The Shutdown Layup/Services/RSF Project team is responsible for the preparation and implementation of the Project Oversight Plans. The Project team, with the support of Management Systems Oversight (“MSO”) and other functional support groups will maintain the Project Oversight Plan to identify oversight activities planned for the project and input Oversight Findings.

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>17 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

Project Oversight plans and findings are maintained by the project through the [RMO Tool](#).

Historical Project Oversight Plan Activities and Findings can be located through the SharePoint [Project Oversight Plan](#) and [Project Oversight Findings](#).

Project oversight of the Shutdown Layup/Services/RSF Project, regardless of contracting strategy, will be executed by the Shutdown Layup/Services/RSF Project team and Functional Support groups as per the following principles and methodology.

### 5.3.1 Oversight Principles

The following are the principles which will govern the implementation of oversight on all project contracts:

- Oversight is not an exercise in Vendors Quality Assurance (QA) management but a check that the prime contractor is following their own policies and procedures and OPG requirements / procedures if applicable.
- Feedback of findings identified to the contractor's Corrective Action (CA) and Continuous Improvement programs to mitigate risk of reoccurrence.
- Ensure the principles associated with the preparation, verification and approval of design documents follows best proven practices and the contractual procedural requirements per the EPC agreements. (See N-GUID-01920-10000, Guideline for Engineering Oversight)
- The higher degree of risk to the project or complexity of design, the potential greater oversight of the activities
- Feedback on oversight activities provide insight and input into the project risk profile / register.
- Appropriate escalation of identified issues can be addressed at the preliminary stages to mitigate risk to final product.
- Trust through verification.

### 5.3.2 Oversight Methodology

Given the above guiding principles, oversight activities will be separated into two areas of surveillance which will support the optimal use of OPG resources while providing adequate oversight to ensure the final deliverable meets the quality intent of the contracts. The two areas of surveillance are "Routine" and "Strategic". Any "In-Process" activities are driven by issued processes and procedures. Project oversight is intended to focus on the "Routine" and "Strategic" oversight implementation.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>18 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

### 5.3.2.1 Routine Oversight

Routine oversight is defined as planned recurring oversight activities undertaken as a part of the execution of the project. The driving factors for Routine oversight activities are as follows:

- Regular “face to face” progress meetings to review risks as well as schedule and cost performance
- Monitor project progression metrics
- Visit or reside in contractor’s offices and engage contractor staff in informal discussions on deliverables
- Cross-pollination of functional groups and project team members
- To help ensure that project risks are dealt with in a timely manner
- To assist in proactive resolution of issues

Formal observations from routine oversight may be documented in minutes of meeting, updates to the risk register and/or comments detailed in the Oversight Log in the RMO Tool.

### 5.3.2.2 Strategic Oversight

Strategic oversight is defined as planned oversight activities undertaken in response to risks identified in the risk register as well as to mitigate perceived risks arising from OPEX and routine oversight activities. The driving factors for strategic oversight activities are as follows:

- Risk mitigation for high project risks.
- To prevent repeat industry OPEX events that specifically pertain to the scope of work.
- To observe and review critical project steps and activities and ensure compliance to project and program requirements

Formal observations from strategic oversight may be documented in updates to the risk register and/or comments detailed in the RMO Oversight Findings.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>19 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

### 5.4 Contract Management

The Shutdown Layup/Services/RSF Project will be providing oversight on each EPC Contract in compliance with Contract Management Standard N-STD-AS-0029, to ensure that the terms and conditions of each contract are being followed.

#### 5.4.1 Contract Management Plans

The projects in Shutdown Layup/Services/RSF will have their respective contracts managed under N-PLAN-00150-10001, Extended Services Master Service Agreement: Contract Management Plan.

### 5.5 Engineering Design Management

Engineering Design Management in Darlington Refurbishment follows the modification process outlined in N-PROC-MP-0090. All modifications will have Modification Design Packages (MDP) and Scope of Work (SOW) prepared in advance under the OPG QA program.

Each Contractor working with the Shutdown Layup/Services/RSF Project will issue design plans for each modification in compliance with their respective Contractor \ Owner Interface Requirements (COIRs) and QA programs.

Engineering Earned Value will be implemented in accordance with N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management and required to be documented in each contractor's P6 schedule.

### 5.6 Project Gate Progression Plan

The OPG gated process, described in N-MAN-00120-10001-GRB, is a critical project process and requires integration with the EPC contractor's processes as various contractor inputs will be required for each gate. The gate progression strategy for the Shutdown Layup/Services/RSF Project must take into account the needs and timing associated with the EPC contracts. Additionally, it is important to forecast the required finances as accurately as possible.

Each Gate package will include financial forecasts up to the next planned gate. Overall project estimates will be refined further at each gate review. The details of the gate progression strategy are documented in Appendix A.

## 6.0 PROJECT SCOPE MANAGEMENT

Scope Management is conducted as per N-MAN-00120-10001-SCOPE-01, Nuclear Projects Scoping Process.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>20 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

### 6.1 Scope Definition

This PMP only covers the work to be performed during the applicable Gate release. It will be updated routinely and prior to each Gate to ensure it accurately reflects the work and proposed process for managing the work released.

Through NK38-INS-09701-10001, Darlington Nuclear Refurbishment Program-Scope Control, individual Darlington Scope Requests (DSRs), composed of core scope and non-score scope were assigned to the Shutdown Layup/Services/RSF to form the basis of project scope.

Appendix B contains a list of DSRs assigned to Shutdown Layup/Services/RSF. Appendix C contains a complete list of Shutdown Layup/Services/RSF DSRs and their associated groupings by sub-bundle, scopes of work and project numbers. Progression of these DSRs to completion will be executed as per the process defined in NK38-INS-09701-10001. Timelines for progression are as per the Shutdown Layup/Services/RSF Schedule.

#### 6.1.1 Work Breakdown Structure

The Shutdown Layup/Services/RSF Project Work Breakdown Structure has been prepared in accordance with N-MAN-00120-10001-SCH-05 and can be found in the P6 schedule.

#### 6.1.2 Scope Control

The SDLU/Services/RSF project scope is evolving throughout the Definition Phase through the preliminary and detailed engineering process within the realms defined in the Modification Design Requirements (MDRs).

The project scope presented in this PMP has undergone challenges via internal project reviews, cost benefit reviews, the Blue Ribbon scope review, Options Review board reviews and Gate Review Board reviews. The project team will strive to challenge scope, quality, schedule and costs of each project to ensure that we are executing the right work efficiently and safely.

If there are any major scope changes from scope that was approved through the gate process, a gate refresh will be submitted. Minor scope changes will be handled using Change Control Forms per the Change Control Process outlined in N-MAN-00120-10001-PC.

Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

## 7.0 PROJECT SCHEDULE MANAGEMENT

Project schedule management is the process of defining, sequencing, and estimating resources and durations of the project activities which are integrated in the project schedule. It will require schedule development and monitoring to be integrated with OPG project and functional groups, EPC contractors and other contractors [e.g. Owner Support Service (OSS)] schedules.

Shutdown Layup/Services/RSF project schedule management will be performed in accordance with NK38-NR-PLAN-09701-10001 Sht: 0002, Darlington Refurbishment Planning And Controls Program Management Plan.

The scheduling development and process shall follow the Scheduling procedures under N-MAN-00120-10001-SCH.

### 7.1.1 Three-level schedule Overview

#### Level 1 - Management Summary Level

The level 1 schedule provides a high-level management summary of the project. It will represent all Units, Phases, Bundles, Program and key project milestones.

The level 1 schedule is a roll up of the Level 2 schedule.

The schedule is prepared by OPG as part of the initial planning phase of the project and updated to reflect the progression of planning, i.e. as projects are better defined, the Level 2 Schedule is updated.

#### Level 2 –Schedule

The Level 2 schedule is a roll-up of the Contractors detailed Level 3 schedule at the work package level. This covers the full scope of work by Phase, Unit, and Type of work and contains full Critical Path Method (CPM) logic. It is the schedule which will be used, at the Phase and Unit level, to track the overall schedule status of the Program.

#### Level 3 – Detailed Schedules

The level 3 detailed schedules will be prepared by the groups executing the work, including in-house OPG resources and EPC Contractors.

The schedule must be prepared in accordance with the Program's Work Breakdown Structure ("WBS") and coding guideline. This schedule contains the lowest level of detail required to manage and execute the work. It is structured in a way to allow summarizing of the activities at the work package level in order to roll up to the Level 2 schedule.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>22 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

The Level 3 will include the full scope of each vendor / contractor showing all interfaces with other contractors / OPG, and be resource loaded to the lowest level of the defined Work Breakdown Structure as applicable to the contract type.

After being captured as a baseline, the schedule will be regularly updated, providing the basis for status reporting, progress physical percent complete at the activity / Work Package Level, forecasting, and change management.

All vendor / contractor baseline schedules need to be approved by OPG to ensure program milestones, WBS and scheduling guidelines and coding are followed.

Schedule variances and mitigation plans will be analyzed from the Level 3 schedule.

Daily, Weekly and Monthly look-ahead reports will be generated from Level 3 schedule.

### 7.2 Schedule Change Control

Changes to the project scope will be managed through a formal Change Control process as per N-MAN-00120-10001-PC, and implemented at all levels of schedule.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>23 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

## 8.0 PROJECT COST MANAGEMENT

Project cost management is concerned with budgeting and controlling overall project costs. Cost estimates and cash flow forecasts will need to integrate OPG, EPC contracts and other contracts (i.e. OSS) costs in order to obtain overall cost inputs for the Shutdown Layup/Services/RSF Project.

### 8.1 OPG Cost Management

The Shutdown Layup/Services/RSF Project cost management and integration is governed by the Cost Procedures listed under N-MAN-00120-10001-PC and NK38-NR-PLAN-09701-10001 Sht 002, Darlington Refurbishment Planning And Controls Program Management Plan.

EPC contractor costs will be integrated with internal OPG Shutdown Layup/Services/RSF Project costs to provide a total estimated cost for the project. Costs associated with efforts of the OPG functional groups are not currently included at the project level (managed by the respective functional group). Costs for external contracts to prepare modification design requirements and conceptual design reports are included in the project cost estimates.

EPC contractor costs will be incorporated in the project cost management system and updated monthly based on the OPG Financial Reporting and Analytics (FRA) Cost Reports. Costs for work packages, organized by Work Breakdown Structure (WBS), are aligned to the Oncore load sheet provided by each EPC contractor. This allows the EPC contractor costs to be captured at the work package level as determined by the project.

### 8.2 EPC Contractor Change Management

The Shutdown Layup/Services/RSF Project schedule baselines and cashflows will reflect the EPC Contract values. Estimates requested at the gates will be updated (if required) via Change Control Forms once the purchase orders are issued and the actual values are known.

Shutdown Layup/Services/RSF Project work will follow the ESMSA process for cost management.

### 8.3 Cost Contingency

Project level Contingency funding may be identified within the Definition and Execution phases via the Gated Process. Contingency funding is based on known risks and the level of scope definition in the project. There is also Management Reserve funding which is set based on "unknown-unknowns" that could impact the viability of the project. The strategies for managing Contingency and Management Reserve are defined in N-MAN-00120-10001-RISK-04, Nuclear Refurbishment Risk Management and Contingency Development Guide.

## 9.0 PROJECT QUALITY MANAGEMENT

The overall OPG quality management process will apply to all work in the Shutdown Layup/Services/RSF Project; however, the particular QA requirements will be specified in each EPC Contract according to the nature of the work.

### 9.1 OPG Quality Management

The Quality Management of the Shutdown Layup/Services/RSF Project will be in compliance to:

- N-CHAR-AS-0002 - Nuclear Management System,
- N-PROG-AS-0001 - Managed Systems,
- N-PROG-AS-0007 - Project Management,
- N-STD-AS-0028 - Project Management Standard,
- N-STD-AS-0029 – Contract Management Standard,
- N-STD-AS-0030 – Project Oversight Standard,
- N-MAN-09701-10002 – Nuclear Project Oversight Guide
- N-PROC-MM-0010 – Establishing and Maintaining Ontario Power Generation Nuclear Approved Supplier list.

### 9.2 Quality Assurance

EPC Contractors shall perform the awarded scope of work under an OPG-approved quality assurance program. Compliance with applicable quality assurance requirements will not relieve the respective Contractors from any of their obligations or liabilities under the established agreement between OPG and the Contractors. The Contractors will be responsible for ensuring that their Sub-Contractors are working under the Contractor's quality assurance program or have implemented an appropriate quality assurance program acceptable to the Contractor and OPG.

#### 9.2.1 Quality Assurance Plan

Each contractor will be required to prepare a project Quality Assurance Plan that addresses the interface responsibilities with external organizations. All EPC quality assurance plans will address all applicable codes and standards including CSA Z299, CSA N286-05 and CSA N286.7 standards, as required, identifying what quality programs and procedures will be followed, including the contractor's and their sub-contractor's personnel responsibilities under the various quality programs. OPG will review and accept the contractor's project quality assurance plans.

Plan

<b>Internal Use Only</b>

Sheet Number:	Revision Number: <b>R002</b>	Page: <b>26 of 56</b>
<small>Title:</small> <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

## 9.2.2 Quality Control and Surveillance

During the different phases of project work, the project team, jointly with the functional groups will work to ensure that the quality of design, materials, and services provided and the quality of installation and commissioning work performed meet OPG standards, purchase order requirements, and are in compliance to applicable codes and standards.

In the instance of a quality system failure or a breakthrough event occurring for which the contractor is accountable; such adverse conditions will be documented per the contractor's QA Program and per N-PROC-RA-0022, Processing Station Condition Records. The contractor will be asked to initiate a Corrective Action as per their program for any identified quality issues. When there is a systemic failure of their implemented Quality System, a formal Non Conformance and Corrective Action Request process will be initiated by OPG Supply Chain Quality Services as per N-PROC-MM-0010, Establishing And Maintaining Ontario Power Generation Approved Suppliers List.

To ensure compliance to OPG requirements, the contractor interface will be controlled by the Contractor Owner Interface Requirement (COIR) document forming part of each agreement.

For internal quality issues the OPG Station Condition Record (SCR) and corrective action process will be followed.

The contractor will follow their own Quality Assurance Program as stated in ESMSA. As listed in the COIR, a Construction Quality Assurance Plan will be provided for each design package prepared by the ESMSA contractor.

## Plan

# SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN

## 10.0 PROJECT HUMAN RESOURCES MANAGEMENT

The Shutdown Layup/Services/RSF Project human resources management will be in accordance with NK38-NR-PLAN-09701-10001 Sht: 0016, Darlington Refurbishment Staffing Program Management Plan and NK38-NR-PLAN-09701-10001 Sht: 0019, Darlington Refurbishment - Training Program Management Plan.

## 10.1 OPG Human Resources Management

### 10.1.1 Team Resourcing

The Shutdown Layup/Services/RSF Project Organization is shown in Figure 4 below.

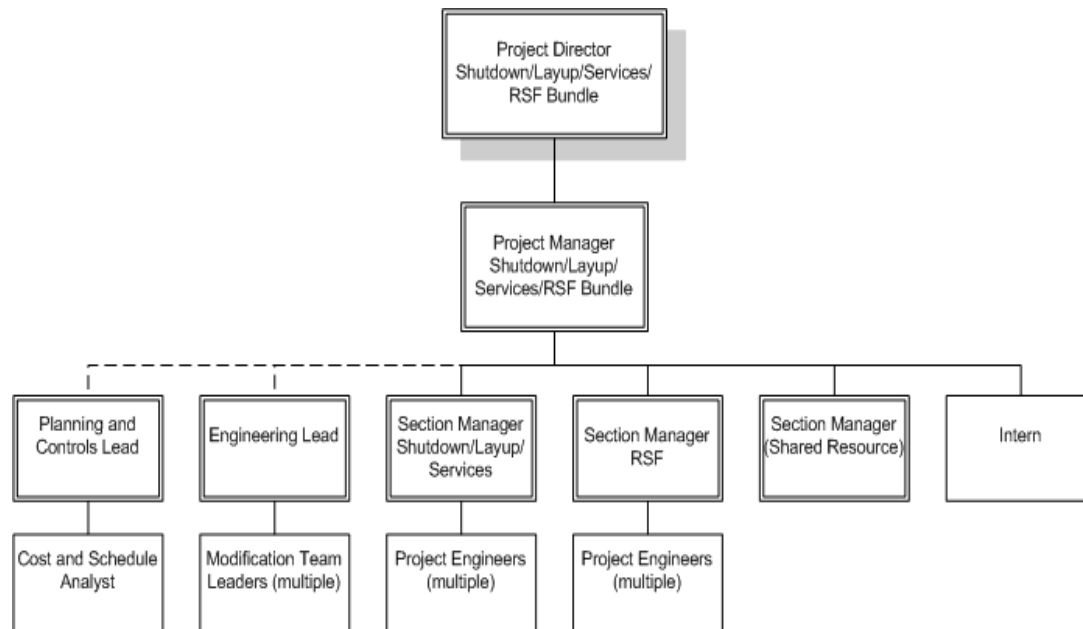

Figure 4 - Project Organization

Nuclear Refurbishment has elected to employ a Matrix organizational model to execute the Refurbishment Program. It is the intent of the Shutdown Layup/Services/RSF Project management team to staff the project team with OPG staff, and if required, supplement by augmented staff to meet the project schedule. OPG staff will either be embedded in the team or will be matrixed from the NR functional support organizations. Where NR functional support staff are currently unable to fulfill a specific need, due to unavailability or missing skill sets, the project will either utilize managed task or augmented staff contracts to maximize outside experience or attempt to find staff within other OPG business units.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>28 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

### 10.1.2 Team Development

Each team member will be qualified by their functional manager. As additional requirements are determined, the project manager will request training for team members. The Project Manager will periodically review the team qualifications against project needs to identify gaps in the training program. Training methods may include internal training, external training, and on-the-job training.

The project team will be assembled from experienced staff and junior staff to ensure that oversight of the EPC contractor is effective and to develop the junior personnel.

AIP, PPR, Monthly reports, SOWs and contract performance will be used to assess and develop the project team.

### 10.2 EPC Contractor Human Resources Management

The EPC contractor in the ESMSA for Shutdown Layup/Services/RSF projects will develop a Resource management plan for all staff and subcontractors in accordance with the ESMSA terms and conditions.

## 11.0 PROJECT COMMUNICATIONS MANAGEMENT

Shutdown Layup/Services/RSF Project communication management will be consistent across each project except if there are differences stipulated in each EPC contract. If major differences exist they will be documented in this plan.

### 11.1 OPG Communications Management

#### 11.1.1 Communication Protocol

##### Correspondence

All formal correspondence (official memorandums) shall be issued to OPG via the Vendor Document Management System (VenDM). Each memorandum must clearly indicate the intended recipient. OPG staff will route the correspondence accordingly, and ensure a record copy is kept on file.

Informal correspondence issued via email, can be sent directly to the appropriate project team member.

##### Requests for Information

Requests for information (RFI) originating from OPG and contractors must be issued in a manner that may be recorded, and therefore transmitted via VenDM.

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10238</b>		
Sheet Number:	Revision Number:	Page:
	<b>R002</b>	<b>29 of 56</b>

Title:

### **SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN**

Responses to RFIs through VenDM shall be managed as per contractual durations outlined in the contract / agreement documents.

RFI's originating from the EPC contractor will be addressed to the Project Manager or Engineering Lead, with cc's to other OPG project team members as applicable. Each RFI will contain related items.

OPG RDM staff will ensure the RFI is routed to the appropriate Project contact for action. OPG will return RFI responses via the VenDM as official memoranda.

#### **Meetings:**

Meetings should be conducted face-to-face with available teleconference and videoconference as required. Minutes of meeting should be documented, reviewed and distributed and actions tracked. Table 1 below tabulates the series of meetings planned for the management of the Shutdown Layup/Services/RSF Project.

Meeting Title	Description	Frequency
SDLU/Services/RSF Schedule Update meeting	Schedule status meeting	Weekly
SDLU/Services/RSF Project Team Meeting	Discussion on project progress, risks and status of major milestones	Bi-Weekly
Change Control Board	This includes the related Options Review Board, Technical Screening Committee and Funding Screening Committee meetings. Scope addition, removal, modification processing.	Bi-weekly or (or as required)
MRM Meeting	Review and processing of station condition records associated with SDLU/Services/RSF	Weekly
Darlington Refurbishment Monthly Program Status Meeting	Project Performance Updates, Issue resolution.	Monthly
Options Review Board	Presentation and review of options to execute/not execute scope.	Monthly (or as required)
PCC Meeting	Discussion of field readiness and execution update.	Daily
Project Risk Review Meeting	Alignment meeting	Bi-Weekly
DN Refurbishment/CNSC Meeting	Alignment meeting	Monthly (or as required)
Nuclear Refurbishment All Staff Face-to-Face Meeting	Project update	Quarterly
DN Refurbishment Execution Three-Stratum Meeting	Project Performance Updates, Issue resolution.	Quarterly (or as required)
Bundle Progress Review Meeting	Bundle Progress and Performance Updates	Weekly

**Table 1 - List of Planned Meetings**

#### 11.1.2 Stakeholder Inputs

Stakeholder inputs are gathered through the various meetings conducted by and with the project team. Actions, issues and risks are then tracked in the appropriate system as described N-MAN-00120-10001-RISK-07, Nuclear Refurbishment Actions Issues Decisions And Key Assumptions Management.

The major stakeholders for the SDLU/Services/RSF Project are listed below.

Identification	Main Expectations	Potential Influence & Phase of Most Influence	Stakeholder Classification
Darlington Nuclear Generating Station (DNGS)	Return of units 1-4 as per Refurbishment Program Charter	Owners of Plant Systems; Execution Phase	Internal
ESMSA Contractors	Coordination with OPG and other EPC Vendors as per ESMSA Agreement	Throughout the entire project	External
NR Function Groups: Engineering, Nuclear Safety, Ops, Maintenance, Rad Protection, Reg Affairs	Consultation, input required for review of deliverables	Required to perform oversight activities; Throughout the entire project	Internal
Darlington Engineering, Operations, Work Control and Maintenance Staff	Consultation when implementing modifications on the operating stations	Owners of the Plant Systems; Throughout the entire project	Internal
Darlington – Mechanical Design Group	Provide input on pressure testing requirements	Owners and operators of station pressure testing equipment. Key stakeholder in developing pressure test strategy	Internal
Government of Ontario	Performance of Program on Time, on Budget, within Scope, and without Safety Incidents	Major influence in making go, no-go decision for Execution Phase	External
OSS Contractors	Coordination with OPG as per OSS Contract	SME support and support on Technical Assessments; Definition Phase	External
Unions	Upholding of Collective Bargaining Agreements	Entire Project	External
Canadian Nuclear Safety Commission	Compliance with Regulations	Throughout the Project	External

# SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN

Identification	Main Expectations	Potential Influence & Phase of Most Influence	Stakeholder Classification
Technical Standards and Safety Authority (TSSA)	Compliance with Regulations	Throughout the Project	External
Municipality of Clarington	Compliance with Codes and By-laws	Throughout the Project	External
Ministry of Environment	Compliance with Regulations	Throughout the Project	External
Ministry of Labour	Compliance with Regulations	Throughout the Project	External
Electrical Safety Authority	Compliance with Regulations	Throughout the Project	External

## 11.2 EPC Contract Communication Management

It is expected that each EPC contractor will issue individual communication management plans as required by the Contract Terms and Conditions.

## 11.3 Performance Reporting

Performance reporting will be executed in accordance with NK38-NR-PLAN-09701-10001 Sht: 0002, Darlington Refurbishment Planning And Controls Program Management Plan.

Project cost and schedule performance will be gauged and monitored using the Earned Value Management technique in accordance with N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management.

## 12.0 PROJECT RISK MANAGEMENT

Risk Management for the Shutdown Layup/Services/RSF Project will require the integration of the Shutdown Layup/Services/RSF Project Risk Management process and the EPC contractor risk management processes.

### 12.1 OPG Risk Management

OPG Risk Management follows the procedures outlined in N-MAN-00120-10001-RISK OPG Risk Management Processes.

Risks in Shutdown Layup/Services/RSF are managed per the governance of OPG Risk Management. The [RMO Tool](#) is a program used to track risks during the entire life cycle of all projects. (Ref. Appendix D)

	<b>R002</b>	<b>32 of 56</b>

Title:

**SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT  
MANAGEMENT PLAN**

## 12.2 EPC Contractor Risk Management

EPC contractors will provide risk management plans as required in the Contract Terms and Conditions.

### 12.2.1 Risk Management Integration

EPC contractors will manage risks per their internal processes. Each EPC contractor may communicate risk to OPG through various methods which will be determined once the EPC contracts are awarded. If the identified EPC contractor risks will impact the Shutdown Layup/Services/RSF Project then those risks will also be added to the Shutdown Layup/Services/RSF project risk register. In general risk communication can take place via the following methods:

- Review risks as part of project communication meetings
- Regularly scheduled risk work shops
- Project reporting

## 13.0 PROJECT PROCUREMENT MANAGEMENT

For all OPG procurement activities, the processes as defined in OPG-PROC-0058, Procurement Activities will be followed.

The EPC contractor will be required to follow their internal Procurement Process, and develop specific procurement management plans for each project as required per the Contract Terms and Conditions and as detailed in N-COI-00120-00001 Contract Owner Interface Requirements.

### 13.1 OPG Procurement Management

Material to be procured by OPG to fulfill Shutdown Layup/Services/RSF scope will be procured using existing OPG processes and procedures.

### 13.2 EPC Contractor Procurement Management

Procurement terms and conditions between OPG and the ESMSA contractor are specified in the ESMSA Appendix 1,2,4,6,8.

## Appendix A: Shutdown Layup/Services/RSF Gate Progression Strategy Plan

### A.1.0 INTRODUCTION

The Gate Strategy outlined in this document meets the intent of N-MAN-00120-10001 “Nuclear Projects – Gated Process” and outlines the gating strategy to be used for the Shutdown Layup & Services Project (SDLU) and Refurbishment Support Facilities (RSF) Project (the “Bundle”) during Nuclear Refurbishment (NR). The tasks and milestones in this gated process will be incorporated into the Level 3 schedule and will be updated as they are clarified and confirmed.

The Bundle is split into 2 sub bundles consisting of a) Shutdown Layup and Services and b) Refurbishment Support Facilities (RSF). This plan will document the overall strategy to achieve and progress the 2 sub-bundles through each respective gate, the deliverables associated with each gate, and the anticipated timing of each gate. As each project is unique in scope, cost, and schedule, the gate strategy will be unique for each. As such, this document will identify the deliverables and requirements that will be either pulled ahead of each gate, pushed to future gates or condensing of gates based on the overall project strategy.

This plan was initially issued to support Gate 1. It is now being updated to reflect the revised Gate Strategy based on the most updated information and NR Program strategies.

The scope definition phase is now complete. The Bundle has completed preliminary engineering, detailed engineering and installation planning under the funding acquired under Gate 2, Gate 2X and Gate 2Y.

At Gate 3, each project’s estimate is refined based on the engineering deliverables completed to provide a Release Quality Estimate (RQE) and Unit 2 Execution Estimate.

### A.2.0 PROJECT FUNDING RELEASE APPROACH

#### A.2.1 Shutdown Layup and Services Program Roles and Responsibilities

- Project Manager
  - Develop/update gate progression strategy plan
  - Identify funding requirements & timing
  - Identify deliverables/activities to support successful completion to the next gate on the schedule
  - Monitor and drive completion of deliverables/activities to achieve gate completion, release of funding and continuance of the work
  - Oversight

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>38 of 56</b>
<b>Title:</b> <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

- Integration across project bundles
  - Support NR Program
- Director Planning & Controls
  - Review gate progression strategy plan for funding requirements and timing
  - Create Program release strategy that secures funding to meet project needs as identified in gate progression strategy
  - Release funding upon successful gate completion
  - Establish Gate Review Board and process
  - Implement Gate Review process, scheduling meetings as required
- Gate Review Board
  - Establish meetings, terms of reference and ensure quorum obtained
  - Review and approve project gate progression strategy plan
  - Monitor gate deliverables and upon successful completion, approve progression through gate
  - Authorize release of funding for next staged gate deliverables and work

### A.2.2 Timing of the Gates by Project/Sub Bundle

The 2 sub-bundles encompassing many systems will progress through their project lifecycles at different rates due to the nature of each sub bundle and the requirements identified by each project during the assessment period with the significant contractors. The Shutdown Layup sub-bundle was previously submitted as separate packages for Gate 1 in Sep 2013 and the Services sub bundle and Refurb Additional Facilities Project were submitted as a combined Gate 1 package in Nov 2013. A Gate 1A was approved in July 2014 for a portion of the total bundle scope. Gate 2 was submitted and approved in September 2014 for all scopes in both bundles.

Gate 2X for both sub-bundles was approved in July 2015. This released funding for Execution Mobilization activities for all SDLU & RSF Projects with class 3 estimates and level 3 schedules.

At Gate 2Y, funding requested for deliverables in the Execution Mobilization Phase to the start of Unit 2 Breaker Open was requested at the GRB for certain SDLU & RSF Projects. Deliverables included:

- Planning efforts (i.e. Comprehensive work packages completion, engineering completion)
- Procurement of Long Lead Materials for Unit 2

**Plan**

Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

At Gate 3, funding for all deliverables in the Execution Phase to the start of Unit 2 Breaker Open was requested at the GRB for SDLU & RSF Projects which had Class 3 estimate and Level 3 schedule. Deliverables include:

- Installation / Commissioning of pre-requisite work, where pre-requisite work is defined as a project with execution work starting prior to Unit 2 breaker open
- Mobilization/Training of Execution Staff

At Gate 3X, all remaining project funding (for projects which have cleared Gate 2Y) required for deliverables in the Execution Phase to the start of Unit 2 Breaker Open will be requested at the GRB. Deliverables include:

- Installation/Commissioning of pre-requisite work, where pre-requisite work is defined as a project with execution work starting prior to Unit 2 breaker open
- Mobilization/Training of Execution Staff

At Gate 3U2a, remaining funding for all remaining Unit 2 Deliverables will be requested.

Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

## Appendix D: SDLU/Services/RSF Risk Management Plan

The purpose of this Risk Management Plan (RMP) is to document how the SDLU/Services/RSF Project will manage Assumptions, Issues, Decisions, Risks, relevant Lessons Learned (LL) and OPEX for the Darlington Refurbishment Project. Assumptions, Risks and OPEX & LL will be managed in alignment with N-MAN-00120-10001-RISK and NK38-NR-PLAN-09701-10001 Sht: 0002, Darlington Refurbishment Planning And Controls Program Management Plan.

### D.1.0 RISKS

Risks are determined through brainstorm sessions, risk workshops, by individuals in the NR organization, subject matter experts (SME), by vendors and by reviewing relevant OPEX. Once a risk is identified it will be assessed systematically on its impact to the project. Risks can then be given a risk response action and will undergo an appropriate degree of monitoring including a monthly review.

### D.1.1 Roles and Responsibilities

#### SDLU/Services/RSF Project Manager

The SDLU/Services/RSF Project Manager (PM) will serve as the Risk Owner of all SDLU/Services/RSF Project Risks. The PM's responsibilities include:

- The overall project risk management and program risks delegated to the projects
- Ensuring that the Risk Management Plan is established and processes are followed within the project
- Ensuring mitigating actions are developed
- Ensuring that the SDLU/Services/RSF Risk Management Team is updating the risk database (RMO)
- Managing reports and records for project and program risks
- Ensuring that risk monitoring and mitigating actions are implemented into cost and schedule planning tools as well as applicable action tracking databases
- Ensuring that review of risks and actions resulting from risks are carried out, at an appropriate frequency, monthly at a minimum
- Developing the SDLU/Services/RSF Project's RMP

#### SDLU/Services/RSF Risk Management Team

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>52 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

The Risk Management Team will consist of members of the SDLU/Services/RSF project. They are responsible for:

- Project risk management within their assigned responsibility as delegated by the PM
- Identifying new risks
- Ensuring that risk monitoring and mitigating actions are implemented into cost and schedule planning tools as well as applicable action tracking databases
- Monthly review of risk assessment, scores, and mitigating actions within their assigned responsibility

### **SDLU/Services/RSF Risk Management SPOC**

The Risk Management SPOC is responsible for:

- Overall SDLU/Services/RSF Project risk management
- Coordinating with the Darlington Planning and Controls Risk Section and other Project SPOCs
- Monitoring the project's risk register (RMO)
- Identifying and entering new risks into the risk database (RMO)
- Conducting monthly review of risk assessment, scores and mitigating actions with risk owners

## **D.2.0 RISK CATEGORIES AND BREAKDOWN**

The SDLU/Services/RSF Project's risks are broken down and grouped into the SDLU/Services Sub-bundle or RSF sub-bundles. For risks that apply to both sub-bundles, the risks are duplicated in anticipation that the two sub-bundles will be conducting gate submission at different time intervals

### **D.2.1 Project Risk Management**

Project risks are risks that primarily affect one Project at Refurbishment. Other groups may have minor impact on the risk and are treated as secondary stakeholders for management of the risk. Risks identified at the project level will be entered into the project risk database (RMO) and managed per the guide N-MAN-00120-10001-RISK-04 Nuclear Refurbishment Risk Management & Contingency Development Guide.

### **D.2.2 Program Risk Management**

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>53 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

Program risks are risks that affect the entire Refurbishment Program as a whole or risks that go beyond the scope of any individual project. For more information on Program Risks please refer to the N-MAN-00120-10001-RISK guides.

### D.2.3 Issues from Risks

Issues can arise from risks that have been realized (Probability = 100 %). Issues and risks will be managed similarly in the RMO Tool. Any potential impacts from Issues to cost and schedule should already be planned for in the project, or documented in a CCF when a risk is realized. In the case that it is not accounted for in the project's cost and schedule (for example an ongoing risk that may occur multiple times, or may occur separately for multiple sub-bundles), then the issue will also be tracked as a risk so that contingency can be identified for the unresolved portion of the issue.

Issues will be treated as risks: they will have owners, actions to resolve them, and will be reviewed as required, be it monthly (or shorter if necessary).

### D.3.0 ASSUMPTIONS, ISSUES AND DECISIONS

Assumptions, Issues and Decisions are important to the Nuclear Refurbishment (NR) program and must be properly documented, reviewed and resolved as per N-MAN-00120-10001-RISK-07, Nuclear Refurbishment Actions Issues Decisions And Key Assumptions Management.

### D.3.1 Roles and Responsibilities

#### **SDLU/Services/RSF Project Manager**

The SDLU/Services/RSF Project Manager responsibilities include:

- Management of the overall Assumptions, Issues and Decisions for the project
- Approval of Assumptions, Issues and Decisions identified by the project
- Assigning required actions to members of the project team
- Ensuring the Assumptions, Issues and Decisions database is being updated
- Ensuring that ongoing review of assumptions, issues, decisions, and actions are carried out

#### **SDLU/Services/RSF Project Team**

The SDLU/Services/RSF Project Team is responsible for:

Plan

<b>Internal Use Only</b>

Sheet Number:	Revision Number: <b>R002</b>	Page: <b>54 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

- Identifying any Assumptions, Issues or Decisions that will affect the SDLU/Services/RSF Project, and the actions required to address / validate them, including required review frequency
- Review of project's Assumptions, Issues and Decisions in their respective databases

#### **SDLU/Services/RSF Assumptions, Issues and Decisions SPOC**

The SDLU/Services/RSF Assumptions, Issues and Decisions SPOC is responsible for:

- Entering Assumptions, Issues and Decisions into their respective databases
- Coordinating with the Darlington Planning and Controls Risk Section and other Project SPOCs
- Coordinating reviews of Assumptions, Issues and Decisions for updates within their respective databases

### **D.4.0 LESSONS LEARNED & OPEX**

This section will detail the use of Lessons Learned and OPEX (LL & OPEX) in the Nuclear Refurbishment Program, and how SDLU/Services/RSF will implement them into our project. Nuclear Refurbishment and the SDLU/Services/RSF project manage LL & OPEX as guided in N-MAN-00120-10001-RISK-06 Nuclear Refurbishment Processing Operating Experience And Key Lesson Learned.

#### **D.4.1 Roles and Responsibilities**

##### **SDLU/Services/RSF Project Manager**

The SDLU/Services/RSF Project Manager responsibilities include:

- Ensuring LL & OPEX are reviewed regularly by project team and accounted for in project cost and schedule
- Ensuring project plans account for LL & OPEX impacts to quality, cost and schedule
- Ensuring the Project LL & OPEX is captured and shared throughout the organization

##### **SDLU/Services/RSF Project Team**

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>55 of 56</b>
<b>Title:</b> <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

The SDLU/Services/RSF Team (referred as SME in N-MAN-00120-10001-RISK-06) is responsible for:

- Identifying any OPEX relevant to the project and sharing it with the project team
- Providing disposition on OPEX entries as requested by Project Manager, Project OPEX SPOC or NR OPEX SPOC

### **Project OPEX SPOC**

The SDLU/Services/RSF OPEX SPOC is responsible for:

- Reviewing new OPEX reports from Nuclear Refurbishment Program OPEX SPOC and forwarding to SDLU/Services/RSF Team members as appropriate
- Identifying new LL & OPEX and provide it to the appropriate groups
- Ensuring that any LL & OPEX are accounted for within Risk Management
- Reviewing SDLU/Services/RSF flagged LL & OPEX from outside the project and providing disposition notes

### **NR OPEX SPOC**

The NR OPEX Section is responsible for:

- Collecting internal and external LL & OPEX reports applicable to Nuclear Refurbishment
- Inclusion of LL & OPEX into Refurbishment OPEX Management Database
- Distributing relevant LL & OPEX to SPOCs monthly
- Managing the Refurbishment LL & OPEX Database
- Preparing and issuing quarterly LL & OPEX report

## **D.4.2 Lessons Learned and OPEX Management**

LL & OPEX discovered by individual SDLU/Services/RSF project team members will be distributed to the rest of the team as appropriate. LL & OPEX can be found from many different sources including other projects (e.g. Balance of Plant, Islanding, etc.), vendors, previous OPG projects (such as Pickering Nuclear Return to Service), other refurbishment projects outside of OPG (Bruce, Point Lepreau, etc), other mega-

Plan

<b>Internal Use Only</b>

<b>Title:</b> <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

projects (such as the London Olympics), etc. This is an on-going process and the SDLU/Services/RSF Project Team will ensure that OPEX identified by external sources will be collected in the appropriate databases.

