also maintains DRP OPEX events list located on the DRP SharePoint team site for all employees to use.

### **2.7 Documentation and Project Closure**

Records, documents and data collectively form the memory of the Darlington Refurbishment Program. They constitute the business and intellectual assets of critical importance, and must be managed to meet both regulatory and business requirements.

Documents shall be managed throughout their life cycle e.g. project planning, execution and program closure in accordance with N-PROG-AS-0006, Records and Document Control.

In addition to the standards and procedures described in N-PROG-AS-0006, Nuclear Refurbishment has developed electronic document control processes in conjunction with the implementation of an Electronic Document Management System (EDMS). N-MAN-00120-10001-RDM, Nuclear Project Records and Document Management, provides the direction related to electronic management of information.

Scope ID represents the contracting strategy, identifying the relationship with the DSR line items and the scope of work to maintain integrity and traceability of the data (Project Control data structure map is in Appendix B).

#### **2.7.1.1 Document Creation**

Requirements for creating, reviewing, approving and issuing Darlington Refurbishment process support controlled documents will be documented in NK38-NR-MAN-09701-

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0002</b>		Revision Number: <b>R001</b>		Page: <b>13 of 22</b>	

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

10001, Darlington Refurbishment – Requirements for Process Support Controlled Documents (pending issuance).

Process support controlled documents are those documents which support the definition or implementation of a process (e.g. Program Management Plans, Manuals, Guides, Instructions and refurbishment-specific technical documents/procedures developed under N-PROC-AS-0028).

#### **2.7.1.2 Filing and Retention of DRP Records**

All records generated as a result of executing work under the DRP Program, must have a documented plan for filing and retention. It is the responsibility of the process owner to confirm the filing and retention requirements. These requirements are documented in a "Records Table" (see sample below), which must be included in the applicable process support document.

Record Created	Associated Form Number	QA Record? Y/N	Filing Information/Retention (PassPort Type/Sub-Type)
Program Risk Identification Form	N-FORM-11306	N	File locally by department.

#### **2.7.1.3 Submission**

All Supplier documentation deliverables must be submitted electronically to OPG using EDMS. Exceptions apply when the format of the deliverable does not support electronic submission. EDMS has replaced the Supplier Document Hub, which will be phased out in early 2014.

#### **2.7.1.4 Review and Acceptance or Approval**

Submittals are routed electronically within EDMS for review. Reviews will be conducted by the appropriate stakeholders in accordance with the Gate Review Process described in N-MAN-00120-10001-GRB. Review comments are stored within EDMS, and returned to the submitter within contractually agreed due dates. OPG Records and Document Management (RDM) staff workflow, track, and report on processing dates.

Documents are routed electronically for acceptance or approval (with some exceptions). Once accepted, a document becomes an official project record at which time it is processed by RDM staff into an Approved Information Management System (e.g. Asset-suite).

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>14 of 22</b>	

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

DRP employs SharePoint team sites for collaboration and storage of OPG internal project documentation and non QA records.

#### **2.7.1.5 Communicating OPG Requirements to Suppliers**

Project Managers are accountable to prepare and issue a formal Communication Protocol document to successful Suppliers immediately after contract award. The Communication Protocol document provides direction on how project correspondence and documentation deliverables are managed, and points to the process support documents and tools that the Supplier must reference in order to be compliant.

#### **2.8 Project Management Logs**

Actions, Issues, Decisions, and Key Assumptions (AIDA) of Darlington Refurbishment will be managed in accordance with N-STD-AS-0028, Project Management Standard.

AIDA is a data base, a repository for Actions, key issues, decisions and assumptions for Darlington Refurbishment Program that will be managed throughout the project lifecycle. The purpose of documenting Actions, Issues, Decisions, and Key Assumptions is to ensure that they are relevant to Darlington Refurbishment and are widely accessible by staff and to maintain an auditable trail for review, reference and monitoring.

N-MAN-00120-10001-Risk 07, Nuclear Refurbishment Actions, Issues, Decisions and Key Assumptions Management, provides guidance on how to document, review, approve and manage Actions Issues, Decisions, and Key Assumptions (AIDA) associated with Darlington Refurbishment.

#### **2.9 Reporting**

##### **2.9.1 Reporting Approach**

Timely and effective reporting supports the successful execution of the Darlington Refurbishment Program. Specifically, reporting will support management decision processes, measure progress against established business objectives, and flag any performance gaps that require management attention.

Further guidance on cost reporting is provided in N-MAN-00120-10001-PC-13, Nuclear Refurbishment Cost Management and Reporting. The overall approach to Program reporting will be defined in a new guide for Darlington Refurbishment Metrics and Reporting Projects Controls (to be developed).

Reporting will follow the same principles for all phases of the program, though the specific metrics and reports may vary to align to the business needs of each phase.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>15 of 22</b>	

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

A comprehensive, tiered metrics infrastructure has been established and will be maintained at program, project, and functional levels to measure progress in the areas of:

- Environment, Health, and Safety
- Scope
- Schedule
- Cost
- Quality

The program has established a repository within the DRP Data Warehouse for metrics and reporting data. Microsoft Business Intelligence (BI) is being used as the program report generation engine to the extent possible.

#### **2.9.2 Standard Reports**

A set of standard reports are produced for communicating program and project level performance to suit various stakeholder needs. Generally, these reports are differentiated by the intended audience, level of detail required, and the metrics reported. Standard reports include the following:

- (a) Board Update is a high level program status report prepared for the Ontario Power Generation (OPG) Board of Directors (BOD).
- (b) Periodic program level performance reports are prepared for senior OPG management audiences (e.g. Nuclear Oversight Committee, Nuclear Executive Committee).
- (c) Major Darlington Refurbishment milestones and performance targets are included in corporate, Nuclear, Nuclear Projects, and Darlington Refurbishment level Report Cards produced on a monthly basis by the corporate Finance function.
- (d) Program Status Report is prepared monthly for senior Darlington Refurbishment management. This report summarizes safety, schedule, cost, and quality performance at the program level.
- (e) Project and Function level Quad Charts are prepared monthly. These reports summarize safety, schedule, cost, and quality performance.
- (f) Functional Reports are quad charts that highlight the status of major functional organizations supporting the program (e.g., Planning and Controls, Engineering etc).
- (g) The Controllership Financial & Oversight Report is produced monthly by nuclear finance. This report is a comparison of actual and forecast costs against the approved Business Plan.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R001</b>	Page: <b>16 of 22</b>	

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

- (h) Standard monthly Earned Value performance reports at all levels from the program down to Work Packages are produced by the BI reporting tool for use by line managers to support ongoing monitoring and control of work programs and projects.
- (i) Joint OPG/Vendor scorecards are produced for all major refurbishment contracts. These scorecards assess performance against the terms and conditions of the contracts.

## **2.10 IT Tools and Applications**

For a large project such as Darlington Refurbishment, maintaining and managing project data and Project Information Technology (IT) tools is very important throughout the life of the project. Critical project databases should be in Chief Information Office (CIO) supported data repositories. The purchasing and maintaining of IT tools must involve the CIO. Appendix C displays the IT tools and their interactions.

The demands, priority and business requirements for IT projects and base services and associated benefits of such services are identified by Darlington Refurbishment. For Line of Business (LOB) funded projects, DRP will approve the business case and release funds before CIO undertakes project work. For the CIO funded projects, CIO will approve the business case and release funds after obtaining concurrence of project sponsor. CIO will document the business case in both cases.

In support of Darlington Refurbishment, the CIO will:

- Prepare an annual demand plan for new projects and base service changes for incorporation into the CIO and DRP business plans.
- Develop and maintain longer term systems strategy and roadmap with collaboration and participation from all levels of Nuclear Projects.
- Execute new projects and base services within the agreed scope, schedule and cost while adhering to the established IT Standards/Strategy, IT Business Plan, IT Project Delivery Framework and OPG investment guidelines.
- Establish technology standards and select vendor and technology for specific projects. DRP will provide input into technology standards and vendor/technology selection decisions. CIO will demonstrate that its decision is the most optimal for OPG.

DRP will provide input into the service levels and quality metrics for the base services. Service levels will be jointly developed and agreed upon with regular reviews and adjustments to meet the evolving needs of business and IT.

## Plan

Title:

### **DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN**

## **3.0 ROLES AND ACCOUNTABILITIES**

### **3.1 Director, Planning and Controls, DRP**

Ensures that effective managed systems are in place for the planning, execution, monitoring, and reporting of scope, schedule, cost, risk, Operating Experience, Gated Process and records management.

Accountable for the provision of accurate, timely performance reports to senior OPG management and stakeholders.

Is the owner of this document and is accountable for its definition, implementation and continual improvement.

### **3.2 Manager, Project Reporting, DRP**

Establish the processes, instructions, and tools necessary to execute cost management, cost estimation, and the Gated Process.

Provide expert support to Darlington Refurbishment client groups in the execution of cost management, cost estimation, and the Gated Process.

### **3.3 Manager Project Infrastructure, DRP**

Establish the processes, instructions, and tools necessary to execute risk and contingency management and operating experience.

Provide expert support to Darlington Refurbishment client groups in the execution of risk and contingency management and operating experience.

### **3.4 Manager Project Scheduling, DRP**

Establish the processes, instructions, and tools necessary to execute schedule management.

Provide expert support to Darlington Refurbishment client groups in the execution of schedule management.

### **3.5 DRP Directors and Managers**

Prepare, monitor, and control function/project budgets and ensure costs are appropriately charged to the right budget item.

Provide inputs to scope, schedule, cost, risk, and Operating Experience systems to support effective monitoring, reporting, and control to meet program objectives.

Review performance reports and take corrective action in accordance with established thresholds and business goals.

Title:

**DARLINGTON REFURBISHMENT PLANNING AND CONTROLS PROGRAM  
MANAGEMENT PLAN**

#### 4.0 DEFINITIONS & ACRONYMS

**Actual Costs (AC)** is the realized costs incurred for the work performed during a specified time period.

**Budget Variance (BV)** is the difference at a given point in time between the Actual Costs (AC) and Planned Value (PV) (i.e.  $BV = AC - PV$ ).

**Cost Performance Index (CPI)** is a measure of the cost efficiency of budgeted resources expressed as the ratio of Earned Value (EV) to Actual Cost (AC).

**Cost Variance (CV)** is the difference at a given point in time between the Actual Costs (AC) and Earned Value (EV) (i.e.  $CV = AC - EV$ ).

**Earned Value (EV)** is the measure of work performed expressed in terms of the budget authorized for that work.

**Forecast** is the project team's estimate of the most likely outcome for a given element of the project (e.g. cost forecast, schedule forecast etc.).

**Planned Value (PV)** is the authorized budget assigned to scheduled work.

**Schedule Performance Index (SPI)** is a measure of schedule efficiency expressed as the ratio of Earned Value (EV) to Planned Value (PV).

**Work Breakdown Structure (WBS)** is the hierarchical decomposition of the work to be carried out to accomplish the objectives and create the required deliverables. It is a tool used to define and group a project's discrete work elements (or tasks) in a way that helps organize and define the total work scope of the project.

**Work Package (WP)** is the work defined at the lowest level of the Work Breakdown Structure (WBS) for which cost and duration can be estimated and managed.

Title: <b>RQE CONTINGENCY DEVELOPMENT REPORT</b>		

## 1.0 INTRODUCTION

RQE Contingency Development Plan, NK38-PLAN-09701-10006 was prepared and approved in Q1 2015, establishing the approach for developing the RQE contingency estimate and describing the associated contingency development principles and processes.

This report documents the activities and results of the RQE contingency development process, the validation processes undertaken and the summarized outputs of the exercise. Further, this report documents the contingency development objectives, governance, procedures, activities and tools applied, including guiding check sheets, questionnaires, tools, models, and results of a series of focussed workshops that lead to defining the inputs used in the first view of the integrated RQE estimate, as provided in RQE "Total Cost Estimate Milestone Snapshot #3" milestone achieved in October 2015. The intent with respect to the RQE contingency estimate is that the final total reserves estimate (contingency + management reserves) will be subject to refinement after undergoing final executive reviews and will reside in the Master Consolidated File (MCF) and board submission materials. This MCF document will be filed for archiving purposes and shall be accessible to alongside the comprehensive RQE support documentation.

## 2.0 OVERVIEW & BACKGROUND

### 2.1 Objectives

The objective of this report is to describe the activities, actions, and challenges performed by the Risk Management organization and the broader Refurbishment organization, including Nuclear Projects Executive Team (NPET) and the Executive Leadership Team (ELT) to meet the requirements of the risk management process from qualitative and quantitative standpoint during development of RQE contingency estimate and ultimately converge on a high confidence and prudentially assessed total reserves estimate for RQE.

### Title:

**RQE CONTINGENCY DEVELOPMENT REPORT**

## 2.2 Background

RQE is the equivalent of the Class III estimate for the 4-unit refurbishment of Darlington Nuclear Generating Station. A robust contingency development process and modelling exercise was undertaken to ensure a high confidence risk and uncertainty based contingency value was prepared as it comprises a major component of the program estimate. The RQE Contingency Development Plan was issued with the expectations regarding the process, timeline, and input quality/requirements to achieve a robust and high confidence contingency estimate. This document was used as the basis for engagement with project/function teams for the challenge workshops.

Risk group members were tasked to follow up and enforce the implementation of the plan including the risk management manual, use of RMO, population of the contingency template, and proper risk qualification and quantification practices throughout. Overall engagement of multiple tiers of oversight groups such as; Ministry of Energy oversight (MODUS), Board of Directors oversight, Enterprise Risk Management, NPET, and NR Program/Functional directors supported the Contingency Development Plan and approved the outcome of the exercise as it related to their scope of work.

In February 2015, Palisade (proprietor of the @RISK Monte Carlo simulation engine) was retained to support a three phase approach to RQE contingency development. A senior consultant was engaged to a multi-phase on site model review and optimization effort. The objective of engagement of palisade was to ensure the model used in the development of the RQE contingency estimate exceeded industry best practice and rigor, and that the outputs of the model are validated and free from user error that may impact the end results. Palisade submitted a Phase one report that reviewed the model run for Release 4D and provided a set of optimizations that were fully incorporated to the RQE model. In June 2015, the RQE Contingency Development Plan was finalized and published and communicated as per the RQE roadmap dates, incorporating a number of process and tool refinements. Upon sufficient maturation of the base estimates for RQE for all bundles of functions, the risk management team developed contingency input templates for the project and functional teams to populate and established a series of challenge workshops to ensure reviewed and balanced inputs were included in the RQE contingency model. The input templates focused on developing 3 point estimates (optimistic, realistic, and pessimistic) for all possible variables associated with discrete risks and cost and schedule uncertainties.

Title: <b>RQE CONTINGENCY DEVELOPMENT REPORT</b>		

**RQE Contingency Model development**

Palisade senior consultants were engaged to ensure robustness and use of industry best practice to the RQE Contingency development process and modeling as per the OPG RQE Contingency Model Scope of Work to Palisade (Ref AAA) and OPG NR Contingency Calculation Initial Finding (Ref BBB). Initially onsite February 2015, Palisade implemented a 3 phase model review and update to the Monte Carlo tools used for RQE contingency analysis. The phases of implementation are outlined below:

- a) **Phase 1:** Initial on site review of the NR Release 4D model was completed in Feb 2015, and a report was provided to OPG for evaluation and further implementation, per OPG NR Contingency Calculation Initial Findings Report (Ref BBB). This report included a matrix of recommended optimizations to be applied to the RQE model.
- b) **Phase 2:** Implementation of RQE model recommendations, including integrates schedule risk and uncertainty analysis, consideration of risk reoccurrence on multiple units, and extensive usage of 3 point estimates – Jul 2015. Refer to Detailed Palisade Agenda (Ref CCC), and Disposition of Palisade Recommendation Implementation (Ref DDD)
- c) **Phase 3:** Final implementation and model run, including enhancement to a fully integrated risk model for 4 units, cost uncertainty and discrete risk contingency development and analysis for management decision making to support RQE. Throughout Phase 3 Palisade conducted periodic reviews and model adjustments through remote support – August/September 2015. Weekly Go-to meetings were set up, The FTP site for file sharing was set up, and along with the regular email correspondence with the senior consultant.

The key advancements in the RQE Contingency model in comparison to the modelling exercise used in previous releases include (not limited to):

1. Identification of unit specific risk impacts, efficiency gains, etc.
2. Maximum application of 3 point estimating including ranges of probability, burn rates, risk recurrence, etc.
3. Integration of program schedule with program risks and execution window uncertainties.

Title: <b>RQE CONTINGENCY DEVELOPMENT REPORT</b>		

4. Robust and comprehensive reports sets (including contingency breakdown reports) to allow for clear and focused analysis of the outputs.

### **3.0 RQE CONTINGENCY DEVELOPMENT – IMPLEMENTATION DETAILS OF THE DEVELOPMENT PLAN**

#### **3.1 Preliminary Process Activities (Getting the Organization Ready)**

All Risk Register items for the projects and functional groups were uploaded into an expanded RQE template spreadsheet, from the RMO tool and populated with the latest discrete risk and cost uncertainty information provided by projects at their Gate 3 meetings where available. The templates were placed in SharePoint and the link provided to the teams for collaboration, review and update for any deltas in the required RQE contingency development analysis data.

In parallel to the activities to obtain the detailed 3 point estimates for cost uncertainty and discrete risks from the broader NR organization, a number of other contingency input streams were pursued based on the requirements defined by the RQE contingency breakdown structure outlined in the RQE Contingency Development Plan, as follows:

- a) Ryan Smith, Dennis Curley and Derek McAuley led the effort to develop the integrated assessment criteria and initial input data for schedule uncertainty aspects of the integrated model. This was subsequently reviewed by Gary Rose, Roy Brown, Mike Allen, and others to ensure appropriate schedule risks and uncertainty was being applied and that it meshed with the progression of critical program aspects, such as RFR R1 Class 2 submission.
- b) July 10<sup>th</sup>, Ryan Smith requested from Risk Oversight Committee members, the NPET, and external oversight support members a listing of high impact low probability risks (aka black swans) for consideration in the model/management reserves. Feedback was received and elaborated on eventually landing not as contingency contributors but rather a management reserve considerations.
- c) Ryan Smith, Lisa Ren in concert with the PMs and P&C Lead prepared contingency adequacy reviews with the Campus Plan projects to support

## RQE CONTINGENCY DEVELOPMENT REPORT

forecasting exercises at the end of June and worked with the P&C Lead to obtain the contingency forecasts for F&IP/SIO projects (having largely “sunk” costs and a very dynamic execution environment required a more deterministic approach with estimates provided by P&M project directors).

- d) Ryan Smith and Steve Wiacek validated the BCS defined insurance uncertainty aspects with feedback from the corporate treasury of the integrated model and ensured these were incorporated into consolidated template. 3 point estimates were obtained and integrated to the model.

These contingency templates were subjected to a rigorous screening and challenge process with a panel of SMEs. Basis for the three point estimates were challenged and actions were taken to correct or clarify the risk content. The objective for these challenge meetings with the project teams (before final submission of their risk registers and 3pt estimates) was communicating that they were in “safe zones” where the Manager of Infrastructure and Risk, and some peer SPOCs from the project team could challenge and calibrate project and functional groups on their risks, conservatism, and bias before it gets to Executive Review for the final contingency calculation.

In conjunction, the latest schedule data was pulled for a systematic and risk based review of programmatic critical path activities as described in section 3.3. This review was performed “off-line” from the workshops described in section 3.2 to ensure the right focus was given by the organization to the right contingency estimate aspects.

### 3.2 Cost Uncertainty and Discrete Risk – Challenge Session Workshops

As per the time line found in Appendix B of this document, NR Risk and Infrastructure set up a series of challenge and review workshops, starting with Functions and continuing with Projects to review risk based contingency items and cost uncertainty elements for an integrated assessment of overall contingency values. The RQE contingency development template, used in association with these challenge workshops, was updated with the assistance of Palisade to include the expanded and comprehensive 3 point estimate approximations required for RQE contingency calculations as defined in Section 3.0 of this document.

### Title:

**RQE CONTINGENCY DEVELOPMENT REPORT**

The checklist attached to the RQE Contingency Development Plan defined the quality review criteria which were utilized to assess the contingency development process inputs, which were distributed in advance of the workshop. These checklists were not mandatory to complete the workshop process but were provided to the teams as guidelines and expectations for what lead in considerations should be made prior to the workshops. Projects and Functions were asked to come to the workshops with any opportunities identified the same way in the table (tagged as opportunity instead of risk which of course would be the bulk majority of line items for review). There were limited opportunities identified by the project or functional teams. Most identified that all cost and schedule optimizations/opportunities were already incorporated in the development of their base estimates and as such there were none reasonably foreseen that could be further applied to the RQE contingency development process.

The 3 point estimates for cost uncertainty was to be provided by the project team by Project # and PEPCCC (Project Management-Engineering-Procurement-Construction-Commissioning-Closeout) element and not bundle. Cost estimate PEPCCC was to be considered for cost to go only, and excluded LTD costs as they are already sunk and certain to ensure an appropriate representation of forward looking for contingency could be estimated. A comment and basis column was added at the end of each table to provide rationales and explanatory details regarding 3 point analysis. In most cases this was prepared in advance of the workshop and completed/adjusted after the workshop. In preparation for each workshop, Projects and Functions were asked to ensure the following was completed prior to the meeting:

Information provided in RQE contingency development template has been;

- Reviewed by their team and relevant stakeholders to ensure the gate 3 data is correct,
- Trued up to the latest project status,
- Completed with all additional RQE delta information and rationale comments

A quality check of the of each bundle and function's contingency information was conducted by using the following RQE Contingency Development Checklist. (REF EEE) The checklist was a guideline to try to extract the highest quality risk and uncertainty inputs prior to the workshops to avoid obvious errors or improper

inclusions. A consistent agenda (or “script”) was development by the challenge panel and reviewed in the workshop to provide a standardized and consistent approach for executing the challenge meetings. The agenda was circulated to the project and functional managers in advance to give them a sense of the focus areas of the challenge meetings. See RQE Contingency Development Agenda (Ref HHH). RQE Contingency Development Template, for Cost Uncertainty (Ref FFF) and RQE Contingency Development Template for Discrete Risk (Ref GGG).

The team leads were asked to validate their submissions with their P&C Leads and Project/Functional directors prior to the workshop meeting. The reviews were conducted with a challenge panel which attended all meetings to coach and review the templates line by line with the project teams.

RQE Risk Contingency Development Workshops included involvement from;

- Risk consultant Shoshanna Fraizinger

The Risk Management Team members

- Ryan Smith, Manager
- Lisa Ren, Section Manger
- Donna Flewell – Process Specialist
- Mirela Courtney – Process Specialist
- James Wu – Process Specialist
- Atef Soliman Cost & Schedule Analyst
- Cost Estimates inputs provided by Mirela Courtney – Process Specialist

Challenge Panel comprised of;

- Dennis Curley, Outage Manager
- Steve Wiacek, Finance Controller

- Andy Elliott, NR PMO Manager
- Jim Carter and/or Carrie Okizaki Modus
- Norton Thomas, Enterprise Risk Management
- Other SMEs were appropriate were included.

Official RQE Contingency Development Minutes of Meeting (REF III) were taken and later distributed to assist the teams with final updates followed up on to ensure closure and incorporation to the final template submissions.

### 3.3 Schedule Uncertainty and Risks to Critical Path

The overall program schedule was analyzed in three major segments (driven by critical path through the integrated schedule) as represented in the Rev A outage logic. These segments were based on the following:

1. Defueling activities – as described by technically driven estimate provided by the vendor (see ref. NK38-PLAN-35000-10005), i.e. “lead in”
2. RFR activities - as described by the vendor class 2 estimate (incorporating all the refinements provided by the rev 0, rev. 0’, rev 0 proxy and ultimately rev. 1 submissions) and;
3. Refurbishment lead in/out activities – utilising the logic of best and worst case scenarios of known integration and interface, Bruce lead out activity logic, OPEX incorporation based on comparisons of other facilities (ie; Wolsong, LePreau)

Detailed forward and back pass analysis was performed and range estimates applied to estimated durations with the support of SMEs and window owners. OPG owned and JV owned schedule based discrete risks were reviewed and some were identified to have a) impact to Program critical path and/ or b) interface or integration aspects; these risk items were pulled into a vertical slice review against the major schedule segments and associated schedule uncertainty values to ensure there was no “double count” or contingency considerations being applied. Individual consultation with SMEs and outage manager continued from July through August and a workshop outlining

### Title:

## RQE CONTINGENCY DEVELOPMENT REPORT

preliminary results and challenge was held on Tuesday August 25th with VP Execution, Director of Planning and Control, Outage Manager, Project Director for RFR, Scheduling Manager and Risk Manager. The preliminary list was adjusted to result in the final schedule risk and uncertainty analysis presented in the RQE.

Sep 23, NPET senior management review was conducted to review the overall 4 units schedule contingency. Also, it focused on items for key items for program contingency and management reserves. This 4-unit analysis was again challenged for the uncertainty and risk applications, ensuring the right range of uncertainties (with basis) and the right risks were applied (with basis) to the schedule. This underwent extremely detailed and rigorous reviews with escalating oversight, all the way up the MODUS direct involvement and NPET member direct involvement.

Burn rate details used in the risk analyses were programmatically defined and applied with the support of the finance and RQE organizations (for both the schedule uncertainty items and schedule impacting discrete risks), Burn Rate - Critical Path Contingency Calculation (REF JJJ), dated as Sep 16 email correspondence in Burn rates for NR PMT, NR construction, etc were obtained from the master consolidated file and optimistic, most likely, and pessimistic critical path burn rates were provided. The range of burn rates covered the “carrying cost” at “off peak” and “peak” period on NR critical path, which shall cover the various execution windows that the risks may occur.

### 3.4 Insurance Uncertainty

Insurance aspects of contingency have been contemplated in conjunction with discrete risk and cost values provided by Finance based on Program assumptions and planning basis defined by the BCS. These have been directly translated into the integrated template for overall modelling and RQE contingency calculations.

### 3.5 Various Review Meetings

The contingency development workshops took place as follows:

- July 13th – Project Contingency Work shop dry run with P&C leads.
- July 14th – Project Contingency Development Review Work shop – Turbine Generator

### Title:

**RQE CONTINGENCY DEVELOPMENT REPORT**

NPET has conducted three review sessions on Aug 25, Sep 11, and the Total Reserves final presentation and review on October 16th. The focus of the meeting was to present the various contingency snapshots prepared in support of RQE and the major contributors of cost and schedule contingencies to allow for details drill down on key elements and executive level decision making. Modus, ERM, and Asset Planning as oversight team to OPG board of directors has conducted various review meetings on the contingency products throughout the development process.

### 3.6 Quality Checks

Quality Checking was done by the risk management team members by completing quality and data integrity checks after the workshops:

- a) Project Teams and NR Estimating were tasked to review the impacts and uncertainty ranges.
- b) Risk management team followed up on actions from review meeting, confirm completion of actions, by reviewing the meeting minutes in detail by Risk log # to ensure the advice provided from the workshop panel was considered. The changes were implemented and reflected in the final submitted data for input into the Palisade @ Risk software.
- c) Risk management team conducted data integrity check to ensure data entry errors were captured upon imputing of the three point estimates into the @Risk software and reviewed with the project teams as required. Inherent to the model, a built in quality check identifies if there are any three point estimates where the optimistic impact exceeds the most likely, pessimistic is less than optimistic, etc.
- d) An additional check was to review the submitted spreadsheets vs. RMO registered Risk Log numbers, to ensure all items were captured in the risk register.
- e) OPG was conducting various model inputs integrity reviews during the model development and contingency calculation, in parallel Senior consultant from the Palisade's software did various overall quality check of the physical model and the formulas. At the time of writing this report is

preparing user manuals and final reports to ensure the model can be easily re-run for check estimate.

- f) OPG Asset Planning and Investment group, ERM, Modus (oversight team from OPG board of directors), Mike White (oversight from MOE), and KPMG have all reviewed and endorsed this RQE NR contingency development process, content, and prudence.

## 4.0 MANAGEMENT RESERVE

Management Reserve (MR) is defined as an amount of project budget withheld for management control purposes. This is reserved for unforeseen work within the scope of the project (PMBOK).

Due to the “unknown, unknown” nature of management reserve, a list of management reserve drivers is developed to define necessary funding (judgment based assessment) to support NR program. This is a common practice when developing MR for capital projects. At NPET and CNO presentation of the Total Reserves for refurbishment, a total management reserves of 800M was determined to be appropriate. The presentation used and a list of management reserve drivers agreed upon with NPET is included in Appendix A.

## 5.0 CONCLUSION – TOTAL RESERVES ESTIMATE

The Refurbishment risk organization has performed activities in accordance with the principles of the RQE contingency development plan and outputs and process to obtain inputs are in alignment with the contingency breakdown structure diagram outlined in the contingency development plan.

Based on evaluation from Palisade, this contingency model configuration aligns with industrial best practices on mega projects. Also the level of details and integrations of schedule and cost uncertainty and risks are reflecting best practice on mega projects.

A RQE Contingency Calculation – Snapshot 3 Report, NK38-REP-09701-0566838 was captured September 30<sup>th</sup>. A MS Excel spreadsheet of the final contingency calculations is on file. This final contingency calculation was augmented with executive adjustments for a small number of emergent items as well as the Management

Reserve analysis to develop a “Total Reserves” estimate. The Management Reserve was developed using executive judgment, analysis of OPEX, and an overall assessment of appropriateness based on the number of days of potential delay and % of overall estimate to complete for the NR program. This results in a Total Reserves Estimate as outlined the RQE MCF (Master Consolidated File) “Total Reserves Summary” tab.

## RQE CONTINGENCY DEVELOPMENT REPORT

### 7.0 APPENDIX A – Management Reserve Drivers

#### Examples of Management Reserve Drivers/Events

This list contains some of the “unknown unknowns” that Management Reserve funds might address. It is not intended to be complete or comprehensive, and other unknown unknowns that emerge may require MR funds.

##### **Vendor Default or Unavailability**

- The risk is that a major NR vendor becomes unwilling or unable (e.g bankruptcy, takeover, change of business philosophy or strategy) to execute the work they have been contracted to perform, resulting in a need to secure a new qualified vendor to perform the scope of work.

##### **Labour Environment**

- The risk is that future challenges in the labour relations environment results in work slowdowns, stoppages, or work to rule action during refurbishment increasing costs and extending schedule.
- The risk is that illnesses (such as pandemic flu) cause delays and cost overruns due to shortage of workers.

##### **Political Environment**

- The risk is that changes in the political landscape impact or delay the project, resulting in cost increases/impacts.

##### **Nuclear Safety and Security**

- This risk contemplates an event where an external entity or regulator, such as the MOL, shuts down all work and OPG cannot gain approval to proceed resulting in financial impacts and schedule delays due to stand downs.
- The risk is that, due to an international or localized event (such as terrorism) site security requirements (or the application rigor of the existing requirements) are increased resulting in added scope, cost increases, and schedule delays.
- The risk is that international or localized events or criminal acts (such as a military coups, piracy, or theft) impact the delivery or availability of required materials or resources for the project impacting cost and delaying schedule.
- Impact due to nuclear event. The risk is that a new nuclear event or accident, whether at an OPG site, another CANDU facility or in the international nuclear community, may delay the refurbishment due to negative public perceptions, new requirements, etc.

##### **Force Majeure**

- The risk is that a force majeure event such as an earthquake, tornado, flood, extreme/beyond normal weather conditions or other such happening results in a need to perform significant rework to get the project back up and running. This assumes that there remains a business case to complete the Refurbishment after the damage from the act of god is assessed.

##### **Financial Factors**

- The risk is that financial factors outside the control of the project (i.e. such as escalation or interest fluctuations beyond those assumed in the development of the RQE base estimate) have a significant impact on the cost of the project.

RQE CONTINGENCY DEVELOPMENT REPORT

## 8.0 APPENDIX B – Timeline of Challenge Meetings and Reviews of Risk and Uncertainty Submissions, Snapshot 2 Support

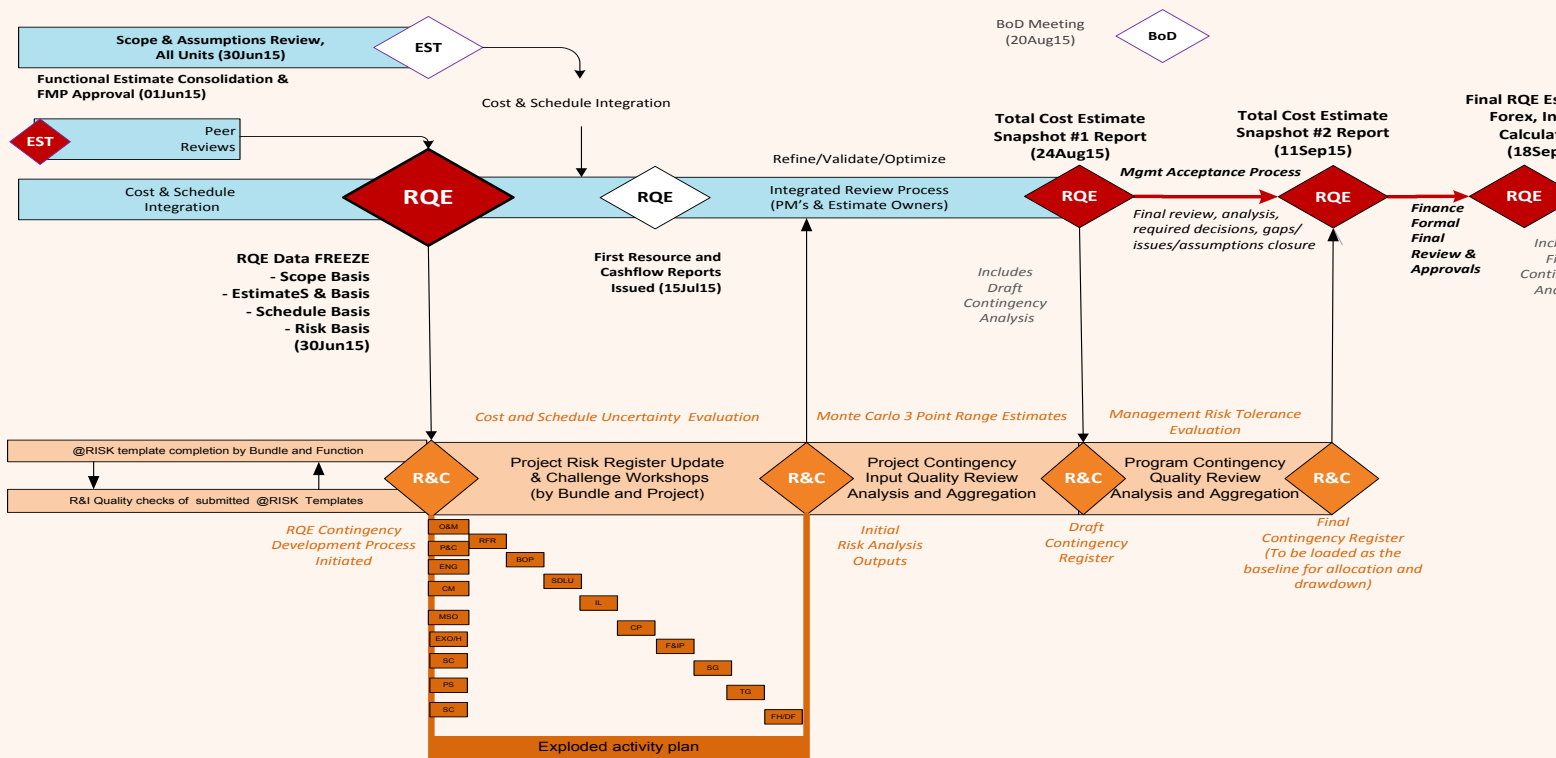

### RQE CONTINGENCY DEVELOPMENT PROCESS & ACTIVITIES

June 2015

July 2015

August 2015

September 2015

ID	Risk Title	Risk Description	Urgency	Risk Status	Owner	Delegate	Risk Date Last Reviewed	Risk Response Type	Post Mitigation TCD	Current				Post						
										Probability	Financial	Schedule	Score	Probability	Financial	Schedule	Score			
Project: Balance of Plant - 73335																				
14206	High Dose for HFD Program [Window 73]	ALARA review has been completed and assessed the Horizontal Flux Detector Replacement Program to result in 115 Rem dose to workers. The high dose is due to hotspots in the SDS2 bunker.		Active	John Stopar	George Naguib	11-Apr-16	Mitigate	30-Jun-16	5	2	2	10	4	1	1	4			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			6756	In Progress	Contingency Plan for HFD Replacement	This action is associated with Risk ID 14207. Contingency planning for stuck detectors during the HFD replacement window will need to be established prior to executing the work.	John Stopar	George Naguib	30-Jun-16											
13299	Radiation Protection Risks with Flux Detector Removals [Window 28, 73]	Due to the highly radioactive nature of the flux detectors, there is a possible schedule delay during execution of FD removals if a detector becomes lodged, stuck, or broken within the chopper tool. The Stern design of the chopper tool includes small contingency tooling to dislodge detectors in the case of minor issues during chopping. This tooling is designed to deal only with specific circumstances (ie. minor blockages). Darlington Reactor Maintenance has made use of a robotic assembly during removals on the outermost FD assemblies on the deck. The execution team cannot rely on this robotic tool due to the wholesale replacement strategy. The deck is far too crowded with safety related drive mechanisms to allow use of a travelling robotic assembly. The purpose of this risk is to document the possibly schedule and cost delays associated with unforeseen failure of the chopping tool. EDIT 20NOV2015: This risk is also associated with HFD schedule delays due to radiological interferences with RFR.	2	Active	John Stopar	George Naguib	11-Apr-16	Accept	15-Jul-16	3	2	3	9	3	2	3	9			
			There are no Not Started, In Progress Actions associated with the risk.																	
11337	Reactivity Deck Training Location [No Window Related]	The risk is that current facilities are insufficient for reactivity mechanism training. In the event that the EPC contractor cannot use the existing DNGS training facility, a new facility would be required. This would cause significant cost increase to the project.	3	Active	John Stopar	George Naguib	17-Feb-16	Mitigate	31-Mar-14	2	1	4	8	1	1	3	3			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			1723	In Progress	Details of Risk Response Strategy for Risk #11337	Training Plans are to be developed by the EPC vendor for Flux Detectors and AAs. A station integration meeting will be conducted to ensure alignment with the vendor training plan (as shared use of the RMD mock up will be required).	John Stopar		15-Dec-15	VFD and HFD Mock-ups exist in Turbine Hall. Arrangements for shared use required. J.Stopar 30 SEP 2015 : the Unit 2 Level 1 is still under development and the execution windows for Adjusters, VFDs are being shifted. The schedule must be set before meaningful discussions can take place with the Fuel Handling Dept which is the owner of the RMD rehearsal Facility.										
12027	Possible Electrical Cable Insulation Damage When Replacing Flux Detectors [Window 28, 73]	Possible deterioration of existing cable insulation (from the Flux Detector to the Amplifier) when replacing Flux Detectors becauseaged cable insulation may be very fragile and breakdown upon contact.	3	Active	John Stopar	George Naguib	11-Apr-16	Monitor	15-Jun-16	3	1	2	6	3	1	2	6			
			There are no Not Started, In Progress Actions associated with the risk.																	
14026	Horizontal Flux Detector Mock Up at MCDF [Window 73]	Due to the high number of interferences in the SDS2 Bunker and inability to perform real life training in situ, an HFD mock up is being planned and constructed at the MCDF in order to aid both Refurb and Station personnel in realistic training and contingency planning.		Active	John Stopar	George Naguib	11-Apr-16	Monitor	30-Jun-16	3	2	1	6	3	2	1	6			
			There are no Not Started, In Progress Actions associated with the risk.																	
144	RM Drive Mechanism Damage due to handling and AA Replacement work	This risk is associated with the possible damage to RM Drive Mechanisms during handling (ie. removal and reinstall of AA Drive Mechanisms) as well as surrounding work during AA rod replacement and VFD replacement work.		Active	John Stopar	George Naguib	26-Apr-16	Mitigate	31-Oct-16	3	1	2	6	2	1	1	2			
			There are no Not Started, In Progress Actions associated with the risk.																	

<a href="#">14226</a>	73592 - Containment project SID 7010 Procurement Risk for 18" AOVs [No Window Related]	The risk is that late delivery (& subsequent replacement) of the 18" 3-Way AOVs will impact vault atmosphere during refurbishment. For Containment Sope ID 7010, due to DNGS OPEX, the 18" valve originally specified was found unsuitable for this application. A different valve was recommended. The tech. Spec. is being prepared by contractor, review by HSL design and OPG. The procurement of the valve may be delayed due to the availability of the tech spec. Current quoted lead time is approximately 4 months. The work was originally scheduled to start after D1641 (July 2016) Impact: The installation schedule will be determined after the firm delivery date is available.		Active	Scott Guthrie	Gee Sham	06-Apr-16	Mitigate	18-May-16	4	2	4	16	2	2	2	4
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">14300</a>	Conventional Electrical (Project # 73762) Hydro One work protection requirements in switchyard [Window 4, 126, 127]	It has recently been determined that OPG owned equipment in the switchyard is in an area requiring Hydro One work portection. Typically these areas require the work to be performed by Hydro One and not by OPG or it's contractors. It is mostly certain at this point that the affected scope will have to be taken from AREVA who is currently the intended constructor (though no execution contract has been issued). Currently AREVA has a contract to assess and perform work planning for this and other electrical scope. Should it be confirmed that scope has to be taken from AREVA, it will have to either be given to Hydro One, or taken out of refurbishment for the station to oversee. In this case, Hydro One would again be performing the work, but the deliverables that are part of all refurbishment work (CWPs, ITPs, procedures) would likely not be required.		Active	Scott Guthrie	Greg Mills	11-Apr-16	Accept	30-Jun-16	4	2	4	16	4	2	4	16
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">14401</a>	AA Replacement Staff Experience [window #21]	This risk is associated with the introduction of new tooling and processes to staff with little experience in performing the work. AA Rod Replacement has never been performed at Darlington and is new to the contractor. The lack of experience is associated with the tooling/work process of replacing and discharging AA rods as well as assembly and installation of correct AA Rod Types.		Active	John Stopar	George Naguib	26-Apr-16	Mitigate	31-Oct-16	4	4	4	16	2	1	1	2
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">13898</a>	Risk of not having qualified procedure staff in time to complete procedure updates for BOP projects [No Window Related]	Resource availability in the procedure group currently pose as a risk. Qualified procedure staff required to complete procedure updates for BOP projects. The impact is that without the procedures updated and available in Passport, there is a chance that the work will not be accepted resulting in a delay to execution.		Active	Scott Guthrie	Kevin Tse	08-Apr-16	Monitor	31-May-16	3	2	5	15	3	2	5	15
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">13369</a>	73592 - Vault Work Interferences with JV Work [Window 8]	BoP project work will get delayed due to JV work being on critical path, this will lead to a contractor stand down resulting in additional costs and schedule delays. 14370	Project 73750 Valve Rehabilitation - Risk of system modifications due to increased weight of replacement valves (Window 122)	The Valve Rehabilitation Project covers 80 valves - a subset are subject to replacement with new. A number of replacement valves are not available like for like with the original, and are being addressed with NICRs. During preparation of the NICRs as part of the procurement process, it became known that some replacement valves have significantly higher weights than the original valves. There is a risk of system modifications due to increased weight impacting on system stress reports/seismic analysis/allowable stresses.	3 Active Scott Guthrie M Hodges 19-Apr-16 Monitor 28-Oct-16 2 2 5 10 2 2 5 10																	
			There are no Not Started, In Progress Actions associated with the risk.																	
13299	Radiation Protection Risks with Flux Detector Removals [Window 28, 73]	Due to the highly radioactive nature of the flux detectors, there is a possible schedule delay during execution of FD removals if a detector becomes lodged, stuck, or broken within the chopper tool. The Stern design of the chopper tool includes small contingency tooling to dislodge detectors in the case of minor issues during chopping. This tooling is designed to deal only with specific circumstances (ie. minor blockages). Darlington Reactor Maintenance has made use of a robotic assembly during removals on the outermost FD assemblies on the deck. The execution team cannot rely on this robotic tool due to the wholesale replacement strategy. The deck is far too crowded with safety related drive mechanisms to allow use of a travelling robotic assembly. The purpose of this risk is to document the possibly schedule and cost delays associated with unforeseen failure of the chopping tool. EDIT 20NOV2015: This risk is also associated with HFD schedule delays due to radiological interferences with RFR.	2 Active John Stopar George Naguib 11-Apr-16 Accept 15-Jul-16 3 2 3 9 3 2 3 9

			6604	In Progress	Finalize procurement strategy for ASDCH pump-motor assemblies delivery	Response startegy for this risk is to mitigate the impact:1. finalize the design specification for those specific small valves2. engage EPC vendor to investigate market for the available vendors, issue the RFP and award the PO to that vendor who can meet the bid evaluation criteria and the required lead time to avoid the delays in ASDCH pump-motor assemblies delivery	Katie Stewart	Doina Idita	30-May-16	1.Design specification complete and to be accepted by OPG 2.Velan has been engaged in conversations with ES Fox and the PO is imminent Due date extended until confirmation received on delivery date							
14072	73312 - Fire Penetrations Barriers Inspections Inadequate Resources [No Window Related]	The risk is that there are inadequate resources in NR Design & Field Engineering (FE) for the work under IIP-OI-006 and the required work will not be finished on time. The work was significantly increased due to newly realized scope as per NK38-CORR-09701-0554318 (Attached). In addition to the above scope, It was realized by Design that there were many penetrations missed in the first phase of inspections by FE so a new plan was developed to re-inspect the rooms with the help of Design as per NK38-CORR-09701-0574472 (Attached). There is a risk that many new penetrations will be discovered and FE will have to re-inspect all rooms instead of using a sampling criteria as outlined in the attached memo. If FE is required to re-inspect all rooms (even low risk) then this will significantly increase work for FE, Design & Projects and cause further schedule delays. This is a risk because IIP-OI-006 commitment is to be fulfilled by the end of 2016.	4	Active	Scott Guthrie	Amuk Sandhu	05-May-16	Monitor	30-Jun-16	3	1	3	9	2	1	2	4

13881	Unique Components Rehabilitation (Project # 73782) Potential delay to project due to materials not on site [Window 104]	The risk is that Material on site milestones may be missed due to material lead times, and delays in establishing a PO to the OEM. This risk is against the Unique Components Rehabilitation Project (# 73782) and is specific to the EP modules which are being ordered by E.S. Fox from Mirion Technologies. It was originally planned to issue the material PO for the modules in May/June 2015 (Phase 2) and therefore no order of long lead materials was required during Phase 1. However, the completion of Phase 1 was delayed, and the PO for Phase 2 was also delayed. As such, the original material order by date (late July 2015) was missed. Fox issued a PO to Mirion which took additional months to be approved with a promised delivery date of November 2017. A meeting at E.S. Fox's location in Niagara was held with Mirion representatives. A plan was worked out to move delivery to June 5. This should meet the installation related deadlines. As of yet, the PO has not formally been changed to this delivery date. There is a on-going risk that additional problems or delays will jeopardize this date.	4	Active	Scott Guthrie	Greg Mills	11-Apr-16	Mitigate	30-Apr-16	1	1	3	3	1	1	3	3

14370	Project 73750 Valve Rehabilitation - Risk of system modifications due to increased weight of replacement valves (Window 122)	The Valve Rehabilitation Project covers 80 valves - a subset are subject to replacement with new. A number of replacement valves are not available like for like with the original, and are being addressed with NICRs. During preparation of the NICRs as part of the procurement process, it became known that some replacement valves have significantly higher weights than the original valves. There is a risk of system modifications due to increased weight impacting on system stress reports/seismic analysis/allowable stresses.	3	Active	Scott Guthrie	M Hodges	19-Apr-16	Monitor	28-Oct-16	2	2	5	10	2	2	5	10
			There are no Not Started, In Progress Actions associated with the risk.														
12295	Project 73750 - Insufficient Temporary Facilities To Support Valve Rehab Scope resulting in delays and cost increase. [Windows 122, 124, 57, 29]	Event - Temporary facilities on site prove to be inadequate. Much of the valve work will need to be performed "on-site" (due to contamination and logistics of welded in valves) As there is limited space during refurb, this may result in increase costs and schedule to remove valves offsite (i.e.decontam / ship contaminated valves off site). This may affect the following windows: 29, 48, 54, 57, 103, 104, 122, 124, 131 Cause - Unforeseen needs associated with valve rehab facilities. Impact - Additional facilities required causing schedule and cost impact.	3	Active	Scott Guthrie	M Hodges	11-Apr-16	Monitor	29-Apr-16	2	2	4	8	2	1	2	4
			There are no Not Started, In Progress Actions associated with the risk.														
12297	Project 73750 - Risk of Added Cost to Valve Rehabilitation Due to Addition of IEE/NICR/MODs [Windows 122, 057, 124]	Event - IEE/NICR/MODs are required as a part of valve rehabilitation. Cause - Obsolete parts Impact - The realization of this risk would lead to increased cost and added delays to schedule.	3	Active	Scott Guthrie	M Hodges	11-Apr-16	Accept	15-Apr-16	2	2	4	8	1	1	3	3
			There are no Not Started, In Progress Actions associated with the risk.														
14413	Project 73750 Phase 2 cost escalation (Windows 122, 124, 029, 057)	The current estimate for the execution phase of the valve rehab project may be substantially lower than the actual costs.	3	Active	Gary Grahn	M Hodges	28-Apr-16	Mitigate	26-Oct-19	4	2	1	8	4	2	1	8
			There are no Not Started, In Progress Actions associated with the risk.														
12305	Project 73750 - Risk of Increased Cost Due to Valve / Actuator Discovery Work or as a Result of Obsolete Valves [Window 29, 122, 124, 131]	Event - Valves will be replaced / repaired / overhauled as per the current approved scope. During this work, there is the potential for 'discovery' issues to arise that will need to be addressed in order to return the valve to proper working order (either the valve or the actuator). This 'discovery' work will result in additional cost or schedule delay. May also result in NICRs being required. This may affect windows: 29, 48, 54, 57, 103, 104, 122, 124, 131 Cause - Inaccurate drawings leading to valve to actuator fit up problems. Actuators may not be adequate for new valves and may need to be replaced. Impact - Depending on the severity of the issue there could be cost or schedule impacts.	3	Active	Scott Guthrie	M Hodges	11-Apr-16	Mitigate	29-Apr-16	2	2	3	6	1	2	2	2
			There are no Not Started, In Progress Actions associated with the risk.														
13778	Project 73750 - Additional Tenting for Contamination Control - Valve Rehabilitation [Window 29, 48, 54, 57]	Event - Implementation of tenting for contamination control may require a modification. Activities that may cause loose/airborne contamination include use of an arter grinder for valve overhaul. This may affect windows: 29, 48, 54, 57, 103, 104, 122, 124, 131 Cause - Procedures drive the requirement for a temporary modification. Impact - Cost impact due to additional resources needed for TMOD.	1	Active	Scott Guthrie	M Hodges	12-Apr-16	Mitigate	27-Jun-16	2	1	3	6	1	1	1	1

			5405	In Progress	Fire Protection Penetration/Construction Joint Field Inspections	Completion of the final fire penetrations and construction joints is required to assess the extent of repair scope. The first action is to complete the inspections TCD Aug 15. Upon completion of tyhat activity, the action ID will be updated to status when Engineering will complete the inspection analysis to confirm repair scope. That TCD will be established once the inspection reports are generated.  Update : OPG Field engineering providing the inspection service. Commencing Jan 2016. Expected finish, first quarter 2016. Insopection analysis ongoing,	Scott Guthrie	Gary Grahn	30-Jun-16	Extent of penetrations/construction joints confirmed, SoW being drafted to obtain selective sampling to confirm EOC for Sikaflex. Date extended to Jan 2016 to allow for SoW finalization, contract issuance and status of sampling findings.							
13347	PHT Pump Dismantling Tools Unavailable [Window 48]	The Risk is that the Primary Heat Transport (PHT) Pump disassembly/assembly tools required for PHT pump inspection and maintenance will not be readily available by the station. In the event of a forced outage, station maintenance will need to take back the PHT Pump tools for the use of seal replacement. This will lead to a contractor stand down until the PHT Pump tools can be obtained to continue PHT pump inspections.		Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	03-Apr-17	2	1	3	6	2	1	3	6
			There are no Not Started, In Progress Actions associated with the risk.														
13364	PHT Pump Component Procurement Uncertainty [Window 48]	The risk is that there is an uncertainty in the cost of material procurement for the PHT Pump Long Lead components (15 month lead time). Funding was approved in Phase 1 to complete the purchase of the materials but the estimate from the OEM was a class 5 and did not include all the regulatory license approvals.	3	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	31-May-16	2	1	3	6	2	1	3	6
			There are no Not Started, In Progress Actions associated with the risk.														
13400	EHS Project - Inability to Perform Construction Walkdown [Windows 48, 104]	The risk is that there has not been a construction walkdown held for the Class 1 portion of this modification due to no planned Unit 2 outages available during the detailed design phase. The design and construction team have not been able to get into the reactor vault, therefore the design is based on available pictures and laserscans for piping layouts and supports. There is a large risk of interferences being present in the current piping runs which are not clearly visible from available pictures. 15-Nov-2015 update: Several walkdowns were performed during the VBO outage on Unit 2 to confirm the constructability of the design and note any interferences. 2 minor interferences were noted on portions of piping that could be measured, however much of the leak detection design could not be verified due to barriers and height of the desired install locations.	1	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	31-Dec-18	3	2	2	6	2	1	2	4
			There are no Not Started, In Progress Actions associated with the risk.														
13577	PHT Project - Switch Module Replacements [Window 48]	The risk is that during the replacement of the Primary Heat Transport (PHT) pressure switch cables, the alarm switch modules will also require replacement due to degradation over time.	1	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	31-Jul-17	2	1	3	6	2	1	3	6
			There are no Not Started, In Progress Actions associated with the risk.														
13658	EHS - DEC Revisions due to Unavailability of Vendor Information [Windows 48, 104]	The risk is that DEC revisions will be required due to the unavailability of vendor information. The design of the EHS piping and support structures depends on the dimension and weights of the material components (such as manual and check valves, and other items). These items will not be available until 4-6 weeks into procurement of the components, however PO's have not yet been issued for them (in progress).	2	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	31-Aug-16	3	2	1	6	3	2	1	6
			There are no Not Started, In Progress Actions associated with the risk.														
13766	ESW L15, Risk of 72800-V223 passing during Refurbishment Outage on units 1&4 [Window 53]	Impact to ESW L15 Replacement - There is a risk that 72800-V223 will not provide sufficient isolation to the branches from the main header. V223 was replaced in all units during Vacuum Building Outage (Fall 2015), and will be used during refurbishment to provide isolation during replacement of ESW L15. V223 could only be inspected/replaced during VBO as all units have to be shutdown. This risk applies to future refurbishment outages units 1&4 as there is potential for V223 (butterfly valve) to degrade over time and not provide sufficient isolation.	1	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	31-Jan-22	2	1	3	6	2	1	3	6
			There are no Not Started, In Progress Actions associated with the risk.														
137	PHT & Aux - PHT Pumps Will Require Repairs [window 048]	During DNRU2 a single PHT Pump (2-33120-P3) will be inspected to determine the condition of the pump and if any contingency repairs are required. The risk is that the 2-33120-P3 is in poor condition and will require full repairs. This will lead to inspections of 2-33120-P1/P2/P4 and potential additional	1	Active	Scott Guthrie	Jessica Perryman	22-Apr-16	Monitor	30-Jul-17	1	2	5	5	1	2	5	5
			There are no Not Started, In Progress Actions associated with the risk.														

163		repairs. This would also impact the scope for the remaining refurbishment unit outages.																	
14017	EHS - Localized Pressure Test May Require New Tool [No window Related]	The EHS project will be installing class 1 piping through an existing penetration EP05066. The risk is that a new tool (vacuum box) may be required to complete a localized pressure test on the EP after installation of the piping. The impact would be increased procurement costs for the project (one time cost for U2, as the tool should be able to be re-used).	3	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Accept	31-May-16	5	1	1	5	5	1	1	5		
			There are no Not Started, In Progress Actions associated with the risk.																
13631	The risk is that the project team will be taking on the effort for the commissioning Work Plans due to limited OPG resources (all windows)	The Current Assumption as of ES Fox's estimates is that OPG will be creating commissioning work plans as per the COIR. OPG will be sending a clarification to E.S. Fox and update the COIR, stating that ES Fox will be completing the Commissioning Work Plans, with OPG Verifying and accepting. Cost is for Engineer's time preparing CWP's.	3	Active	Scott Guthrie	Kevin Tse	15-Apr-16	Monitor	30-Sep-15	4	1	1	4	4	1	1	4		
			There are no Not Started, In Progress Actions associated with the risk.																
13664	Construction Interfaces	The Risk is that ownership and funding streams for various construction interfaces are unclear. As a result, the vendor was asked to remove CI costs from bids until clarity can be attained.	1	Active	Scott Guthrie		15-Jul-15	Monitor	15-Jul-15	2	2	1	4	2	2	1	4		
			There are no Not Started, In Progress Actions associated with the risk.																
13926	EHS - Hydraulic Analysis Reassessment [No Window Related]	The risk is that the Hydraulic Assessment will require a revision when the actual post-accident flow requirements are specified in the operating documentation for EHS supply.	1	Active	Scott Guthrie	Jessica Perryman	19-Apr-16	Monitor	31-Aug-16	2	1	2	4	2	1	2	4		
			There are no Not Started, In Progress Actions associated with the risk.																
14291	Stoppie Plug: Risk of burn through during welding of split tee (PMOD) [Window 57]	During the workplan review for the stoppie plug modification, it was identified that there is a risk of burn through of the 20" pipe during welding of split tee. This poses a potential for an unisolable leak from the Inter Unit Service Water Header (IUSWH). The maximum size of the leak would depend on the extent of any breach. Large leaks, while having a very low probability of occurrence, would have potentially severe consequences including flooding of U2 (north of Column Line 11 thus potential effects on U0 and U1) as well as the potential to impact on the operation of LPSW systems of Units 1, 3, and 4. Both of these events, should the break size be sufficiently large, would introduce a severe transient situation to the Plant and would likely require the use of a Group 2 Heat Sink in order to maintain Nuclear Safety. <del>The risk of these events has been mitigated by the following considerations:</del>	1	Active	Scott Guthrie	Jessica Perryman	22-Apr-16	Monitor	15-Apr-16	1	4	3	4	1	4	3	4		
			There are no Not Started, In Progress Actions associated with the risk.																
13352	[Window 515] Risk of detector accessibility	The Risk is that detectors in the field are not accessible for replacement. Should this be the case, relocation is the only option for the modification. This will be addressed via a FIC, and required more time and effort than anticipated, as the FHA/FSSA must always be adhered to. Any relocations must be reviewed, validated, and approved by the Design Services Provider as the design basis must be protected.	2	Active	Scott Guthrie	Oweis Chohan	15-Mar-16	Monitor	11-May-15	3	1	1	3	3	1	1	3		
			There are no Not Started, In Progress Actions associated with the risk.																
Project: Balance of Plant - 73550																			
14401	AA Replacement Staff Experience [window #21]	This risk is associated with the introduction of new tooling and processes to staff with little experience in performing the work. AA Rod Replacement has never been performed at Darlington and is new to the contractor. The lack of experience is associated with the tooling/work process of replacing and discharging AA rods as well as assembly and installation of correct AA Rod Types. ## Risk Report by Project with Associated Actions

13307	60, 133, 90]	maintenance work the scheduling of this work will need to work around and with many other projects. The estimates given were based on the information given in the Scope of Work which may not be accurate once the schedule is integrated. This may negatively affect the cost to do the work. Cause - Schedule integration. Impact - Schedule and cost impacts.	5403	In Progress	BoP Preventive/Corrective Work Scheduling in Outage Window & Effective Use of Staff	Once the vendors have been awarded for the Other and Electrical work scopes, a review will be required to confirm how the vendors will effectively manage work as it changes within an outage window. This could be caused by interferences or other issues requiring work control to move the WO within the same window. To alleviate this issue, the vendor needs to have a job jar strategy in place prior to the window to ensure that resources can be re-directed as required to other work thereby ensuring value for money for OPG.	Scott Guthrie	M Hodges	30-Jun-16	Discussed with ES Fox about job jar work. Once the schedule is integrated a review of the work will be completed to see which work can be performed independently of other work. There will be some work which will need to occur when the system is tagged out under permit. Other work can be performed either with a stand alone permit or during a long window for shutdown and layed up systems. This will be identified during the integration phase of scheduling. The schedule is in the process of being integrated. Due date changed to reflect completion of schedule integration. May 13/16 Update: First integration meeting review completed, second scheduled for June 2016. Level 3 schedules are now trades resourced and preliminary trades assessment has been completed. Challenge is determining extent of resources required for Portfolio, Outage overflow & AISC projects as Level 3 schedules down to trades level don't exist for that scope. Fox is attempting to estimate resources for that scope to confirm overall trades resources (action owner Scott Waters) to demonstrate that resources are planned. The job jar strategy will be finalized after the resource plan is finalized and the second Integration meetings are completed in June. Action extended to June 30/16.									
13355	Preventive Maintenance - "Other" Parts Risk	Event - Parts required which are no longer available. This may require design changes to be done. Also delays in obtaining parts may push the scheduled tasks requiring a lengthening of the work window or re-establishing the required plant conditions to perform the maintenance. Cause - Obsolete parts Impact - OPG is performing engineering function for this work, may require additional resources.	2	Active	Scott Guthrie	M Hodges	12-Apr-16	Monitor	16-Oct-16	4	1	1	4	4	1	1	4		
	There are no Not Started, In Progress Actions associated with the risk.																		
Project: Balance of Plant - 73762																			
14300	Conventional Electrical (Project # 73762) Hydro One work protection requirements in switchyard [Window 4, 126, 127]	It has recently been determined that OPG owned equipment in the switchyard is in an area requiring Hydro One work portection. Typically these areas require the work to be performed by Hydro One and not by OPG or it's contractors. It is mostly certain at this point that the affected scope will have to be taken from AREVA who is currently the intended constructor (though no execution contract has been issued). Currently AREVA has a contract to assess and perform work planning for this and other electrical scope. Should it be confirmed that scope has to be taken from AREVA, it will have to either be given to Hydro One, or taken out of refurbishment for the station to oversee. In this case, Hydro One would again be performing the work, but the deliverables that are part of all refurbishment work (CWPs, ITPs, procedures) would likely not be required. Project: Balance of Plant - 73514																	
14365	LPSW Alternative Cooling (Project # 73514) Material Risk for pre-req work [Window 513]	During readiness meetings conducted for oversight on WO 4785353 determined uncertainty regarding type of flanges to be used and whether or not valve repacking will be required. This may impact timing and costs associated with this pre-req for the installation of the LPSW TMODs.	4	Active	Scott Guthrie	Greg Mills	17-Apr-16	Mitigate	30-Apr-16	4	1	3	12	1	1	1	1
			There are no Not Started, In Progress Actions associated with the risk.														
14427	LPSW Alternative Cooling (Project # 73514) Potential EC revision due to work window complications [Window 057]	Between March 4 and March 30, 2016 received email notifications from system engineer that complications relating to the LPSW outage window will partially invalidate a TMOD prepared for servicing critical cooling loads during the LPSW outage. There appears to be potential for having to perform an EC revision on the existing TMOD. See email attachments to this risk. As design has been complete for some time, an EC revision will cause considerable disruption and impact schedule and estimate. Impacts will likely involve revision to RQE, revision to approved installation work plans, revision to approved commissioning specifications, revision to installation strategy, etc. It is not clear what prompted this situation. With the issue of PIMS REV B2 (April 15, 2016) the PULSW outage window was changed, however the window coordinator says this is not the cause. This may have been due to original errors in defining the parameters of the TMOD. No SCR.	4	Active	Scott Guthrie	Greg Mills	04-May-16	Mitigate	30-Jun-16	4	3	1	12	1	1	1	1

14072	73312 - Fire Penetrations Barriers Inspections Inadequate Resources [No Window Related]	The risk is that there are inadequate resources in NR Design & Field Engineering (FE) for the work under IIP-OI-006 and the required work will not be finished on time. The work was significantly increased due to newly realized scope as per NK38-CORR-09701-0554318 (Attached). In addition to the above scope, It was realized by Design that there were many penetrations missed in the first phase of inspections by FE so a new plan was developed to re-inspect the rooms with the help of Design as per NK38-CORR-09701-0574472 (Attached). There is a risk that many new penetrations will be discovered and FE will have to re-inspect all rooms instead of using a sampling criteria as outlined in the attached memo. If FE is required to re-inspect all rooms (even low risk) then this will significantly increase work for FE, Design & Projects and cause further schedule delays. This is a risk because IIP-OI-006 commitment is to be fulfilled by the end of 2016.	4	Active	Scott Guthrie	Amuk Sandhu	05-May-16	Monitor	30-Jun-16	3	1	3	9	2	1	2	4

Data Refreshed: 12-May-16 10:30 PM

13756	[Window 532] Testing of all private fire main control valves	The risk is that during operability testing of the private fire main control valves, significant issues are found with the valves. Should this occur, the impact is that the sample size of valves may be increased, increasing the scope and schedule of the inspection campaign. In addition, there is a risk that current sample size of valves (alternate compliance) may not be accepted by the regulator. If such, sample size may increase, increasing scope/schedule/cost. Also, there is a risk that the testing method to test these valves may require the installation of TMODS, increasing project schedule/cost and scope. In addition, repairs are not estimated as base cost for these inspections. These will be tracked accordingly.	3	Active	Scott Guthrie	Oweis Chohan	01-Dec-15	Monitor	24-Sep-15	3	1	2	6	3	1	2	6

Project: Balance of Plant - 73618																	
14278	Conventional Electrical (Project # 73618) Contract Award Delays Leading to Material Delay Risk [Window 4, 126, 127]	Risk is that delays in awarding BOP Electrical scope to a Constructor will result in missed material order milestones and therefore material late on site for work. Ongoing delays as a result of constant scope change, discovery items and work protection concerns has resulted in several "restarts" on the process of awarding work. Work has been on the verge of being awarded several times and then cancelled due to discovery of new scope,or some other item of concern to the organization. In the last month discovery of work protection complications has resulted in additional delays to preparation of award package. Project: Defuelling -																	
	PHT Pump Breakdown Stops Flow Defueling [Window 12]	EVENT: If one of the PHT pumps were to fail CAUSE: Flow Defueling will be used during the Defueling campaign which requires the continued use of the PHT pumps to circulate coolant IMPACT: The failure of one of the PHT pumps would make Flow Defueling impossible, requiring the use of Dummy Bundle push defueling for the entire reactor greatly extending the schedule and therefore cost of the project.	2	Active	Sorin Marinescu	Antonio Carito	03-May-16	Mitigate	15-Jul-16	4	3	4	16	2	4	4	8
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			5669	In Progress	Procure enough DFB to entirely push defuel units.	Procure enough DFB to entirely push defuel units. Currently expected to procure enough DFBs to Defuel Unit 2 by September 1 2016.	Sorin Marinescu	Antonio Carito	15-Jul-16								

13872		<p>where the cost of the project.</p> <p>Update May03,2016:=====</p> <p>Original risk &amp; associated mitigation concentrated on a complete loss of ability to flow defuel. Based on recent station events and further evaluation, this update assumes some ability to continue flow defuel if a PHT pump or pump motor is lost. Impact of a single pump failure would result in an impairment to the project's ability to flow defuel per the current strategy.</p> <p>An elevated stator cooling event was recently experienced on U2 PHT Pump Motor 1. Initial evaluation of the impact indicated that 3 pump flow defuelling may be possible, but that the loop with the failed pump would have flows reduced to values below 25.4kg/s which would place those channels into the push defuel w/ dummy bundle regime. The result would be an increase to the push defuel phase of approximately 178 channels to the initial push scope of approximately 124 for a total of ~302 channels requiring push defuelling. This would impact critical path schedule by ~29 days (~15 for defuelling and ~14 for dummy bundle removal activities).</p> <p>An EDM for the pump motor was held on April 15, 2016 resulting in a backflushing strategy being implemented. Additional options examined included pump motor replacement (19-21 days outage time) and alternate cooling via ACUs ducted to the motor cavity.</p> <p>Execution of the backflush resulted in normal temperatures being established successfully. The event however, highlights the project's (and program's) vulnerability to loss of a PHT pump during defuel activities.</p> <p>Given that shut-down flow defuelling activities are known to cause elevated motor temperatures, coupled with the recently highlighted vulnerabilities to the PHT pump motors, efforts should be made to continue pursuing the alternate cooling methods for use during refurbishment defuelling. Strong consideration must be made to implement the alternative cooling strategies for defuelling even though nominal operational temperatures have been restored.</p>																																																																																											
11099	Single Ended Flow Defuelling Not Achievable at Lower Flows in Future Units (perf. impr. opp.) [Window 12]	<p>EVENT: The current limit for single-ended channel defueling is not lowered for future units. Note that this does not affect the U2 base case assumptions and strategy.CAUSE: currently the assumption about flow defueling is that we can successfully flow defuel at lower flows for future units. It is anticipated that flow requirement criteria currently used for single-ended defueling may be reduced, resulting in some schedule improvements for future campaigns. Data and experience gathered during U2 refurbishment is planned to be the basis for determining potential for this opportunity.</p> <p>IMPACT: This would result in the need to perform double-ended flow defueling or the use of Dummy Fuel Bundle push defueling either of which will result in future unit defueling campaigns being of similar duration to U2's.</p>	<table><tr><td>1</td><td>Active</td><td>Sorin Marinescu</td><td>Antonio Carito</td><td>11-Apr-16</td><td>Mitigate</td><td>30-Aug-16</td><td>2</td><td>1</td><td>5</td><td>10</td><td>2</td><td>1</td><td>4</td><td>8</td></tr><tr><td>Action#</td><td>Status</td><td>Action Title</td><td>Action Description</td><td>Owner</td><td>Delegate</td><td>Due Date</td><td colspan="8">Comments</td></tr><tr><td>5580</td><td>In Progress</td><td>Get required approval to lower defuelling criteria from 30 kg/s for 2 bundles to 24.9 kg/s</td><td>Get required approval to lower defuelling criteria from 30 kg/s for 2 bundles to 24.9 kg/s</td><td>Sorin Marinescu</td><td>Antonio Carito</td><td>15-Aug-17</td><td colspan="8"></td></tr><tr><td>5581</td><td>In Progress</td><td>Procure sufficient inventory of Dummy Fuel Bundles</td><td>Procure sufficient inventory of Dummy Fuel Bundles to facilitate push defuelling alternative for future Units (post Unit 2)</td><td>Sorin Marinescu</td><td>Antonio Carito</td><td>15-Dec-17</td><td colspan="8"></td></tr><tr><td>5582</td><td>In Progress</td><td>Create Unit 2 Monitoring and Performance Plan</td><td>Create Unit 2 Monitoring and Performance plan for execution during Unit 2 and implement OPEX on successive units to improve defuel duration target of 113 days. 13909	Pipe Relocation in U4 RAB May Not Be Completed Before Next Flask Shipment	the 2018 flask shipment. Cause: Discovery issues and delays in design, procurement, fabrication, and installation. Impact: Station operation may be impacted if the flask transfer cannot be completed. The new piping that connects the new boilers to the existing steam distribution header in the powerhouse, which passes through the Unit 4 Reactor Auxiliary Bay (RAB), is located too low and will interfere with the loading of the spent resin flask transportation package. This new section of pipe will need to be relocated before the next flask transfer scheduled for early 2018, per e-mail from Operations.	Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6461	In Progress	AHS Project 16-34000: Establish a Schedule with Adequate Margin for U4 RAB Line Reroute	Work with the Contractor to establish a schedule to complete the installation prior to the next flask shipment with adequate margin.	Mike Nairne	Raaj Kovinthan	30-Jun-16	OPG PO issued. Contractor is working to establish a design contract.									
14281	34000 - AHSF - Additional Security Camera Not Installed by AFS	Event: Additional security camera not installed by AFS. Cause: Technical/discovery issues. Impact: Delay to AFS.  During initial review it was discussed that without the bridge in place we could only make a estimated guess on camera coverage which was assessed at the time. As we move forward with placing the fence into service and doing commissioning we were required to complete a LUX level in the area of the bridge and a new camera assessment using the CNSC approved assessment tool. During the tests it was determined that the LUX levels at the ground are below required LUX level of 5 and that the assessment tool could not be made out from the cameras in some areas due to the pipes. Based on this information we have advised the need for additional lighting and camera assessment in the area to meet the CNSC requirements.	3	Active	Mike Nairne	Raaj Kovinthan	25-Apr-16	Transfer	31-May-16	2	1	5	10	1	1	5	5		
			There are no Not Started, In Progress Actions associated with the risk.																
12161	34000 - CBH Demo - Discovery Work	Event: The old Construction Boiler House (CBH) will be demolished after the new AHS Facility is placed into service. There is risk of discovering work that is not captured in the scope of the demolition contract. Cause: The scope of demolition work was not completely defined. Impact: Increase in the EPC contract cost.	2	Active	Mike Nairne	Raaj Kovinthan	25-Apr-16	Mitigate	05-Jan-16	1	1	4	4	1	1	4	4		
			There are no Not Started, In Progress Actions associated with the risk.																
12997	34000 - AHSF - Operating Manuals Are Not Ready by AFS	Event: There is a risk that Operating Manuals (OM) are not ready by AFS. Cause: The size and content of the new Boilerhouse Manual is significant. The work on the OMs was starte too late, and cannot be complete within the available time. The Operations Procedures group cannot support this project due to competing priorities. Impact: The Station will not accept the modification, and the AFS will be delayed.	3	Active	Mike Nairne	Raaj Kovinthan	25-Apr-16	Mitigate	30-Jun-15	1	1	4	4	1	1	4	4

12646	No OPEX available for New Boiler Blowdown Design performance.This may result in subsequent additional inspection and system design changes	Although the design features used in the modified Boiler Blow-off system (single pipe design with flow restriction at pipe exit) are standard but there is no OPEX of Boiler Blow-off System performance with flow restriction. The Boiler Blow-off systems at Pickering and Bruce do not use flow restriction and also have more than one pipe at the exit of the Blow-off system. Additional inspections costs will be expensed after the first installation to gather OPEX and if potential issues are identified design updates for other units may be required. Potential changes to the first unit design & need for removal/re-installation.		Active	Ricardo Fiorini	Ashish Deb	27-Apr-16	Mitigate	31-Aug-16	341122112
There are no Not Started, In Progress Actions associated with the risk.										
12641	Discovery Work during Outage can potentially result in system design chnages and can result in Outage delay	There is a risk that the as found conditions in the Boiler Blowdown Duct Chimney are not as per the design documents and modification design cannot be installed as planned. Design changes to approved design may be needed. In addition to the design changes the work may not be completed within the allocated outage window, hence delaying the outage completion.		Active	Ricardo Fiorini	Ashish Deb	02-May-16	Mitigate	30-Jun-16	41282112
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments
			4259	In Progress	Flexibility in design to cater for unknown field conditions	Vendor to have flexibility in design to cater for as found field conditions (like re-bars interference with the anchors), adjustment of pipe support frame.	Ricardo Fiorini	Umar Rizwan	31-Dec-15	The current approved design has provides a 100 mm X 100 mm area for locating the anchor. There is still a risk of hitting a re-bar as scanning under water is not possible. This risk will be accepted and addressed during installation.
			4260	In Progress	Contingency support design to be available to address unknown field conditions	Vendor to have contingency support designs available that can be installed if original design cannot be implemented.	Ricardo Fiorini	Umar Rizwan	31-Dec-15	The current design does not include any contingency support configurations. A mock-up test is planned to test the anchor installation prior to the Outage. Any design changes to the current support design will need to be carried out under the FIC process.
			4261	In Progress	Need for additional piping inspection to confirm field conditions	Video inspection already completed for pipe support inspections to be reviewed to identify any anomalies. If required, additional inspections can be planned prior to implementation of the modifications. Inspections were completed during VBO-2015. The results of inspections need to be reviewed.	Ricardo Fiorini		31-Dec-15	Video inspections have been completed in Units 2 & 3. Inspections may need to be carried out in the remaining units. As part of the VBO work, refurbishment organization conducted inspections of all the Boiler Blowdown Shafts/Chimneys. The inspection videos will be reviewed to identify any installation issues. Based on the review of these videos a decision will be made regarding completing inspections in Unit 4 and 1.
12643	Vibration Limit exceeded	Prior to the final AFS of the modification, it is planned to carry-out vibration testing of the modified piping to ensure acceptance criteria for vibration limits outlined in the Modification Design Requirements (NK38-MDR-36410-10003, Section 2.3.2) is met. There is a risk that the system vibrations are not within the acceptance limit.		Active	Ricardo Fiorini	Ashish Deb	27-Apr-16	Mitigate	30-Apr-15	31262112
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments
			4266	In Progress	Design/Installation of Contingency Support(s) required to address High Vibrations during system commissioning	The system design changes will be analyzed to ensure requirements of the MDR are met by the revised system configuration. If during testing system vibrations are found outside of specified acceptance criteria, then additional contingency support(s) could be installed to address the issue.	Ricardo Fiorini		31-Dec-15	The risk of finding issues with vibration results is low based on discussion with the Design Agency (RCMT/AMEC-NSS) and OPG vibration group. The velocity measurements will be taken during commissioning and in case issues are found then detailed vibration data will be analyzed and a path forward will be defined. Additional material for a single support is being ordered to ensure material is available if additional support is required to address the vibration issue.

Risk Report by Project with Associated Actions

12642	Diving work in BBD Chimney is considered "High Safety Risk" activity and has a potential of injury and can delay the work completion	Underwater work is considered high risk activity (potential of delay to installation work as minimum and potential of fatality as worst case) as diving work has not been attempted in the Boiler Blowdown Duct Chimney before. The flow conditions in the BBD chimney are not fully known.		Active	Ricardo Fiorini	Ashish Deb	02-May-16	Mitigate	30-Jun-16	3	1	1	3	2	1	1	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			4265	In Progress	Prepare rescue plan to deal with accident scenario during diving work	Vendor to prepare a rescue plan to deal with any accident scenarios during performance of diving work.	Ricardo Fiorini	Umar Rizwan	29-Jan-16	A rescue plan will be provided prior to the start of the D1641 Outage.							
12645	Potentially degraded Concrete Condition in the BBD Chimney/Enclosure can impact anchor performance	A risk has been identified that the blow-off duct/shaft concrete may have been degraded by the periodic operation of Units 1, 3, & 4 at elevated temperatures following interim repairs/modifications to the blow-off lines, which resulted in termination underwater (95 m & 98 m elevations) within the vertical section of the ducts. The degraded concrete surface may impact anchor performance.		Active	Ricardo Fiorini		27-Apr-16	Mitigate	31-Mar-15	3	1	1	3	2	1	1	2

Project: DNGS Projects - 31508																	
13862	31508 - Delay - NV537 Installation	The installation of the NV537 modification is at risk of delay. The delay is due to a pre-existing condition where the station OM has been claiming the valve as part of containment boundary during dousing water fill operation. In the absence of resolution to the CB issue, it has not been possible to process a revision to the OM, which would require a similar containment boundary be defined. EC was approved with the condition that pre-existing station condition regarding use of V542 and NV537 as a temporary containment boundary during dousing storage tank fills was resolved.This line and associated valves are not of the required class for designation as a CB, and a plan to request an exemption for this case has been unsuccessful. This action generated out of this issue ( AR 28172655-01 ) has not been resolved and next anticipated step is a CNSC submission by Plant Design on Jan 29, 2016. There is also a related risk that the results could result in rework, contributing to delay.	2	Active	Brian Graham	Dale Schnedler	26-Apr-16	Monitor	30-Apr-16	5	1	5	25	5	1	5	25
			There are no Not Started, In Progress Actions associated with the risk.														
14172	31508 - BDBE Procedure updates (EMeG's) Delay/Rework	Uvailability of adequate resources with correct skill sets for preparing/updating the Emergency Mitigating Response Guide procedures may cause delays and rework, impacting the fainal AFS and turnover for Fukushima modifications.	3	Active	Brian Graham		26-Apr-16	Monitor	31-Jan-17	3	1	5	15	3	1	5	15
			There are no Not Started, In Progress Actions associated with the risk.														
12649	31508 - Fukushima Phase I There is a risk of scope growth impacting cost and schedule of the project.	Project may experience significant cost and schedule impacts due to scope definition:  Initial scope for this project consists of numerous modifications initially provided as solutions in a "Fast track" context, rather than problems. Program is composed of numerous small modification, integration issues with the overall respose drive changes. Many aspects of BDBE response are new, outside normal practices or require "extent of response" decisions. Frequent scope change and clarification continues to occur in the design phase, contributing to cost and schedule delays. This project is part of a larger,evolving program for BDBE and SAM, making it more difficult to control scope at the individual project level. Alignment with PNGS ( for compatibility of equipment and consistency) often results in delay and sometimes scope as there are significant difference between the stations. The BDBE project structure is unique in having a support organisation outside of projects which has retained a significant role in ongoing scope definition. This is an ongoing risk.	2	Active	Brian Graham	Dale Schnedler	26-Apr-16	Accept	31-Dec-17	2	2	5	10	1	2	5	5
			There are no Not Started, In Progress Actions associated with the risk.														
12648	31508 - Fukushima Phase I There is a risk of cost growth due to currency fluctuation.	Depreciation of the Canadian dollar relative to the US dollar could impact ability to complete project within release or available business plan funds resulting delay and possibly rework.	3	Active	Brian Graham	Dale Schnedler	26-Apr-16	Monitor	31-Dec-16	2	1	1	2	2	1	1	2
			There are no Not Started, In Progress Actions associated with the risk.

			<a href="#">5692</a>	In Progress	16-31514 - EPC Vendor to pursue reduced lead times from equipment suppliers	ES Fox is working with Swagelok to reduce the lead time for the needle valves and the ball valves for the PHT modifications.	James Philipps		31-Dec-15									
<a href="#">14328</a>	16-31514: Effects of additional shielding required for GFP Sample Delay Coil	Due to the increased amount of shielding required for the GFP Sample Delay Coil to ensure 2.5 MREM working limit in room R-253, the design has to include a structural package, with calculations, to ensure safety. This will affect cost for design, as well as extra material and labour, as this was not anticipated and was specifically noted in the assumptions of the Purchase Order with ESFox to be a PCA during detailed design.		Active	Ricardo Fiorini	Amanda Krishnakumar	25-Apr-16	Mitigate	28-Apr-17	3	1	3	9	2	1	2	4	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6678</a>	In Progress	Complete and Thorough Design Review	To ensure a smooth installation process, a complete and thorough design review is required with appropriate stakeholders to avoid complications in the field during execution phase.	Amanda Krishnakumar		29-Jul-16									
Project: DNGS Projects - 31520																		
<a href="#">14326</a>	16-31520: Lack of Station Resources for Rest of Installation of Obsolete Chemical Analyzers	Control Maintenance (CCMD) and Chemistry Lab (THM) are the two main station resource groups that are required for installation of the remaining analyzers. CCMD in particular is low on resources and THM does not have as many qualified people for calibrating the analyzers. This can impact schedule if there aren't resources available when required for work.		Active	Ricardo Fiorini	Amanda Krishnakumar	27-Apr-16	Mitigate	29-Dec-17	4	2	4	16	3	2	3	9

Risk Report by Project with Associated Actions

Report ID: 07077  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

<a href="#">12781</a>	delay/extend TRF T1701 Outage	maintenance window impacting critical path of the TRF Outage as a result of underestimation of scope.																
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			4288	Not Started	31701	Incorporate working overtime/add 2nd shift/extra manpower as required during the TRF T1601 Planned Outage Window as a recovery plan.	Ricardo Fiorini		30-Nov-16	0								
<a href="#">12784</a>	New turbine will not perform with the same capacity or reliability as the existing current turbine	New turbine will not perform with the same capacity or reliability as the existing current turbine under our specific operating environment due to potential unknown parameters or latent failure modes. This could include possible interference and compatibility issues with the current TRF Systems Structures and Components (SSCs) of the CRS.		Active	Francis Davis	Ray Kurhan	29-Apr-16	Mitigate	28-Apr-17	2	4	4	8	1	2	3	3	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			4292	Not Started	31701	To minimize/eliminate these potential risks, obtain new turbine replacement from the TRF turbine original equipment manufacturer (OEM). OEM has proven experience/OPEX with upgrading oil bearing turbines to dynamic gas bearing turbines in hydrogen cryogen	Ricardo Fiorini		30-Nov-16	0								
<a href="#">12778</a>	Detailed Design (EPC) Completion Milestone Missed	Detailed Design milestone of July 08, 2016 not complete by EPC Contractor as a result of under estimation of hours to complete per project schedule causing potential schedule/milestone delays impacting T1701 Outage execution.		Active	Francis Davis	Ray Kurhan	29-Apr-16	Mitigate	08-Jul-16	2	2	3	6	2	2	1	4	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			4284	In Progress	31701	For T1701 Outage Scope EPC Contractor to follow D-INS-39000-10003 (TRF Planned Outage Milestones) and if schedule/milestones are impacted, Contractor to provide a Recovery Plan to OPG.	Ricardo Fiorini		08-Jul-16	EPC Contractor is behind schedule in issuing the latest PO to the turbine OEM Linde and the Design Agency AMEC is maintaining their position that their work will be delays possibly impacting/pushing the Detailed Design milestone date of Jan.22, 2016. OEM needs to provide certain drawings/information in order for Design Agency to complete their Detailed Design scope although several independedant tasks could be completed in parallel. Contractor has been asked to review intregated scheduled and see where effeciencies can be made to recover schedule.  ES Fox notified OPG that the Detailed Design Milestone of Jan.22, 2015 will not be achievable as the Turbine OEM documentation/deliverables are critical path and are required for AMEC to complete Detailed Design, refer to SCR#N-2015-16888. Project has prepared a directed change PCRAF-004 to realign vendor project schedule and yearly cash flows as the TRF T1601 Outage window has been moved/pushed to TRF T1701 Outage (start Feb.08, 2017). As a result this should recover the Detailed Design Milestone based on the new T1701 Outage Start Date. New Detailed Design Milestone TCD is July 08, 2016.  In Q1-2016 the Project has received new Production Schedule from ES Fox now targeting the Detailed Design complete date as 26-May-2016, which is in advance of the OPG Milestone 08-July-2016.								
	Configuration Issues Related to TRF Plant Equioment and Design	Identification of configuration management issues or legacy issues to ensure design documentation represents actual field equipment conditions, if any conditions are discovered additional effort/scope will be required to complete Detailed Design. potential schedule and cost impacts. GENERATION

Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

12796	31710 - Resources Unavailable if Work Moves	If the project has to move the SDC HX replacement work late into refurbishment due to failure to obtain isolation, or due to schedule delays preventing execution prior to Refurbishment, there is a risk that Refurbishment resources (Operations, Maintenance, Design, Field Engineering, Contract Management Office, Radiation Protection, etc.) are unavailable to provide support during 2 month long 24/7 execution periods that are back to back (1 .5 month gap in between ).		Active	James Philipps		29-Apr-16	Mitigate	31-Mar-15	4	2	5	20	2	1	4	8
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			4300	In Progress	Oversight of Vendor Compliance to MA-022	Project to provide oversight of the vendor (accountable for detailed design, work plans and assessing) and will notify management early of any potential schedule delays and risks to MA-022 compliance.	Ricardo Fiorini		30-Jun-18	2015-09-16, 2051-10-09: In communication with Work Control to identify risks to and missed MA-22 milestones and to identify recovery dates to ensure SDC HX work stays on the plan.							
			4301	In Progress	Vendor Prepare recovery plans	Vendor will be accountable to prepare recovery plans & present status updates daily at Project Control Center (PCC) meeting.	Ricardo Fiorini		24-Mar-16	Dec 08, 2015: U2HX1 work has been kicked off the plan due to assessment incomplete. Work rejected from 2016WW12 and moved to 2016WW52.							
			4316	In Progress	31710 - Communicate with Work Groups to Secure Resources in Advance	Communicate and engage affected OPG work groups well in advance to ensure support will be available duringthe required time.	Ricardo Fiorini		15-Oct-15	0							
			4317	In Progress	31710 - Plan Installations Outside of High Resource Loaded Time Frames	Schedule tasks where possible when resources will be available. (I.e. outside of planned outages).	Ricardo Fiorini		31-Dec-16	0							
12792	Degraded PULSW Isolation Valves are not replaced prior to SDC HX's replacement.	There is a risk that degraded Powerhouse Upper Level Service Water (PULSW) system isolation valves are not replaced prior to SDC HX replacements. The PULSW system isolation valves for HX1 (PV11, PV57) and HX2 (PV12, PV60) are in a degraded condition and require overhaul / replacement prior to the SDC HX Replacement. If the valves are not replaced during a PULSW outage prior to SDC HX replacement, then the project will likely not be able to isolate the HX's, and therefore the Project execution will have to be deferred until the Isolation valves can be replaced. The use of ice plugs as an alternate means of isolation may also not be possible due to several limitations (will require the procurement of pipe freezing jackets for 16" diameter piping, a continuous supply of LN2 for the installation duration (30 days), a new feeder freezing penetration on the south side of the reactor (to enable ice plugging on PV11 pipe work inside containment) and minimal fluid flow in the pipe work (difficult with passing isolation).		Active	James Philipps		29-Apr-16	Mitigate	31-Dec-16	4	1	4	16	2	1	4	8
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			4308	In Progress	31710 - PULSW Outages in D1321/D1411/D1531/D1641 to replace Valves	Identify the issue to station management and requested PULSW outages are added to every Unit Outage prior to SDC HX Replacement, to allow for PULSW isolation valve replacement.	Ricardo Fiorini		30-Apr-16	Unit 2: Valves could not be replaced in D1321. Unit 1: Valves replaced in D1411. Unit 3: Valves scheduled for replacement in D1531. Unit 4: Valves scheduled for replacement in							
			4309	In Progress	31710 - Vendor design alternate means of isolation	Requested EPC Vendor to evaluate alternate contingency means of isolation on the service water side and to provide an Isolation Strategy Report. The Project will then obtain approval from the station to have the EPC vendor design, fabricate, and install an alternate means of PULSW isolation.	Ricardo Fiorini		30-Jun-16	U2 TMOD to be complete by April 8, 2016. U1/U3/U4 TMOD to be complete by June 30, 2016.							
			5678	In Progress	31710 Execute Test PULSW Isolations	Perform test isolations in advance of the HX replacements to determine acceptability of pulsw isolation. If unacceptable, communicate to required stakeholders and take appropriate follow-up actions (move HX replacement into Refurb or post-refurb, re-attempt isolation, fix valves etc.)	James Philipps		31-Dec-16	U2HX1 test isolation planned for 2016WW04 per WO 4783166 and 4890198. Initial results are that isolation is acceptable on p/s and s/s. U2HX2 test isolation planned for 2016WW07 per WO 4783171 and 4875513.							
12786	16-31710: Incorrect Radioactive Waste Characterization of the SDC HX's Delays Waste Disposal	Event: The assumed radioactive waste characterization of the SDC HX's (used to determine design requirements for shipping container) is incorrect. Cause: Assumptions made in determing waste characterization prove incorrect, and radiological waste characterization is higher than planned due to higher than expected contamination of the HX. Impact: If a shipping container is designed and fabricated based on the incorrect characterization, then a new container will need to be designed and fabricated, which will significantly delay the removal of the old HX's from the Darlington site.		Active	Ricardo Fiorini	James Philipps	29-Apr-16	Mitigate	31-Mar-15	3	1	5	15	2	1	5	10
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6313	Not Started	16-31710 - Stage Old HX so it doesn't impact installations	If old HX cannot be shipped off-site immediately (due to need to obtain a new transport container), and the old HX is interfering with new HX installation, then obtain approval to store in a different location (new SATM approved).	James Philipps		30-Jun-16								
	Late Delivery of Long Lead Material (SDC HX's)	There is a risk that late delivery of long lead material will delay the start of installation. This risk is highest for the first HX, as the start of installation is very close to the completion of fabrication. For the remaining three HX's installed under this release. there is low risk of late deliverv.		Active	James Philipps		29-Apr-16	Mitigate	31-Mar-15	3	1	5	15	2	1	2	4
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							

12787		In addition the the HX's, long lead material for temporary supports that was identified late (due to late design issuance) will delay temport support fabrication and installation which is a pre-requisite to HX replacement activities.																	4294	In Progress	31710 - Oversight of the EPC vendor to ensure committed delivery dates are for HX and other LLM..	EPC Vendor oversight of the HX Manufacturer to make sure the committed delivery dates are met.	James Philipps		31-May-16	Current delivery is March 24 2016 for U2HX1. Vendor is taking measures to try and improve date to March 03, 2016, in order to have on site well in advance of SOI date. 2016-03-30: Temporary supports are now critical path, so EPC vendor is expediting procurement and fabrication of these supports.
12788	31710 - Damage to Equipment & Materials	There is a risk that the HX and/or other equipment / material is damaged due to improper storage by vendor, poor handling during shipment/installation, or exposure to harsh environmental conditions.		Active	Ricardo Fiorini		29-Apr-16	Transfer	30-Jun-15	3	1	5	15	2	1	3	6									
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments																
			4296	In Progress	31710 - Vendor Preparation of procurement plan and material management plan.	The EPC vendor will prepare a procurement plan and material management plan that will identify the storage and warehousing of the SDC HX's. OPG will review and accept the plans, in order to ensure OPG's expectations for storage and shipment are met.	Ricardo Fiorini		31-Dec-17																	
			4299	In Progress	31710 - Approved Lift and Material Handling Plans to Mitigate Damage	OPG to provide oversight during fabrication and installation activities. OPG will review the installation work plans for lifting and rigging details and HX movements within the station, to ensure appropriate measure are being taken to mitigate damage to the HX's. HX Movements and Lifts will be performed per OPG approved Critical Lift Plans and Material Handling Plans.	Ricardo Fiorini		31-Dec-18	Preparation of U2HX1 work plans and lift/material handling plans is in progress. Plans for subsequent installations to follow.																
12790	31710 - Conflicts with other work being done inside the station	There is a risk that the installation timeline conflicts with other work being done inside the station. Work of higher priority may be in execution inside the station that will interfere with the project, be it conflict in resource allocation, use of space, or use of equipment. A key concern is with Refurbishment related activities, which may be scheduled to take place in parallel with this project.		Active	Ricardo Fiorini		29-Apr-16	Mitigate	31-Dec-18	3	1	5	15	2	1	2	4									
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments																
			4303	In Progress	Work with Refurbishment Organization to Address Conflicts	The project team will continually collaborate with the refurbishment organization to evaluate any potential conflicts during the planned installation windows.	Ricardo Fiorini		31-Oct-16	Initial discussions had with Refurbishment and Work Control at the beginning of November 2015. The project and Refurbishment will work to																
14146	31710 - Additional Design to Address Increased HX Seismic Loads Delays Start of Installation	There is a risk that additional design to address increased HX seismic loads delays start of installation. Additional design is required to due errors in the original Combustion Engineering HX model and seismic analysis. Therefore the loads on the floor anchors are greater than initially design for, and heat exchanger flexibility could result in unacceptpable loads and fatigure failures in the piping system. Additional engineering may result in modifications to the HX, new piping supports in the field or extensive fatigure analysis, all of which could significantly delay the start of field installation. If significant, this could push the work into refurbishment.		Active	James Philipps		29-Apr-16	Mitigate	29-Feb-16	2	1	5	10	2	1	4	8									
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments																
			6451	In Progress	Perform Seismic analysis	Perform Seismic Analysis and Level D analysis with HX natural frequency	James Philipps		15-Apr-16																	
12793	PULSW Piping Condition is unacceptable for welding to the new SDC HX Nozzles.	There is a risk that PULSW piping condition is unacceptable for welding to the new SDC HX nozzles. The PULSW piping at the HX tie-in points (shell side supply and discharge nozzles) is in a degraded condition due to microbiologically induced corrosion (MIC), and is approaching the minimum allowable wall thickness at certain pit locations. There is a risk that the piping is in such a degraded state, that it is unsuitable for welding to the nozzles on the new SDC HX's.		Active	Ricardo Fiorini		29-Apr-16	Accept	31-Mar-15	2	1	3	6	2	1	3	6									
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments																
			4312	In Progress	31710 - Replace PULSW Piping prior to HX Replacement	SDC HX / MIC Component Engineer was requested to have PULSW piping replaced by the Station prior to SDC HX Replacement. Work was not approved into scope. Therefore, if piping deemed unacceptable at time of replacement, then piping will need to be replaced on the spot. Vendor to ensure contingency material is available.	Ricardo Fiorini	James Philipps	31-Dec-18																	
	Environmental Releases during Installation	There is a risk of Environmental Releases during execution activities (HX draining and drying activities) to the lake and air.		Active	James Philipps		29-Apr-16	Mitigate	30-Jun-16	2	1	3	6	1	1	2	2									
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments																

<a href="#">12803</a>			<a href="#">4327</a>	In Progress	Work Plan Review by Environmental Compliance and ALARA	EPC vendor to ensure all requirements outlined in the Environmental Impact Worksheet are captured in the installation work plans. Darlington Environmental Compliance work group will review all work plans before they are routed for approval. Coordinate closely with ALARA regarding the drying and transport of the HX's within the station (inside andoutside). ALARA work group will review all work plans before they are routed for approval.	Ricardo Fiorini		08-Apr-16	Work plan review is in progress with sign-off expected by end of Feb 2016.								
<a href="#">12805</a>	Heat Exchanger Unavailability	There is a risk that the Project cannot obtain permission from Reactor Safety and Operations to exceed the 'maximum amount of acceptable unavailability for SDC HX's per year' (72 days per year per unit or 288 days per year per station [R-6]). The estimated time of each SDC HX's unavailability during replacement is 40 days, and therefore in a given year only 1 HX per unit could be replaced. This may prevent the SDC HX's from being replaced in order of age, with Unit 2 first, followed by Unit 1, Unit 3 and finally Unit 4.		Active	James Philipps			29-Apr-16	Accept	24-Mar-16	2	1	3	6	2	1	3	6
There are no Not Started, In Progress Actions associated with the risk.																		
<a href="#">12791</a>	Accessibility Issues	There is a risk that issues getting inside containment (access from MCR) or working inside containment (Breathing Air and Suit Communications system, Cooling System issues) cause delays to the execution work in the field and prolong the overall replacement duration.		Active	Ricardo Fiorini			29-Apr-16	Accept	31-Mar-15	2	1	2	4	2	1	2	4
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6390</a>	In Progress	16-31710 - Ensure Containment Systems Avaible for Work in SDC rooms	Work Plan has pre-requisite steps to ensure Breathing Air and Suit Communication systems, and SDC Air Condition Systems are available for use prior to starting the work in the field.	James Philipps		20-May-16	Work Plan preparation is in progress.								
<a href="#">12798</a>	16-31710 Design Quality	There is a risk that the EPC Vendor's Design Engineering Change (EC) Packages lack the necessary detail due to insufficient field walkdowns, or incorrect assumptions, thus leading to delays because of rework, or additional scope to address missed items.		Active	Ricardo Fiorini			29-Apr-16	Mitigate	31-Mar-15	3	1	1	3	2	1	1	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">4322</a>	In Progress	31710 - 3rd Party Review of Design	A third party review of design documentation is required as part of the Contract.	Ricardo Fiorini		30-Dec-16	Third party review required for revised Design due to rework								
<a href="#">12802</a>	Inability to completely dry the SDC HX's in a timely manner.	SDC HX's need to be dry prior to removal from containment and for shipping off-site. The time to dry the HX's needs to be minimized, as it is on critical path (new HX's cannot be installed until the old HX's are dry and removed from containment). The use of Munters, Heaters, HEPA units, and vacuum pumps may not be able to dry the HX's in the time allotted (based on the allowed unavailability duration for each HX Installation), which could extend installation schedule and impact nuclear safety (increased time with no redundant HX). There is a also a risk that this equipment cannot completely dry the HX's, which could cause a tritium emission during recycling from remaining D2O(see Pickering Moderator HX Recycling SCR N-2013-16015).		Active	James Philipps			29-Apr-16	Accept	30-Jun-16	3	1	1	3	3	1	1	3
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">4326</a>	In Progress	Incorporate Past HX Drying OPEX	The ES MSA Contractor is to review OPEX from Pickering HX Drying Activities during Detailed Design and Installation Planning, and review all options for HX drying, to ensure the preferred option can effectively remove all residual water from the HX's prior to shipment for disposal/recycling, and, enable HX replacement activities within the allowed SDC HX unavailability time.	Ricardo Fiorini		11-Dec-15	OPG has provided the EPC Vendor with OPEX on Moderator HX drying and Dry Fuel Storage Container Vacuum Pump system. OPG Projects and ALARA have had several discussions with the EPC vendor regarding drying requirements.								
Project: DNGS Projects - 31716																		
<a href="#">13727</a>	Risk of the production equipment failing testing and or commissioning due to the complexity in designing the amplifier boards - 31716	Based on Pickering OPEX and the complexity of designing the amplifier board, there is a risk that the delivered product might fail testing or commissioning. This can have an impact on the total cost of the project and lead to installation and or commissioning delays.	2	Active	Rajbir Singh	Bassam Alawi		12-May-16	Accept	31-May-17	4	2	4	16	2	2	4	8
There are no Not Started, In Progress Actions associated with the risk.																		
<a href="#">13776</a>	Risk of OPG Design not having the Technical Expertise to support the project - 31716	OPG Engineers providing design oversight might not recognize the limits of their technical expertise. This can cause significant rework and can impact the project scheudle if milestones are delays and or missed.	2	Active	Rajbir Singh	Bassam Alawi		12-May-16	Accept	10-Oct-16	4	1	4	16	1	1	3	3
There are no Not Started, In Progress Actions associated with the risk.																		
	Risk of the production equipment failing testing and or commissioning due to the complexity in designing the amplifier boards - 31716	Since the amplifiers will be custom designed, their quality will not have been proven. There is a risk that excessive failures occur. The consequences of excessive failures could be excessive rework and or commissioning delays.	1	Active	Rajbir Singh	Bassam Alawi		12-May-16	Avoid	01-Jul-19	3	2	4	12	2	2	2	4