#### **D.4.2.1 Integration of Lessons Learned and OPEX**

Once the relevant LL & OPEX has been identified, the Project OPEX SPOC working with the Project Team must determine necessary actions to avoid these issues. Following a review of LL & OPEX any potential Risks, Assumptions or Issues will be identified and documented in their respective database. The mitigating actions developed from the Risk, Assumption or Issue will be assigned to the project team members to ensure that project scope, schedule, cost, quality, nuclear safety and worker safety are all taken into consideration. The project team will share any discovered LL & OPEX with other projects and vendors working with the SDLU/Services/RSF project as necessary.

The Refurbishment OPEX Database can cross-reference RISK ID numbers to the relevant OPEX found from new risks. Similarly any new risks identified from OPEX will be registered into RMO with the corresponding OPEX ID Number. Similar cross-referencing should also be done for any related Assumptions, Issues and Decisions.

#### **D.4.3 Review of Lessons Learned & OPEX**

All LL & OPEX will be reviewed monthly. Older OPEX entries flagged to SDLU/Services/RSF with associated actions will be reviewed as required when the action has been completed.

## 1.0 INTRODUCTION

The Steam Generator (“**SG**”) project is one of the major projects under the Darlington Nuclear Refurbishment Program. This document covers the Project Management Plan (“**PMP**”) of the Nuclear Refurbishment (“**NR**”) SG Project.

Title:

**STEAM GENERATOR – PROJECT MANAGEMENT PLAN**

## 2.0 PROJECT DESCRIPTION

The SG Project is one of the major projects under the Darlington Nuclear Refurbishment Program. The SG Project scope of work has been generated from the SG Life Cycle Management Plan (“**LCMP**”) and the Component Condition Assessment (“**CCA**”) program undertaken by Ontario Power Generation (“**OPG**”) in order to identify elements of the SG and other Heat Exchangers which require inspection, maintenance and/or modifications in order to support the extension of Darlington’s operating life.

Life extension inspection, maintenance and modification to the SG equipment shall endorse the efficient operation of those components supporting the extension of the life of the station.

The SG Project is planned to be executed within the refurbishment window for each unit.

### 2.1 Project Objective

The objective of the SG Project is to complete the entire approved scope during the refurbishment outages: safely, on time and on budget.

### 2.2 Scope of Work

To meet the contracting objectives and project execution requirements, the targeted SG scope bundle is composed of major and minor elements. The Scope of Work (“**SOW**”) for the SG project has been broken down into separate documents detailing the different elements of the work required. These are discussed in more detail in Section 6.0 Scope Management.

#### 2.2.1 Base Scope

1. **Primary Side Cleaning (“PSC”)** – SG PSC is the mechanical cleaning of the inside of the SG primary side tubes to remove magnetite deposits. A presentation made to the OPG Executive Committee on April 14, 2009 recommended to continue pursuing PSC as a method of restoring Reactor Inlet Header Temperature (‘**RIHT**’), Primary Heat Transport Flow, and Neutron Over Power (‘**NOP**’) margin. This shall help extend the SGs End of Life until the end of the plants second life.
2. **Secondary Side Cleaning (Water lancing)** – Water lancing is a process for removing tube sheet deposits. The NR scope requires waterlancing of all 16 SGs with a combination of high pressure lancing and low pressure/annulus flushing with visual inspections.
3. **Access Port Installations** - The ports are required to allow additional incremental visual inspection of SG internals during refurbishment and post refurbishment. Moreover, the ports are also required to provide the ability to clean the upper support plates and pre-heater region through water lancing or

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>9 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

future chemical cleaning. Lastly, the ports shall also provide access for foreign material retrieval and remote inspection of U-bend region and upper supports.

4. **Inspection and Repair** - Inspection and Repair work is as per the LCMP. An augmented inspection and repair scope for refurbishment has been established.
5. **Divider Plate Inspections, Boiler Open/Close, and Inspection Support** - Primary Side Divider Plate Leakage Measurements using Acoustic Leakage Inspection System (“**ALIS**”) and/or equivalent shall be undertaken during the refurbishment outages to compare measurements conducted in previous outages. Boiler Open and Close shall be required in support of major SG work campaigns. Support shall be required for 4. *Inspection and Repair* (including holder of record, scaffolding, etc).
6. **SG Primary Side Lay-up work** –Lay-up work includes the design, procurement, installation, and removal of isolating bungs and temporary manway covers to support lay-up of primary side of SGs. After the completion of the primary side work, the boilers shall be required to be boxed up.
7. **Bleed Cooler Inspection and Bundle Replacement** - The Darlington bleed coolers have never been inspected due to insufficient recall time. In accordance with the NK38-REP-33320-10009, *Primary Heat Transport Pressure And Inventory Control - Bleed Cooler*, during the Unit 2 Refurbishment Outage, Eddy Current Testing (“**ET**”) (tube side) and Ultrasonic Testing (“**UT**”) wall thickness measurements (shell and nozzles) will be performed on 2-33320-HX2. Based on the results of ET, tube plugging may be required.

Depending on the severity of the degradation observed, the bleed cooler bundle may require replacement. If replacement is required, it shall be replaced by a Contractor during NR.

See Section 6.0, Scope Management, for a summary of the Darlington Scope Requests (“**DSR**”) that are being executed under the SG Project.

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 3.0 PROJECT MANAGEMENT APPROACH

The PMP describes how the SG Project shall develop, manage, and execute its scope of work. The PMP approach is based on OPG Governance, the Refurbishment Program (NK38-PLAN-09701-10067) processes, and the contract specific requirements detailed in the SG Engineering Procurement and Construction Agreement. The vendor specific PMP shall also be incorporated into the overall management of the SG project.

The SG PMP has been developed as per N-MAN-00120-10001-GRB, *Nuclear Projects - Gated Process* and NK38-PLAN-09701-10227, *Nuclear Refurbishment – Pre-Gate Readiness Review Alignment Meeting - Terms of Reference*.

### 3.1 Management Plans

The PMP integrates and consolidates all the subsidiary management components. These components are described further in detail in the subsequent sections and associated documents. The content of each management plan is subject to change as the project progresses.

The SG management plans are summarized in Table 1.

**Table 1 – SG Management Plan Summary**

Document Number	Sheet	Title
NK38-PLAN-09701-10164	0001	Steam Generator Project Management Plan
NK38-PLAN-09701-10164	0002	Steam Generator Schedule Management Plan
NK38-PLAN-09701-10164	0006	Steam Generator Engineering Management Plan
NK38-PLAN-09701-10164	0012	Steam Generator Safety Management Plan
NK38-PLAN-09701-10164	0013	Steam Generator Environmental Management Plan
NK38-PLAN-09701-10164	0015	Steam Generator Contract Management Plan

### 3.2 Project Integration Management

For each area of the project, a review has been conducted of the relevant OPG, Darlington Refurbishment, SG Project and Contractor Governance, Guidelines and Desktop Guides. Figure 1 shows the hierarchy and integration of this governance for the SG Project. For each sub-management plan, this integration diagram shall be presented to show the governance integration across all areas.

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 3.3 Contracting Strategy

The NR Program Commercial Strategy identified a need to establish separate contracting strategy for each of the major projects under the NR Program. This strategy is a revision of the first SG contracting strategy and incorporates the results of the Expression of Interest (“**EOI**”) process and confirms OPG's decision to continue with its sourcing approach to solicit and evaluate Request for Proposals (“**RFP**”) from selected contractors for the SG project.

The recommended contracting strategy is based on the business drivers and commercial principles set out in the NR Program Commercial Strategy and specific contracting considerations relevant to the SG Project. The Darlington Nuclear Generating Station SG refurbishment scope consists of the following scopes of work:

1. Primary Side Clean
2. Waterlancing, or Secondary Side Clean
3. Access Port Installation
4. SG Inspections and Maintenance
5. Divider Plate Leakage Measurements
6. Lay-up

The SG team examined a number of work packaging options. After an analysis which included evaluating advantages and disadvantages of each option, the SG team recommended pursuing a bundled approach for contracting purposes. A bundled approach for contracting purposes shall allow work to be efficiently scoped, planned, scheduled, and managed in accordance with the NR schedule; while at the same time maintain a single point of accountability with the awarded contractor.

The Engineering, Procurement and Construction (“**EPC**”) contract is the appropriate contracting model given the nature of the SG refurbishment work. Within the framework of the EPC contract, various pricing models were also considered by the SG team. It was decided that the pricing structure of the contract be primarily fixed for the major scopes of work except for the PSC execution work. The PSC execution work shall be cost reimbursable with an established target price given some of the uncertainties such as the coordination effort required for executing PSC work in the vault.

A competitive bidding process for the award of the SG scope was issued through the Request for Purchasing (“**RFP**”) process. The contract for the SG Project was awarded to Babcock and Wilcox and Candu Energy Inc. on December 31, 2013.

For detailed information on the SG contracting strategy, refer to NK38-REP-09701-10024, *Contracting Strategy for Steam Generators*. For more detail on how the SG Contract is being managed, refer to NK38-PLAN-09701-10164-0015, *Steam Generator Contract Management Plan*.

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

#### 4.0 PROJECT GATE STRATEGY

The intent of the gated process is to enable flexible management control of funding and gate progression approvals through the project life cycle. The process ensures that projects meet a consistent expectation of quality and performance. Gate progression approval is based on:

1. Meeting previous phase requirements,
2. Instilling confidence that the project team shall deliver quality, safety, cost, value for money, and schedule performance for the next phase(s).

The gated process is supported by a set of project management and functional elements such as planning, schedule, cost, and quality. These assist in establishing work flow expectations for the project management team. These elements are implemented using a graded, risk based approach.

A gate progression strategy for the SG Project must take into account the needs and timing associated with the SG EPC Agreement as well as the progression of the project and overall refurbishment program. Additionally, it is important to forecast the required finances as accurately as possible.

#### 4.1 SG Project Gates

Project Gates are completed in accordance with:

1. NK38-PLAN-09701-10227, *Nuclear Refurbishment- Pre-Gate Readiness Review Alignment Meeting- Terms of Reference*
2. N-MAN-00120-10001, *Nuclear Projects - Gated Process*

Table 2 lists a summary of the phased approach as structured through the gated project phases for the SG contract. It also highlights the work to be completed in each contractual phase and the gates that apply to those phases. The gate strategy is in accordance with the correspondence from G. Rose dated April 27, 2015, Subject: *RQE Strategies regarding Gate 3 Submissions*:

Title:

## STEAM GENERATOR – PROJECT MANAGEMENT PLAN

### 5.0 SCOPE MANAGEMENT

#### 5.1 Introduction

Scope Management for the SG Project and Refurbishment program as a whole identifies the method of defining, managing, and controlling the scope throughout the project. It includes the development of the following:

1. Life Cycle Management Plan
2. Scope Statements
3. SOW documents
4. Work Breakdown Structure
5. Cost Benefit Analysis (“**CBA**”)
6. Decision Record and Analysis Summary (“**DRAS**”)

Furthermore, the SG Scope Management shall be conducted in accordance with:

1. SG Project EPC Agreement
2. NK38-INS-09701-10001, *Darlington Nuclear Refurbishment Program – Scope Control*

#### 5.2 Scope Statements

The goal of the SG Project is to deliver all core and approved non-core SG scope (through the DRAS process) safely, within the allotted timeline, and within budget.

##### 5.2.1 Core scope

Core scope is work that must be completed in order to achieve the Primary Objective of refurbishment as defined in NK38-INS-09701-10001, *Darlington Refurbishment Project – Scope Control*. Core scope includes:

1. **Regulatory scope** – scope that is not optional in order to support station license and regulatory requirements, as agreed with the regulator and documented in the Integrated Improvement Projects based on Environmental Assessment, Integrated Safety Review, and other activities such as Global Assessment which do not require Economic Assessment.
2. **Station Life Limiting Components** – modification, repair, or replacement of station life limiting components that must be replaced in order to allow the extension of station operations beyond its current end of life, including items which have an asset class tied to station life.

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>17 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

3. **Component Upgrades** – work to upgrade components, which have a high station priority that can only be done during an extended refurbishment outage.
4. **Programmatic work** – Programmatic work typically performed online or in a normal station outage that must be done in the refurbishment period in order to maintain station licence, including mandatory Preventive Maintenance, inspections, etc.
5. **Prerequisite Scope** – scope that must be done in order to enable a successful refurbishment, including pre-refurbishment incremental inspections to determine refurbishment scope, and pre-refurbishment modifications such as islanding modifications or fuel machine upgrades to meet refurbishment production requirements during the refurbishment period.

### 5.2.2 Non-Core Scope

Non-core scope shall be performed in the refurbishment period if:

1. it has no impact on the projects Core Scope critical path
2. it does not add risk to the successful completion of core scope, and
3. cost or resource efficiencies and station priority warrant the work to be executed in the refurbishment period.

A Business Case Assessment or DRAS (**N-FORM-11390**) demonstrating the economic advantage; including risk management and/or reliability improvement, and priority of completing this work during, pre-, during or post-refurbishment shall be required to gain approval.

Non-Core scope shall be assessed against approved criteria to determine whether it is economic and favourable to include it within the scope of the Darlington NR Program. Only after assessment and approval by the Scope Review Board shall this Non-Core scope be added into the NR Program.

### 5.3 Scope of Work

The SOW for the SG project is broken down into separate documents detailing the different elements of the work required. Table 3 lists the SOW documents

**Table 3 - Darlington Refurbishment - Steam Generator Scopes of Work**

Document Number	Title	Scope Type
NK38-SOW-33110-10014	Darlington Steam Generators – Primary Side Cleaning Scope of Work	Core - Programmatic

NK38-SOW-33110-10015	Darlington Refurbishment – Unit 1-4 SG Divider Plate Leakage Measurement, SG Open Close and Support	Core – Prerequisite
NK38-SOW-33110-10016/ NK38-SOW-33110-10024 (Optional) NK38-SOW-33110-100026	Darlington Refurbishment – Units 1-4 Steam Generator Inspection and Repair/ Darlington Refurbishment – Units 1-4 Steam Generator Inspection and Repair (Optional) Darlington Unit 2 - 2016-2019 Refurbishment Outage Steam Generator Scope Of Work	Core – Prerequisite
NK38-SOW-33110-10017	Darlington Refurbishment – Steam Generator Access Port Installations	Non-Core
NK38-SOW-09701-10037	Steam Generator Primary Side Systems Layup- Scope of Work	Core – Prerequisite
NK38-SOW-33300-10002	Darlington Refurbishment – PHT Pressure and Inventory Control - Miscellaneous Scope	Non-Core

### 5.3.1 SG Darlington Scope Requests

The SG Scope of work is derived from Darlington Scope Request (“**DSR**”) Database. Table 4 lists the SG DSRs.

**Table 4 - Steam Generator DSR List**

DSR	Title	Type	Status
TS0500-2	Darlington Steam Generators: Inspection/Maintenance as per LCMP (Augmented for Refurb Scope)	CS04 Mandatory “Construction Period” Outage Work	Approved
TS0050-3	Darlington Steam Generators: Primary Side Cleaning (PSC)	CS02 Life Limiting Components	Approved
TS0050-4	Darlington Steam Generators: Access Ports	VE01 Operations, Outage, Cost, Resource and Maintenance Efficiencies	Approved
TS0100-2	DNGS Primary Heat Transport Pressure and Inventory Control: U2 Bleed Cooler Inspection and Repair	VE02 Safety Improvements beyond Standards	Approved
TS0100-8	DNGS Primary Heat Transport Pressure and Inventory Control:	VE02 Safety Improvements	Approved

Plan

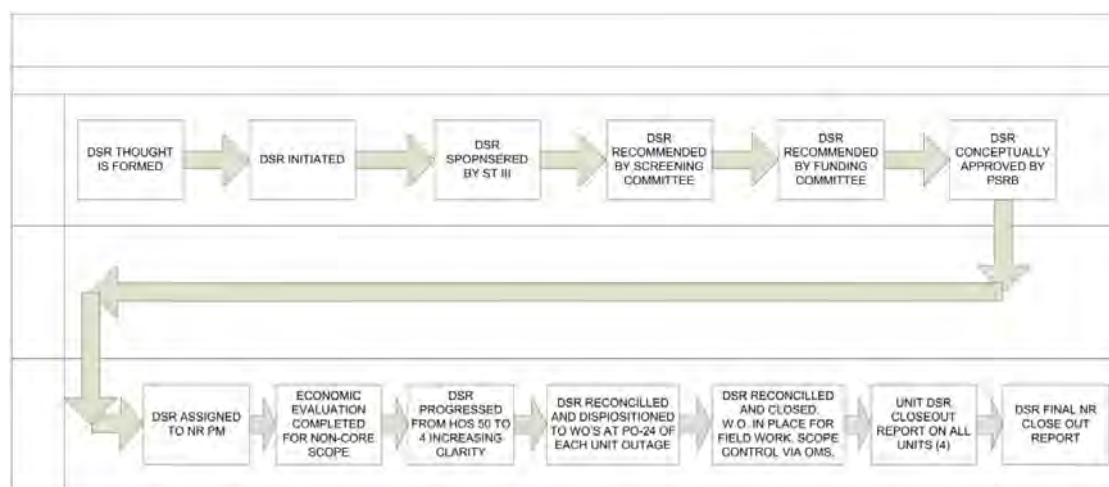

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10164</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R004</b>	<b>19 of 56</b>

Title:

**STEAM GENERATOR – PROJECT MANAGEMENT PLAN**

	Replace Bleed Cooler (Contingency)	beyond Standards	
--	---------------------------------------	------------------	--

The DSRs shall go through a number of transitions from creation to reconciliation against a Work Order for each unit, and to close out as illustrated in Figure 3. There shall be five closeout reports, one per unit, as well as a final closeout report at the end of the project. The DSR managed in the DSR database is the currency of scope control until 24 months prior to the Refurbishment Outage at which time the currency shall change to Work Orders managed in the Outage Management System (“OMS”).

**Figure 3 - DSR Line Item Life Cycle**

### 5.3.2 Health of Scope

Darlington NR scoping strategy includes a Health of Scope (“HOS”) grouping number which is a representative of the work required to progress a DSR from the identification stage to the definition stage. Each DSR in the DSR database has been categorized with a HOS number identifying how well the scope is known and understood. The target is to get the HOS to 4. This shall enable the work to have sufficient clarity that it can enter into the Work Management processes (Engineering Change Control (“ECC”), Work Orders etc.) at the RO-24 OMS Work Order Scope Definition Complete Milestone. Table 5 lists the HOS definitions:

**Table 5 - Health of Scope Definitions**

HOS	Definition
04	All Work Orders input for DSR on all applicable Units or all work completed for DSR
05	DSR is adequately known such that it is ready for Work Order to be input on all Units
10	Work is known at the component / MEL level
20	Work is known at the system or project level but not component
30	Actions to implement selected, may be a component strategy across many systems

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>20 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

40	Analyze the completed report to determine actions / path forward
50	Assessment is required to build a report for analysis
60	Pure engineering or procedures with no likely field work (i.e. provide CNSC with reports, update procedures, etc)
90	Scope shall not be executed in Nuclear Refurbishment, DSR shall be removed pending PSRB approval

### 5.3.3 Scope Review and Verification

The SG Project scope is expected to change throughout the Definition Phase.

Scope verification shall include quality checks, tracking PCDs, reviewing the Basis of Estimates (“**BOEs**”), and monitoring status against the Release Quality Estimate (“**RQE**”). As the Execution Phase progresses, the final cost of each deliverable shall be compared to the RQE at a high level. For the SG Project, scope verification shall involve continually validating scope against the original estimate and ensuring that the vendor does not complete more work than that which is required to achieve success.

OPG and the Contractor shall collaborate by co-developing risk registers and estimates in order to complete the SG Project successfully. This is expected to prevent surprises, provide value for money, and ensure that OPG receives all agreed-upon deliverables.

### 5.3.4 Scope Control

Scope control is the process of monitoring the status of the program scope. Potential scope changes shall follow NK38-INS-09701-10001, *Darlington Refurbishment Project – Scope Control*.

The Darlington NR Program Scope Review Board (“**PSRB**”) shall provide the initial verification of refurbishment scope, and also support control of scope as the Program is developed and executed. The PSRB shall ensure that all scope additions and deletions have undergone a thorough assessment based on scope impact on plant safety, reliability, regulatory requirements, environmental impacts, refurbishment outage impacts (cost and schedule), and the economic value to support the post refurbishment operation of Darlington Nuclear Generating Station.

### 5.3.5 Scope Change Control

The process for identifying the project scope and the management of scope changes is described in NK38-INS-09701-10001, *Darlington Nuclear Refurbishment Program – Scope Control*. The intent of the instruction is to ensure that proposed scope additions and/or deletions have undergone a thorough assessment based on the return on investment, impacts on plant safety, reliability, project schedule and cost, program resourcing, regulatory requirements, and environmental impacts.

Currently, all work requested to be included in the scope of the Darlington NR Program is initiated via the DSR database. The DSR form (D-FORM-10757) must be completed in order to add new scope to the DSR database. The DSR database provides a

Plan

Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10164</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R004</b>	<b>21 of 56</b>

Title:

**STEAM GENERATOR – PROJECT MANAGEMENT PLAN**

common format through which DSRs can be submitted and reviewed. Once requested in the database, the scope shall be processed and reviewed by the screening committee, the funding committee, and the PSRB.

Once the SG execution phase begins, OPG shall be required to provide responses to the vendor requests within predefined time intervals; delayed responses could potentially affect the critical path schedule. In an effort to streamline the process and facilitate timely and accurate OPG responses to changes in the work, all SG discovery work shall be initiated through PCDs.

DSR entries shall not be required for PCDs since discovery work items will correspond to an existing DSR database line item. For example, unanticipated work required to relocate materials that block access to a target system (i.e., a system associated with an approved DSR database line item). Costs associated with the PCDs shall be assigned to the specific schedule tasks that require the additional work. Furthermore, when additional discovery work is identified and a PCD has been approved, a variance shall be declared against the original DSR line item and the applicable schedule milestone. The details of the work changes or additional work discovered shall be added to the description of the existing DSR line item and/or the existing milestone deliverable.

For PCDs that demand significant changes in the work and thus significant cost increases, approval must be obtained as per N-MAN-00120-10001-RISK-07, *Nuclear Refurbishment Assumptions and Decisions Management*. See Table 6 for reference:

**Table 6 - Guidelines for Required Approvals of Significant Decisions via the DRAS Process**

<b>P</b>	Prepared by
<b>Re</b>	Reviewed by
<b>A</b>	Approved by

The requirements for review and approval of decisions vary; refer to Table 6 for guidelines. Generally, the preparation, review, and approval of decisions shall exhibit diligence and prudence in the characterization and analysis of the issue. Documented evidence that a thorough vetting of the technical and economic aspects of the decision has been undertaken is required. This supporting documentation shall be attached to the associated N-FORM-11390, *Decision Record and Analysis Summary* for reference during review and approval activity.

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 5.3.6 Decision Record and Analysis Summary ( “DRAS” )

DRAS forms are required for any new proposed scope and for the removal or modification of existing scope. There is a requirement for a Cost Benefit Analysis to accompany any new proposed scope. Potential additional program scope may result from gaps identified by the Condition Assessment process and after evaluation by a Cost Benefit Analysis as outlined in NK38-INS-09701-10001, *Darlington Nuclear Refurbishment Program - Scope Control*.

DRAS records can be found in the [RMO Tool – Decision Log](#). Table 7 lists the approved and pending DRAS's associated with SG Project.

**Table 7 - Steam Generator DRAS Summary**

DRAS ID	Description	Status
67	Steam Generator Access Port Installation	Approved
235	SG Project – Blue Ribbon Implementation	Approved
450	SG Project – Scope Removal - Replacement of all Main Steam Pressure Alarm Units	Approved
546	Transfer of Bleed Cooler Inspection and Repair/Replace Scope to Station	Not Approved, but DSRs Updated

### 5.4 Work Breakdown Structure ( “WBS” )

WBS establishes a systematic and hierarchal approach for the identification of all of the work elements within a given Project. The WBS is common at the highest level across all projects within Nuclear Refurbishment. However, the WBS still provides flexibility for additional definition or further breakout of each WBS element to lower levels. The WBS is the foundation of the overall schedule for all phases until closeout and is also used to create Control Accounts for purposes of estimating, collecting, and monitoring costs and earned value. It shall clearly define the deliverables at the program and project levels and serve as an integrator for reporting.

### 5.5 Scope Management Integration

Figure 4 shows the integration of scope management governance being applied to the SG Project.

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

## 6.0 RESOURCE/STAFFING MANAGEMENT

There are two aspects of resource management for the SG Project. They are the:

1. SG Project Team Resource Management (Internal)
2. EPC Contractor Resource Management (External)

### 6.1 SG Project Management Team

Figure 5 shows the proposed SG Project Organization. The key roles and their respective accountabilities are detailed in Section 7.1.4. NR has elected to employ a matrix organizational model to execute the Refurbishment Program. It is the SG Project's plan to staff the project team with OPG staff, and supplement with augmented staff or managed task activities to meet the project schedule and needs. OPG staff shall either be embedded in the team or shall be matrixed from the NR functional support organizations. Where NR functional support staff are currently unable to fulfill a specific need, due to unavailability or missing skill sets, the project shall either utilize managed task or augmented staff contracts to maximize outside experience or attempt to find staff within other OPG business units.

#### 6.1.1 SG Project - Key Roles

The key roles on the SG Project are as follows:

1. Project Sponsor - Vice President, Nuclear Refurbishment Execution
2. Contract Owner - SG Project Director
3. Design Authority - Director Refurbishment Engineering
4. Accepting Organization - DNGS Director of Operations and Maintenance (DOM)
5. The SG Project Director has the accountability for all aspects of the SG Project.

#### 6.1.2 Limits of Authority

The authority to execute the SG Project resides with the Project Sponsor – Vice President of Refurbishment Execution. As the sponsor, the VP of Refurbishment Execution delegates execution authority to the SG Project Director. This authority includes the following:

1. Determine the structure, size and makeup of the organization required for project execution.
2. Organizational Authority Register (“OAR”) authority for SG Project as per OPG-STD-0017, Organizational Authority Register.

Plan

Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10164</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R004</b>	<b>25 of 56</b>
Title:		
<b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 6.1.3 Project Organization

The SG Project staffing structure has been organized to facilitate project execution in the EPC contracting model. The organization has been setup to align with the work packages (“WP”).

It is SG Project’s plan to staff the project team with OPG and Owner Support Services (“OSS”) Managed Task or Augmented Contract staff. OPG staff shall either be embedded in the team or shall perform functions “matrixed” from the NR functional support organization. Where NR functional support staff are currently unable to fulfill a specific need, due to unavailability or missing skill sets, the project shall either utilize managed task contracts to maximize outside experience or attempt to find staff within other OPG business units.

The proposed project organization is shown in Figure 5:

**Figure 5 - SG Project Organization Chart**

This chart reflects the proposed staffing structure as of April 2016, with proposed construction support starting in 2016 throughout the course of the construction planning and execution phase. This structure is expected to change during the subsequent project stages based on project demands.

### 6.1.4 Roles and Accountabilities

**Project Sponsor:** Vice President, Nuclear Refurbishment Execution

1. Ensure the program is fully staffed

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>26 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

2. Ensure adherence to Nuclear Refurbishment Program
3. Administer monthly Steering Committee meetings.
4. Address any concerns escalated in a timely fashion
5. Administer quarterly Executive Oversight Meetings

**Project Director:** Director, Steam Generators

The SG Project Director has the accountability for all aspects of the Project including:

1. Environment, Health & Safety
2. Scope
3. Schedule
4. Cost
5. Risk
6. Quality
7. Staffing & Resources
8. NR Program Governance adherence
9. Reporting & Communications
10. Oversight
11. Contract Adherence

**Project Manager (PM):** Manager, Steam Generators

The SG project assigned project manager. The PM has the overall accountability for the successful delivery of their sub projects which includes:

1. Environment, Health & Safety
2. Scope
3. Schedule
4. Cost
5. Risk
6. Quality
7. Stakeholder Management
8. Communications & Reporting
9. Vendor oversight

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>27 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

**Project Controls Lead / Cost and Scheduling Analyst:**

The Project Controls Lead and Cost and Scheduling Analyst are accountable to:

1. Ensure project conforms to NR Program Governance, supported by routine quality
2. checks and self assessments
3. Liaising between functions and project including centers of excellence
4. Gated Process including budget loads and baselines
5. Reporting including Earned Value
6. Analysis and Forecasting
7. Business Planning
8. Project Tools including Information Technology (“IT”) tools, processes and instructions
9. EPC contractor integration within OPG system
10. Scheduling
11. Oversight
12. Plan and Perform oversight on various elements of project controls based on risk

**Procurement Single Point of Contact (“SPOC”):**

The functional Procurement SPOC shall be accountable to:

1. Be the single point of contact with the EPC contractor for all procurement related matters
2. Hold the Contractor accountable to complete procurement activities in accordance with the correct Quality Assurance (“QA”) requirements, procedures and programs
3. Coordinate OPG conducted audits and attend as required
4. Arrange for OPG participation in, and oversee, contractor audits of sub-contractors as required
5. Ensure oversight of EPC contractors sub-contractors procurement process
6. Ensure materials and services are procured per schedule
7. Ensure and coordinate resolution of any Non-Conformances
8. Confirm authenticity of procured material

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>28 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### Engineering Lead/Matrix Engineer:

The Engineering Lead/Matrix Engineers shall be responsible for:

1. Ensuring that the Engineering Change Control (“**ECC**”) process required is defined, understood, reflected in the schedule and implemented per process
2. Provide resources and context to perform adequate document reviews within the contractual time frame allotted
3. Ensuring resources and context to perform adequate oversight of EPC contractors to ensure project objectives for cost, scope, schedule, and quality are met
4. Attend Construction, Operability, Maintainability, and Safety (“**COMS**”) reviews and ensure Operating Experience (“**OPEX**”) is embedded in the Engineering deliverables
5. Ensure scope is defined, understood and managed per the applicable scope management governance
6. Ensure all risks associated with Modifications are identified in risk register per appropriate governance; mitigating actions are prepared tracked monthly and updated as required
7. Identify, coordinate and solicit all stakeholder inputs to engineering deliverables reviews
8. Plan and Perform oversight on various elements of the project based on risk

### Contract Management:

Support the project team to ensure key contract elements are managed in accordance with the agreed contractual terms and conditions. Responsibilities include, but are not limited to, facilitating Contract Change Management and Issues/Dispute Resolution, maintaining and implemented the contents of the Contract Management Plan.

For more details, refer to NK38-PLAN-09701-10164-0014, *Contract Management Plan*.

### 6.1.5 Qualifications

Each project member that is matrixed shall be assigned the appropriate qualifications by their respective functional manager to ensure compliance with the applicable standards for that group. A review of the current qualification set that are available for project management, contract owner, and similar functions is performed by the project. In order to effectively provide oversight to the EPC contractors, one would ideally have like experience and training similar to that of the EPC contractor. The project shall explore internal and external opportunities to develop these skills.

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>29 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 6.1.6 Succession Planning, Training and Resource Development

As a result of the SG schedule extending over a long duration, appropriate succession planning strategies need to be assessed and incorporated into the development of the project team members. Project Management shall provide mentorship and on-the-job training opportunities for the project team members to participate in over the course of the project. This shall facilitate the development and growth of internal resources.

As the project team changes over time, internal project team members shall have developed the skills and qualifications necessary to move into new roles with greater responsibilities as vacancies emerge through attrition and organizational changes.

### 6.2 EPC Contractor Resources Management

The SG EPC contractor shall be responsible for the management of their staff. Their resources shall be managed in accordance with their Resource Management Plan, which shall be submitted to the project Post-Award.

### 6.3 Resource Management Integration

Figure 6 shows the integration of resource management governance being applied to the SG Project.

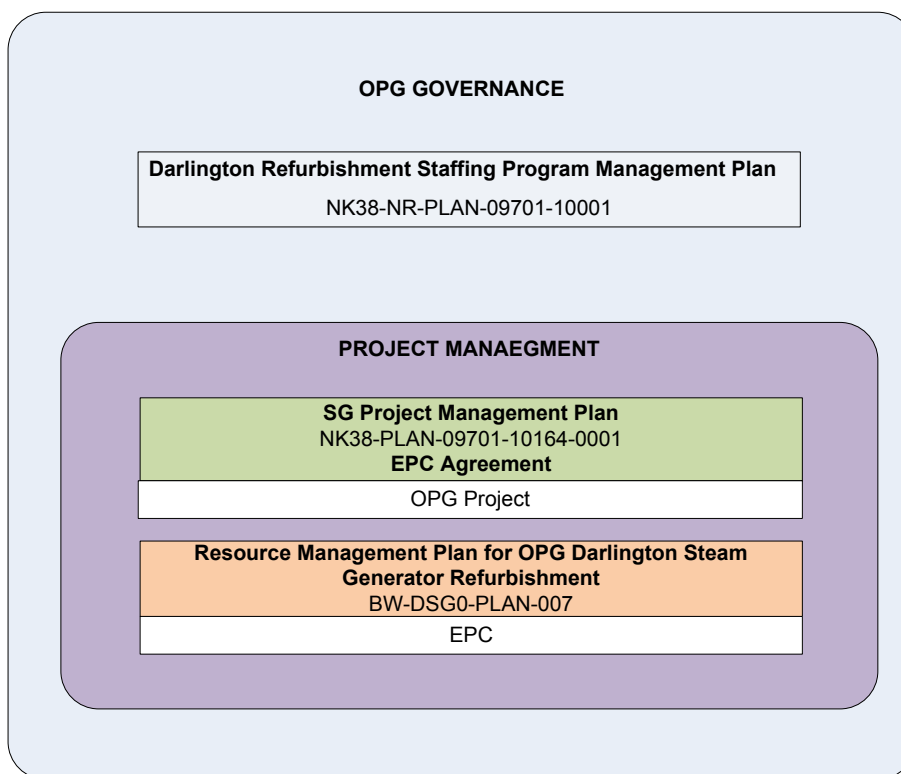

Figure 6 - SG Resource Management Integration

Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R004</b>	<b>30 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

## 7.0 COMMUNICATION AND STAKEHOLDER MANAGEMENT

The purpose of SG Communication Management Plan is to provide a framework and understanding of the communication methods and requirements to be utilized throughout the course of the project. This includes communication between both internal and external stakeholders.

Communication management shall be in accordance with N-MAN-00120-10001, *Project Communications*

### 7.1 Roles and Responsibilities

Records and document management is a shared responsibility amongst all NR employees in referencing and filing information according to governance and non-governance process documents.

**Project Managers (PM's)** – are responsible to prepare and issue a formal Communication Protocol document to the successful supplier immediately after contract award. The Communication Protocol document shall provide direction on how all project correspondence and documentation deliverables are managed. All suppliers shall comply with the standards and requirements of this plan. PM's shall adhere to and share with suppliers, N-MAN-00120-10001-RDM-03, *Nuclear Projects Supplier Document Submission*.

**NR Records and Refurbishment Document Management (“RDM”)** – shall manage the Darlington Refurbishment records and data provided by OPG and suppliers, perform quality checks, route to the appropriate stakeholders and track the status and performance through the review/acceptance cycle. RDM shall also retain and publish all “Change Papers” and related ECC documentation. RDM is also responsible for registering and managing controlled documents, management of the Vendor Document Management (“**VenDM**”) system, and the population of the Records and Controlled Documents modules in Asset Suite 7. RDM shall adhere to N-MAN-00120-10001-RDM-R000, *Nuclear Projects Records and Document Management*.

**Refurbishment Employees and Vendors**– have the responsibilities to identify, protect, and present their records as intellectual assets; this is accomplished by completion of training, use of training aides, and through adherence to communications issued to guide staff on information management rules or practices.

### 7.2 Information Control

The main stakeholder communication methods are:

1. Telephone and Email communications
2. Submittals and Requests for Information (“**RFI**”)
3. Meetings

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>31 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 4. Publications and Reports

**Emails:** Regularly used to document interface with stakeholders, the project team, and with the SG EPC Contractor. The SG Project shall comply with Nuclear Projects protocol for declaring emails per NK38-PLAN-09701-10067 Sheet 0009, *Program Documentation and Project Closure Management Plan*.

**Submittals and RFIs:** As per the SG EPC Agreement, Submittals and RFIs are important communication methods. Submittals are described in Section 2.8 of the SG EPC Agreement. The internal process for handling Submittals and RFIs is described in Appendix A: Submittals and Request for Information Processing.

**Meetings:** Conducted face-to-face with available teleconference and videoconference as required. The stakeholder meetings involving the SG Project and its stakeholders are listed in Table 8.

**Publications and Reports:** Publications of SG information are communicated to internal stakeholders via OPG newsletters (e.g. The Pulse) and Intranet websites (e.g. SG intranet website).'