Run by:

12809	amplifier boards failing prematurely since they will be custom designed and their quality will not have been proven - 31716	that premature failures occur. The consequences of premature failure could be spurious reactor trip or failure to trip during adverse conditions.	Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments												
			6152	In Progress	Premature Failure - 31716	Since the amplifiers will be custom designed, their quality will not have been proven. There is a risk that premature failures occur. The consequences of premature failure could be spurious reactor trip or failure to trip during adverse conditions. Technical subject matter experts along with OPG designer will be involved in the oversight.	Bassam Alawi	Bassam Alawi	01-Jan-18													
			6153	In Progress	Introduce rigorous testing to mitigate equipment failure - 31716	To mitigate the risk of the production amplifier units from failing during commissioning, rigorous testing will be done at both the vendor facility and at the darlington station to identify equipment failures before installing on channel.	Bassam Alawi	Bassam Alawi	29-Dec-17													
13777	Risk of potential Schedule Impact due to changing future planned outage dates 31716	There is a risk that long range planning can risk meeting the changing future planned outage dates. This can change the execution strategy of the project and ultimately impact the project completion date.	2	Active	Rajbir Singh	Bassam Alawi	12-May-16	Accept	31-May-17	3	1	4	12	2	1	3	6					
			There are no Not Started, In Progress Actions associated with the risk.																			
13794	Risk of equipment vendors estimating or overestimating the development and production cost of the amplifier units - 31716	There is risk that some vendors may have under estimated the development and production cost of the equipment. This is indicated by the large discrepancies between the vendor quotes. The total vendor cost might exceed the vendor allocated budget in the BCS.	3	Active	Rajbir Singh	Bassam Alawi	12-May-16	Accept	29-Jul-16	3	3	3	9	1	2	2	2					
			There are no Not Started, In Progress Actions associated with the risk.																			
13779	Limited OPG Resources can cause delays to the projects due to lack of support - 31716	The OPG design resource is limited at the present time. There is a risk that any emergent issues on other projects could divert resources away from this project which can lead to schedule slippage.	3	Active	Rajbir Singh	Bassam Alawi	12-May-16	Accept	31-May-17	3	1	2	6	3	1	2	6					
			There are no Not Started, In Progress Actions associated with the risk.																			
Project: DNGS Projects - 32202																						
14173	32202 - BDBE Procedure updates (EMEG's) Delay/Rework	Uvailability of adequate resources with correct skill sets for preparing/updating the Emergency Mitigating Response Guide procedures may cause delays and rework, impacting the fainal AFS and turnover for Fukushima modifications.	3	Active	Brian Graham		26-Apr-16	Monitor	31-Jan-17	5	1	5	25	2	1	5	10					
			There are no Not Started, In Progress Actions associated with the risk.																			
12811	32202 - Fukushima Phase II - Risk of cost and schedule growth due to Functionality Review findings.	Beyond Design Basis Functionalaity Review could expand in scope due to discovery or find deficiencies requiring remedial actions by the project. This would result in extended project schedule and cost.	3	Active	Brian Graham	Dale Schnedler	26-Apr-16	Monitor	31-Mar-15	2	2	5	10	2	2	5	10					
			There are no Not Started, In Progress Actions associated with the risk.																			
12815	32202- Fukushima Phase II Risk of delay or cost increases due to scope definition/control	Project has significant risk of scope evolution stemming from:  Ongoing evolution of OPG/Industry/CNSC approach to BDBE. Initial scope for this project consists of numerous modifications initially provided as solutions in a "Fast track" context, rather than problems. Use of 'Category 4' Modification process, with weaker definition of deliverables. Program is composed of numerous small modifications, integration issues with the overall respose drive changes. Many aspects of BDBE response are new, outside normal practices or require "extent of response decisions. Frequent scope change and clarification continues to occur in the design phase, contributing to cost and schedule delays. Project is part of a larger program for BDBE and SAM response, making it more difficult to control scope at a project level. Alignment with PNGS ( for compatibility of equipment and consistency) often results in delay and sometimes scope as there are significant difference between the stations. The BDBE project structure is unique in having a support organisation outside of projects which has retained a significant role in ongoing scope definition. This may cause delay or cost impacts. <del>This is an ongoing risk.</del>	2	Active	Brian Graham	Dale Schnedler	26-Apr-16	Monitor	30-Dec-16	1	2	5	5	1	2	5	5					
			There are no Not Started, In Progress Actions associated with the risk.																			
	32202 Fukushima Phase II - Exchange rates may impact ability to complete project within release/schedule/available businees	Exchange rates may impact ability to complete project within release/schedule/available businees	3	Active	Brian Graham	Dale Schnedler	26-Apr-16	Monitor	31-Mar-15	1	1	1	1	1	1	1	1	1				

12812	There is a risk currency fluctuation for US EPC Vendors/Material will impact the ability to complete the project on schedule or withing the available release and business plan funds.	plan. Signiricant materials and EPC resources are sourced from the US.	There are no Not Started, In Progress Actions associated with the risk.															
Project: DNGS Projects - 33258																		
12823	Equipment reliability during Execution - 33258	All equipment on the alternate division must be functional. This applies also to equipment inside steam rooms. This can lead to increased prerequisites and schedule delays if equipment is deficient.		Active	Rajbir Singh	Mario Campigotto	12-May-16	Mitigate	31-Aug-17	4	2	5	20	2	3	3	6

14251	33973	may increase cost. Other technical issues remain open from first SG commissioning and these could increase scope//complexity for the remaining replacements (cost and schedule). Possible Discovery work for each SG remains a risk.	6442	In Progress	Resolution of vibration monitoring system	To minimize risk and reowir to the remaining SGs, the vibration monitoring issue will be resolved prior to proceeding to installation of next SG.	Rajbir Singh		31-May-16										
			6443	In Progress	Float in installation schedule	The start of installation of the 2nd SG has been postpone by approximately 4 months to allow time for the resolution.	Rajbir Singh		31-Aug-16										
14249	Loss of Resources during Execution - 33973	If there are major delays to the SG outage schedule the project could loose continuity in expertise and knowledge within OPG resources (primarily DTL/MTL/FTL roles). Plus, there is risk of losing continuity in control equipment vendor's resources/expertise, which are critical for commissioning. Per experience from the first SG commissioning, Station resources are limited, and there is the risk of delay to commissioning if there are emergent issues. Due to the delay of 2nd SG Commissioning, the schedule is slipping into the approaching D1641 outage, which is resulting in potential loss of dedicated resources.		Active	Rajbir Singh		12-May-16	Mitigate	28-Apr-17	3	1	4	12	2	1	4	8		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6437	In Progress	Ensure project staff	Project staff will be retained for at least the second SG, but will be reassigned temporarily if there are major delays in the project schedule.	Rajbir Singh		31-Mar-17										
			6438	In Progress	Station Communication	The project will work with the Station to plan up front and secure resources to support commissioning.	Rajbir Singh		31-May-17										
			6439	In Progress	Resource Review	The resource load will be reviewed with the Station at Senior Management level. Resource commitments will be arranged early in the planning process.	Rajbir Singh		31-Mar-17										
14252	Possible machine overhaul for SG4 during Commissioning - 33973	Current SG4 machine status/condition - hydraulic start drive, internal gearing and bearing assemblies especially with the deteriorated condition of the front bearing/housing - deteriorated owing to the repeat start/stops cycle required as part of (controls system) commissioning. Thus the SG4 control system commissioning cannot be completed unless machine overhaul is done, impacting schedule.		Active	Rajbir Singh		12-May-16	Mitigate	31-May-16	3	1	4	12	2	1	3	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6444	In Progress	Station Co-ordination	Work with Station on potential mitigation/recovery plan, if possible include the potential of a gas generator replacement.	Rajbir Singh		31-May-16										
14248	Vulnerable SG Outage Schedule during Installation - 33973	SG outage schedule is vulnerable to emergent SG breakdown maintenance/repair. Such emergent issues could result in project delays in the order of months. There is also risk that major emergent issues could shuffle the order of execution of the remaining SG controls replacements. During the current SG4 Commissioning, issues for the speed probe have risen.		Active	Rajbir Singh		12-May-16	Mitigate	31-Mar-17	2	1	5	10	2	1	5	10		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6436	In Progress	33973	For delays greater than 6 months, the project will be placed in deferral status. Detailed designs have been completed for all of the remaining SGs. All design packages will be revised to incorporate the lessons learned from the first SG, allowing the flexibility to change the order of SG controls installations. The planning of the next SG will be integrated with the Station plan. This project schedule will minimize impact to VBO.	Rajbir Singh		31-Mar-17										
14250	Lack of Performance from EPC Vendor and possible multiple SG Outages during Execution - 33973	There will be a learning curve for the EPC Contractor in providing engineering support for execution since they do not have OPEX from first SG. Darlington OP&P does not allow for more than one SG to be removed from service at any time. Forced outage of any SG during the installation or commissioning of this project will result in more than one SG outage, which may affect station operation.		Active	Rajbir Singh		12-May-16	Mitigate	31-Mar-17	2	1	5	10	2	1	5	10		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6440	In Progress	Additional OPG Oversight	OPG's Project and Design team will provide additional oversight during the execution of the next SG.	Rajbir Singh		01-Mar-17										
			6441	In Progress	Salvaged Spares from previous SG replacements	Controls system components salvaged from the retrofitted SGs will be available as spares for the remaining SGs, thereby providing an interim bridging strategy until all SGs retrofits are completed in 2017. This may help in reducing the SG outage time.	Rajbir Singh		31-Mar-17										
12837	Emergent SG maintenance/repair issues arise.	There is risk of emergent SG maintenance/repair issues, casued by deteriorating SG equipent. The result would be delay of the SG controls execution and project schedule, since one SG only can be removed from service at any time. There would also be cost impact through interest charges.		Active	Rajbir Singh	Raaj Kovinthan	12-May-16	Accept	31-Jan-17	3	3	3	9	3	3	3	9		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			4425	In Progress	33973	This risk cannot be mitgited or avoided. Ensure installation schedule is aligned with the SG outage cycle plan.	Rajbir Singh	Raaj Kovinthan	31-Jan-17	Controls installation is aligned with 10 year SG outage plan. Will continue to monitor.									

14120	Gas Generator Vibration Readings Higher Than Expected	Event: There is a risk that the gas generator (GG) vibration readings will be greater than the readings recorded prior to the modification (i.e. GG vibration operating margin to alarm/trip could be reduced). Cause: The new monitoring equipment being more sensitive than the old equipment. Impact: This could result in the new equipment being not accepted for service by stakeholders and or delay to SG4 (2nd SG) return to service.		Active	Rajbir Singh	Raaj Kovinthan	12-May-16	Mitigate	20-Jun-16	4	2	2	8	2	2	2	4
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6266	Not Started	Evaluate Alternate Vibration Probe for Gas Generator	Evaluate an alternate vibration probe (manufacturer CEC) for the SG gas generator during commissioning of SG4.	Rajbir Singh	Raaj Kovinthan	11-Mar-16	Probe procured and ready to be tested durin commissioning.							
12841	Vendor expertise is not available during commissioning.	Turbomachinery commissioning expertise (within controls vendor) is a scarce resource. There is a risk that vendor resources may not be available to support commissioning, casued by changes in the execution schedule. The result would be delay to commissioning and SG return to service. <a href="#">13802</a>	38466 CSA Sewage Line Project - Source of Clean Water	There is a risk that clean water cannot be provided to clean the temporary tank, temporary piping, and the main sewage sump (i.e. type of water, source of water). The impact is delays in the work leading to cost increase.		Active	Rajbir Singh	Samantha Thurston	09-Mar-16	Mitigate	10-Jun-16	2	1	2	4	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">5523</a>	In Progress	38466 CSA Sewage Lift Station Project - Source of Clean Water (Risk ID 00013802)	Arrangement for the source of the water to be made prior to entering the construction stage.	Samantha Thurston	Samantha Thurston	10-May-16	Review of installation area and resources are in progress.							
<a href="#">13797</a>	38466 CSA Sewage Line Project - Condition of the Asbestos sewer line (0-79120-L68-W6ACC)	Inspection of the asbestos sewer line (0-79120-L68-W6ACC) from 2006 found only minor spot repairs were required. Since asbestos sewer line is expected to last 70 years, there isn't a large concern that major repairs would be required. An inspection in the future would be beneficial in identifying if any other spot repairs are required on the line. The risk for not inspecting the line is that the condition of the line will be unknown and even though there is a new sewage line (0-79120-L67-W6A) inside the powerhouse, the asbestos line, 0-79120-L68-W6ACC, may also need major repair and would lead to leakage or clogging the line. Project: DNGS Projects - 80062																	
13988	80062 - There is a risk that the vendor will change their battery manufacturing process	If battery manufacturer changes the manufacturing process, they may not support the batteries specially designed for OPG. Vendor is preparing to switch their manufacturing process for cell plates from vertical pour to side pour, they have found this process to be more efficient with better quality. If vendor does support the OPG specific batteries there will be additional costs for them to produce additional cell plate molds. The vendor recommends OPG switch to the standard batteries used in all other nuclear applications. The difference is between a single point plate suspension deign (standard) or a 2 point plate suspension design (OPG).	2	Active	Marc Clemente	Marc Clemente	29-Apr-16	Monitor	28-Apr-16	2	3	1	6	2	3	1	6

	6549	Not Started	80023 - Obtain cost estimates for valves following approval of technical specification	Obtain cost estimate from vendors following approval of technical specification.	Francis Davis	S Naeem	29-Jul-16												
14312	80023 SG LCV Replacement Schedule Risk if All Installation Required to be Completed During Outage	The original plan is based on completing retrofit of 4 LCV's per unit during outage, and the remainder of the 4 retrofits per unit online. Also, not more than 4 LCV's were to be modified during a specific unit outage. This plan was developed in consultation with stakeholders during the COMS process. However, if it is determined following the first outage installation that the remainder of the LCV's also need an outage to modify, then this will increase the project schedule.	1	Active	Francis Davis	S Naeem	29-Apr-16	Monitor	13-Jul-18	1	1	5	5	1	1	1	1

			5715	In Progress	Mitigate Impact to Schedule and Cost Due to Potential Exceptions to Cat ID	Project to work with Supply Chain and Procurement Engineering during procurement process, to assess any Cat ID exceptions identified. Mitigating activities will be determined and the project will then work with Supply Chain to implement actions to mitigate the issues. Ex 1: Design acceptance of deviations. Ex 2: Use of premium time with vendor as required to address exceptions.	Sorin Marinescu	Greg Maggs	31-May-17								
Project: Minor Modifications - 83061																	
14295	83061 - PNGS Stator Cooling Water Dissolved Oxygen Reduction - Software categorization	Event: Software qualification of one or more components or group of components is required for the successful implementation of this modification Cause: Due to the low chemical addition rates required for alkalyzation of the stator cooling water the metering pump to be used may have a PLC or other software. Impact: Software qualification would extend the implementation schedule by several months. Estimated at 5-6 months.	3	Active	Chris Chan	Jonathan Liberda	13-Mar-16	Monitor	31-Dec-16	3	2	4	12	2	2	4	8
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6707	In Progress	83061 - PNGS Stator Cooling Water - Software qualification	Chemical addition equipment may require software qualification (possible due to needing a PLC or other equipment). Software group involvement in the preliminary design process will be used to expedite the approvals required.	Chris Chan	Jonathan Liberda	03-Jun-16								
	83061 - PNGS Stator Cooling Water Dissolved Oxygen Reduction - Software categorization Run by:	Event: There is no finding to confirm testing of the stator cooling water and equipment requirements require	3	Active	Chris Chan	Jonathan Liberda	13-Mar-16	Mitigate	31-Dec-16	2	1	4	8	1	1	4	4
For Internal Use Only																	

Page 1 of 1

14293	water Dissolved Oxygen Reduction - Chemistry testing funding	There is no funding to perform testing on the stator cooling water and equipment coupons to ensure no adverse effects as a result of the alkalization of the system. (eg: precipitation) Cause: Due to the expedited nature of this modification, PNGS minor modifications (MMOD) will provide bridge funding until BCS approval. It is possible that MMOD have insufficient funding to perform testing. Impact: Delay to the project until BCS approval. Expected total resultant delay is 2-3 months.	6696	In Progress	83061 - PNGS Stator Cooling Water - Tracking progress of project funding	Track BCS approval by P&M and corporate Chemistry to ensure funding available when required.	Chris Chan	Jonathan Liberda	27-May-16										
14294	83061 - PNGS Stator Cooling Water Dissolved Oxygen Reduction - Construction schedule risk	Event: Implementation of any required work during outage, for example on the stator cooling head tank, is to be completed during the next available outage. Preferred outage is 1671. This does not meet the require milestone dates as per N-PROC-MA-0013 R16, in particular milestone 10 - Scope Freeze. Cause: There is a short timeline between request for the modification (February 2016) and expected implementation (Q4 2016 to Q1 2017). Impact: Outage scheduling is prepared to minimize nuclear safety risk, maintenance windows, and permitry evolutions. Late scope additions require re-review of several of these considerations.	4	Active	Chris Chan	Jonathan Liberda	13-Mar-16	Avoid	31-Dec-16	2	1	4	8	2	1	4	8		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6699	In Progress	83061 - PNGS Stator Cooling Water 1671 outage scope injection	Implementation of stator cooling water sparging is likely to have some installation scope requiring outage. 1671 outage scope freeze milestone has passed, and any new scope much be progressed using a scope change form.  This action is to socialize the additional scope with the 1671 turbine SWC prior to formal scope change and then to track the scope change to implementation upon detailed design approval.	Chris Chan	Jonathan Liberda	30-Jun-16	April 1, 2016, email was sent to the SWC for the turbine highlighting possible addition of some work on the stator cooling head tank.									
14292	83061 - PNGS Stator Cooling Water Dissolved Oxygen Reduction - Construction funding availability	Event: The business case summary (BCS) for project 83061 - Implementation of Pickering 018 Stator Cooling Water (SCW) alkalization and make-up water deoxygenation has not yet been approved despite the need for this modification to be implemented in later 2016 to early 2017. Impact: There are no funds available to support execution of this project until the BCS is approved.	3	Active	Chris Chan	Jonathan Liberda	01-Apr-16	Mitigate	30-Jun-16	3	1	2	6	3	1	2	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6721	In Progress	83061 - Stator Cooling Water - Track spending under MMOD	Due to the expedited nature of this modification MMOD will provide bridge funding to progress the engineering. This action is to track the following: Establishment of tracking Tempus work events for future re-assignment upon BCS approval Periodic assessment of BCS approval to assure construction financing availability.	Chris Chan	Jonathan Liberda	06-May-16	TWE are setup for all project staff BCS is currently with projects and modification, AISC part A is approved. AISC part B in development. Project charter is in final approvals									
14297	83061 - PNGS Stator Cooling Water Dissolved Oxygen Reduction - Material availability	Event: The modification may require custom fabricated materials, such as a double walled chemical storage tank. Cause: There is a short timeline between request for the modification (February 2016) and expected implementation (Q4 2016 to Q1 2017). Impact: Such custom fabrications may have a long lead time. Potential impact to schedule is 4-5 months.	3	Active	Chris Chan	Jonathan Liberda	13-Mar-16	Mitigate	07-Jan-17	2	1	3	6	1	1	1	1		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6722	In Progress	83061 - PNGS stator cooling water - Preliminary design scoping for long lead items	As part of the preliminary design, possible long lead materials are to be identified and procurement to be started as early as possible.	Chris Chan	Jonathan Liberda	24-Jun-16	Preliminary design will include a review for potential long lead items. This action will be reviewed at that point.									
14296	83061 - PNGS Stator Cooling Water Dissolved Oxygen Reduction - Alkalization system tie-in point	Event: #-41240-V2036 cannot be used, either by modification with a Tee or other means such as TMOD or TALT, to allow for alkalization when required and/or online chemical cleaning when required. Cause: The proposed tie-in point #-41240-V2036 for the stator cooling alkalization system is also used for online chemical cleaning. Impact: The addition of a new injection point into the stator cooling water system will increase the cost and schedule of this modification. The extent of the impact will depend on finding a new location for injection.	3	Active	Chris Chan	Jonathan Liberda	13-Mar-16	Monitor	31-Dec-16	2	2	2	4	2	2	5	10		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6705	In Progress	Alkalization tie-in point availability to SCW system	Confirm that the online chemical clean tie-in point can be used for permanent alkalization addition. Possible system configuration may require isolation during online chemical cleaning, requiring the use of a Tee.	Chris Chan	Jonathan Liberda	01-Jun-16	Walked down the tie-in point. There is room to add a Tee, need confirmation during detailed design it can be used.									
Project: Minor Modifications - 82839																			
	Technical Specification for the LP FWHX procurement of need to updated	Event: Technical specifications prepared by the design are not updated with the comments from SME. Project: Nuclear Waste Management (Project) - 60217																			
13020	Quality of Current Cost Estimate	The current cost estimate for this project is Class 4, created internally based on a cost estimate provided by Tetra Tech as part of the Feasibility Study. There is a risk that the lower class cost estimate provided by the EPC vendor does not align with this cost estimate due to deviations in the scope proposed by the Feasibility Study. This may result in insufficient or excess funds being requested based on the current estimate of project costs.	4	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Mitigate	20-May-16	3	3	4	12	2	2	2	4		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			4723	In Progress	Base Cost Estimate on Vendor's Proposal	Prepare the project cost estimate on the basis of the EPC vendor's cost estimate given in their proposal. Complete negotiations to ensure the cost is in accordance with the scope and is not excessive. This will allow the project cost estimate to be in line with the vendor's proposal, and will ensure that sufficient funds will be requested with appropriate contingency.	Sharon Maddock	Steven Sahakian	20-May-16	Vendor proposal expected 06-May-16.									
13477	Sample Stations Building Accomodation for Equipment	There is a risk that the existing sample station buildings (MISA huts) cannot accomodate the new equipment necessary due to size constraints.	3	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Mitigate	22-Mar-17	3	3	4	12	2	2	2	4		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			5196	Not Started	Review Design to Evaluate Need; Revise Scope if Necessary	Evaluate during early stages of the design phase. If structural changes (either to the MISA huts or sumps) or excavations are required, assess solutions and revise the scope accordingly. Ensure that sufficient contingency is assigned to support this need and to address this risk.	Sharon Maddock	Steven Sahakian	22-Mar-17										
13474	Sample Stations Structural Change Requirements	There is a risk that structural changes / excavations are required for the installation of Parshall flumes, sump pumps, power cables, and communication lines if current facilities do not support. The recommendation has not been evaluated in the Feasibility Report in sufficient detail.	3	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Mitigate	22-Mar-17	3	2	3	9	2	2	2	4		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			5196	Not Started	Review Design to Evaluate Need; Revise Scope if Necessary	Evaluate during early stages of the design phase. If structural changes (either to the MISA huts or sumps) or excavations are required, assess solutions and revise the scope accordingly. Ensure that sufficient contingency is assigned to support this need and to address this risk.	Sharon Maddock	Steven Sahakian	22-Mar-17										
13484	Neglecting Other (Related) Modification Designs in Sample Stations Upgrade Design	There is a risk that the design of this modification is completed without consulting the concurrent or recently completed designs of other modifications which are related to and/or interface with the sample stations. This may result in an inadequate design.	2	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Avoid	22-Mar-17	3	1	3	9	2	1	2	4

Data Refreshed: 12-May-16 10:30 PM

Project: Nuclear Waste Management (Project) - 60218																			
13726	Delay in Closeout of POs 220438 and 229265 due to Outstanding Payouts and Rate Settlements	There is a risk that the closeout of POs 220438 and 229265 is delayed due to Performance Fee payouts, the outstanding rate increase, and PMT (project management) rates being negotiated between OPG Supply Chain and the vendors, Black & McDonald and RCM Technologies.	1	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Accept	29-Jul-15	3	1	2	6	3	1	2	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			5695	In Progress	Follow Up with Supply Chain	OPG Supply Chain to complete settlement of payouts and rates which will allow for ES MSA POs to be closed. Follow up with Supply Chain on the status of this.	Sharon Maddock	Steven Sahakian	30-Sep-15	COMPLETED (09-Sep-15): Followed up with Supply Chain. They are in the last stages of settling these payouts and rates and will follow up with Projects upon completion. Now depends on EPSCA unions posting their rates. Action to close once POs can be closed.									
Project: Nuclear Waste Management (Project) - 60219																			
13943	Delay in Closeout of PO 228027 due to Outstanding Scope Addition Work	There is a risk that the closeout of PO 228027 is delayed due to outstanding WUFDSE Room 129 Overpressurization work, included as a scope addition to this PO, documented by PCA: PO-228027-2014-002. Installation of the louver, damper, and actuator is completed but software changes and tie-in to the HUND system still remain.	3	Active	Sharon Maddock	Steven Sahakian	04-May-16	Mitigate	29-Jul-16	3	1	3	9	1	1	2	2

Project: Nuclear Waste Management (Project) - 80032																			
14234	Pending Changes (EC-118441) could impact Software EC Completion	The changes from the reconfiguring the Generator Control Logic (as part of EC 118441) in not expected to be complete before mid May 2016. However, the Software Qualification (EC133290) for this project is to be completed by August 30, following the Software Integration Testing. The current timelines for integrating the 2 ECs has the potential to delay Engineering completion, and also result in some rework for completing the Software EC.	3	Active	David Calkin	Rajkumar Ramaswamy	29-Apr-16	Mitigate	30-Jun-16	4	4	5	20	2	1	3	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			7005	In Progress	Complete Software for EC118441	Complete software portion of EC118441- Generator Control Logic.	Sharon Maddock	Lashan Munasinghe	29-Jul-16	In-progress									
14416	Impact of this BMS modification on interfacing Data Handling System has not been verified	The communication protocol between the New BMS and the Data Handling System has not been confirmed. If this design is not confirmed the alarms from the BMS may not be available at the Data Handling System.	4	Active	Rajkumar Ramaswamy	Parames Misra	29-Apr-16	Mitigate	30-Jun-16	4	1	4	16	1	1	2	2		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6979	In Progress	Develop Test Bed to confirm communication protocol between DSF BMS and Datahandling System	Fox Sub-contractor to develop test bed to confirm the communication protocol between BMS and Data Handling Sysytem.	David Calkin	Rajkumar Ramaswamy	30-Jun-16										
	EPC Contract cost could increase due quality of the estimate.	The EPC estimate is a Performance Fee proposal. Inadequate scope control could result in scope/cost growth		Active	David Calkin	Rajkumar Ramaswamy	29-Apr-16	Mitigate	29-Aug-16	3	1	3	9	3	1	3	9		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									

14060				6294	In Progress	Conduct bi-weekly verification of the design work progress.	Provide adequate project oversight to manage cost growth. Schedule regular bi-weekly progress meetings and review design deliverables.	David Calkin	Rajkumar Ramaswamy	30-Aug-16	Weekly project review meetings are scheduled for a set of standard agenda items, to monitor the earned value. All Engineering deliverables are milestone based, and hence the risk is low. However, the OPG Project/ Engineering staff will be at the Engineering Contractors site to physically review the the progress, and ensure OPG receives value for money. The Engineering contractor will also upload all deliverables (monhly basis) to a sharepoint site, to enable OPG monitor the design progress.									
13747	Software Categorization and Qualification issues not fully resolved, adequate documentation not available	The initial screening has indicated that the software needs to be Cat 2. The Building Management System (BMS) communicates alarms to the WVRB Control Room, for operator action during evenings and weekends, when the Processing Building is unmanned. The WVRB Control Room is designated as Cat 2. The BMS is primarily designated Cat 2, only because it is providing input to the Cat Software (WVRB). Currently the Incinerator Upgrades project is working on reducing the Cat 2 designation of the WVRB software. This would imply that the BMS software categorization could also be lowered.Additionally, no adequate Software System Requirements/ Design Description documentation is available.	4	Active	Bana Berro	Parames Misra	22-Apr-16	Monitor	29-Sep-15	2	1	4	8	2	1	4	8			
			There are no Not Started, In Progress Actions associated with the risk.																	
Project: Nuclear Waste Management (Project) - 60145																				
14042	Wraparound Engineering Completion	There is a risk that Wraparound Engineering (ECC Transitioning to Nuclear ECC) will be delayed due to outstanding design documents.	3	Active	Sharon Maddock	Lashan Munasinghe	29-Apr-16	Mitigate	31-Oct-16	3	2	4	12	2	2	3	6			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			6022	In Progress	Obtaining Revised As-Builts from Designer of Record	Designer of Record (WalterFedy) has revised and provided all As-Builts with Field Changes incorporated. Several As-Builts from Designer of Record (Areva) are outstanding.	Sharon Maddock	Lashan Munasinghe	29-Jul-16											
Project: Nuclear Waste Management (Project) - 80056																				
14055	AFS Vehicle Modification Dates will not be achieved because of GEN4 Trunnion issues.	AFS vehicle modification dates will not be achieved for LiftKing Vehicles,LT1366K on July 28, 2016, LT13558K on January 12, 2017, LT1025K on June 15, 2017 due to GEN 4-2 Trunnion failure issues which has delayed the start of the first vehicle modification from September 15, 2015. Operation will not place GEN4s back into service until the Trunnion issue been resolved to allow the release of the LiftKing vehcles for modifications.	4	Active	Sunantha Broekhuysse	Paul Menard	04-May-16	Accept	29-Apr-16	5	5	5	25	1	1	1	1			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			6284	In Progress	Operation to Release LiftKing vehicles to start vehicles modifications.	Operation will not release Liftking Vehicles until the GEN4 Trunnion Failure issues have been resolved to their requirements.	Sunantha Broekhuysse	Paul Menard	28-Jun-16	Received verbal confirmation on May 3, 2016 from Sponsor, LT1366K will be ready to ship to the vendor for Modification on June 28, 2016, thus re-starting the project that has been on hold since September 15, 2016.										
			6285	In Progress	Provide LiftKing Revise Plan due to delays caused by GEN4 trunnion failure issue.	Provide a Project Revise Plan once Operation release the GEN4s back into Operation to allow the LiftKing vechilce to be modified.	Sunantha Broekhuysse	Paul Menard	18-May-16	Waiting for Operations provide a release date of the 3 LiftKings in order to provide a revised fabrication schedule. On May 3, 2016, Sponsor verbally advised that LT1366K will be ready to ship to the Vendor for modification on June 28, 2016 thus re-starting the project from September 15, 2015. Project will require two weeks to prepare a revised acceptable schedule and initiate a PCRAF for June AISC approval.										
	Extend Liftkting Vehicle Modification duration due to Vendor's shoo availability.	Three vehicle modification at the vendor is expected to take 4 months each. The duration and the timing on each vehicle modifications was agreed with the vendor based on a start of modification starting September 15. 2015 and ending April 16. 2017. Pending vendor's shoo loading the overall	3	Active	Sunantha Broekhuysse	Paul Menard	04-May-16	Mitigate	31-May-16	2	1	3	6	1	1	3	3

Project: Nuclear Waste Management (Project) - 60127																	
14261	Lack of Resource Priority	There is a risk that, due to the minor impact this work has on the facility, required resources will be allocated to greater priority work leading to schedule delays.	3	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Mitigate	15-Mar-17	4	1	4	16	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6456	In Progress	Facilitate Proper Planning and Ongoing Communication with Project Team	Plan remaining items appropriately and ensure schedule reflects actions/deliverables. Communicate with project team regularly.	Sharon Maddock	Steven Sahakian	15-Mar-17	Risk realized. Design resources have been allocated to higher priority work, pushing the schedule by approximately 2 months at the earliest.							
14262	New or Resurfacing Legacy Issues	There is a risk that, due to the history of legacy issues with this project, further issues will be identified preventing AFS or closeout.	3	Active	Sharon Maddock	Steven Sahakian	27-Apr-16	Mitigate	15-Mar-17	2	1	2	4	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6457	In Progress	Review Project Information, Plan Appropriately	Review project history, issues, and outstanding items; and consult with stakeholders. Plan outstanding work appropriately to ensure processes are followed and all issues are identified and resolved.	Sharon Maddock	Steven Sahakian	13-Jan-17	AFS Strategy Memo documents legacy history, issues, and outstanding items preventing AFS and closeout. Discussion with previous Project Lead, DTL, RSE, DA, and the facility have brought to light all issues and the plan forward. Nuclear ECC process to be followed going forward. Post Response Risk Score to be achieved as AFS approaches.							
Project: Nuclear Waste Management (Project) - 60183																	
14426	Project Completion Risk	Remaining open items at risk include sampling station re-location, removal of temporary cameras, public address, SMR, and jersey barriers, and the completion of paving and bollards. Resolution process regarding the items listed above is being addressed with OPG and ESFOX Management. Resolution is required by mid-May to meet CNSC commitment of 30 June 2016.	3	Active	Sunantha Broekhuyse		04-May-16	Monitor	21-May-16	2	2	3	6	2	2	3	6
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			7075	In Progress	Project Cost Overruns	PCRAF required to draw down contingency. ██████████ ██████████ ██████████ Projects/ES FOX senior management challenge resolution in progress, to be resolved by mid-May to meet CNSC commitment of 30 June 2016.	Sunantha Broekhuyse		31-May-16								
Project: PNGS Projects - 40976																	
13810	13-40976 - FH Outage and IOP- Material availability Cost and schedule impact	Much of the material like , FM/FT cable harnesses and Ajax pump motors for the FH scope has not been procured ever or recently and therefore there is a risk to schedule and cost when not readily available - long lead times, engineering evaluation (ECC ) required, etc.	4	Active	Craig Vervey	Rathin Bagchi	20-Apr-16	Mitigate	30-Dec-15	4	3	4	16	4	3	4	16
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6685	In Progress	Project material availability in time for execution- FM/FT cable harnesses	Cable harness -To followup with supply chain for Po issuance and delivery dates for U58 cable harnesses Ajax Pump motors - Supply chain to provide firm delivery dates	Craig Vervey	Rathin Bagchi	30-May-16								

			<a href="#">6851</a>	In Progress	Project material availability in time for execution- Ajax Pump Motors	To follow up with supply chain for firm delivery dates for Ajax pump motors	Craig Verwey	Rathin Bagchi	30-Jun-16	Vendoer ASL audit I/p.							
<a href="#">13811</a>	13-40976 - FH Outage Work- Access Issues - Schedule and Cost impacts	Resources / contractors are 'onboarded' basedon outage schedule. If the windows change - delayed after the onboarding starts there will be delay costs for contractor resource who can not be re-assigned, this risks exists for each outage.		Active	Craig Verwey	Rathin Bagchi	20-Apr-16	Mitigate	31-Dec-15	4	3	4	16	4	3	4	16
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">6686</a>	In Progress	Obtain firm excution windows to mobilize contractor resources- P1681 FT catenary hoses/Thrust bearing/Rolling shield	Organize challenge meeting with outage organization to obtain committed start date before mobilizing contractor resources on site for P1681/P1671/P1751/P1761 outages and IOP Mods.	Craig Verwey	Rathin Bagchi	30-Sep-16	P1681 challenge meeting with outage organization for FT Hoses complete. P1681 Thrust bearing and rolling shield challenge meeting to be held by April 30/2016 FT MAC valves IOP schedule meeting with FH complete. On going action to complete future outages /IOP execution scheduling .							
<a href="#">14376</a>	13-40976 FH Mod: FM 90 Degree Rotation Mod - Design Solution	The design solution was made as per the solution in Pickering A unit 1 & 4, which are working. however, the solution is not working after the modification was installed in Unit 6.		Active	Craig Verwey	Andy Yan	20-Apr-16	Accept	28-Oct-16	5	2	3	15	5	2	3	15
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">6839</a>	In Progress	Correct Design Solution	Correct Design solution:  Identify cause of design solution failure. Explore the correct design solution Approve design solution is correct. Revise the design EC's with correct solution.	Craig Verwey	Andy Yan	01-Jul-16	Identification of design solution failure is in progress.							
			<a href="#">6840</a>	Not Started	Reschedule installation Windows	The installation of 90 degree rotation mod is to be re-scheduled in IOP once the correct design solution is in place:  Identify the installation windows. Schedule WO's in IOP Remove any hold to keep WO's in the plan.	Craig Verwey	Andy Yan	30-Sep-16								
<a href="#">14215</a>	13-40976 - FH Mod: FT MAC Valves - No Fuel Window Availability	Installation of this mod requires no fuel windows on the respective unit. Therefore, the status of the unit and its fuelling requirements may cause delay to schedule and carrying costs to the project. Due to materials issue as per SCR N-2016-06776, new installation no fuel windows are required.	4	Active	Peter Loi		18-Apr-16	Mitigate	29-Jul-16	3	4	4	12	2	4	4	8

			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			6798	In Progress	41024	Project meeting/updates are made weekly to discuss engineering deliverables.	Aditi Bhardwaj		30-Jun-16									
13533	Design vendor resources	There is a risk that the Design vendor resources may change or be assigned to other higher priority OPG projects based on preliminary engineering phase which will delay engineering		Active	Aditi Bhardwaj		02-May-16	Mitigate	01-Nov-16	2	1	4	8	1	1	3	3	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			6801	In Progress	41024	Projects to ensure that engineering does not get delayed due to other OPG projects of higher priority, with weekly to biweekly updates for deliverables.	Aditi Bhardwaj		30-Jun-16									
13534	Performance of replacement SDS1 isolation amplifiers	There is a risk that the replacement components may not fit/function as expected as they have been reverse engineered and have a different connector than the old isolation amplifier. This would require rework/testing which would impact cost and schedule.		Active	Aditi Bhardwaj		02-May-16	Mitigate	30-Jun-16	2	1	3	6	1	1	2	2	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			6915	In Progress	Performance of replacement SDS1 isolation amplifiers	Project team along with Station Engineering will be monitoring the sample installation closely currently its scheduled for WW27 IOP for 2016.	Aditi Bhardwaj		30-Jun-16									
Project: PNGS Projects - 41027																		
13267	49299/49158/41027 - Risk of additional scope to ensure functionality of BDBE modifications (BCS)	The EPC vendor will perform a functionality assessment study to ensure all of the project modifications will function following a BDBE. If the EPC vendor assessment identifies a gap in functionality post BDBE which requires additional scope to close, it will result in increased cost and schedule for the projects, possibly putting the CNO milestone to complete Fukushima action items by 2017 at risk. As a result of functionality assessments (including SMAs) being done to ensure mods. installed/planned will function post BDBE, gaps may be identified that need to be addressed, leading to additional scope to implement solutions.	3	Active	Cleve Desouza	Cleve Desouza	02-May-16	Mitigate	30-Nov-17	3	4	4	12	3	3	2	9	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			5490	In Progress	49299/49158/41027 - Mitigate functionality assessment implementation	Team of subject matter experts work with EPC vendor engineering team to challenge and disposition any threat for unwarranted scope growth that could result from functionality assesement. This action will continue over the entire duration of the work package and will be statused monthly.	Cleve Desouza		31-May-16	OPG is working with HSL and ARES to go through any potential issues that were presented in order to reduce the risk of scope growth.								
	49299/49158/41027 - Risk of schedule delays due to outage	As a result of unforeseen outage work program delays, resources or installation windows may become unavailable, which could impede our ability to meet outage related milestones and incurred undesired cost.	3	Active	Cleve Desouza		10-May-16	Monitor	23-Dec-17	4	1	3	12	4	1	3	12

13267	BDBE modifications (BCS)	schedule for the projects, possibly putting the CNO milestone to complete Fukushima action items by 2017 at risk. As a result of functionality assessments (including SMAs) being done to ensure mods. installed/planned will function post BDBE, gaps may be identified that need to be addressed, leading to additional scope to implement solutions.	5490	In Progress	49299/49158/41027 - Mitigate functionality assessment implementation	Team of subject matter experts work with EPC vendor engineering team to challenge and disposition any threat for unwarranted scope growth that could result from functionality assesement. This action will continue over the entire duration of the work package and will be statused monthly.	Cleve Desouza		31-May-16	OPG is working with HSL and ARES to go through any potential issues that were presented in order to reduce the risk of scope growth.									
13971	49299/49158/41027 - Risk of schedule delays due to outage	As a result of unforeseen outage work program delays, resources or installation windows may become unavailable, which could impede our ability to meet outage related milestones and incurred undesired cost.	3	Active	Cleve Desouza		10-May-16	Monitor	23-Dec-17	4	1	3	12	4	1	3	12		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6920	In Progress	49299/49158/41027 - Manage Schedule Changes due to Outage	Use OPEX from previous outage delays to ensure adequate resources to support approved outage schedule Ensure adequate funding to execute work with contingency for limited delays Inform OCC Manager, Outage Section Manager, Outage Manager and Project Sponsor of any delays  - attend weekly outage meetings and stability of slated installation windows on outage schedule - re-allocate resources in response to outage window changes to minimize cost and time impacts - communicate and escalate key management personnel unresolved outage scheduling issues	Cleve Desouza		23-Dec-17										
13649	49299/49158/41027 - INADEQUATE SCOPE DEFINITION MAY CAUSE INACCURATE ESTIMATES (BCS)	As a result of inadequate definition and understanding of scope/requirements may cause adverse contract cost and time to complete modification.	3	Active	Cleve Desouza		02-May-16	Mitigate	08-Jul-16	3	2	3	9	2	1	2	4		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			5499	In Progress	Scope Clarification/Stability	This action is to ensure that the currently defined scope of the project remains intact and that all stakeholders invovled have a clear understanding of the scope of the projects and the work to be done to meet requirements of the scope. OPG projects to ensure EPC vendor and all stakeholders involved have a clear understanding of the scope. Projects will challenge any new scope suggested and also provide clarification of the scope, as appropriate.	Cleve Desouza		30-Dec-16	With EPR (including DG Storage) detail design nearly complete, better understanding the design elements lead to increase estimate. Impact on the cost is in the order of \$6M. - Full scale testing is also being undertaken to further confirm hydraulic capability of the EME pump network. PCRAF is being prepared.									
14347	49158 - Risk to EME Building Construction due to Buried Utilities	Due to the existence of at least 2 utility cables (including the main fibre-optic networking cable connecting the 777 Brock Rd. location to the main plant) running beneath the planned construction location for the new EME building, there is a risk that the construction could be delayed by the relocation and retermination of these cables/utilities.	3	Active	Cleve Desouza	Nima Khezri	02-May-16	Monitor	31-Jul-16	2	1	3	6	2	1	3	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6922	In Progress	49158 - Investigate Buried Utilities and Develop a Path Forward	Prepare a plan in order to perform additional work to investigate the buried cables. Scanning and excavation will be performed.	Cleve Desouza	Nima Khezri	31-May-16	2016-04-26: In approximately 2-4 weeks, additional information should be available so that a path forward can be decided for how to deal with the buried cables.									
14415	49158 - Risk of Delay to NV18/V16 Material Delivery	Due to the fact that the procurement of pressure boundary qualified Storz fittings may take longer than initially expected, there is some risk that the installation and AFS of the NV18/V16 modifications may be delayed. The original schedule was based on a material delivery date of May-June, at this time the last items	3	Active	Cleve Desouza		02-May-16	Accept	26-Jul-16	2	2	3	6	2	2	3	6		
			There are no Not Started, In Progress Actions associated with the risk.																

13270	49299/49158/41027 - US-CAN exchange rate retrofit for contract due to currency exchange difference	There is a risk of cost increase as a result of the exchange rate difference between the Canadian Dollar and the US Dollar (USD), which may lead to higher cost on the PO.	2	Active	Cleve Desouza		02-May-16	Accept	08-Jan-17	4	1	1	4	4	1	1	4
			There are no Not Started, In Progress Actions associated with the risk.														
13746	49299/49158/41027 - Availability of Resources (BCS)	As a result of a high volume of deliverables and station priorities, receiving sufficient OPG station resources may be challenging, leading to an impact in schedule and cost.	2	Active	Cleve Desouza		10-May-16	Monitor	06-Oct-16	2	2	2	4	2	2	2	4
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6917	In Progress	49299/49158/41027 - Manage Availability of Resources	OPG Projects will challenge the EPC vendor to work with station work management to avoid conflict with station schedule and resource planning. OPG Projects will also ensure that the EPC schedule utilizes staggered reviews, where possible, to minimize OPG work group resource requirements. Routinely monitor resource balance and challenge project team (including EPC) vendor to plan work with consideration for minimizing resource conflict or identify if risk is imminent.	Cleve Desouza		06-Oct-16								
13750	49299/49158/41027 - Changes to cost of modifications (BCS)	As a result to the potential refinement of industry, regulatory, and station approach, as well as incomplete modification packages at the time of estimation, there may changes to the cost of the modifications.	2	Active	Cleve Desouza		10-May-16	Accept	30-Nov-17	2	2	2	4	2	2	2	4
			There are no Not Started, In Progress Actions associated with the risk.														
14096	49299/49158/41027 - Risk of IOP Work Being Removed from Scope	As a result of the fact that there is a good deal of upcoming IOP work and that this work is scheduled differently from outage work, there is a risk that Fukushima-related IOP work may be ranked as low-priority and removed from IOP scope.	3	Active	Cleve Desouza		10-May-16	Monitor	31-Aug-17	2	1	2	4	2	1	2	4

	41043 - N - T5 governor limit for derating T4701 to T4001	Since T5 governor limit for derating T4701 to T4001 impacts turbine capacity under high ambient conditions it may not be able to achieve 3.5MW at 35 C		Active	Partha Chatterjee		02-May-16	Mitigate	16-May-16	4	3	5	20	4	2	4	16	

Risk Report by Project with Associated Actions

14275	derating 14701 to 14001 impacts turbine capacity under high ambient temperature conditions	conditions it may not be able to achieve 2.5MW at 35 C.																	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6486	In Progress	41043 - N - T5 limit for derating T4701 to T4001 impacts turbine capacity under high ambient temperature conditions	Project to coordinate with Solar to confirm any mismatch between existing T4001 Engine curve and derated T4701 Engine curve. Performance engineering is reviewing the total load requirement. At present the existing EPG are not tested at 2.5 MW load.	Partha Chatterjee		30-May-16										
14276	41043 - O - Air supply requirements for T4701 is greater than T4001 Engine	Since air supply requirements for bearing seals, air assist is greater than the requirements for existing T4001 Centaur, Air receivers may not have sufficient capacity for 5 black start attempt. Design requirements may not be met. Further mods to air supply system may be needed.		Active	Partha Chatterjee		02-May-16	Mitigate	16-May-16	4	3	5	20	5	3	4	20		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6488	In Progress	41043 - O - Air supply requirements for T4701 is greater than T4001 Engine	Projects to coordinate with Solar and obtain the air supply requirement for the new engine and compare with the existing air supply data to confirm any issue with the 5 black start. Depending on the outcome, further actions may be required. Projects to verify the Licensing requirement for 5 black start.	Partha Chatterjee		16-May-16										
14277	41043 - P - New engine T4701 may not be compatible with existing EPG Auxiliary system	New engine T4701 may not be compatible with existing EPG Auxiliary system for example: 1. Bleed valves and guide vane actuators not compatible. 2. Turbine does not align with existing shaft positions. 3. Air intake and exhaust systems are not compatible. 4. Significant software mods required to accomidate new turbine fuel and control requirements. 5. Incompatibility with new engine mounted sensors (Vibration, speed and temperature)		Active	Partha Chatterjee		02-May-16	Mitigate	16-May-16	4	4	5	20	4	2	5	20		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6360	In Progress	41043 - Auxiliary may require upgrade	Design contractor will review with OEM upfront for any compatibility issues with new engine in operation. Projects will discuss any findings from the compatibility report with OEM and sponsor to confirm the path forward. Depending on the outcome further action may be required.	Partha Chatterjee		16-May-16										
14264	41043 - H - Maintenance resource for feild execution	Since the same maintenance crews are supporting existing SG and EPG work, there may be a resource issue to support the EPG engine field installation work . As per present status EPG 1 Installation is scheduled to start Jul 15 2016, but this schedule may be advanced if the EPG 1 design is completed earlier. MC resources need to be adjusted to support the field installation based on the SG/EPG cycle plan .	3	Active	Partha Chatterjee		02-May-16	Accept	15-Jun-16	4	2	4	16	3	2	4	12		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6462	In Progress	41043 - H - Maintenance resource for feild execution	Project will update work control and maintenance on a continuous basis for any changes in the schedule for the engine installation. The design schedule is expected to be finalized by mid April 2016 (after completion of preliminary engineering) and the EPG 1 installation schedule will be reviewed to expedite the installation window.	Partha Chatterjee		15-May-16										
			6525	In Progress	41043 - H - maintenance resource for feild execution	Maintenance section manager to review the new schedule and confirm the resource requirements.	Sunil Ahuja		30-May-16										
14266	41043 - I - Extra resources required to complete EPG1 preinstallation work	Extra resources are required to complete EPG1 preinstallation work (workplans, assessing, TPARs)		Active	Partha Chatterjee		02-May-16	Mitigate	29-Jun-16	4	2	4	16	4	2	3	12		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6490	In Progress	41043 - I - Extra resources required to complete EPG1 preinstallation work	Projects will coordinate with performance engineering to get help from SME to draft the EPG workplans/TPARs.	Partha Chatterjee		15-Jun-16										
14271	41043 - J - Lube oil system is not capable of rejecting T4701 heat load	Lube oil system may not capable of rejecting T4701(new engine) heat load causing the turbine to trip on high oil temperature.	4	Active	Partha Chatterjee		02-May-16	Mitigate	16-May-16	4	2	4	16	3	2	3	9		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6483	In Progress	41043 - J - Lube oil system is not capable of rejecting T4701 heat load	Ensure Cooler fins are clean and prior to commissioning test check operation of the control valves and the cooler.	Dan Gleeson		16-May-16										
1	41043 - K - Turbine Lube oil flow requirements of new T4701 turbine exceed the	Since Turbine Lube oil flow requirements of new T4701 engine may exceed the requirements of the T4001 engine, Turbine may trip on low lube oil pressure.	3	Active	Partha Chatterjee		02-May-16	Mitigate	16-May-16	4	3	4	16	3	2	4	12		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									

272	T4001		6482	In Progress	41043 - K - Turbine Lube oil flow requirements of new T4701 turbine exceed the T4001	Obtain flow data requirements from Solar and compare with existing capacity.Any issue discuss path forward with sponsor.	Partha Chatterjee		16-May-16										
14288	41043 - Q - Completing technical specification and engaging OEM prior to establishing clear design requirements	Completing technical specification and engaging OEM prior to establishing clear design requirements i.e. prior to obtaining DA and DOM approval on the MEC package which usually consists of modification details, MDR, RTM, Software quality, HFE requirement. Tested engine may not meet all the requirements stated in revised TS. In this case, Station will be asked to accept the engine taking deviation to the approved revised specification. Rework may be required.		Active	Partha Chatterjee		16-May-16	Accept	16-May-16	4	2	4	16	2	2	3	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6506	In Progress	41043 - Q - Completing technical specification and engaging OEM prior to establishing clear design requirements	Review FAT test results of the actual engine and any deviation from the TS will be reviewed with performance engineering. Revise TS once the MEC is authorized and obtain concurrence from OEM. TCD for completing the preliminary engineering is May 2016.	Mano Velayuthan		23-May-16										
14184	41043 - F -There is a risk that the Design Quality will not be up to standard	Due to an accelerated schedule, there may be re-work due to product quality not being up to the standard. Work management preparation milestones will be missed.	3	Active	Partha Chatterjee		02-May-16	Mitigate	15-Jul-16	3	1	5	15	2	1	4	8		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6354	In Progress	41043 - There is a risk that the Design Quality will not be up to standard	Signed Station Alignment memo with all key milestones and escalation mechanism.	Dan Gleeson		30-May-16										
			6706	In Progress	41043 - F -There is a risk that the Design Quality will not be up to standard	The design package will undergo cold body review so that any error in design is detected earlier.	Mano Velayuthan		30-May-16										
14289	41043 - R - OEM will only perform their standard test as part of the FAT	OEM will only perform their standard test as part of the FAT. OEM will not perform the test that we requested in TS due to time constraints. This means, OPG will need to accept the deviation from TS through concession. Additional testing to be performed during SAT.		Active	Partha Chatterjee		02-May-16	Accept	23-May-16	5	1	3	15	4	1	2	8		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6507	In Progress	41043 - R - OEM will only perform their standard test as part of the FAT	Additional testing on the engine will be performed during the SAT to meet all the design and specification requirements. The SAT procedure is expected to be ready by mid July 2016.	Partha Chatterjee		15-Jul-16										
14180	41043 - B -Seismic Qualification	Seismic Qualification of the engine is required. 1.OEM wil not be performing seismic analysis and therefore OPG will need to engage another company such as Curtis Wright to complete the Analysis. If any issue is discovered in respect to the seismic analysis the engine has to be accepted with additional review/study as OEM will not alter any change to their standard engine design. 2. The speed probe and the backup overspeed module needs to be seismically qualified which may delay the installation of the engine.	4	Active	Partha Chatterjee		02-May-16	Accept	15-Jul-16	3	1	4	12	2	1	3	6		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6359	In Progress	41043 - Seismic Qualification	Seismic Qualification Report for the new engine will be done via analysis by a third party (Curtis Wright) . Mass of the new engine is expected to be similar to the old hense the risk is low.	Mano Velayuthan		30-Jun-16										
			6520	In Progress	41043 - B -Seismic Qualification	The speed probe and backup overspeed module will also be done via analysis as the size and weight of these component are similar to the old one.	Partha Chatterjee		30-Jun-16										
14182	41043 - D -Commissioning limitations during FAT at Solar	1)Some commissioning may not be able to be performed due to operational restrictions or impracticalities during FAT. 2) During FAT the control software used to run the engine may not be the same as the site control system hence engine characteristics verified during FAT may not match the existing engine.	3	Active	Partha Chatterjee		02-May-16	Mitigate	29-Apr-16	3	1	4	12	3	1	3	9		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			6357	In Progress	41043 - Commissioning limitations during FAT at Solar	Project will coordinate with design and OEM to finalize the commisioning strategy and requirements as part of the FAT and site testing. Any gaps in the testing will be documented VIA analysis.	Partha Chatterjee		16-May-16										
			6703	In Progress	41043 - D -Commissioning limitations during FAT at Solar	Additional load testing will be performed at site to confirm the new engine characteristics match the existing engine. SAT procedure to be ready July 16 2016.	Partha Chatterjee		15-Jul-16										

14186	41043 - G - Acceptance of new engine emmissions by enviroment group and MOE	With Fukushima project completion the existing emission level at Pickering is very close to the acceptable limit. The ministry may request OPG to reduce the emission level for any new modification. New engine may not meet the present emission standard requirements per federal/provincial. Enviromental group need to provide concurence on this issue.	3	Active	Partha Chatterjee		02-May-16	Mitigate	16-May-16	3	2	4	12	3	2	4	12
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6353	In Progress	41043 - Acceptance of new engine emmissions by enviroment group	After obtaining the emission data for the new engine from the FAT, Projects will coordinate with the environmental group to confirm the acceptance and identify any new emmissions modeling requirements by MOE. New actions may result depending on the outcome.	Partha Chatterjee		15-Aug-16								
14273	41043 - L - New turbine fuel requirements are not compatible with OPG existing fuel specification.	New turbine fuel requirements are not compatible with OPG existing fuel specification. Excessive contamination in the fuel will reduce the turbine life and may create problems with contol of fuel flow.		Active	Partha Chatterjee		02-May-16	Accept	16-May-16	3	4	4	12	3	2	2	6
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6484	In Progress	41043 - L - New turbine fuel requirements are not compatible with OPG existing fuel specification.	Performance engineering to review the fuel requirement with component engeneering and summarize any issue with fuel compatibility. As per initial review the delta in the fuel specification should not be a risk, Being reviewed by SME.	Dan Gleeson		30-May-16								
14274	41043 - M - Multiple modifacaton work during EPG outage may impact engine installation	In the EPG outage there are other modification/maintainence work scheduled with the engine replacement. If the window for engine installation is not properly planned it will impact the engine installation schedule.		Active	Partha Chatterjee		02-May-16	Accept	30-May-16	4	3	3	12	2	3	3	6
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6704	In Progress	41043 - M - Multiple modifacaton work during EPG outage may impact engine installation	SWC to prepare intergrated logic sequencing all the installation/testing activities. Seperate logic to be prepared for installation and commissioning activities.	Partha Chatterjee		16-May-16								
14298	41043 - T - OEM not providing technical documents	There may be a problem in meeting EPG reliability value as OEM will not be providing any customized technical documentation for the replacement engine it also may cause last minute changes to the approved design packages.		Active	Partha Chatterjee		02-May-16	Accept	02-May-16	4	1	3	12	3	1	3	9
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6514	In Progress	41043 - T - OEM not providing technical documents	Design contractor will try to obtain the reliability number through analysis. Additional actions may arise from the analysis. If required the EPG engine during final commissioning may need to undergo extended period of load run to obtain the reliability number.	Mano Velayuthan		16-May-16								
14290	41043 - S - Noise level of the new engine may be higher than the Original equipment	Noise level may be higher than the original equipment as the new engine has higher output. May need to modify our existing system to bring down the noise level to an accepted level.		Active	Partha Chatterjee		02-May-16	Mitigate	23-May-16	3	1	3	9	3	1	3	9
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6509	In Progress	41043 - S - Noise level of the new engine may be higher than the Original equipment	PPE requirement may need to be changed and station needs to provide acceptance to this deviation.	Partha Chatterjee		16-May-16								
Project: PNGS Projects - 40983																	
14340	Delays due to other work control priorities.	There is a risk that delays will be encountered in installation due to Work Control priorities and new scoring system to maintain scheduled work on the plan. In addition, some work will be scheduled on the cycle plan which may change based on station priorities.	2	Active	Sunantha Broekhuys	Paul Menard	20-Apr-16	Accept	16-Dec-16	2	1	3	6	2	1	3	6

Risk Report by Project with Associated Actions

Report ID: 0707A    [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

14369		The project schedule for the charter is not clearly defined. The monitoring and data collection requirements for critical ACU and Pumps are not clearly defined. In addition, Fire Retardant Fluid (FRF) has now been included in this charter which was not part of the original charter. There is a risk of further scope growth on this project. Depending on the requirements of this project, there is a risk of longer durations required to complete engineering (step backwards to complete Conceptual, Value Engineering, COMS, etc).																
Project: Pre-requisite Projects -																		
11808	Qualified vendors are not available	The risk is that qualified vendors are not available, which impacts the project schedule.		Active	Dragan Popovic		27-Oct-15	Monitor	31-Jan-14	2	1	2	4	2	1	2	4	
There are no Not Started, In Progress Actions associated with the risk.																		
11810	Infrastructure facilities are not available or are inadequate; e.g. congestion in common areas	The risk is proposed facilities are not available or are inadequate; e.g. leading to personnel congestion in common areas (such as Retube Command Centre) for the project duration.		Active	Michael Allen	Dragan Popovic	27-Oct-15	Monitor	31-Jan-14	2	2	2	4	2	2	2	4	
There are no Not Started, In Progress Actions associated with the risk.																		
11811	Project/Construction relatedFatality/Serious Injury during Readiness (Campus Plan) Phase of project	Risk is that such injuries may affect the project schedule, cause delays, result in financial impact and potential difficulty controlling the outcome (legal).		Active	Dragan Popovic		27-Oct-15	Mitigate	31-Jan-14	2	2	2	4	1	2	2	2	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			3214	In Progress	Project/Construction related Fatality/Serious Injury during Readiness (Campus Plan) Phase of project	Risk that such injuries may affect the project schedule, cause delays, result in financial impact and potential difficulty controlling teh outcome (legal)	Dragan Popovic		01-Jun-16	2014.09.18 Safety incidents are recorded (including SCRs), jointly reviewed and investigated with Lessons Learned shared among OPG and ESMSA vendor groups. Safety is a major focus of Project Control Centre daily reporting.								
Project: Pre-requisite Projects - 73365																		
12471	73365 CFVS - Lack of schedule float for weather delays	The weather during the spring months can be rainy and windy. If the winds are too high then craning activities cannot be performed. There is a risk that there is insufficient float in the schedule to account for poor weather conditions. If there is insufficient float then activities put on hold due to rain and/or high wind will cause a delay to schedule and increased costs for trades on standby and craning equipment rental.	3	Active	Jacque Ciccarelli	Samantha Thurston	04-May-16	Mitigate	29-Apr-16	4	2	4	16	3	1	4	12	
There are no Not Started, In Progress Actions associated with the risk.																		
14371	73365 CFVS - There is a risk that the Project EAC will exceed the current Project approved budget	It is forecasted that the Project EAC will exceed the current Project approved budget. The Vendor is continually submitting overtime requests and CTPs and PCAs that are outside of the currently approved budget. This risk will result in additional cost to the project exceeding the approved budget. Approval at Gate 4 or through a CCN will be required to increase project funding.	3	Active	Jacque Ciccarelli	Samantha Thurston	26-Apr-16	Mitigate	30-Jun-16	4	2	4	16	3	2	3	9	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			3090	In Progress	CFVS - Increased ES MSA contrator cost estimate	Review vendor costs during weekly quad chart review meeting. Request detailed CTP and PCA information from the vendor. Present PCAs and CTPs to PMOC for review and approval. Request additional funding through a CCN or at Gate 4 if required.	Samantha Thurston	Samantha Thurston	30-Sep-16	April 2016 update: Gate 3D funding was received for \$80.6M which is less than requested. The vendor continues to submit PCAs and CTPs above the Gate 3D estimate. Vendor continues to submit overtime requests to maintain the schedule without submitting corresponding CTPs to document the value for money.								
	73365 CFVS - Risk that the schedule is not realistic to achieve the AFS milestone	The current P6 schedule has multiple issues of concern including incorrect logic, incorrect activity ties, and incorrect durations. During three week lookahead reviews the contractor is constantly reporting that they are fixing logic errors and updating durations to maintain the AFS milestone date.	3	Active	Jacque Ciccarelli	Samantha Thurston	26-Apr-16	Mitigate	09-Sep-16	4	2	4	16	3	2	3	9	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								

14372	due to errors in the schedule	There is a risk that the schedule is not realistic to achieve the AFS milestone due to errors in the schedule.															
14374	73365 CFVS - Material Risk impacting execution schedule	Timely delivery of materials is at risk due to lack of availability of materials and late fabrication of prefabricated items. If material are delivered late there is a risk that it will delay the execution schedule. This will impact the schedule and cause increase in costs to make up the time.	3	Active	Jacquie Ciccarelli	Samantha Thurston	22-Apr-16	Mitigate	02-Sep-16	4	2	4	16	3	2	3	9
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6835	In Progress	73365 CFVS - Material tracking	OPG PM is continually tracking materials with the ES MSA vendor to ensure materials are brought on site as required. OPG has requested that the ES MSA vendor contact their fabrication shop to request that they expedite prefabrication when materials are available. ES MSA vendor has contacted their fab shop and they will expedite as required.	Jacquie Ciccarelli	Samantha Thurston	31-Aug-16	April 22: CTP was submitted for additional costs for HSL to modify documents in order to substitute stack material. OPG is reviewing the CTP request. Fox has been in contact with their fabrication shop to ensure they are on track to fabricate the required materials.							
			6871	In Progress	73365 CFVS - Tracking of Civil Construction Concerns	OPG PM is continuing to meet with the ES MSA PM to track the project schedule and material status. Tracking is performed as follows: Weekly Design status meeting with ES MSA vendor and their design subs, OPG design, OPG Projects and OPG nuclear safety to review the P6 engineering activities, meeting actions for ES MSA vendor, subs and OPG and ITF actions. Weekly Construction status meeting with ES MSA PM and construction foreman, OPG Project, OPG CMO and FE to review the P6 construction and procurement activities and ongoing field work. Daily construction conference calls each morning with OPG project team(PM,CMO,FE, PCC) and ES Fox PM and foreman to review the plan of the shift and review issues that require assistance. Weekly Quad Chart meeting with OPG PM and ES MSA PM to review risks, budget, and milestones. As required, Pour readiness meetings and overall schedule review meetings. ES MSA Vendor is also meeting daily with their sub vendors to review the schedule and find efficiencies where possible.	Jacquie Ciccarelli	Samantha Thurston	30-Sep-16	April 22: at the readiness meeting on April 14th OPG was notified that the Q1 pour date would push to April 20th. The date was then pushed 4 more times to Thursday, April 28th. The regular meetings provide OPG the opportunity to track the schedule and actions with the vendors and keep an open line of communication. April 29: ES MSA vendor is meeting with their civil sub vendors to discuss the remaining activities and create a path forward for efficiencies. They will report their findings to OPG today. The Q1 pour date pushed to Tuesday, May 3rd due to underestimated duration for formwork closing. May 2nd update: ES MSA vendor pushed the Q1 pour to Thursday, May 5th. May 3rd update: ES MSA vendor pushed the Q1 pour to Friday, May 6th due to close proximity to vacuum building making form closing difficult.							

<a href="#">13265</a>	73365 CFVS venting stack monitoring requirement potential need to purchase new stack monitor	Reactor Safety review of CFVS MDR requirements traceability matrix identified potential need for project to purchase a new stack monitoring portable device. Project action to date was only to obtain isolatable sample points to tie-in a portable device provided by others. Risk is that a new monitor will need to be designed and purchased and installed, or test connected and commissioned prior to AFS. Project is ~ 6 months from final AFS	2	Active	Jacque Ciccarelli	Samantha Thurston	15-Apr-16	Monitor	30-Jun-16	2	1	5	10	1	1	5	5	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">4899</a>	In Progress	73365 CFVS resolve need for CFVS Project to provide stack monitoring device	Communicate with stakeholders to identify issue and get support for resolving the requirement. 1. Review RTM requirement with design oversight, nuclear safety and emergency planning organizations and 2. Identify issue to steering committee, project and refurbishment engineering line organizations Identify options to meet potential requirement 1. identify potential existing devices and how they could be mobilized and integrated into CFVS procedures 2. identify requirements for device specification and existing equipemtn similar to device to determine potental cost and schedule Prepare plan to implement if resolution is that a new device will be required	Bill Devlin	Colin Barfoot	08-Apr-16									
<a href="#">14375</a>	73365 CFVS - Reach Rod Interferences	There is a risk that interferences in the field will impact the reach rod installation schedule. This will result in a delay to the schedule activities and increased costs to avoid or remove the interferences.	4	Active	Jacque Ciccarelli	Samantha Thurston	20-Apr-16	Mitigate	29-Jul-16	2	1	4	8	1	1	2	2	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6838</a>	In Progress	73365 CFVS - Path forward for Reach Rod Interferences	ES MSA vendor is working with OPG FE to scan the concrete walls within the reach rod installation area for rebar. ES MSA vendor will work on avoiding the interferences or removing the interferences if applicable.	Jacque Ciccarelli	Samantha Thurston	29-Jul-16	April 22: An emergency exit sign needs to be moved. A field change is required for this. The field change will take approximately 5 days to complete. Moving the sign should be completed within one shift. TCD for field change completion is April 29th.								
<a href="#">14377</a>	73365 CFVS - TPAR submission behind schedule for document updates	TPARs have not been submitted for many documents requiring updates for the CFVS AFS in September. This task is with the ES MSA vendor to complete. OPG procedures group has submitted SCR D-2016-10006 to document the late TPARs. If the TPARs are submitted late then there is a risk that this will cause a push to the AFS milestone.	4	Active	Jacque Ciccarelli	Samantha Thurston	04-May-16	Mitigate	20-May-16	2	1	4	8	2	1	4	8	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6841</a>	In Progress	73365 CFVS - TPAR submission and document update tracking	ES MSA vendor and OPG project teams are meeting to discuss the TPAR submission and document updating requirements. Ongoing tracking of these activities will be done to ensure the AFS milestone date is not at risk.	Jacque Ciccarelli	Samantha Thurston	26-Aug-16	April 22: OPG PM emailed the vendor MTL a list of documents requiring updates and requested an update on the status of the TPARs for those documents. OPG PM emailed the current status of the documents to the OPG procedures contact to ensure they are aware of the status. ES MSA vendor submitted request for weekend overtime for TPARs.								
<a href="#">14229</a>	73365 CFVS - Containment Filtered Venting System (CFVS) - PRV30 delay	The risk is that the final weight of PRV30 is not bounded by the stress and seismic analysis already performed for the CFVS system, resulting in design revisions and possible rework of fabricated components (eg. supports). This risk has been created due to late procurement of the component, and delayed acquisition of required information (weight & centre-of-gravity) from the manufacturer. This risk is documented in SCR N-2015-17029 and associated A/R 28180737. Also tracked via CFVS ITF Items 204 and 211.	3	Active	Tyler Wreford		15-Apr-16	Mitigate	13-Apr-16	2	1	3	6	1	1	1	1	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6870</a>	In Progress	73365 CFVS - PRV30 valve weight information requirement	ESMSA Vendor to perform a conservative bounding assessment to confirm this risk is low. ESMSA Vendor to work with component manufacturer to obtain required information (weight and CoG) as soon as possible (i.e. improve on current estimate).	Jacque Ciccarelli	Samantha Thurston	30-May-16									

Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

12058	73365 CFVS - Containment Filtered Venting System: (CFVS)Access to the work areas	The risk is that access to the work areas may be denied due to delays in obtaining the necessary access permit or changes in the station meaning access to the PRVM is not possible The risk is that the containment tie-in installation may be extended 1 day beyond the scheduled window. The consequence is aligned resources will incur standby/ delay cost, and if delay is longer than 1 day it could move the scope to another work week (delay of 8 weeks non critical path with a higher cost) .	2	Active	Jacque Ciccarelli	Samantha Thurston	15-Apr-16	Mitigate	30-Aug-16	1	2	2	2	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			3185	In Progress	CFVS - Access to PRVM to complete placing CFVS in service activites	Mitigating actions: 1. Develop appropriate CAD models and perform RELAP analysis. 2. conduct installation reviews with the construction group and vendor to examine potential issues. 3. Develop construction alternatives as required.  For final placing system in service, plan execution of 1 look per week to minimize impact of delays in no fuel windows needed to obtain PRVM access needed for isolation to do work.	Colin Barfoot	Colin Barfoot	28-Jul-16								
Project: Pre-requisite Projects - 73815																	
12085	Refurbishment Project Office (RPO) 10-73815: Security System Tie-ins	Security equipment being installed in the RPO requires tie-ins to the existing Darlington Entry Control System (ECS), Security Monitoring System (SMS) and Physical Barrier System (PBS). The ECS, SMS and PBS sub-systems are known to have existing configuration management issues, obsolete software and equipment. Integrating new security equipment into the Station's existing ECS, SMS and PBS introduces risk during the installation and commissioning phases for the Security ECs. The project may be required to upgrade existing software packages or components, which would require additional design effort and cost to ensure tie-ins are successful.	3	Active	Bill Devlin	Courtney Brisebois	28-Apr-16	Monitor	29-Feb-16	3	1	3	9	3	1	3	9
			There are no Not Started, In Progress Actions associated with the risk.														
12444	Refurbishment Project Office (RPO) : Risk that Security Control Maintenance resources are	Risk that Security Control Maintenance resources are not available to support RPO Commissioning.	3	Active	Bill Devlin	Courtney Brisebois	28-Apr-16	Mitigate	16-Mar-16	5	1	1	5	1	1	1	1
			There are no Not Started, In Progress Actions associated with the risk.														
12100	Refurbishment Project Office: Gaps in the Process for Procuring Spare Parts	There is a risk that there are gaps in the new spare parts process and that there will be churn in getting the spare parts into the OPG warehouse. The process of dealing with spare parts that are purchased by the EPC vendor is problematic as per OPEX from the revolving door project and Sally Port Project. This would result in additional costs for unforeseen delays.	2	Active	Bill Devlin	Courtney Brisebois	28-Apr-16	Accept	31-Mar-15	3	1	1	3	3	1	1	3
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			3092	In Progress	RPO - Spare Parts	Mitigating Actions: OPG will ask for a list of proposed spare parts from the vendor after design is complete. This list will be reviewed with NEF and Opperations.	Jacque Ciccarelli		30-Apr-15	Meeting Held October 21 to go over required actions to support AFS, including creating a spare parts list. This action will be tracked in the weekly design meeting.  Spare Parts List and Maintenance Plan are outstanding.							
Project: Pre-requisite Projects - 31555																	
14287	16-31555 - Building Structural Steel Delivery Dates	Event: Changes to the 100el slab thickness Cause: Design changes to an accepted EC Impact: Late fabrication and delivery of structural steel	4	Active	Anthony Colella	Anthony Colella	04-May-16	Mitigate	31-May-16	5	2	5	25	2	2	4	8

-------	--------------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Run by:

<a href="#">12289</a>	EPG3 - Commissioning of EPG3 may take longer than anticipated	Due to specialized resource requirements and complex permity requirements, the risk is that the commissioning of this new system may take longer and be more challenging than estimated impacting schedule. In addition, as of January 2016, OPG assumed the commissioning planning work from the Vendor which could result in additional challenges during the transition of responsibilities.	3	Active	John Ieraci	Mark Ciana	27-Apr-16	Mitigate	27-May-16	4	1	4	16	3	1	3	9
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">3022</a>	In Progress	Secure EPG3 Commissioning Resources	Secure EPG3 Commissioning Resources (MM/MC/OPS/Commissioning Plan Writers) by name	John Ieraci	Brian Krystolovich	20-May-16	Presently, Work Protection will be per OPG Standards. Commissioning planning and the effort to write the Detailed Commissioining Plans has been assumed by OPG as of January 2016. A team is being assembled and some delay has been encountered during this transition. Weekly meetings are being held with the Commissioning Team to monitor progress of these activities.							
			<a href="#">6578</a>	In Progress	Develop EPG3 Commissioning Permit Strategy	Commissioning Permit strategy to be developed and communicated.	John Ieraci	Brian Krystolovich	31-May-16	In Progress							
			<a href="#">6934</a>	In Progress	Add EPG3 Commissioning Activities to the IPG schedule	Commissioning Field Execution Activities are to be added to the Station IPG schedule to ensure resources are planned and available.	John Ieraci	Brian Krystolovich	31-May-16	Meeting with Vendor, station stakeholder I/P.							
<a href="#">12290</a>	EPG3 - Critical Spare Parts Unavailable for AFS	There is a risk that critical spares may not be available for the scheduled AFS due to the late identification of the spare parts list. The unavailability of spare parts would threaten the AFS being completed and a risk to meeting the Refurbishment breaker open commitment.	3	Active	John Ieraci	Mark Ciana	27-Apr-16	Mitigate	31-May-16	4	3	4	16	3	3	3	9
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">3309</a>	In Progress	Obtain Cost & Delivery Schedule For all Project Spare Parts	Project team to obtain costs and schedule of procuring spares by the Vendor and issue PO rev.	Mark Ciana		31-May-16	Parts lists created for Turbine-Generator and most sub-systems. Review process initiated with Maintenance, Design and the System Responsible Engineer. List will be vetted and concurrence obtained prior to issuance. Schedule & cost to follow once list finalized.							
<a href="#">13934</a>	EPG3: IESO Approval for new Generator may affect AFS date	Generator is subject to IESO registration. This was identified late. Engineering will request an IESO "exemption". If this "exemption" is not accepted, then the scheduled AFS date will be at risk because EPG3 could not be connected to the EPS bus during testing. In addition, if the exemption is not acceptable, then EPG1 and EPG2 can be impacted since the modifications required to support the EPG3 registration will impact the the other EPG's through a common relay.	3	Active	John Ieraci	Mark Ciana	27-Apr-16	Mitigate	31-May-16	3	2	4	12	2	2	3	6
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">6308</a>	In Progress	Issue IESO exemption Letter	Engineering to issue an IESO "exemption" letter that requests exemption from IESO requirements and await response to IESO	Mark Ciana	Mark Ciana	06-May-16	Engineering has issued the exemption letter to IESO and is with them for assessment. The exemption is only for the "speed of response" and DROOP requirements only. No request for an exemption for "under-frequency" response requirements was requested with this exemption letter. However, as part of the market registration application (see Action 6935) OPG has requested time from the IESO to the end of the year (2016) to review the justification to not meeting the "under-frequency response" requirements. If no justification can be provided, then the EPG3 may be subject to the under-frequency requirement which will result in a future modification.							
			<a href="#">6935</a>	In Progress	Complete IESO Market Registration for EPG3	IESO Market Registration of EPG3 to be completed.	John Ieraci	Mark Ciana	30-Sep-16	IESO Market registration application has been completed. IESO currently assessing the application.							
	EPG3: Risk to Software Qualification to Category 2	The equipmment was supplied without adequate documentation to support Cat 2 software qualification. The EPG Vendor has agreed SMT to qualify the EPG3 software/firmware to Cat 2	3	Active	John Ieraci	Mark Ciana	27-Apr-16	Mitigate	27-May-16	3	2	4	12	3	2	3	9

13954	Qualification to Category 2	Qualification. The EPC vendor has engaged SWI to qualify the EPG3 software/firmware to Cat 2. Some of the required information to complete qualification is either not available or proprietary. This issue could impact anticipated AFS, if not resolved in a timely manner. Extra effort required by ESFL/HSL/SWI could impact cost and schedule.	6938	Not Started	Obtain Software Version Numbers of Solar Skid Components that do not have Qualification Data Available	The following component software version numbers are to be obtained following the uncrating of the EPG3 skid and powering up the individual components. 1. Atas Copco - Air Compressor and Dryer Components; 2. Siemens Level Transmitter; 3. Precision Engine Controls (PEC) - Engine Bleed Valve and Engine Guide Vane Controls Once the software versions are known, then the Vendor (FOX/SWI) can request specific qualification data from these suppliers to progress the CAT 2 qualification	John Ieraci	Mark Ciana	31-May-16										
			6939	In Progress	Obtain Senior OPG Procurement Support to contact specific sub-Suppliers for Qualification Data	Certain EPG sub-component suppliers are unwilling to provide specific documentation and sales history to support software qualification to CAT 2 even though the hardware and software versions are known. Senior OPG procurement support may be required to help obtain this information. The following components may be affected: Caterpillar - Diesel Generator, ADEM A4 and EMCP Controllers; Dwyer - Dust Collector Timer Controller;	John Ieraci	Mark Ciana	31-May-16	Typical Memo being prepared to outline exactly what is to be requested from each sub-supplier to facilitate discussion with sub-supplier.									
			6940	In Progress	Ensure Certain Software Functional Tests are included in the appropriate EPG3 Commissioning Work Plans	The following software functional checks were not tested during the EPG3 FAT test: 1. Lube Oil Header Pressure Low; 2. Generator Protection Fault - (CAT 1); 3. Back Up Lube Oil Pump Fail; As a result, these functional tests must be included in the appropriate EPG3 commissioning work plan and done on site. This is necessary to support software Cat 2 qualification of the associated components.	John Ieraci	Brian Krystolovich	12-Aug-16										
14411	EPG3: Potential Claims	There are risks of potential claims on the project due to various charges that currently in dispute or being challenged including the following: <div></div> <div></div> <div></div> These potential claim could impact the final cost of the project if these potential claims/disputes are realized.	3	Active	John Ieraci	Mark Ciana	27-Apr-16	Monitor	31-Aug-16	4	3	2	12	3	2	2	6		
			There are no Not Started, In Progress Actions associated with the risk.																
12281	EPG3 - More Stringent Requirements for Work on/or near group 2 Safety Systems	There is a risk that the Station may impose more stringent requirements (or work methods) and oversight than anticipated for the electrical modifications planned on and in close proximity to Group 2 safety systems (EPS BUS, EPS Control Room) due to the complexity of the tie ins and commissioning. This may result in potential schedule delays and additional costs. ODM req'd.	3	Active	John Ieraci	Mark Ciana	27-Apr-16	Mitigate	02-May-16	3	1	2	6	2	1	2	4		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			3036	Not Started	ODM For Tie-in at EPS (Electrical)	ODM endorsement for tie-in at EPS (including back-out provisions and contingency strategies) prior to start of field work.	Mark Ciana		15-Jun-16	SIM for EPS tie-ins to be completed Jan 25, 2016 to communicate strategy and solicit input from senior managers. A formal ODM to be scheduled once senior manager comments and actions have been dispositioned. ODM to be scheduled for the next available opportunity (June 2016)									
131	EPG3: CSA N291 Concrete/Rebar Materials Testing Results Not	Late identification that CSA N291 requires concrete batch materials and rebar to be tested per specific requirements. A material testing lab is now engaged, however results are pending. There is a risk that the results will not be acceptable, yet the concrete and rebar has already been placed.	2	Active	John Ieraci	Mark Ciana	22-Mar-16	Accept	26-Aug-16	1	5	5	5	1	5	5	5		
			There are no Not Started, In Progress Actions associated with the risk.																

14250	Acceptable	This potentially means rework, with the associated impact to Project cost and schedule.																
Project: Pre-requisite Projects - 73380																		
14424	STOP Project work area interference with other outage work scope	Event: Installed shielding wall and scaffolding to support STOP installation found to be in the way of other outage work Cause: Lack of outage coordination on time and space usage Impact: Where other critical work has to proceed rework is required for removal and reinstallation of STOP scaffolding and shielding	3	Active	Dragan Popovic	Colin Barfoot	02-May-16	Mitigate	07-Jul-17	4	2	3	12	2	2	2	4	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			7014	In Progress	Prepare time and space matrix for used space for transient shielding and scaffolding builds	For the STOP and ESC piping reconfiguration modifications take detailed photographs of the installed scaffolding, tenting and ventilation, shield walls and other transient material that is needed at specific time and places to support ESC STOP modification installation. distribute information to Outage ECTL and refurbishment	Dragan Popovic	Colin Barfoot	09-Dec-16									
12228	73380 - Shield Tank Overpressure Protection(STOP) - Permitry	Event: Delay to project waiting for permit and related heat sink conditions Cause: Potential for delays due to time to establish permit requirements i.e. through IPTE process to drain ESC extension. On heat sinks due to outage work ESC can only be shutdown when heat sink conditions allow. Impact: Unit 4 initially only had one window for ESC tie-ins from April 8-27 including drain refill and testing duration when ESC could be shutdown, this was insufficient to complete prerequisite work and system tie in. Delays in completing draining during D1641 if reoccur will also delay execution. Update Second outage ESC drain window added March 2016 after moderator drain maintenance window.	2	Active	Bill Devlin	Colin Barfoot	29-Apr-16	Mitigate	31-Aug-17	3	1	3	9	3	1	2	6	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			3102	In Progress	STOP - Permitry	Mitigating actions: 1. Required permitry will be established with Station ahead of time. Update Nov.17: Regular HIT team meetings are ongoing to address STOP issues.	Colin Barfoot		28-Aug-15	Updated due date to ensure prior to the start of the D1531 outage that there have been no changes to the outage plan and scope which could cause issues to the risk item.								
12345	73380 - STOP- installation interferences with existing station equipment which require equipment relocation, removal or redesign of piping or supports	Event: During STOP installation of seismically qualified vent line or class 2 piping and supports or maintenance platform there may be interferences that were not identified during the design phase. Update to risk is need for new scope to relocate unit hydrogen igniter and Unit 4 electrical panel including 1) 4-57100-RE1 -- Gamma Monitor 2) 4-57100-RE11 -- Mosfet Sensor Cause: Due to equipment location being different between units and access not close enough to determine interferences during STOP design walk downs. Risk Impact: Since the lines are seismically analysed it will require a redesign and analysis, with added design costs and potential outage schedule delay	2	Active	Bill Devlin	Colin Barfoot	27-Apr-16	Mitigate	28-Oct-16	3	1	3	9	3	1	2	6	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			3184	In Progress	STOP - Installation interferences	Mitigating actions: 1. Detailed inspections will be performed as close as possible to the vault ceiling as soon as vault access is available. 2. tasks have been added in outage P6.	Colin Barfoot	Colin Barfoot	29-Jul-16	mitigated for unit 3, in progress for unit 4 installation of STOP modifications.								
14254	73380 ESC STOP Vault access restrictions	Event: Vault Access via vault coordinator control limits the number of personnel allowed to be in the vault due to breathing air and emergency egress reasons. Cause: Vault access is provided to work groups based on outage determined priority. Impact: During each outage ESC STOP execution was delayed for several days in aggregate due to priority based access restrictions.  Risk is that access delays will add to project and outage critical path.	3	Active	Dragan Popovic	Colin Barfoot	02-May-16	Accept	30-Jun-16	3	2	3	9	3	2	2	6	
			There are no Not Started, In Progress Actions associated with the risk.															
14111	73380 - Late scope addition to resolve ESC Pressure Pulse issues for D1641 execution	Event: Pressure Pulse identified in Unit3 ESC piping system by STOP SIR team will be addressed by Auto Pump Time delay and Pump discharge piping modifications with a new type nozzle check valve installation. Cause: Risks are associated with short timeline to complete design, work planning , assessing, procurement and execution and with first time use of this type and size of valve at OPG. Impact: design schedule does not support outage readiness milestones, recovery plan will be needed for all remaining units. Additional oversight and direct management with HIT team	3	Active	Jacque Ciccarelli	Colin Barfoot	11-May-16	Mitigate	01-Jul-16	3	2	2	6	3	2	2	6	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			6225	In Progress	Implement ESC Pressure Pulse elimination modifications	Support execution of STOP HIT action plan to prepare for and implement new scope identified for pressure pulse elimination modifications in D1641 outage	Jacque Ciccarelli	Colin Barfoot	01-Jul-16									
	14316 - STOP RD Setpoint - Supporting Analysis for 440 kPa RD Not Yet Final	The risk is that the 440 kPa STOP Rupture Disc (RD) cannot be installed during the D1641 Outage because the supporting assessment concludes the bulkhead failure criteria to be less than 275 kPa.	4	Active	Gerry Martin		03-May-16	Mitigate	20-Apr-16	1	2	5	5	1	1	1	1

Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

14316		<p>The STOP MDR requires the STOP setpoint to be selected such that the pressure pulse when relieving the shield tank does not fail containment, including the fuel transfer bulkheads installed during refurbishment. The overpressure failure limit for the bulkhead, as stated in the MDR, is 96.5 kPa(g). At this value, analysis shows it is not possible to meet the above requirement with a 440 kPa RD. However, additional analysis is currently being performed which will show, with a very high level of confidence, that the actual failure limit for the bulkheads is 275 kPa (same as the rest of containment). At this value, the MDR requirement is met with a 440 kPa RD.</p> <p>Current indication from the analysis is that the bulkhead failure limit is 275 kPa or higher, with very little risk that the analysis will conclude otherwise.</p> <p>The Outage Milestone Recovery TCD for issuance of the EC revision (to increase the RD setpoint to 440kPa), is 21-Mar-2016. The TCD for the bulkhead failure limit analysis is 20-Apr-2016. Until the bulkhead failure limit analysis is complete there is an associated risk to the project. The EC revision will be approved and released per the Outage Milestone Recovery Plan.</p>															
14233	73380 - ESC Pressure Pulse Testing - Lack of Testing	<p>Event: Pressure pulses in ESC system above the design set point of the STOP RD, potential to be different in each unit.</p> <p>Cause: Original design of piping and check valves as measured on Unit 3 ESC</p> <p>Impact: Lack of testing could result in ineffective design solution in that it does not adequately resolve the pressure pulse issue resulting in failure of the STOP rupture disc, or STOP would not be installed or will be isolated, leading to ineffective STOP installation.</p> <p>Risk for requiring EC revision to support testing results different than expected or with lower probability not being able to execution modification due to proximity to setback.</p>		Active	Colin Barfoot		11-May-16	Mitigate	15-Apr-16	2	2	2	4	2	1	2	4
There are no Not Started, In Progress Actions associated with the risk.																	
14237	73380 - ESC Pressure Pulse Testing - Hydraulic Assessment/Analysis for Validation	<p>Event: New nozzle check valves selected as design solution to mitigate or eliminate ESC piping pressure pulse do not have detailed supporting performance analysis</p> <p>Cause: The Conceptual Design Report, NK38-REP-34110-10034, recommended replacing the current End Shield Cooling pump discharge check valves with nozzle check valves, and perform a hydraulic analysis/assessment (or testing by valve vendor) to validate the effectiveness of the nozzle check valves to resolve the water hammer concern. OPG decided not to perform the hydraulic analysis</p> <p>Impact: Risk is that the valves arrive with no assessment and will not perform at the desired level of effectiveness in resolving the pressure pulse.</p>	3	Active	Colin Barfoot		27-Apr-16	Accept	11-Jul-16	2	2	2	4	2	2	2	4
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6832	In Progress	10-73380- ESC Nozzle check valves dynamic characteristic curves to be obtained	Action to resolve the performance characteristics meet the requirements for OPG DNGS ESC discharge piping to be effective in mitigating or preventing pressure pulses on pump shutdown or duty swap. Implement by obtaining representative dynamic characteristic curves and performance results to demonstrate acceptable valve closure times.	Raza Zaidi	Sean Bagshaw	13-May-16	initial curves received , in review - do not cover full expected range of operation.							
14230	73380 - Breach of Containment if residual pressure pulse causes leak in 34110-RD1 BDBE Rupture Disk	<p>Event: A leaking rupture disk would be a failure of the primary containment boundary (closed loop ESC system).</p> <p>Cause: Pressure pulse from ESC system pumps and check valves.</p> <p>Impact: If we take the parallel to a leaking coil on vault cooling, the vault cooling OM says to isolate the leaking coil, but we cannot isolate the leaking rupture disk this would lead to a unit shutdown.</p>	3	Active	Dragan Popovic	Colin Barfoot	11-May-16	Mitigate	15-Jul-16	1	1	3	3	1	1	3	3

			<a href="#">5412</a>	Not Started	Install barriers around striker plates of the Airlock #1	Install barriers around striker plates of the Airlock #1 to eliminate damages. 03FEB2016: JEFF P. Find out current status from JV if there is a plan to install the barriers and that if this is included in the Class II estimate.	Jeffrey Palmateer	Jeffrey Palmateer	29-Feb-16	It is estimated \$100K as cost to acquire barriers and install the barriers around striker plactes of Airlock #1.							
<a href="#">14161</a>	Manufacturing delay possible for Feeder Flow Element and Pressure Breakdown Orifice (Inconel-690 materials), necessary for the Upper Feeder Installation [Window 76]	[Execution Phase] Event: The feeder flow elements (FEs) and pressure breakdown orifices (PBOs) are to be manufactured and delivered to the feeder fabricator and then need to be welded to the upper feeder assemblies prior to shipping them to site for installation. The current start date for upper feeder installation is October 2017 (feeders will need to be on site before then). Therefore, the manufacturing of feeder flow elements and PBOs could delay site installation of feeders if not manufactured in a timely manner. Cause: There is a high likelihood that FE's and PBO's will be received late due to the lead time for Inconel-690 material and for the fabrication of the sub-assemblies. Impact: Feeder assemblies will not be available intime for schedule site execution date. [JV Risk 8.131 / 8.134]	4	Active	Andrew Cerilli	Cole Stark	19-Apr-16	Transfer	01-May-17	5	2	5	25	5	2	5	25
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			<a href="#">6882</a>	In Progress	oversight of risk transfered to JV	this action is in place to ensure risk 14161 which is transfered to the Contractor and is being mitigated by the vendor has an action to avoid triggering "Risk without mitigation action" metric. OPG mitigation is to perform oversight and it is not the practice to input RMO actions to document oversight activities.	Andrew Cerilli		31-Jan-18	this action will not be stasured, it is only in place to allow the transfered risk to not trip "risk without action" metric. Action is to perform oversight which is managed in oversight portion of RMO.							
<a href="#">14115</a>	Feeder fabrication schedule delay as a result of flow element (I690) weldability challenges. [Window 76]	[Execution Phase] Event: There is a risk of delays to feeder fabrication schedule. Cause: Flow Element and Pressure Breakdown Orifices material has been changed to Inconel 690 from Inconel 600 per DRAS 584. Challenges associated with dissimilar metal welding procedures development and qualification for Inconel 690 using filler metal 52M are expected. Impact: Delays to the feeder fabrication schedule will further challenge the availability of feeder pipes for the start of the Upper Feeder Install series for DNGS Unit 2 refurbishment. [JV Risk 8.124/8.135]	2	Active	Andrew Cerilli	Andre Sidiropoulos	19-Apr-16	Transfer	01-May-17	4	1	5	20	4	1	5	20

			6415	In Progress	Convert a Legacy Annulus Bellows Spare to the RFR Design - Prototype Effort	Have a vender convert one spare bellows to the rfr design. This action requires review of deliverables, attendance at meetings and oversight of the vendor as required.	Cole Stark		01-Jun-16								
12322	End Fitting Waste Processing - First Of A Kind (FOAK) risk [Window 184]	Execution Phase Risk: EVENT: As a result of the first of a kind nature of the End Fitting waste processing with no existing operating experience, the risk is that the Waste Processing becomes the critical path, with negative impacts on the schedule. CAUSE and IMPACT:This may occur due to two scenarios: 1) (primary risk) Equipment Reliability - there is more downtime of the tooling system than planned. Due to the radiation hazards, equipment failures may be difficult to troubleshoot and concerns regarding safety may lead to significant delays during execution. Design Requirements call for close to 100% equipment availability, which may be difficult to demontrate in test program. 2) (secondary risk) EF Waste Processing Rate - The End Fitting Removal from the Vault may be faster than the End Fitting Waste Processing in Retube Waste Processing Building can handle. This would lead to a need for extra EF flasks to continue reactor face work, and might lead to a delay starting the next stream of waste removal to clear the backlog of EF waste.	3	Active	Michael Hersch	Sean Carpenay	12-May-16	Mitigate	31-Jul-16	3	1	5	15	2	1	5	10
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			2988	In Progress	Initiating contingency plans for Tooling Systems in End Fitting Waste Processing	Initiating contingency plans with contractor on unplanned maintenance of the tooling systems in End Fitting Waste Processing.	Michael Hersch	Sean Carpenay	31-Aug-16	2015/04/21: No Contingency Plan initiated. Operating Manual (OM) does contain a contingency section, but we consider it weak in content. To truly have a contingency plan, these procedures must be vetted during testing at ATS. Testing program under evaluation. 2016/01/12: Proof of Concept testing started week of Jan 11, 2016. TCD of FAT testing complete is March 2016. Any failure modes identified during POC and FAT testing will require a troubleshooting/contingency plan as part of the OM for final procedures milestone acceptance. 2016/04/04: FAT testing is currently in progress. The Waste Tooling System will include a Post FAT and Stand-by Plan to further test the contingencies of the EF Station. Thus, the due date has been changed to the end of August to accommodate the Stand-by Plan completion.							
13326	Excusable Delays [Windows All]	Execution Phase: Due to conditions beyond the control of JV and OPG RFR, 5.2 (a) Excusable Delays Section of EPC Agreement explains the condition and the contract terms of excusable delays, which have impacts on Execution phase Schedule. This risk concentrates on delays of more than 3 days. The examples include, but not limited to: - Radiation conditions (tritium, alpha, debris, high activation product concentration, high radioactive debris/particles) higher than expectations causing delays in cleanup (> 3days);- Fueling machine stops unexpectedly (> 3days) below the bulkhead of the Unit being refurbished with Labour Force in the vault working on critical path;- Unplanned Fuel Handling activities affecting duct access (> 3days) applicable to critical path refurbishment work in the duct;- Required upgrades/repairs/maintenance to OPG existing facilities (> 3days);- Unexpected operating plant transients with impacts > 3days on critical path;- Delay in completion of work required to be completed by OPG (or its vendors) (> 3days);- Reactor not defueled on time as scheduled by OPG (> 3days);- Delay in Breaker Open milestone (> 3days);- Loss of station power (OPG supply) to run JV equipment / tools (> 3days)- D2O spills (> 3days)- Activities in operating units (including testing and Safety Related System Test of adjacent operating units) causing interruptions in refurbishment work (> 3days)- Vault Equipment Airlock Malfunction causing interruptions in transitions and material movement (> 3days)- CNSC work stoppage (> 3days)- MOL work stoppage not due to JV's negligent work (> 3days) PCD according to 5.2 (a) Excusable Delays (> 3 days)	1	Active	Roy Brown	Cameron Macleod	11-Mar-16	Monitor	01-Jan-26	3	1	5	15	3	1	5	15
			There are no Not Started, In Progress Actions associated with the risk.														