**Records** are communication technology and information distribution tools that shall be used by the project. They include:

1. Vendor Document Management System ("**VenDM**"): External environment used for exchange, review, and management of Submittals and RFIs as per the SG EPC Agreement
2. SharePoint 2007: Internal document storage, exchange environment used for storage of project documents, deliverables, schedules, cost information, as well as confidential & commercially sensitive information relevant to the SG contract.
3. OPG RDM are owners of both the VenDM, SharePoint, and are responsible for process definition and support, technical support for VenDM it relates to Submittals, RFIs as outlined in the SG EPC Agreement.
4. Project Records shall be maintained in VenDM, SharePoint and Project Emails. As applicable project records shall be indexed and stored in Asset Suite.

### 7.3 Stakeholder Inputs

Stakeholder inputs are gathered through the various meetings conducted by and with the SG project staff. Actions, issues and risks are then tracked in the appropriate system as described in NK38-PLAN-09701-10164-0010, *Steam Generator Risk Management Plan*. The major stakeholders for the SG Project are listed in Table 9. Figure 7 shows the main groupings and relationships of the major stakeholders determined by stakeholder analysis. When situations arises that specific stakeholder

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>32 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

input is required but not available, additional resources shall be obtained either internally or externally to ensure that any stakeholder input gaps are managed. An example would be when a specific expertise is required to review an engineering package and an external contractor is utilized for expert review.

## 7.4 Contractor Communication expectations

### 7.4.1 Preparation Phase

Within 10 Business Days of the date the contract is awarded, the Contractor shall:

1. meet with all appropriate parties, including OPG's Representative to confirm the manner and approach in fulfilling the requirements of the contract;
2. meet with individuals designated by OPG's Representative to confirm design requirements and approach;
3. identify and analyse requirements of applicable Governmental Authorities with whom consultation is to be undertaken in respect of the project; and
4. obtain any information that it deems necessary for providing all work.

### 7.4.2 Kick-Off Meeting

The project kick off meeting was held 10 days after Contract Award. The contractor and OPG representatives were in attendance. At this meeting the parties discussed safety and environmental protection programs (including those of subcontractors) and their requirements, the hazards associated with the work, labour matters, design concepts, schedules, procedures for handling Submittals, communication protocols, procedures for processing each Application for Payment, delivery procedures for the site, records maintenance, site security, and any other matter raised by a Party.

Specific agenda items that were addressed during kick-off meeting were:

1. Confirm Scope of Work in the Purchase Order
2. Confirm the Schedule for the work
3. Agree on all deliverables (documents, data, materials, etc.) and services OPG owes the contractor and the required dates for each item
4. Agree on all deliverables (documents, data, materials, etc.) and services the Contractor owes OPG and the required dates for each item
5. Agree on the lines of communication and approval authority for both technical and other contractual matters for both the Contractor and OPG organizations.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>33 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

#### 7.4.3 Steering Committee

The Senior Management Representatives of each Party are currently convening in a steering committee (the "Steering Committee"). The Steering Committee is composed of Senior Management Representatives of each Party. The expectation is that the Senior Management Representatives shall attend and shall only use delegates of equal seniority occasionally. The Steering Committee meets at any time at the request of OPG, and shall otherwise meet at least quarterly. The Steering Committee resolves outstanding disputes, reviews progress reports and addresses issues which affect or could affect the Contract schedule or the reimbursable target cost work.

#### 7.4.4 Meetings

In addition to the kick-off meeting, the Contractor shall schedule, attend and conduct such other pre-construction, construction, pre-job mark up (including resolution of jurisdictional issues), hazard review, site co-ordination, weekly (or daily as required by OPG) progress review meetings, and commissioning meetings as are requested by OPG or are otherwise desirable, including any meetings required by the Specifications. The Contractor shall include in the agenda of any such meeting any issue requested by OPG. Progress review meetings shall usually focus on safety, environmental matters, labour requirements, procedures, progress, clarifications of the requirements of this Agreement, and scheduling (including interfaces between Persons providing services at the generating station). The Contractor shall ensure that all Subcontractors and other Persons requested by OPG shall attend these meetings. The Contractor shall ensure that each representative of the Contractor and any Subcontractor attending meetings shall be qualified and authorised to act on behalf of the Party each represents. The Contractor shall provide the space for the meeting. The Contractor shall prepare and distribute minutes of each meeting within three Business Days thereafter.

#### 7.4.5 Performance Reporting

Project reporting shall be performed by the SG Project in accordance with the NR Program as per the N-MAN-00120-10001, *Project Communications*, and by the Contractor according to the SG Project Agreement.

The Contractors shall report periodically, according to the SG Project Agreement, in the following areas at a minimum:

1. Health, Safety & Environmental Performance;
2. Schedule Performance including but not limited to:
  - a. Engineering Activities;
  - b. Procurement Activities;
  - c. Construction Activities;
3. Submittals.
4. Cost Performance;

Monthly Integrated Project/Functional Communication Meeting	Discussion of Project Quad-Charts	Monthly
Darlington Refurbishment (DN) Monthly Program Status Meeting	Project Performance Update. Issue resolution.	Monthly
DN Refurbishment/ NWMD Coordination Meeting	Alignment meeting	Bi-Weekly
ITF Review	Review Issue Tracking File progress	Weekly (As Required)
DN Refurbishment Execution Three-Stratum Meeting	Project Performance Update. Issue resolution.	Monthly
Execution Steering Committee	Resolve outstanding disputes. Review progress reports. Addresses issues which affect or could affect the contract schedule or the reimbursable target cost work.	Quarterly

## 7.5.2 Stakeholder Inputs

Stakeholder inputs are gathered from the various meetings conducted by and with the project team. Actions, issues, and risks are then tracked in the appropriate system as described in the Risk Management Plan (NK38-PLAN-09701-10164-0010). The major stakeholders for the SG Project are listed in Table 9.

**Table 9 - Stakeholder Registry**

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

#### 7.5.4 Darlington Refurbishment Significant Issue Resolution

In certain circumstances, it may be required that the SG Project follow D-GUID-09701-10018, *Darlington Refurbishment Significant Issue Resolution* (“**SIR**”) for issue resolution. D-GUID-09701-10018 is not a replacement for the EPC vendor issue resolution process. The use of a SIR Team is an enhancement to any vendor process and is a tool made available to the vendor for resolution of a significant issue that cannot be resolved through the vendor’s own issue resolution/corrective action process. OPG reserves the right to initiate a corrective action process at any phase of the NR Project but shall review all impacts to contractual agreements prior to involvement of the EPC vendor.

#### 7.6 Communication Management Integration

Figure 8 shows the integration of communication management governance being applied to the SG Project.

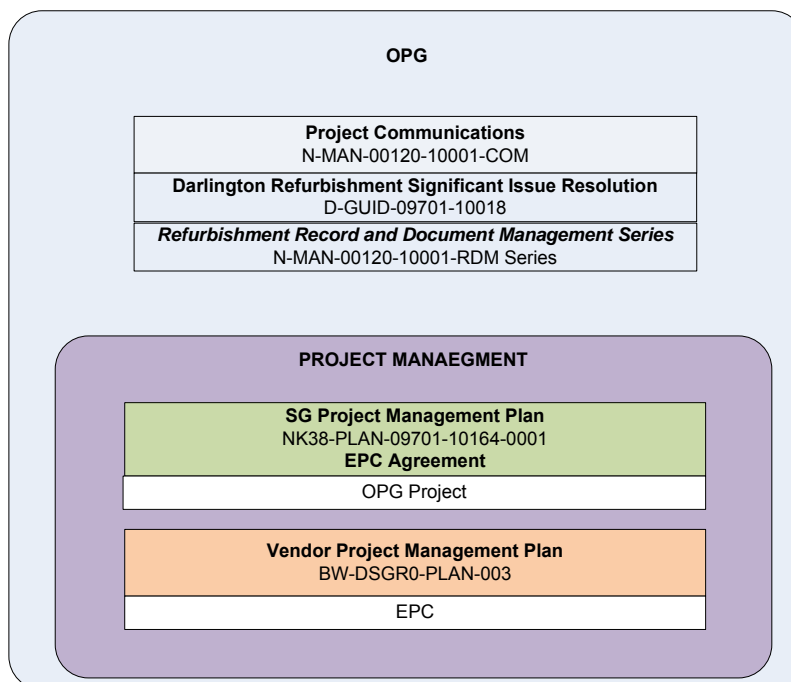

Figure 8 - SG Communication Management Integration

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

## 8.0 CONSTRUCTION MANAGEMENT

Through effective management of contractors, the SG Project Team shall ensure that contractors employed on the SG Project execute their work safely, effectively, and in a manner consistent with OPG's and the Contractors policies, procedures, quality requirements, safety values, and objectives.

The project shall be executed in a manner consistent with industry best practices and a culture that embraces the belief that all accidents are preventable. The SG Project Team, and its contractors, shall carry out their refurbishment activities in a responsible manner that minimizes risks to employees, the public and the environment.

### 8.1 Construction Management

For management of the construction phase of the SG Project, the Project shall comply with the requirements provided in:

1. NK38-PLAN-09701-10012, *Management Plan: Management of Contractors for Darlington Refurbishment Project*
2. NK38-PLAN-09701-10223, *Darlington Refurbishment Construction Execution Functional Management Plan*
3. (To Be Issued) Division of Responsibilities
4. N-GUID-09701-10120, *Guideline For Construction Oversight*
5. SG COIR Section 3.0 - Construction Interface Matrix
6. SG EPC Agreement Terms and Conditions
7. Occupational Health and Safety Act ("OHSA")

Through effective management of contractors, OPG shall ensure that contractors employed on the Darlington NR Project execute their work safely, effectively and in a manner consistent with OPG's policies, procedures, safety values and objectives. The project shall be executed in a manner consistent with best industry practices and a culture that embraces the belief that all accidents are preventable. OPG and its contractors shall carry out the refurbishment activities in a responsible manner that minimizes risks to employees, the public, and the environment.

The Construction Management objective is to:

1. Ensure alignment between all the project stakeholders (including the Contractors) executing the construction phase of the project
2. Provide oversight such that the project is completed safely while meeting quality requirements, cost targets and schedule milestones.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>40 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

General Construction Management principles related to SG project include:

1. Our ability to influence a positive outcome and achieve all the project objectives starts before execution in the field. If we stop or delay Work after it has started for things that should have been addressed during earlier phases, we have failed. Accordingly, a significant amount of oversight is provided prior to field implementation ensuring readiness.
2. We work hard at building trust and our relationship with the group executing the Work as we believe openness and trust is the only way to meet all the project objectives.
3. The level of oversight applied shall be risk based and be specific to each critical evolution of the SG Projects as detailed in the Project Oversight Plans (“POP”)
4. Oversight shall be performed in accordance with N-STD-AS-0030, *Project Oversight Standard* and N-MAN-09701-10002, *Nuclear Refurbishment Project Oversight*.

The Contractor is required to be self sufficient and adopt industry best practices while performing installation and construction work for SG Project. Based on nuclear industry OPEX regarding execution of EPC contracts, the level of oversight in the POP shall be proportionate with the Contractor’s experience and past performance as well as the measured risk associated with execution tasks.

## 8.2 Construction Oversight

Construction Oversight is discussed in more detail in N-GUID-09701-10120, *Guideline For Construction Oversight*. Specific oversight plans for Construction activities associated with the SG Project can be found the [RMO Tool – Oversight Log](#). The responsibility of oversight plans enteritis is shared between all stakeholders. The ownership of the oversight plan in RMO tool resides with SG Project Director or Delegate.

In accordance with the Darlington Refurbishment Construction Execution Functional Management Plan, the execution oversight team shall be comprised of shared resources between SG and TG projects. Allocation of these resources shall be negotiated between the project directors or delegates based on scheduled activities during respective project execution windows. The numbers of required staff in key positions are listed in Table 10.

Plan

Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>42 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

## 9.0 RISK MANAGEMENT

The method for Risk Management of the SG Project shall ensure risks are identified, assessed, and analyzed for risk response, as well as monitored to a robust and consistent standard to ensure that project objectives are achieved. SG risk management is in compliance with N-MAN-00120-10001, *Nuclear Projects Risk Management Process*.

### 9.1 Risk Management Processes, Procedures and Templates

The following processes, procedures and forms supplement the risk management process for the SG Project for Nuclear Refurbishment:

1. N-MAN-00120-10001, *Nuclear Projects Risk Management Process*
2. N-MAN-00120-10001, *Nuclear Refurbishment Risk Management & Contingency Development Guide*
3. N-MAN-00120-10001, *Darlington Refurbishment Lessons Learned And OPEX Management*
4. N-MAN-00120-10001, *Nuclear Refurbishment Actions Issues Decisions And Key Assumptions Management*

### 9.2 Risk Management Process

Risk management provides projects with forward-looking actions and metrics to reduce the likelihood and minimize the impact of undesirable events during the project life cycle. The goal of risk management is to remove obstacles to project success before they occur in order to minimize their consequential effect on project costs, schedule, quality, and safety targets.

Proactive risk management is used to understand the characteristics of the risk, how to manage them, and plan for *contingency* based on the *residual risks*. As such, risk management can have a significant impact on the financial health of the project.

Risk management should be performed with a graded approach. The intent of this approach is to match the level of effort with the impact to safety, cost, schedule, and success of the project.

Figure 10 shows the overview of the Risk Management Process.

Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10164</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R004</b>	<b>43 of 56</b>
Title:		
<b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

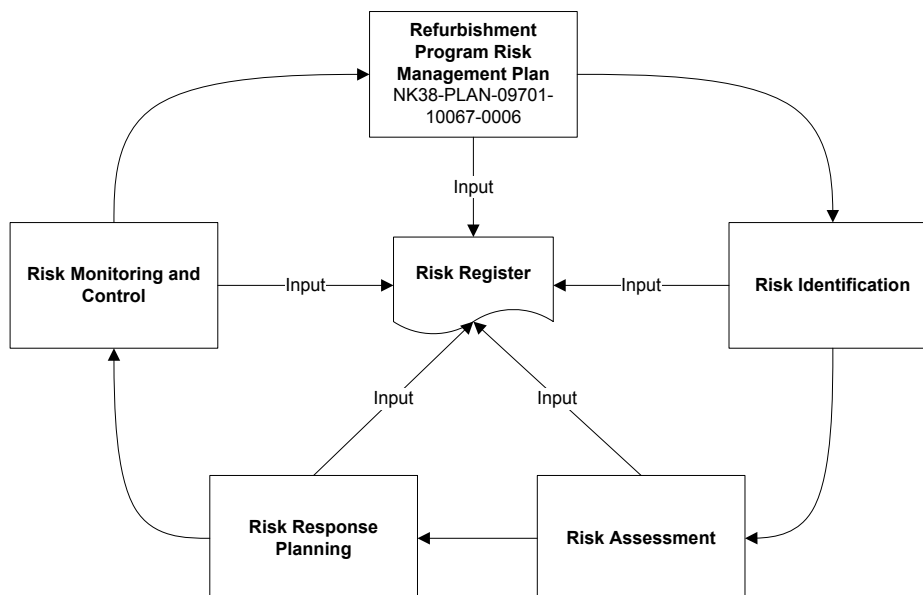

Figure 10 - Risk Management Process Overview

### 9.2.1 Risk Register

The SG Risk Register is created by the SG Project Team, but shall be maintained and updated by the SG Risk Single Point of Contact (“**SPOC**”). Reports can be produced as required by the project/contractor/department to support risk management activity.

The NR Project Planning and Controls shall provide oversight and interface with the local risk SPOC to ensure the risk database is being updated as per the existing risk management governance.

NR Risk Team shall manage the integration between Program Risk Registry and SG Risk Registry.

### 9.2.2 Contractor Risk Register

For the SG Project, a Risk Management Plan has been prepared by the EPC contractor and is managed by the contractor Project Team. The Contractor RMP establishes the method on how the contractor effectively manages the risks that they can control and enables transparency of risks to OPG.

The Contractor's risks shall be incorporated into the SG Project Risk Register on a case by case basis.

### 9.3 Risk Identification

Risk Identification for the SG Project shall follow the process outlined in N-MAN-00120-10001, *Nuclear Projects Risk Management Process*.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>44 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

### 9.3.1 Risk Meetings

Risk meetings are scheduled with SG Project team members, functional support (as required) and contractor staff (Post Award) to review the risk register and add any updates (review scoring, mitigating actions, close outs, etc) to existing risks based on new information. Additional risks can be introduced during these meetings.

**Pre-Award** - Prior to Contract Award, the SG Project team participated in quarterly Risk Meetings to review the risk register. Adhoc meetings were held in addition to the quarterly meetings if new information required the immediate: addition of a new risk, revision of an old risk or mitigating actions, or close out of a risk.

**Post Award** - After the SG Contract is awarded, Risk Meetings shall be held on a monthly or quarterly basis to ensure the risk registry is maintained current and that applicable oversight is in place for new and escalating risks. The Contractor shall participate in the monthly risk meetings and take ownership of the risks that are under the Contractor's control.

### 9.4 Risk Assessment

Risk assessment for both SG Project shall follow N-MAN-00120-10001, *Nuclear Projects Risk Management Process*. Risk assessment for the Contractor shall follow the processes outlined in their own RMP. If their RMP has any major gaps in comparison to the Refurbishment Program RMP, then the Nuclear Project RMP shall take precedence, and the Contractor shall be required to follow those processes.

### 9.5 Risk Response Planning

The majority of the SG Project scopes of work have been awarded as fixed price contracts. For fixed price contracts, the risk is inherently built into the contractor's estimate and therefore minimal additional contingency shall be assigned to this portion of the work. For fixed price work, risks shall be tracked with emphasis on maintaining project schedule milestones.

For the Target Price portion of the contract, the Contractor has built risk into their Target Price estimate and agreed to target band. For known project risks that could have adverse financial and schedule impacts to the project, the Project shall manage these risks through allocation of contingency funding. The Contractor shall be responsible for managing their risks to ensure they achieve their target price and schedule, and OPG shall monitor the contractor's adherence to risk management processes as per section 3.5.2 Contractor Oversight. Ongoing management of mitigating actions to potential risks shall be carried out by both the Project Team and Contractor to reduce the impact, should those risks be realized.

### 9.6 Risk Monitoring and Control

Risk monitoring and control for both SG Project and the Contractor shall both follow N-MAN-00120-10001, *Nuclear Projects Risk Management Process*. The following sections address how oversight is managed for both the Project and Contractor.

Plan

## STEAM GENERATOR – PROJECT MANAGEMENT PLAN

### 9.6.1 Project Oversight and the Risk Management Oversight Tool

SG project risks and associated oversight are management through the [Risk Management Oversight Tool](#). This is a living tool that allows the project to provide details on risks, mitigating actions, and the oversight activities in place for the Project to monitor and control risks associated with the contractors work.

### 9.6.2 Contractor Oversight

OPG shall monitor the Contractor's adherence to the risk process (with support from the functional SME) and their internal oversight activities to ensure risks are monitored and controlled appropriately. These activities shall be documented in the POP described in Section 9.6.1.

### 9.7 Risk Management Plan Integration

Figure 11 demonstrates the integration of risk management governance being applied to the SG Project.

Title:

## STEAM GENERATOR – PROJECT MANAGEMENT PLAN

### 10.0 PROJECT OVERSIGHT MANAGEMENT

The SG Project team is accountable to provide oversight of the contracted scope, via the SG EPC Agreement, to ensure that the Contractor delivers the products and services with acceptable technical quality and appropriate project controls critical to success. This POP shall provide a uniform methodology to be used for oversight activities ensuring that the deliverables, as supplied by the Contractor, meet the intent of the SG Agreement.

This plan is issued to cover the different stages of Engineering, Procurement, and Construction as it applies to the Darlington Nuclear Generating Station SG contract.

The SG Project Manager is responsible for the creation and implementation of the POPs in NR. The Project Manager, with the support of Management Systems Oversight (“**MSO**”) is maintaining the POP to identify oversight activities planned for the project.

POPs and findings are maintained by the project through the [RMO Tool](#).

Historical POP Activities and Findings can be located through the SharePoint [Project Oversight Plan](#) and [Project Oversight Findings](#).

#### 10.1 Project Oversight Plan Integration

Figure 12 shows the integration of project oversight governance being applied to the SG Project.

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

## 11.0 QUALITY MANAGEMENT

Quality Management of the SG project team shall implement planned and systematic activities to ensure the project's deliverables are achieved with the expected results. Quality Management has four areas of focus that are monitored, controlled and reported. Those areas are:

4. Design Engineering
5. Procurement
6. Installation, Construction & Completion Assurance
7. Commissioning

The areas of scrutinized focus are as follows:

1. Schedule activities that monitor the development and verification of the Design Requirements into deliverables
2. Evaluation of critical quality activities during Engineering, Procurement and Construction phases of work, and insertion of owner hold and witness points into ITPs and P6 Schedule.
3. Management of non-conformances as they are identified, documented, reported, and designation of responsibility for disposition.
4. The Corrective Action Plan (“**CAP**”) to determine the cause of the non-conformances, the prevention of their reoccurrence, and that the non-conformance shall be corrected within a specified time limit.

The Contractor shall perform the entire scope of work under their approved quality assurance program. The Contractor is responsible for ensuring that its Sub-Contractors are working under the Contractor's quality assurance program or have implemented an appropriate quality assurance program acceptable to the Contractor and OPG. It is the project's expectation that the Contractor shall implement, maintain and comply with the approved quality assurance programs that have been identified and agreed to in the EPC Agreement for the Darlington Refurbishment SG Project

Quality management shall be administered in consultation with the additional following documents:

1. N-STD-AS-0028, *Project Management Standard*
2. N-STD-AS-0029, *Contract Management Standard*
3. N-STD-AS-0030, *Project Oversight Standard*

Plan

<b>Internal Use Only</b>

Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

4. N-MAN-09701-10002, *Nuclear Project Oversight Guide*

### 11.1 Quality Program

The project quality management approach described in the following section shall demonstrate the following elements:

1. Quality planning to determine the type and frequency of internal and external quality standards and monitoring required for project success.
  - a. Quality Assurance to plan a systematic pattern of means and actions designed to provide confidence that items or services shall meet specified requirements and perform satisfactorily in service. These include quality systems, instruction, training, qualification and checklists.
  - b. Quality Control processes to ensure that specified requirements are met through monitoring, inspections, testing, examinations or verifications. This includes the documentation of non-conformances and corrective actions. Quality Surveillance shall be carried out by OPG to ensure the vendor is performing Quality Control in accordance with their approved processes and procedures.

### 11.2 Quality Planning

The SG Project shall use a combination of industry best practices and OPEX from similar OPG projects to anticipate and plan for potential quality concerns and risks. It is the mission of the SG project team to implement a successful campaign, and this benchmarking shall be one of the components to build this success model which shall be incorporated into the POP.

The EPC Vendor's Quality Assurance Plan (BW-DSGR0-PLAN-006) forms the foundation for QA requirements and governing processes to be followed during the execution of the SG project. When planning quality related oversight activities, the vendors QA plan and the applicable referenced vendor QA procedures shall be utilized to develop criteria and specific areas of focus.

### 11.3 Quality Oversight

Quality oversight activities are planned and documented using the [RMO Tool](#) and may also be incorporated into the P6 schedule, when required.

### 11.4 Quality Assurance

The Contractor shall implement, maintain and comply with an OPG-approved auditable quality assurance program in accordance with its own internal program and the requirements of the EPC Agreement. The contractor is expected to ensure that all of their work is provided in accordance with the applicable quality assurance program.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>49 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

Expectations of the Contractor's quality assurance program:

1. Ensure the workmanship used to perform work shall fully meet the requirements of the agreement
2. Meet applicable elements for design (engineering), procurement and construction services of *CSA N286-05, Management System Requirements for Nuclear Power Plants*, as amended, restated or replaced from time to time; (as a guideline with respect to applicable elements of *CSA N286-05 for EPC Services*, refer to memo *N-CORR-01930-0387907 P* dated July 11, 2011);
3. Conform with the requirements of *CSA Quality Standard Z299.1* or such equivalent quality standard agreed to by OPG that may replace said standard;
4. Meet applicable elements for design software (use, modification or development) of *CSA N286.7, Quality Assurance of Analytical, Scientific and Design Computer Programs for Nuclear Power Plants*;
5. Meet the requirements of *CSA N285.0, General Requirements for Pressure Retaining Systems and Components in CANDU Nuclear Power Plants*, as amended, restated or replaced from time to time. All pressure boundary activities shall be carried out in compliance with *CSA N285.0* and where required under a "Certificate of Authorization" issued by the Technical Standards and Safety Authority;
6. Meet the Electric Power Research Institute guidelines with respect to the prevention and detection of *Counterfeit, Fraudulent and Suspect Items (CFSI)*; and
7. Ensure that Subcontractor evaluation and selection is performed in compliance with the requirements of the applicable elements of *CSA N286-05* and *CSA Z299* series of quality standards or such equivalent quality standard agreed to by OPG that may replace said standard.

#### 11.4.1 Non-Conformance

If the Contractor or OPG identifies anything which does not conform to the quality assurance program set out in the EPC Agreement, the Contractor shall promptly correct the non-conformance (unless the Contractor proposes to "use as is") and deliver a notice in the form of "Quality Assurance Non-Conformance Notice" to the Project and report the corrective action proposed to be taken by the Contractor.

#### 11.5 Quality Control/Surveillance

The combination of OPG and EPC Governance, and SG Project and EPC Quality Management Plans shall be used to govern quality on the project. Quality Control shall be performed by the EPC vendor through their QA organization. OPG shall perform

Plan

Document Number: <b>NK38-PLAN-09701-10164</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R004</b>	Page: <b>50 of 56</b>
Title: <b>STEAM GENERATOR – PROJECT MANAGEMENT PLAN</b>		

quality surveillance on the vendors QA processes and activities and may insert witness and hold points during key activities of the work program. These activities shall be strategic and proactively planned and executed using a risk based approach.

## 11.6 Quality Records

The Contractor shall provide OPG with signed and dated legible copies or originals of all inspection documents pertaining to the work performed, including installation and testing. The Contractor shall retain all quality assurance documentation and records for seven years after the Final Completion Date or for any longer period specified in the agreement.

## 11.7 Quality Management Plan Integration

Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

## 1.0 INTRODUCTION

The *Darlington Refurbishment Project Charter*, D-PCH-09701-10000, documents the purpose of the Darlington Refurbishment Program.

Darlington NGS is aging and there is a need to assess and make recommendations with respect to the feasibility of continuing to operate beyond the current nominal end-of-service life dates. The goal of the refurbishment project is to extend the service life of the units by an additional 30 years of post-refurbishment operations.

Refurbishment will involve an outage for replacement of life-limiting components, as well as maintenance or replacement of other components which can be most effectively done during the refurbishment outage period.

The Nuclear Refurbishment (NR) organization has been established with the responsibility of assessing, making recommendations to OPG's Senior Management with respect to the feasibility of refurbishing the Darlington units, developing the scope, schedule and estimate for the Refurbishment Program, and providing overall program oversight on the execution of all activities associated with refurbishment. For Darlington, NR will undertake the Darlington Refurbishment Project, in phases per the approved Program Release strategy, to:

- Assess the technical feasibility of refurbishing Darlington and operating it for an additional 30 years of post-refurbishment operations
- Make recommendations as to the lead time required to be prepared to refurbish each unit,
- Fully define refurbishment scope,
- Execute front end planning including developing contract management strategies, cost estimates, schedules, a full risk assessment, and a release quality estimate for the project,
- Manage the refurbishment pre-outage planning and preparation activities,
- Provision of overall program oversight on all execution and commissioning activities, and
- Project Closeout.

The refurbishment is currently planned to begin in 2016. The first two unit refurbishment will be unlappped with the 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> units' shutdown in a partially overlapping sequence. Currently, the approved plan to refurbish the four units is shown in the following table:

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-41000-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R003</b>	<b>8 of 91</b>

Title:

### TURBINE GENERATOR PROJECT MANAGEMENT PLAN

Unit	Start of Refurbishment Outage	Finish of Refurbishment Outage	Duration (Months)	Overlap on Previous Unit
D2	October 2016	October 2019	36	
D3	October 2019	October 2022	36	0
D1	March 2021	March 2024	36	19
D4	October 2022	October 2025	36	17

The current reference schedule is as follows:

- Initiation Phase – 2008 - 2009 COMPLETE
- Definition Phase - Preliminary Planning – 2009 - Dec 2011 COMPLETE
- Definition Phase - Engineering and Detailed Outage Planning – 2012 - 2016
- Field Execution and Closeout Phase (four units) – 2016 - 2025
- Operation Phase (Return to Service of Units) - Starting with the first unit in 2019

The Turbine Generator Project is one of the major projects within refurbishment. Timely, cost effective preparation and completion of this scope and project will be required to meet objectives for the refurbishment outage.

The goals of the Darlington Refurbishment project (ref: NK38-CORR-09701-0458306, *Common Outage Goals and Objectives for Darlington Refurbishment*), which are aligned with the high level goals of the Turbine Generator Project, are:

- Station and Refurbishment scope is completed safely, at the specified quality, on time and on budget;
- Transitions of units, work programs and staff between the Station and Refurbishment are planned and controlled to minimize disruption in Refurbishment and Plant Operations;
- Darlington operation post-Life Extension meets OPG documentation requirements and operating objectives, as defined by the Nuclear Performance Index and the Equipment Reliability Index.

## 2.0 PROJECT DESCRIPTION

The Turbine Generator Project (the "Project") is one of the major projects under the Darlington Nuclear Refurbishment Program. The Turbine Generator sets, auxiliaries, and controls are highly specialized equipment designed and supplied as an integrated system for the Darlington station. The Project is planned to be executed within the refurbishment window for each unit.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>9 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The Project scope of work has been generated using recommendations from a Component Condition Assessment (CCA) program undertaken by OPG in order to identify components of the Turbine Generators and their auxiliaries which exceed the lifetime or need replacement due to other reasons. These recommendations are a combination of the Condition Assessment Program (CAP) report developed by the OEM - Alstom Canada Inc. and OPG operational experience. One of the findings in the CCA process was that a variety of turbine generator components either mechanical, electrical or instrumentation have to be replaced due to aging or obsolescence related issues. Another finding was that a number of components require more detailed inspection or technical analysis.

To meet contracting objectives and project execution requirements, the targeted Turbine Generator work packages have been bundled as follows:

- (a) Turbine and Auxiliaries - inspections, overhauls, repairs, modifications and replacements of specific equipments and components.
- (b) Generator and Auxiliaries - inspections, overhauls, repairs, modifications and replacements of specific equipments and components.
- (c) Moisture Separator Reheater (MSR) - inspection, overhaul, repair, modification and replacement of specific equipments and components.
- (d) Steam Turbine Electronic Controls (STEC) - upgrades from an analog to a digital platform.
- (e) Generator and Excitation Controls - upgrades from an analog to a digital platform.

Life extension of the Turbine Generator equipment will extend the life of the station by 30 years to the 2050 station end date.

### 3.0 PROJECT MANAGEMENT APPROACH

There are five distinct phases considered during the life of the project:

- Project Definition
- Execution Planning
- Project Execution
- Commissioning
- Project Closeout

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>10 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The Definition Phase includes the scope identification, development of the contracting strategy and contract award, detailed engineering substantial completion, and other tasks required to prepare for the Execution Phase work.

The Execution Planning Phase includes completion of all engineering deliverables, procurement, and outage planning.

The Execution Phase work includes detailed engineering, inspection, overhaul, refurbishment, replacement of TG equipment and components, layup and preservation of the turbine generator and auxiliary systems.

The Commissioning Phase includes both static and dynamic commissioning of the refurbished / replaced equipment including controls and excitation systems.

The Project Closeout includes the administrative closure (archive project information, confirming all deliverables have been met, analyze project success, lessons learned, transfer the project products to Operations) and the contract closure.

The project management approach for the TG Project has two main components:

- **Engineering Services and Equipment Supply (ESES) model**

The Turbine Generator equipments and components are highly specialized with a significant level of integration. It has been determined that purchasing the most critical / specialized TG components, equipment and engineering services from the Original TG Equipment Manufacturer (OEM) is the most time / cost efficient alternative.

OPG has awarded an ESES contract for the Darlington Refurbishment Turbine Generator Project with the OEM - Alstom Power & Transport Canada.

During execution, the ESES will provide technical assistance and support to the EPC in disassembly and assembly of the turbine generator, assist in dispositioning any inspection findings and installation and commissioning of new equipment. The ESES will also execute certain specialized inspection (DIRIS,etc.)

The ESES project management plan is detailed under TS-PLAN-PMT-0002.

- **EPC (Engineering, Procurement and Construction) contracting model.**

The EPC contractor will provide the integration of the entire project scope, including the equipment supplied from the ESES (as described above). This will include the Engineering Change Control related work, limited procurement, as well as field execution.

OPG will be accountable for performing oversight for all Contractors involved in refurbishment and integrating all work packages throughout the project lifecycle.

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-41000-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R003</b>	<b>11 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Current OPG strategy is to contract this portion of the contract to a qualified Engineering, Procurement and Construction (EPC) contractor. This portion is currently awarded to a Joint Venture (JV) SNC-Lavalin and AECON contractor.

The JV project management plans are detailed under, including sub-plans with the main PMP:

- DNGS TGR – Project Management Plan – Definition Phase 617391-0002-00000-30IM-0001
- DNGS TGR – Project Management Plan – Execution Phase 617391-0002-00000-30IM-0019

Other components include IMS, who will perform inspection on the turbine generators, assessment and recommendations based on inspection results. Third party source surveillance supplier to perform source surveillance on Alstom supplied parts and engineering equipment. This support can be contracted or terminated as required as per the project needs.

Appendix A contains the Contracting Strategy Summary for TG Project.

### **NK38-GUID-09701-10031 “Darlington Refurbishment Execution Strategy”**

provides construction execution information related primarily to Vendors and Construction Execution Field Support, and contains key program and process changes or developments. Information includes details, principals, comments and expectations related to key activities which are or will be planned, executed and verified.

## 3.1 Roles and Responsibilities

The key roles on the TG Project are as follows:

Project Sponsor - Vice President, Nuclear Refurbishment Execution

Contract Owner - TG Project Director and Project Manager

Design Authority - Director Refurbishment Engineering

Accepting Organization - DNGS Director of Operations and Maintenance (DOM)

The TG Project Director and TG Project Manager have the accountability for all aspects of the TG Project.

### 3.1.1 Limits of Authority

The authority to execute the TG Project resides with the Project Sponsor – Vice President of Refurbishment Execution. As sponsor, the VP of Refurbishment Execution delegates execution authority to the TG Project Director. This authority includes the following:

## Plan

Internal Use Only		
Document Number:	Usage Classification:

<b>0001</b>	<b>R003</b>	<b>12 of 91</b>

Title:

### TURBINE GENERATOR PROJECT MANAGEMENT PLAN

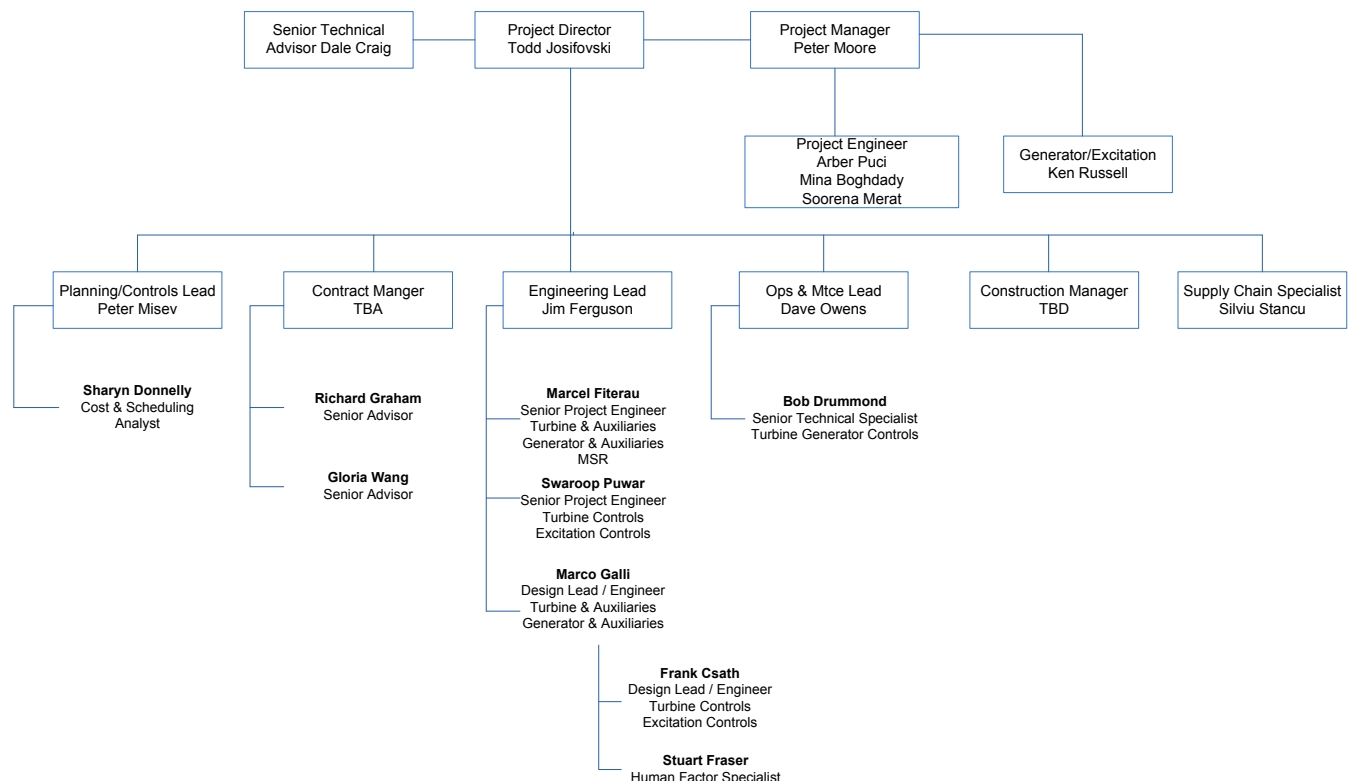

- Determine the structure, size and makeup of the organization required for project execution.
- OAR authority for TG Project costs as per OPG-STD-0017, *Organizational Authority Register*.