<a href="#">13556</a>	Reactor Core Components demand more RWC/DSO [Window 114]	[Definition Phase] Event: As results of characteristics of irradiated reactor core components, the risk of more RWC/DSO needed. Cause: (1) the lid not being able to be closed due to pile height of wastes inside RWC/DSO during waste reduction being too high , and (2) excessive waste emissions from waste inside RWC/DSO may occur with negative impacts on schedule. (OPEX from Bruce and Wolsong) (3) OPG SOW requires PT cut to leave a stub on endfitting of 6" or less. JV current plan is to leave an 8" stub which will result in more pressure tube material in the end fitting RWC. SCR-N-2015-08429 was raised to document the non-conformance with the SOW. Impact: Additional funding required for more RWC/DSOs. [JV Risk 8.127]	1	Active	Andrew Cerilli	Cole Stark	05-Apr-16	Transfer	15-Oct-16	5	3	1	15	5	3	1	15

ONTARIOPOWER  
GENERATION

Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

13564		Cause: Caused by using the lower priced of the two supplier's single unit bid cost (2013) as the expected cost for subsequent units. Impact: This would result in a need for additional approved funding/budget if only the more expensive supplier's PTs are installed in subsequent reactor units.																
14425	Failure to Upgrade Unqualified Source Material for I690 Flow Elements / Pressure Breakdown Orifices	Event: There is a risk that the supplier of Flow Elements (FE) and Pressure Breakdown Orifices (PBO) may fail to upgrade the unqualified source I690 BAR stock they have purchased if due to its quality issues are revealed during the upgrading process. Cause: The supplier of FE and PBO's have purchased unqualified source I690 BAR stock material because nuclear grade I690 is not a readily available product on the market. The supplier will be upgrading unqualified source I690 BAR stock material in parallel with machining activities in support of schedule recovery efforts. Impact: Should the supplier find that the unqualified source material cannot meet the ASME requirements, rework would be required, beginning with ordering new I690 BAR or pipe stock. This would have significant schedule implications.	4	Active	Andrew Cerilli		03-May-16	Mitigate	31-May-16	2	1	5	10	2	1	3	6

Data Refreshed: 12-May-16 10:30 PM

13333		Impact: Negative impacts on Execution Phase schedule.																		
			5408	In Progress	Reinforce high safety culture	Reinforce high safety culture in the project team to eliminate safety events or near-misses to avoid impacts of Stop Work Orders.	Jeffrey Palmateer		01-Jan-26	2015/07/13: No mitigation cost as this shall be part of normal training. To ensure that there is a strong safety culture within the JV Project Team there are numerous interactions to ensure there is strong communications, interactions such as; There is a scheduled weekly mock-up walk down with a quorum of the both RFR Construction Mangers (JV & OPG) with the Training Area Supervisor and the Safety Representatives Weekly OPG/JV day meeting where safety events or issues are dicussed and tracked SCR's are entered for significant events or occurances; list can be provided if required										
13571	Quality issues of JV work causing extra rework [Window 23]	Execution Phase Event: Extra rework (including higher welding failures (Feeders not meeting tolerance, feeder over bend, welding procedures and human performance involved.), work in bellow cut, feeder overbent, feeder not meeting tolerances, CT install, PT retraction, CT head) Cause: Quality issues of JV work Impact: May occur with negative impacts on schedule.	1	Active	Roy Brown	Tara Rehsi	28-Apr-16	Mitigate	15-Oct-16	2	1	4	8	1	1	4	4			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			5428	In Progress	Additional qualification requirement for vault workers	28 April 2016: The main focus of the mobilization plan (standby plan) is to rehearse retubing activities. JV is executing the standby plan. Feb 2016: Additional qualification requirement for vault workers to improve quality of vault workers to avoid reworks. mobilization plan (standby plan) approved for mitigation that will support and establish training requirements	Jeffrey Palmateer	Tara Rehsi	15-Oct-16	\$1M budget on additional qualification requirement on vault workers.										
13892	End Fittings will not be available in time to support the scheduled site execution date [Window 168]	[Execution Phase] EVENT: There is a risk that End Fittings will not be available in time to support fuel channel installation (execution window 119).  CAUSE: Caused by various issues with the overall procurement steps and strategies as well as complications with individual components.  IMPACT: This would result in a miss of the Execution Date. Therefore reducing the amount of available time for the JV to unpack, inspect and assemble sub-assemblies in preparation for the fuel channel install series. [JV Risk 8.118]		Active	Andrew Cerilli	Andre Sidiropoulos	08-Apr-16	Transfer	02-May-16	2	1	4	8	2	1	4	8			
			There are no Not Started, In Progress Actions associated with the risk.																	
	Waste - Insufficient Number of Retube Waste Containers [Window 117]	Definition Phase: As a result of many risks, such as the set listed below,the risk that a larger number of Retube Waste Containers needed than planned may occur during the Execution phase, which would lead to negative effects on both schedule and cost. Examples of risk requiring larger number	3	Active	Michael Hersch	Yung Cheung	23-Mar-16	Mitigate	31-Dec-17	3	2	1	6	1	1	1	1			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										

11582		of Retube Waste Containers are: 1) Inefficient segregation practices are encountered. 2) Container may not be optimized for, or compatible with, the volume reduction process. 3) Latest discovery of higher than anticipated level of Cesium-137 in pressure tubes which may trigger need of extra RWCs.	<a href="#">3331</a>	In Progress	Review number of containers used during Execution Phase	27APR2016 - JV has completed the technical evaluation on the bids for additional RWCs. A recommendation for purchase is to be provided in 2 weeks time. once that is approved a PO will be out. To ensure sufficient containers are available for the remaining reactor units, review the number of containers used during the Execution phase for the first refurbishing unit. The current strategy is to increase the contingency of containers for the first reactor unit in addition to starting early production for the second reactor unit. At the completion of the first reactor unit the actual number of containers consumed will be the baseline for the following three units and this strategy eliminates the risk of insufficient containers being available for the first unit. [M Carter May 26,2015]  RAP for additional 11 RWCs sent to OPG for acceptance on Sept. 1, 2015. [ M Carter Sept 9, 2015] EQR for second set of containers to be purchased from Alternate Supplier issued [ M Carter Nov 10, 2015]	Michael Hersch	Yung Cheung	31-Dec-17	The current strategy is to increase the contingency of containers for the first reactor unit in addition to starting early production for the second reactor unit. At the completion of the first reactor unit the actual number of containers consumed will be the baseline for the following three units and this strategy eliminates the risk of insufficient containers being available for the first unit. [M Carter May 26,2015] The additional bids for the additional RWC/DSOs are currently being reviewed. The recommendation for purchase should be going to OPG for approval in the next few weeks. [Y Cheung April 25, 2016]  RAP for additional 11 RWCs sent to OPG for acceptance on Sept. 1, 2015. [ M Carter Sept 9, 2015] EQR for second set of containers to be purchased from Alternate Supplier issued [ M Carter Nov 10, 2015]									
			<a href="#">3662</a>	In Progress	Review Canadian Nuclear Labs (CNL) Report on D1321 SFCR Channel M09 Pressure Tube (PT) Gamma Spectroscopy	The latest results from CNL has confirmed values of Cs-137 on the PT (base metal plus magnetite layer) are about 2.0 to 3.0 higher than Cs-137 values found on the end fittings (from the same channel) and values found on the steam generator tubes (from oxiprobe analysis). To address this concern, OPG to assess what are the key impacts of this finding, develop strategies to address the impacts, and execute the strategies.	Michael Hersch	Jeff Johansson	30-Sep-15	This action is assigned to Jeff Johansson. Three sub-actions are identified. -OPG (Jeff J)set-up a meeting with key stakeholders from RFR, NWED and RP to review and discuss the results and assess what the key impacts are of this finding (meeting held on 11Feb2015). Subsequent meetings may be required. -Upon agreement on the impacts, a strategy will be developed to address the impacts to ensure that any risks associated with this finding is minimized or mitigated (TCD: TBD). -Adopt and execute the above developed strategy to close this risk (TCD: TBD after strategy is developed). 11-Mar-15: On target to complete at end of March 2015. Jeff J 2015-04-01: Draft report received and going thru the disposition process. Final report to be issued in April. Due Date: moved to end of April 2015. 2015-04-27: Pending JV response. 2015-7-2: Report submission delayed until end of August 2015. TCD for this risk revised to September 30, 2015.									
13329	Claims from Retube and Feeder Replacement (RFR) Vendor Not already Covered in the Contract [Potential Window 160-188]	Execution Phase: As a result of OPG not meeting its obligations, there are risks of the RFR vendor making claims for additional costs, cost claim from schedule delay not covered in the Contract, in the Execution Phase. Note: there is a similar risk for Definition Phase (risk #12214).	1	Active	Roy Brown	Cameron Macleod	21-Apr-16	Monitor	01-Jan-26	2	3	1	6	2	3	1	6

13562		Impact: Negative impacts on Cost and Schedule	5421		In Progress	Phased turnover of Operations to Construction	As components are accessible in phased turnover, OPG to do inspections with formal report generated from these inspections to document the findings and give the formal report to contractor to avoid uncertainty.	Ken Brown	Jeffrey Palmateer	15-Oct-16	No incremental costs. 28April2016: Action delegation requested from Ken Brown and Jeff P.									
			5422		In Progress	Dedicated OPG oversight team to document potential JV claims in real time	Dedicated OPG oversight team members to document the potential JV claims in real time. Two FTEs are deployed as the dedicated resources for the entire project duration.	Ken Brown	Jeffrey Palmateer	15-Oct-16	28April2016: Action delegation requested from Ken Brown and Jeff P. ~Two FTEs are estimated to cost \$2M incremental for the entire RFR Project for 4 Units. 1. Turnover Tasks to record the turnover conditions, including photos of components such as AGS pigtails, before JV and after JV for documenting the environment before and after to provide evidence to support or deny JV's claims in future investigation. 2. Phased turnover of operations to construction (As components are accessible, OPG to do inspections). Formal report to be generated from these inspections and given to contractor. 3. Dedicated OPG oversight team to integrate with JV As Found Team to document potential JV claims in real time (e.g. Two FTEs for entire project duration) Mitigation Cost: \$2M (incremental)									

13569	Interruption from False Alarms of Safety Events [Potential Window 160-188]	Execution Phase: Event: The risk of false alarms of Safety Events Cause: False alarms could be raised by workers based on their personal sensing (chemical smell, temperature, gamma, ozone etc.) and physical alarm malfunctioning, Impact: negative impacts on Schedule.	1	Active	Roy Brown	Jeffrey Palmateer	28-Apr-16	Monitor	01-Jan-26	2	1	3	6	2	1	3	6		
			There are no Not Started, In Progress Actions associated with the risk.																

13911	Risk of need to procure additional pressure tubes [No Window Related]	[Execution Phase] Event: An additional set of pressure tubes may need to be procured if OPG decides to install pressure tubes manufactured by only one supplier accross all 4 units. This would potentially bring the total number of reactor sets worth of PTs to 5. Cause: OPG may decide that all pressure tubes installed in Darlington Refurbishment must come from one vendor. For the first unit, RFR scope include procurement of two full reactor quantities of pressure tubes from two separate vendors as a commercial risk mitigation strategy. The current project estimate includes 2 additional reactor quantities of pressure tubes (for a total of four reactor quantities). Impact: the pressure tubes from the vendor not installed in Unit 2 will not be useable by Refurbishment, and an additional reactor quantity of pressure tubes will need to be procured.	3	Active	Andrew Cerilli	Andre Sidiropoulos	05-Apr-16	Mitigate	30-Apr-16	2	3	1	6	2	3	1	6

Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

<a href="#">14015</a>	Components	There is a risks that electrical components in the WTS may fail due to high humidity in the RWPB. Cause: The waste tooling system contains electrical components that have a maximum humidity rating of 80%. This is not in compliance with the OPG Tooling Design requirements of 95%. There is a residual risk to OPG of delay due to a JV response to procure more spares of sensitive electrical components affected by the 95% humidity. The RWPB Tech Spec for active ventilation, NK38-TS-73600-10003 R00 has a max humidity requirement of 80% however there is a risk that with the number of overhead door openings for truck entry and exiting that this may not be maintained in the cases where outside humidity is high. Impact: Potential critical path delays due to frequent component replacements and/or insufficient spares if rapid/common mode component failure on high humidity days.															
<a href="#">14016</a>	Toolset Modification due to Station Status Documents for Units 1, 3 & 4	[Execution] Event: There is a risk that Station Status Documents (SSD) for units 1,3,4 will reveal anomalies that challenge tooling design or MOD packages. Preparation of SSDs for future units have not yet been started. Cause: The station status documents were generated for Unit 2 only. Upon review of the station status documents, there were anomalies identified that challenged the tooling design which had to be accounted for. The station status documents for Units 1,3,4 are not initiated so any anomalies in those units are not considered in the current design of the toolset. Impact: Modifications to the toolset or MOD packages may be required. The cost of completion of the station status documents for Units 1,3,4 are considered in the class II estimate. However, the cost of any modifications to the tooling or MODs is unknown.	3	Active	Michael Hersch		04-Apr-16	Monitor	01-Jan-19	3	2	2	6	3	2	2	6
There are no Not Started, In Progress Actions associated with the risk.																	
<a href="#">11106</a>	RWC/DSO may not be delivered on-time [Window 114]	[Execution Phase] Event: RWC's will not be delivered on time to meet Window 114 (End fitting removal) of Unit 2 Level 1 outage Cause: There is a risk that retube waste containers cannot be manufactured and/or delivered on-time, due to delays in placing the order, schedule compression due to misunderstanding of need by date, and potential production ramp-up risks based on OPEX from previous similar fabrications. IMPACT: Critical path delays.	3	Active	Andrew Cerilli	Cole Stark	05-Apr-16	Monitor	30-Apr-16	1	3	4	4	1	3	4	4

	Concealed Conditions [Potential Window 160-188]	Execution Phase: Due to uncontrolled and unknown conditions inside the vault, especially, those inside the reactor, 4.8 Concealed Conditions Section of the EPC Agreement explains the condition and the contract terms of concealed condition. which can have cost and schedule impacts on	1	Active	Roy Brown	Jeffrey Palmateer	29-Mar-16	Accept	01-Jan-26	1	3	4	4	1	3	4	4
			There are no Not Started, In Progress Actions associated with the risk.														

ONTARIOPOWERGENERATION

Risk Report by Project with Associated Actions

13325		<p>Execution Phase.</p> <p>The examples of Concealed Conditions include, but not limited to:- CTSB Inspection Results;- Feeder nozzle found unsatisfactory;- Calandria tube contacting horizontal flux detector when they are moved;- As-built configurations vary from design and drawings, while laser scan and walk down etc. did not identify the variations and the JV had done everything possible;- Permanent bulkhead unexpected repairs identified during NDE;- Unexpected deficiencies of existing EPs in shutdown cooling rooms, after due diligence of JV exercised;- As-found "original construction" feeder flaws uncovered, after JV verification completes but could not identify those feeder flaws earlier;- Unexpected changes to containment boundary from OPG/other vendors may cause interruption to containment isolation pressure test;- Calandria Vessel discovery work requiring new tool and new method to remove the discovery materials;- PT factures longitudinally, resulting in jagged end on the PT</p>															
13442	Not able to dry PHT System with Bulk Dry Proposal [Window 29]	<p>Exectuion Phase Risk.</p> <p>Event:</p> <p>The joint venture has decided to go with a bulk dry strategy that would use the PHT Vacuum Dry tooling to remove all of the water in the PHT system from the Very Low Level Drain State (VLLDS). The risk is the residual risk that the Channel Drain Tool is required during execution as contingency. Channel Drain Tool has been procured and accepted by OPG as a contingency. The original plan to create a tie-in point (MOD) to interface with the channel drain tool with D2O collection has been cancelled. This CWP instructions on how to implement the channel drain tool were cancelled. JV and OPG SMEs reviewed the risk of requiring CDT if Bulk PHT failed to remove all water in Jan 2016 after sucessful completion of FAT testing of the system at TKMS in Oct 2015. This review determined the likelihood of the risk occuring was sufficently low that the CWP were not required. This decision was documented in the JV risk register and was part of the evidence package for OPG acceptance of the CDT final design.</p> <p>Cause and Impact:</p> <p>If the bulk dry process is not successful at Darlington, it will not be easy to revert back to a Channel by channel drain process as there will be no D2O transfer system tie-in and two major parts of the tool are not being delivered. The risk would result in having to drain and drum each fuel channel, with significant impact on critical path and increased radiation exposure to workers.</p> <p>The bulk dry strategy has not been successful during any other refurbishment project (OPEX). PT. Lepreau, Wolsong and G2 all used a channel drain prior to vacuum dry. Bulk dry was attempted during the Pickering Safe Storage project, however, there were a number of issues that arose during that operation which slowed down the process.</p>	2	Active	Michael Hersch	Sean Carpenay	12-May-16	Monitor	15-Oct-16	1	1	4	4	1	1	4	4
			There are no Not Started, In Progress Actions associated with the risk.														
13527	New Annulus Spacer design may not be used for Darlington [No Window Related]	<p>[Definition Phase]</p> <p>Event</p> <p>The new annulus spacer design is not accepted for use for Darlington.</p> <p>Cause</p> <p>In the event that the interm results of the irradiation testing does not provide assurance of the analysis model used by Candu Energy, the Chief Nuclear Engineer has the authority to request the project to use the original spacer design and material (Inconel).</p> <p>Impact</p> <p>The impact this risk is mainly financial as the RFR project will have to purchase a new set of Inconel spacers, and will need to update design registration and analysis documentation.</p>	2	Active	Andrew Cerilli	Geoff Colling	19-Apr-16	Mitigate	01-Jun-16	2	2	1	4	1	2	1	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6409	In Progress	Obtain Acceptance of New Annulus Spacer Design for use at Darlington NGS	NR Components engineering, with the support of the RFR project, must obtain the final approvals to install the new Annulus Spacer Design at Darlington NGS.	Thomas Lau		20-May-16	The process to obtain approval has been mapped: a) CEI to review CNL relaxation data and analysis whether the CEI model and qualification program is bounding b) AMEC to assess incremental risk based on the higher relaxation rate c) Cold body review (KT process is suggested) of available information for recommendation to CNE d) EDM							
	Significant Radiation Exposure without Optimal Shielding in Pre-	<p>[Execution Phase]</p> <p>Event: Risk of radiation exposure may be significant</p> <p>Cause: Due to higher than estimated dose rate and collective dose accumulation of the work group</p>	1	Active	Johnathon Hash	Kwok Tsang	11-May-16	Mitigate	14-Oct-16	2	2	2	4	1	1	1	1

**Report ID:** 0707A [Tech Tips](#)  
**Report Owner:** L. Greenland  
**Process Owner:** R. Smith  
**Data Refreshed:** 12-May-16 10:30 PM

13563	Requirement Tasks [Window 8, 16]	during the Pre-Requirement period and lack of shielding Strategy dedicated for that period. Impact: Negative impacts on Cost and Schedule.																	
			5423	In Progress	Shielding strategy to minimize exposure	Use Shielding strategy dedicated to the Pre-Requirement period to contain radiation to lower dose exposures.	Jeffrey Palmateer	Johnathon Hash	01-Aug-16	DUE DATE CHANGED TO 1 AUG 2016. OPG Project team with JV and OPG RP are working on a shielding and Radiation protection strategy. ** OWNERSHIP TO BE TRANSFERRED TO RP ** No incremental costs expected. This was a strong focus area post CL-III estimate submission. The dose calculations and totals that had been provided as the basis (no-basis) were as noted by OPG as a sign-off of the submission. There were many challenge meetings to review the calculations with a SME hit team in support of the CL-II submission; the dose became more reasonable and was accepted as the basis with new shielding strategies in place such as rada-shielding. However there are many actions and options being progressed to progress the dose mitigation. RWPB waste process from removal phase will be a major focus.									
13568	Non EF Waste Processing not Meeting Demand [Window 115, 116, 117]	Execution Phase Risk: Event: There is a risk of Waste Processing (excluding EF waste processing, which is covered by risk #12322) becoming the Critical Path and interrupting the reactor face work with negative impact on Schedule due to lower than expectation performance. Cause & Impact: Expected cause is Equipment Reliability - there is more downtime of the tooling system than planned. Due to the radiation hazards, equipment failures may be difficult to troubleshoot and concerns regarding safety may lead to significant delays during execution. Design Requirements call for close to 100% equipment availability, which may be difficult to demontrate in test program.	2	Active	Michael Hersch	Sean Carpenay	12-May-16	Monitor	01-Oct-17	1	1	4	4	1	1	4	4		
	There are no Not Started, In Progress Actions associated with the risk.																		
13744	Risk of Damage During Transportation and Handling of Fuel Channels and Feeders During Baseline Inspections [Window 71, 76, 83, 118, 119]	Event: Baseline inspections are required for the fuel channels and feeders in order to support future inspections, analysis and life cycle management. Cause: During these inspections, the FCs and feeders may be transported and handled by groups (i.e. IMS) other than the vendor. With this transfer of responsibility over the materials, there is associated risk that the materials may be damaged. Impact: These materials are pressure boundary items and any damage to them would require dispositioning or replacement. This risk is relevant during the execution phase, specifically between manufacturing of the PTs and Feeders and their installation. 14319	(possible similar risks to EF/CT/CTI) [Window 114, 115, 116, 117]	WTS and RWPB, with negative impacts on the schedule and worker dose due to need to cleanup. This residual risks remains despite best practices in RFR WTS design and procedures. CAUSE: This risk is postulated to occur by loose contamination being spread from the PT chute that links the VRS press to the RWC debris cover. There is a 'O-ring' like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is retracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring. By design, it is expected that the 'dirty' pins on the WTS lidding station will become contaminated over time as they lift the debris cover. there are seperate 'clean' pins for lidding the RWC lids. However, it is speculated that the partly contaminated debris cover will be lifted over clean RWC lids and transfer some of this loose contamination to the clean lids, therefore requiring cleanup. Note that this lidding station is contained inside a large concrete bunker so direct beams are not a concern. IMPACT: Based on OPEX with a similar WTS VRS press used at Lepreau Refurbishment - when PTs were crushed, the loose containnation led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.															
	Project: Retube and Feeder Replacement - 10000																
13266	Waste - ILW containers for non-standard waste streams [No Window Related]	Definition Phase: There may be a requirement for ILW containers to be designed for some ILW that are not the standard waste stream. Examples of such waste stream include the primary VRS press, chute and primary HEPA filter. This is identified in the JV document, "RFR Waste Forecast Quarterly Update Report" (509407-0000-00000-40RA-0094) and the Radioactive Waste Notifications (RWN) for the waste streams of interest.	3	Active	Cameron Webb	Yung Cheung	29-Mar-16	Mitigate	31-Mar-16	3	3	2	9	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			5929	In Progress	The plan for the VRS press and chute	The plan for the press and chute is: 1: Decontaminate in the WTS using CO2 blasting 2: Debris from CO2 blasting will go into a RWC/DSO assembly 3: Following decontamination, the press will be removed and placed in a "strong box". This "strong box" will either be stored on-site or off-site for approximately 10-15 years (after storage period, the press will be size reduced), or will be shipped to a decontamination facility for further decontamination and size reduction. For this plan to be viable, the following concerns will need to be addressed: 1: Impact of decontamination debris in the RWC/DSO assembly (long term storage) 2: Potential and impact of condensation build up during decontamination. There should be no water in the retube waste container. 3: Need specification of the proposed "strong box". At a minimum, this will still need to meet Minstry of Transportation requirements (tie-downs) for on-site transfer. 4: To confirm that the EA and licence of the RWSB can accept the new waste stream.	Cameron Webb	Yung Cheung	03-Jun-16	05 May 16 - The CWP will be updated to include steps to ensure there will no water in the RWC from in-situ decontamination. The "strong box" will be developed once the RWN has been processed. The TCD for the approval of the RWN is May 13, 2016. The steps associated with the assessments (EA) will be identified in the completed RWN. 28 Jan 16- On Track							
			5930	In Progress	The plan for primary HEPA filters and Misc ILW	The plan for the primary HEPA filters and misc ILW is to place the waste items in the RWC/DSO assembly. For this to work, an interface for the RWC/DSO assembly to allow the waste to be safely placed in the waste container will need to be designed. The concerns associated with this plan are: 1: Safety assessment may need to be revised to assess the impact of the proposed waste streams 2: Long term safety: filters will contain fine zirconium dust, so there is a higher chance for a fire to occur in the RWC/DSO assemby during storage. 3: Need to confirm if the waste should go into the RWC/DSO assembly or the Darlington in-station flask.	Cameron Webb	Yung Cheung	30-Jun-16	05 May 16 - The primary HEPA filters and VFF (Vacuum Filter Flask) filters will be going into the RWC. The types of assessments that need to be performed to demonstrate that there are no additional risks to the RWSB with this new waste stream have been identified. These assessments will identified in the RWSB New Waste Form process. The JV has a preliminary interface design, which has been reviewed by OPG. The JV will submit a cost estimate for this the interface (design and fabrication) for OPG to review and accept. 28 Jan 16- On Track.

			3175	In Progress	Provide Constant Oversight on Waste Strategy	OPG to provide constant oversight on Joint Venture Retube and Feeder Replacement Waste Plan and Refurb. Waste Plan.	Cameron Webb	Yung Cheung	29-Apr-16	Scroll down for latest updates. 29-Oct-14: Verify that the OPG Refurbishment Integrated Waste Management Plan is aligned with the SLN-Aecon Joint Venture Waste Plans and the latest Waste Quarterly Update Report. Furthermore, the aforementioned documents must ensure that RFR waste is suitably packaged and the intent of the Nuclear Waste Management waste acceptance criteria is met. This will help to ensure seamless turnovers between the Retube and Feeder Replacement Project and the Nuclear Waste Management Division. 17-Nov-14: Joe Burnham noted that as per RFR Waste Forecast Quarterly Update Report, all other items that have not been approved to be loaded into RWC (and that consists of fuel channel components that were originally known to have to be disposed of) do not have a container identified for use. The new Waste Forecast Update may have more information on this. 13-Mar-15: Waste Forecast report to be updated at the end of March 2015. 24-Apr-15: Even though RWNs are only required to be submitted one month prior to shipment, high priority RWNs are being pushed to identify risks and drive engineering of the containers. 6-May-15: High priority RWNs will be submitted on 8-May-15. OPG to review and then forward to Waste Acceptance Coordinator. 29-May-15: All high priority RWNs have been submitted except one, the VRS primary HEPA filters. Submission of this RWN is tracked by Action # 3153. 11-Jun-15: All high priority RWNs are submitted. VRS Chute RWN (non high priority) is in progress. 25-Jun-15: WWMF reviewed RWNs and have no comments. WWMF new waste coordinator to circulate to skateholders for their review. 20-Jul-15: Beginning to receive comments back from stakeholders on the RWNs. 10-Aug-15: New waste form has been initiated. Waiting for JV to provide additional information so that new waste review can be initiated. 17-Aug-15: A schedule is to be developed that shows the timeline for procurement of containers. 18-Sep-15: JV is working on outstanding R

13991		Impact: Potential impact on critical path.																
	6198	In Progress	Track Rework	Track rework and develop mechanism to minimize construction and engineering rework.	John Hamilton	Adam Coyle	14-Apr-17	12-Jan-16: No rework tracked so far. Will develop mechanism to track rework. Engineering rework is defined as revised design post DEC approval. Construction rework is defined as re-installation or re-fabrication. 29-Jan-16: Rework means that work that is required to correct original work (or rework) that is not defective. To proactively minimize pilecap pour rework, they are now scheduled to the weekends, as any delay at the Sally Port during the weekdays will incur rework to this task. 19-Feb-16: To minimize potential rework/delay, the first pilecap zone pour will use 3 pump trucks, 1 station outside the PA incase one of the other 2 inside the PA fails. 22-Mar-16: Update to Critical Path: Zone 1 pour was executed per logistics plan and executed in 2 hours less than planned. The next 10 pours will be planned and executed in the same manner. 13-Apr-16: Zones 3 and 2 poured within allocated time. No rework. 12-May-16: Zone 4 and 5 poured within allocated time. No rework.										
13980	RWPB Engineering - Delay or Schedule inaccuracy impacting Critical Path [No Window Related]	[Definition Phase] Event: delay to Engineering or inaccurate schedule estimate Cause: Inefficient Engineering hand-offs and/or P6 misalignment to need dates Impact: Negative impact to Construction schedule.	3	Active	John Hamilton	Peter Kempton	12-May-16	Monitor	30-Dec-16	2	1	3	6	2	1	3	6

Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

14319	(possible similar risks to EF/CT/CTI) [Window 114, 115, 116, 117]	WTS and RWPB, with negative impacts on the schedule and worker dose due to need to cleanup. This residual risks remains despite best practices in RFR WTS design and procedures. CAUSE: This risk is postulated to occur by loose contamination being spread from the PT chute that links the VRS press to the RWC debris cover. There is a 'O-ring' like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is retracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring. By design, it is expected that the 'dirty' pins on the WTS lidding station will become contaminated over time as they lift the debris cover. there are seperate 'clean' pins for lidding the RWC lids. However, it is speculated that the partly contaminated debris cover will be lifted over clean RWC lids and transfer some of this loose contamination to the clean lids, therefore requiring cleanup. Note that this lidding station is contained inside a large concrete bunker so direct beams are not a concern. IMPACT: Based on OPEX with a similar WTS VRS press used at Lepreau Refurbishment - when PTs were crushed, the loose containmation led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.															
12428	OPG Foreign Material Exclusion (FME) Events Concealed [Window 42, 111, 114, 115, 116, 117]	Execution Phase: Events: FME items sitting inside Concealed Areas that cannot be discovered/identified in Walkdowns may occur during RFR work in Execution Phase Cause: As a result of historical FME events, Impact: Additional inspection / repair activities with negative impacts to * RFR cost * RFR schedule SCR; N-2015-19073 - RFR – Lack of FME Program was filed to identify the lack of FME currently in place as practice. For trending; N-2015-22746 - RFR Tooling shipped to DEC from manufacture with visable Foreign Material JV will issue REV-0 of the FME plan as per the meeting on Nov 4th with planning manager - Sebastian Wojewoda. Follow-up by Gerard Edison with JV SME indicated that incororpoation of comments have been completed and issue date TBD by JV. The JV will require an approved FME plan for the standby plan that has been approved and issued.	3	Active	Roy Brown	Jeffrey Palmateer	29-Mar-16	Accept	01-Jan-26	1	2	2	2	1	2	2	2

14117	Condensate Line Relocation (DEC123638)- Material Delivery Dates Present Risk to Outage Pre-Requisite Execution [Window 130]	[Definition Phase] Event This item documents the risk associated with delayed delivery of material for the Condensate Line Relocation Modification (DEC123638). Installation of this DEC requires a TRF Outage and as such must be coordinated with the station outage schedule. Currently, POs are just being let for the majority of the material required to complete this modification and the JV Procurement Schedule has delivery dates for this material that do not meet the needs of the Project Schedule (see specific details provided in the Comments). Cause Significant delays have been experienced in the Procurement Process. There are many reasons for these delays, however, the main cause of the delays seen related to materials required for this Modification is [REDACTED] [REDACTED].Impact Lack of Material availability and delays in the installation of DEC123638 may result in a TRF Forced Outage to complete the work at a later date following the TRF Planned Outage and prior to Breaker Open. This could have significant financial impacts to OPG.	4	Active	Andrew Cerilli	Ian Wilcox	09-May-16	Monitor	13-Apr-16	1	2	1	2	1	2	1	2

14136		sustained samples which demonstrate the requirements and risk for palstic suits is no longer necessary. Cause: At present this could take between three and five days of continued monitoring and surveys. Impact: The schedule and the assumptions made from the project need to be aware and reflect these requirements to ensure a smooth transition with minimal delays is achievable.															
Project: Retube and Feeder Replacement - WA																	
14319	Spread of Contamination during RFR Waste Processing of crushed PT (possible similar risks to EF/CT/CTI) [Window 114, 115, 116, 117]	Execution Phase Risk: EVENT: There is a residual risks that that there will be spread of loose contamination in the RFR WTS and RWPB, with negative impacts on the schedule and worker dose due to need to cleanup. This residual risks remains despite best practices in RFR WTS design and procedures. CAUSE: This risk is postulated to occur by loose contamination being spread from the PT chute that links the VRS press to the RWC debris cover. There is a 'O-ring' like barrier that seals the connection between the chute and RWC debris cover during PT crushing, however when the chute is retracted, it is speculated that some of the fine particles in the chute would become loose and spread beyond this ring. By design, it is expected that the 'dirty' pins on the WTS lidding station will become contaminated over time as they lift the debris cover. there are seperate 'clean' pins for lidding the RWC lids. However, it is speculated that the partly contaminated debris cover will be lifted over clean RWC lids and transfer some of this loose contamination to the clean lids, therefore requiring cleanup. Note that this lidding station is contained inside a large concrete bunker so direct beams are not a concern. IMPACT: Based on OPEX with a similar WTS VRS press used at Lepreau Refurbishment - when PTs were crushed, the loose containmation led to high dose rates in the vault that required significant cleanup. For RFR, the negative impact would be on the schedule for PT removal and worker dose due to need to cleanup loose contamination.	3	Active	Michael Hersch	Sean Carpenay	04-Apr-16	Monitor	01-Feb-18	2	1	2	4	2	1	2	4

Risk Report by Project with Associated Actions

13636	Currently no alternate cooling water design for SA compressors [Window 506]	EVENT: No cooling water available during 60 day LPSW outage. CAUSE: No alternate connection designed in SA mod or LPSW alternate cooling mod, to LPSW. IMPACT: More design work required on existing mods (T/P mod) or reduced service air capacity.		Active	Andy Ireland		06-May-16	Accept	01-Nov-17	2	1	1	2	2	1	1	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			5376	In Progress	Turn off CP11 during U2 outage	MTL to coordinate with Operations to determine most efficient way to turn off CP11 during U2 outage.	Andy Ireland	Kris Dabiran	05-Jul-16	5Feb2016: An operations memo might not be necessary. MTL to discuss with Operations to determine path forward							
			5476	In Progress	Investigate impact of no alternate cooling water for SA compressors during U3 LPSW outage	SDLU to investigate the the impact of having no alternate cooling water to Service Air Compressors during the U3 LPSW outage.	Andy Ireland	Kris Dabiran	05-Jul-16	5Feb2016: For U3 outage, provisions available to supply temporary power/cooling water to SA compressor. Impact on U3 will be determined by beginning of U3 outage.							
14129	OPG Acceptance of Design ECs without having Final Certified Vendor (Atlas Copco) Documents [Window 505]	EVENT: Rework might be needed for Design EC to align with final approved Atlas Copco documents. CAUSE: Accepting the Design ECs without verifying information from Approved Atlas Copco Documents. IMPACT: Additional cost and schedule delay for rework.		Active	Andy Ireland	Kris Dabiran	06-May-16	Mitigate	30-Jun-16	1	1	2	2	1	1	2	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			7272	In Progress	Monitor Receipt of Atlas Copco Documentation	Refer to NK38-CORR-09701-0579150. Breathing Air Design for Header was accepted without all of vendor documentation provided. OPG MTL to track receipt of documents from vendor to DSP and ensure that documents are reviewed against design to ensure that no changes are required. Update this action as required until all documents in NK38-CORR-09701-0579150 are received all changes to EC are identified.	Andy Ireland	Kris Dabiran	30-Jun-16								
14323	Breathing Air Additional Scope Increase [Window 505]	EVENT: Breathing Air VBO compressor and Pre-Bulkhead tie-ins to new Refurb Breathing Air design is delayed CAUSE: Scope was not identified in the Scope of Work or the MDR and thus was identified late in the design IMPACT: Additional cost to expedite design and field work.	4	Active	Andy Ireland	Kris Dabiran	06-May-16	Mitigate	01-Dec-16	1	2	1	2	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6720	In Progress	Develop a strategy completion of design and installtion of modification required for VBO compressor connection to the new Breathing Air header	Upon acceptance of usage of VBO compressor as redundancy in the event of new breathing air compressor failure, a modification needs to be designed to provide means for connection of VBO compressor to the new breathing air header. 1) discussion to be held with OPG refurb design engineering to determine the availability of resources TCD April 08, 2016 2) In the event OSS funding is required to complete the design, project to secure the funding through CCF process 3) Construction scope to be added to the existing contract with ESFL through CCF/PCA process upon completion of design and acceptance of construction estimate 4) This modification to be AFS'd at the same time as the original breathing air modification scheduled for December 01, 2016	Andy Ireland	Kris Dabiran	01-Dec-16								
13588	Discovery work [No Window Related]	EVENT: There is a risk that there will be work that is not accounted for. Funding might not be allocated to something that is unplanned. CAUSE: Unforeseeable events such as a broken component in the field. For example, SG internal condition is different than expected. IMPACT: Addition of work during next phase which will increase cost and schedule delays.		Active	Andy Ireland		12-May-16	Accept	31-Oct-19	1	1	1	1	1	1	1	1
			There are no Not Started, In Progress Actions associated with the risk.														
Project: Shutdown, Layup, Services - SL																	
	PHT Aux. SDLU - Dry Air Purge at risk due to Dead Legs [Window 481]	Following draining of the PHT auxiliary systems, there will be areas where liquid water is held up as stagnant legs (hereafter referred to as dead legs). The presence of dead legs will block the flow path for the drv air purgae and will result in an unsuccessful shutdown layup of the auxiliariw systems.	3	Active	Paul Ross	Carrie Smith	21-Apr-16	Avoid	01-May-17	4	2	4	16	3	2	3	9
There are no Not Started, In Progress Actions associated with the risk.																	

14392		At the very least, draining of dead legs may impact the installation window for the dry air purge if a strategy is not developed. If shutdown layup conditions are not met, then prolonged exposure of the carbon steel to wet conditions in the presence of air will result in corrosion and significant degradation. If not detected, that could compromise the system's pressure boundary when the system is returned to service and potentially cause inadvertent impacts on nuclear safety. If detected, it could result in major overhaul of equipment, components and piping significantly delaying Return to Service. This risk was previously identified during COMS and added to the ITF Item #78 and #144 under Master EC #125476. Detailed Design was completed with these risks not closed out.																																																													
14392	New 600 lb flanges not installed in Unit 2 BO1/2 [Window 3]	EVENT: New 600 lb flanges will not be installed prior to installation of the wet layup skids during U2 refurbishment on BO1/BO2. CAUSE: Based on OPEX from previous outages, WOs 2391690 and 32391692 were constantly pushed from outage to outage. IMPACT: Will impact Costs, schedule of DNRU2 if not implemented prior to outage.	<table><tr><td></td><td>Active</td><td>Andy Ireland</td><td></td><td>08-Apr-16</td><td>Mitigate</td><td>30-Oct-16</td><td>3</td><td>2</td><td>2</td><td>6</td><td>3</td><td>1</td><td>1</td><td>3</td></tr><tr><td>Action#</td><td>Status</td><td>Action Title</td><td>Action Description</td><td>Owner</td><td>Delegate</td><td>Due Date</td><td colspan="8">Comments</td></tr><tr><td>5166</td><td>In Progress</td><td>Ensure installation of 600 lb flanges in Unit 2 BO1/2.</td><td>Installation of new 600 lb flanges must occur before SG Wet layup work in U2 Refurbishment. <a href="#">13394</a>			<a href="#">5236</a>	In Progress	Incorporation of Split Coil Design Into Vault Cooler Installation	1) Project to monitor status of station initiative to implement the split coil design. 2) Project to initiate a project change directive if split coil design is implemented by station and brought into Refurb scope. Split coil would be used in selected locations dependent on removal/installation interferences.3) Project to submit PCD to JV for cost and schedule impact, contingency to be utilized.	Sorin Marinescu	Greg Maggs	30-Jun-18										
<a href="#">13463</a>	SDS Interface Compatibility Issues Discovered During Installation [Window 7]	Event: SDS computer compatibility issues during installation. Cause: The system will be thoroughly tested prior to installation under simulated conditions but some conditions (Ispecifically driving actual field solenoid valves) cannot be simulated and therefore must be tested in the field. Impact: Both cost and schedule would be impacted by the interface compatibility issues if they arise.	1	Active	Sorin Marinescu	P Sharawy	11-Apr-16	Monitor	30-Jun-18	2	1	3	6	1	1	3	3		
<a href="#">12327</a>	SDS Computer Project Failure to Meet Hardware Design Requirements [No Window Related]	Event: The system as designed fails to meet design requiprements during design testing and qualification. Cause: Latent design flaws. Impact: Both cost and schedule could be impacted due to substantial rework being required.	1	Active	Sorin Marinescu	P Sharawy	11-Apr-16	Monitor	30-May-17	1	1	4	4	1	1	4	4		
<a href="#">12328</a>	SDS Computer Project Grounding Problem [Window 7]	Event: SDS Computer grounding discovered during install. Cause: Grounding has been an issue in past computer system installations therefore there is a risk tha the same issue will arise with the installation of the new equipment. Impact: Both cost and schedule ofthe project would be impacted.	1	Active	Sorin Marinescu	P Sharawy	11-Apr-16	Mitigate	30-Jun-18	1	1	4	4	1	1	3	3		
<a href="#">13397</a>	Execution delays due to quality or fit-up of vault cooler components results in impact to cost and schedule [Window 64, 70]	Event: Vault Cooler components found to have quality issues making it necessary to perform re-work during installation. Cause: Quality or fit-up issues with Vault Cooler components. Impact: Both cost and schedule would be impacted if re-work had to be performed on the Vault Coolers.		Active	Sorin Marinescu	Greg Maggs	11-Apr-16	Mitigate	31-May-17	2	1	2	4	1	1	2	2		
<a href="#">13399</a>	Vault Cooler Cat ID exceptions due to changes in material/design results in cost impact to material procurement [No Windows Related]	Event: Significant Cat ID tech specs, or drawings exceptions are found for vault cooler components. Cause: Changes in the material or design by the bendor since the original Cat ID was created Impact: Increased cost due to material/design changes	2	Active	Sorin Marinescu	Greg Maggs	11-Apr-16	Mitigate	31-May-16	2	2	2	4	1	2	2	2		
<a href="#">13464</a>	SDS Equipment Fails During Installation [Window 7]	Event: SDS Equipment fails during or before installation. Cause: All SDS computer components are being prcured at the same time therefore, by the time the parts are installed for U4 refurbishmnet they will have been in storage for 7 years creating a risk that they will fail when installed. Impact: The failure of the equipment will have an impact on both cost and schedule as replacement components will have to be procured and installed.	2	Active	Sorin Marinescu	P Sharawy	11-Apr-16	Mitigate	30-Jun-18	1	1	3	3	1	1	3	3		
<a href="#">14398</a>	unit temp power distribution (12 carts) co-ordination during execution	unit temp power dist system being installed by sdlu has 12 power carts located across unit . Risk Report by Project with Associated Actions

Project: Steam Generators -																			
13450	SG Demobilization Activities Extended Due to Layup and Inspection Schedule [Window: 62]	EVENT: EPC vendor will need to carry resources (trades and PMT) for an extended duration in order to support SG demobilization activities at the end of the SG primary side maintenance window while IMS is executing work. CAUSE: Changes to the overall refurbishment schedule that are not driven by the EPC contractor. IMPACT: This could result in an extension to the baseline schedule and a significant cost increase to the project.	3	Active	Pejman Asgaripour	Mike Lutz	03-May-16	Mitigate	24-Jun-16	5	2	4	20	5	2	1	10		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			5217	In Progress	Explore alternative options for PS demob and layup activities to reduce/elimnate holding costs for SG EPC vendor	Explore alternative options for PS demob and layup activities to reduce/elimnate holding costs for SG EPC vendor: -contract out PS demob activities (remove tent/scaffold, remove temp power, etc) to contractor working inside vault -Vendor to utilize terms of the Project Agreement, and coordinate trades sharing between other contractors to eliminate holding costs.	Pejman Asgaripour	Mike Lutz	31-Jul-16	Status update May 3, 2016: Primary Side civil demob activities will be performed by a subcontractor to BWXT. This should reduce risk associated with carrying costs for trades. To be confirmed once subcontractor agreement is in place. Agreement to allow trades sharing between vendors has not been implemented. This will be monitored up to execution as a cost savings opportunity, but base plan and funding for execution will not include this scenario.									
13415	Site services/support unavailable [Window 34, 37, 62, 34-132]	EVENT: Field services like electrical connections, water connections, layout areas, service air, breathing air, station provided PPEs, permitry, scaffolding area, and/or rad protection may not be available when required by the schedule. CAUSE: Two groups assigned to the same resource at the same time. Priority being given to other project groups to use services identified by the SG project. IMPACT: Delays to project schedule and/or increased costs.		Active	Pejman Asgaripour	Jennifer Nodwell	29-Apr-16	Mitigate	15-Oct-16	3	4	4	12	2	1	2	4		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			7016	Not Started	Provide SG project site requirements to refurb SPOCS	Provide site requirements from the Site Infrastructure Plan to Refurb SPOCS	Pejman Asgaripour		31-May-16										
13417	OPG Causes Delays to the Vendor Schedule due to Other Projects [Window 34, 37, 62, 104]	EVENT: OPG causes delays to the contractor's ability to execute the work in accordance with their schedule. CAUSE: OPG and / or the vendor for other refurbishment projects. IMPACT: This risk captures significant delays, change in outage dates.  This risk is to the overall SG project. Specific risks will be created as potential conflicts with other project's are identified during schedule reviews. Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)  
Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

11928	Activity Loading Exceeds Limits [Window 62]	shielding flask design/selection. IMPACT: Cleaning execution delays or incomplete cleaning and the need to store wastes on site until repackaging for shipment within license limits for activity.															
			1383	In Progress	Investigate location for temporary storage for containers	Investigate location for temporary storage for containers.	Pejman Asgaripour	Mike Lutz	30-Jun-16	Feb. 26/16: Changed action due date to end of June Jan 27, 2016: SATM request for EFFA laydown area in progress. Refurb Waste Management supporting MOU with station identifying waste container laydown requirements for PSC. Dec. 18/15: Plans for radioactive material shipments being finalized. Due date moved to align with the assessing complete milestone (April 15/16) refurb Ops/maint issued a refurb radioactive storage assessment. Sg has provided input on what's req'd for this project. As the final options for radioactive material storage prior to offsite shipment has not been determined, this action cannot close.							
12460	Inadequate Quality Control for Waterlancing Control Software [Window 37]	EVENT: Honing issues, system shutoff parameters, and / or repeat lane visits during waterlancing of the steam generator. CAUSE: Inadequate control of the waterlancing control software. IMPACT: Inadequate sludge removal and / or steam generator asset damage.	1	Active	Pejman Asgaripour	Jennifer Nodwell	21-Apr-16	Mitigate	29-Aug-16	1	2	3	3	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			3677	In Progress	Inadequate Quality Control for Waterlancing Control Software	Inadequate control on Waterlancing control software could result in homing issues, system shutoff parameters, and repeat lane visits leading to: -Asset Damage (Damage to tubes) -Inadequate Sludge Removal	Pejman Asgaripour		05-Aug-16								
13398	Execution Quality-CWP & ITPs are in compliance with vendor's quality program [No Window Related]	EVENT: The contractor performs execution activities without a robust CWPs and ITPs. This could lead to damage to the Steam Generators, ineffective cleaning, or loss of FME controls. CAUSE: The contractor does not properly execute the work. IMPACT: Damage to the Steam Generators, ineffective cleaning and / or loss of FME controls. This could lead to increased costs and schedule delays.		Active	Pejman Asgaripour	Mike Lutz	03-May-16	Mitigate	30-Jun-16	1	3	3	3	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6141	In Progress	Perform Oversight of SG Contractor's CWPs	Perform oversight of the SG contractor's CWPs and ITPs to ensure they meet the contractor's Qa program and OPG's expectations. Oversight should be performed on documents prepared by both BWXT and Candu Energy.	Pejman Asgaripour	Jennifer Nodwell	31-May-16	Mar. 31/16: Due date moved to April 20 March 29/16: Oversight being performed and observations recorded in the oversight log. Due date moved to April 15/16 to align with the milestone for completion of the CWPs. Step one approved.							
	Changes to SG Primary Side Inspection window may conflict with IMS support	EVENT: IMS have committed to the original Refurbishment inspection window in order to coordinate support for Pickering and Darlington Planned outages (per IMS blackout dates). As the window moves. it may conflict with the planned outaage blackout dates resulting in resource conflicts for	2	Active	Pejman Asgaripour	Mike Lutz	29-Apr-16	Monitor	01-Aug-16	3	1	1	3	2	1	1	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							

13975	during Darlington and Pickering Planned Outages [Window 62]	Refurbishment and Planned Outages. CAUSE: Changes to the SG primary side inspection and maintenance window as work control finalizes and refines the DNRU2 Level 1 Schedule IMPACT: IMS resources not available as required by the SG project. Additional costs to the projects and delays to the execution window	5808	In Progress	Assess SG Primary Side Execution Window Changes - DNRU2 Level 1 Rev C	Assess SG Primary Side Execution Window Changes - DNRU2 Level 1 Rev C Following the issue of DNRU2 Rev C, evaluate SG Project Primary Side Maintenance and Inspection window for changes and impact to execution strategy. -Window condensed, expanded, split -EPC Vendor or IMS conflicts with execution schedule date changes Additionally, -Review DNRU2 L1 IMS inspection window against IMS blackout chart to ensure IMS is not scheduled in conflict with Gen Plan commitments. Ensure issues are raised up to Refurb Outage Director.	Pejman Asgaripour	Mike Lutz	17-Jun-16								
			5809	Not Started	Assess SG Primary Side Execution Window Changes - DNRU2 Level 1 Rev 0	Following the issue of DNRU2 Rev 0, evaluate SG Project Primary Side Maintenance and Inspection window for changes and impact to execution strategy. -Window condensed, expanded, split -EPC Vendor or IMS conflicts with execution schedule date changes Additionally, -Review DNRU2 L1 IMS inspection window against IMS blackout chart to ensure IMS is not scheduled in conflict with Gen Plan commitments. Ensure issues are raised up to Refurb Outage Director.	Pejman Asgaripour	Mike Lutz	17-Aug-16								
14356	SG vendor P6 schedule is lost or unavailable [No Window Related]	EVENT: SG vendor is using the OPG schedule and is unable to maintain a backup in the event of a system crash, leading to the schedule being lost CAUSE: P6 Software crashes IMPACT: Potential costs and delay to the schedule to recover the schedule		Active	Pejman Asgaripour		29-Apr-16	Mitigate	17-Aug-16	1	1	3	3	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6808	Not Started	Investigate schedule backup protocols and processes	Investigate with program schedule backup protocols and processes	Melanie Lahti		31-May-16								
11959	Steam Generator Legacy Foreign Material Cannot Be Removed [Window 37]	EVENT: Steam Generator Vendor FME removal tooling may not be able to support the removal of all known legacy foreign material in hard to reach regions of the steam generator. CAUSE: Legacy FME located in a hard to reach region of the SG that the contractor's tool can't reach. IMPACT: This will result in additional FME tooling development by the vendor or engineering to disposition leaving material in the SG.	3	Active	Pejman Asgaripour	Jennifer Nodwell	21-Apr-16	Mitigate	15-Jan-17	2	1	1	2	1	1	1	1
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			1899	In Progress	FME Plans and Controls in Place Prior to Field Execution	FME plans and controls in place prior to field execution. includes having a process flowchart on steps to build a new tool for "must retrieve" FME that includes authorization to use.	Pejman Asgaripour	Jennifer Nodwell	15-Oct-16	FME contingency approach identified via e-mail August 28th. Further work to follow. FME contingency plan will be an appendix to future CWP for secondary side work.							
			2659	In Progress	FME contingency plan	BWC to create SG secondary side FME contingency plan. CEI will need a more basic plan given PHT bung and nature of FME risks. Plan needs to address IMS FME plan level as well.	Pejman Asgaripour	Jennifer Nodwell	30-Jun-16	May 12, 2016: Vendor FME process currently under review with OPG. Due date moved to June 30, 2016. Initiator changed from Amir to Mike since system will not allow past employee.							
13412	Work area restrictions due to Hot Particle [Window 62]	EVENT: Work area restrictions due to high radiological conditions. CAUSE: Hot particle being trapped in the primary side clean system or SG. IMPACT: Schedule delays, costs, and increased dose to crew.		Active	Pejman Asgaripour	Mike Lutz	21-Apr-16	Monitor	15-Oct-16	1	1	2	2	1	1	2	2
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			6144	In Progress	Known Hot Particle Information for Steam Generators	Obtain Dose Data from OPG for any known Hot Particles before each unit outage.	Pejman Asgaripour	Mike Lutz	14-Oct-16	Dec. 22/15: Due date set as start of refurbishment outage. This may need to be revised.							