#### 3.1.2 Project Organization

The TG Project staffing structure has been organized to facilitate project execution in the EPC contracting model. The organization has been setup to align with the work packages.

It is TG Project's plan to staff the project team with OPG and Contract staff. OPG staff will either be embedded in the team or will perform functions "matrixed" from the NR functional support organization. Where NR functional support staff are currently unable to fulfill a specific need, due to unavailability or missing skill sets, the project will either utilize managed task contracts to maximize outside experience or attempt to find staff within other OPG business units.

The project organization is shown in the following chart:

This chart reflects the staffing structure as of end of May 2015. This structure is expected to change during the next stages based on project's demands.

## **TURBINE GENERATOR PROJECT MANAGEMENT PLAN**

### **4.0 MANAGEMENT PROCESSES**

#### **4.1 Gated Process for Projects**

The Gated Process for the Project establishes the requirements and strategy for funding release to support the Turbine Generator Project. The Project will adhere to the requirements as specified in N-MAN-00120-10001-GRB *"Nuclear Projects – Gated Process"*.

The gate strategy plan has been developed to document the overall strategy to achieve and progress through each respective gate, the deliverables associated with each gate, and, the anticipated timing of each gate. These activities have been incorporated into the project schedule and will be tracked accordingly. It is anticipated this document and the strategy/timing will change as the project moves forward.

### **5.0 PROJECT MANAGEMENT PLAN COMPONENTS**

The project management plan integrates and consolidates all the subsidiary management components. The content of these subplans are subject to change as the project progresses or the contracting strategy changes.

#### **5.1 Communications Management Plan**

The purpose of the Communications Management Plan is to determine the information and communication needs of the project stakeholders (internal to OPG and external), Project Team and determine how information will be distributed. The Communications Management Plan defines the following:

- Communication requirements based on roles
- What information will be communicated
- How the information will be communicated
- When will information be distributed
- Who sends the communication
- Who receives the communication

The communication plan is consistent with the agreed communication plan between OPG and the EPC and ESES Vendors.

##### **5.1.1 Communications with the Canadian Nuclear Safety Commission and Other Regulatory Agencies**

All official communication with the CNSC and other Regulatory Agencies will be through the OPG Nuclear Regulatory Affairs Division.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>14 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

N-PROC-RA-0047 *“Communications with the CNSC”*, and N-PROC-RA-0026, *“Regulatory Action Management”* are used to manage all regulatory communications.

### 5.1.2 ESES and EPC Communication Management

#### 5.1.2.1 Roles and Accountabilities

All communication from the ESES and EPC Contractors to OPG, and from OPG to the ESES and EPC, will be through the OPG Representative or his Designated Delegate as follows (may change with needs of the project):

Role	Primary	Title	Alternate	Title	Scope
OPG Representative	Todd Josifovski	Project Director	Peter Moore	Project Manager	As per Agreement
Alstom Representative	Michael Winters	Project Director	David Kurz	Project Manager	As per Agreement
JV Representative	Mustafa Shousheh	Project Director	Kevin Folk	Construction Manager	As per Agreement
OPG Project Management	Peter Moore	Project Manager	Pejman Asgaripour	Project Manager	As per Agreement
OPG Designated Delegate	Jim Ferguson	Engineering Lead	Marco Galli	Design Team Lead	Engineering
OPG Designated Delegate	Marcel Fiterau	Senior Project Engineer	Dale Craig	Senior Advisor	Turbine/Generator & Auxiliaries, MSR
OPG Designated Delegate	Swaroop Puwar	Senior Project Engineer	Bob Drummond	Senior Tech Specialist	Turbine Controls
OPG Designated Delegate	Ken Russell	Senior Project Engineer	Swaroop Puwar	Senior Project Engineer	Excitation Controls

#### 5.1.2.2 Darlington Refurbishment Records and Document Control

Nuclear Refurbishment Records and Document Management (RDM) staff play a primary role in the receipt, routing and management of documentation deliverables submitted for information, review or acceptance. RDM staff manages all formal documentation deliverables from the point of submission, until final acceptance by OPG. Contact information for RDM staff is outlined in the table below:

Name	Role	Contact Info
David Glover	Senior Manager, Records and Document Management	<a href="mailto:david.glover@opg.com">david.glover@opg.com</a>
Lynn Adams	Section Manager, Records and Document Management	<a href="mailto:lynn.adams@opg.com">lynn.adams@opg.com</a>
Michael Hughes	Administrator, OPG Engineering	<a href="mailto:michael.hughes@opg.com">michael.hughes@opg.com</a>

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>15 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Name	Role	Contact Info
	Document Management System (VenDM)	
Angela Webster	First Line Manager, Records and Document Management	<a href="mailto:angela.webster@opg.com">angela.webster@opg.com</a>
	RDM Document Controllers	Email account NR DOC CONTROL

The Project Director or Manager for the EPC and ESES will identify the people within their organization, with whom OPG RDM staff will communicate on project documentation issues. This would include one or more persons who are authorized to identify staff needing access to the OPG Engineering Data Management System (VenDM). This will help ensure that OPG has timely and correct information about the number of users and their roles during the life of the project.

### 5.1.2.3 Communication Protocol

#### Correspondence

All formal correspondence (official memorandums) shall be issued to OPG via VenDM. Each memorandum must clearly indicate the intended recipient. OPG RDM staff will route the correspondence accordingly, and ensure a record copy is kept on file.

Informal correspondence issued via email, can be sent directly to the appropriate project team member, with a cc addressed to the standard Email Correspondence lists below.

OPG project team members will obtain an OPG Record Number for official correspondence sent to the EPC or ESES as appropriate, and will forward to DNGD:Refurb Doc Mgmt for filing.

#### Requests for Information

The following process for the flow of RFI has been established between OPG and the ESES and EPC vendors:

1. RFI is generated by JV and sent to Alstom Interface Spoc
2. Alstom Interface Spoc routes the RFI to Alstom's Resident Technical Advisors
3. A conversation happens between Alstom's Resident Technical Advisors and the OPG team to decide who should answer the RFI.
4. IF Alstom responsible, RFI is routed to Alstom department, and response coordinated by Alstom Interface Spoc.
5. IF OPG responsible, it's answered directly by OPG.

#### Email Correspondence

The following email cc: lists have been developed with the ESES Vendor.

**Document Submissions**

The communications management principles for Submittals are outlined below:

- All technical and/or formal documentation deliverables owed by the EPC or ESES has been submitted to OPG via the Vendor Document Management System (VenDM) and will continue to be in that manner for any future documents, except where other means have been agreed between OPG and vendors.
- Submission to OPG (or from OPG) of Submittals or other transmissions to/from the ESES or EPC Contractors has been done via existing FTP (before contracts award) or VenDM (after contracts award).
- VenDM has been subdivided into elements as per TG WBS. For example, separate folders for submittals related to Turbine & Aux, Generator & Aux, and Turbine Controls etc.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>19 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- The ESES and EPC have developed a matrix of planned submittals (“Submittal Tracker”).
- Submittals have been workflowed to reviewers of a particular document by OPG sub-leads for comments. OPG reviewers will enter comments directly into VenDM, for transmission back to the Contractor.
  - For the ESES, as per contractual agreement and in compliance with their internal QA program, comments have been gathered in a single document on the ESES side of VenDM for dissemination and disposition of comments among their various international design groups. The ESES have been consolidating the comments/dispositions and entering them back into VenDM for transmittal to OPG.
  - For the EPC, the VenDM has been used in a manner which supports effective communication, timely review and acceptance of submittals, and value for money.
- TG project SPOCs are accountable for timely review consolidation of comments for Submittals. The turnaround time has been as per contractual durations outlined in the contract / agreement documents.
- Contractual review periods only begin once a document is uploaded into VenDM.
- Updated submittals which include incorporation of comments by OPG are stored in OPG’s shared TG drive or Internal SharePoint drive and will continue to be in the same manner for the remaining phases of the project.

## 5.2 Scope Management Plan

The Scope Management Plan identifies the method of defining, managing and controlling scope throughout the project. It includes the development of:

- Scope statements
- Work Breakdown Structure
- Scope of supply / scope of work documents
- Cost Benefit Analysis - CBA
- Decision Record and Analysis Summary - DRAS
- Process by which scope changes will be managed

The Turbine Generator Scope Management will be in accordance with NK38-INS-09701-10001, *Darlington Refurbishment Project – Scope Control* and NK38-NR-PLAN-09701-10000, *Refurbishment Program Management Program*.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>20 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### 5.2.1 Scope Statements

The primary objective of the Refurbishment Program is to successfully refurbish the DNGS life-limiting components in order to allow the station to operate for 30 years (or the equivalent of 210,000 EFPs) beyond the current predicted end of service life. The Refurbishment Program must maintain and return the unit in the condition in which it is turned over, at a minimum. The goal of the TG Project is to deliver all core and approved non-core TG scope (through the DRAS process) within the allotted timeline and budget.

**Core scope** is work that must be done to achieve the Primary Objective of refurbishment as defined in NK38-INS-09701-10001, *Darlington Refurbishment Project – Scope Control*. Core scope will determine the critical path for the refurbishment outage and sets the lower boundary for the cost estimate. Core scope includes:

- **Regulatory scope** – scope that is not optional in order to support station license and regulatory requirements, as agreed with the regulator and documented in the Integrated Improvement Projects based on Environmental Assessment, Integrated Safety Review and other activities such as Global Assessment which do not require Economic Assessment.
- **Station Life Limiting Components** – modification, repair, or replacement of station life limiting components that must be replaced in order to allow the extension of station operations beyond its current end of life, including items which have an asset class tied to station life.
- **Component Upgrades** – work to upgrade components, which have a high station priority that can only be done during an extended refurbishment outage.
- **Programmatic work** – Programmatic work typically performed online or in a normal station outage that must be done in the refurbishment period in order to maintain station licence, including mandatory Preventive Maintenance, inspections, etc.
- **Prerequisite Scope** – scope that must be done in order to enable a successful refurbishment, including pre-refurbishment incremental inspections to determine refurbishment scope, and pre-refurbishment modifications such as islanding modifications or fuel machine upgrades to meet refurbishment production requirements during the refurbishment period.

**Non-Core Scope** – Will be performed in the refurbishment period if it has no impact on the projects Core Scope critical path, does not add risk to the successful completion of core scope, and where cost or resource efficiencies and station priority warrant the work to be executed in the refurbishment period. A Business Case Assessment or Decision Record Analysis Summary (DRAS) N-FORM-11390 demonstrating the economic advantage; including risk management and/or reliability improvement, and priority of completing this work during, pre-, during or post-refurbishment will be required to gain approval.

**Plan**

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-41000-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R003</b>	<b>21 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### 5.2.2 Scope of Supply

The first component of the TG contract is for Engineering Services and Equipment Supply. The OPG has engaged to purchase directly some of the most specialized TG equipment / components and engineering services from an Engineering Services and Equipment Supply (ESES) Vendor, the scope being outlined in the following documents:

- (a) NK38-SOW-41000-10002 Scope of Supply - Turbines and Aux
- (b) NK38-SOW-42000-10002 Scope of Supply - Generators and Aux
- (c) NK38-SOW-41800-10002 Scope of Supply – Moisture Separator Reheater (not issued)
- (d) NK38-SOW-64100-10003 Scope of Supply - Turbine Controls Upgrade
- (e) NK38-SOW-64220-10002 Scope of Supply - Generation Excitation Control Upgrade

### 5.2.3 Scope of Work

The strategy for overall TG refurbishment, including the integration of services and equipments supplied by the ESES (as shown under Scope of Supply) has been developed separately, through a separate contract with the EPC contractor. As such, Scope of Work documents have been generated. They were broken down into each of the 5 subprojects plus Inspections:

- (a) NK38-SOW-41000-10003 Scope of Work - Turbines and Aux
- (b) NK38-SOW-42000-10003 Scope of Work - Generators and Aux
- (c) NK38-SOW-41800-10003 Scope of Work – Moisture Separator Reheater
- (d) NK38-SOW-64100-10004 Scope of Work - Turbine Controls Upgrade
- (e) NK38-SOW-64220-10003 Scope of Work - Generation Excitation Control Upgrade
- (f) NK38-SOW-40000-10001 Scope of Work – Inspections (Optional Scope)

### 5.2.4 Scope of Work (Other)

- (a) NK38-SOW-44000-10001 Scope of Work - Turbine Hall Crane
- (b) NK38-SOW-41000-10001 Scope of Work - Condenser Struts
- (c) NK38-SOW-09701-10041 Scope of Work - Turbine Generator And Auxiliaries Systems Layup

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>22 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

## 5.2.5 Scope Review and Verification

Through definition phased on the project, scope has been removed from and/or added to the Darlington Scope Request (DSR) database. As described in the NK38-NR-PLAN-09701-10001, *Refurbishment Program Scope Management Plan* when the Definition Phase is complete, the Program scope has been finalized and currently reflects the scope baseline. Following the Definition Phase, it is expected that minimal scope changes will be initiated through the DSR process. For the most part, TG discovery work will be covered by project contingency on identified contingent work and via contingency analysis (Monte Carlo). Any additional discovery work (unknown unknowns) will be covered by management reserve. The majority of discovery work changes will be initiated through Project Change Directives (PCDs) which will streamline the process, facilitate swift OPG responses, and ensure that schedule milestones are achieved.

Scope verification will include quality checks, tracking PCDs, reviewing the Basis of Estimates (BOEs) and monitoring status against the Release Quality Estimate (RQE). As the Execution Phase progresses, the final cost of each deliverable will be compared to the RQE at a high level. For the TG Project, scope verification will involve continually validating scope against the original estimate and ensuring that the Contractor does not complete more work than that which is required to achieve success.

OPG, the ESES and EPC Contractors will transparently collaborate under a Cooperation Agreement, by co-developing risk registers and estimates, in order to complete the TG Project successfully. This is expected to prevent surprises, provide value for money, and ensure that OPG receives all agreed-upon deliverables.

## 5.2.6 Scope Change Control – ESES and EPC

The process for identifying the Project scope and the management of scope changes is described in the *Scope Review Instruction* (NK38-INS-09701-10001). The intent of the instruction is to ensure that proposed scope additions and/or deletions have undergone a thorough assessment based on the return on investment, impacts on plant safety, reliability, project schedule and cost, program resourcing, regulatory requirements and environmental impacts.

Currently, all work requested to be included in the scope of the Darlington Refurbishment Program is initiated via the DSR database. DSR form (D-FORM-10757) must be completed in order to add new scope to the DSR database. The DSR database provides a common format through which DSRs can be submitted and reviewed. Once requested in the database, the scope will be processed and eventually reviewed by the screening committee, the funding committee and the PSRB.

Once the TG execution phase begins, OPG will be required to provide responses to the Contractor requests within predefined time intervals; delayed responses could potentially affect the critical path schedule. In an effort to streamline the process and facilitate timely and accurate OPG responses to changes in the work, all TG discovery work will be initiated through PCDs.

**Plan**

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>23 of 91</b>

Title:

**TURBINE GENERATOR PROJECT MANAGEMENT PLAN**

DSR entries will not necessarily be required for PCDs since discovery work items will likely correspond to an existing DSR database line item. For example, unanticipated work required to relocate materials that block access to a target system (i.e., a system associated with an approved DSR database line item). Costs associated with the PCDs will be assigned to the specific schedule tasks that require the additional work. Furthermore, when additional discovery work is identified and a PCD has been approved, a variance will be declared against the original DSR line item and the applicable schedule milestone. The details of the work changes or additional work discovered will be added to the description of the existing DSR line item and/or the existing milestone deliverable.

For PCDs that demand significant changes in the work and thus significant cost increases, approval must be obtained as per N-MAN-00120-10001-RISK-07, *Nuclear Refurbishment Assumptions and Decisions Management* (see the following table for reference):

IMPACT TYPES	<\$1M	\$1M-\$5M	\$5M-\$20M	\$20M-\$50M	>\$50M
SCOPE STRATEGIC REGULATORY TECHNICAL RESOURCE OTHER	<b>P</b> – Initiator (minimum Band H)  <b>A</b> – Band G in Initiating Organization	<b>P</b> – Initiator (minimum Band H)  <b>Re</b> – Band G in Initiating Organization  <b>A</b> – Band E/F in Initiating Organization	<b>P</b> – Initiator (minimum Band G)  <b>Re</b> – Band E/F in Initiating Organization  <b>Re</b> – Director, P&C  <b>A</b> – SVP	<b>P</b> – Initiator (minimum Band G)  <b>Re</b> – Band E/F in Initiating Organization  <b>Re</b> – Director, P&C  <b>A</b> – SVP	<b>P</b> – Initiator (minimum Band G)  <b>Re</b> – Band E/F in Initiating Organization  <b>Re</b> – Director, P&C  <b>Re</b> – SVP  <b>A</b> – EVP

### 5.2.7 Scope Change Control – ESES Specific

Scope Change has been carried out in accordance with section 5.2.5, the Agreement and ESES's Standard practices. ESES's Scope Change Procedure covers the following:

- To record, control and authorize all changes and variances to the As-Sold Scope of Supply and/or Services.
- To ensure that sell, cost, man-hour, and schedule impacts of the change are evaluated and identified through the Internal and External Control of Change (COC). The impact of the COC will be monitored through the project financial reporting system.

The incorporation of this system promotes the following benefits:

- Ensure the effect of the change on every discipline is evaluated.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>24 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Provide a formal approval process to ensure changes made to scope of work are reviewed.

ESES will apply the following technical change management process / Interim Inspection Report (IIR) process for parts and equipment:

- (a) Disassembly of component takes place.
- (b) Damage / Defect / Out of Tolerance / Out of Specification / found by on-site personnel.

An Interim Inspection Report (IIR) shall also be issued under the following circumstances:

OPG instructs ESES to install an out of tolerance / out of specification part due to the unavailability of spare parts.

ESES or ESES's Subcontractor follows an incorrect procedure during installation, test or any other site procedures, which are not in compliance with ESES's technical instructions.

A spare part supplied by ESES does not meet with the required standard / dimension / specification but site personnel have to install the part due to time limitations. This would include supplied parts that are within service tolerance or would require replacement within a period less than normal service life of the component.

The Interim Inspection Report (IIR) should also mention any limitation imposed on the performance / reliability of the Turbine Generator due to the installation of parts / components not meeting ESES's design criteria.

- (c) The next available IIR # is to be taken out (Format of IIR # --- Contract # - 1, 2, 3, etc.) and the applicable (turbine or generator) interim inspection report is to be written by the applicable on-site Technical Field Advisors. (The "Report", "Recommendation" and "Schedule Impact" Section are completed.)
- (d) The IIR is officially submitted to OPG either for disposition or information only.
- (e) At the same time the IIR is to be officially submitted to the ESES's Lead Centre Engineering Group for review / comment / disposition as applicable. (The "Engineering Department Recommendation" Section is to be completed.)
- (f) When a response is received from the ESES's Lead Centre Engineering Group, then OPG also must be informed regarding the official Engineering Disposition.
- (g) All IIR's are submitted to OPG for review in order to receive an acknowledgment that OPG has seen and reviewed the "as-found" condition.

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>25 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- (h) If the IIR is returned from an “information only” submission, it is to be ensured that either OPG (the “customer”) has signed the IIR or that a record is kept of who reviewed the IIR and when. (The “Customer’s Response” Section is to be completed.)
- (i) If the IIR is returned from an “OPG review” submission, it is to be ensured that OPG has signed off on the IIR and has provided their acceptance, rejection and/or their own recommendation that may require subsequent review by ESES’s Engineering. (The “Customer’s Response” Section is to be completed.)
- (j) ESES’s on-site personnel are to ensure that all other applicable areas of the IIR are completed prior to final submission to the applicable Canadian Project Manager. In addition, if the recommendation that is given to OPG by ESES requires a change to the original contract, then the IIR must be submitted to the applicable Canadian Project Manager immediately for creation of a Change Request Notice (CRN), which will then be submitted to the customer for their review and acceptance of the additional cost.
- (k) Check that recommendations have been implemented and recorded in IIR.
- (l) Reassembly of machine takes place.

### **5.3 Staffing & Resource Management**

#### **5.3.1 Project Organization / Staffing Plan for the ESES and EPC Contractors**

The roles and responsibilities shown below will be utilized for the Equipment Supply and Engineering Services and Engineering, Procurement, Construction portions of the TG refurbishment project and will be managed by the respective parties.

The ESES’s General Project Team which is led by the Project Director will be put in place as required for the various phases of the project (planning, supply, installation). Support personnel from Taxation, Commercial and Legal, Parts and Logistics, Human Resources and Finance will support the project on an as required basis. The project specific functions of Quality Assurance, Project Controls, Commercial, Supply Chain/Logistics and Planning/Scheduling will report directly to the Project Director. Also reporting to the Project Director, is the Project Manager who is responsible for the coordination of ESES’s internal project resources as well as acting as the Deputy Project Director. The Project Director (or delegate) will be the single point of contact (SPOC) with OPG for the Darlington Refurbishment Project.

The EPC’s project teams will be divided into two phases: Definition phase and Execution phase. A Definition Phase Resourcing Plan was fully defined by the EPC after contract award, coinciding with the Project Management Plan submittal.

The EPC has developed an Execution Phase Resourcing Plan during the Definition phase. The Project Management team assembled during the Definition phase will continue to operate through the Execution phase. Project organization charts were

Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

included in the EPC proposal, and was finalized and accepted by OPG coincident with submission of the EPC Project Management Plan.

## 5.3.2 OPG Roles and Responsibilities

### 5.3.2.1 Project Sponsor

The OPG Project Sponsor:

- “Owns” the project
- Provides the key link between the project team and the OPG senior leadership team
- Supports the project director.

### 5.3.2.2 Project Director

- Acts as Contract Owner
- Project Manager responsible for overall Cost, Schedule, Quality and Scope

### 5.3.2.3 Section Manager – Projects

- Acts as Project Manager responsible for overall Cost, Schedule, Quality and Scope
- Coordinates / facilitates matrixed team – project engineers, CSA, etc

### 5.3.2.4 Contract Manager

- Handles all contract related issues
- Provides contract analysis and support to Project Manager
- Liaises with counterpart within ESES and EPC vendors
- Monitors and preserves OPG’s rights and entitlements under the contracts
- Manages support by Legal (except for Amendments)

### 5.3.2.5 Section Manager – Engineering Lead

The TG Engineering Lead will be matrixed to the Project Director for all engineering related issues including:

- Schedule, Quality and Safety as pertains to Engineering deliverables

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>27 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Align to the project Vendor Owner Interface Requirement for ESES Vendor, and N-STD-MP-0009, *Contract/Owner Engineering Interface and Oversight* for the EPC Contractor
- Act as technical liaison for the Contractor
- Provide technical leadership for matrixed engineering staff assigned to the project team
- Facilitate technical communication between project team and functional support organization
- Facilitate and expedite resolution of project technical issues
- Ensure solutions and approaches are technically correct, effective and consistent with OPG expectations
- To the extent possible, staff the project teams with the required number of appropriately qualified Project Engineers
- For specialized skills will approach the functional group as a shared service
- Maintain Qualified contingency resources via the Owner Support Service (OSS)

### 5.3.2.6 Project Engineers / Senior Advisors

- Review ESES / EPC technical submittals
- Review/respond to Requests for Information
- Act as Subject Matter Experts / liaise with ESES and EPC
- Review non-conformances
- Review as-found component conditions review disposition by ESES
- Provide oversight for ESES / EPC engineering and field activities
- Review commissioning/testing results

### 5.3.2.7 Project & Controls Lead

- Acts as interface between the Project and the functional Project Controls group
- Responsible for project reporting and metrics in the area of cost & schedule
- Analyses cost metrics and variances

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>28 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Updates schedule monthly through the Cost & Scheduling Analyst
- Prepares gate submission packages for funding

### 5.3.3 ESES Roles and Responsibilities

#### 5.3.3.1 Project Director

The Project Director has the total responsibility for the performance of the project in accordance with the contract and to the satisfaction of the Customer, ESES's management and all other stakeholders including but not limited to:

##### Project Execution Strategy:

- Based on the contract, developing and implementing the strategy for the execution of the ESES's work scope in order to achieve the project's performance goals.

##### Performance Management:

- Constantly monitoring and, if requested, reporting the identified performance indicators.
- Immediately taking all necessary actions and decisions to guarantee financial, time, quality and safety performance to maximize the project goals achievements.

##### Project Content Management:

- Addressing change by deciding on actions and leading them in consideration of the defined strategy.
- Immediately informing OPG of any relevant impact on the overall performance of the project.

##### Risk and Opportunities Management:

- Constantly updating and reviewing the risk and opportunities of the project.
- Evaluating and deciding on actions that benefit the overall performance of the project, consulting with the management if appropriate.
- Following-up these actions, implementations and results.

##### Project Process:

- Assuming full responsibility for the delivery of the allocated project scope, from start until all obligations are complete.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>29 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Taking necessary actions to improve the project process. Also providing feedback to other Business Functions on the performance of the project and processes.
- Leading Monthly, Quarterly Review, Executive, Steering Committee , and QPR Presentation Meetings

### People Management:

- Providing direction to the Project Manager for building, leading and coaching the committed project team to guarantee the highest-level performance for the project.
- Defining project goals and objectives, reviews performance evaluations and provides performance evaluation and development plans to the functional management.

### Safety:

- Development and implementation of site EHS programs to ensure compliance with ESES and OPG standards.
- Have a good knowledge of ESES and OPG Safety Policies and Procedures.
- Participating in safety and environmental incident investigations.
- Participating in personal and peer job safety.
- Have completed all necessary training to carry out the assigned tasks.
- Use Human Performance tools Questioning Attitude, STAR (Stop-Think-Act-Review), job site review, etc.

### Work Control:

- Required to stop work in the event of any conflict with Health, Safety, Work Package, or OPG, or ESES's policy or procedure.
- Be able to manage integration with overall refurbishment schedule.

### Quality:

- Recording and reporting of projects lessons-learned and participating in closeout meetings with OPG Project Director.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>30 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Commercial:

- Ensure that the contractual commitments, obligations and requirements are commonly understood by all personnel.
- Provide guidance and direction on questions of interpretation of the contractual terms and conditions.

### 5.3.3.2 Project Administration

#### Responsibilities

- Follow up on open/outstanding/overdue actions from the Action Tracker in the ESES Team Site
- Provide back-up for the Submittal Tracker and OPG Submittal Process
- Responsible for all local logistics for the Project Team
- Coordinate the security clearance, immigration and training requirements of the ESES Project Team
- Coordinate the customer training requirements

### 5.3.3.3 Local Project Managers

The Project Manager is more inward focus toward the project's requirements, schedule, and budget.

The Local Project Manager will be specifically responsible for three distinct areas of the project.

- Product Supply Phase – The Project Manager will oversee and coordinate all supply activities from ESES's various Product Lines in conjunction with the Project Manager. Additional Project Managers/Project Management support will be engaged as required.
- Project Execution and Commissioning Phase – The Project Manager will oversee and coordinate all Site Execution and Commissioning Activities in conjunction with the Refurbishment Outage Coordinator Lead.
- Stator Rewind (Units 3&4) – The Rewind Workshop Project Manager will report directly to the Project Manager in all matters relating to the stator rewind activities that will be completed at an offsite workshop.+

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>31 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The responsibilities of the Project Managers include but are not limited to:

### Communication:

- Providing adequate reporting to all stakeholders such as OPG, business partners and management.
- Managing the internal and external communication loop.

### Project Organization

- Setting up and securing the necessary resources for the execution of their specific project.
- Organizing the Project Team and ensuring that the team members have clearly identified roles, responsibilities, defined interfaces and are empowered to execute their duties.

### Quality, Environmental and Health & Safety Management

- Ensuring best compliance with specification at lowest final cost.
- Launching the preparation and monitoring of inspection test programs.
- Consolidating and approving the documentation on the allocated scope.
- Ensuring Quality, Environmental and Health & Safety requirements are met.

### Risk and Opportunities Management

- Assisting the Project Director with reviewing the risk and opportunities of the project.
- Providing input to the Project Director on actions that benefit the overall performance of the project and following-up and/or implementing those actions and reporting results to the Project Director.

### People Management

- Building, leading and coaching the committed project team to guarantee the highest-level performance for the project.
- Directing the implementation of project goals and objectives, evaluating performance against them and providing performance evaluation and development plans to the Project Director.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>32 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Project Planning

- Developing and monitoring the Master Time Schedule, managing project float to ensure timely completion of the project.

### Safety

- Development and implementation of site programs to ensure compliance with OPG Contractor company's policies and standards.
- Have a good knowledge of OPG and ESES's Safety Policies and Procedures.
- Participating in safety and environmental incident investigations.
- Participating in personal and peer job safety
- Have completed all necessary training to carry out the assigned tasks.
- Immediately notify supervisor of all injuries, no matter how minor, and near misses.
- Use Human Performance tools Questioning Attitude, STAR, job site review, etc.

### Work Control

- Required to stop work in the event of any conflict with Health, Safety, Work Package, or OPG, or ESES's policy or procedure.

### Quality:

- Recording and reporting of projects lessons-learned and participating in closeout meetings with Project Director.

### Commercial:

- Assisting the Contract Manager with claim handling.
- Create and maintain Delay and COC register

### Reporting Structure:

- The Project Managers report in all project related items directly to the Project Director for installation items.

Plan

<b>Internal Use Only</b>

Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>33 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

#### 5.3.3.4 Project Planner/Scheduler

The responsibilities of the Project Planner/Scheduler include but are not limited to:

##### Safety:

- Participating in safety and environmental incident investigations.
- Participating in personal and peer job safety
- Have completed all necessary training to carry out the assigned tasks.
- Immediately notify supervisor of all injuries, no matter how minor, and near misses.
- Use Human Performance tools Questioning Attitude, STAR, job site review, etc.

##### Work Control:

- Assisting the Project Director in the development of a clear, accurate and consistent outage installation schedule. The schedule shall reflect the correct scope, costs, resources, constraints, logic and task durations in line with the Contractor's Time Schedule and have effective interfaces with the OPG's Program Milestones (PIMS).
- Preparing regular progress reports to OPG.
- Prepare and issuing daily 'look ahead' reports, forecasts and schedule briefings.
- Liaise with OPG site installation planning dept. to update station schedules as required.
- Updating and maintaining the schedule.
- Attending the Shift Turnover meetings.
- Required to stop work in the event of any conflict with Health, Safety, Work Package, or OPG, or ESES's policy or procedure.
- Lead Update meetings and look ahead discussions.
- Ensuring full compliance of all Installation scheduling activities with ESES's internal requirements.
- Supervising the work control documents (work packages).
- Supervising the interface between ESES's work groups and the OPG's Work Control System.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>34 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Analyzing and maintaining the consolidated schedule and project plan
- Assisting the Contract Manager with contract change handling.
- Prepare the project schedule in line with the Work Breakdown Structure provided by the customer, to ensure that ESES's schedule may be aligned with the overall Darlington Refurbishment Schedule. Internal ESES requirements for data collection, controlling, etc. capabilities to be maintained.
- Data collection/updates/analysis
- Earned Value – "S" Curves and Engineering Hours
- Monthly Reporting

### Quality:

- Recording and reporting of projects lessons-learned and participating in closeout meetings with Project Director.

### Reporting Structure:

- The Scheduler reports in all project related matters directly to the Project Director.

### 5.3.3.5 Quality Assurance Manager

The responsibilities of the Quality Manager include but are not limited to:

### Safety:

- Participating in safety and environmental incident investigations.
- Participating in personal and peer job safety
- Have completed all necessary training to carry out the assigned tasks.
- Immediately notify Project Director of all injuries, no matter how minor, and near misses.
- Use Human Performance tools Questioning Attitude, STAR, job site review, etc.

### Work Control:

- Attending the Shift Turnover meetings.
- Required to stop work in the event of any conflict with Health, Safety, Work Package, or OPG, or ESES's policy or procedure.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>35 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Quality:

- Ensure the mechanical integrity, quality of the turbine & generator refurbishment
- Ensure that all work is carried out in accordance with ESES and OPG policies, procedures and expectations.
- Regular audits of work packages and test certificate completion (twice per week).
- Manage installation documentation handover.
- Create and maintain a site register of NCRs (non-conformances).
- Monitor NCR resolution and report on completion.
- Audit and witness FME close out inspections as required.
- Recording and reporting of projects lessons-learned and participating in closeout meetings with Project Director,

### Authority:

- The Quality Manager is authorized to act on behalf of the Project Director and Project Manager in all matters regarding Quality issues, but in no case agree to any modification of or amendment to the contract documents. He is authorized to stop the work, if required, to ensure the quality of the product is maintained.

### Reporting Structure:

- The Quality Manager reports all project related matters directly to the Project Director and Project Manager

### 5.3.3.6 Supply Chain / Logistics Manager

The Supply Chain / Logistics Manager is responsible for movement of equipment and materials on site. The responsibilities of the Supply Chain / Logistics Manager include but are not limited to:

### Safety:

- Participating in safety and environmental incident investigations.
- Participating in personal and peer job safety
- Have completed all necessary training to carry out the assigned tasks.
- Immediately notify supervisor of all injuries, no matter how minor, and near misses.

### **TURBINE GENERATOR PROJECT MANAGEMENT PLAN**

- Use Human Performance tools Questioning Attitude, STAR, job site review, etc.

#### Work Control:

- Attending the Shift Turnover meetings.
- Required to stop work in the event of any conflict with Health, Safety, Work Package, or OPG, ESES or EPC's policy or procedure.

#### Quality:

- Recording and reporting of projects lessons-learned and participating in closeout meetings with Project Director

#### Material Control:

- Coordinating material deliveries with OPG.
- Coordinating with OPG Security regarding incoming equipment and material deliveries.
- Managing the safe delivery of equipment and materials to the correct working areas as scheduled and required.
- Inventory of contract material and spares.
- Document and report equipment/material deficiencies and shortages.
- Identification and quarantine of damaged equipment

#### Authority:

- The Supply Chain / Logistics Manager is authorized to act on behalf of the Project Director regarding logistic/material issues, but in no case agree to any modification of or amendment to the contract documents.

#### Reporting Structure:

- The Supply Chain / Logistics Manager reports in all project related matters directly to the Project Director

### **5.3.3.7 Contracts Manager**

The responsibilities of the Contract Manager include but are not limited to:

- Handling of all contract related issues raised by the site installation or project teams or external parties until all relevant commercial obligations are complete and all relevant commercial issues are resolved/settled.

**Plan**

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>

Title:

**TURBINE GENERATOR PROJECT MANAGEMENT PLAN**

- Ensuring that contractual commitments, obligations and requirements are commonly understood and respected by the site installation team and providing assistance in ensuring commitments, obligations and requirements are properly addressed.
- Providing requested contractual analysis and support to the Project Team.
- Establishing, implementing and managing project specific commercial procedures, particularly those impacting subcontracting, clarifications, variation requests/orders, insurance, notifications, correspondence and claims management strategy.
- Liaising with site installation planning to ensure appropriate schedules and supporting documentation are produced, monitored, and maintained to support Project Claim strategy.
- Supporting the development of the project risk and opportunity identification and analysis via implementation of appropriate commercial action plans.
- Preserving and monitoring ESES's rights and entitlements as provided in the contract, including proper notices to all relevant parties.
- Controlling back charges from site and ensuring appropriate recovery from relevant 3<sup>rd</sup> parties.
- Managing Project Insurances, including submission, monitoring and settlement of insurance claims in accordance with the Policies.
- Providing guidance and direction on questions of interpretation of the contractual terms and conditions, as well as general contractual issues relative to any aspect of the installation.
- Handling and managing of support by Legal Department and external experts wherever needed.
- Providing support to Legal Department as required in the event of a Dispute.
- Undertaking such necessary commercial tasks, as instructed/requested by Project Director, to facilitate Project Director's effectiveness in Project Management.
- Working with JV
- Creating and maintaining contract change register.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>38 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Authority:

- The Contract Manager is authorized to take positions, gather factual statements, advance position statements and act upon notices, directions, and instructions on behalf of the Project Director, but in no event to agree to any modification of or amendment to the contract documents.

### Reporting:

- The Contract Manager reports in all project related items directly to the Project Director.

## 5.3.3.8 Resident Technical Advisor (RTA)

### Responsibilities

The Resident Technical Advisor is responsible for the oversight of the planning, coordinating and execution of the site work for the Darlington Refurbishment project. The role's responsibilities include supporting all aspects of installation planning, budget and resources estimating, and the coordination of interfaces between Alstom's project organization, including internal and external installation subcontractors, and OPG's site organizations. Responsibilities include, but are not limited to:

- Integrated outage planning with contractors and OPG; schedule, procedures, budgetary estimates, risk management, EHS, etc. covering all resources; manpower, tools and equipment. The development of an overall integrated outage plan including risk review, mitigation plan and follow-up.
- The technical and organizational interface to ESES's Refurbishment Engineering and Project Management, OPG's site organization and ESES's contractors.
- Maintaining and developing generic and project specific procurement specifications.
- Directing the execution of the retrofit outage scope.
- Full responsibility for managing the installation schedule, EHS, and the reporting to and interfacing with OPG on site.
- Project specific reporting to the Project Director.
- Ensuring that Alstom and its contractor conform to all applicable local, plant, province and country legislation and ESES procedures in respect of EHS issues for own protection and for protection of reporting staff.
- Recording and reporting of projects lessons-learned and participating in closeout meetings with Project Director, OPG's representatives and contractors.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>39 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Integrated outage planning for all resources (man-power, tools and equipment) with contractors and customers including schedule, procedures, budgets, risk management, EHS, etc.
- Supporting and leading incident investigations.
- Training and instruction of ESES's Refurbishment Organization and OPG Operations and Maintenance staff.
- Supporting Experience feedback initiatives with input, evaluation and leading of improvement actions.
- Defining site management organization and structure for Installation.
- Managing installation related documentation exchanges and requirements.
- Providing input for the claims register to Contract Manager and Scheduler.
- Notifying the OPG Project Director if the job will be delayed.
- Resident Technical Advisors will be involved in outages (pre-refurbishment) wherever feasible, for training purposes and to provide outage support.