ONTARIOPOWER GENERATION Risk Report by Project with Associated Actions

Report ID: 0707A [Tech Tips](#)

Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

<a href="#">13418</a>	Defects in the Shell [Window 37]	EVENT: Will require redesign of port location or require a repair before proceeding. CAUSE: Defects identified in the shell during mag particle and UT scans. IMPACT: This could lead to significant schedule delays and cost impact.		Active	Pejman Asgaripour	Jennifer Nodwell	21-Apr-16	Mitigate	01-Oct-16	1	1	2	2	1	1	1	1	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6140</a>	Not Started	Review Results of UT Scans of the SG Shell	UT scans are scheduled as a pre-req to the installation of the access ports to check for defects in the SG shell. The results of the UT scans need to be reviewed by OPG to confirm that the planned access port location is acceptable.	Pejman Asgaripour	Jennifer Nodwell	30-Jan-17	Dec. 22/15: Due date of Jan. 30/17 based on the current project schedule. This will need to be confirmed once rev. 0 of the program schedule is released.								
<a href="#">11989</a>	IMS Unable to Support Steam Generator Inspections [Window 37, 62, 104]	EVENT: IMS is unable to support steam generator inspections as scheduled during refurbishment CAUSE: IMS has schedule conflict due to the need to support other planned, forced, or external business activities. IMPACT: Delays to the refurbishment steam generator execution window and additional costs.	1	Active	Pejman Asgaripour	Mike Lutz	21-Apr-16	Monitor	01-Aug-16	1	1	1	1	1	1	1	1	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">1919</a>	In Progress	Via IMS workforce planning, determine if potential resource conflicts exist for future work, determine impacts and prevent cost creep.	Via IMS workforce planning, determine if potential resource conflicts exist for future work, determine impacts and prevent cost creep.	Pejman Asgaripour	Mike Lutz	30-Oct-16									
<a href="#">13919</a>	PSC - CWP completion far in advance of execution date may result in CWP revisions/rework [No Window Related]	EVENT: Changes are required to the CWP's based on validation testing performed by the contractor prior to field execution. CAUSE: OPG imposing early CWP completion date for PSC CWPs and procedures. IMPACT: Re-work to the CWP's which will be an extra cost to the project. CWP will be aproved in April. The validation testing will take place following CWP approval. It does not get executed until 2018	1	Active	Pejman Asgaripour	Mike Lutz	29-Apr-16	Accept	08-Oct-17	1	1	1	1	1	1	1	1	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6142</a>	Not Started	Determine Impact of Validation Testing on PSC CWP	The CWP for primary side clean is being prepared in advance of validation testing at the contractor's facility. Post validation testing the approved CWP needs to be reviewed to determine if the results of the validation testing drives any changes to the CWP.	Pejman Asgaripour	Mike Lutz	25-Nov-16	Dec. 22/15: Need to revise completion date to align with completion of the validation testing.								
<a href="#">14357</a>	Contractor Field Staff Impact Station Operations [Window 34, 37, 62, 104]	EVENT: Contractor field staff negatively impact station operations CAUSE: Lack of contractor awareness of impact to station operations during field execution IMPACT: Delay to the station schedule April 13, 2016: Risk raised based on OPEX from Service Air project		Active	Pejman Asgaripour		29-Apr-16	Mitigate	31-May-16	1	1	1	1	1	1	1	1	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			<a href="#">6800</a>	In Progress	Assess station operations which the SG project impacts	SG project to assess which station operations the project can impact. Once these are known, separate risk and actions will be created for those operations	Waleed Ahmed		31-May-16									
<a href="#">14358</a>	Contractors Field Staff Not Prepared To Perform Field Work [Window 34, 37, 62, 104]	EVENT: Contractor field staff are not prepared (knowledge, experience) to perform field work CAUSE: Contractor field staff lack required qualifications RESULT: Delay to the execution schedule and rework Risk raised on OPEX based on the VVRS project		Active	Pejman Asgaripour		29-Apr-16	Mitigate	01-Mar-17	1	1	1	1	1	1	1	1	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments

			5808	In Progress	Assess SG Primary Side Execution Window Changes - DNRU2 Level 1 Rev C	Assess SG Primary Side Execution Window Changes - DNRU2 Level 1 Rev C Following the issue of DNRU2 Rev C, evaluate SG Project Primary Side Maintenance and Inspection window for changes and impact to execution strategy. -Window condensed, expanded, split -EPC Vendor or IMS conflicts with execution schedule date changes Additionally, -Review DNRU2 L1 IMS inspection window against IMS blackout chart to ensure IMS is not scheduled in conflict with Gen Plan commitments. Ensure issues are raised up to Refurb Outage Director.	Pejman Asgaripour	Mike Lutz	17-Jun-16									

12 first time evolution in the

1302		CAUSE: The unavailability of validated procedures for first time maintenance activities presents some level of unknowns. IMPACT: This can potentially result in adverse cost/schedule/quality impact.																
11217	TG- Lack of skilled and experienced EPC Vendor Staffing [Window 61, 100]	EVENT: Lack of Skilled and experienced craft labour, QC and supervision resources in Definition, Planning and Execution phases for TG project for performing the work as per schedule with sufficient quality; avoiding any potential rework. CAUSE: Ability of vendor to hire the experienced and skilled personnel and the unavailability of experienced and skilled personnel. IMPACT: Potential rework that can impact cost and schedule.	1	Active	Peter Moore	Todd Josifovski	12-Apr-16	Mitigate	31-Oct-16	2	2	4	8	1	2	3	3	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			2332	In Progress	Project will conduct oral review board to assess the capability and experience of the all trades supervision.	Given known lack of turbine / generator experienced craft labour resources, in Canada and globally, the action is to investigate potential augmenting of JV craft labour with OPGturbine crew support and resources to participate in install/commissioning forcross pollination of this specialty knowledgeto the JV resources, and also to assistturbine crew in terms of hands on training to prepare for future AFS/turnover.	Peter Moore	Dave Owens	12-Dec-16									
13309	TG Crane, all lifting Equipment and Tools Availability and Capability. Ie. Slings, lifting tools [Window 61,100]	EVENT: The condition of the crane is degraded to a point where it cannot support the requirements of the TG project. Due to the condition of the crane there is a possibility of performing standard maintenance, incremental maintenance or a modification to the crane in order to meet the TG project requirement. OPEX on similar installation has shown that the crane would require modification in order to meet the load demand required for this turbine work. CAUSE: Additional aspects is the residual reliability risk of the TH Crane after refurbishment. If the TH Crane experience any break down during the critical path of the TG window, cost and schedule will be negatively impacted. Also, there is a risk related to plant integration, related to any forced outages or other station emergency requirements to use the cranes which may supersede TG Project needs, resulting in negative impact to cost and schedule. IMPACT: This event can lead to cost and schedule impact.	1	Active	Peter Moore	Todd Josifovski	13-May-16	Mitigate	30-Sep-16	2	3	4	8	2	3	4	8

13446	TG - Material delays due to incomplete documentation, wrong material or improper storage [No Window Related]	EVENT: Alstom may not be able to provide pedigree documentation that JV requires for completion of receipt inspection of OEM supplied materials activities in accordance with JV's Quality Assurance Program. This can lead to materials not being released on time from the JV's warehouse. CAUSE: This risk might occur due to the OEM not following QA, improper material or quantiites, or documentation missing from sub-vendors or due to human error.In addition, the risk is also JV non-compliance with storage requirements conditions of Alstom parts, resulting in parts that cannot be used, or additional analysis must be performed resulting in delays. This risk may also occur due to OPG cat id documentation not being correct / up to date, causing delays or rework in Alstom or JV ordering materials, or rework in drawings or documentation. IMPACT: This can lead to schedule impact due to materials being unavailable	3	Active	Peter Moore	Mina Boghdady	11-May-16	Mitigate	30-Oct-16	2	1	4	8	1	1	3	3	
			There are no Not Started, In Progress Actions associated with the risk.															
13531	TG Risk of Schedule Delay / Cost Due to OPG and Vendor Handoffs / Dependent Activities [Window 61,100]	EVENT: Due to multiple vendor handoffs, the TG contacting strategy has been optimized to reflect strengths of vendors and internal OPG groups involved. CAUSE: Late or incomplete handoffs, or late completed activities may result in delay or rework by other vendors or OPG groups.These contactors are in a very high demand therefore if they are let go there is high chance we might not be able to rehire them on time. Project also might not be able to redeploy this resources on another project. IMPACT: However the risk is that there will be schedule delay or additional costs due to the multiple handoffs / dependent activities between OPG / Alstom / JV / IMS.	1	Active	Peter Moore		11-May-16	Monitor	01-Dec-16	2	3	4	8	2	3	4	8	
			There are no Not Started, In Progress Actions associated with the risk.															
13575	Stator Mid Section transportation risk [No Window Related]	EVENT: As part of the TG scope of work a new generator stator mid section is being procured. CAUSE: The transportation of the stator mid section is currently in the ESES scope. However a risk is imposed that infrastructural upgrades (St. Mary's Cement Dock, Gravel road connection, etc.) are required to complete the stator transportation. IMPACT: The infrustructure upgrade will impact cost.	1	Active	Peter Moore		11-May-16	Accept	01-Dec-16	4	2	1	8	4	2	1	8

<a href="#">3973</a>	[Window 61]	could coincided with their blackout dates that IMS has identified for support of planned outages in PNGS and DNGS as part of generation plan initiative. IMPACT: There is significant impact on schedule that might occur. The SG bundle and TG project could fall into the same category.																
<a href="#">14030</a>	TG - New Stator Midsection risk [No Window Related]	EVENT: The TG project is procuring a new stator to be used on U3 generator from Alstom. The new stator is specified and expected to be delivered on site as a direct replacement item. CAUSE: There is a risk that the new stator can arrive at the darlington site not with the right components and the design does not have the correct specification. Therefore the stator functionality and operability is not similar to the original. IMPACT: This will lead to great schedule and cost impact.	3	Active	Peter Moore		31-Aug-16	Mitigate	31-Aug-16	2	2	4	8	1	1	2	2

Project: Unit Islanding - 73461																			
11950	Containment Isolation work in the Fuel Handling duct could increase the critical path schedule and lead to cost overruns due to fueling requirements [Window 23, 88]	[Execution Phase] Event:The critical path isolation of the refurb unit from containment (bulkhead installation), and subsequent removal post fuel channel and feeder replacement, may extend beyond scheduled windows. The frequency/availability and duration of no-fueling windows is determined by operating unit zone levels, trolley reliability and required trolley maintenance. Cause: Reasons for no fueling windows not occurring as planned could include unit zone conditions and trolley reliability. The JV planning basis is that any work below the 100m elevation 87% efficient for U2 BH install and drops to 50% for U2 removal and all other work on subsequent unit. This risk documents delay above and beyond the JV planning basis. Impact:If no fueling windows are shortened or do not occur per plan, critical path schedule delays will result as well as cost overruns due to crew standby time. This risk is to identify project level impacts. Program risk #685 is to identify impact at the program level (i.e. critical path that affects all of NR)*QUAD CHART RISK*	2	Active	Marc Paiment	Alex Markovsky	02-May-16	Mitigate	30-May-16	4	1	5	20	3	1	4	12

			2070	In Progress	Complete assessment and develop shielding requirements.	Vendor to develop radiation protection "As Low As Reasonably Achievable" (ALARA) plan in conjunction with detailed design to add shielding or remove workers during fuel trolley movement. Vendor toperform sensitivity analysis to determine appropriate amount and typeof shielding required.	Alex Markovsky	Alex Markovsky	15-Apr-16	Vendor shielding assessment has been submitted. Needs to be revised by JV and accepted by OPG. Draft received.							
11449	Failure of Containment Boundary pressure tests resulting in critical path delays [Window 23, 88]	[Execution Phase] Event: Failure of Containment Boundary pressure tests resulting in critical path delays Cause: The specified leak rates may not be achieved which would require theleak to be found, addressed, and the pressure test repeated. Portions of the U2 and U3 new Temporary Containment Boundary have never been part of the containment boundary and therefore have never been pressure tested.This new boundary may contain leak paths. Also, there may be unusual system alignments during the pressure tests which may inadvertently introduce leak paths. Lastly, Unit 2 and Unit 3 permanent bulkheads could fail the commissioning pressure test causing schedule delays. Also leaking closure plugs may cause leakage into PHT or increase humidity levels in the vault causing inaccurate readings.' to 'EVENT: The specified leak rates may not be achieved which would require the leak to be found, addressed, and the pressure test repeated. Portions of the U2 and U3 new Temporary Containment Boundary have never been part of the containment boundary and therefore have never been pressure tested. Impact: Schedule delays	3	Active	Marc Paiment	Alex Markovsky	02-May-16	Mitigate	31-May-16	2	1	2	4	2	1	2	4
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							
			2496	In Progress	Complete Temporary Containment Boundary walkdowns to identify potential leak paths	Complete walkdowns in planned outages prior to refurbishment. Identify potential leak paths and develop a plan for executing repairs as required.	Luca Mucciarone	Alex Markovsky	15-May-16	Units 1, 2 and 4 complete. Unit 3 walkdown completed in D1531. JV to submit walkdown report.							
12391	Critical Path extension in refurb unit due to inadequate Vault Vapour Recovery System performance. [Window 23, 24]	Event: Delays to Containment Pressure tests to commission the Bulkhead due to high vault humidity. Cause: The pressure tests require low vault humidity which is obtained through efficient operation of the Vault Vapour Recovery System (VVRs). A pre-req project is being executed to address inadequate performance of the VVRs. This also impacts the time required to reduce tritium to allow both airlock doors open. Current unit Vault Vapour Recovery System reliability and efficiency levels are low which is currently acceptable because a common containment structure provides Vault Vapour Recovery Systemredundancy from other units. Installation of the containment Bulkhead will eliminate the redundancy for the Refurb unit and reduce the redundancy for the operating station. Impact: Inadequate performance of the refurb unit Vault Vapour Recovery System will potentially delay obtaining the required humidity levels for testing and delay critical path	3	Active	Marc Paiment	Joanne Mercieca	04-May-16	Mitigate	15-Oct-16	2	1	2	4	1	1	1	1

			2641	In Progress	Perform oversight on use of OPEX by JV for Containment Isolation scope and review CWP's.	JV has not obtained OPEX on other refurbishments from competitors.OPG to collect OPEX and make available to JV (Complete).Perform oversight to ensure OPEX is incorporated into design and installation plans. Refer to Oversight plan#29 for design. Newoversight plan entry for installation planning to be entered.	Luca Mucciarone	Alex Markovsky	31-May-16	Oversight was performed on the design plan but haven't started oversight on the installation							
12391	Critical Path extension in refurb unit due to inadequate Vault Vapour Recovery System performance. [Window 23, 24]	Event: Delays to Containment Pressure tests to commission the Bulkhead due to high vault humidity. Cause: The pressure tests require low vault humidity which is obtained through efficient operation of the Vault Vapour Recovery System (VVRS). A pre-req project is being executed to address inadequate performance of the VVRS. This also impacts the time required to reduce tritium to allow both airlock doors open. Current unit Vault Vapour Recovery System reliability and efficiency levels are low which is currently acceptable because a common containment structure provides Vault Vapour Recovery Systemredundancy from other units. Installation of the containment Bulkhead will eliminate the redundancy for the Refurb unit and reduce the redundancy for the operating station. Impact: Inadequate performance of the refurb unit Vault Vapour Recovery System will potentially delay obtaining the required humidity levels for testing and delay critical path	3	Active	Marc Paiment	Joanne Mercieca	04-May-16	Mitigate	15-Oct-16	2	1	2	4	1	1	1	1

Project: Unit Islanding - 73463																			
11950	Containment Isolation work in the Fuel Handling duct could increase the critical path schedule and lead to cost overruns due to fueling requirements [Window 23, 88]	[Execution Phase] Event:The critical path isolation of the refurb unit from containment (bulkhead installation), and subsequent removal post fuel channel and feeder replacement, may extend beyond scheduled windows. The frequency/availability and duration of no-fueling windows is determined by operating unit zone levels, trolley reliability and required trolley maintenance. Cause: Reasons for no fueling windows not occurring as planned could include unit zone conditions and trolley reliability. The JV planning basis is that any work below the 100m elevation 87% efficient for U2 BH install and drops to 50% for U2 removal and all other work on subsequent unit. This risk documents delay above and beyond the JV planning basis. Impact:If no fueling windows are shortened or do not occur per plan, critical path schedule delays will result as well as cost overruns due to crew standby time. This risk is to identify project level impacts. Program risk #685 is to identify impact at the program level (i.e. critical path that affects all of NR)*QUAD CHART RISK*	2	Active	Marc Paiment	Alex Markovsky	02-May-16	Mitigate	30-May-16	4	1	5	20	3	1	4	12

			6316	In Progress	Review hoisting and rigging plans for bulkhead installation	Review JV's hoisting and rigging plan for installing bulkhead to prevent hoisting and/or rigging failure while installing the bulkhead.	Luca Mucciarone	Luca Mucciarone	31-May-16	Reviewer to be identified.							
			6317	In Progress	Review JV quals	To prevent failure while hoisting and/or rigging the bulkhead, Islanding will review JV quals.	Luca Mucciarone	Luca Mucciarone	30-Sep-16								
			6318	In Progress	Inspect hoisting and rigging equipment	To prevent hoisting and/or rigging failure while installing the bulkhead, Islanding will inspect the hoisting and rigging equipment.	Luca Mucciarone	Luca Mucciarone	31-Oct-16								
12250	A second set of Bulkhead panels are not available should the 1st and 2nd unit outages overlap. [Window 23]	[Execution Phase] Event: A second set of Bulkhead panels are not available should the 1st and 2nd unit outages overlap. Cause: The risk is that Unit 3 will come down early (see Risk 678) which may result in overlapping with Unit 2 outage and there will not be a second Bulkhead available. This would require expedited procurement of a second bulkhead set Based on unlapping of therefurb first and second outages, an economic decision (DRAS 539) has been made to postpone fabrication of a second bulkhead until it is required for overlapping of the 2nd and 3rdrefurb outages. Impact: Schedule delay and material cost	1	Active	Marc Paiment	Alex Markovsky	02-May-16	Accept	31-Oct-19	1	1	1	1	1	1	1	1

Risk Report by Project with Associated Actions

639		workers for execution of Refurbishment.	3431	In Progress	Risk Action	NRAD, Human Resources, VP of Fleet O&M and the Refurbishment VP of Execution to review and comment through appropriate processes any new CNSC regulation on hours of work to ensure they are not too onerous to implement and will not limit the availability of construction trade workers for refurbishment.	R J Maceacheron		15-Oct-16	This action is associated with Risk 639 (Risk Response Type - Monitor).							
673	Licensing Fees Higher than Release 4c Budget Estimate	The risk is that the licensing fees are expected to be higher than projected in the 4c release estimate. The release estimate uses the 2014 CNSC projected costs for Darlington, and for Refurbishment, and assumes future increases over the life of the project remain constant at the 1.5% year over year increase projected for CNSC fiscal 2015/2016 and 2016/2017. The 2015 CNSC projected costs for Darlington and for refurbishment are due in early May. This risk will be updated at that time as required. Program: Engineering -																	
822	Completion of Refurbishment SIOs (Safety Improvement Opportunities)	The risk is that the 5 Safety Improvement Opportunity Projects (SIOs), which are a regulatory requirement to complete prior to starting refurbishment, are not complete and appropriate contingency plans to progress the Unit 2 refurbishment cannot be developed and negotiated with the CNSC, resulting in delays to Unit 2 execution and consumption of all the schedule contingency duration for on Unit 2.	3	Active	Art Rob	Art Rob	19-Apr-16	Avoid	15-Sep-16	3	3	5	15	1	3	5	5
There are no Not Started, In Progress Actions associated with the risk.																	
797	Vendor technical proficiency and less than adequate adherence to design governance may lead to unforeseen issues during design implementation/execution, leading to rework, cost overruns and schedule delays.	Failure to follow processes as written in design governance and failure to rigorously complete all required steps may not allow the full benefit of the robustness of the ECC design process to be realized. The many steps in the process are typically built upon previously identified process short-comings, and failure to rigorously execute each step may lead to re-work, for example failure to rigorously complete system heath/component health report research, failure to complete an effective COMs meeting, failure to complete a meaningful OPEX search, and failure to identify and address issues in the Issue Tracking file (ITF) may lead to an inadequate design. The inadequate design may not be fully released until the point of installation/execution, at which time rework, cost overruns or schedule delays may occur.	4	Active	Gregg Mccabe	Rajeev Leekha	11-May-16	Mitigate	30-Sep-16	3	3	3	9	2	1	2	4
There are no Not Started, In Progress Actions associated with the risk.																	
820	Discovery work arising from valve replacements	The risk is that there is a large amount of discovery work encountered in the valve replacement program resulting in cost impacts and schedule delays to the planned valve replacement schedule. This is caused by limitations in the ability to examine/inspect valves internals prior to refurbishments and OPEX from previous refurbishment projects.	1	Active	Michael Allen	Val Bevacqua	12-May-16	Monitor	28-Jun-18	3	3	1	9	3	3	1	9
There are no Not Started, In Progress Actions associated with the risk.																	
792	Scope Increase for Entrainment and Benthic Invertebrate Community Study & Entrainment and Benthic Invertebrate Community Study	Effluent Characterization: It is a CNSC commitment that the Effluent Characterization study be completed and used in the updated DN Environmental Risk Assessment, which is to be submitted to the CNSC by the end of 2016. The sampling plan for the effluent characterization has been reviewed and accepted by the CNSC. If this funding is not approved, we will not meet the CNSC commitment.  Entrainment and Benthic Invertebrate Community Study: OPG has committed to the CNSC and other regulators to confirm findings discussed in the DNGS EA for refurbishment and continued operations by implementing follow-up monitoring program (FUMP) which includes the entrainment and benthic invertebrate Community Studies and associated aquatic sampling work that must be completed prior the start of Refurbishment. Two reports must be submitted to the CNSC at the end of 2016 and one in 2017 to address the additional monitoring required for the Fisheries Authorization. Sample results may result in additional sampling being required.  Potential Impact: Delay in meeting the CNSC commitment.	4	Active	Nienke Smith		09-Mar-16	Mitigate	15-Jan-16	4	2	2	8	1	1	2	2

811	Vendors since Proficiency has never been measured.	Proficiency report cards have been created to measures INPO's proficiency building blocks (list below). Gaps in proficiency will be determined by evaluating vendors and OPG personnel against the scorecards. Mitigating action 6748 (references AR 28184215-04) is to develop and implement the report card for OPG and each of OPG's primary vendor: General Electric, SNC, Sargent Lundy, RCMT, AMEC NSS, Tetra Tech, Worley Parsons and Areva. INPO Proficiency Building Blocks 1) Education 2) Skills Training 3) Repetition with feedback 4) Experience in a variety of situations 5) Timeliness or currency of performance	6782	In Progress	Proficiency The action is to formalize the requirement for monitoring and managing OPG and Vendor proficiencies by developing and implementing a report card. Reference AR 28184215-04, 5, 6. The proficiency scorecard has been developed and has been sent out to vendors and internally in OPG for feedback and comments by May 18, 2016. The feedback received from the vendor partners and OPG will be examined and incorporated into the scorecard as necessary. May 13, 2016 S. Malakhail	Nienke Smith	Saad Malakhail	30-Nov-16									
770	Discovery and Emergent work impacting Engineering	During inspections or detailed reviews of tasks it is possible that new work will be identified and will require Engineering support. It is expected that discovery work will be found during refurbishment outage and other IIP related work. The causes may be varied but centrerd around either inspections or re evaluation based on OPEX, or extent of condition, or new analysis. The impact of such emergent work could be further Engineering input as required beyond that has been included in the budget.	1	Active	Neil A Mitchell	Gregg Mccabe	11-May-16	Monitor	15-Oct-16	3	1	2	6	2	1	1	2

			4919	In Progress	Engineering workload; Ability to meet the milestone for the completion of Engineering and Monitoring of schedule, cost, and quality related to the completion of engineering needs to be improved.	Engineering workload; Ability to meet the milestone for the completion of Engineering and Monitoring of schedule, cost, and quality related to the completion of engineering needs to be improved. Report wording for clarification: The challenge associated with the management of the large engineering workload has been identified in monthly reports to the MOE since June 2013. In Q2, 2014, refurbishment senior management recognized the issues related to engineering and initiated interim actions and a root cause investigation. The focus of the improvement actions has been the implementation of a collaborative approach to planning (preliminary engineering, scope definition and cost/schedule estimations) and detailed design engineering. This has resulted in examples of faster response for requested information and shorter review cycles for approval of an engineering package by the Design Authority. However, there has not been sufficient progress in the management of the engineering workload to remove the current challenge. This is based on on-going weaknesses in the management of engineering scheduled work to ensure overall ability to complete the workload, as well as monitoring the quality of engineering work to identify and correct adverse performance trends. The Nuclear Oversight Committee (NOC) of the OPG Board of Directors has also expressed concern over the ability to complete the large amount of engineering work by the engineering complete milestone of May 2015. Work down curve was presented to the NOC at its November meeting shows that the large majority of engineering packages (225 of 300) will be completed between March 1 and May 15, 2015. The NOC has sufficient concern over the detailed engineering schedule that it has requested an update in January 2015. Curve represents the completion of engineering work associated with the core refurbishment projects. It does not include the remaining engineering work for the Campus Plan and Safety Improvement Opportunity (SIO) projects. This engineering work will require some of the same resources that will be used for the engineering for the core refurbishment projects. Since there is not a similar work down curve for the Campus Plan and SIO projects, it is not possible to assess the impact of this parallel work load. However, it is not trivial. At the December 19th engineering project meeting, a table was provided identifying the number of engineering packages managed by the refurbishment organization as 244 and the number managed by the Projects & Modifications (PM&M) organization for the nuclear refurbishment as 421. In addition, there are an unknown number of station projects that are managed by the PM&M organization that must be completed prior to the start of the Unit 2 refurbishment outage. One example for which assistance has been requested from refurbishment engineering is PHF LRV Modifications to address waterhammer issues. The total engineering effort for the first six months of 2015 includes the work for the core refurbishment projects, the Campus Plan projects, the SIO projects, and other prerequisite projects. The core refurbishment projects have a work down curve for the engineering packages, but the others don't - thus not permitting an assessment of the aggregate engineering workload. By its nature, the large engineering workload in a relatively short period of time introduces a challenge to maintain high levels of quality. The monitoring and trending of engineering quality are critical for a large project. During Q4, refurbishment engineering has developed an engineering quality dashboard of nine sections that include both quality results and quality enablers. One key indicator of quality is the number of engineering Event Free Day Resets (EFDRs) during the period. During the first three quarters of 2014, there were 4 EFDRs declared, while in Q4, there have been 5 declared. The likely cause of the increase in number is improvement in sensitivity of quality issues rather than degradation in quality. OPG management correctly states that its engineering change control (ECC) process is consistent with industry practices. However, the ECC process is one aspect of quality engineering. With the EPC contracting model is used for projects, an equivalently critical process is the owner acceptance of design agency products. It is not clear that OPG's owner acceptance is fully aligned with industry practice. Given the cost impact and latent risk of engineering errors, it is recommended that OPG request WANO/INPO to perform a review of its engineering processes, specifically its owner acceptance of design agency products. In conclusion, further management focus is required to support the timely completion of quality engineering packages.	Neil A Mitchell	31-Dec-16	OPG Response: o OPG is on track for substantial completion of Engineering by the August 2015 milestone. o Currently, 65% of Engineering is complete. o Engineering for Re-tube & Feeder Replacement and Turbine Generators, which represents ~75% of direct execution phase work, is nearly 90% complete. o Detailed schedules and performance metrics are in place. o Engineering is performed in accordance with OPG's and the contractors' quality programs, and follows a rigorous change control process. o A program level Engineering quality dashboard is being implemented o Engineering is done under nuclear industry best practice processes developed by the industry over many years o Engineering processes are regularly reviewed and assessed, including WANO o We are not re-designing the plant o Identify what drives the need for a design change, e.g. largely regulatory o Put the workload in context; e.g. how many modifications and design changes, at a system level, are being made o Separate new facilities/systems, e.g. SIO's and campus plan, from other design changes o Bring out the point about the risk based approach that's used o How is quality monitored and managed o Identify that metrics are in place and dashboards to help track and manage the work are being developed Updated on June 2/15: OPG Response (1) Detailed design for the Darlington Refurbishment Program is 79% complete; 5% below target of 84%. (2) The variance is due to delays in the design of the Turbine Generator control system modifications which have been deferred from Unit Refurbishment. These design delays will be recovered by of July , 2015 and will have no impact on the RQE. (3) One of the lessons learned from all previous refurbishments was to complete detailed design before starting construction. Darlington Refurbishment Project will be the first Refurb project to meet this objective 13 months before the start of Refurbishment. 2016May06 - Meeting								
	Software Quality not fully implemented leading to delays in acceptance.	Software Quality not fully implemented may be caused by: - Incorrect Software categorization; - Incorrect or incomplete Software QA program, development or testing		Active	Rajeev Leekha	Bhaskar Pillarisetty	30-Mar-16	Monitor	23-Sep-16	2	3	3	6	1	2	2	2
	There are no Not Started, In Progress Actions associated with the risk.																

<a href="#">809</a>	testing or AFS	- Lack of documentation (e.g. Software verification, software maintenance plan etc.) These can delay the acceptance of the software EC package(s), delay in fully test the software systems, concessions / exceptions for missing/missed software processes and delay in commissioning and AFS of modification.															
<a href="#">702</a>	Resource Risk for Unit RTS, Commissioning and Close-Out	The risk is that there are not enough Systems and Components Engineering resources for the following phases of the project: 1) Execution readiness preparations (ie. CWP review/approval, Workplan preparation, Holds assessment and removal, TPAR review, Procedure review and approval, etc.) 2) Unit Return to Service (RTS) (i.e. Restart specifications and Workplan preparation/execution, etc.) 3) Commissioning (i.e. commissioning report preparation/approval, commissioning Workplan preparation/execution,. etc.) This is primarily due to major milestone/delivery changes (i.e. removal of segmented documentation & holds removal milestones); as well as, incrementally higher resource demands during the overlap of subsequent outages which delay the project execution. The cause of this may be inadequacy of appropriately trained staff in terms of numbers or Money available to add FTES that may be available to complete the work in a timely way.	1	Active	Paul Ross	Paul Ross	09-Mar-16	Monitor	01-May-19	2	1	2	4	1	1	1	1
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">789</a>	New scope for Modification added to Refurbishment Project	During detailed assessing and schedule development it is possible for alternative support supplies (electrical, water, air) to be identified. Past experience is unit outages has typically identified these requiriements well after the milestone for design complete and often continues through out the outage. The impact is the resource in Design Engineering and Project Support to cope with the additional demand.	2	Active	Gregg Mccabe	Rajeev Leekha	11-May-16	Mitigate	17-Mar-17	4	1	1	4	2	1	1	2

<a href="#">796</a>	Increased Scope of Environmental Assessment Follow-up Program Elements Resulting from CNSC Negotiations	The original estimate for the Environmental Assessment (EA) follow up program elements was based on preliminary understanding of the commitments presented in the EA. Recent negotiations with the CNSC on the Effluent Characterization and Entrainment and Benthic Invertebrate Community Studies resulted in expansion of the scope of work. Negotiations with the regulator is ongoing for the other sampling plans and may impact other EA follow up program elements. The impact of this risk is increased scope, increased cost and delays in schedule. This risk can impact completion of Integrated Implementation Plan (IIP) Items IIP-EA-010, IIP-EA-011, IIP-EA-012 and IIP-EA-013.	3	Active	Nienke Smith		09-Mar-16	Monitor	30-Mar-16	2	1	2	4	1	1	1	1

	Refurbishment leadership and specialized project management resources are	The risk is that OPG senior leadership team and key project management talent will not be retained on the Project over the 12 yr+ duration, putting the Project at risk of success. The risk can be characterized into the following categories: 1. OPG Nuclear is largely an operations and maintenance	3	Active	Candice Kay		21-Apr-16	Mitigate	31-Mar-16	4	3	3	12	3	3	3	9	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								

561	not in place and secured in role could result in significant impacts on cost, schedule and quality.	based organization with talent in large scale regulated mega-project management that is still maturing. As a result, project management leadership and talent streams need to be cultivated within the organization and/or sourced externally from the competitive market. 2. Demographics are such that close to 70% of those in the senior leadership roles on the Refurb Project (Band F and up) are eligible to retire by the next 3 years. 3. Succession planning and development initiatives have not been given the profile necessary needed to ensure leadership capacity needed for a successful refurbishment project. 4. Compensation and staffing restrictions resulting from external bodies such as the Auditor General and shareholder legislation has caused OPG to adjust policies in an effort to balance reputational harm.	3290	In Progress	Succession Planning / Process Improvements 2.4	Utilize standardized metrics for measuring leadership “Health Pipeline” for Projects	Candice Kay		31-May-16	<ul style="list-style-type: none"><li>· To be developed across the fleet in a standardized fashion by Talent COE.</li></ul> UPDATE MARCH 10 (L. Ainsworth for Candice Kay) Nuclear Projects Peert Team - launched the Succession Planning efforts. All Priority 1 roles to be updated by April 30, 2016. Nuclear Projects role have been further integrated into the Nuclear Succession Planning process by:  Adding more roles to Priority 1 reviews, and by defining Priority 2 Project roles. All IDP’s to be completed for MG & Priority 1 & 2 candidates by May 20, 2016
			3306	In Progress	PPR Health & Development Planning 4.4	Mandate Knowledge Transfer for current incumbents that are in a Priority 3 role – ensure Temps and Contractors in key roles have this as part of their performance measures	Candice Kay		31-May-16	<ul style="list-style-type: none"><li>· For 2015 PPR’s consideration or meet wide Knowledge Transfer.</li><li>· New tool to be rolled out to ELT &amp; NEC Q2, 2015.</li><li>· Nuclear Projects cascading to occur and embedded into PPRs as determined by Q3, 2015.</li></ul> UPDATE MARCH 10 (L Ainsworth for Candice Kay) PPR for 2016 to be aligned with Project Excellence goals - cascade to all staff. Nuclear Projects:  Staffing Plan to be approved/finalized by May 2016 (Draft completed by April 2016)  Project Management Capability Builder - Plan in place as per Project Management Peer Team

Program: Managed Systems Oversight - 10000

764	Vendor Performance and Inexperience Managing their CA Programs	EVENT: Vendor or OPG Poor Performance requiring additional oversight resources. CAUSE: Cause of Vendor or OPG Poor Performance may be due to lack of capability, lack of experience or time pressure. IMPACT: Impact would be to conduct additional oversight surveillances to identify and correct the problems and potential delays to field work. EVENT: Increased number of SCRs requiring additional OBU Resources from Corrective Action Control Group. CAUSE: Cause of increased number of SCRs would be due to vendor's inability or inexperience in managing their corrective action programs to OPGs expectations. IMPACT: This would prompt OPG Senior Management to request MSO to include all vendor adverse conditions in the OPG SCR database. Further, poor vendor performance of the CA programs would result in recurring field issues and potential cost impacts and schedule delays to NR.	2	Active	Dave Stiers	Frank Dias	11-May-16	Mitigate	31-Jan-17	3	1	3	9	2	1	3	6

Program: Operations and Maintenance -

	Return to Service funding does not support RTS operating as a proiect	RTS is currently set-up as a functional support group. Funding is to provide oversight of the RTS process with work being completed by other groups such as operations, maintenance, engineering and chemistry. During the RTS process. modifications are required to support evolutions such as hot		Active	Boris Vulcanovic	Mike Stewart	10-May-16	Mitigate	30-May-16	5	1	5	25	5	1	1	5
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							

804		conditioning and the HTS hydro test. For the purposes of the RQE submission, these projects were to be supported by a currently establish refurbishment project bundle. Following the RQE submission, it was decided that RTS would act as a project to support these evolutions and any other that arise. RTS requires additional funding to be able to perform this role. If funding is not provided, there is a risk to the current schedule as engineering, procurement and installation needs to be initiated to meet the target dates.	5906	In Progress	Hot Conditioning project bundle assignment (HTS RTS HIT)	Project bundle required for HTS Hot Conditioning. Management has asked RTS and Eng to review taking this project. Mike Stewart and Paul Ross are reviewing the doability of performing project functions. Recommendation to be given on feb 5th and due date updated. 02/03/2016	Mike Stewart		15-May-16	DRAS is ready for M. Allen signature. It will then go to PSRB for review and acceptance. Following PSRB, a project bundle will be assigned for the hot conditioning process. 30 Nov 2015 January 8, 2016: DRAS is signed and bundle assignmet on the agenda for the next PSRB. Jan 11: Action owner requested a project bundle to be assigned the scope. Issue is to be presented to Mike Allen for bundle assignment. Jan 15 - due date moved to reflect PSRB assigning bundle with mike Allen. Feb 23 - due date moved, RTS is considering the efficiency of creating a new project versus using the infastructurer of a current project. Mike Allen/Boris Vulcanovic to make the final decision. New due date to reflect time for review. March 6/2016: CCF initiated for RTS to become a project by hiring a PM and an MTL. Closure of this action will be done on acceptance by CCB and funds allocated. March 15, CCF ready but not being presented until April CCB. Risk#804 initiated. Apr. 04/2016 updated by A. Kalafatis: CCF now being presented at May CCD. Due date moved to May 15/2016.									
			5907	In Progress	Hot Conditioning skid and monitoring equipment procurement, engineering and installation (HTS RTS HIT)	Establish the parameters of a DSR and drive the approval to get a funding stream released with a project manager assigned to get the necessary design and procurement completed	Mike Stewart		15-May-16	Awaiting action 5906 on assignment of project bundle. Due date move to April 15/2016 to allow time for HTS RTS path forward to be completed. CCF ready but not going to CCB until April, Risk#804 initiated Apr. 04/2016 update by A. Kalafatis: CCF now planned for May CCB. Due date moved to May 15/2016.									
805	Breaker Open Milestone at Risk due to the lack of required deliverables received by Ops and Mtce	Event: TPAR Milestone was missed and Vendors were given an additional 2 1/2 months to complete. Other TPAR milestones are not adjusted. O&M deliverables affected are TCR-FAR-Training Packages-Turnover Plans-TPARs. Cause: Originally the TPAR milestone was Oct 2015, one year prior to Breaker Open. This gave O&M 12 months to prepare for Refurbishment shutdown. Design was late and Milestone was re-adjusted and split up and now due February, giving only 9 months for O&M to complete their required Work. Vendors couldn't make that Milestone so Projects gave them an additional 2 1/2 months, giving only 6 1/2 months for O&M to do the same work we had planned and said we needed 12 months. Impact - O&M deliverable for TPARs, TCR FARs, Training packages and turnover plans are delayed and O&M is crushed for time due to Vendors not making milestones. TPARs and TCR-FARs are still trickling in. RTS is going around to Project Managers to get the Vendors to start Turnover Planning. Training is waiting on procedures (TPAR) to be completed so they can train the operators and maintainers in preparation for Refurbishment Breaker Open Milestone. April Update: OP2070 -Assessing Milestone (April 15) Missed and extended 2 1/2 months.	4	Active	Boris Vulcanovic	Mike Dance	12-May-16	Monitor	04-Jul-16	5	1	5	25	5	1	4	20	There are no Not Started, In Progress Actions associated with the risk.	
	Valve Program Vendor Contract not Secured	Event: Currently the Work Control department is creating a valve schedule. Schedule changes are very likely once Vendor is chosen. Resource leveling is not possible until figures are provided. Currently, there is no established strategy to execute the Valve Maintenance program for Unit 2. Report Owner:L. Greenland

Process Owner:R. Smith

Data Refreshed:12-May-16 10:30 PM

839		<p>poses significant risk to the planning exercise currently underway for the other projects in Refurb, Major impact: Missed milestones for Planning, Assessing, ITP's, and CWP's , BWXT declined to perform the cyclical valve maintenance. Currently there is \$12M allocated to perform 640 Crit 1 and 2 valves. The BWXT quote prior to their decline of the work was \$48M. Maintenance is preparing Scope of Work to initiate a contract to perform this valve work. This contract will also include ~ 480 crit 3 and 4 valves that were to be performed and funded by maintenance.</p> <p>The late awarding a new valve contract is documented in risk 14257. The risk of increase scope due to discovery in the valve program is documented in risk 718.</p> <p>This risk is to document the possibility that the valve contract may exceed the \$12M originally allocated for the crit 1 and 2 valves and the maintenance allocation for the crit 3 and 4 valves.</p>															
708	Materials budget for emergent broke-fix maintenance and scope growth during Shutdown, Layup and Runup is not included in MTCE budget.	<p>Event: Materials required for broke-fix maintenance and scope growth during Shutdown, Layup and Run up Phases is not in MTCE Budget</p> <p>Cause: Contingecy funds not included in business planning process</p> <p>Potential impacts: Unable to repair, required for start up equipment, affecting critical path duration.</p> <p>1. From Scope Freeze to Breaker Open: For the purpose of calculating the contingency for this specific risk, we assume, based on station IPG scope growth history, that there will scope growth between each Unit WO scope freeze and breaker open. Based on DNGS IPG history, 1-2 work orders are added to scope per day. The added work is then scheduled in the online schedule (not necessary FIN work to be executed immediately). It is expected that much of the work added during this period would be executed by DNGS IPG, however, some scope may be added to D1621 scope and executed during the outage proper. This type of 'cyclic' backlog scope will occur over a period of 16 months for each unit. We are estimating that, of the identified work during unit operation during this time period, 1 WO per week will actually be accepted into B/O-B/C scope. That equates to 64 new work orders. We assume a cost per work order of \$6,000 average per work order. In total, this calculates to \$400,000 per unit. (\$1.6 million for overall Program).</p> <p>2. From Breaker Open to Breaker Closed: For the purpose of calculating the contingency for this specific risk, we assume, based on station outage history, that there will be an average of 4 work orders per day of the outage, reviewed and approved for new scope, from breaker open to breaker closed. At Scope Freeze for D1621 and DNRU2, the D1621 WO # was 5,498. At 4 new WO per day, at ~1100 days, equals 4,400 work orders. We assume a cost per work order of \$6,000 average per work order. In total, this calculates to \$26 million per unit (\$104 million for overall Program).</p>	2	Active	Boris Vulcanovic	Val Bevacqua	12-May-16	Monitor	15-Oct-16	5	2	3	15	3	2	3	9

Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

777	and Augmented Staff rules.	<p>this qualification and are retired. we have asked for exceptions around the rules in this case but denied. Still have no Verifier on the team and I am having to request NR OPs Manager to act as Verifier. He could be a bottle neck. The other part is the Augmented Staff Contract duration. Max for outside contractor is 5 yrs. Max for OPG rehire is 3 years. We are supporting a 10 yr project. If we cant keep contractors beyond these durations all the way through refurb we will be starting over with new talent constantly repeating lessons learned. Negotiations need to made with Auditor General to get an exception for the Refurbishment Project.</p> <p>Background: Refer to SCRs N-2015-21011 and N-2015-21102 on overall hiring process and governance. There is a lack of necessary talent in the present preferred Vendors supplying Augmented Staff. For the O&amp;M Technical Procedures Team it requires experienced Operations and Maintenance Staff previously employed by OPG. They have to knowledgeable of System and Change process for Technical Procedures owned by O&amp;M.</p> <p>HR AUGSTAFF group can only reach out to our Preferred Vendors (CPUS, CTSNA and Ian Martin). The Jobs have gone out to the agencies to advertise on July 10, 2015. Request for additional Resume has gone out to the Agencies numerous times. Once a month since July, we also had a conference call led by Aug staff so I could directly talk to all the preferred Vendors requesting these specialized staff. To do that I have one OPs staff and still waiting on Security Clearance, and I had one other OPs staff who accepted another Job Offer and a Mtce Staff who got another Job with a different company while still waiting for security clearance. The staffing plan was to have 2 OPs and 2 Mtce start in July to ensure we made our documentation milestones in 2016. The first being OP2160S1 February 15, 2016; this would be for Containment, Layup and Islanding documentation ready for Training and field staff to be successfully in Layup and Islanding of Unit 2.</p>															
565	Insufficient Qualified Radiation Protection Coordinators (BTU) to support Execution	Event: Insufficient number of qualified Radiation Protection Coordinators (RPCs) to successfully provide service protection oversight for radiological work performed by EPC contractors. Cause: due to low numbers of currently qualified Trades RPC's plus attrition and insufficient training and qualification of new Trades RPCs prior to execution of Refurbishment activities and opportunities with other industrial project in the province. Impact: may lead to schedule delays and cost overruns or could cause RP events due to lack of oversight or lack of properly experienced oversight.	3	Active	Johnathon Hash	Jeff Johansson	12-May-16	Monitor	29-Jul-16	4	2	3	12	2	1	3	6
There are no Not Started, In Progress Actions associated with the risk.																	
748	Transition/Transfer Plan commitments not met (Ops & Mtce Readiness)	Refurbishment may not have sufficient Ops and Mtce resources to execute pre-requiresite miletone deliverables (e.g. assessing, procedures, permitry, strategic plans, licensing) as well as field staff to execute pre-requisite field work for D1621 and DNRU2. NK38-PLAN-09701-10113 Sht OPS-01 Operations Ownership Transfer Plan andNK38-PLAN-09701-10113 Sht OPS-01 Maintenance Ownership Transfer Plan require additional details and clarification on roles and accountabilities of both site and refurb organizations. This includes the plan for transition of staff from Darlington to Refurbishment for both preparation and execution phases of the project. A comprehensive review of the state of Readiness of Ops & Mtce is required to ensure metrics are in place, strategic plans are progressing and resources are being applied for success.	2	Active	Boris Vulcanovic	Ross Mccord	12-May-16	Monitor	15-Sep-16	4	2	3	12	2	2	2	4
There are no Not Started, In Progress Actions associated with the risk.																	
860	Vault Projects Window (104) working opportunities	Event: There is the possibility of extending the working window availability by 25 days in Window 104. This is the period of time during the Dummy FB Removal and PT Sever. No work is currently being scheduled due to lack of clarity on the RP rules required for such work. This needs to be resolved to allow maximum use of this near critical path work window.		Active	Johnathon Hash		11-May-16	Monitor	16-Sep-16	3	2	4	12	1	1	1	1
There are no Not Started, In Progress Actions associated with the risk.																	
864	Identifying priority for staff within our BTU Project ranks and staff assigned to BTU Refurbishment	A risk was raised to ensure we have documented direction and planning for staff who are assigned to Refurb when non routine events occur. The risk identified includes (but is not limited too) response to IPG events, response to events within the refurb project but outside of our U2 island, various facility events and work priorities during significant competing projects (such as an outage).	2	Active	Johnathon Hash	Jeff Johansson	11-May-16	Monitor	07-Oct-16	4	2	3	12	1	2	1	2
There are no Not Started, In Progress Actions associated with the risk.																	
	Availability of DN Authorized Staff for Station and Refurb Support	Event: Insufficient authorized staff (certified Authorized Nuclear Operator (ANO), Control Room Shift Supervisors (CRSS) and Shift Managers (SM)) staff (2013-2017) and Non-Licensed Operator (NLO) staff (2013 >2020) to support Operations (outage. On-Line work (IPG). Emergaent Work (FIN).	4	Active	Boris Vulcanovic	Ross Mccord	12-May-16	Mitigate	02-Apr-17	5	1	2	10	3	1	2	6
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments							

677		<p>procedures, training) and Refurbishment planning and execution. Causes: 1) Attrition due to retirements of ANO, CRSS/SM, NLO and Authorized Training Staff (ATS) due to demographic pool. 2) ANO initial training program throughput has historically been lower than the 60.0% previously assumed. 3) CRSS initial training previously have not been successful in producing new candidates for two (2) consecutive groups. 4) Lack of Authorization Training program-ready candidates has resulted in 40% to 50% smaller than Business Plan class sizes causing refloat to NR OM&amp;A budget for ANOITs. 5) Knowledge gap between NLO and ANO In Training (ANOIT) results in lower entry calibre. 6) Shortages in Authorized Training Staff (ATS) to support ANO recovery plan needs. The risk is compounded by a high reliance on augmented staff to support a recovery plan and operate the business. Impact: This has the potential to impact on refurbishment planning and execution, Unit outages and VBO durations, efficiency of FIN and IPG, support for Authorization Training and backlogs in Ops Procedure.</p>	1481	In Progress	Risk 677 - action 12 to mitigate the effects on critical path due to the lack of certified staff	Remediation Plan (Plan B) For refurbishment, key positions are being filled by Darlington previously licensed contract staff. Plan B requires that augmented staff previously licensed at other CANDU stations be used where necessary. Although this strategy is not optimal it partly mitigates the shortfall risk as a larger pool of previously licensed staff is available for use in the refurb planning phase. This strategy may need to be extended into the execution phase of the refurb project. An agreement is in place between the station, training and refurb on the placement of contract staff previously licensed at Darlington to ensure qualified augmented staff is placed as priorities dictate. Preparations are underway to staff the refurb unit with non licensed staff once fuel and D2O has been removed. This could allow the refurb ANO to perform other refurb duties (such as IA) while non licenesed staff monitors the unitthus increasing the availability of currently authorized staff for refurb execution.	Ross Mccord	Dan Cowley	29-Feb-16	updated plan B actions to include non licensed staffing of refurb unit, changed due date to May 31th to monitor potential impacts of new NR contracting policy on authorized staff availability for contract work. All actions are on track and progressing. Authorized Nuclear Operators are no longer the critical group. CRSS authorized personnel are now the recognized critical resource. There is sufficient CRSS in the training program and their progress is being monitored closely. Plans are in progress to accelerate the co piloting of the successful candidates to meet refurb needs however for the lead unit however we will be unable to co pilot adequate numbers in time. In order to mitigate this senior ANO staff will be considered for step up during the initial phases of the outage. These numbers have been built into the RQE estimate.									
758	Chemistry Laboratory Support	Event: a Chem. Lab technician (1 FTE) was to be assigned from January 2015 to support the DNR Chemistry/Technical section. This didn't materialize as planned. Starting on May 20th the lab was expected to release someone to support refurbishment 2 days per week. This support has not been received consistently. Cause: Currently there is a shortage of resources due to some staff members being on a long term absence from work and due to the time lag associated with hiring a new technician following a retirement. In addition there are at least 7 staff members who are eligible to retire by the end of 2016. It takes 18 months minimum to qualify an individual. Impact: Refurbishment Chemistry & Environment is not confident that the Darlington Laboratory will have qualified staff and analytical equipment in place within 16 months to support work that is in approved scope.	3	Active	Boris Vulcanovic	Roger Daly	10-May-16	Monitor	31-Aug-16	5	1	2	10	3	1	1	3		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			5396	In Progress	Implement a lab readiness plan	Implement a lab readiness plan that will bring the laboratory into position to support Refurbishment earlier than breaker open. The plan would involve a regular meeting where areas that are being tracked are discussed and work down curves are presented where applicable. Items that are currently deemed at risk include: i) Hiring to address increased attrition expected. ii) Training program for Refurbishment Unit access (health and safety training) and refurbishment sampling (From shut down to RTS) iii) Instrument commissioning	Roger Daly	Emily Cornthwaite	14-Sep-16	As of 28Jan2016 the laboratory has had 1 individual retire and 2 individuals on long term medical absences since this action was initiated. A review of the SCR database revealed that there were 13 Darlington SCRs raised since June 2015 when the lab started to provide regular support for the refurbishment project (It is important to note that the VBO and a forced U3 outage also occurred during the surveyed period). A 'day in the life of a refurbishment laboratory technician' exercise is currently being prepared. This exercise is the first step required to quantify any potential discrepancy in resources required to support refurbishment activities. SCRs were unable to be linked below. They include: D-2016-00739/ 01985 and D-2015-12824/ 14726/ 15220/ 15604/ 15991/ 17416/ 17597/ 18693/ 29981/ 30018/ 30137									
863	Evaluate hazard impact during changing system configurations and status during refurbishment	Dynamic system changes will occur during refurbishment. Ensuring we have the monitoring in place during these changes will ensure we do create unintended risk to staff and other work due to increased hazards. This is a learning event from the End Shield Cooling drain during 2014. For refurbishment, the critical risk is to identify during significant changes to systems the appropriate type and frquency of monitoring PRIOR to the change execution so RP and associated organizations can validate assumptions for intended impact. In some cases, systems will be drained as a first time activity. Regardless, any reduction in shielding or introduction of unsurveyed internals needs to be identified and mitigating actions in place.	2	Active	Boris Vulcanovic	Johnathon Hash	11-May-16	Monitor	10-Oct-16	5	2	2	10	1	2	2	2		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments									
			7646	In Progress	Secure OSS contract to produce a Field Execution Manual	RP will commission a manual modeled on the Unit 2 Level 2 Logic reference manual. This manual will detail RP support plans and rational for use by Field staff to better understand the project goals.  The scope of work will maintain floor plans, system window timelines, REPs, day in the life expectations as well as critical fundamental reference items for everyday use as well as context for briefing by RP personnel.	Johnathon Hash	Joe Cicchini	07-Oct-16	Drafting the N Form for OSS support.									