### Safety

- Obtain ESES Internal EHS Management System Qualification
- Development and implementation of site EHS programs to ensure compliance with Alstom and OPG standards.
- Have a good knowledge of ESES and OPG Safety Policies and Procedures.
- Participating in safety and environmental incident investigations.
- Participating in personal and peer job safety
- Have completed all necessary training to carry out the assigned tasks.
- Use Human Performance tools Questioning Attitude, STAR (Stop-Think-Act-Review), job site review, etc.

### Authority

- The Resident Technical Advisor is authorized to act on behalf of ESES and the Project Managers on all aspects of installation, planning, coordination and execution but in no case to agree to any modification of, or amendment to, the contract documents. He/ She is authorized to direct, instruct ESES's site management and installation organizations.

## Plan

Internal Use Only

Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>40 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Reporting

- The Resident Technical Advisor reports all project related matters directly to the Project Manager & Project Director.

### 5.3.3.9 Technical Field Advisor (TFA)

#### Responsibilities

The Technical Field Advisor provides technical advice and guidance for the disassembly and modification of the existing plant and the installation of the new refurbishment components. Responsibilities include but are not limited to:

- Ensuring the mechanical integrity, quality of the turbine & generator refurbishment and operation.
- Providing technical assistance and advice on the disassembly and reassembly of all turbine components.
- Directly monitoring the disassembly and assembly of the turbine and associated equipment, providing guidance to the craft labor as required to ensure the mechanical integrity and quality of the turbine.
- Ensuring that the pre-determined work scope is completed following procedures, instructions and inspection and test plans.
- Ensuring that check sheets and work packages are completed and signed off correctly and in a timely manner consistent with the requirements of the contract.
- Maintaining an individual work record and notebook.
- Supervising the use of precision measuring hand tools, hydraulic bolt stretchers, and other industrial tooling and equipment.
- Prepare detailed reports based upon findings and actions taken as and when required.
- Supervised the work to be performed to the applicable quality standard to ensure safe and reliable operation of equipment.
- Notifying the Refurbishment Outage Coordinator if job will be delayed.

#### Authority

- The Technical Field Advisor is authorized to act on behalf of ESES in aspects of execution of the contract work.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>41 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Reporting

- The Technical Field Advisor reports in all project related matters directly to the Refurbishment Outage Coordinator.

**Note:** These responsibilities will be expanded upon once the team is specifically defined.

#### 5.3.3.10 Assessment Engineer

The responsibilities of the Assessment Engineer will be determined upon once the team is specifically defined.

#### 5.3.3.11 Project Manager - ESES's Design and Manufacturing Headquarters

The Project Manager will coordinate the design, manufacture and supply activities for the various project packages (Turbine & Auxiliaries, Generator & Auxiliaries, Turbine Controls, and Excitation Controls). The project specific functions of Finance, Commercial, Scheduling, Quality Assurance, Project Engineering and Supply Chain will report directly to the Project Manager. Additionally, the individual Project Managers/Director for the specific project packages will coordinate their tasks and responsibilities with the Project Manager.

The Project Manager has the responsibility to coordinate all matters related to the performance of the TS Product Line scope of supply of the project. The Project Manager clearly communicates the essential tasks and requirements of the TS Product Line scope of supply of the project to the Design project team.

The responsibilities of the Project Manager include but are not limited to:

- Constantly monitoring and, if requested, reporting identified performance indicators as provided by Project Director. Immediately taking all necessary actions and decisions to guarantee financial, time, quality and safety performance for the TS Product Line scope of supply
- Providing adequate reporting to all stakeholders and managing the communication loop between Project Director and TS Product Line project team.
- Assists the Project Director with reviewing the risk and opportunities of the project. Providing input to the Project Director on actions that benefit the overall performance of the TS Product Line scope of supply and following-up and/or implementing those actions and reporting results to the Project Director.
- Ensuring best compliance with specification at lowest final cost. Ensuring Quality, Environmental and Health & Safety requirements are met.
- Building, coordinating and coaching the project team.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>42 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Developing and monitoring the Time schedule for TS Product Line scope of supply, managing the respective project float to ensure timely completion of the project

### Authority:

- The Project Manager is duly authorized to act on behalf of the Project Director in all matters related to the specific Project Manager scope of supply (Turbine and Generator) and coordinates with PAC, but in no event to agree to any modification of or amendment to the contract documents

### Reporting Structure

- The Project Manager reports to the Project Director

### **5.3.3.12 Quality Assurance Manager - ESES's Design and Manufacturing Headquarters**

The Quality Assurance Manager has the responsibility to coordinate all matters related to OPGs and ESES's quality standards for the contract for the TS Product Line scope of supply of the project with the design project team

The responsibilities of the Quality Assurance Manager include but are not limited to:

- Knowledge of ESES and OPG Quality policies and procedures
- Ensuring manufacturing processes in accordance with ESES and OPG policies and procedures
- Ensuring using of qualified sub suppliers
- Managing and communicating QA related changes and variances to the Project Manager
- Developing and managing creation and execution of test plans
- Identifying, managing and communicating risks defined by QA to the Project Manager
- Guaranteeing QA relate project documentation

### Authority:

- The Quality Assurance Manager is duly authorized to act on behalf of the Project Manager to stop work or initiate corrective actions if any conflict with Quality based OPG, or ESES's policy or procedure related to the specific TS Product Line scope of supply

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>43 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Reporting Structure:

- The Quality Assurance Manager reports to the Project Manager

**5.3.3.13 Project Engineers - ESES's Design and Manufacturing Headquarters**

The Project Engineer has the responsibility to coordinate all matters related to OPGs Engineering Change Control process for the contract for the TS Product Line scope of supply of the project with the Design project team. The responsibilities of the Project Engineer ECC include but are not limited to:

- Knowledge of OPG Engineering Change Control process and procedures
- Ensuring compliance with the OPG Engineering Change Control process and procedures
- Providing engineering support to Project Management

Authority:

- The Project Engineer is authorized to act on behalf of the Project Manager ESES's Design and Manufacturing Headquarters concerning all aspects of the OPG Engineering Change Control process related to the specific scope of supply

Reporting Structure

- The Project Engineer ECC reports to the Project Manager

**5.3.3.14 Project Planner - ESES's Design and Manufacturing Headquarters**

The Project Planner has the responsibility to coordinate all matters related to the time schedule of contract for the TS Product Line scope of supply of the project with the Design project team. The responsibilities of the Project Planner include but are not limited to:

- Producing comprehensive schedules covering TS Product Line scope of supply
- Monitoring actual progress of the individual work packages, comparing to baseline and reporting progress against schedule
- Forecasting the impacts on schedule of proposed changes
- Providing recommendations to improve schedule

Authority:

The Project Planner is authorized to act on behalf of the Project Manager concerning all aspects of scheduling for the specific M TS Product Line scope of supply

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>

Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### Reporting Structure:

- The Project Planner reports to the Project Manager

### **5.3.3.15 Document Controller - ESES's Design and Manufacturing Headquarters**

The Document Controller has the responsibility to coordinate all matters related to the technical and quality documents to be provided to OPG for the TS Product Line scope of supply of the project with the Design project team. The responsibilities of the Document Controller include but are not limited to:

- Managing and maintaining document flow between TS Product Line and the General Darlington Project Team for the TS Product Line scope of supply
- Maintaining updated records of all documents required for the respective review points
- Managing the list of deliverables for the TS Product Line scope of supply

### Authority:

- The Document Controller is authorized to act on behalf of the Project Manager concerning all aspects of technical and quality documents for the specific TS Product Line scope of supply

### Reporting Structure:

- The Document Controller reports to the Project Manager

### **5.3.3.16 Supply Manager - ESES's Design and Manufacturing Headquarters**

The Supply Manager has the responsibility to coordinate all matters related to sourcing and procurement to be provided to OPG for the TS Product Line scope of supply of the project with the Design project team. The responsibilities of the Supply Manager include but are not limited to:

- Ensuring all required ESES and OPG standards, guidelines and specifications are considered related to procurement
- Maintaining the list of OPG qualified supplier
- Coordinating the qualification of new supplier, if required
- Requesting extension of OPG qualified supplier list

## Plan

### **TURBINE GENERATOR PROJECT MANAGEMENT PLAN**

#### Authority:

- The Supply Manager is authorized to act on behalf of the Project Manager concerning all aspects sourcing and procurement related to the specific TS Product Line scope of supply

#### Reporting Structure:

- The Supply Manager reports to the Project Manager.

### **5.3.4 EPC Roles and Responsibilities**

For a full list of EPC Roles and Responsibilities, refer to the EPC Execution Phase Project Management Plan. However, few of the key roles are:

Construction Manager

Scope Lead

Project Director

#### **5.3.4.1 Joint Venture Executive Committee**

- Comprised of Aecon and SNC-Lavalin executive management representatives
- Responsible for ensuring the project is properly staffed with qualified and experienced personnel and overall project and contract oversight
- Supervises the Project Director

#### **5.3.4.2 Project Director**

- Responsible for overall contract execution, project management, engineering, field execution, commissioning, labor relations and client relations
- Responsible for ensuring project is executed in compliance with contract provisions; all applicable corporate standards, policies and procedures; applicable regulations, codes and standards; applicable client policies and programs

#### **5.3.4.3 Construction Manager**

The construction Manager reports to the Project Director, and is responsible for the following:

- For the overall execution of assigned scopes of work;
- To interface with the engineering manager and customer;

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>46 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- For work planning and control for construction and installation activities;
- To ensure that personnel assigned to perform activities are trained, qualified and competent to perform their assigned tasks effectively;
- For the performance of all constructions and construction planning activities;
- For maintaining construction schedule;
- For trade supervision;
- For supervision of any on-site subcontractors;
- To ensure that construction equipment, tooling, materials and resources are consistent with the requirements of, and the capabilities offered in the contract;
- To ensure that work is performed efficiently and in accordance with project plans and customer specifications;
- For review of safety plan;
- For involvement in union discussions;
- For site infrastructure management

### 5.3.4.4 Engineering Project Manager

- Responsible for overall engineering work program deliverables and effective integration with all phases of the project
- Responsible for ensuring that engineering is performed in compliance with contract provisions; all applicable corporate standards, policies and procedures; applicable regulations, codes and standards; applicable client policies and programs

### 5.3.4.5 Deputy Project Director / Definition Phase Construction Manager

- Responsible for overall technical definition of the Execution Phase work program per contractual requirements
- Supervises Project Scope leads, and Project Director's direct reports as required

### 5.3.4.6 Project Controls Manager

- Responsible for overall project support functions for scheduling, accounting, procurement and administration
- Responsible for preparation of project schedules, cost reports, and invoices

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>47 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Supervises Project Schedulers, Project Accountants, Project Controls Coordinators

### 5.3.4.7 Project Estimating Manager

- Responsible for overall development and issuance of Definition Phase cost estimates, risk register and contract changes
- Supervises Contract and Risks Manager, Project Estimators, Project Estimating Coordinators.
- Responsible for definition and development of execution estimate of Unit 2 and all the subsequent units. The class estimate will integrate all working groups such as OPG, IMS, JV and Alstom.

### 5.3.4.8 Project Scope Leads

- Responsible for production of Definition phase technical deliverables, and overall project management of assigned technical work scope, including safety, quality, budget and schedule
- Supervises Superintendents, Technical Advisors, and Project Coordinators.

### 5.3.4.9 Project Quality Manager

- Responsible for generating the overall Project Quality Plan ensuring compliance of project operations/deliverables with relevant codes and standards
- Responsible for ensuring training records related to Project Quality Plan are maintained
- Responsible for ensuring Project Quality Procedures training is delivered to project personnel
- Responsible for regularly reporting performance metrics for project quality

### 5.3.5 Project Coordinator / Assessors

- Prepares Field Work Packages
- Prepares Asset Suite work orders and task assessments
- Interfaces with Refurbishment Work Control to schedule Asset Suite work orders
- Monitors technical issues in the field and assists Field Engineers with preparation of Change Notices

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>48 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Prepares As-Found Reports and As-Left Reports with input from Construction Coordinator

### 5.3.6 ESES Resource Planning for Non-Trades

ESES's professional (non-union) personnel will support the project with both on and off site activity to support the scope of work. ESES resourcing for the core technical team will accommodate timing of vacations, training and holiday requirements within their resource planning. ESES will also consider suitable number and timing of returns of out-of-town specialists to their dispatch location so to minimize impact on the project.

### 5.3.7 ESES Succession Planning

A succession plan, simply put, is a component of good HR planning and management. Succession planning acknowledges that staff will not be with an organization indefinitely and it provides a plan and process for addressing the changes that will occur when they leave. Most succession planning focuses on the most senior manager/director, however, all key positions will be included in the plan. Key positions can be defined as those positions that are crucial for the operations of the organization and, because of skill, seniority and/or experience, will be hard to replace.

The succession plan involves nurturing and developing employees from within the ESES organization. Employees who are perceived to have the skills, knowledge, qualities, experience and the desire can be groomed to move up to fill specific, key positions. The ESES Organization will:

- Assess its current and future needs based on its strategic plan, goals and objectives, or priority programs and projects. This will include the Darlington Refurbishment Project Team.
- Match these to the capabilities of the existing workforce
- Develop a plan to manage the gaps that will arise when individuals in key positions leave or are promoted, as will likely be the case with certain members of the Darlington Refurbishment Team due to the length of time of the entire project span.

### 5.3.8 ESES Knowledge Transfer to and from the Project Team

All ESES Project Managers (PM) have the responsibility of recording, tracking and completing Lesson Learned records in the Service Account Management (SAM) database. A "Lesson Learned" is any issue or activity that occurs during any project phase that would result in either a negative or positive impact on the Current Control Budget (CCB) of the project, or any other non-financial impact.

Normally a Lesson Learned is inputted into the SAM database upon completion of the entire project. For the Darlington Refurbishment Project, the lessons learned will be inputted into SAM database and presented to OPG before the start of the next unit outage.

Document Number:	Usage Classification:	
<b>NK38-PLAN-41000-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R003</b>	<b>49 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Contract managers log Lessons Learned in the Service Account Management database. Lessons Learned are reviewed by a Contract Manager. The purpose of reviewing the collection of Lessons Learned in the SAM is to provide the PMs with past histories from other projects and also to share the difficulties that other PMs have encountered on their projects.

It is the role of the Project Manager to facilitate and promote the Lessons Learned process during the agenda of all project meetings; therefore, the Project Manager is responsible for compiling and logging all Lessons Learned into the SAM and for distributing the outcome to other Project Managers at the end of their project.

## 5.4 Documentation and Closure Management

Records, documents and data collectively form the memory of the TG Project. Together they constitute the business and intellectual assets of critical importance, and therefore must be managed to meet both regulatory and business requirements.

The purpose of the Documentation and Closure Management Plan is to manage the process of organizing, storing, protecting, and sharing documents. This section describes how documents will be managed throughout their life cycle during the planning, execution and project closure.

### 5.4.1 Project Document Description

The management of documentation is described in relation to three principal activities: Document Creation, Document Control, and Records Management.

The TG Project Plan for Records and Documents Management (RDM) adheres to OPG-PROG-0001, *Records and Document Control* and OPG-PROC-0019, *Record and Document Management*.

### 5.4.2 Roles and Responsibilities

Records and document management is a shared responsibility amongst all Nuclear Refurbishment employees in referencing and filing information according to governance and non-governance process documents.

- **Project Managers (PMs)** – are responsible to prepare and issue a formal Communication Protocol document to the successful supplier immediately after contract award. The Communication Protocol document will provide direction on how all project correspondence and documentation deliverables are managed. All suppliers will comply with the standards and requirements of this plan. PMs will adhere to and share with suppliers N-MAN-00120-10001-RDM-03, *Nuclear Projects Supplier Document Submission*.
- **NR Records and Document Management (NR RDM)** – will manage the Darlington Refurbishment records and data provided by OPG and suppliers, perform quality checks, route to the appropriate stakeholders and track the status and performance through the review/acceptance cycle. RDM also retain

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>50 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

and publish all “Change Papers” and related Engineering Change Control documentation, are responsible for registering and managing controlled documents, management of the VenDM database, and population of the Records and Controlled Documents modules in Asset Suite 7. RDM will adhere to N-MAN-00120-10001-RDM, *Nuclear Projects Records and Document Management*.

- **Refurbishment Employees** – have the responsibilities to identify, protect, and present their records as intellectual assets, this is done by completion of training, use of training aides, and through adherence to communications issued to guide staff on information management rules or practices.

#### 5.4.3 Document Creation

Document creation is the first stage in the records management cycle. The TG Project follows the existing OPG program requirements for creation and approval to ensure compliance with standards.

During the development and review of project documentation, industry best practice is to employ information technology that provides access controls and minimizes document editing requirements during collaboration and review of in-process documents. This helps avoid re-work and confusion. To address this need, document creation and update is to be performed within the document libraries established within the appropriate SharePoint team site.

#### 5.4.4 Document Control

Document Control is a managed process of information and documentation exchange between OPG and its suppliers. All document submissions from suppliers to the Darlington Refurbishment program are conducted through a central electronic portal (a secure website) known as Vendor Document Management System (VenDM).

The processes for document reviews and acceptance have been defined and recorded in a series of process support documents. Within the document control process, the Project Manager ensures all documentation deliverables from suppliers are defined with established due dates. RDM track and record processing dates so that OPG can monitor compliance to contractual commitments and provide the necessary reporting. NR Contract Managers support the process by participating in Supplier/OPG process discussions to ensure actions/agreements align with the contract. Document Control staff manage the process for receipt/review/issuing of supplier submittals.

#### 5.4.5 Records Management

A record provides evidence of the performance of business activities and/or the achievement of results, to demonstrate conformance to standards or compliance with laws, or to retain knowledge and information of business importance when needed. A record is that version of a document designated to be maintained in an Approved Information Management System (for electronic records) or a Records Centre (for hard copy record).

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>51 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

All records are stored as required by OPG-PROG-0001, *Records and Document Control*. Official QA records are indexed and stored in OPG Nuclear approved information management system (Asset Suite 7). Additionally, NR employs SharePoint libraries for the storage of in-process project documentation and non QA records.

All Refurbishment project records are managed in accordance with OPG-PROC-0019, *Record and Document Management*, and adhere to OPG-STD-0030, *Classification, Protection and Release of Information*, and OPG-MAN-8133-0002, *Records Management Authority Register*. Each record is managed according to a predetermined plan which is documented in the Records Table resident in the process document which governs the activity resulting in the creation of the record. The Records Table will identify the database in which the item will be indexed, the retention requirements for the document, and may detail the relationships or links to other objects or data that must be maintained.

Any electronic information to be issued as a record is to be sent to file via a workflow task request or by submitting to the appropriate RDM e-mail account, where it will be reviewed, categorized and indexed in the appropriate information management system. This will allow for easy search and retrieval based on unique identifiers, specific supplier and/or project codes, and types of correspondence.

Project records delivered as a hard copy will be scanned, indexed and retained as necessary based on their classification.

All supplier deliverables not identified as an ECC deliverable or controlled document will be addressed as a project record and be managed as described in the appropriate Records Table.

Confidential or commercially sensitive information should be addressed in detail in the Communication Protocol.

### 5.4.6 Miscellaneous Project Data Management

There are several areas where miscellaneous data will be accumulated by the supplier or OPG staff during the life of the project which normally would not have significant relevance when the work is performed internally. This data needs to be collected and delivered to RDM, then organized for potential future retrieval. These may include, for example, Vault Entry Logs or MSDS/WHMIS data for materials brought on site by suppliers.

### 5.4.7 Document Nomenclature System

Document numbering schemas have been developed for project documentation in cases where the existing OPG numbering convention is not suitable or the need to establish unique numbering systems existed, in order to enhance management or retrieval.

Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

## 5.5 Schedule Management

### 5.5.1 Overall Planning and Scheduling Process

The overall planning and scheduling process can be represented in two major stages:

- (a) Project Planning and Schedule Development, resulting in the formation of a Baseline Schedule
- (b) Schedule Management, Monitoring, Analysis, Reporting, and Mitigation, resulting in regular periodic schedule updates

The three levels of schedule hierarchy are outlined below; overviews of how the schedules interact with each other refer to NK38-NR-PLAN-09701-10001 SHEET: 0002 *Program Schedule Management Plan*.

The scheduling development and process shall follow, as applicable to the specific contractor, N-MAN-00120-10001-SCH-09 *Scheduling Requirements from EPC Contractors*, N-MAN-00120-10001-SCH-02 *Standard Project Milestones*, and N-MAN-00120-10001-SCH-06 *Milestone Framework*.

The Joint Venture progressive planning and schedule development will follow the process listed above. JV is responsible to integrate all the working groups such as OPG, IMS, Alstom and JV into the schedule.

#### Level 1 - Management Summary Level

The level 1 schedule provides a high-level management summary of the project. It will represent all Units, Phases, Bundles, Program and key project milestones.

The level 1 schedule is a roll up from the Level 2 Co-ordination and Control Schedule.

The schedule is prepared by OPG as part of the initial planning phase of the project and updated to reflect the progression of planning, i.e. as projects are better defined, the Level 2 Control and Co-ordination Schedule is updated.

#### Level 2 – Co-ordination and Control Schedule (C&C Schedule)

The level 2 schedule covers the full scope of work by Phase, Unit, and Type of work and contains full Critical Path Method (CPM) logic. It is referred to as the C&C schedule, or, Control and Co-ordination schedule, as this is the schedule which will be used, at the Phase and Unit level, to track the overall schedule status of the Program.

It will be updated and controlled by OPG and based on the Contractors detailed Level 3 Schedules.

#### Level 3 – Detailed Schedules

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-41000-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R003</b>	<b>53 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The level 3 detailed schedules will be prepared by the groups executing the work: the ESES and EPC Contractors.

The schedule must be prepared in accordance with the Program's Work Breakdown Structure ("WBS") and coding guideline. This schedule contains the lowest level of detail required to manage and execute the work. It is structured in a way to allow summarizing of the activities in order to update the Level 2 C&C Schedule.

The Level 3 will include the full scope of each vendor / contractor showing all interfaces with other contractors / OPG.

The Schedule will be resource loaded to the lowest level of the defined Work Breakdown Structure as applicable to the contract type.

The Schedule will define all long lead procurements.

After being captured as a baseline, the schedule will be regularly updated, providing the basis for status reporting, progress physical percent complete at the activity / Work Package Level, forecasting, and change management.

All vendor / contractor baseline schedules need to be approved by OPG to ensure program milestones, WBS and scheduling guidelines and coding are followed.

Schedule variances and mitigation plans will be analyzed from the Level 3 schedule.

Daily, Weekly and Monthly look-ahead reports will be generated from Level 3 schedule.

### 5.5.2 Schedule Integration

All Contractors' Level 3 Schedules or OPG Functional detailed schedule will be fully aligned, utilizing a common Work Breakdown Structure and coding guideline as per N-MAN-00120-10001-SCH-01 *Work Breakdown Structure Direction* and N-MAN-00120-10001-SCH05 *Nuclear Refurbishment Project WBS and Control Account And Work Packages*, and integrated in the overall C&C Schedule.

The C&C Schedule will be the program's basis for measuring schedule progress. Additionally, the C&C schedule, as described in NK38-NR-PLAN-09701-10001 sheet 2 *Program Cost Management Plan*, will be integrated with the Cost Management software ("Proliance") for the purposes of reporting Earned Value and determining cash flows / forecasting.

### 5.5.3 Work Breakdown Structure (WBS)

The WBS is subdivided to work packages (WP) as related to Scope and aligned with contracting strategy. Every WP is represented with one activity in the C&C Schedule that integrates into Proliance for Earned Value calculations. The WP can be represented in Level 1, C&C and in the Detailed Level 3 schedule, as needed.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>54 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The WBS is controlled by the Program Management Office (PMO) Scheduling Group and is available from within Primavera Planner (P6).

For a detailed look at the standard Refurbishment program Work Breakdown Structure refer to N-MAN-00120-10001-SCH-05 *Nuclear Refurbishment Project WBS and Control Account And Work Packages*.

### 5.5.4 Work Breakdown Structure Dictionary

The TG Work Breakdown Structure Dictionary (WBSD) is a companion document to the WBS and provides a description of each of the work elements to be accomplished during the Project. The WBS and thus the WBSD will evolve and must be revisited and potentially revised as the Project develops.

The WBSD contains information related to certain high level WBS. Depending on the nature of a given WBS element, the WBSD may capture some of the following information:

- Coding for each WBS element.
- Responsible and accountable individuals or organizations.
- A description.
- A list of quality requirements.
- A list of resource requirements.
- The contracting model.

The WBSD will be updated to different levels of detail as the scope develops. Once the scope baseline for the TG Project is accepted, changes to the WBS and the WBSD are expected to be minimal.

### 5.5.5 Milestone Management

Milestones within the Program will be managed at various levels per the following:

All phases will be controlled by Program Milestones. Adherence to milestone timelines and definitions is essential to ensure a successful Refurbishment. Refer to N-MAN-00120-10001 *Nuclear Refurbishment – Milestone Definition Framework* for the following:

- Milestone Tier Structure
- Milestone Numbering Nomenclature
- Common Milestone Definition Template

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-41000-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>0001</b>	<b>R003</b>	<b>55 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Milestone Completion Progress Monitoring
- Quality Requirements for Milestone Deliverables
- Milestone Closeout and Document Retention Requirements

### 5.5.6 Schedule Change Management

Changes to the baseline scope will be managed through a formal Change Control process as per N-MAN-00120-10001-PC, *Project Control* and implemented at all levels of schedule.

### 5.5.7 Schedule Monitoring and Control

The contractor's / OPG Level 3 Schedule will be updated regularly using OPG guidelines (see N-MAN-00120-10001-SCH09 *Nuclear Project Scheduling Requirements from EPC Contractors*). During the planning phase, schedules will be updated at least once per month; during execution, that will increase to as frequently as needed to manage the schedule, i.e. critical path activities may be updated daily, near critical path activities weekly, and others monthly.

Variance / critical path analysis, and percent complete at the work package level will be prepared for every schedule on a monthly basis. The Project & Controls Lead and Cost & Scheduling Analyst will review the contractor's schedule and prepare highlights of issues / corrective actions required and take appropriate steps working through the project team and the contractor to resolve.

The Level 3 will be summarized in order to update the Coordination and Control schedule.

Overall program variance / critical path analysis will be prepared by OPG's Program Management Office (Project Planning and Controls).

Forecast dates at the work package level and percent complete will be integrated with the Earned Value Software ("Proliance").

### 5.5.8 Schedule Management and Controls Governance

Additional information, based on the *Project Management Standard* (N-STD-AS-0028), on the schedule management processes utilized by the Refurbishment Program can be found within N-MAN-00120-10001-SCH, *Nuclear Refurbishment Schedule Management*.

### 5.5.9 Schedule Approach for Equipment Supply and Engineering Services Vendor

The Schedule and associated resources are developed by the ESES through close collaboration among project team members and stakeholders with input from functional managers and research from past projects. Where appropriate, the ESES's

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>56 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

global schedules were used, applying adjustment for Canadian workforce. The schedule has been developed using Primavera P6 format.

The schedule will be maintained as a Primavera P6 by the Darlington Cost & Scheduling Analyst. Any proposed changes to the schedule will follow ESES Vendor's change control process and the Changes to Contract Schedule section contained in the Agreement. The Vendor will be applying the appropriate tools and reporting structure to monitor the ongoing health of the project.

### Schedule Approach:

- (a) Reflective of the nature of the ESES Agreement (fixed price, delivery-based milestone payments), the ESES schedule will not be resource loaded.
- (b) The Vendor Owner Interface Requirements (VOIR) document details the specific Engineering change requirements for each component/work package and the number of face to face meetings that will be required between OPG and ESES Vendor. The VOIR forms a part of the ESES Agreement and the most up to date copy is kept in the project files.
- (c) The ESES Vendor developed a Submittal Tracker document covering all component/work packages based upon the requirements of the VOIR. This Submittal Tracker identifies the kind and number of documents that are required as a result of the requirements of the VOIR and which documents are required to be submitted to OPG.
- (d) The Submittal Tracker was used to identify the resourcing and effort required in order to complete the applicable tasks relevant to the Engineering change control process.
- (e) Finally, the ESES Vendor's baseline schedule has been developed on the basis of the VOIR, the Submittal Tracker and the resourcing and efforts required to Engineer and Supply the major components in ESES's scope of supply.

**Note:** The VOIR hold points will be treated as milestones, whereas the Submittal Tracker deliverables will be shown as individual activities in the schedule that are logically required to satisfy their respective milestone.

Alstom is not an EPC vendor but is an engineered equipment supplier as per ESES Agreement signed in March 2013. It is considered appropriate and best value for money to have the EPC vendor manage reporting on Alstom's activities and inputs, in the context of the overall EPC execution schedule, and based on Alstom's status reporting. Alstom is responsible, as an engineered parts supplier, to deliver and maintain a separate shop schedule for the offsite work (LP blade carriers).

The ESES activities will be captured, managed and progressed as follows for different types of work activities:

1. Activities in Alstom Workshop

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>57 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Alstom is to deliver, maintain, and status a separate shop schedule for the offsite work (LP blade carrier shipping and machining/modification in Chattanooga, TN). The JV's schedule incorporates windows, established with information from Alstom, for this shipping and offsite work. The activities in the JV Execution schedule are a summary of the Alstom shipping and shop schedule. They will be reported/progressed in the JV schedule based on periodic (daily, weekly etc) updates based on Alstom's shipping/shop schedule.

### 2. Alstom Field Labour for Specialized Inspections and Technical Field Advisor Support

Alstom is providing TFA support of JV execution activities, and also certain specialised inspections (eg. DIRIS inspection on generator rotor). These activities are captured in the JV's execution schedule, based on both Work Order tasks for TFA support, and Alstom OPEX/ information regarding specialized inspection duration. They will be reported/progressed in the JV schedule based on periodic (daily, weekly etc) Alstom updates.

Alstom has a contractual milestone in July/2015 to finalize TFA Reimbursable Work Targets. Alstom TFA labour hours can be resource loaded in the JV schedule or, and/or Alstom can provide histograms.

The Project will be confirming this strategy with the JV, but there is very low risk to ability to implement.

### 3. Cost Collection (Project Management, Core Resident Field Advisors etc)

Given that the core work (#1 and #2) is covered in the JV schedule, it is not cost effectively or value for money for Alstom to produce a schedule for the purpose of level of effort activities (PM, Core RTA's, etc). Nor is it appropriate for OPG to create/report on a schedule on behalf of a vendor. It is proposed that PM, Core RTA, etc costs are captured via Oncore to Proliance on the basis of a Proliance PIF (cash flow) and related to Work Packages. There will be a direct relation to the Alstom payment schedule for these activities.

## 5.6 Procurement Management

Darlington Refurbishment Turbine Generator Project approved SOW's documents provide detailed information regarding TG and Auxiliaries refurbishment and components / equipment replacements. Some of the components need to be replaced with like-for-like components; some components are obsolete and will be replaced with new technology. Some component replacement is identified as contingency based on future inspections and test results. However, none of which has been identified as long lead item. (16 months lead time as defined in ESES Agreement)

*Darlington Refurbishment Turbine Generator Project Negotiation Plan* NK38-PLAN-09701-10096 provides guidelines related to the procurement of the TG components / parts.

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>58 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Due to difference in units' condition and existing TG sets' degradation mechanisms there are some differences between the units components / parts lists. One of the significant differences is the Generator Stators' conditions in Darlington units 3 and 4 when compared with Units 1 and 2, which will require rewinding / replacement. The project team identified these components up front to allow proper procurement and manufacturing (if required) planning to meet project objectives.

Based on existing NK38-09701-10030, *Darlington Refurbishment Turbine Generator Project's Contracting Strategy Summary for Turbine Generators* and the subsequent - *Turbine Generator Refurbishment Project Alternate Contracting Plan* NK38-09701-10112, a contract was negotiated and awarded to the TG sets OEM – Alstom to engineer, manufacture and deliver the Scope of Supply (SOS) components / parts.

The recommended path and TG project Objective is to have all components required for one DNGS unit Refurbishment manufactured and delivered not less than 90 days before breaker open for each of the Darlington unit refurbishment.

Due to contingency items identified in the TG Project SOS the project team is expecting to have more components / parts manufactured or procured and delivered for the DNGS Refurbishment Outage Unit 2. Based on the inspection results and the condition assessments of the Unit 2 TG set, the need for more or less contingency components/parts for future refurbishment units will be assessed by the Project team and the procurement plan will be updated accordingly.

Beside the TG sets components/parts identified in the SOS, a contract was awarded to an EPC Contractor for Engineering (ECC) and Project Execution Phase (e.g. installation) and procurement through that contract limited materials for logistics and installation.

These materials are common materials that will be procured and managed during Project execution phase by the EPC Contractor. These kinds of materials will be procured by the EPC Contractor under the second contract T&C and these materials are but not limited to:

- PPE
- Welding
- Rigging materials
- Fencing
- Containers
- Rentals( trucks, waste containers, diesel generators etc)
- Other consumables that are not supplied by the ESES

Due to the nature of these materials, the project team will ensure through the contract T&C that these materials will be available and operational 2 months ahead each unit breaker open and also that they are properly maintained along the projects (e.g. scaffolding will be reused and will be inspected for safety before each subsequent unit Refurbishment outage).

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>59 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### 5.6.1 ESES and EPC Procurement Management

A Purchase Order for parts and engineered products has been issued to the ESES (Alstom) in connection with the Engineering and Equipment Supply Agreement dated 27<sup>th</sup> of March 2013.

The Agreement scope of supply includes two sections; Spare parts delivery for Steam turbine and auxiliaries and Generator and auxiliaries. For Unit 2, there are 8 spare parts packages with 1416 line items:

1. MS75301001 TSSM SOW Spares
2. MS75301002 TSSM Recomm. Spares
3. ME75300502 TSEM SOW Spares
4. ME75300503 TSEM Recomm. Spares
5. ME75300504 TSEM HV Bushings
6. ME75300505 TSEM Terminal Box
7. ME75300506 TSEM Aux. SOW
8. ME75300500 TSEM Aux. Recomm.

As per Agreement requirements, Alstom reports schedule progress on Procurement, Manufacturing, Shipment, and Delivery in the Contract Schedule (P6) based on the project Work Breakdown Structure (WBS). Alstom control transactions, to internally monitor progress of RFQs such as deliveries, expediting logistics, setup and other related project deliverables as per WBS, is in the Alstom SAP/pmX system.

Parts delivery from the ESES is required contractually not less than 90 days in advance of Unit Breaker Open, and nominally 10 months prior to the Turbine Generator Unit work window. Therefore EPC and ESES vendor activities with respect to delivery and receipt of parts ensure that actual need dates for parts are accommodated.

In order to provide tracking at a deeper level than the ESES schedule and mitigate risk of any potential late parts delivery, a method to track procurement, manufacturing, shipping, and delivery has been implemented such that Alstom will report monthly on status in the supply /manufacturing chain of the individual parts.

The EPC shall evaluate, audit (as appropriate) any supplier as per the PQAP. As described in the Quality Plan, 617391-0002-00000-38QP-0001 - Quality Assurance Plan, it is the intent that the EPC shall use suppliers on the OPG ASL for the purposes for which they have been approved. For the suppliers not on OPG's ASL, a copy of the audit report, checklist shall be provided to OPG. Evaluation results shall be submitted to OPG and input into Asset Suite as per Appendix D of the COIR.

The EPC procurement activities will predominantly deal with bulk materials (e.g. cables, fittings) and will be performed from the Cambridge office as detailed in the PQAP. ESES vendor engineered materials and some tooling will be free-issued to the EPC.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>60 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

### 5.6.2 Procurement, Manufacturing and Shipment Earning Rules

Earning rules are established and implemented for non-deferred scope for parts. The rules for spare parts material procurement, manufacturing and shipment will be based on quantities. The reported progress earned in the schedule, at activity level, will be tracked and calculated at the part level using the progress reporting from Alstom's SAP/pmX system.

Earning rules are established and material tracking will also be implemented for engineered products (deferred scope); subject to timing of procurement/manufacturing activities for these engineered items.

Table below demonstrates the earned progress rules per schedule activities. These rules are applied to procurement of non-deferred parts:

Schedule Activities Example for T & A (MS75301001)-(SOW Spares) Package	Earned Progress based on quantities
Request for Quotation Process (SOW Spares)	Total % earned calculated at the item level in SAP
Issue of Purchase Order (MS75301001)-(SOW Spares)	Total % earned calculated at the item level in SAP
Receipt of order acknowledgement (SOW Spares)	Total % earned calculated at the item level in SAP
Procurement of Goods (SOW Spares)	Total % earned calculated at the item level in SAP
Manufacturing (SOW Spares)	Total % earned calculated at the item level in SAP

### 5.7 Cost Management

The purpose of the Project Cost Management Plan is to outline how the T/G project manages budgets and costs over the life cycle of the project.

The governing document defining NR's approach to cost management is N-STD-AS-0028, *Project Management Standard*. Cost management and control practices are further detailed in N-MAN-00120-10001-PC, *Project Controls*.

#### 5.7.1 Cost Model

Project funding will be allocated from the program via the Gated Process and the Gate Review Board in accordance with N-MAN-00120-10001-GRB. Estimated funding requirements for the program life cycle beyond the current release will be documented as unreleased funds at the project and functional levels.

Changes to project funding levels within a release will be managed via a formal change control process in accordance with N-MAN-00120-10001-PC, *Project Controls*.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>61 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Funding required in the current release period will be categorized and tracked as follows in Nuclear Refurbishments Project Cost Management system ("Proliance"):

- *Original Budget* is the approved funding established by the release or Gated Process. Original Budgets cannot be altered for the period in which they apply.
- *Control Budget* consists of the Original Budget plus the sum of all approved Directed Changes (i.e. baseline changes).
- *Approved Funding* consists of the Control Budget plus all approved funding requests not impacting the baseline.
- *Projected Budget* represents the accountable manager's forecast of cost at completion of the current release, and includes all pending (i.e. unapproved) funding change requests plus the impact of undocumented funding impacts based on managerial judgment.

The TG project is using the Earned Value Management principle for forecasting, as per N-MAN-00120-10001-SCH07 *Earned Value Management*. It should be noted that the ESES Vendor's earned value reporting will be developed in a manner that is reflective of its particular scope and combined reimbursable target price/fixed price nature of the contract (deliverable based milestone payments and non-resource loaded schedule for the fixed price work).

Project level Contingency funding may be allocated within the Definition and Execution phases via the Gated Process. Contingency funding is based on known risks. There is also Management Reserve funding which is set based on "unknown-unknowns" that could impact the viability of the project. The strategies for managing Contingency and Management Reserve are defined in NK38-PLAN-09701-10067 Sheet 0006, *Darlington Refurbishment Risk Management Plan*. Release of Contingency and Management Reserve funding will be controlled via the change control process in accordance with N-MAN-00120-10001-PC, *Project Controls*.

## 5.7.2 Cost Breakdown Structure

There will be a systematic and hierarchical Cost Breakdown Structure (CBS) that identifies all the Control Accounts used by the Project. Within each Control Account will be specific Work Packages. Budgets for all TG work will be established at the Work Package level and associated actual costs will be collected at the Work Package level to support cost performance monitoring including earned value measurement.

## 5.7.3 Project Cash Flows

As the costs and schedules for projects are developed, resource loaded schedules (as applicable) will be derived to form the basis of the function and project cash flows to support business planning and cost performance monitoring processes. The schedules will establish Planned Value (PV) at the Work Package level, which will then be translated into budget cash flows in the cost management system.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>62 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

#### 5.7.4 Measuring and Reporting Project Costs

Costs will be managed at project, function, vendor, and Work Package levels using source data from OPG financial systems. Vendor costs will be managed in accordance with contract terms and conditions to meet OPG requirements.

Cost performance will be measured using standard industry metrics, including Earned Value (EV), Schedule Performance Index (SPI), and Cost Performance Index (CPI).

Earned Value (EV) is the value of work performed and will be calculated within the NR cost management system using Work Package budget information from the cost management system work progress information derived from schedules.

Schedule Performance Index (SPI) is a measure of progress achieved compared to planned progress. SPI will be calculated within the OPG cost management system based on the equation:

$$SPI = EV/PV$$

Cost Performance Index (CPI) is a measure of the value of work completed compared to actual cost (AC) and will be calculated within the OPG cost management system based on the equation:

$$CPI = EV/AC$$

Cost variances at project level will be regularly monitored to ensure that actual and forecasted costs are within Life-to-Date (LTD) approved funding levels.

Forecasting will include mitigation and recovery plans as required.

Cost reports will be published on determined frequency in accordance with the Project Reporting Management Plan.

#### 5.8 Quality Management

The ESES and EPC Contractors shall perform the entire scope of work under an OPG-approved quality assurance program. Compliance with applicable quality assurance requirements will not relieve the respective Contractors from any of their obligations or liabilities under the established agreement between OPG and the Contractors. The Contractors will be responsible for ensuring that their Sub-Contractors are working under the Contractor's quality assurance program or have implemented an appropriate quality assurance program acceptable to the Contractor and OPG.

##### 5.8.1 General

##### 5.8.1.1 Quality Records

The Contractor will provide OPG with signed and dated legible copies or originals of all quality documentation pertaining to any goods and services. The Contractor will

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>63 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

identify, index, and file quality records for prompt retrieval for seven years after the completion of the goods and services or for any other period required by the applicable quality assurance standard.

The Contractor and OPG will each have a single point of contact (SPOC) to facilitate information exchange to enable update of Passport documentation (EPC only).

The Contractor will provide an electronic copy of all deliverable documents in a format approved by OPG's Business Services, Nuclear Programs, as outlined in OPG-STD-0057 "*Electronic Document Management*" and N-PROC-AS-0042 "*Records and Document Management*".

The Contractor will be required to provide a detailed listing of all quality documents that are required for turnover and will be expected to submit the preliminary list for OPG's review, which will be used as a baseline during the turnovers.

#### 5.8.1.2 Audit and Surveillance Rights

The Contractor is subject to audits, inspections, and witnessing by OPG to ensure compliance with the requirements of the Specification, Codes and Standards, drawings, and Contractor's approved submittals.

OPG shall have the right to witness any inspection called for in the Contractor's quality plan and submitted Inspection & Test Plan (ITP). The Contractor shall co-operate with OPG in establishing when the various inspections and hold points will be performed during design, manufacture, testing, and preparation for shipment. Goods shall not be shipped prior to OPG inspection release. This shall be incorporated in the submitted ITP as a hold point.

The Contractor shall notify Sub-Vendors of OPG's inspection and testing requirements.

The Contractor shall make provision for access by OPG or OPG's inspection representative to the plant/ manufacturing facility or the plant/manufacturing facilities of their Sub-Vendors at any reasonable time during the course of the Project.

OPG may advise the Contractor in writing of any non conformance identified during a visit.

#### 5.8.2 ESES Vendor Quality Management

The ESES Vendor must implement, maintain and comply with an OPG-approved quality assurance program that:

- (a) Will ensure the workmanship used to produce and perform the goods and services will meet all OPG requirements as per the agreement
- (b) Engineering Services consisting of upgrades, optimization and modifications to existing steam turbine generator sets including the control of design activities

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>64 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

related to field services in compliance to CSA Z299.1 and applicable elements of N286-05

- (c) Supplier's manufacturing facility where each item is manufactured shall be on OPG Approved Supplier List for the required quality level specified by OPG.
- (d) When acting as a distributor or agent for an item, the original manufacturer shall be on OPG's Approved Supplier List.
- (e) Items used for Pressure retaining system that requires CSA B51 or CSA N285 Class 6, shall be procured from a supplier who is registered with the Technical Standards and Safety Authority(TSSA).
- (f) Meets EPRI Guideline with respect to the prevention and detection of counterfeit and fraudulent items.

The ESES Vendor can submit to OPG for review and approval a suitable quality assurance program that satisfies the applicable requirements given in CSA Standard N286-05. OPG may impose additional applicable requirements on the Vendor to ensure that the requirements of CSA N286-05 are met.

The Vendor will be mandated to be qualified and remain qualified during the course of the project to the following requirements:

- Design engineering services which include the software /firmware will be developed to meet the requirements of CSA Z299.1 and the applicable elements of CSA N286-05 for Design.
- Meets applicable elements for Design software (use, modification or development) of CSA N286.7, Quality assurance of Analytical, Scientific and Design Computer Programs for Nuclear Plants.

The Engineer, Procure and Construct (EPC) contractor will be mandated to be qualified and remain qualified during the course of the project to the following requirements:

- Applicable elements for engineering, procurement and construction services of CSA N286-05, Managed System Requirements for Nuclear Power Plants as amended, restated or replaced from time to time.
- CSA Quality Standards Z299.1 or such equivalent quality standard agreed by OPG that may replace said standard.
- Applicable elements for Design software (use, modification or development) of CSA N286.7, Quality assurance of Analytical, Scientific and Design Computer Programs for Nuclear Plants.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>65 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- CSA N285.0 General Requirements for Pressure Retaining Systems and Components in CANDU Nuclear Power Plants, as amended, restated or replaced from time to time.
- Electric Power Research Institute (EPRI) guidelines with respect to the prevention and detection of Counterfeit, Fraudulent and Suspect Items (CFSI)
- Ensure Subcontractors' evaluation and selection is performed in compliance with the requirements of the applicable elements of CSA N286-05 and CSA Z299 series of quality standards or such equivalent quality standard agreed to by OPG.

During the different phases of Project work, the Project Team jointly with the Functional Team will ensure the quality of design, quality of materials and services provided and the quality of installation and commissioning work performed at station:

- (a) Comply with OPG standards
- (b) Meet Purchase Order requirements
- (c) Comply with applicable codes and standards

### 5.8.2.1 ESES Inspection and Test Plan

ESES shall submit Inspection and Test Plans (ITP) and reference acceptance criteria.

OPG reserves the right to insert inspection requirements and hold points as required to verify quality objectives. An Inspection Test Plan (ITP) is to be submitted to OPG for review /approval prior to manufacturing. The ESES Vendor shall maintain a Customer Shop Inspection Schedule of OPG hold and witness points, and notify OPG in advance of such points. A third party Source Surveillance inspection agency will be utilized to conduct hold and witness points on behalf of OPG, at ESES sites in Europe and potentially the U.S. Source surveillance for ESES off-site activities in Ontario (i.e. generator auxiliaries skids) will be executed by OPG Supply Chain Quality Services.

The ITP shall describe the inspections, tests and verifications for all products and services specified in the contract. The test plan shall be approved by the manager primarily responsible for Quality Assurance and accepted by OPG. Test plans shall clearly state the test method, test equipment and accuracy, acceptance criteria and basis.

OPG shall be provided access to review procedures referenced on inspection and test plans; during the life of the contract, the plan and procedures are to be updated to reflect revisions.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>66 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

OPG shall have the right to establish witness and hold points for which the Vendor shall give ten (10) business days prior notification. In addition, OPG may establish witness points to ensure resolution of quality issues.

### Inspection and Test Strategy for QL-4 OEM Parts

Many of the ESES (OEM) parts have historically been QL-4 and will continue to be QL-4. As an additional level of oversight, OPG is receiving ITPs from Alstom, inserting witness points, and conducting reviews on selected parts at Alstom's site in Europe using a third party source surveillance vendor. In general the rationale for this level of oversight which exceeds the normal requirement for QL-4 parts is:

- Volume of parts required for Refurbishment (i.e. OPG is not simply purchasing single parts for ongoing operational replacement, but 1000+ parts for a major refurbishment campaign – “construction project”).
- Mitigation of risk around timely parts receipt with expected quality; OPEX from other Nuclear Refurbishments.
- The Project Team is following a risk based methodology, to perform oversight / ITP witnessing on selected parts only, which have higher potential to impact Refurbishment or the Station.
- This is consistent with the level of oversight / documentation Ontario Hydro utilized for turbine generator initial erection. At that time, Merz & McLellan was engaged as OPG's source inspection agent.

### 5.8.2.2 ESES Inspection Test Plan Content

The ITP shall contain as a minimum:

- The products or services that are to be subcontracted and specify the Quality Assurance Program to be applied.
- How the Vendor will verify the sub-supplier's conformance to specified requirements by one of the following methods:
  - (1) Inspection & Test by the sub-supplier as defined in the sub-supplier's Inspection and Test Plan.
  - (2) Inspection & Test by the Vendor at the sub-supplier facility.
  - (3) Surveillance by the Vendor.
  - (4) Incoming Inspection.
  - (5) Where each inspection and test point is located in the production cycle.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>67 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- (6) What characteristics are to be inspected at each point and specify acceptance
- (7) Criteria and any sampling plan to be used.
- (8) Where OPG has established WITNESS / HOLD or verification points.

### 5.8.2.3 ESES Deviations and Non-Conformance

Any departure from any requirement of approved specifications is considered a deviation or non-conformance. Examples include physical defects in equipment, test failures, equipment out-of-tolerance, or deviations from specification, inspection or test procedures.

The ESES shall be responsible for the disposition of all non conforming items, during engineering, manufacture, procurement and execution, including those of its Sub-Vendors. Non conformance reporting shall be classified and dispositioned at three levels:

Level 1 – Non conformance which does not affect the function, safety of operation and interchangeability of components in any way. Level 1 non conformance will be recorded and retained to be available for OPG to review if requested

Level 2- Non conformances which may impact spares, delivery schedule, standard design/drawings, or require calculation or analysis to disposition. Level 2 non conformance reports will require submission to OPG for information.

Level 3 – Non conformances which impact contract document, incomplete or missing inspections, and deviations impacting maintenance, interchangeability, life cycle, or spares. Level 3 non conformance reports require submission to OPG in accordance with section 2.7 of the Agreement. Further engineering or fabrication prior to final resolution shall be at the Vendor's risk.

The ESES shall establish and maintain measures for controlling and disposition of all non conforming items which is to include:

- (a) Defining the responsibility and authority of those who disposition the non conforming item
- (b) Detect and record the non conformance
- (c) Identify and hold non conforming items for evaluation
- (d) Develop a disposition, obtain concurrence of responsible parties, and submit to OPG for acceptance where required
- (e) Implement and accept disposition

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>68 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- (f) Specify requirements for re inspection and testing of the repaired or reworked components
- (g) Provide quarantine of the item to prevent unauthorized use
- (h) Maintain records identifying non conformances, the nature and extent of the issue, disposition, and records of repair and re inspection.

#### 5.8.2.4 ESES Software Quality Assurance Project Requirements

The ESES is required to comply with the software QA requirements as specified in the following design requirements and associated technical specifications prepared for both Turbine controls upgrade (NK38-SOW-64100-10003) and Excitation controls upgrade (NK38-SOW-64220-10002).

- NK38-MDR-64100-10001 Turbine Generator Controls
- NK38-MDR-64160-10001 Turbine Generator Supervisory System
- NK38-TS-64100-10001 Turbine Generator Control System Procurement
- NK38-MDR-64220-10001 Generator Excitation and AVR Controls
- NK38-TS-64220-10001 Generator Excitation and AVR Digital Control System Procurement

There are no software requirements associated with the Turbine and Auxiliaries and Generator and Auxiliaries scope of work.

#### 5.8.2.5 ESES Software Maintenance/Software Tools

The ESES is required to comply with the software maintenance / tools requirements as specified in the following design requirements and associated technical specifications prepared for both Turbine controls upgrade (NK38-SOW-64100-10003) and Excitation controls upgrade (NK38-SOW-64220-10002).

- NK38-MDR-64100-10001 Turbine Generator Controls
- NK38-MDR-64160-10001 Turbine Generator Supervisory System
- NK38-TS-64100-10001 Turbine Generator Control System Procurement
- NK38-MDR-64220-10001 Generator Excitation and AVR Controls
- NK38-TS-64220-10001 Generator Excitation and AVR Digital Control System Procurement

There are no software maintenance / tools requirements associated with the Turbine and Auxiliaries and Generator and Auxiliaries scope of work.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>69 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

#### 5.8.2.6 ESES Quality Control Oversight

The oversight activities will be based on the documented oversight plan in accordance with N-STD-AS-0030, *Project Oversight Standard* and N-MAN-09701-10002, *Nuclear Projects Oversight Guide*. The basis of oversight will be:

- (a) Risk
- (b) Criticality
- (c) OPEX (internal and external)

To ensure compliance with the OPG requirements:

- The ESES Vendor interface will be controlled by the Vendor Owner Interface Requirement (VOIR) document forming part of the agreement and all other deviations, additions, exceptions, revisions accepted by both OPG and the Vendor.
- The EPC Vendor interface will be controlled by the Contractor Owner Interface Requirement (COIR) document forming part of the agreement and all other deviations, additions, exceptions, revisions accepted by both OPG and the Contractor.
- Assessments, witnessing activities, document review etc will be performed as required to ensure that Quality is never compromised.
- The Vendor's QA program will be audited in intervals as required, but not greater than three years to ensure that the Contractor is continue to implement the Quality program as required by OPG.

Adverse conditions such as Quality System failure or breakthrough events for which Contractor is accountable, will be documented as per N-PROC-RA-0022, *Processing Station Condition Records*. Contractor will be asked to initiate a Corrective Action as per their program for any identified quality issues. When there is a systemic failure of Quality System implemented, a formal Non Conformance and Corrective Action Request process will be initiated by Supply Chain Quality services as per N-PROC-MM-0010, *Establishing and Maintaining Ontario Power Generation Nuclear Approved Suppliers List* and N-GUID-01935-10004, *Desktop Guide for Supplier Non-conformance Correction Requests (NCAR)*.

#### 5.8.3 EPC Quality Management

The EPC Contractor shall submit a Construction Quality Assurance Plan (QAP) to OPG within the time frame stipulated in the Contract Agreement. The QAP shall include items such as:

- Project Quality Assurance requirements

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>70 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- Training & Qualification
- Organizational structure and roles
- Design process (control, planning, use of analysis software, documentation, design verification, etc)
- Procurement requirements and documents
- Inspection and test
- Control of measuring and test equipment
- Handling, storage and shipping
- Non-conformances and corrective action
- Quality Assurance records

This Project Management Plan will be fully updated upon acceptance of the QAP.

## 5.9 Risk Management

### 5.9.1 Risk Management Overview

Risk management provides projects with forward-looking actions and metrics to reduce the likelihood and minimize the impact of undesirable events during the project life cycle. The goal of risk management is to remove obstacles to project success before they occur in order to minimize their consequential effect on project costs, schedule, quality, and safety targets.

Proactive risk management is used to understand the characteristics of the risk, how to manage them, and plan for *contingency* based on the *residual risks*. As such, risk management can have a significant impact on the financial health of the project.

Risk management should be performed with a graded approach. The intent of this approach is to match the level of effort with the impact to safety, cost, schedule and success of the project.

### 5.9.2 Risk Identification

Risk identification is the process of determining and documenting the risks and their characteristics that can affect the project. It is an iterative process as new risks may be identified throughout the project lifecycle and previously identified risks may not have realized and are closed. The risks must be defined in relation to project objectives and it is important to distinguish a risk from its causes and *consequences*.

Currently the risks for the TG project are recorded into a Risk Registry (contract pre-award phase); after the contract award they were transferred into the Project /

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>71 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

Departmental SharePoint risk database. In late March, 2015, all risks were transferred to a new Risk Management Oversight (RMO) tool.

- (a) Risks are identified through:
  - (1) Facilitated brainstorming sessions or risk workshops
  - (2) Individual project team member or stakeholder input
  - (3) A review of experience (OPEX) and lessons learned from other internal and external projects
  - (4) Any other relevant techniques or sources (e.g. Delphi technique, checklists, Project Definition Rating Index (PDRI)).
- (b) Identified risks are clearly and unambiguously described, so that they can be understood by those responsible for risk assessment and risk planning. Elements of the risk statement should include a description of the risk event, the *consequences* of such event occurring, the project objectives impacted, the potential causes of risk realization and expected time period of the risk occurring.
- (c) The project risks are grouped into logical risk categories. This aids in the identification of project risks and the assignment of ownership and serves as a method of grouping of risks for assessment, analysis, monitoring and reporting. This also allows the project to consider related risks that have the potential to produce a greater *consequence* than the individual risks.
- (d) The projects documents and updates risks in the risk register. A risk register is the document containing the results of risk analysis, and risk response planning. The risk register details all identified risks, including description, category, cause, *probability* of occurring, impact(s) on objectives, proposed responses, owners, and current status. The risk register is updated quarterly (the frequency may increase when closer to the Refurbishment Outage).
- (e) A *Risk Owner* is identified for each risk, which is accountable to ensure that an appropriate response strategy is selected and implemented.
- (f) Each risk has:
  - Risk identification number
  - A concise risk title
  - Risk category

### 5.9.3 Risk Monitoring and Control

Risk monitoring is essential as projects are dynamic and project risks will evolve over time. Risk monitoring and control involves the tracking of identified risk, monitoring of

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>72 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

*residual risks*, identification of new risks, monitoring the execution of risk response plans and evaluation of risk response effectiveness. *Contingency* reserves should also be periodically monitored.

Projects should review the project risks and update the risk register to document any changes and new risks as per the RMP. It is recommended that risks are not deleted from the risk register. If a risk is deemed to be irrelevant, the risk should be statused as "Closed". Risks can be closed (and the rationale documented) for any of the following reasons:

- (1) Risk matured, the expected time for risk realization has passed.
- (2) The *risk trigger* does not exist anymore and there is no other risks related to this condition
- (3) The risk has been mitigated to the point that it is considered a Business As Usual (BAU) risk.

Projects should prioritize the project risks, and communicate any changes to project stakeholders, including risks that have been triggered or a risk that has increased significantly in *probability*.

## 5.10 Engineering Management

OPG has adopted a combined EPC/ESES Vendor contractual model to be applied to the TG Project. For the engineering portion of the work, the *Modification Process*, N-PROC-MP-0090, will require OPG interfaces with the EPC to accept, review, support, approve and/or authorize deliverables required as part of N-PROC-MP-0090.

In order to provide the ESES with the flexibility to work under their QA Program and identify/utilize key acceptance and oversight points, a TG contract specific Vendor Owner Interface Requirements (VOIR) has been developed.

Similarly, for the part of the TG scope assigned to the EPC contractor, in order to provide its flexibility to work under their QA Program but within the bounds of N-PROC-MP-0090, a TG contract specific Contractor Owner Interface Requirements (COIR) has been developed.

### 5.10.1 Design Reviews

The design deliverables requiring OPG to Review, Accept, Approve, and/or Authorize shall be routed through the Engineering Lead Section Manager or DTL, to the assigned Project Engineer that will coordinate the necessary acceptance, approval and/or authorization per appropriate governance (e.g. N-PROC-MP-0010, *Engineered Tooling Change Control*, N-STD-MP-0009, *Contractor\Owner Engineering Interface and Oversight*, N-PROC-MP-0105, *Quality Design Plan*, N-PROC-MP-0078, *Specification Review Acceptance and Use Of Vendor Technical Documents* and N-PROC-MP-0009, *Design Management*).

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>73 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The ESES shall participate in an initial design review meeting with OPG during preliminary engineering. This meeting will involve all project stakeholders and the purpose of this meeting will be to discuss the specification, design, manufacture, testing, and inspection requirements for preliminary engineering solutions and equipment to be supplied. This will also provide an opportunity for plant equipment walkdown and inspection to ensure compatibility of the proposed replacements.

Design drawings shall be submitted by the ESES for review to OPG at 50%, 70%, 90% completion as outlined in VOIR.

### 5.10.2 Engineering Closeout

Engineering Closeout shall be conducted in accordance with N-PROG-MP-0001, *Engineering Change Control* and N-PROG-MP-0010, *Engineered Tooling Change Control*.

### 5.10.3 Engineering Oversight

The oversight will be:

- Performed in accordance with N-STD-AS-0030, Project Oversight Standard, N-MAN-09701-10002, Nuclear Projects Oversight Guide, and N-STD-MP-0009 Contract/Owner Engineering Interface and Oversight.
- Engineers will follow approved procedures as well as direction from Design Authority on how to perform Oversight, in line with the Project Oversight Plan
- Focus on ensuring Contractor meets their own quality program and meeting specified requirements and contractual terms
- With support and approval of Project Managers, conduct targeted review of Contractor's Engineering deliverables and verify Contractor's internal Engineering oversight activities
- The Project Engineers may require support from Engineering Functional Groups such as Design Engineering, Engineering Projects. An Owners Support Services Contractor will be available to provide additional resources or support of the Project Engineers and Engineering Functional Groups when need.

## 5.11 Construction Management

The TG Construction Management will be in accordance with NK38-PLAN-09701-10012, *Management Plan: Management of Contractors for Darlington Refurbishment Project*, and NK38-PLAN-09701-10067 Sheet 14 *Program Site Implementation And Construction Management Plan*.

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>74 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The Construction Management objective is to ensure alignment between all the project stakeholders including the Contractors and groups executing the construction phase of the project, and to provide oversight such that the project is completed safely, meets the quality requirements while achieving cost and schedule targets. OPG staff will act as “Enablers” that support the executing groups, work with them to achieve world class safety, meet quality requirements and achieve the project schedule milestones.

General Construction Management principles related to TG project:

- (a) The ability to influence a positive outcome increases when the construction details are clarified and well planned prior to field implementation.
- (b) A relationship based on trust and openness between OPG and execution contractor is crucial for meeting all the project objectives
- (c) The level of oversight applied will be risk based and be specific to each of the five TG sub-projects” as detailed in the Project Description section of this document.
- (d) Oversight will be performed in accordance with N-STD-AS-0030 *"Project Oversight Standard"* and N-MAN-09701-10002 *"Nuclear Projects Oversight Guide"*.

It is assumed that the TG EPC contractor would be self sufficient and adopt industry best practices for performing installation and construction type of work for turbine generator refurbishment. However, based on nuclear industry OPEX regarding execution of EPC contracts, the level of oversight in the Project Oversight Plan will be commensurate with the EPC Contractor’s experience and past performance.

Prior to execution of the scope of work OPG will provide a fully serviced office for the Contractor’s single point of contact (SPOC) in a location with the Project team.

During site execution OPG will provide the following:

- Identified work “islands” to perform the scope of work on the refurbishment unit separated and isolated from the operating units. The area provided would include laydown for the major components of the turbine generator equipment and control / operation of the crane for the duration of the execution window for the work.
- Two fully serviced re-locatable office structures on the turbine floor. Computer and telephone services will be the responsibility of the Contractor.
- A reasonable number of 600V 3 phase 60Hz welding receptacles to be used for bolt heating and inspection equipment. Any distribution boards or extension cables shall be supplied by the Contractor.
- A reasonable number of 120V 60Hz power supplies.

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>75 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- A reasonable number of service compressed air supplies, however distribution headers and hoses will be supplied by the Contractor.
- Reasonable amounts of service water from the low pressure service water system. Distribution headers or hoses will be supplied by the Contractor.
- Washrooms in the powerhouse. External washrooms will not be provided.
- An area to use for breaks and lunch, and an area for coats and storage of personal items.
- Parking for the Contractor staff and trades.

In the event on-site laydown is insufficient, it will be the Contractor's responsibility to arrange site storage and warehousing including transportation to and from site and material handling. (This is to include a staging plan and inventory control process). Movement of major equipment / items within the work area, in and out of the work area / site, and to any off site areas shall be integrated with OPG's and project requirements (i.e. Lifting Plan, SATM Plan, Transportation Plan, etc). See NK38-CORR-09701-0537091 Refurb Vendor Storage Protocol.

OPG shall provide two turbine hall cranes during execution of the refurbishment work on each turbine generator. The turbine hall crane operators shall not be provided and are the responsibility of the Contractor. OPG shall perform any inspections and maintenance on the turbine hall cranes prior to the commencement of work on each unit and will arrange and perform any call-ups on the cranes at a mutually agreeable time while they are under the operation of the Contractor (see NK38-CORR-22000-0500070).

OPG and the contractor will make arrangements to ensure the ingress and egress from the area would be streamlined to maximize working time for installation and construction.

The Contractor will remove only non-asbestos insulation, and re-apply new insulation as required within the Contractor's scope of work. The determination of the non-asbestos replacement insulation material selection will be mutually agreed to by OPG and the contractor, and should be as per original installation wherever possible. If asbestos insulation is found, OPG is to be solely responsible for its removal and disposal including any resultant delays.

Asbestos containing gaskets will be removed and replaced by the Contractor in accordance with the applicable health and safety standards, with the work being carried out by a qualified contractor, or sub contractor having insurance coverage acceptable to OPG. OPG will be advised of the Contractors' qualifications and insurance coverage prior to the work being executed, and OPG will be responsible for the safe disposal of any asbestos containing gasket material.

The Contractor shall use the special tools supplied during the initial installation of the turbine generator sets. This is to include any lifting beams, rotor stands, spreader

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>76 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

beams, bolt heating, stub shafts, etc. The existing special tools shall be provided by OPG to the Contractor in a state ready for their use including completion of any calibrations, call-ups, or maintenance. These tools shall be returned on the completion of the Project and the Contractor shall replace any tool that is damaged or lost while in its possession at the Contractor's cost. This tooling shall be inspected and inventoried at the beginning and end of the Project. Any additional special tooling which is required to complete the Project will be the responsibility of the Contractor (i.e. spreader beams, rotor stands, and OPG qualified slings for applicable large lifts).

The Contractor shall supply all standard rigging required to complete the scope of work with the exception of special rigging which is included with the special tooling ( slings etc for rotor and inner cylinder removal, turbine generator jib cranes ). Any special rigging supplied by OPG will be supplied and returned under the conditions identified in the previous paragraph.

The Contractor shall supply all hand tools as necessary for completion of the Contractor's scope of work. OPG will be responsible for providing decontamination / transfer permits to allow the tools to be removed from the site.

The Contractor will comply with all OPG radiation requirements for transportation of material and personnel on and off site.

All Contractors' personnel involved in the construction and installation activities will require appropriate training. There are several types of training requirements:

All Contractor training must meet the requirements of OPG procedure N-TQD-510-00001, "*Supplemental BTU, Direct Hire and Contract Management Training and Qualification Description*".

- The Contractor will develop a training plan for each trade, professional and supervisory staff group.
- The Contractor will provide its own training facilities for any training conducted under their accountability.
- OPG will provide oversight of any specialized training that the Contractor is conducting through routine observation and audits of material.
- All training records must be maintained as QA records in the OPG TIMS II ("*Training Information management System*") database or an equivalent Contractor's training database to demonstrate qualifications.
- Contractor and / or Project specific training and qualifications are the responsibility of the Contractor.
- General training requirements is the responsibility of the Contractor, with support from OPG:

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>77 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

- (1) Nuclear general employee training (NGET) computer based training (CBT) mandatory for issuance of site access card.
- (2) Additional CBTs / computer assisted trainings (CALs) / administrative requirements (ARQs) mandatory for all Boiler Trade Union (BTU) direct hire, Contractor supervisors of BTU and Contractor personnel (e.g. Intro to Corporate Safety Rules, procedural usage and adherence). Mandatory training requirements for Contractor supervisors of BTU-general foreman (e.g. health and safety law, pre-job brief). Supervisory personnel, prior to assuming supervisory oversight activities independently, shall complete all OPG training requirements applicable to that position or equivalence approved by OPG. OPG will assess BTU foremen qualification via an oral review board to ensure their qualification in conformance with OPG standards.
- (3) Islanding & interface training, provided or arranged by OPG, which includes: access restrictions and controls, shared areas, barriers & controls, incident / emergency response, staging of materials.
- (4) Training qualifications required to perform task specific work - examples: radiation protection training (e.g. orange 1 badge, half mask air purifying respirator), work protection (e.g. work protection applicant level 4), Class III to VIII industrial lift truck, confined space and conventional safety training.

The current plan, as per NK38-CORR-09701-0513497, is for a single service scaffolding provider to purchase and maintain Refurbishment scaffolding material stock. Scaffolding erection shall comply with OPG requirements for construction, inspections etc.

The Contractor shall provide its own garbage and debris removal from site and disposal off site. The Contractor will ensure that all work areas will be cleaned and left in a state as good as original, including removal of all equipment, tooling, and temporary barriers, and meeting OPG Material Condition, Housekeeping and Inspection Standards.

The Contractor shall have and administer its own confined space program during execution of the scope of work. This program shall be approved by OPG to ensure compliance with OPG standards and shall comply with OSHA requirements. This shall include identification of confined spaces, set up, testing and monitoring etc.

### **5.11.1 Cooperation Agreement**

The effective use of a Cooperation Agreement is essential to obtain tripartite (OPG/JV/Alstom) agreement to cooperate, work together, not interfere with each other, resolve issues, and act transparently. The Cooperation Agreement will help to minimize any impact with constant monitoring and address any issue.

The Cooperation Agreement reflects the following principles:

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>78 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

#### ***Success Criteria***

- All parties shall strive to achieve a common goal to ensure the project is executed safely, with quality in accordance with their respective contracts and within the allotted budget and schedule.
- The parties will acknowledge that the success of the project depends upon the success of each of the parties.

#### ***Integration***

- All parties will develop and work to an integrated schedule for the project.

#### ***Transparency***

- All parties shall act in good faith and disclose information that the receiving party requests and reasonably needs to perform their work under their respective contracts, subject to and in accordance with the respective parties' confidentiality agreements.

#### ***Effective Communication***

- All parties shall agree to a communication protocol for timely and effective exchange of information.

#### ***Issue Resolution***

- All parties must adhere to the pre-established resolution protocol contained in their respective contracts, or as may be otherwise agreed to by the parties
- The parties will endeavour to work to resolve issues in a timely manner, and communicate the unresolved issues through the proper channels.

#### ***Contract Terms and Conditions***

- The rights, remedies and obligations of all parties will remain within their respective contracts.

### **5.12 Safety Management**

It has been recognized that a unique approach to the management of the Nuclear Refurbishment (NR) Project is required due to the large scope and duration of the project, and the multi-employer configuration. The operations and construction safety integrity is required so that all refurbishment work is completed in a safe, high quality, and economic manner. This will require an integrated approach between OPG, ESES, EPC, and other contractors/work groups where Safety is the **CORE VALUE** of the NR project as well for the individual Turbine and Generators project.

Together, OPG and all contractors on the project are committed to this **CORE VALUE**. OPG and all the contractors will protect every employee's right to work in a safe and healthy refurbishment work environment. This will be achieved by preventing work-caused injury and ill health and by complying with all relevant safety legislation, written safety procedures, and using safe work practices established for NR work.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>79 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

The ultimate purpose of project safety management processes is to ensure that projects are planned and executed in a manner that ensures a safe work environment is established in order to prevent incidents. These plans will provide NR Project Teams and support staff with a clear understanding of the Health & Safety management requirements for the project. The Guide for Refurbishment Work Stoppage / Reporting and Recovery is NK38-GUID-09701-539564.

The Turbine Generator (TG) Project will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), the OPG expectations (N-POL-0001, *Nuclear Safety Policy*, OPG-POL-0001, *Employee Health And Safety Policy* and N-GUID-09701-10011, *Darlington Refurbishment - Safety Management Essentials*), and the TG ESES and EPC Agreement Terms and Conditions.

The over-arching health and safety performance requirements have been set out in N-GUID-09701-10011 "*Safety Management Essentials*" and have been issued by OPG to the contractors performing work under the NR Program. Based on this Guide, the Contractor will develop a Project Site Specific Safety Plan for their work scope that will meet or exceed the requirement of OPG as described in the Guide and as referred to in Safety Exhibit 2.4 of the contract.

Together, the NR Safety Governance framework (including N-GUID-09701-10011) and the TG ESES and EPC Contractors' Safety Program and specific safety plans will form the bases of the Safety Management Plan for the TG Project.

### 5.13 Environment Management

The Environmental Management Plan (EMP) describes how OPG and TG Contractors will manage environmental issues for Turbine Generator Refurbishment Program.

It establishes a framework for environmental management for the TG Project, and Vendors/Contractors in accordance to defined goals, objectives and expectations for the Nuclear Refurbishment Program.

During all phases of the TG project, the ESES and EPC Contractors shall comply with the program level requirements of the *Nuclear Refurbishment Environmental Management Plan* (NK38-PLAN-09701-10067 Sheet 12) as summarized below:

#### 5.13.1 Goals and Objectives

##### Objectives:

- Maintain Environmental Management System Certification during the project
- Event-free operations during the project.
- Minimize impacts on the operating units.
- Minimize delays in return to service.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>80 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

#### Goals:

- Operate As Low As Reasonably Achievable for radiation exposure of the Public and the Environment (PE-ALARA)
- Zero Reportable Spills and Environmental Infractions
- Maximize landfill diversion of conventional waste in alignment with regional objectives.
- Maintain top quartile performance for the generation of Low and Intermediate Level Radioactive Waste (LILRW) during Refurbishment and sustain top decile performance following the project.

### 5.13.2 Contracting Requirements for Environmental Management

With respect to the Project, there are certain elements that must be considered: the standard requires that any person performing work or services on a site, which has the potential to cause a significant environmental impact, should be aware of the requirements and importance of the Environment Management System (EMS) and are competent to perform the job assigned. Also, for Contractors performing an operation or activity that has the potential where environmental impacts are significant, these controls should take the form of documented procedures. Regardless of who performs the work (i.e. sub-Contractors) the Contractor is accountable for ensuring compliance.

Whether or not OPG is the Constructor of a project or the project is an Owner Only project, OPG can be found liable for environmental regulatory infractions. The Project Manager is responsible for ensuring environmental requirement specifications are prepared, approved and followed. This must be done with full knowledge of the degree of environmental risk inherent to the construction or maintenance activities involved in the project (including environmental impact risks, stakeholder risks and legal risks).

The TG Project Manager will prepare an assessment of the *Environmental Aspects* and potential *Environmental Impacts*, unique to the project. This assessment will be integrated into the Contractor's Environmental Management Program (CEMP). The assessment provides assurance to the workplace parties that the environmental risks unique to the project have been identified and that adequate controls to eliminate or mitigate the risks are in place before work commences.

This plan provides the TG Project Manager with an understanding of the environmental risks of the project and in conjunction with the N-GUID-09701-10013: *Nuclear Refurbishment – Environmental Requirements Guideline* which provides expectations and specific requirements for the CEMP.

### 5.13.3 Contractor Environmental Management Expectations

The ESES and EPC Contractors are required by OPG to identify hazards, evaluate risks and develop appropriate plans to mitigate risks. OPG expects Contractors to

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-41000-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>81 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

manage their operations to protect the environment the welfare of site staff and the environment. Their process, procedures shall be subject to competent scrutiny through the supply chain. Environmental programs and/or operations that do not meet these expectations, and in particular where there are opportunities that have not been utilized to improve the use of good environmental practice and/or eliminate/reduce significant risks, shall not be deemed acceptable (subject to assessments of reasonable practicability).