706	Present ERT mincomp plan does not accommodate for and Islanded Unit while meeting adequate response time to emergent events	Event: DN Refurbishment organization is oblidge to comply with fire protection regulatory standards. Darlington's present ERT mincomp plan does not accommodate for and Islanded Unit while meeting adequate response time for potential emergent issues. Cause: A safety event that required ERT to respond either on Islanded Unit or Station. Other work requiring ERT to respond in the event of an emergency will be required to stop until ERT able to respond. eg, hot work, high angle rescue, confined space Potential impact: All work requiring ERM response to safety issue will stop if ERMs are required to attend to another event	1	Active	Boris Vulcanovic	Val Bevacqua	12-May-16	Accept	15-Oct-16	3	2	3	9	1	1	2	2	
			There are no Not Started, In Progress Actions associated with the risk.															
779	Shielding required to access vault via AI 2 and associated west stairs	Owing to the frequently changing nature of vault gamma beams, secure access and egress routes to vault work on the upper elevations is problematic. Coordination of work in windows with safe access paths in a manner those does not impact the RFR Joint venture, and thus delay critical path, may prove unmanageable, Additionally, analysis of the risk of an unplanned exposure may conclude that it is appropriate in terms of ALARA planning to provide this safe access route. The risk is that a decision will be made to install a shielding modification that is not covered in current program cost projections.	3	Active	Johnathon Hash	Johnathon Hash	11-May-16	Monitor	30-Sep-16	3	1	3	9	1	1	1	1	
			There are no Not Started, In Progress Actions associated with the risk.															
865	Acquisition, management, deployment and Storage of Contamination Control Equipment	Ownership and Control of HEPA units, Vacuums, and Munter Tritium scrubbers during refurbishment is not clear. At present, there is no program which describes the purchase, management, storage and use of semi-portable equipment required to ensure effective contamination control will be available and maintained on the project. This risk may include components of the plan to install the large Munter units in the vault however, the risk is raised to account for the other equipment expected to be needed during refurbishment activities.	2	Active	Johnathon Hash	Jeff Johansson	11-May-16	Monitor	30-Dec-16	3	1	3	9	1	1	1	1	
			There are no Not Started, In Progress Actions associated with the risk.															
728	Acute Tritium Release above Station IIL during NR Primary Side Drain and Dry Operation	Event: Potential to have an acute Tritium Emission that exceeds the Station Internal Investigation Limit (IIL)for tritium emissions during the NR Outage, particularly during Moderator and Heat Transportdraining and drying steps. Cause: -High tritium inventory in Moderator System, ineffective drying capacity from skids, poor condition of Vault Vapor Recovery Dryers or insufficient focus on Spills and Leaks. Potential Impacts. -Could delay work due to driers or skids needing regeneration. - Unfavourable Public Relations if high emissions persist and if insufficient preparation done ahead of time to mitigate.	2	Active	Roger Daly	Ray Kissel	10-May-16	Mitigate	14-Oct-16	4	2	1	8	3	1	1	3	
			There are no Not Started, In Progress Actions associated with the risk.															
	Large Potential Worker Doses due to Inadequate Internal (Alpha etc.) Hazard Characterization and Management	Event: Nuclear Refurbishment employees or Contractors are exposed to unexpected radionuclide(s) which leads to significant dose assignment. Cause: Source term chacterization was inadequate and thus radiological work planning, protective actions and dosimetry requirments do not properly protect workers from the hazards present. Impact: Potentially high doses that could exceed OPG dose limits or CNSC Dose limits, as well as a disruption to Nuclear Refurbishment work. Regulatory, public and union relations issues would be very problematic and would be amplified by the fact that Bruce Power had the same type of event during their refurbishment. Risk 508 closed to this risk, (564)	3	Active	Johnathon Hash	Johnathon Hash	11-May-16	Mitigate	30-Dec-16	3	2	2	6	2	2	2	4	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			5876	In Progress	Strategy for smear samples to determine radionuclide characterization for U2	a) Source Term Characterization · Section 2.2: Develop a strategy for taking smear samples for the purpose of source term characterization of Unit 2 when radioactive systems are opened up for refurbishment. Samples locations should include radioactive systems in Unit 2, RWPB, and Fuel Handling. Once samples are taken, they should be analyzed radio-chemically and the conclusions with respect to dose contributions from the AMEC report should be validated. Also calculate the beta-gamma: alpha ratio to confirm capability of WBM to indicate the presence of alpha emitting radionuclides in the body and continued use of pancake for both beta-gamma measurement and, by inference, alpha presence (as per N-INS-09071-10013). TCD: March 1, 2016	Johnathon Hash	Scott Stafford	30-Sep-16									

<a href="#">5877</a>	Not Started	Confirm Alpha Level III classification with U2 Smears	<ul style="list-style-type: none"><li>Section 2.2: Based on current source term knowledge, some areas where open work on contaminated HT system components is being done may fall into the Alpha Level III classification. Therefore the requirements for work as described in N-INS-09071-10013 should be implemented for those areas. The classification level should be confirmed on an ongoing basis with Unit 2 alpha characterization smears analyzed by the iSolo. TCD: March 1, 2016</li></ul>	Johnathon Hash	Scott Stafford	30-Jun-16	
<a href="#">5879</a>	In Progress	Test ICP-MS Method to Identify the presence of hard to detect Radionuclides	<ul style="list-style-type: none"><li>Section 2.2: Test the method of ICP-MS on Unit 3 outage samples to identify all potential radionuclides (especially those that are hard to detect). The ICP-MS method will identify all stable elements and their isotopes and then calculating the relative activity of the corresponding activation products knowing the absorption cross-section and neutron flux. This will provide assurance that all the hard to detect radionuclides (even those for which a radio-analytical or dosimetry method is not available) are identified and quantified. This will also assist in developing activity ratios for all hard to detect radionuclides for the purpose of dosimetry assessment and contamination monitoring. If the potential dose for the hard to detect radionuclides is high or surrogates are not available, the ICP-MS method will indicate that a radio-analytical method (assuming there is none yet in place) for the hard to detect radionuclide should be developed for dosimetry and contamination monitoring.</li></ul>	Johnathon Hash	Scott Stafford	02-Sep-16	<p>Further sampling is required and will be performed during the D1641 outage. The samples obtained will be sent to Kinectrics for testing as well as using the ICP-MS method of testing for hard to detect radionuclides. The results of the analysis will determine the requirement for further radio-analytical methods to be developed.</p> <p>Met with Kinectrics. Validating their proposal for ICP-MS sample counting for the project.</p>
<a href="#">5880</a>	In Progress	Define the policy for PAS sampling usage during U2 Refurbishment	<p>a) Dosimetry</p> <ul style="list-style-type: none"><li>Section 3.2: Develop a clear policy on the extent of PAS usage in the U2 refurbishment and implement the policy. Ensure laboratory resources are available to analyze the results. In order to reduce the pressure on the dosimetry laboratory to analyze the large volume of PAS samples, consideration should be given to perform a pre-screening of PAS filters using PIPS solid state detectors (i.e., iSolo or PIPS multi-sample instruments).</li></ul>	Johnathon Hash	Scott Stafford	30-Jun-16	recommendations from external report are being reviewed for path forward.
<a href="#">5881</a>	Not Started	Define and Implement a confirmatory Dosimetry Monitoring Program for Alpha Emitting Radionuclides	<ul style="list-style-type: none"><li>Section 3.2: Define and implement a confirmatory dosimetry monitoring program for alpha emitting radionuclides. This will consist of a sampling of individuals who are involved on alpha hazard work as part of the Unit 2 Refurbishment. The sampling will include the submission of fecal and urine samples followed by radio-analytical analysis by an outside laboratory. This will require identification of activities and workers selected for participation as well as the infrastructure to implement this (i.e., sampling kits, recording, lab analysis, calculation of dose, and communication with workers). One option to consider is to pre-select workers and have them submit baseline bioassay samples before work begins. TCD: October 1, 2016</li></ul>	Johnathon Hash	Scott Stafford	15-Sep-16

<a href="#">5882</a>	In Progress	Define Areas for ICAM Positions in Work Locations	<div><div></div><div>Sect 4.1.1: Define areas where iCAMS are to be positioned during work involving a significant potential for alpha exposure. It is recommended that an iCAM be positioned inside a work tent (where one is provided) if feasible due to space or dose rate limitations. If iCAMS cannot feasibly be placed inside the tent, then spot sampling should be performed frequently during refurbishment activities that have potential for airborne hazard. TCD: March 1, 2016</div></div>	Johnathon Hash	Scott Stafford	30-Jun-16	
<a href="#">5883</a>	In Progress	Darlington Routine Radiation Surveys Instruction Modified to include Unit 2 Refurbishment	<div><div></div><div>Sect 4.1.1: Modify D-INS-09071-10012, Darlington Routine Radiation Surveys, to expand the routine alpha monitoring program for Unit 2 refurbishment. TCD: March 1, 2016 Moving due date to June 30 in order to capture recommendations from an external report for Hard to Detect Nuclide Monitoring.</div></div>	Johnathon Hash	Scott Stafford	30-Jun-16	
<a href="#">5884</a>	In Progress	Develop a Strategy for Job Specific Non-Routine Surveys	<div><div></div><div>Sect 4.1.1: A strategy for non-routine surveys for specific jobs/locations for the Unit 2 refurbishment should be developed (i.e., frequency, timing). TCD: March 1, 2016  Date changed to June 30 in order to accommodate recommendations from the hard to Detect Nuclide external report.</div></div>	Johnathon Hash	Scott Stafford	30-Jun-16	
<a href="#">5886</a>	Not Started	Confirm Alpha Counting room for Refurbishment	<div><div></div><div>Sect 4.1.1: Confirm the availability of a facility for counting alpha contamination samples. TCD: March 1, 2016</div></div>	Johnathon Hash	Scott Stafford	30-Jun-16	
<a href="#">5887</a>	Not Started	Confirm Monitoring Compliance with Alpha Contamination Limits	<div><div></div><div>Sect 4.2.1/4.3.1: Confirm through ongoing source term/alpha characterization of Unit 2 that the beta-gamma: alpha activity ratio is greater than 5. This will confirm that pancake and WBM are sufficient to confirm compliance with alpha contamination limits.</div></div>	Johnathon Hash	Scott Stafford	30-Jun-16	

564							
<a href="#">5888</a>	In Progress	Sam Alarms will limit release of Alpha Contamination	<div><div></div><div>Sect 4.3.1: Confirm that SAM alarms based on gamma emitting contamination will also limit the release of alpha contamination below corporate limits. TCD: February 1, 2016</div></div>	Johnathon Hash	Scott Stafford	30-Jun-16	<div>The action has been assigned to the Senior Health Physicist for NR RP and he will be working with the Health Physics department at HPD to determine if the Small Article Monitor will adequately limit the release of alpha contamination and if it should be used for that application. An update will be provided by 3 March 2016. 3 March 2016 Summary The small article monitors will limit the release of alpha contamination present in most isotope mixes found in the station. Isotope mixes not guaranteed to trigger a SAM alarm have been identified in a small number of characterization surveys. Areas or systems known (or suspected) to contain this type of contamination are identified as Alpha Level 3 and subjected to enhanced monitoring requirements specific to the hazard. These requirements are sufficient to meet contamination control objectives without relying on SAM alarms. Details: As a gamma sensitive instrument that is not capable of detecting alpha particles, the SAM is not intended for Alpha contamination monitoring. Any ability to limit the release of alpha contamination would be dependent on the relative abundance of gamma emitters in the contamination mix. Based on discussion with HPD and a review of our source term data, it has been concluded that for most isotope mixed, the level of gamma activity is sufficient to trigger a SAM alarm for alpha levels below corporate release limits. However, this is not guaranteed for all possible isotope mixes. While a SAM does provide an additional barrier against the release of alpha contamination, it is not solely relied upon for this purpose. This is currently reflected in the design and execution of OPG contamination control process. In particular, areas or systems identified as having source terms with relatively large alpha components (i.e. alpha level 2 or 3) are subjected to an enhanced level of monitoring specific to the detection of alpha contamination. In addition, tools and equipment removed from the radiolo</div>
<a href="#">5889</a>	Not Started	Shielding for Icams located in high gamma background	<div><div></div><div>Sect 4.4.1: Shielding for iCAMs will be required when they are placed in high gamma background areas (i.e., on platforms near the feeders and reactor face). Data Refreshed:12-May-16 10:30 PM

<a href="#">2</a>	delaying layup activities																
<a href="#">844</a>	Initial vault crane maintenance	Event: Maintenance strategy for initial vault crane maintenance (on critical path immediately after defuel) has not been solidified. Consideration is being made for use of external contractors but this presents a schedule risk for FOAK work in plastics, in the vault. The conflict with using DN station resource is placement of D1711 outage. Present plans has the D1711 outage pushed back by 4 weeks so their will be no competition for resource.		Active	Val Bevacqua		12-May-16	Accept	11-May-16	2	3	2	6	2	2	2	4
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">861</a>	Shutdown to GSS Window 001 OM 09110 changes	Event: The current logic for unit shutdown contains the standard OM 09110 activities. Given the nature of the Refurb project, certain activities contained in this OM are unnecessary. A revised OM needs to be created for the Refurb shutdown.	3	Active	Ross Mccord	Dan Cowley	18-May-16	Mitigate	15-Aug-16	3	2	2	6	1	1	1	1
			There are no Not Started, In Progress Actions associated with the risk.														
<a href="#">724</a>	Chemistry Control Procedural Review Risk	Event: Due to a short period of time from design been complete (Aug 2015) and where required documentation (Chemistry Control OM and Chemistry Lab Procedures) is needed (Aug 2016) the completed documentation being ready in time is at risk. Also, there will be required reviews on O&M documentation during the same time frame. This will be a challenge for Chemistry Department based on present resources and therefore putting deliverables been ready for breaker open at risk. Cause : NR design documentation is scheduled for issued for all projects at the same time. Potential impacts : Chemistry Control documentation preparation may be late affecting chemistry control during initial stage of layup.	2	Active	Boris Vulcanovic	Roger Daly	10-May-16	Mitigate	30-Nov-16	5	1	1	5	3	1	1	3

			<a href="#">3811</a>	In Progress	Chemistry Control Procedural Review Risk /link to milestones in P6 schedule	Link Chemistry Control Manual and Chemistry Laboratory Procedures preparation TCD to the milestone in P6 schedule. Coordinate NR Work Plans review with Chemistry Control Manual and Chemistry Laboratory Procedures preparation.	Roger Daly	Sergei Voitchenko	14-Sep-16	Milestone entitled "Chemistry Laboratory Lay-Up Generic Routine Sheet "has been identified as a target. Chemistry Control Manual and Chemistry Laboratory Procedures preparation TCD is set at September 15, which is three months prior to this milestone's due date of Dec 15, 2015. Chem. Lab Technician starts to work 2days/week on CLP preparation starting from April 2015.  Update Aug 18 2015: draft version of "Chemistry Laboratory Lay-Up Generic Routine Sheet " or Chemistry Tasks required for refurbishment has been created in CEM. These tasks are all set to inactive until all CLPs are prepared, system placed in layup, and chemistry control initiated as per layup Chemistry Control OMs. Preparation of CLPs is also identified in Risk # 758. Therefore TCD for Risk # 758 and Risk #724 should be the same as Action #5396 : 2016/09/14 Update Nov 23/2015: 4 CLPs out of 23 are sent for approval.

	1485	In Progress	Risk 597 - action 3 to mitigate a Nuclear safety event that affects critical path.	Mitigate events when they occur: • When an event occurs, there is training, procedures and practice in handling events, thus the event is handled in a manner that mitigates the severity. • Contracts have been structured to mitigate the risk exposure to OPG. • Lines of communication to external oversight bodies, regulatory authorities and contract companies are clear and have been set in advance.	Ross Mccord	Dan Cowley	15-Sep-16	As part of risk mitigation strategy for item 597 AR28164125-03 and 04 has been raised to produce and event catagorization matrix and event recovery decision and action chart. Actions 5 of this AR will be todevelop a training package for shift management on types of reactor safety events, catagorization and event recovery strategies. Development of the training package cannot start until the matix and action chart has been approved. The traget for approval has been moved to Jan 30 2016. suggest the target for the training package (slide presentation for authorized staff feb 15 2016. In discussion with the NR DOM it was decided to move this issuance of this document (if required). The document will be reviewed in early Sept along with other plans produced by construction management to see if it should be required																											
	Service Air Project Available for Service at RISK	A Number of Technical Procedure Action Requests TPARs have been submitted to the O&M Procedures group but additional TPARs are still required. The Vendor ES Fox can not provide as they are still waiting on Vendor documentation to answer questions needed to proceed with procedure	4	Active	Boris Vulcanovic	Mike Dance	12-May-16	Monitor	31-May-16	4	1	1	4	1	1	1	1																		
There are no Not Started, In Progress Actions associated with the risk.																																			

806		<p>process.1. Instructions on the start up and shut down of the new compressors including exactly how to operate the HMI to do so.2. The HMI has many features and capabilities. Probably more than what operations typically utilizes. For example which features/screens are to be locked out and what can operators or maintenance staff do with HMI? We need explicit instructions. 3. We also understand NK38-MMM-75110-10007 is not entirely accurate as OPG has customized the HMI different from the normal manual. This means the instructions that will be created should be created referring to the updated manual, and the MMM will have to be updated if this is true. 4. At what point does Atlas Copco take over troubleshooting? What routine and breakdown maintenance is done by OPG and what is done by service agreement? This needs to be specified both in operating and maintenance procedures.5. More detail on how compressors are set up wrt loading and unloading pressures. For example how is lead/lag compressor selected and determined? Do operations rotate duty as a predefine, or is it done automatically? 6. Section 5 alarms will need instructions on how to operate HMI such that history is not erased and troubleshooting instructions are clearly laid out when an alarm is received. There is some detail provided already but they need to be elaborated with HMI operating detail. 7. Exactly how do the two Service Air systems interface. If the new CPs become unavailable can CP1-4 be run flat out to service Refurb? Has reactor safety looked at the requirement to only allow one of 7 CPs to be out for maintenance? This seems overly restrictive. These are the Major questions needed to be answered but the Vendor is waiting for information still from their Vendor in able to produce the additional TPARs required for this scope of work. Vendor material coming in April with the AFS scheduled in July. Available for Service AFS is at RISK due to lack of information needed to produce procedure changes and short time frame in which to implement the changes to the required procedures.</p>															
759	Defuelling Cost Could Increase	<p>Event: The latest RQE operations budget holds OBU defuelling cost for the defuel campaing on all four units. During 4D planning the strategy and associated cost to complete the defuel was not fully developed so the estimate was less optimal.</p> <p>Cause: In order to reduce the potential cost of the defuel for RQE planning, an analysis was completed and a strategy selected that relies on the current 5 crew schedule for the first unit and a 4 crew shift schedule for the F/H department for subsequent units in order to optimize the business plan.</p> <p>Impact: Since an approved 4 crew schedule has yet to be approved for use there is a risk that defuel cost may increase if the approval is not obtained.</p>	2	Active	Ross Mccord	Michael Mcfarlane	12-May-16	Mitigate	30-Jun-16	3	1	1	3	3	1	1	3

854	Management of document revisions during execution	Event: Timeliness & control of the amount of changes that will occur is unlikely to be handled with the current process.	There are no Not Started, In Progress Actions associated with the risk.														
				Active	Boris Vulcanovic	Mike Dance	11-May-16	Accept	11-May-16	2	1	1	2	2	1	1	2
802	Reburbishment Maintenance - Milestone OP2070 Work Package Assessment Complete - At Risk	Based on data from the Assessment Status metric for week ending February 26, 2016, there is a risk that Refurbishment Maintenance will not meet the April 15 Work Package Assessing Complete Milestone, OP 2070. Maintenance is assessing at an average rate of 450 tasks per week. There are 5300 tasks requiring assessment. Approximately 2500 tasks have been added since December 2015. There are 20,000 Maintenance tasks in D1621 and DNRU2.	4	Active	Val Bevacqua	Brad Schofield	12-May-16	Monitor	15-Mar-16	1	1	1	1	1	1	1	1
			There are no Not Started, In Progress Actions associated with the risk.														
813	Refurbishment Chemistry & Environment - "Milestone OP2070 Work Package Assessment Complete" at risk	Based on data from March 29th there is a risk that refurbishment Chemistry & Environment will not meet hte April 15 work package assessing complete milestone OP 2070. As of March 10th there was less than 20 hours of assessing time by a trained assessor from the chemistry laboratory. There are more than 150 tasks to be assessed by 15Apr2016. Laboratory assessing resources have not been available to be released to refurbishment per the OBU agreement. Scope additions are expected since there currently roughly the same number of tasks for this 3 year outage as there are for a normal 60 day outage. THM scope identification not well understood by individuals writing the CWPs and expecting to get support. There is a risk that there will be a lot of surprise work for laboratory employees if the number of tasks does not increase. Have been notified by R&FR that CWP preparation will not be complete until the end of May. The assessing milestone to have tasks assessed before all the work is identified is measuring to a metric not measuring actual readiness status. It is expected that there will be additional tasks identified after the assessing milestone. New Milestone date extended to June 17.	4	Active	Roger Daly	Emily Cornthwaite	10-May-16	Monitor	15-Apr-16	1	1	1	1	1	1	1	1

Data Refreshed: 12-May-16 10:30 PM

683	performance has required additional oversight during all phases, resulting in an increase in staff costs in OPG	significantly involved in all phases (Definition through Execution) due to the vendor's inability to meet contractual commitments on cost, schedule and quality. This has required the Owner to build an oversight organization capable of supporting/directing the planning, execution and technical supervision of the work. Current RQE forecast of OPGoversight manpower/cost assumes the EPC contractors for DNR will have the required capabilities to meet the contractual commitments on safety, quality, cost and schedule. Should the OPEX repeat itself on DNR then significant schedule impact could occur and considerable qualified oversight resources would be required.																		
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			1457	In Progress	Risk Action	Scale the Construction Oversight Group with the required quantity of specialists (Engineering/Procurement, Facilitators/coordinators, welding, NDE, Quality and safety) outside of the project teams to ensure both objectivity of oversight and provide the needed support/guidance to the vendors. These refurbishment experienced specialists and support staff may not reside within OPG. This strategy will be more cost effective and scalable than building up the individual project teams.	Ken Hobbs	Robin Granger	15-Oct-16	Construction Oversight Group has been established with resource level and organizational make up approved. Required specialists, FME, Hoisting and Rigging, Pressure Boundary, Electrical, etc. Specific Construction Oversight qualification is developmented and implemented. External Construction Oversight is now in place through Keiwiit. Current organization will be tested through the 5 RTE Projects schedule for 2016 prior to breaker open. Lessons Learned will be incorporated prior to U2 breaker open.										
762	Key skilled craft resources not available when required for Units 3, 1, 4 Execution	Refurbishment Project Contractors will be unable to secure the number of required key skilled craft resources for Units 3, 1 and 4 Execution like boilermakers, pipefitters, welders, millwrights and electricians as a result of attrition in the trades and other mega-project opportunities which may lead to schedule delays and cost overruns.	1	Active	Michael Allen	Ken Hobbs	07-Mar-16	Mitigate	16-Oct-26	4	3	4	16	3	3	3	9			
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments										
			6286	In Progress	Resouce Planning for Units 3, 1, 4.	Evaluation of tactics and aligned with owners strategy to minimize the risk of skilled craft shortages. The tactics evaluated will include both short term approaches (i.e. temporary foreign workers) and longer term solutions (i.e. outreach to schools, apprentices, targeting underrepresented groups). Process is similar to Action 1449 but for Units 3,1,4.	Ken Hobbs	Robin Granger	30-Jun-23	• Ongoing assessments of resources planned right up to breaker open on last unit, Unit 4. •Overall action plan NK38-PLAN-09701-10231 issued in Asset Suite on Nov 20th,2014										
	EHS and other Vault Projects - Radiography Cannot be Completed on	The risk is that non-destructive examination (NDE), in the form of radiography, cannot be completed on schedule to verify nuclear class piping welds due to potential critical path impacts. Radiography is a high rad hazard and requires evacuation of the vault which may not be feasible due to critical path	2	Active	Michael Allen	John Stopar	22-Apr-16	Mitigate	31-May-17	5	1	3	15	3	1	2	6

Report Owner: L. Greenland  
Process Owner: R. Smith  
Data Refreshed: 12-May-16 10:30 PM

814	Schedule Due to Critical Path Work (windows 104)	work completed by the JV. This will lead to schedule impacts for the Emergency Heat Sink (EHS) project, valve rehabilitation, valve PM's, and other projects to find time to complete radiography NDE. Per SCR N-2016-02304 it was raised that radiography may not be allowed to be performed in the vault, to prevent impacts to critical path work being performed by the JV.																
			3436	In Progress	Alternate NDE Required: Radiography Cannot be Performed inside the Vault	VW: Emergency HTS Make-Up Installation How much radiography will be required during this Vault projects installation work window?	Scott Guthrie	Jessica Perryman	03-Apr-17	all work groups/ projects to id their vault radiography requirements to Dennis. Boyd - requested to determine other if other "non-radiography" technologies avail. Jan 15th, 2015: Did discuss this with vendors (ES Fox and AMEC) and we have a path forward to determine radiography amounts (still unknown as piping modelling is underway), I'll get you detailed drawings when the modelling is done. 4Feb2015 note: all in vault projects to strive to not have to radiograph. As JV is working 6x10h: Sunday will be "radiography day". 28Apr2015 note: unkown currently how much radiography is required...this will be known better as design progresses. Due date pushed to EHS 40% design complete date for follow up. Vendor looking into other forms of NDE for pipe welds. 4-Sept-2015 Update: Will confirm amount of NDE through assessing/work planning phase. 3-Feb-2016: it was recently raised in the vault window meeting that radiography may not be allowed. This will affect multiple projects in the vault project window that require radiography. Other means of NDE is being investigated. 5-Apr-2016: This action is going to be canceled once a new action is generated and linked to a Program Risk, instead of Project Risk. The new action will be noted before this action is closed. Updates: Contacted IMS to investigate Phased Array option as an alternative. IMS to deliver proposal to BOP. New action will include all IMS support activities and TCDs.								
	U2 Containment Isolation schedule extension due to Fuel Handling operations on operating units. [window 23]	[execution phase] Event: The critical path isolation of the NR unit from containment (bulkhead installation), and subsequent removal post fuel channel and feeder replacement, may extend beyond scheduled windows. Cause: Critical path containment isolation activities can only be completed during no-fueling windows. The frequency/availability and duration of no-fueling windows is determined by operating unit zone levels, trolley reliability and required trolley maintenance. Impact: If no fueling windows are shortened or do not occur per plan, critical path schedule delays will result as well as cost overruns due to crew standby time. Reasons for no fueling windows not occurring as planned could include unit zone conditions and trolley reliability.	2	Active	Michael Allen	Marc Paiment	06-May-16	Mitigate	31-Oct-16	3	1	4	12	3	1	3	9	
			Action#	Status	Action Title	Action Description	Owner	Delegate	Due Date	Comments								
			1685	In Progress	Risk Action	Reviewing/modifying fuelling strategies to provide longer no-fueling windows. This will increase efficiency during Bulkhead installation and removal as there will be a fewer number of inturptions.	Michael Mcfarlane	Michael Mcfarlane	31-Oct-16	Banking strategy has been developed that would allow longer windows of no fuelling of up to 10 days (D-OA-37000-10015-R00). As well, the bulkhead Installation co-Incides with the D1711 outage which eleiminates the need to fuel unit 1. With potential changes to AWPP 007, this would maximize bulkhead installation time and minimize interuptions

684		window. 2. Depending on the amount of tube plugging needed, the station may need to de-rate the unit. 3. In the unlikely event that the tube damage is so severe that de-rating the unit is not ecomincally viable, complete SG replacement may be required.	1731	Not Started	Review PSC OPEX regarding Primary Side Clean Adverse Impact to SG Tube Integrity prior to execution window (T-6month)	Review PSC OPEX regarding Primary Side Clean Adverse Impact to SG Tube Integrity prior to execution window (T-6month)	Pejman Asgaripour	Mike Lutz	23-Aug-17	As pre req to this action, optimization will include extended duration tests to ensure visible wear is produced. Visible wear will clearly identify how process parameter adjustments affect tube wear, allowing verification of future decisions that may occur(ie increase execution blast duration). future operating pressures will be within the bounds of qualification completed in 2009.										Review OPEX with EPC vendor following PSC campaign in Cernavoda in Q2 2016.			
679	Zebra Mussel Fouling Impacting Operations and Refurbishment	Ongoing Unit Operation: Darlington’s historical intermittent chemical injection strategy for low pressure service water (LPSW) and powerhouse upper level service water (PULSW) was not fully effective in preventing zebra mussel accumulation in some areas that supply cooling to safety related components. This resulted in unavailability of a shutdown cooling pump and instrument air compressors because of Zebra mussel in cooling systems. In addition, loads have seen reduced cooling effectiveness (HT Pump motor cooler, Vault Coolers, etc). Refurbishment (drained and dried service water systems as a contingency): Zebra/quaga mussels, silt and foreign material (FM) concentration can affect successful startup of service water systems following a period of long term drain and dry. The concern is foreign material becoming solidified in the pipe. The flow in the pipe would then be permanently reduced not meeting operational requirements. This could occur following the drain and air dry of contaminated LPSW pipework.	1	Active	Jeff Lehman	Andy Ireland	01-Mar-16	Monitor	31-Dec-15	1	1	1	1	1	1	1	1	1	1

Program: Refurbishment Execution - RF																							
772	Qualification of Existing Bellows	The existing bellows are not currently qualified for the full post refurbishment life. There is a risk (low probability) that qualification testing will fail which would require that all bellows be replaced (960 bellows per unit), resulting in increased cost and critical path duration. In addition, the lead time for the large quantities of bellows is substantial with ~6-12 months of float to the need date in the field. Test program is underway and results are expected within the time required to initiate procurement. The current bellows replacement tooling that is currently in the JV toolset is not efficient for a complete bellows replacement program which could be required if bellows qualification testing failed. The incremental tooling development would be required and a high level estimate of tooling development, manufacturing and testing timeframe is 24 months.	3	Active	Michael Allen	Marc Paiment	18-Feb-16	Mitigate	29-Feb-16	1	2	5	5	1	2	5	5	5	5

Data Refreshed: 12-May-16 10:30 PM

790	not integrated with DINGS schedule and Resource Balance Toolkit	their IFC and Outage plans. This also includes the resource demand loaded into the Resource Balance Toolkit (RBT). Potential Impact of this are: - critical conflicts of work on the refurbishment unit with operating units may not be properly identified and resolved. - non-integrated schedules may overdemand shared OBU staff that reside with the site. Current site overdemand is preventing the release of staff to the project.	There are no Not Started, In Progress Actions associated with the risk.														
698	Unexpected Operating Unit Impacts	Activities in Operating Units (either adjacent units or units being prepared for refurb or readied for return to service) may cause unpredictable access issues and work hindrances resulting in refurb workers stopping work and, hence,productivity losses - negative impacts on costs and schedule. This level of integration of a unit under refurbishment with the midst of multiple operating units has never been undertaken before. This risk is transferred from RFR JV (Risk #44) to OPG.	1	Active	Karen Fritz	Daniel Sawyer	01-Oct-15	Accept	01-Jan-27	3	2	3	9	2	2	3	6
			There are no Not Started, In Progress Actions associated with the risk.														
689	Failure to eliminate current constraints on vault loading	The risk is that failure to eliminate current constraints (vault egress limits and breathing air capacity) on vault loading as assumed for DNRU2 Level 1 Rev A outage plan will extend critical path by up to 30 days.	3	Active	Karen Fritz	Daniel Sawyer	01-Oct-15	Mitigate	15-Nov-15	2	1	4	8	1	1	2	2
			There are no Not Started, In Progress Actions associated with the risk.														
	Failure to obtain approval for early HTS Fill	At an Operational Decision Meeting (ODM) on June 1st, approval in principle was obtained to allow filling the HTS prior to the restoration of the normal containment boundar. However the approval was conditional on a number of actions. Actions have been established in the Passport Action tracking database to address the conditions given in the ODM approval which includes some follow-up nuclear safety analysis and CNSC approval for a minor revision to an OP&P. The risk is that one or more of the follow-up conditions can not be met, and the logic reverts to having an HTS fill following the removal of the bulkhead. This logic change would add approximately 43 days to the lead-out logic for each unit.	2	Active	Karen Fritz	Daniel Sawyer	01-Oct-15	Mitigate	15-Jul-16	2	2	4	8	1	2	4	4

			5389	In Progress	martingInitiate Moderator RD failure scoping analysis.	Initiate preliminary analysis to establish, for the case of an in core LOCA with bursting of calandria (moderator) rupture discs, the consequences of D2O releases from Moderator and PHT systems, taking into account tritium concentrations in both the moderator and PHT, as well as the release of entrained fission products or other radiological contaminants in the released D2O.	Gerry Martin		30-Aug-16	AMEC contacted to start scoping out analysis, high level analysis plan and cost and time estimate received. Review of documents generated some comments that need to be resolved before work can progress. TCD changed to Jan 15, 2016 to allow for work scope finalization and analysis to be completed.  Restart HIT team formed, meetings being held to narrow down the correct questions to ask contractors to complete the analysis. Contract for the analysis is not yet in-place as scope of required analysis and initial conditions are still being developed. action extended till March 30th - Gerry Martin Jan 8th, 2016. Contract being finalized as scope was recently clarified, no firm TCD from signed contract available, action extended till Aug 30, 2016 - Gerry Martin March 24, 2016							

[761](#)

<a href="#">5390</a>	In Progress	Impact of non-tritium HTS radionuclides	Ensure that spill analysis for the HTS fill scenario includes an assessment of the effect of entrained contaminants or provides a limiting value.	Gerry Martin		30-Aug-16	<p>Analysis for the D2O contingency storage project is being reviewed to determine if that analysis can be used to respond to this action. Quantification of what possible contaminants could be present in the PHT coolant may prove difficult and would need some bounding assumptions. The present analysis assumed dose came from tritium gas escaping the reactor vault, and did not assume any liquids escape. Solid contaminants would not likely escape from the vault as they are heavy, non-soluble and would stay with the liquid, and not exit the RV with the tritium gas. C-14 may be presents, but typically, the dose from tritium is 7 times that from C-14 for scenarios such as this one. TCD extended to Jan 15, 2016 to allow for D2O storage tank work to be completed and finalized - to determine applicability to this situation.</p> <p>Restart HIT team formed, meetings being held to narrow down the correct questions to ask contractors to complete the analysis. Contract for the analysis is not yet in-place as scope of required analysis and initial conditions are still being developed. action extended till March 30th - Gerry Martin Jan 8th, 2016 Contract being finalized as scope was recently clarified, no firm TCD from signed contract available, action extended till Aug 30, 2016 - Gerry Martin March 24, 2016</p>
<a href="#">5391</a>	In Progress	Assessment of spill volume and rate	The analysis is to include an assessment of maximum volume of tritiated D2O that may be released in the event of an accident, the maximum rate of release that may be experienced and the impact of that volume/rate on the proposed release mitigation strategy.	Gerry Martin		30-Aug-16	<p>Assessment of total spill volume is underway and argument to be supported is that there is enough spill capacity containment in the vault that water will not be exiting the RV. TCD extended to Jan 15 2016 due to completing priorities of Aug 15 design milestone and now DNGD VBO support.</p> <p>Restart HIT team formed, meetings being held to narrow down the correct questions to ask contractors to complete the analysis. 776		back in). Barring a change to the critical lift plan, that will drive 8 vault evacuations and depending on how pessimistic you are that could be anywhere from a half shift to a shift of critical path time lost for each such evolution. We currently don't have any critical path time allocated for this activity.	5703	In Progress	Analysis of HTS pump motor critical lift plan requirements	In the current outage in Unit 1 they cleared the vault when they lifted a HTS pump motor, presumably for concern that a dropped motor would actually penetrate the containment structure and kill people below it. We're swapping 4 pump motors in DNRU2, which means 8 lifts (out and back in). Barring a change to the critical lift plan, that will drive 8 vault evacuations and depending on how pessimistic you are that could be anywhere from a half shift to a shift of critical path time lost for each such evolution. We currently don't have any critical path time allocated for this activity.	Ryan Finnie		14-Jul-16	DNGS Civil Design Engineering indicated that the original recommendation to clear the vault for lifting HTS pump motors was based on a hand calculation that incorporated conservative assumptions. A more detailed analysis using a software simulation is being performed by DNGS Civil Design to determine the amount of damage that would likely occur if a HTS pump motor were to be dropped during a lift over the vault. The results of this analysis will determine whether the original recommendation can be revised. Additionally, a request has been made to Civil Design to incorporate the Adjustor Rod flask lift into this analysis. The expected completion date for this analysis is January 8, 2016. Due to competing priorities with outage extensions and forced outages at the station, DNGS Civil Design Engineering has not completed the analysis for the PHT Pump Motor Lift. Additional time will be required to complete the analysis and interpret the results. [11JAN2016] (Feb. 09/16)-Request for Support Refurb/Station Design Engineering is in place. Due to competing priorities (Design Eng.) new TCD has not yet been provided to perform calculations. (Mar22/16) NR Design Engineering has indicated that the analysis can be performed and independently verified by 30JUN16.							
798	Higher Than Expected CSA Demand for U134	The RQE Plan only reflected 8.5 FTE CSAs budgeted for 2018 and beyond (due to a planning assumption that anticipated a drop in demand for CSAs post January 15, 2016 milestone: OP2360 – All Level 3 Schedules Quality Acceptance Complete). However, the "CSA Transition Plan" developed late in 2015, has clearly identified a need for 11 CSAs 2016-2023 in order to adequately support Pre-Req work and Unit Execution based on the OPEX and Lessons Learned based on the last 12 months. CCF 812 was generated to remedy this situation for U2.. There is a risk that U134 will experience the same higher demand and will require additional funds to remedy this demand. Among other details, some drivers for this increased need include: 1. Increased demand for dedicated CSA support for reviews, scheduling, and actions based on Pre-Reqs to Breaker Open for each of U134. 2. Increasing requests from Vendors to provide dedicated CSA support at vendor location, which take OPG CSAs away from crucial oversight and planning activities 3. Increased demand for OPG-performed activities to be scheduled within the Integrated Level 3 (U13)	1	Active	Karen Fritz	Vijay Santhanam	14-Jan-16	Monitor	31-Jul-16	4	2	1	8	4	2	1	8
			There are no Not Started, In Progress Actions associated with the risk.														
785	Inadequate schedule detail and work instructions to support the schedule development milestones	The risk is that less than adequate schedule detail and work instructions developed to support the schedule development milestones (REV C and REV 0) from all schedule owners leads to less than adequately planned Execution Schedule.		Active	Karen Fritz	Daniel Sawyer	11-Nov-15	Mitigate	15-Jan-16	3	2	2	6	2	2	2	4
			There are no Not Started, In Progress Actions associated with the risk.														
791	Refurbishment project not properly accomodated in the Generation Plan	Refurbishment project reflected on the long range generation plan only as a high level place keeper. Outage schedule and planned generation does not currently take into account the shared O&M and vendor support for the outages at PNGS and DNGS. Potential impact is an unavailability of critical resoruces or vendors during peak demands due to scheduled overlaps. This needs to be reflect in the genration plan as submitted to the OEB to ensure credible generation assumptions.	4	Active	Karen Fritz	Daniel Sawyer	11-Nov-15	Monitor	29-Jul-16	2	2	1	4	2	2	1	4
			There are no Not Started, In Progress Actions associated with the risk.														
	Requirement for 24/7 PCC coverage	To maintain lower staff numbers, a days based rotation for PCC coverage is described. The underlying assumption in this model is that little work is conducted on the back shifts that will not be	1	Active	Karen Fritz	Daniel Sawyer	02-Oct-15	Accept	15-Oct-19	2	1	1	2	2	1	1	2

Program: Work Management - RF

800	HTS RTS Schedule Risk – Hot Conditioning with Fuel in Core	<p>EVENT: The current base case is sequenced such that fuel is manually loaded in core and later Hot Conditioning is performed, which may not be an acceptable sequence if this results in deposits on the fuel bundle.</p> <p>CAUSE: During Restart of Bruce Units 1 &amp; 2, Hot Conditioning was performed with fuel in core using EDTA process. Deposits were seen on fuel bundles from both units, with hot conditioning being the probable cause of the deposits. Unit operation with fuel bundles that have deposits is not an analyzed configuration for the fuel. As such, the CNSC directed Bruce Power (see NK21-CORR-00531-10509) not to perform any Hot Conditioning on subsequent units with the fuel in core unless there is agreement with the CNSC. It cannot be precluded that a similar phenomenon could happen at Darlington. Darlington is using the conventional hot conditioning rocess not EDTA which was used at the Bruce.</p> <p>Chemistry concerns with hot conditioning following ATC still need to be resolved. There is no current approved documentation supporting HC after the reactor is critical. Increased activated crud may result from performing HC while critical resulting in increased dose rates that affect worker safety and plant equipment lifecycle.</p> <p>IMPACT: The current RTS sequence (hot conditioning with fuel in core) may not be acceptable if it is found that Hot Conditioning with fuel in core results in deposits on the fuel. This would be an unanalyzed configuration in the safety report and would result in diminished regulator confidence in the project and S-99 reportable events. Allowing deposits on the fuel must be precluded or dispositioned. A change in RTS sequencing may be required resulting in a 30-45 day extention to the current schedule.</p>	2	Active	Karen Fritz	Daniel Sawyer	11-Mar-16	Mitigate	18-Mar-16	5	4	4	20	1	1	2	2

Title:

**NUCLEAR PROJECTS RISK MANAGEMENT**

**Revision Summary**

Revision Number	Date	Comments
R002	2015-03-30	Major Revision to the document to address the integration of the draft P&M Risk Guide RISK-G-01 and to incorporate direction of the new Risk Management and Oversight (RMO) tool. Integration of all NR manuals (RISK-04, RISK-05, RISK-06, RISK-07, RISK-08) regarding OPEX, lessons learned, assumptions and decisions management into a single document.
	2014-06-28	Updated the Risk Management Process to include Key Risk Areas and the related sponsors' responsibilities
	2014-03-24	Integrate N-MAN-00120-10001-Risk 05 (contingency development) to create a consolidated single document. Removed the cost control/change control/reporting sections for contingency. Non-intent updates to provide clarification or context as requested by manual users.
R001	2013-07-07	Minor updates
R000	2012-07-25	First Issue

Title:

## NUCLEAR PROJECTS RISK MANAGEMENT

### 1.0 DIRECTION

Risk management is a systematic approach to identifying, analyzing, and responding to project risks. The goal of risk management is to proactively identify and manage risks in order to deliver projects safely, with quality, on time and on budget. This document provides direction to projects for both day-to-day risk management activity as well as the risk management preparations for authorization packages presented at funding gates/committees.

### 2.0 SCOPE

A graphic depicting the “inputs to” and “outputs of” risk management activity that fall under the scope of this document is outlined below. The sections of this manual are structured in alignment with this diagram.

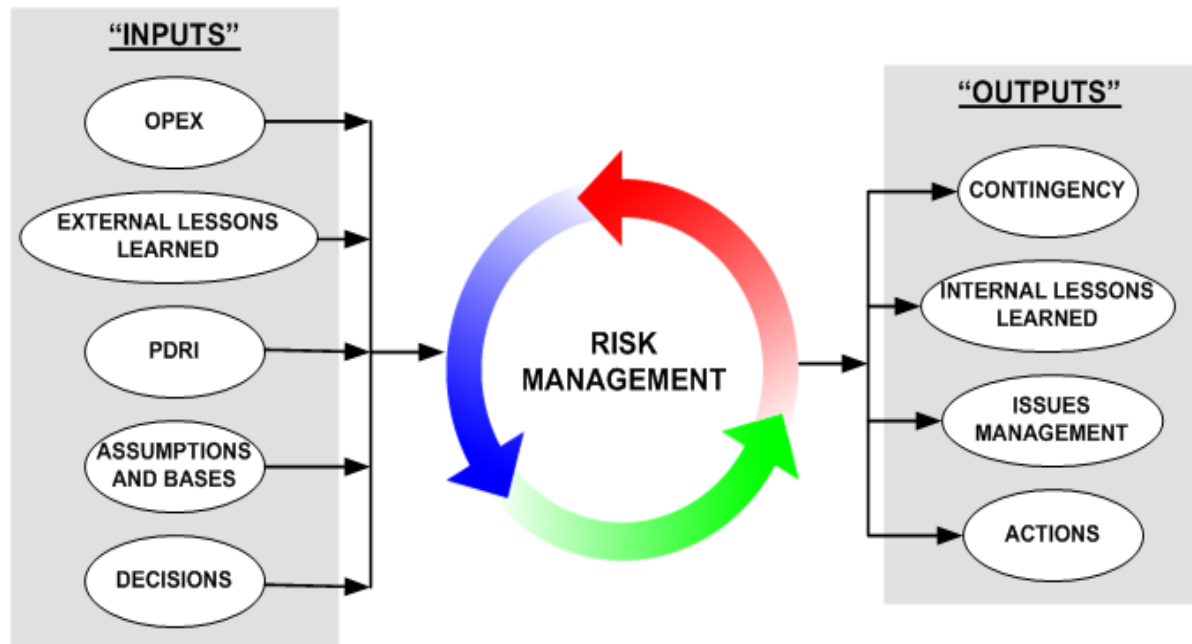

Figure 1: The Risk Management Process

#### 2.1 Risk Management and Oversight Tool (RMO)

The Risk Management and Oversight (RMO) tool is an application project managers will use to perform risk management activity for projects. The Project Management Office (PMO) is the owner and administrator for this tool and provides training, support, and guidance to the organization. This manual does not include detailed direction for using the RMO tool. For details on how to use the RMO tool, refer to *N-GUID-09701-10123, Risk Management and Oversight Tool*.

## Manual

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>6 of 35</b>

Title:

## NUCLEAR PROJECTS RISK MANAGEMENT

### 2.2 PMO Role

The PMO Risk Department will provide guidance to the project managers in the application and interpretation of the requirements outlined in this manual. The support provided exists both in the day-to-day application as well during preparation of funding approval packages (e.g. Gate Review Board). The PMO risk department will perform oversight of the RMO contents on behalf of the Nuclear Projects organization and will prepare reports, metrics, self-assessments, and other such analyses from time to time to monitor the effectiveness and use of the processes outlined in this manual. Annually a consolidated report will be prepared incorporating a strategic review and identification of any corrective actions.

Additional project controls support and deliverables, where applicable, are outlined in the appropriate section of this manual.

### 3.0 RISK MANAGEMENT INPUTS

Risks to project objectives can be identified from a number of sources. If these sources of risk are not considered both in the development of the initial risk profile as well as during ongoing risk management activity the ability for the project manager and senior leadership to make informed decisions about the project may be adversely impacted.

#### 3.1 Operating Experience (OPEX) and External Lessons Learned

OPEX is information ***gained through experience*** that should be retained for future use. Depending on the observation made, OPEX could be a valuable technique, a best practice or a successful outcome you wish to repeat or an undesirable result you wish to avoid. When applicable OPEX is recognized, the project manager is then equipped with the knowledge to incorporate it into their baseline cost and schedule or manage it as a risk.

The Nuclear Projects process complies with *OPG N-PROC-RA-0035, Operating Experience Process*. This base standard has an operational focus. For project risk management, the goal is to look beyond operational events and seek out events that have happened both in nuclear and non-nuclear projects that may present risks to the project that is being undertaken.

OPEX obtained through RA-0035 process is added to the RMO database by the PMO and dispositional by the designated department or project. Anyone with access to the RMO tool can add an OPEX event under the OPEX tab. The PMO can assist the project manager in searching for specific event types and populating the RMO OPEX library with new information that will be helpful to others.

Lessons Learned (LL) are similar to OPEX items, in that they have a foundation in past events. A lesson learned however ***goes beyond an individual event to provide key insights and clearly identify the causal factors that contributed to a positive or negative outcome***. The RMO tool contains a searchable lessons learned library, with major lessons learned categorized as Programmatic Lesson Learned (PLL). Each PLL

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>7 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

is assigned an owner within Nuclear Projects whose accountability is to ensure that proper actions are developed, assigned, and are monitored to completion.

### 3.1.1 Project Manager Direction

Project managers should be up to date on the content of the OPEX and LL libraries as they conduct their day-to-day risk management activities. Good practice would be to establish periodic reviews of OPEX and LL within their project teams during regular risk reviews.

Prior to any funding gate a detailed review of the RMO OPEX and LL library must be performed and any items that were considered in the preparation of the baseline cost and schedule or resulted in a project risks shall be identified. A summary of the review performed shall accompany the gate or funding approval package in the form of a narrative in *N-FORM-11652, Nuclear Projects Risk Management Input Assessment*.

#### PMO Role

The PMO Risk Department receives external OPEX from the central nuclear OPEX coordinator. The OPEX received has been pre-screened as per *N-GUID-04947.02-10000 External Events Screening Guide* and is determined to be relevant to Nuclear Projects. These items are populated in the RMO tool by the PMO risk department. The PMO risk department will also proactively seek out external and internal project related OPEX events through a variety of sources identified in Appendix A. The PMO risk department provides oversight support and disseminates significant information in real time through email communications. The PMO risk department creates programmatic lessons learned (PLL) based on significant OPEX and presents them to CARB.

### 3.2 Project Definition Rating Index (PDRI)

The Project Definition Rating Index (PDRI) is an industry best practice front end planning tool that helps assess the level of project scope definition and stakeholder alignment during the critical formative stages of the project. The objective of a PDRI is to identify gaps in scope definition early on, prior to committing significant funding to the project. The gaps in understanding or definition identified in the PDRI workshop shall be closed by the project manager prior to proceeding further (i.e. prior to submitting the funding package for approval). At minimum if the gaps cannot be resolved the project manager can use the insights gained in the PDRI session to inform the project risk register.

The requirement for a project to undertake a PDRI workshop is defined by the gating process. The PMO Risk Department can assist the project manager in executing a PDRI workshop by providing resources and facilitation.

Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>8 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 3.3 Assumptions and Project Bases

Assumptions are factors in the planning process that are considered to be true, real, or certain, without proof or demonstration. Assumptions are ***not completely defined in project documents*** but are required in order to develop the cost and schedule estimates for projects.

Project bases are ***documented descriptions of how an estimate, schedule, or other plan component was developed*** and defines the information used in support of development.

To the extent possible when preparing funding approval packages, the use of assumptions shall be minimized. It is important when preparing the cost and schedule estimates to disposition assumptions so that the project plan being presented has been validated and is supported by project bases. Any residual assumptions that cannot be dispositioned or built into the cost and schedule as a project basis shall be entered into the RMO assumption log and reviewed during preparation of the project risk register. Assumptions are to be populated in the RMO tool, and can be initiated by any Nuclear Projects personnel with access. Project bases that are not documented in other project documents (such as the basis of estimate) shall also be documented in the assumptions log in the RMO tool.