Where design is part of the works, the Contractor shall comply with the requirements in this guideline:

- (a) The Principal Contractor shall ensure that: all environmental requirements are fully Incorporated into the Engineering, Procurement and Construction (EPC) process;
- (b) There is clear allocation of responsibility and authority for environmental management matters;
- (c) There is an effective interface with regulators, including obtaining relevant licences, consents and permits;
- (d) This Guideline and other requirements are clearly communicated through their supply chain, and reflected in the Contractor Environmental Management Program (CEMP);
- (e) Ensure that sub-Contractors are competent and resourced to work to the required standards;
- (f) Ensure compliance with site as well as their own requirements by their personnel, sub-Contractors personnel and visitors;
- (g) There is cooperation with the TG Project Manager and OPG Environment Advisor;
- (h) There is cooperation and participation in environmental programs for Contractors;
- (i) There are mechanisms in place to ensure cooperation and exchange of information on neighbouring/shared risks and logistics;
- (j) Ensure that relevant information on work in the area designated as under their control is provided to OPG to facilitate coordination, so that the activity of any party does not result in undue risk;
- (k) Members of the team have access to appropriate, competent environmental management advice and support; and
- (l) Monitoring and reporting including: completion of the monthly Environment Scorecard and reporting of incidents and accidents is undertaken.

Sheet Number: <b>0001</b>	Revision Number: <b>R003</b>	Page: <b>82 of 91</b>
Title: <b>TURBINE GENERATOR PROJECT MANAGEMENT PLAN</b>		

#### 5.13.4 Environmental Performance Metrics and Targets

A single, consistent set of Environmental Metrics (measures and targets) for Nuclear Refurbishment and Contractors at the Program and Project levels are under review and will be approved for use (NK38-REP-09701-10145, *Proposal for Refurbishment Chemistry & Environment Metrics*).

NR Senior Line Management, NR Project Teams and Contractors will use the metrics to identify unsatisfactory performance against prescribed targets and identify methods to eliminate causes for unsatisfactory safety performance.

Program and Project Environment metrics will be tracked on a prescribed frequency and reported graphically, or otherwise, through the Refurbishment Program Monthly Status Report and TG Project Manager Status Reports.

#### 5.13.5 Environmental Oversight and Monitoring

Environmental oversight and monitoring requirements for Nuclear Projects will be established under direction of N-STD-AS-0030: *Project Oversight Standard*. Environmental oversight criteria are identified in N-GUID-09701-10013: *Nuclear Refurbishment – Environmental Requirements Guideline*. Environmental oversight criteria will be included in Project Oversight Plans (POPs).

A Darlington Environmental Review Team (DERT) has been established and will be a key environmental compliance oversight mechanism for the Program.

### 6.0 PROJECT REPORT MATRIX

The NR Planning and Controls Project Management Office (PMO), in accordance with N-PROG-AS-0007, *Project Management* and N-MAN-00120-10001-CST, *Nuclear Refurbishment Cost Management and Project Reporting*, will be providing the TG Project with reports in the following areas:

- Schedule performance, SPI
- Cost performance, CPI
- Earned Value, EV
- Forecast to complete based on EV, by cost element
- Metrics, including variance analysis, response times to requests for reviews of submittals, requests for information

The TG Project will provide the following to the NR PMO to be incorporated in the project reporting:

- Project Manager's status

## Appendix A: Contracting Strategy Summary for TG Project

This Turbine Generator Refurbishment Project Contracting Strategy Summary provides the currently recommended alternative contracting strategy for the Turbine Generator Project (the “**Project**”) under the Darlington Refurbishment (“**DR**”) program (the “**Program**”) as the project objectives and negotiations goals could not be met through the original contracting approach (full EPC).

The Project Team recommends allowing inclusion of the original equipment manufacturer (“**OEM**”) in the alternate contracting plan. Participation of the OEM will help OPG minimize redesigned components and reverse engineering which will ultimately help to minimize risk.

The EPC contracting model is recommended because it helps ensure the achievement of OPG’s business objectives, DR Program and Project objectives and is the least risk option. This model includes:

- (a) EPC with OEM as prime subcontractor or Joint Venture (“**JV**”);
- (b) EPC without the OEM (i.e. reverse engineering or full replacement);
- (c) EPC where OPG manages the interface between OEM and EPC contractor where:

Work is done under 2 separate agreements (i.e., an agreement with the EPC contractor concluded as a result of a competitive process and an agreement with the OEM concluded as a result of selective single sourcing);

OPG contracts with OEM for engineering, technical support and OEM supplied equipment or components and then free issues materials to the EPC Contractor selected through the alternate process; or OPG assigns the agreement with the OEM to the EPC contractor.

The TG project using a risk based approach preceded with option c) (see above) as per alternative procurement plan NK38-PLAN-41000-10001 and this option includes the following 2 separate contracts:

- An agreement with an ESES Contractor, specifically the Turbine Generator OEM – Alstom (concluded as a result of selective single sourcing);
- An agreement with the EPC contractor concluded as a result of a competitive process considered as EPC wrap-up that will perform the EPC role using the components/parts provided and using the technical support services from in the first agreement with the OEM

All other options specified in the alternative procurement plan were considered higher risk due to reverse engineering and integration.

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>5 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

## 1.0 BACKGROUND

The Program Scope Review Board (PSRB) reviews and approves proposed additions or deletions of major program level scope for refurbishment of the Darlington Nuclear Generating Station (DNGS) as described in the Darlington Refurbishment Program – Program Scope Review Board - Terms of Reference (NK38-PLAN-09701-10003), DNGS Refurbishment Project Reference Plan – Scope Definition (NK38-PLAN-01060-10003) and in accordance with the Darlington Refurbishment Program Charter (D-PCH-09701-10000).

The process of identification of Program scope and the management of scope changes is described in this instruction and applies to all phases of the Darlington Refurbishment Program. This will ensure that the proposed additions and/or deletions have undergone a thorough assessment based on the return on investment, impacts on plant safety, reliability, project schedule and cost, program resourcing, regulatory requirements and environmental impacts. Refurbishment scope is maintained in the Darlington Scope Request (DSR) database.

Scope in the Darlington Refurbishment Program will support the Darlington Refurbishment Principle Program Objectives:

- (a) Confirm feasibility of refurbishing DNGS reactors
- (b) Plan and execute all work required to refurbish the Darlington units
- (c) Ensure the scope of the refurbishment outages will enable economic operations of each unit for an additional 30 years post-refurbishment.

Refer to Program Structure and Summary Management Plan, NK38-PLAN-09701-10067 Sht: 0001, for an overview of the Program and NK38-PLAN-09701-10067 Sht: 0002, Refurbishment Program Scope Management Plan, identifies how the program scope will be defined, managed and controlled throughout the Darlington Refurbishment program.

## 2.0 DIRECTION

This instruction applies to all staff performing or supporting the identification and definition of scope related to the Darlington Refurbishment Program. This instruction describes the process for submission and approval of scope additions by the Darlington Refurbishment Program Scope Review Board (NK38-PLAN-09701-10003). Scope changes and deletions will also follow the process outlined in this instruction.

Rigorous identification and control of the Darlington Refurbishment Outage Program scope and execution is essential to successful completion of the refurbishment on budget and on schedule and shall be based on the following principles:

- Project safety and defense-in-depth is maintained

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>6 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- Established Dose Targets are not exceeded
- Appropriate Program and Project work is completed
- Project schedule is not extended unnecessarily and recovery plans are developed as required
- The Program costs do not unnecessarily exceed budget
- Planning and integration with key work management areas of the company (outage and online Darlington schedules)
- Reasonable contingencies are in place for unforeseen circumstances that may arise, i.e. discovery work, during the Darlington Refurbishment Program
- Identify, prioritize, track and mitigate risks associated with the project.

For the purpose of supporting this scope control instruction, the Refurbishment Program scope will include core scope and non-core scope. Scope categories are chosen by the scope initiator and confirmed by the technical screening and funding committees and approved by the PSRB. Scope categories are used to ensure the correct work is accepted into scope with clear justification to support the Program Objectives. Once scope is accepted into the Program, the scope must still follow the Gate Review Board approval process for funding and scope management, in accordance with Nuclear Projects – Gated Process (N-MAN-00120-10001-GRB). Refer to Appendix G of this document for a flowchart of Refurbishment Scope Review Process.

### 2.1 Transition to Ad-Hoc PSRB Meetings

As of May 2014, the quarterly PSRB and Funding Committee Review will be replaced with Ad-Hoc meetings. The NR Project Planning and Controls will have the responsibility in scheduling the need-based PSRB and setting up the agenda.

## 3.0 SCOPING PRINCIPLES

### 3.1 Darlington Refurbishment Objectives

The goal of the refurbishment project is to extend the service life of the units by an additional 30 years of post-refurbishment operations. Refurbishment will involve an outage for replacement of life-limiting components, as well as maintenance or replacement of other components which can be most effectively done during the refurbishment outage period.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>7 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

### 3.1.1 Primary Objectives

- Successful refurbishment of Darlington Station Life Limiting Components in order to allow Darlington to operate for 30 years beyond the current predicted end of service life.
- The Refurbishment Project will return the unit in better condition than which it was received.
- A successful refurbishment project requires delivery of all core and approved non-core scope within the timeline and budget established in the Release Quality Estimate and as documented in the project Business Case Summary (BCS).
- Project cost and schedule as well as post-refurbishment performance goals are met with quality, because they will come under extreme scrutiny due to the high profile nature of this project and its impact on OPG's reputation.
- Where scope is approved by PSRB, NR (Nuclear Refurbishment) may recommend inclusion of scope to pre-refurbishment station outage.
- The Refurbishment Program must ensure that all scope is known and is executable.

### 3.1.2 Secondary Objectives

- Refurbishment will assess the scope and overall economics of the program, with consideration of the following:
  - Hardened Backlog
  - 10 Year Investment Program
  - Minor Modification Program
  - Margin Management Plan
  - System Health and Lifecycle management plans
  - System Available for Service (SAFS)/Ready for Service (RFS) process with respect to plant status and operational burdens.
  - Outage Improvement Initiatives
- Support the station vision by delivering value enhancing station improvements (non-core scope).

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>8 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- The amount of non-core scope executed during the refurbishment outage will be based on priority of work, and cost benefit assessment. This scope will be optimized to minimize the risk to the refurbishment critical path schedule, and overall project costs.
- All non-core scope must meet strict financial hurdle rules prior to consideration i.e. 9.5% discount rate and 6 year payback (per memo from Chief Financial Officer). Refer to Appendix K for a copy of the memo.

## 3.2 Scope Categorization

All scope is categorized as core scope (CS) or non-core scope (NCS). All core scope will be linked back to the program objectives and non-core scope will be categorized to control and monitor types of scope added and deleted from the Program. Refer to Appendix D of this document for a chart of all scope categories and their description.

### 3.2.1 Core Scope

Consists of work that must be done to achieve the Primary Objective. Core scope will determine the critical path for the refurbishment outage and sets the lower boundary for the cost estimate. Refer to Appendix E of this document for a brief summary of the current document major components of core scope. Core scope includes:

- **Regulatory scope** – Scope that supports station license and regulatory requirements (not optional), as agreed with the regulator and documented in the Integrated Improvement Projects based on Environmental Assessment, Integrated Safety Review and other activities such as Global Assessment which do not require Economic Assessment.
- **Station Life Limiting Components** – modification, repair, or replacement of station life limiting components that must be replaced in order to support the primary objective to allow DNGS to operate for 30 years beyond the current predicted end of service life. This includes items which have an asset class tied to station life and can only be done in a drained and defuelled state. Examples include: Calandria Tubes, Pressure Tubes and Feeders.
- **Component Upgrades** – work to upgrade components, which have a high station priority that can only be done during an extended refurbishment outage with units in a drained/defueled state. Examples include LISS (Liquid Injection Shutdown System) nozzle inspections & repairs, Shutoff Rod guide tubes, and Calandria vessel inspections and repairs.
- **Programmatic work** – Typically performed online or in a normal station outage that must be done in the refurbishment period in order to maintain station licence, including mandatory preventive maintenance, inspections, etc.
- **Prerequisite Scope** – Inspections to determine refurbishment scope and Modifications/upgrades that must be done before refurbishment starts to meet

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

production requirements to enable a successful refurbishment. This includes islanding modifications and fueling machine upgrades.

- **Facilities & Infrastructure Plan** – construction of facilities and improvements to the infrastructure to support the refurbishment. See Scope Exclusions (3.2.4) below for exceptions.

### 3.2.2 Non-Core Scope

Consists of work that will be performed in the refurbishment period if it has no impact on the projects Core Scope critical path, does not add risk to the successful completion of core scope, and where cost or resource efficiencies and station priority warrant the work to be executed in the refurbishment period. A Business Case Assessment Summary (BCS) or Decision Record Analysis Summary (DRAS; N-FORM-11390) demonstrating the economic advantage; including risk management and/or reliability improvement, and priority of completing this work during, pre-, during or post-refurbishment will be required to gain approval.

Non-Core scope may include:

- **Safety Improvement Opportunities** – Safety or Environmental improvements beyond standard that provide benefits to the station in terms of increased reliability and/or lower operating costs some of which is documented in the Integrated Safety Review and Safety Factors Reports.
- **Station Improvement Opportunities** – Station improvements that provide benefits to the station in terms of increased reliability and/or lower operating costs, and where it is economically beneficial to OPG to perform the work in the refurbishment period.

### 3.2.3 Facilities & Infrastructure

Facilities & Infrastructure and Campus Plan projects, to support post-refurbishment operations will be funded by the Darlington Refurbishment program. The Darlington Site Infrastructure Co-ordination Committee will prioritize projects to be executed within this funding envelope.

### 3.2.4 Scope Exclusions

The following items are specifically excluded from the scope of Darlington Refurbishment Project:

- Operations and Maintenance work required to be performed to maintain the plant outside of the refurbishment outage window.
- Tritium removal facility improvements, upgrades, or replacements.
- Spare components, either capital or inventory (Other than per ECC (Engineering Change Control) )

## Instruction

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- New Maintenance Facility

## 4.0 PROCESS

Management of the Refurbishment Outage and the complexity over a long period of time will be a key factor in the success of the overall Program. The PSRB will approve the selection of only the correct scope to achieve success of the Program on schedule and within budget.

The Scope Management Process for the Darlington Refurbishment Program is graphically represented in Appendix A. This diagram represents (primarily) the Program Scope Review Board process and the Major Scope decision process. Approval of the further evolution of Major Scope is approved by the Gate Review Board (As per the Gated Process, N-MAN-00120-10001-GRB).

All work requested to be included in the scope of the Darlington Refurbishment Program must be initiated in the Darlington Scope Request database. Scope will originate from several areas of the Program, including the Environmental Assessment and Integrated Safety Review actions, Plant Condition Assessment, including Aging Management recommendations (through Component Condition Assessment's), infrastructure projects, Station Work Management requirements and Station Improvement Initiatives. Considering each scope origin, the scope request information originates in different forms and must be requested in a common format for the Program to control the scope. The Darlington Scope Request database for the Refurbishment Program will be the format in which DSR Line Items are submitted.

Once requested in the database, the scope will be processed accordingly through the database for consideration in the technical screening and funding committees and at one of the PSRB meetings.

Post Major Scope Milestone completion (May 2011) all proposed non-core scope will require a cost benefit analysis (i.e. BCS or DRAS) and project schedule impact review accompanying the DSR. Refer to Developing and Documenting Business Cases (OPG-STD-0076) for BCS process and Nuclear Refurbishment Actions, Issues, Decisions, and Key Assumptions Management (N-MAN-00120-10001-RISK-07) for DRAS process.

### 4.1 DSR life cycle

The DSR will go through a number of transitions from creation to reconciliation against a Work Order at 24 months before each unit's outage, and to close out as illustrated in the diagram below. A DSR starts as a high level thought and progresses from identification stage to the definition stage; depending on how well the scope is known and understood.

There will be five closeout reports, one per unit, as well as a final close out at the end of the project. The DSR managed in the DSR database is the currency of scope control until 24 months prior to the Refurbishment Outage (RO-24) at which time the

Title:

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

currency will change to Work Orders managed in the Outage Management System (OMS). The reconciliation report will be complete by the RO-12 (Unit OMS Work Order Scope Freeze Milestone).

## 4.2 DSR database

The term DSR refers to a Darlington Scope Request line item. The DSR database is the source of scope control for the Darlington Nuclear Refurbishment Project. It is available on the project management section of the Darlington Refurbishment web page.

Refurbishment scope is maintained in the DSR data base. Scope management will be integrated into the Refurbishment program information management system through various processes; examples include schedules, contracts, scope of work documents, budgets and business plans. Scope information management shall follow approved OPG, Nuclear and Refurbishment governance, including, but not limited to, N-PROG-AS-0006, Records and Document Control.

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>12 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

### 4.2.1 DSR initiation

It is intended for anyone to be able to initiate a DSR. To initiate a DSR, open DSR database and follow on screen instructions; if unsure, STOP and ask the DSR database administrator for help. During the DSR creation, the scope initiator will be required to categorize the scope (outlined in Appendix D) and select a DSR type (outlined in Appendix J).

All scope requested in the Darlington Scope Request database must be supported by a Stratum Level 4 sponsor. The sponsor's electronic signature will be required at the time of scope request prior to review at any of the scope review boards. Post Major Scope Milestone completion (May 2011) all new proposed scope will require a cost benefit analysis (i.e. BCS or DRAS) and project schedule impact review accompanying the DSR. After PSRB approval, the DSR database administrator will migrate the initiated draft DSR into the live database and send out an email notification to the PMs (Project Managers) of completion.

If a new DSR is created through an administrative DRAS (does not change scope; i.e. part of an approved DSR is moved to a new DSR with an approved status) and does not require PSRB approval, the signed and issued DRAS can be brought to the DSR database administrator to have the new DSR migrated to the live database.

The PM will need to input a change request to give the newly migrated DSR (at minimum) a title, status, bundle and health. The PM must also review and update any effected work orders.

### 4.3 Scope hierarchy

The scope hierarchy is a method of ranking the DSR line items in the DSR database to establish priority using Scope Type, Risk Rank, Prerequisite Indicator and Economic Valuation. The Scope Hierarchy is further detailed in Appendix H.

### 4.4 Technical Screening Committee

After major scope has been requested and sponsored in the DSR database, a Technical Screening Committee will review the requests. The committee will review a specific list of requirements including Core and None Core designations to ensure the scope request is adequately prepared for the PSRB. The technical screening committee will be led by the Vice President (VP), Nuclear Refurbishment Engineering.

The committee will make technical acceptance recommendations on specific scope items to the Refurbishment Funding Committee and the PSRB.

The Screening Committee Chair and Quorum is as follows:

**Chair:** Vice President, Nuclear Refurbishment Engineering

**Quorum Required (Voting Members):**  
Vice President, Nuclear Refurbishment Engineering

Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

Director, Operations and Maintenance, Darlington  
Director, Operations and Maintenance, Nuclear Refurbishment  
Director, Engineering, Darlington

Technical Screening Committee meetings require all quorum members or empowered delegates present.

See Appendix C for decision matrix to be used as a guideline by the Technical Screening Committee to make technical acceptance recommendations.

### 4.5 Funding Committee

After Major Scope has been requested and sponsored in the DSR database, and the Technical Screening Committee has recommended the proposed scope addition the Funding Committee will make funding stream recommendations. The Funding Committee will be led by the Director, Nuclear Refurbishment Planning and Controls.

The Funding committee will make funding recommendations on specific scope items to the PSRB.

The Funding Committee Chair and Quorum is as follows:

**Chair:** Director, Nuclear Refurbishment Planning and Controls

**Quorum Required** (*Voting Members*):

Director, Nuclear Refurbishment Planning and Controls  
Director, Business Support, Darlington  
Director, Asset Planning and Integration  
Controller, Nuclear Refurbishment

The Funding Committee meetings require all quorum members or empowered delegates present.

See Appendix F for funding matrix to be used as a guideline by the Funding Committee to make decisions.

### 4.6 Program Scope Review Board

The PSRB shall be a senior cross-functional board with representation from the site and supporting business units. The review board shall consist of voting members and nonvoting members. Non-voting members are scope sponsors or advisors in the Board. All scope presented at the PSRB should be supported by at least one sponsor among the Board membership. This is to ensure that there is support for the scope that is requested and knowledge of the scope that is requested at each meeting. The PSRB voting members will strive to arrive at a consensus for all scope requests. The Director of Planning and Control, Nuclear Refurbishment shall be the Chairperson of the PSRB and will designate a secretary to the PSRB whom will ensure that all

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>14 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

decisions are implemented in a timely manner. Required quorum for PSRB meetings shall be all of the voting members. In the event of the unavailability of the individual specified below, the Board member may delegate the meeting attendance to an empowered delegate.

The Program Scope Review Board Chair, Quorum and non-voting members are as follows:

**Chair:** Director, Planning and Controls, Nuclear Refurbishment

**Quorum Required** (*Voting Members*):

SVP or Deputy VP, Darlington Nuclear  
SVP, Nuclear Refurbishment  
SVP, Nuclear Engineering and Chief Nuclear Engineer

**Non-Voting Members of the PSRB** (*Sponsors & Advisors*):

VP, Engineering, Nuclear Refurbishment  
VP, Execution, Nuclear Refurbishment  
VP, Corporate Business and Investment Planning  
VP, Science & Tech, or Director, Eng Services  
Director, Operations & Maintenance, Darlington Nuclear  
Director, Operations & Maintenance, Nuclear Refurbishment  
Director, Engineering, Darlington Nuclear  
Director, Engineering, Nuclear Refurbishment  
Director, Work Management, Darlington Nuclear  
Director, Planning and Control, Nuclear Refurbishment  
Director, Investment Management, Nuclear Finance  
Director, Commercial Projects and Facilities  
Director, Business Support Director, Darlington Nuclear

**Note:** The VP, Science and Technology and Director, Engineering Services shall be responsible for scope recommendations within their respective areas of responsibility and attend as appropriate.

In order to record a decision at the PSRB, consensus must be reached between the three (3) Voting Members. This applies to scope approvals and rejections. The PSRB Voting Members will strive to meet the meeting objective of reaching consensus on all scope items during the meeting or by requesting additional information to be provided by the scope sponsors and initiators, in order to support a decision.

## 4.7 Scope Challenge

The scope is challenged a number of times throughout the scoping process. It is challenged at the Technical Screening Committee meeting, financially at the Funding Committee meeting and finally as part of the PSRB, requested scope will be scrutinized to determine whether it must be completed in the Refurbishment Outage and whether it adversely affects the refurbishment outage(s) cost and schedule.

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>15 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

For each scope request, the PSRB will utilize a list of questions that will challenge the scope initiator to support justification. These questions will address necessity, business need, risk and impact on cost and schedule (Appendix B). Appendix C shows a Scope Flow Decision Matrix which also will be used to validate and challenge the scope. Following approval of Major Scope by the PSRB for inclusion in refurbishment (Refurb) scope, the scope is formally added to the DSR database as Approved. If scope has not been approved, rejection justification will be formally recorded and the scope will be set to "Not Refurb" in the database indicating that it is not part of the refurbishment project and will follow Darlington's normal processes for evaluation.

### **Scope Challenge Meeting** (Prior to Gate 1 and 3 of the Gated Process N-MAN-00120-10001-GRB)

As per N-MAN-00120-10001-GRB, Nuclear Projects Gated Process there is a requirement for a Review of Scope to reassess and confirm need. This is accomplished through a Scope Challenge Meeting. The meeting is chaired and led by the Project Manager who owns the work being proposed to progress the project through the next decision Gate. For each DSR, the PM will utilize the Scope Decision Matrix (Appendix C) to justify / challenge the scope. The PM will complete the summary table in Appendix I and present to the Scope Challenge meeting Quorum for challenge of content and methodology. The completed table confirming recommendations will be submitted with the documents for the Gate Review Board Meeting (N-MAN-00120-10001-GRB). A DRAS will be completed as required and presented at next PSRB.

The Scope Challenge Meeting members are as follows:

**Presenter / Chair:** Project Manager, Nuclear Refurbishment Execution

**Quorum:** Vice President, Nuclear Refurbishment Engineering  
Director, Operations and Maintenance, Nuclear Refurbishment  
Director, Project & Controls, Nuclear Refurbishment

**Advisors:** Director, Nuclear Safety, Nuclear Refurbishment  
Director, Engineering, Nuclear Refurbishment

## 4.8 DSR Changes

If the DSR has not been through Gate 1 of the Gated Process (N-MAN-00120-10001-GRB), i.e. funding not yet allocated for this project, changes are requested through the change control form (change request) within the DSR database. Contact DSR Database Administrator for assistance.

If one of the PM's has been to Gate 1 for the DSR requesting funding, then a Change Control Form (N-FORM-11252) must be completed and approved prior to any DSR database changes.

DSR Change process:

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>16 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- For scope changes, DRAS completed by Project Manager and approved by PSRB
- If at or past (funding) gate 1, complete N-FORM-11252 prior to any DSR database changes
- Change control form Initiated in DSR database by an individual
- Change control form concurred (electronically signed) by Project Manager and appropriate stakeholders.
- For intent changes, the change control form also needs to be approved by System Engineering Manager, Nuclear Refurbishment.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

**Note:** At this time, the DSR Database Administrator is a WCTL (Work Control Team Leader) working for the NR Outage Manager.

### 4.9 Decision Record and Analysis Summary (DRAS)

Decision records are critical in maintaining an auditable trail of the NR Program changes, including changes in strategy, regulatory interactions, technology, resource, scope, etc. These important decisions should be validated by the appropriate authority to ensure alignment across all NR organizations. Refer to N-MAN-00120-10001-RISK-07, Nuclear Refurbishment Actions, Issues, Decisions, and Key Assumptions Management for full DRAS process. If a DRAS affects DSRs, then the follow the steps in section 4.8, DSR change process.

### 4.10 DSR Database change request

Changes to an approved DSR (before gate 1) are requested using the change control form in the DSR database with supporting document (i.e. DRAS), for auditable trail. DSR change control form is an electronic form found in the DSR database in the DSR menu, called "Request change to DSR info". When the form opens up, select the correct DSR and enter your proposed changes in the blue fields on the right of the original DSR. The specific approval is dependent on what is being changed, i.e. intent or non-intent.

This electronic method of change control which allows an individual to propose a change which will then be approved by the Project Manager. The time, date, and LAN ID associated with the change are all recorded in the DSR database.

#### 4.10.1 Intent Change process

Changes in Scope, context or title of a DSR are considered intent changes.

Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>17 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

- For scope changes, DRAS completed by Project Manager and approved by PSRB
- Change control form completed (quoting DRAS number) in DSR database by the Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by Engineering Project Manager, Nuclear Refurbishment
- For intent changes, the change control form also needs to be approved by System Engineering Manager, Nuclear Refurbishment.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

### 4.10.2 Non-Intent Change process

Fixing spelling errors or splitting one DSR into multiple DSRs (which doesn't change scope or context) are considered a non-intent change and does not require engineering approval.

- Change control form completed in DSR database by the Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by appropriate stakeholders.
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.

**Note:** If unsure, default to intent change or contact DSR database administrator.

### 4.11 DSR Ownership Change

- Change control form completed in DSR database by Sending Project Manager, Nuclear Refurbishment
- Change control form concurred (electronically signed) by Receiving Project Manager, Nuclear Refurbishment
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.

**Note:** If one of the PM's has been to Gate 1 for the DSR requesting funding, then a Change Control Form (N-FORM-11252) must be completed and approved prior to any DSR database changes.

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.12 DSR GAR (Global Assessment Report) and IIP (Integrated Implementation Plan) Tracking**

NR Engineering is responsible to identify DSRs committed in the GAR/IIP. NR Engineering will input change requests and the DSR database administrator will ensure the changes reflect approved documentation. All work orders generated from IIP identified DSR line items will require regulatory tracking in AssetSuite.

### **4.13 DSR (Not Refurb) and Non-IIP**

Darlington Generation Station is responsible to use the current station processes to monitor, track and close the work per the following governances and processes.

- N-PROC-MP-0060: Aging Management Process
- N-PROC-MA-0024: System Performance Monitoring
- N-GUID-01510-10001: Site Component Health and Engineering Program Health Reporting Process
- N-PROC-MA-0097: Equipment Reliability Implementation

### **4.14 DSR status**

DSR Status	Description
Approved	PSRB approved scope for the Darlington Refurbishment Project.
Cancelled	Work that will not be completed by the station or Refurbishment organization.
Closed	All work, actions and reports have been completed.
Not Refurb	DSR is not part of the refurbishment project and will follow Darlington's normal processes for evaluation.
Not Required	Contingency work that has been analyzed and determined to be not required, usually due to a report, analysis or inspection results.
Superseded	The DSR's scope is covered by another existing or new DSR. Superseded to station AR, ASIC project, PM, etc for Non-IIP Station owned DSR.

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

### **4.15 Initiating work requests from DSR items**

Detailed work orders will be required during the Detailed Planning phase. D-GUID-09701-10013, Initiating Work Request for DSR Items, helps establish the correct nomenclature and sufficient level of detail used when initiating the work request.

When Unit, SCI, Device, Scope of Work and Unit condition information is known, the DSR line item is ready to initiate a work request, as per N-PROC-MA-0008, Work Initiation and Prioritization.

### **4.16 Work Requests to Work orders**

Work Control SPOC reviews submitted work requests for N-PROC-MA-0008 compliancy, assigns appropriate attributes/tags and approves the work request to a work order.

### **4.17 Health of Scope (HoS)**

#### **4.17.1 Background**

The Darlington Nuclear Refurbishment scoping strategy includes a Health of Scope grouping number representative of the work required to progress a DSR from the identification stage to the definition stage. Each DSR in the DSR database has been categorized with a Health of Scope number identifying how well the scope is known and understood. A unit suffix has been added to HoS 04 and the newly created HoS N/A. Therefore each unit will need to be dispositioned for every DSR. This will enable a better history of the DSR when doing the DSR closure report for each unit. The target is to get Health of Scope to 04.X (work orders have been input on X unit) or N/A.X (work orders will not be input on X unit). This will enable the work to have sufficient clarity that it can enter into the Work Management processes (ECC, work order etc.) at RO-24 (OMS Work Order Scope Definition Complete Milestone).

#### **4.17.2 Health of Scope number definitions:**

HOS	Definition
0	New items which have not been assigned a Health of Scope by the Project Manager. The expectation is that the HoS is assigned within 2 weeks after the PSRB approval.
03	No further work required on DSR.
N/A.1	This DSR line item will not generate work orders on Unit 1 and does not require any other work orders to support Unit 1's Refurb Outage.
N/A.2	This DSR line item will not generate work orders on Unit 2 and does not require any other work orders to support Unit 2's Refurb Outage.
N/A.3	This DSR line item will not generate work orders on Unit 3 and does not require any other work orders to support Unit 3's Refurb Outage.
N/A.4	This DSR line item will not generate work orders on Unit 4 and does not require any other work orders to support Unit 4's Refurb Outage.

## Instruction

Document Number:	Usage Classification:	
<b>NK38-INS-09701-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R006</b>	<b>20 of 50</b>

Title:

### **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

04.1	All Work Orders that this DSR requires on Unit 1 and to support Unit 1's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.2	All Work Orders that this DSR requires on Unit 2 and to support Unit 2's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.3	All Work Orders that this DSR requires on Unit 3 and to support Unit 3's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
04.4	All Work Orders that this DSR requires on Unit 4 and to support Unit 4's Refurb Outage have been input (with N-PROC-MA-0008 and D-GUID-09701-10013 compliance).
05	DSR is adequately known such that it is ready for Work Order to be input on all Units (Scope of work and unit condition known).
10	Work is known at the component / MEL level (unit, SCI and Device known).
20	Work is known at the system or project level but not component
30	Actions to implement selected, may be a component strategy across many systems. Options developed and preferred selected at system level (potentially many systems).
40	Analyze the completed report to determine actions / path forward. Required assessments or analysis have been completed and issue, priority, constraints and success criteria are understood.
50	Further assessment is required to build a report for analysis to understand the identified issue before the scoping process can begin. At this point the extent, the impacts, the significance, nor the potential resulting actions are known
60	Pure engineering or procedures with no likely field work (i.e. provide CNSC with a report, update procedure, etc). Activities identified as pure engineering or requiring documentation update will be planned by the responsible functional organizations and will be scheduled in the functional organization schedule ensuring that the deliverables meet the timelines identified in the overall Project Integrated Master Schedule.
90	DSR recommended to be removed from NR scope and will not be executed in Nuclear Refurbishment. DSR will be removed from NR scope, pending PSRB approval. The expectation is that the Project Manager who owns the Scope Health 90 item will have the DRAS completed and approved 14 days prior to the next SRB and communicated to the NR Outage Manger for inclusion and scope removal approval at the next SRB.

Note: Any required unit 0 work will be tagged with the unit requiring the implementation.

#### **4.17.3 HoS change process**

- Change request initiated in DSR database
- Change request approved by the Project Manager, Nuclear Refurbishment
- Change request concurred (electronically signed) by appropriate stakeholders
- DSR Database Administrator reviews the change request for appropriate approvals and updates the DSR database.
- Review and update any affected work orders in Asset Suite.

Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>21 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

**Note:** HOS 90 scope removals approved by SRB at next scheduled meeting.

### 4.17.4 Requirements to Progress HoS

This section identifies deliverables required to take a DSR from the Identification phase to Definition phase at a system level through identifying examples of deliverables for each category.

#### **Health of Scope 50 to 40**

Review the scope for the need to prepare an assessment for further analysis. Deliverables to move DSR to 40 may include:

- Nuclear Safety Assessments/Analysis
- Detailed system assessments
- Code gap analysis
- Reliability assessments
- Life Cycle Management plan
- Material/fatigue analysis

To obtain these deliverables an in-house resource may be assigned or a contracting strategy developed and an outside vendor used. The assessments, plans, analysis should end in recommendations that lead to a better understanding of the issue identified in the DSR. At this point the DSR is considered to be HoS 40.

#### **Health of Scope 40 to 30 or 20 if only 1 System or Project**

Review results of the assessments and identify if DSR requires a modification to the plant, maintenance on a system (i.e. repair, replace) inspection or test. Identify options and select preferred to resolve the DSR issue. Steps to progress to 30 may include the following:

- New DSR presented to PSRB for approval
- Prepare and process DRAS form N-FORM-11390 as per N-PROC-LE-0008 if required to either progress DSR or close the item.
- Prepare EDM (Engineering Decision Making Meeting) materials and hold EDM if required to progress complex scope issues as per N-GUID-01900-10001, if EDM agrees with potential scope then generate ECR (Engineering Change Request)
- Prepare Project Gate documents as per N-MAN-00120-10001-GRB.

## Instruction

Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>22 of 50</b>

Title:

## **DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

- Prepare Conceptual Study/Report as required identifying potential options to address the problem/needs statement. May be prepared by Refurbishment, OSS (Owner Support Services) or EPC (Engineer, Procure, Construct) vendors.
- Generate inspection requirements or plans to support planning of recommended testing or inspections

Additional assessment or analysis may be required to further define the options where the initial assessment cannot conclusively recommend a path forward to resolve the DSR. In this case the DSR Health of Scope is returned to 50 for further assessment.

### **Health of Scope 30 to 20**

Work scope should be defined at a system level. Inspections and Conceptual studies may define a need for further scope to be added into the project, contingencies should be planned for by this time and high risk contingency items should progress through the gated process as required if the inspection work cannot be done until a later date. Activities to progress to 20 may include:

- Options developed and preferred selected at system level.
- Prepare Project Gate documents as per N-MAN-00120-10001-GRB

### **Health of Scope 20**

Work is known at the system or project level but not component. Initiation Phase complete, the following activities can begin:

- Generate a project charter or needs statement for potential modifications to be implemented outside of the Darlington Refurbishment organization.
- Identify non-modification work recommended in the assessments and contact Nuclear Refurbishment WCTLs to input work request for the work, if DSR item issue can be resolved through execution on non-modification work the DSR item can be reclassified as 5 in the Health of Scope
- Develop Preliminary Design Requirements for potential modifications where scope has been adequately defined
- Definition Phase begins. System or project scope is defined. ECR can be generated (ECR identifying problem statement for potential modifications as per N-PROC-MP-0090)
- Sufficient information available to begin to prepare preliminary and detailed design scope of work for EPC RFP (Request for Proposal)
- Long lead items identified

### **Health of Scope 20 to 05**

## Instruction

<b>Internal Use Only</b>		
Document Number: <b>NK38-INS-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R006</b>	Page: <b>23 of 50</b>
Title: <b>DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL</b>		

Unit, SCI, Device, Scope of Work and Unit condition is known for the DSR and is ready to initiate work requests, as per N-PROC-MA-0008, Work Initiation and Prioritization. Detailed work orders will be required during the Detailed Planning phase. D-GUID-09701-10013, Initiating Work Request for DSR Items, helps establish the correct nomenclature and sufficient level of detail used when initiating a work request from a DSR. It is expected that once ECR's are approved, conceptual design options are identified and preliminary design requirements are prepared. The EPC contracts can then be issued where the contractor will further define the work and ensure that work order planning is completed. Work will be managed via the Gated Process (N-MAN-00120-10001-GRB).

### **Health of Scope 05 to 03 or 04.X or N/A.X**

Work have been input for unit X (04.X) or work orders will not be input for unit X (N/A.X). This requires each unit to be dispositioned for every DSR, which creates a better history for DSR closure reports. If there is no work required for DSR, it can go to HoS 03.

## **4.18 Scheduling**

Darlington Refurbishment Project Managers are accountable to identify the deliverables required to progress DSRs through the Scope Health Definition levels to Health of Scope 03 or 04.X or N/A.X. P6 schedule activities will be created for the deliverables that progress a DSR to HOS 03 or 04.X or N/A.X. The Project Managers will update and maintain the health of scope rating of the DSR in the DSR database.