#### 3.3.1 Assumption Revision or Closure

Assumptions can be closed when they are no longer relevant or when they are known to be incorrect or invalid. New or modified assumptions that impact other projects directly, or those that are widely applicable (i.e. "program" level assumptions) shall be broadly communicated by the initiating project manager in order to bring awareness to those affected departments or projects. For example, an assumption pertaining to contracting or resourcing strategies may have a wide ranging impact on projects already in flight therefore strategic, effective communication is imperative.

#### 3.3.2 Project Manager Direction

Prior to submission of funding approval packages, the project managers shall populate the assumptions log in RMO. These assumptions shall be assessed to determine if they introduce risk to the project and require entry to the project's risk register. A summary of the assumptions made shall accompany the gate or funding approval package in the form of a narrative in *N-FORM-11652, Nuclear Projects Risk Management Input Assessment*.

The project managers shall keep up to date on the content of the assumptions log as they conduct their day-to-day risk management activities, and assess risks against assumptions made. Good practice would be to establish periodic reviews of the RMO assumptions log for any new programmatic assumptions made or any assumptions made for projects that may impact the subject project. The project manager shall re-validate their assumptions on a regular basis and at minimum at funding approval gates or when initiating the change control process.

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>9 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 3.4 Decisions

***Documented decisions form a part of the project basis.*** Decision records are critical for maintaining an auditable trail for Nuclear Projects and assist in “telling the story” of the projects. In most cases, decisions exist in the form of approved documentation generated by following existing approved processes (the modifications and the engineering change control processes, Engineering or Operational Decision Making, for example). Decisions made under the execution of these processes do not need to be duplicated in the RMO tool.

Project decisions that should be entered into the RMO are those that are not covered by existing processes. These decisions tend to be strategic in nature and arise when there is not a clear path forward but rather a number of possible options to achieve the project’s objectives. Too often, these decisions are made informally without the appropriate authority and are not communicated effectively, resulting in adverse impacts on the projects. These decisions shall be documented in a DRAS (*Decision Record and Analysis Summary*) N-FORM-11390 and entered into the RMO tool once approved. A control document number shall be obtained for the DRAS and the DRAS shall be submitted to records in parallel with being added to the RMO decision log.

This decisions process and associated N-FORM is flexible and may be applied to provide structure to a number of different project departments for a number of different types of decisions. While all decisions documented in a DRAS shall be recorded in the RMO tool, this manual will not provide direction for all the various possible applications.

#### 3.4.1 Project Manager Direction

There is no strict prescription or threshold for entering decisions in the RMO tool. If there is confusion regarding the appropriateness of preparing a DRAS, contact the PMO risk department for support and guidance. As a general rule, the project manager should use judgment and input decisions in the RMO tool if:

- The decision forms a fundamental aspect of the project basis and is not documented elsewhere as part of approved project processes, and/or
- The decision would assist external and internal personnel in understanding the rationale and the considerations made in establishing the project plan, and are not documented elsewhere as part of approved project process.

In all cases, decisions must be validated with sufficient authority to ensure prudence and facilitate alignment among multiple organizations. Where a decision has a financial impact, the DRAS approver must have the authorization to approve the decision based on OPG-STD-0017, Organizational Authority Register. At minimum, for decisions that impact (or have the potential to impact) other OPG organizations, the Stratum IV manager of that department, or their delegate, shall review and comment. It is the project manager’s accountability to ensure this happens. Any DRAS that results in a change of scope to the project must be submitted to the appropriate project review board/committee for authorization prior to approval. Any employee can initiate a decision in the RMO tool provided it is supported by an approved DRAS.

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

To the extent possible when preparing funding approval packages, the practice of documenting decisions is encouraged. The objective when preparing the cost and schedule estimates is to formally document decisions to support the project basis. A summary of the decisions made and recorded in RMO in the development of the project plan shall accompany the gate or funding approval package in the form of a narrative in *N-FORM-11652, Nuclear Projects Risk Management Input Assessment*. Good practice would be to establish periodic reviews of the RMO decisions log for any new decisions made that may impact the subject project and following up on any impacts if required.

Owners of the decisions recorded in the RMO tool shall review these decisions quarterly and update the project risk register as appropriate. Decisions that impact multiple organizations shall be broadly communicated by the decision owner in order to bring awareness to those affected departments or projects.

## 4.0 RISK MANAGEMENT

Project managers are accountable to apply the risk management (RM) practices identified in this section to their projects. The PMO Risk Department will provide tools, guidance, training, and support to the project managers.

The RM process includes the following fundamental steps:

- Planning** – defining how to conduct risk management activities for the project or program.
- Identification** – determining events that may affect the project objectives and documenting their characteristics.
- Assessment** – analyzing and prioritizing identified risks based on probability and impact (qualitative), and estimating the potential cost and schedule implications of the risks to the approved objectives if they were to occur (quantitative).
- Treatment** – determination of the most appropriate risk response to reduce threats to project objectives, or exploit opportunities to improve project performance.
- Monitoring and Control** – implementing risk response plans, monitoring identified risks, identifying new risks, and evaluating risk process effectiveness throughout the project life cycle.

### 4.1.1 Risk Management Planning

A Risk Management Plan (RMP) describes how risk management responsibilities structured and performed. Each project should prepare a standalone RMP or have a section dedicated to risk management within its Project Management Plan (PMP). Where the project is a subset of a larger program, referencing the program RMP or PMP and documenting any specific project deviations or details to the parent plan is acceptable.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>N/A</b>	
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>11 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

Included in RMPs are the following sections:

- **Risk Management Methodology** - defines the approach, tools, and data sources that may be used to perform risk management on the project.
- **Roles and Responsibilities** - defines the risk management leads, support personnel, and other team members including their responsibilities and accountabilities to ensure compliance with the risk management process.
- **Monitoring and Control** – definition of when and how often the risk management process will be performed, including the establishment of major risk management activities to be included in the project schedule. Monitoring and update frequencies will reflect the phase of the project life cycle (i.e. the execution phase will require a focused effort to stay on top of risks with more frequent updates).

### 4.1.2 Risk Identification

Risk identification is an iterative process because new risks may evolve or become known as the project progresses. The risk profile presented to support contingency development in a funding approval package is a “point-in-time” snapshot. Failure to perform ongoing risk management activity is negligent from a project management perspective and will result in adverse impacts to the individual project and the overall portfolio.

A number of techniques or forums may be used to identify risks. The project team and functional and external stakeholders should be involved in the process so they can develop and maintain a sense of ownership and responsibility for the risks and associated actions.

Tools and techniques to identify risks include, but are not limited to:

- Facilitated workshops
- Structured Interviews with experienced project team members, stakeholders and SMEs.
- Project Definition Rating Index (PDRI) Workshops
- OPEX and Lessons Learned Review
- Basis of Estimate (BOE) Review; review of assumptions and constraints in the BOE can be used as a source for risk identification.
- Project Schedule Review; review of near critical, critical path and schedule float in schedule assumptions can be used as a source for risk identification.
- Review of a standard risk breakdown structure for potential risks (Refer to Appendix C)

#### 4.1.2.1 Common Pitfalls in Risk Identification

There are five common pitfalls in risk identification that leads to inefficiencies in managing risks:

- Identifying Risk Without Clear Project Objectives

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>12 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

Effective risk identification requires a high quality project plan with clearly defined cost, schedule, quality, and safety objectives. Without this, one cannot effectively identify risk to these objectives and items raised will be based in speculation and not facts. This can lead to initiating actions too early, team confusion, and create a perception that risk management is not an effective use of time or resources.

#### (b) The Presumption of Failure

Too often project and functional managers submit project plans (scope, cost, schedule, resources) for approval that they do not believe are reasonable and achievable. Further, a large risk register may be viewed as a means to indicate to the approval board that the project "is not easy" or has been unsuccessful in the past. This presumption of failure creates too many risks to effectively manage and a lack of clear prioritization for the team. A project risk register is not a repository to capture known shortcomings of an underdeveloped project plan.

#### (c) Identifying Issues as Risks

Issues are events that have 100% probability of occurring, or have occurred already and require resolution. As such, these are not preventable risk events but rather issues that should be addressed. Identifying issues as risks may distract the project managers and prevent them from focusing on the adverse impacts that are truly preventable.

#### (d) Business-as-Usual Risks

Events that will be addressed in the normal course of conducting work are termed Business-as-Usual items. These are items that have a process, plan or organization in place to address them, but the concern is that the execution may be "less than adequate". Examples of poor use of Business-as-Usual risks include:

- "Project Managers may not meet milestones".
- "Oversight plan may not provide complete details to provide guidance for oversight."

In general, in order to be a risk there has to be impact to the objectives of the project plan. Business as usual items may truly present a risk to the project but the cause and the impact must be clearly identified in the risk description in order to be effectively managed.

#### (e) Vague or Misleading Risk Titles and Risk Descriptions

Risk titles that are vague or misleading may result in response plans that do not address the real risk that the project is facing.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>13 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

#### 4.1.2.2 Risk Titles

Risk titles describe the event and the context of the event.

**“There is a risk of insufficient welders available <event> to support Execution <context>”**

#### 4.1.2.3 Risk Descriptions

Risk descriptions should be comprised of the risk **event**, the **cause** of the event, and the **impact** of the event on project objectives. The absence of any one of these critical items would preclude the item from being added to the risk register due to the inability to define a proper risk treatment.

**“There is a risk of insufficient welders available <event> to support Execution due to competition with other large industrial projects in the province <cause>, resulting in a delay that will impact the critical path by 30 days <impact>”.**

#### 4.1.2.4 Opportunities

An opportunity is an event that, if it is implemented or occurs, increases the likelihood of achieving project objectives. An opportunity must demonstrate a clear benefit to achieving a project objective *in sufficient magnitude to offset the risk presented by changing course*. Opportunities identified in the SharePoint log “Opportunities Inbox” will be reviewed periodically by the PMO risk department and reported in the Risk Oversight Committee meetings for further consideration. In all instances where opportunities are identified as valid, they are to be pursued with focus (i.e. exploited to the extent possible).

### 4.1.3 Risk Assessment

#### 4.1.3.1 Risk Register

A project risk register is a living repository of risks and is the project manager’s tool for identifying, assessing, monitoring, and updating project and program risks. The RMO tool contains the risk registers for all nuclear Projects – it is the working tool and also provides storage and backup of all risks and the associated logs. Risks included in the risk register should include **all project life cycle risks** that can be properly defined, without speculation, bias, or other such features identified in section 4.2.1.

#### 4.1.3.2 Qualitative Scoring of Risks

Qualitative risk scores assist those inside and outside project team in quickly determining the biggest risks to the project. A “heat map” scoring approach is taken based on the probability of occurrence, schedule impact and financial impact of a risk (refer to Figure 2). After the probability, financial impact and schedule impact scores are determined the risk score is calculated by multiplying the probability score with the financial or schedule score, whichever is highest. The heat map scoring is standard for probability and schedule impact, but scaled to four categories for cost assessment criteria based on magnitude of the project and financial impact of the risk. This scaled

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>14 of 35</b>

Title:

**NUCLEAR PROJECTS RISK MANAGEMENT**

approach allows all project managers to qualitatively assess and prioritize risks to their project, with the understanding that a high risk to a \$500K project is not as impactful as high risk to a \$100M refurbishment project that has the same score.

Impact Score	5	5	10	15	20	25
	4	4	8	12	16	20
	3	3	6	9	12	15
	2	2	4	6	8	10
	1	1	2	3	4	5
RED = Major Risks YELLOW=Significant Risks GREEN = Minor Risks		1	2	3	4	5
		Probability Score				

**Figure 2: Generic Heat Map identifying the potential qualitative risk scores for Nuclear Projects**

Refer to Appendix D for the risk assessment criteria/scale and guidelines for how to use the heat map.

#### 4.1.3.3 Urgency

Urgency is another qualitative risk measure that assists project managers in prioritization. In the RMO, an urgency score shall be applied for each risk. The measure of urgency for risks in Nuclear Projects is as defined below:

Urgency Score	Approximate Timeline for risk response	Urgency Assessment Criteria
1	> 1yr	Risk treatment activities complete or risk not required to be addressed for the foreseeable future
2	6 months – 1 yr	Risk can be addressed in the long term and risk treatment will still be effective
3	1-6 months	Risk should be addressed in the midterm for risk treatment to be effective
4	Within 1 month	Risk must be addressed immediately for the risk treatment to be effective

#### 4.1.3.4 Quantitative Risk Analysis

Quantitative risk analysis is the process of assigning a dollar value to the effect of identified risks on overall project objectives. Quantitative risk analysis is performed on risks that have a significant qualitative residual risk score and require contingency funding. Not all risks qualitatively scored and managed per this process will require contingency (refer to Section 5.1 for guidelines). Wherever possible, the estimating

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>15 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

group should be engaged in supporting the determination of the cost impact of a risk to the project plan. If the quantification of risk exceeds the cost benefit argument for the project, the viability of the project should be revalidated.

### 4.1.4 Risk Treatment

Risk treatment requires effort to develop a plan to minimize the risk and implement response actions where appropriate. All risks in the risk register should have one of the following risk responses:

- **Avoid** – Obtain information to better define the risk source, eliminating the risk entirely. In this case the residual risk score should be reduced compared to the current risk score to reflect the level of confidence in the ability to avoid this risk.
- **Transfer** – Shifting some or all negative impacts of a threat to a third party (e.g. to a contractor via contract terms and conditions). If this response is chosen, the risk owner is still accountable to manage this risk on an ongoing basis. In this case the residual risk score should be less than the current risk score due to the consequence of the risk being transferred to a third party.
- **Mitigate** – Take actions to reduce the probability and/or impact of an adverse risk event to be within acceptable limits. In this case the residual risk score should be less than the current risk score due to mitigation actions being taken.
- **Accept** – Take no action and accept the possibility that the risk could occur. In this case the residual risk should reflect the current risk score, because nothing is being done to reduce the risk. Accepting risk may result in significant cost impacts, as such the risk owner is required to gain the endorsement of the responsible project director prior to selecting this response.
- **Monitor** – Periodically assess the risk through the normal course of project execution until, a) clear mitigating actions are identified, or b) a more appropriate risk response is identified. In this case the residual risk should reflect the current risk score, because nothing is actively being done to reduce the risk.

An informal cost-benefit analysis may be performed to evaluate the appropriate of the risk response. For example, if the cost to mitigate the risk is greater than accepting the probability and the impact of the risk “as-is”, then the risk response should be “Accept” and not “Mitigate”.

#### 4.1.4.1 Evaluating the Effectiveness of Risk Responses

All risks in the risk register should have three risk scores:

- Pre-Response Risk Score** – the score assuming that the risk will be accepted. This is a one-time assessment at the “point of discovery” of the risk.
- Post-Response Risk Score** – the score of the residual risk assuming the risk response is completed successfully. This score is subjective and based on the confidence level of the risk owner in the effectiveness of their risk response. This post response score is a gauge of how manageable the risk owner believes the risk is.

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>16 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

- (c) **Current Risk Score** – the score reflecting the current status of the risk. This is the primary measure of risk exposure for the purpose of planning and risk metrics/response analysis.

## 4.2 Risk Monitoring and Control

### 4.2.1 Risk Reviews

The risk owner identified in the RMO tool has complete accountability for the content of their risks in the tool and for the implementation regular reviews of these risks. This is true even if they have delegated their authority to update or manage the risk to others. Each risk owner shall perform, at minimum, monthly risk reviews to:

- Ensure risk responses are optimal based on the latest information;
- Ensure mitigation actions are on track and status the actions in the actions log in the RMO tool and initiate new actions were warranted;
- Determine if the assumptions related to the risks are still valid and update in the Assumptions log in the RMO tool, if applicable;
- Determine if the risk characteristics have changed;
- Determine if new risks should be identified;
- Determine if risk has been realized or has expired and can be closed in the RMO Tool (with justification).
- Assess, modify and validate the risk score and any other applicable fields (such as owner, comments, etc.) in the risk register as required.

### 4.2.2 Risk Reporting

Risk reporting is performed in line with monthly or quarterly reporting cycles. The content of risk reports can be taken directly from the RMO Tool using the Business Intelligence (BI) report engine. For senior management and external stakeholder reporting, the PMO risk department may make the the risk wording in the RMO tool more concise to align with the level of detail required in the specific reporting vehicle.

Examples of reporting vehicles for risk include:

- Risk Dashboard
- Key Risk Area Summary Report
- Program Reports
- Quad Charts
- NOC ( Nuclear Oversight Committee) Reports
- Quarterly ERM (Enterprise Risk Management) Reports
- User Reports (“boxed” reports) from BI

## Manual

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>17 of 35</b>

Title:

## NUCLEAR PROJECTS RISK MANAGEMENT

### 4.2.3 Risk Metrics

In order to assess the effectiveness RM in Nuclear Projects, the PMO risk department will prepare metrics. The Risk Dashboard will contain the primary metrics that will identify trends and allow comparisons of risk across the projects, functions, and Nuclear Projects as a whole. As risk management is a qualitative measure, with no focus on achieving a quantitative “target”, metrics prepared shall be geared towards process compliance only. As the risk management practice in Nuclear Projects evolves and matures, additional metrics may be introduced.

### 4.2.4 Key Risk Areas

Key Risk Areas are used to group risks from different projects which may impact major, overarching Nuclear Projects objectives. Each Key Risk Area is assigned a senior management sponsor who is responsible for providing oversight of the Key Risk Area to ensure that it is effectively being managed as a whole. Key Risk Areas are intended to provide a cross-cutting look at high level risk areas which need increased visibility and attention within Nuclear Projects. It is important to note that not all risks in the RMO Tool need to be categorized under a Key Risk Area.

The Sponsor of a Key Risk Area is required to champion the risk management process to ensure that, as an aggregate, the Key Risk Area is being addressed **efficiently** and **effectively** in order to minimize impact on NR objectives. It is expected that the Key Risk Area Sponsor is:

- **Knowledgeable of** and **able to communicate** the general “health” and status of the Key Risk Area at the R-ROC and in other major communication vehicles, as required.
- **Proactive in initiating change in their Key Risk Area** to improve the efficiency and effectiveness of the NR response.
- **Available to provide the strategy/rationale** for the requested change to the individual risk owners, when required.
- **Rigorous in follow up** to ensure sponsor directives have been implemented.

## 5.0 RISK MANAGEMENT OUPUTS

Effectively managing the outcomes of realized risks is critical to recovering project objectives. Ineffectively managing realized risks can create a snowball effect where distractions result in loss of focus on the remaining risks leading to their eventual impact on the project.

### 5.1 Contingency

Contingency is a tool to manage uncertainty and risk throughout the life of a project. The contingency reserve should be proportional to the project size, duration, complexity, risk exposure and tolerance, prior experience with the work, and

Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

confidence levels set by management. ***Contingency is not a tool to compensate for an underdeveloped project plan.***

Contingency covers the *known unknowns* in a project. Specifically, these are the uncertainties associated with a schedule and cost estimate, as well as the discrete risk events that impact the objectives defined by these fundamental products. Any contingency development exercise requires a high quality, vetted estimate and schedule. Without a high quality project plan, one cannot effectively identify risks or the level of uncertainty. Without a high quality risk register and well understood uncertainty profile, one cannot effectively calculate an appropriate contingency estimate. It is the expectation that the project plan presented for contingency analysis is reasonable and achievable and endorsed by necessary stakeholders during its development.

The PMO risk department will work with the project managers to develop an appropriate project contingency estimate. Contingency should be calculated in advance of submitting the funding approval package to the approving board/committee but after the development of the cost and schedule estimate. Once approved, ongoing contingency adequacy reviews should be performed through the PMO risk department in line with Section 5.1.5.

Management Reserve (MR) is an amount of the project's calculated contingency withheld for management control purposes.

### 5.1.1 Discrete Risks

Risk events have cost, schedule, quality, or safety impacts, all of which can be characterized into potential financial consequences.

The cost score should indicate the direct cost impacts resulting from the realization of the risk exclusive of time dependent costs. Using three point estimates to establish ranges of possible outcomes for risks, the impact of the discrete risks can be modelled in a Monte Carlo simulation to estimate the amount of contingency required to address these specific events.

The schedule score identified on the risk register indicates the impact to a project's critical path, usually expressed in "days" and easily translated to dollars based on burn rates. This approach to schedule contingency (i.e. burn rate x days delay) is high level approach and is less precise than range analysis on a CPM schedule, which is the preferred method. This approach uses a Monte Carlo methodology and assigns three point estimates to critical path project activities considering the risks identified.

### 5.1.2 Cost Estimate Uncertainty

Cost estimate uncertainty is a function of estimate class and is an implicit risk to project objectives. For example, a point estimate built upon conceptual design information is only assumed accurate within a very broad range and may have many potential outcomes. Uncertainty in estimates is expected to decrease over time as the project definition improves and the project matures. Appendix E Table 1 identifies the ranges of uncertainty associated with estimate class definition as defined by AACE.

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

The determination of the size of the contingency fund must take into the account the estimate accuracy and project phase.

Cost growth areas typically covered by estimating uncertainty contingency are more general than those covered by discrete risks, and include items such as:

- Minor errors in omissions in the estimating process (e.g. precise quantity is only known during execution)
- Variability of productivity (e.g. estimating based on execution in the summer, but actually executed in the winter)
- Variability in wages (e.g. labour agreements expiring during execution)
- Variability in prices (e.g. material prices assumed)

Effort must be made to ensure the factors covered by cost estimating uncertainty are not duplicated in the project risk register. Using three point estimates, the impact of the cost estimate uncertainty can be modelled in a Monte Carlo simulation to estimate the amount of contingency required to address these events.

Estimate uncertainty does not capture variability in scope.

#### 5.1.3 Risk Tolerance and Confidence Levels

Risk tolerance is the degree, amount, or volume of risk that an organization is willing to accept. Nuclear Projects risk tolerance is informed by a number of contributors including the experience and instinct of the project management team, past performance of similar projects, and stochastic methods.

In stochastic risk analysis, it is often expressed in a percentage value called a confidence level. For example, a P50 value on a Monte Carlo contingency estimate means that a project manager can be 50% confident that the contingency allocated is sufficient to address the risks and uncertainties defined for the project.

In managing a portfolio or program of projects, the concept of confidence levels can be useful in managing contingency funds. For example, for a given project's contingency analysis, the following structure could be employed to support the approval authority of contingency funding. This is for illustrative purposes and may be applied differently for different funding streams and risk tolerances within the Nuclear Projects organization.

Contingency \$ at Confidence Level	Up to P50 (Current Phase Risks and Uncertainties)	Up to P50 (Future Phase Risks and Uncertainties)	P50 → P70 (All Risks and Uncertainties)	P70 → P90 (All Risks and Uncertainties)
Treatment Upon Project Approval to Proceed	Released to Project	Allocated to Project but not Released	Allocated to Project but not Released to	Allocated to Management Reserves

### 5.1.4 Probabilistic Analysis of Uncertainties

Monte Carlo simulation is a form of probabilistic analysis. It is a method to predict the impact of defined risks and uncertainties using project simulations. Gathering the three point estimates required for the Monte Carlo method can be quick and simple or rigorous, and should be commensurate to the overall magnitude or cost of the project. For example, small projects can use the projects manager's judgment for inputs but large projects should be done with rigor and inputs from knowledgeable personnel. Poor quality inputs to the Monte Carlo (including choosing a misrepresentative probability distribution, or omissions of key risks) will produce misleading results – "garbage in, garbage out".

The PMO risk department will perform the Monte Carlo analysis for risk and uncertainty inputs defined by the project manager. All contingency requests in support of funding approval packages are required to have a supporting Monte Carlo analysis, unless an exception is approved by the Director of the executing Nuclear Projects organization.

The general steps to executing the Monte Carlo contingency analysis are as follows. The PMO risk department can help provide direction and guidance to project teams where required:

- Confirm the basis of analysis. The project scope, schedule, and estimate should be well defined/finalized with minimal anticipated changes.
- Conduct risk screening to determine which risks are warranted to have contingency allocated against them. Not all risks are suitable for contingency allocation. Appendix E Table 2 provides a guideline on how risk screening should be conducted.
- Gather inputs for probabilistic analysis. This involves obtaining three point estimates (Most Likely, Optimistic, and Pessimistic) for residual risk impacts, cost uncertainty, and the logic tied critical path schedule activities.
- Run Monte Carlo simulations using software and analyze the results. Results will be presented as S-Curves or in other tabular forms/reports generated from the Monte Carlo tool.
- Determine the size of contingency required for the determined level of confidence.
- Reassess the inputs if required based on the outcome of the analysis and iterate steps (a) through (e).

Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 5.1.5 Monte Carlo Analysis - Limitations

Monte Carlo project predicts the impact of the identified risks and uncertainties by running simulations to identify the possible outcomes of the project. This technique helps in forecasting the likely outcome of a project, thereby helping decision makers and project managers in make informed decisions.

***Monte Carlo contingency analysis is not intelligent. It will not compensate for omissions or errors in the risk registers or estimates that are submitted for analysis. The output of a Monte Carlo considers only those risks and uncertainties the project manager has identified as an input to the process.***

### 5.1.6 Contingency Adequacy Review

The owner of contingent funds should re-evaluate the amount of contingent funds required as the project progresses. Contingency funds defined in funding approval packages are “point-in-time” estimates that reflect the project risk profile in that instance. As the project progresses, risks will be retired and new risks will emerge. It is critical that the contingency estimate is updated to reflect this and maximize the organization’s flexibility in managing these funds.

Contingency reviews should be conducted at the following checkpoints:

- (a) Gate submission, including gate refreshes; BCS submission or superseding BCS submission
- (b) Upon initiation of the project change control process;
- (c) Release planning;
- (d) Risk realization, especially a risk with high demands for funds;
- (e) Unexpected event requiring high demands for funds;
- (f) Significant change in the risk register;
- (g) Significant deviation from the planned usage of contingency
- (h) Alongside regular cost forecasting as defined by the PMO cost control department.

Note that the contingency adequacy review (or contingency assessment during normal forecasting activity) may reveal that there is too much contingency or not enough contingency allocated to the project. The project manager should return contingent funds that are no longer required via change control. If additional funds beyond what has been approved at the gate or release are required, then the function manager or project manager should request additional funds via change control process.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>22 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 5.1.7 Refurbishment Contingency Development

All projects being executed within the Nuclear Projects organization, including refurbishment projects, are required to comply with this manual. However, for Nuclear Refurbishment, a white paper will prepared for each release period detailing how the contingency estimate is assembled. This white paper will be governed by this manual but will contain sufficient detail and additional considerations commensurate to the magnitude of the project.

### 5.2 Internal Lessons Learned

Internal lessons learned (ILL) are valuable because they ***provide real time, directly applicable experiences that other project managers can use when establishing their project plans***. ILL usually take the form of detailed reports prepared upon project completion as defined in the modifications process. While this is valuable the objective of the ILL process is to share lessons both large and small in an effective way with minimal administration. Management and documentation of ILL is conducted electronically in the RMO Lessons Learned library.

ILL entries can be generated by Nuclear Projects staff for the purposes of sharing non-confidential OPEX and Lessons Learned from their department, project, a specific task, pre-post job debriefings, oversight activity, benchmarking trips, meetings, human performance observations or any other source.

#### 5.2.1 Project Manager Direction

All project managers shall proactively document important lessons learned throughout the project life cycle to support improved project performance within the Nuclear Projects organization. Project managers will notify the PMO risk department to ensure lessons are documented and disseminated properly to increase awareness among the Nuclear Projects organization and improve management decision making.

#### PMO Role

The PMO Risk Department actively solicits real-time feedback on ILL throughout the organization, ensures accessibility to all members of the project and ensures standards, quality and completeness is accomplished. PMO Risk Department will provide simple templates for the project management team and prepare communication products (reports, emails, articles) for dissemination to the Nuclear Projects organization and its vendors.

### 5.3 Issues Resulting from Realized Risks

An issue is defined as ***a point or matter in question or in dispute***. For projects, issues that arise usually surface gaps that must be addressed in order to achieve project safety, quality cost, and schedule objectives. Project issues can occur when risks are realized, assumptions made during the development of the project plan are

## Manual

<b>RISK</b>	<b>R002</b>	<b>23 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

proven to be invalid, or as the result of project authorization to proceed at risk with an underdeveloped plan.

Issues ***are not the normal challenges encountered in the progression of project planning and execution.*** Similar to risks, issues generated from realized risks – as defined in this manual - must demonstrate the potential to impact approved project objectives.

#### 5.3.1 Project Manager Direction

Management of issues resulting from realized risks have one of two outcomes:

- A recovery plan is prepared and implemented with the target of achieving the approved plan, or
- The issue cannot be recovered and impacts the ability to execute the approved plan, resulting in a need to modify the plan (i.e. move milestones, increase costs beyond contingency).

When an issue of this type arises a Station Condition Record (SCR) shall be raised to document the issue as an adverse condition. In most cases this SCR will be trended D4 and closed out to recovery actions input to the RMO action log or to the change control process, as appropriate, wherein the issue will be managed to closure. Any actions generated in the RMO action log associated with an issue of this type shall reference the SCR. As defined by the requirements of the SCR process, and depending on the severity of the issue, actions inside the SCR process may be required. In this scenario, the actions do not need to be duplicated in the RMO actions log.

The project manager, depending on the severity and possibility of repeat occurrence, shall work with the PMO risk department to generate an internal lesson learned for distribution by the PMO.

#### 5.4 Actions

Project actions not included in an existing managed system (project schedule, business plan, action tracking, etc.) will be documented and managed in the RMO action log. This action log can take the place of Microsoft excel or word files that project managers may be using to track actions.

Nuclear Projects action sources should be diverse and comprehensive and may include, but are not limited to, meeting actions, audit response actions, actions to mitigate risks, actions to validate assumptions, actions arising from assumptions, decisions, issues, oversight, OPEX and lessons learned implementation actions. Actions that are part of the normal course of executing project work such as day to day individual accountabilities and “business as usual” actions should not be included in the log.

### 5.4.1 Reporting

User reports can be generated by anyone at any point in time. These online business intelligence (BI) reports may be communicated from time to time in meetings or other forums. PMO risk department will administer these reports and facilitate project team access to them, in real time. Change to reports will occur from time to time as required.

## 6.0 ROLES AND ACCOUNTABILITIES

### 6.1.1 Senior Vice President and Vice Presidents in Nuclear Projects

Champion the risk management process in Nuclear Projects.

### 6.1.2 Project Managers and Directors

Apply this manual to all projects being executed by the Nuclear Projects organization.

### 6.1.3 Project Team

Support project managers and directors through application of this manual.

### 6.1.4 PMO Risk Department

Support project team members in the application of this manual and the RMO tool. Maintain this manual and provide guidance, training, and support to project teams. Support Nuclear Projects executives by providing oversight and reporting of the risk management program in Nuclear Projects.

## NUCLEAR PROJECTS RISK MANAGEMENT

### Appendix F: Outputs of the Monte Carlo Method

Several standard outputs are available to provide project managers with insights to cost, and even schedule predictability in their projects. These graphical representations of results allows for robust means of communicating risk, and provides additional data to support decision making and identify the possible outcome of decisions.

Figures F-1 and F-2 are graphs depicting the results of a Monte Carlo simulation defining the probability distribution of cost and schedule outcomes based on input assumptions. This type of information is useful for understanding the expected cost/duration and the range/dispersion of the projected cost and durations.

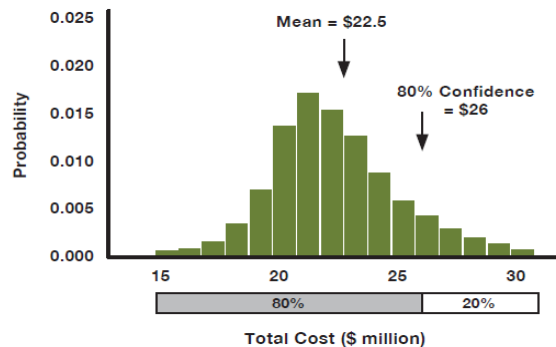

Figure F-1: Sample Probability Mass Function on Project Costs

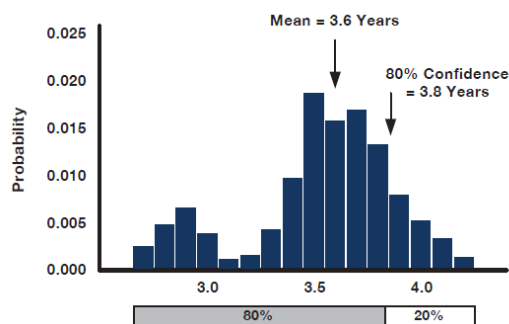

Figure F-2: Sample Probability Mass Function on Schedule Duration

### Confidence in Cost or Schedule

The cumulative probability functions shown in Figure F-3 provide the same information shown in Figure F-1, but in a cumulative manner. The cumulative functions provide a quick reference for the mean (P50) and a confidence level in the estimate or schedule.

**Identification of Risks with the Greatest Impact**

Sensitivity analysis is a primary modelling output that can be used in the valuation of the impacts of individual risks. Figure F-4 Sample Sensitivity Analysis on Project Risks provides a sensitivity analysis in the form of a “tornado diagram”. Tornado diagrams depict the influence of individual risks and highlight the greater contributors to the overall risk. Using this information, project managers or function managers can spend more effort on mitigating the risks that has the higher impact on the success of the project/function.

Appendix G: Risk Management Process

# Refurbishment Readiness for Execution

Roy Martin  
April 26, 2016

## BEHAVIOURS

- Say It, Do It
- Simplify It
- Think Top and Bottom Line
- 
- 

VALUES ▪ SAFETY ▪ INTEGRITY ▪ EXCELLENCE ▪ PEOPLE & CITIZENSHIP ▪

## Refurbishment Ready for Execution

- Completion of the Definition Phase
  - RQE delivery
  - Execution Organization implementation
  
- Readiness to Execute Plan
  - Preparing of Processes for testing
  - Implementation of the RTE Test period work
  - Table-Top exercises for the balance of Processes
  - Lessons Learned implementation and Process Adjustment
  - Change Management throughout

## Readiness to Execute Plan Periods

### ■ Plan Periods

- Lead-up Period (Complete)
  - Develop the test plans for the Test Period, and define 'table top' exercises to test those plans, processes and activities that can't be directly tested during the implementation of the Test modifications
- Pre-test Period (Complete)
  - Refine work programs and 'proxies' for the test period, conduct challenge meetings and indoctrinate the Execution team on the RTE purpose
  - Preparation for the for the RTE field work
- Test Period (February 2016 – mid-June 2016)
  - Execute the planned field work activities and 'table-top' exercises
  - Develop the basis of information for conducting extensive lessons learned reviews focused improvements and corrections to training, work processes, team dynamics and worker and team behaviours
- Implementation of Lessons Learned (June 2016 – October 2016)
  - Make the identified changes based on vetted results from the Test Period
  - Conduct change management to ensure that all part of the integrated execution are practicing the changes in their work

## Readiness to Execute Plan Periods

### ■ Plan Periods

- Lead-up Period (Complete)
  - Develop the test plans for the Test Period, and define 'table top' exercises to test those plans, processes and activities that can't be directly tested during the implementation of the Test modifications
- Pre-test Period (Complete)
  - Refine work programs and 'proxies' for the test period, conduct challenge meetings and indoctrinate the Execution team on the RTE purpose
  - Preparation for the for the RTE field work
- Test Period (February 2016 – mid-June 2016)
  - Execute the planned field work activities and 'table-top' exercises
  - Develop the basis of information for conducting extensive lessons learned reviews focused improvements and corrections to training, work processes, team dynamics and worker and team behaviours
- Implementation of Lessons Learned (June 2016 – October 2016)
  - Make the identified changes based on vetted results from the Test Period
  - Conduct change management to ensure that all part of the integrated execution are practicing the changes in their work

## RTE Example Review

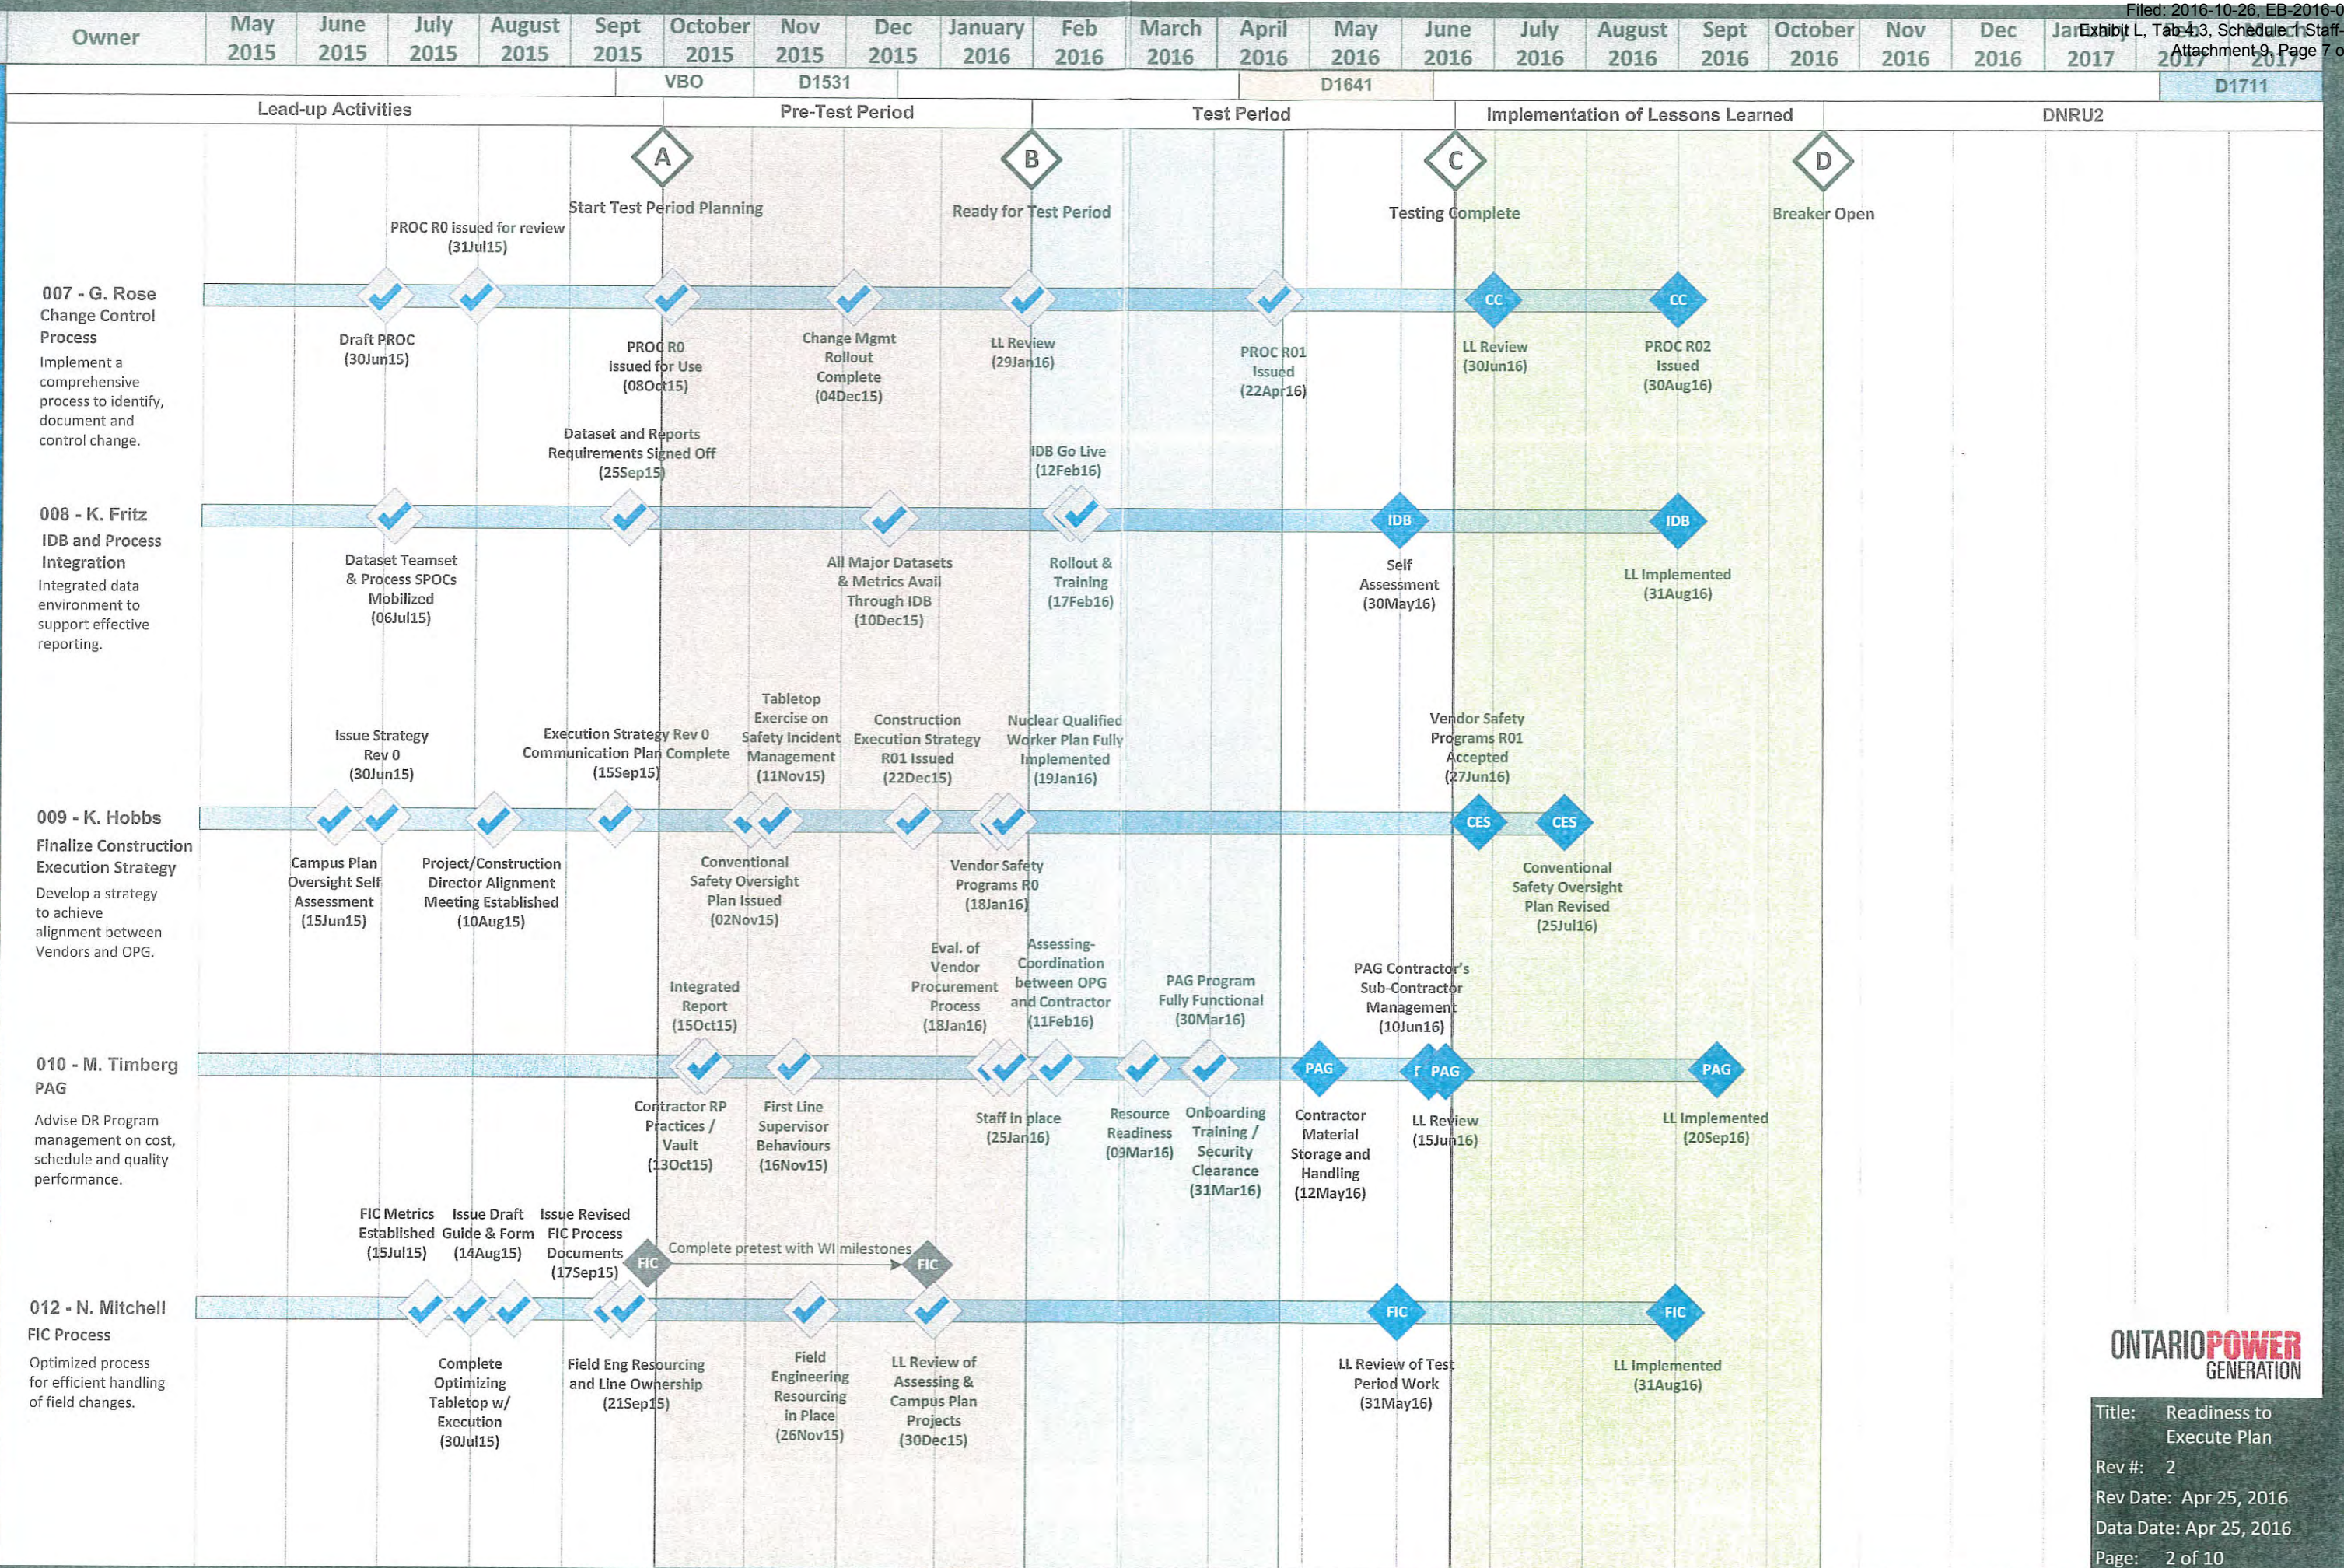

- Distribute RTE Package and Review examples

**Board Staff Interrogatory #74**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-11, Attachment 3, page 10

In her report, Dr. Galloway states that "[t]he Facilities and Infrastructure Projects (F&IP) and Safety Improvement Opportunities (SIO) were not necessarily completed per the initial planned schedule and estimate, however I did not find any fundamental issues that would impact the Program execution."

Please explain why OPG has such a high level of confidence in the forecasted schedule and budget for the remaining work in DRP when OPG was unable to complete the required preliminary work on budget and on schedule?

**Response**

Please refer to the answer to Ex. L-4.5-1 Staff-78, where OPG details the application of lessons learned from the Heavy Water Facility project to the other Darlington Refurbishment Program projects. Exhibit L-4.5-1 Staff-78 also explains that there are significant differences between the Darlington Refurbishment Program projects during the Execution Phase (which will primarily be completed on in-station components and equipment) and the Facility and Infrastructure Projects (F&IP) and Safety Improvement Opportunities (SIO), many of which were new construction, first-of-a-kind for OPG and the Darlington site, and involved excavations.

OPG also notes that, while some of the F&IP and SIO did go over budget and schedule, others were completed on schedule and budget.

**Board Staff Interrogatory #75**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-11, Attachment 3, page 53 Ref: Exh D2-1-3, Attachment 25, page 23 Ref: Exh D2-2-8, Attachment 1, page 7

Dr. Galloway in the first reference above, states that she found the Release Quality Estimate to be a Class 3, which according to the second reference above means that there is an expected accuracy range of -20% to +30%. The third reference states that OPG has determined the amount of contingency required to deliver the project, and produced a high confidence (P90) schedule.

Please reconcile a Class 3 estimate with P90, a 90% confidence that the contingency is appropriate and the schedule will be met.

**Response**

Please note that the range for a Class 3 Estimate referenced in Ex. D2-1-3, Attachment 25, p. 23 are the larger ends of the low and high Class 3 Estimate ranges. As shown in Ex. D2-2-8, Chart 1, p.3, the AACE expected accuracy ranges for a Class 3 Estimate are: Low -10% to -20%; High: +10% to +30%.

The Class of Estimate and the confidence level determined through detailed risk assessments and contingency development are not the same.

The Class of Estimate refers to the expected uncertainty range of the base cost estimate excluding contingency, and is determined by assessing the amount of work, particularly the level of project definition, which was completed in order to develop the estimate. It means that, over a large sample of projects which achieved a Class 3 estimate before execution, one would expect the actual costs of those projects to fall within a range of -10% to -20% to +10% to +30%. In OPG's case, the Release Quality Estimate (RQE) development process included completion of the detailed engineering, evaluations of actual durations to perform tasks on the reactor mock-up, detailed resource estimates, and many other factors which would support a conclusion that the RQE was at least to a Class 3 estimate quality.

OPG's contingency development process is explained in detail in Ex. D2-2-7. It includes the assessment of (1) cost estimate uncertainty, (2) schedule estimate uncertainty, and (3) discrete risks. It utilizes range estimates for projects within the major work bundles and

1 functional support costs, as well as range estimates for durations of critical path activities on  
2 the schedule. It also involves assessing the probabilities and consequences of discrete risks.  
3 These inputs are then processed through a Monte Carlo simulation which simulates the  
4 outcome of the project thousands of times and produces an output which informs  
5 management as to the level of contingency (both cost and schedule) which would be  
6 required to give a particular confidence level that the actual cost of the project would be  
7 expected to be below a certain value. This is the basis for OPG's determination that, with  
8 \$1.7B (2015\$) of contingency added to the base cost estimate, there is a 90% probability  
9 that the Darlington Refurbishment Program's actual costs would be below \$12.8B.

10  
11 Please note also that the \$1.7B (2015\$) in contingency represents approximately 20% of the  
12 going forward costs for the Darlington Refurbishment Program, and approximately 31% of  
13 the costs of the project bundles. Therefore, the contingency amount as a percentage of the  
14 Darlington Refurbishment Program costs is in the expected range for a program with a Class  
15 3 estimate.