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

### 5.0 DSR DATABASE DEFINITIONS

<b>Acct_Org</b>	Accountable Organization
<b>Add_Info</b>	Additional information
<b>APP_ISR</b>	Indicates that the DSR is included in the Integrated Safety Review (ISR)
<b>Bundle</b>	Work Grouped by Project Manager area of responsibility (i.e. Balance of Plant [BOP], Fuel Handling [FH]) translates to Complex code on the work order.
<b>CCA</b>	Component Condition Assessment Number
<b>CONTINGENCY</b>	Contingency Flag
<b>Cost_Element</b>	Category from original Darlington Refurbishment Business Case to which the cost is allocated
<b>Cost_Estimate</b>	Cost estimate
<b>Description</b>	Description of work encompassed by the DSR (usually from CCA)
<b>DSR</b>	DSR related to the Line item
<b>DSR_Init</b>	DSR initiator (LAN ID)
<b>Dsr_Line</b>	DSR Line Item Number
<b>Ex_Owner</b>	Execution Owner by name
<b>Fog</b>	Functional Outage Grouping
<b>FUN_STR</b>	Funding Stream i.e. Station funded or Refurb funded, etc.
<b>Gate</b>	Last Gate of the Gate Review Process the DSR has passed through
<b>Grouping</b>	Health of Scope indicator
<b>Economic Evaluation</b>	Indicator of completion of the economic evaluation (Y=yes economic evaluation completed, N=no economic evaluation not completed, Not Required= economic evaluation not required; i.e. HOS 60 DSRs and Core Scope DSRs)
<b>Hierarchy</b>	Priority Ranking of DSRs
<b>Inspection</b>	Indicator that an inspection is required
<b>Item</b>	DSR Line item number
<b>Meet_Date</b>	SRB meeting date
<b>Not_Refurb_Reason</b>	Reason for the scope being rejected by PSRB and not included in the Refurbishment of Darlington
<b>Prereq_Type</b>	Categories for Prerequisite work. (The scope bucket may be non Pre-req but have some pre outage Work Orders)
<b>Priority</b>	Not Used at This Time
<b>PSRB_Sponsor</b>	Manager level or higher who sponsors the scope for consideration by PSRB

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

### B.2.0 NON -CORE SCOPE (NCS)

#### B.2.1 Sustaining (SU) - Non - Core Scope

Sustaining Scope is not mandatory to execute the Refurbishment Outage and achieve the Program Objectives. It may provide long term benefits to the Darlington Site and stations outside the primary Program Objectives. All Non-core Scope requires economic justification (i.e. DRAS).

Category		Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>SU01</b>	Sustaining Infrastructure	<ul style="list-style-type: none"> <li>Infrastructure upgrades required to sustain an additional 30 years of operations.</li> <li>Work is listed as part of the Darlington Master Campus Plan and the Darlington Program Campus Plan Scope Statement</li> <li>Is not part of, nor does it directly support core scope.</li> </ul>	Q. Can the work be executed after Refurbishment is complete without impacting ongoing plant operations?	<ul style="list-style-type: none"> <li>Salt Shed</li> <li>Heavy Vehicle Storage Building</li> <li>Boiler House</li> <li>Lakeshore Garage</li> <li>Gas Bottle Storage</li> </ul>
			Q. What is the economic benefit to refurbishment or to the continued operation of DNGS for an additional 30 years?	
			Q. What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	
			Q. Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>SU02</b>	Station Upgrades	<ul style="list-style-type: none"> <li>Non-infrastructure station upgrades required to sustain an additional 30 years of operations.</li> <li>Is not part of, nor does it directly support core scope.</li> </ul>	Q. Can the work be executed after Refurbishment is complete without impacting ongoing plant operations?	<ul style="list-style-type: none"> <li>New or improvements to permanent stairway, lifting device, floor grating, access hatches.</li> <li>Logistics improvements to loading bays, cafeteria, walkways</li> </ul>
			Q. What is the economic benefit to refurbishment or to the continued operation of DNGS for an additional 30 years?	
			Q. What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	
			Q. Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>SU03</b>	Equipment Renewal	<ul style="list-style-type: none"> <li>One time replacement at current end of component life</li> </ul>	Q. Would the refurbishment core scope still be possible to execute without this scope / infrastructure?	<ul style="list-style-type: none"> <li>Steam Turbines and Turbine Auxiliaries: Main Lube Oil Pump</li> </ul>

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

Category	Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
	(Nominal 30 years). <ul style="list-style-type: none"> <li>Replacement of obsolete components</li> <li>Inspections to determine equipment condition not part of normal PM program.</li> </ul>	<b>Q.</b> What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later? <b>Q.</b> Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	<ul style="list-style-type: none"> <li>Main Condensate System: LP Heaters</li> <li>Fuel Handling Inverters Replacement</li> <li>Turbine Control Upgrade</li> </ul>

### B.2.2 Value Enhancing (VE) - Non - Core Scope

Value Enhancing Scope is not mandatory to execute the Refurbishment Outage. There may be significant advantages to the station or to OPG by executing some value enhancing scope. It will primarily have an impact on the post-refurbishment time period. Value Enhancing scope would optimize (primarily) the cost efficiencies post-refurbishment and may help the Station meet efficiency targets (these are not Refurbishment targets). Value Enhancing scope could also provide cost or resource efficiencies during Refurbishment, but are not absolutely essential in completing the work. All Non-core Scope requires economic justification (i.e. DRAS).

Category	Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>VE01</b>	Operations, Outage, Cost, Resource & Maintenance Efficiencies	<ul style="list-style-type: none"> <li>Scope can be proven to add value to the station operations in future by improving maintenance methods, saving costs on outages, optimizing resources or improving operations.</li> </ul>	<ul style="list-style-type: none"> <li>Outage Heat Sink modification expected to reduce outage durations post-refurbishment.</li> <li>Modification to enable a valve to be replaced with a new design instead of repairing a valve.</li> <li>Modification to allow specified maintenance to be completed at-power rather than during an outage condition.</li> <li>Technically required work which is known to extend outage duration or incur greater dose in regular outages and makes an economic case to include in the Refurbishment Program.</li> </ul>
		<b>Q.</b> Has a clear explanation been provided as to why the expected impacts/ savings (e.g. OM&A costs, planned outage time, forced loss rate, operator work around, dose reduction, etc) are defensible and attributable to this specific scope of work?	
		<b>Q.</b> Has a review been done to ensure that the expected savings/impacts of this scope of work have not already been included in other proposed work scope?	
		<b>Q.</b> Have all major stakeholders (and potentially an independent 3rd party) validated the expected savings/ impacts?	
		<b>Q.</b> Have all potential post-project implementation costs been included?	
		<b>Q.</b> Have required infrastructure and support work costs been included?	
		<b>Q.</b> What is the Cost of parts and labour? Is it economically beneficial to do

## DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL

Category		Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>VE04</b>	Infrastructure upgrades that are expected to increase efficiencies for the <u>Refurbish</u> Outage period only, but do not directly support Core Scope.	<ul style="list-style-type: none"> <li>Scope that can improve efficiencies during the refurbishment such as improved resource effectiveness, reduction of delays, improved site transportation/logistics.</li> </ul>	<b>Q.</b> What are the economic benefits to executing the work during the refurbishment outage? What is the Cost of parts and labour? Is it economically beneficial to do in Refurb rather than later?	<ul style="list-style-type: none"> <li>Increased security monitors or security equipment to make entrance to the station more efficient</li> <li>Moving existing facilities closer to the work face to decrease travel time for trades or management staff</li> </ul>
			<b>Q.</b> How can the station benefit from this work post-refurbishment?	
			<b>Q.</b> Are the parts: <ul style="list-style-type: none"> <li>Available (for purchase or spares on hand)?</li> <li>Obsolete?</li> <li>Long lead items?</li> </ul>	
<b>VE05</b>	Enhance Corporate Reputation	<ul style="list-style-type: none"> <li>Proposed scope that will/may enhance OPG's or Darlington Refurbishment Program's corporate reputation with Clarington, Ontario or other groups.</li> </ul>	<b>Q.</b> Is the scope directly related to Refurbishment? (Is this something where funding would normally be obtained through another business unit as part of that unit's core business?)	<ul style="list-style-type: none"> <li>Modification to improve environmental emissions</li> <li>Modification to reduce sound emissions from the station</li> <li>Public Affairs communications (billboards, additional temporary communication stations in the community).</li> </ul>
			<b>Q.</b> How will the scope improve OPG's corporate reputation?	
			<b>Q.</b> Why should this scope be part of the Refurbishment program (and not part of Darlington Nuclear's ongoing operations?)	
			<b>Q.</b> What external groups does this impact (i.e. is there a group that is specifically interested in this initiative?).	
			<b>Q.</b> Is there a strategy in place to communicate this improvement, should it be added to scope?	

### B.2.3 Performance Improvement (PF) - Non - Core Scope

Performance Improvement Scope is non-core scope that supports the reduction of Unit backlog work orders or supports System Health targets beyond the condition at unit turnover to the Refurbishment Program management team. All Non-core Scope requires economic justification (i.e. DRAS).

Category		Description of Scope Type	Questions for Scope Justification	Example of Proposed Scope
<b>PF01</b>	Reduce Unit Backlog (non-core, most likely CM or	<ul style="list-style-type: none"> <li>Non-core work that will help reduce backlogs on Darlington Units.</li> </ul>	<b>Q.</b> Does this work exceed the condition in which Refurbishment received the unit from Operations?	<ul style="list-style-type: none"> <li>Valve that has been in disrepair for many years (through many outages). Parts have</li> </ul>

**DARLINGTON NUCLEAR REFURBISHMENT PROGRAM-SCOPE CONTROL**

General Questions for all Scope Requests (in any category)	
<b>Stakeholders/ Integration/ Objectives</b>	<ul style="list-style-type: none"> <li>Has an assessment been done of other upcoming scope/projects to determine whether there are opportunities for integration of work to realize cost/schedule savings?</li> </ul>
	<ul style="list-style-type: none"> <li>Is this scope or proposed project dependent on other planned scope/ projects being included in refurbishment scope? If so, specify.</li> </ul>
	<ul style="list-style-type: none"> <li>Have all key stakeholders (e.g. DN Refurbishment, DN Operations, Nuclear Engineering, and Regulatory Affairs) provided input and have their issues been dispositioned?</li> </ul>
	<ul style="list-style-type: none"> <li>How does this scope or proposed project address one or more of the Refurbishment Program Objectives? Specify.</li> </ul>
<b>Alternatives</b>	<ul style="list-style-type: none"> <li>Has the alternative of doing the work during the pre- refurbishment period been considered/assessed? Provide clear rationale why not feasible; i.e. discuss drawbacks, major risks.</li> </ul>
	<ul style="list-style-type: none"> <li>Has the alternative of doing the work during the post- refurbishment period been considered/assessed? Provide clear rationale why not feasible, i.e. discuss drawbacks, major risks.</li> </ul>
	<ul style="list-style-type: none"> <li>Is the technical justification for completing the work during the refurbishment outage robust?</li> </ul>
	<ul style="list-style-type: none"> <li>Have all feasible alternatives (or alternative approaches) of executing the work during the refurbishment outage been developed?</li> </ul>
	<ul style="list-style-type: none"> <li>Has the impact on refurbishment outage schedule and cost of the preferred alternative been assessed?</li> </ul>
<b>Scope/ Project Cost Estimate</b>	<ul style="list-style-type: none"> <li>Has a scope and cost estimate been developed for all feasible alternatives?</li> </ul>
	<ul style="list-style-type: none"> <li>Is the basis for the estimate of scope/ project costs clearly stated?</li> </ul>
	<ul style="list-style-type: none"> <li>Have cost estimate ranges been provided for scope/ project costs to indicate the accuracy of the estimate?</li> </ul>
	<ul style="list-style-type: none"> <li>Does the estimate include contingency and provide the basis for the contingency?</li> </ul>
<b>Economic Analysis of Feasible Alternatives/ Risk Assessment of Preferred Alternative</b>	<ul style="list-style-type: none"> <li>Have major risks and mitigating actions been identified? (Risks areas include finance, schedule, quality, corporate reputation, regulatory, health &amp; safety, environment &amp; nuclear safety).</li> </ul>
	<ul style="list-style-type: none"> <li>Have potential incremental schedule /cost impacts been assessed if these risks materialize?</li> </ul>
	<ul style="list-style-type: none"> <li>Has specific contingency been included in the schedule/cost estimates to address these potential risks?</li> </ul>
	<ul style="list-style-type: none"> <li>Has the alternative of doing the work during the pre-refurbishment period been considered / assessed?</li> </ul>
	Does the NPV analysis include a table showing a breakout of the contributions to NPV of each of the expected savings/impacts?

## Appendix E: Core Scope of the Darlington Refurbishment Program

### Refer to NK38-PLAN-01060-10003, Darlington NGS Refurbishment Project Reference Plan – Scope Definition

Core Scope of the Refurbishment Program will support the primary objectives of the Program. Core Scope is included in the Business Case Summary for the Program.

The following is a **brief** summary of the current documented major components of Core Scope.

- Replacement of all Fuel Channels (calandria tubes and pressure tubes)
- Replacement of all Feeders
- Balance of Plant life limiting components only where justified to support Program Objectives and support an economic business case
- Regulatory work required to be performed in order to extend the life of the station by an additional thirty years, as indicated in the CNSC approved Integrated Safety Report (ISR), Environmental Assessment (EA), and Integrated Implementation Plan (IIP).
- Work related to outage preparation, including development of tooling, mock-ups, training, unit islanding, installation of barriers, modifications, etc. to support the outage, and all planning activities related to items included in the scope of the Darlington Refurbishment Program.
- Infrastructure development to directly support the refurbishment outage
- Work Management work committed to be performed on the unit within the start and end date of that unit refurbishment outage.

Appendix K: MEMO: Value-Enhancing Investment at DNGS during Refurbishment

700 University Avenue, H7G5, Toronto, ON M5G 1X6

MEMORANDUM

April 12, 2013

MR. D. REINER  
Senior Vice President  
Nuclear Refurbishment

Value-Enhancing Investment at DNGS during Refurbishment

The Refurbishment of Darlington represents a significant milestone in the evolution of OPG. During the life of this project, we will see the cessation of coal (2014) and the potential end of operations at both Pickering A and Pickering B (2020). Both of these major events will lead to a significant shrinking of OPG's operations. At this time, there is no guarantee of New Nuclear becoming a reality, or a repowering of the Thermal sites. This downsizing of operations, and the need to be cost competitive going forward puts significant pressure on our ability to raise capital and to sustain operations over the long-term.

To minimize our capital requirements during the refurbishment outage and to make quality investments in the plant that support high quality, profitable operations going forward, I am proposing that the Refurbishment Project adopt more stringent criteria for assessment of sustaining, value-enhancing and performance improvement work that is to be included in the refurbishment outages. The criteria will apply to all scope that is not considered core scope as defined by the Scope Review Board governance.

The adoption of more stringent criteria on sustaining, value-enhancing and performance improvement initiatives during the refurbishment outage, would help to constrain scope to only those high value scope items that show a significant contribution to the bottom line. These more stringent criteria would include a hurdle rate of 9.5% (WACC) valued on the forecast System Economic Values and a simple payback period of six years, or 2 outage cycles.

A handwritten signature in black ink, appearing to read "Donn Hanbidge".

Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

## 1.0 INTRODUCTION

### 1.1 Objective

This document establishes the Earned Value Management (EVM) methodology for Nuclear Refurbishment (NR) as a management tool for program and project planning and control.

The intended audience of this manual is all staff involved in NR work, including OPG, direct work contractors and their major sub-contractors.

### 1.2 Guidance

Earned Value Management is a standard project management technique for quantifying and measurement of project progress performance. It not only provides comparison of actual costs against that budgeted, but also allows continual analysis of progress achieved against that planned throughout the project timeline and across individual tasks at the Control Account/Work Package level.

In other words, the project (or a Control Account/Work Package) “earns” progress as work steps are completed thus allowing management to implement strategies should the project (or a Control Account/Work Package) track “off-plan”.

EVM provides necessary incentive mechanisms to project teams and contractors; it also provides effective approaches to assess program/project progress and cost status, and is the basis for a more precise forecast for time and cost control during schedule implementation.

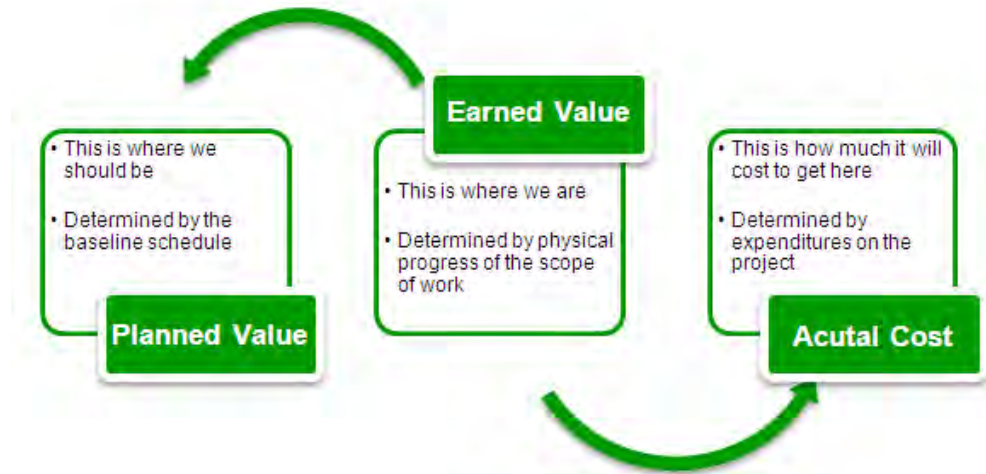

In order to conduct Earned Value Analysis, three components are needed; Planned Value to be earned, Earned Value (physical progress percent complete against budgeted value) and Actual Costs (from finance/ accounting or contractor invoices and accruals). Earned Value Process Summary is described below:

## Manual

Title:

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 1.3 Purpose

Earned Value Management benefits are well identified by major industry key players, such as:

- EVM provides a sound basis for problem identification, corrective actions and management re-planning as may be required. It provides for early identification of performance trends and variances from the management plan and allows management decision making while there is adequate time to implement effective corrective actions (ANSI/EIA-748-B Earned Value Management Systems).
- Earned Value is a commonly used method of performance measurement. It integrates project scope, cost and schedule measures to help the project management team assess and measure project performance and progress (PMI – A Guide to the Project Management Body of Knowledge).

Utilizing Earned Value Management methodologies and tools allow:

- The integration of scope, schedule and cost.
- Assessment of past and current performance.
- Comparison of progress against plan.
- Assessment of trends over time.
- Early identification of issues and allow the development of mitigation or recovery plans.
- Project teams to provide improved forecasts of future performance.

## 2.0 DEFINITIONS

Refer to Project Controls Definitions for definitions used in the development of and within the Darlington Nuclear Generation Refurbishment Program Project Controls governance documents and manuals.

Additionally, a comprehensive list of P&C definitions is maintained by the NR Project Controls to provide program-wide read access, which is amended on a more frequent basis.

<b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>

### 3.0 PROCESS

The EVM process can be summarized under three major phases as below:

- EVM Planning
- EVM Monitoring
- Change Management

#### 3.1 EVM PLANNING

3.1.1. **Scope Definition** – OPG projects define scope, Refer to Scope Manual N-MAN-00120-10001/ SCOPE and NK38-INS-09701-10001

3.1.2. **Prepare WBS and Define Control Accounts/Work Packages:** The WBS will represent all of the work to be completed. It will form the basis for developing project schedule, resource estimation, performance measurement, management control and reporting. As the program progresses from one phase to another, WBS will be reassessed. If the program requirement changes, the WBS will evolve with the program. Establishing WBS Standard structure and guideline is first deliverable under this subject:

WBS Standard Structure/Guideline	
Responsible Organization	Manager – PMO – Scheduling
Key Output	WBS Guideline

Project and Functional managers are accountable for preparing standard WBS structure for use in all bundles.

Detailed WBS Defining All Work Packages	
Responsible Organization	Project Managers Functional Managers
Key Output	Detailed WBS define all work packages

Detailed WBS preparation includes:

- Preparing detailed WBS following WBS Guidelines to break the work to the lowest possible work packages (WP) based on defined scope
- Establish WP Numbering system (refer to NR standard WBS)

## Manual

### REFURBISHMENT EARNED VALUE MANAGEMENT

- Issue Rev 0 of WBS

Define Control Account: Control Account can be understood as a group of related Work Packages that can be completed by a unique organization in a continuous time window. Refer to WBS Guideline N-MAN-00120-10001/SCH-05

- 3.1.3. **Prepare CBS:** NR Program is utilizing Activity Based Cost (ABC) and practically defined Work Breakdown structure is considered as Cost Breakdown Structure (CBS).
- 3.1.4. **Prepare Estimate by WP:** Based on WBS/CBS, prepare resources cost for every work package for Project Manager Approval.

Prepare Estimate by WP	
Responsible Organization	Estimating Group Project Managers Functional Managers
Key Output	Prepare estimate for every Work Package

- 3.1.5. **Prepare WBS Dictionary and get Manager's Approval:** The WBS dictionary defines the work scope represented in each element of WBS.

Prepare WBS Dictionary and get Manager's Approval	
Responsible Organization	Project Managers Functional Managers
Key Output	WBS Dictionary for all associated work packages

WBS Dictionary mainly contains the following:

- Summary scope description
- Deliverables

### REFURBISHMENT EARNED VALUE MANAGEMENT

- Estimate data resources/dollars
- Assumptions/Constraints
- Baseline schedule for the CA/WP
- Earning Rules

3.1.6. **Establish Rules of Credit:** In order to establish the Earned Value, the achieved progress must be assessed for each scheduled element and entered into the Cost Management System (this can be thought of as the “earned value”).

Establish Rules of Earning	
Responsible Organization	Project/Functional Manager
Key Output	Rules of earning guideline

- There are 3 basic methods for determining schedule progress (percent complete) and they should be selected and recorded in the WBS Dictionary for each Work Package (Level 3 activities progress contribution into their associated Work Package and Work Packages progress contribution into their associated control account should also be defined under Rules of Credit):
  - Discrete Effort – Discrete tasks are those tasks which are quantifiable to individual work products or predetermined tangible measurement. Techniques utilized for discrete efforts are:
    - Fixed Formula – 0/100, 50/50, 25/75 etc. With this method, x% of work is credited as complete for the measurement period in which the work begins, regardless of how much work has actually been accomplished. Remaining % is credited when the work is completed. Fixed formula techniques are most effectively used on small, short-duration task (typically less than two reporting periods)
    - Units Complete (Physical % Complete) – physical quantity count converted into a percent. Hours are often used for labour tasks such as engineering deliverables or

Title:

### REFURBISHMENT EARNED VALUE MANAGEMENT

installation Work Packages, (For example, for a total fuel channels of 480 if we complete the removal of 48 then the physical % complete would be 10% for the fuel channel removal Work Package).

- Valued Milestone (Steps) – It involves predetermined percent complete based on internal milestones within the Work Package. That value is earned as the milestones are completed (generally applicable to Fixed Price or Procurement Work Packages). This method is sometimes called weighted milestones.
- Level 3 activities progress contribution into their associated Work Package and Work Packages progress contribution into their associated control account should also be defined under Rules of Credit.
- Apportioned Effort – Apportioned effort is work for which the planning and progress are tied to other efforts. The budget for the apportioned account will be time-phased in relation to the resource plans for the base account(s). Status and the taking of earned value are driven by the status on the base account(s). If the base account(s) are on schedule, the apportioned account will be on schedule and an appropriate amount of value will be earned.
  - For example, Non-Manual Construction Support could be evaluated at 90% of the composite percent complete of all direct construction Work Packages. The final 10% would be earned when the paperwork closeout at the end of the project is complete (which is generally after the craft is gone).
- Level of Effort (LOE) – LOE is work scope of a general or supportive nature for which performance cannot be measured or is impracticable to measure. Resource requirements are represented by a time-phased budget scheduled in accordance with the time that the support will likely be needed. The earned

## Manual

Title:
<b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>

value is earned by the passage of time and is equal to the budget scheduled in each time period. The performance data provided is simply a comparison of budget to actual cost. For LOE  $SPI = 1$ ;  $EV = PV$  and  $CPI = EV/AC$ .

3.1.7. **Baseline Schedules:** Please refer to the Program Schedule Management Procedure, NK38-PLAN-09701-10067-0004, for the definition of Baseline Schedules. Responsibilities and deliverables are as follow:

Level 3 Baseline Schedules Preparation	
Responsible Party	Project Managers Function Managers
Key Output	Baseline schedules

- Gate Submission Baseline, the Level 3 baseline schedules will be finalized with resource loaded (labour/quantity) and approved by management.
- In order to set up the project and its work package in planned values the Cost Control group must be provided with the following:
  - Work Package number
  - Work Package title
  - Work Package owner
  - Work Package baseline early start date
  - Work Package baseline early finish date
  - Work Package monthly resources distribution

Baseline Schedule Approval	
Responsible Party	Manager – PMO – Scheduling
Key Output	Review and approve L3 Schedule Baseline for use Ensure alignment with guidelines and procedures

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 3.2 EVM Monitoring

3.2.1. Calculating Earned Value, collecting Actual Costs, Schedule Performance Index (SPI) and Cost Performance Index (CPI), Cost and Schedule Variances by Work Package are supposed to be performed under monitoring phase.

3.2.2. **Progressing:** Level 3 Schedule activities would get progressed based on their physical progress (i.e. comparing physical quantity of complete work vs. physical quantity of scope), progress values from Level 3 activities contribute into their associate Work Package progress as per defined and documented earning rules.

Progressing	
Responsible Party	Contractors/Project Managers
Key Output	Percent Progress for every WP

- Every WP is represented by many activities in the Level 3 Schedule to cover the scope of work/resource loaded to an agreed level of RBS and based on the established rules of earning
- Physical % complete will be calculated by Level 3 activities rolled into the WP level
- In some cases progress may be calculated in a dedicated progress measurement/monitoring system and then input into the Level 3 activities (This assumption should be document as part of Earning Rules).

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 4.0 GRAPHS, FORMULAS, AND DEFINITIONS

**AC (or ACWP):** Actual cost of work performed to date; the actual costs charged against the activities

**PV (or BCWS):** Budgeted cost of work scheduled to date (planned value); the total baseline costs budgeted for the activities scheduled or planned

**EV (or BCWP):** Budgeted cost of work performed to date (earned value of accomplished work)

**BAC:** Budget at completion; BCWS at end of project, or original budget + changes

**ETC:** Estimate to Complete

**EAC:** Estimate at Completion

$$EAC = AC + ETC$$

**CV:** Cost Variance

$$CV = AC - EV$$

**CPI:** Cost Performance Index  
=  $EV / AC$

**SV:** Schedule Variance  
=  $EV - PV$

**SPI:** Schedule Performance Index  
=  $EV / PV$

**VAC:** Variance at Completion (Projected Variance)  
=  $EAC - BAC$

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>Reference</b>

Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

### 5.0 ANALYSIS AND MEANINGS

The Earned Value analysis is conducted by creating the Planned Value, calculating Earned Value, collecting Actual Cost, calculating the CPI, SPI, Cost Variance (CV) and Schedule Variance (SV).

The following are quick indicators:

- $CPI > 1$  indicates that the project is progressing under budget
- $CPI < 1$  indicates that the project is progressing over budget
- $SPI > 1$  indicates that the project is progressing ahead of schedule
- $SPI < 1$  indicates that the project is progressing behind schedule

## Manual

Sheet Number: <b>SCH-07</b>	Revision Number: <b>R002</b>	Page: <b>21 of 39</b>
Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

### 6.0 CHANGE MANAGEMENT

The Performance Measurement Baseline will only be changed for Directed Changes. Directed Changes should be reflected in both Cost and Schedule at the same time if they affect both. Directed Changes may be issued to cover variances so great that they impact the ability to obtain a meaningful measure of performance. Approval process will follow the workflow as per the change management process.

Refer to the Project Controls Plan, N-MAN-00120-10001-PC.

- The Cost Control group will lead the Change Management Process; the Scheduling group will support running “what-if” scenarios and assess schedule impacts (Original Baselines should always be retained and new baseline should get populated).
- Once the change is approved, it will be implemented to both cost and schedule baselines.

## 7.0 P6 – PROLIANCE INTERFACES

- Proliance is the software for managing Planned Values, Cost Control, Earned Values plus performing analysis on each work package and control account level.
- SPI/CPI shall be calculated at the Work Package level where Actual Cost is collected. Cost reports and earned value can be rolled to various levels according to the WBS/CBS.
- Percent complete shall be calculated for every work package using Level 3 schedule and earning rules.

### 7.1 Initial Setup of the Plan

- 7.1.1. Level 3 schedules shall represent every work package in the WBS contributing into Earned Value Management.
- 7.1.2. Level 3 schedules shall be resource loaded with labour and quantity according to the predefined resource library.
- 7.1.3. After completing baseline schedules; the following will be generated from by the Project Cost and Schedule Analysts:
  - 7.1.3.1. Early Start/Early Finish date for every work package in the WBS.
  - 7.1.3.2. Monthly labour distribution for Early Plan (Planned Values per Work Packages by units).
  - 7.1.3.3. Level 3 schedules shall not contain any cost values or cost calculation or cost related activities (such as escalation or interest).
  - 7.1.3.4. Planned Values (PV)/Budgeted Cost for Work Scheduled (BCWS) for every work package shall be calculated and transferred to Proliance according to WBS/CBS. This will ensure that Planned Values (PV)/Budgeted Cost for Work (BCWS) are available on units and equivalent cost and roll up to the overall project.

### 7.2 Monitoring and Calculating SPI/CPI

- 7.2.1. Level 3 schedules shall be updated under P6 and on agreed frequencies and lead to Earned Value calculations.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Reference</b>
Sheet Number: <b>SCH-07</b>	Revision Number: <b>R002</b>	Page: <b>23 of 39</b>

Title:

### **REFURBISHMENT EARNED VALUE MANAGEMENT**

- 7.2.2. Level 3 schedules shall be integrated and percent complete and status will be calculated for every work package.
- 7.2.3. Work packages percent progress, forecast early date, and forecast finish dates from Level 3 schedules shall be obtained and transferred to Proliance.
- 7.2.4. Actual Cost will collected through Nuclear Financial Reporting and Analytics (NFRA) and stored under Proliance.

### **7.3 P6 / Proliance Change Management**

- 7.3.1. Scope, Cost, and Schedule changes shall be recorded in Proliance (Budgets, Planned Values, earning Rules, etc.).
- 7.3.2. All changes except pure cost related changes shall be implemented in P6.

## REFURBISHMENT EARNED VALUE MANAGEMENT

### 8.0 EARNED VALUE MEASUREMENT GUIDELINES

In EVM, the progress of all work must be measured. Measuring project performance is a complex task involving many interrelated and progressive steps. The key to performance measurement is the objective assessment of work in progress. Measuring the amount of work scope completed is planned at the task level in conjunction with the performance measurement baseline. An EV technique is selected for each task based on temporal and physical quantities. Objective measurement of physical progress on tasks with tangible outcomes is superior to other all other measurements. Tasks that can be completed in one progress-reporting period require only one measurement and are preferred. Tasks that span several reporting periods should be measured objectively with milestones representing intermediate, tangible outcomes. Appendixes subsections provide the guidelines for measuring the project progress objectively.

#### Earned Value Management Guidelines

- Modification Design Request (MDR)
- Design
- Planning & Assessing
- OPG Procurement – Long Lead Items
- OPG Procurement – Non-Long Lead Items
- Vendor Procurment
- Construction
- RTS

## 9.0 TOOLS

Earned Value will be managed by the following systems:

- Primavera P6 – Scheduling, Resourcing and Progress Updating
- Proliance – Planned Value, Actual Costs, Earned Values and Forecasts
- BI Tool –Reporting, CPI/SPI , Forecasting, Budget, Actual

### 9.1 Primavera P6

- 9.1.1. The original program baseline schedule will be developed by the respective teams based on the latest funding release, resource requirement, and timeline.
- 9.1.2. The project baseline schedule for each project will be developed by OPG at gate using the standard Work Package fragnets.
- 9.1.3. The above baseline may be revised on agreement of the contract schedule with the appropriate EPC contractor. The EPC contractor's schedule must roll up to the work packages included in the project baseline schedule.
- 9.1.4. Project teams shall update each of the work packages with the progress achieved based on the established Earning Rules.
- 9.1.5. A progress values will be developed on a cyclical basis to transfer work package attributes and progress information to Proliance.

### 9.2 Proliance

- 9.2.1. The Original Program Budget and Planned Value will be developed by the Program P&C Department, based on information developed by the projects in the development of the Original Program Schedule Baseline.
- 9.2.2. The Control Budget and Planned Value for each project will transferred to Proliance, developed by the respective projects for their scope of work which, will comprise:
  - 9.2.2.1. Work Packages for Work that has been approved under latest fund release.
  - 9.2.2.2. Work Packages for future Work at Control Account level.
  - 9.2.2.3. Work Packages schedule information and progress information will be uploaded from Primavera P6 on a cyclical basis.

Title: <b>REFURBISHMENT EARNED VALUE MANAGEMENT</b>		

### 9.3 BI Tool

9.3.1. The BI Tool will use data from both Primavera and Proliance to develop required reports for:

9.3.1.1. Project Performance (CPI, SPI)

9.3.1.2. Cost and Schedule Planned and Actual Data

9.3.1.3. Forecasts

9.3.1.4. Risks

9.3.1.5. Other related information.

## NUCLEAR REFURBISHMENT EARNED VALUE MANAGEMENT

### Appendix H: Earned Value Management / Planning Assessing

#### Darlington Refurbishment Program

#### Earned Value Process – Rev00 – Planning Assessing Phase

All values are guidelines to be finalized between contractor and OPG upon Level 3 Schedule Approval. WBS, earned value (EV) percentages, and EV analysis frequency are to be agreed upon. L3 Schedule shall be resource loaded.

#### Set the Planned Value (PV) in Primavera/Proliance

##### WBS Structure/Other

- Step 1**
- Create WBS/Control Account for each MEC.
  - Create WBS/Work Package for each MEC
  - EC related activities should be under each Work Package

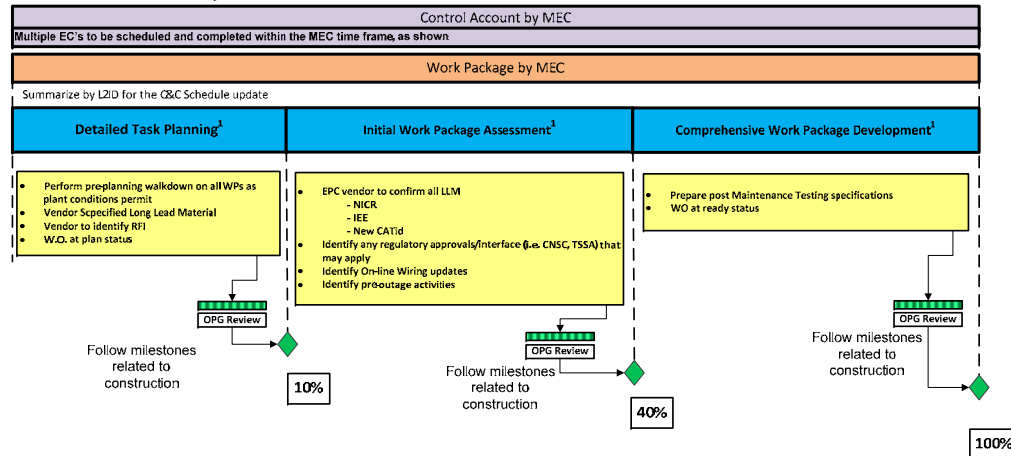

- Step 2**
- Estimate total Hours/Dollars by Work Package
  - Establish Earning Rules

##### Primavera

- Step 3**
- Load WBS Summary with Total Budget hours (VUL)
  - Contractor prepares Detailed L3 Schedule including OPG interfaces.

##### Proliance

- Step 4**
- Establish BCWS dollars.
  - Establish Earning Rules (use generic template). Need adaption for each PO.

#### Earning Rules for Planning Assessing

(Percentages to be agreed upon submittal of L3 Schedule)

ONE MEC	One WP per MEC	100%	Detailed Task Planning	10%
			Initial Work Package Assessment	40%
			Comprehensive Work Package Development	100%

#### Monitor the Progress – Calculate SPI/CPI

##### Oncore/TEMPUS

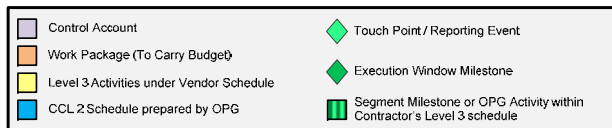

- Setup TEMPUS & Oncore with Work Package #
- Collect Actual spent by Work Package

##### Primavera

- Update the schedule with status and calculate % complete based on earning rules
- Project CSAs to prepare status and % complete by Work Package to Proliance

##### BI Reporting

- SPI/CPI will be calculated for every Work Package

### Title: NUCLEAR REFURBISHMENT EARNED VALUE MANAGEMENT

## Appendix I: Earned Value Management / OPG Procurement – Long Lead Items

### Darlington Refurbishment Program

### Earned Value Process – Rev00 – OPG Procurement – Long Lead Items

All values are guidelines to be finalized between contractor and OPG upon Level 3 Schedule Approval. WBS, earned value (EV) percentages, and EV analysis frequency are to be agreed upon. L3 Schedule shall be resource loaded.

#### Set the Planned Value (PV) in Primavera/Proliance

##### WBS Structure/Other

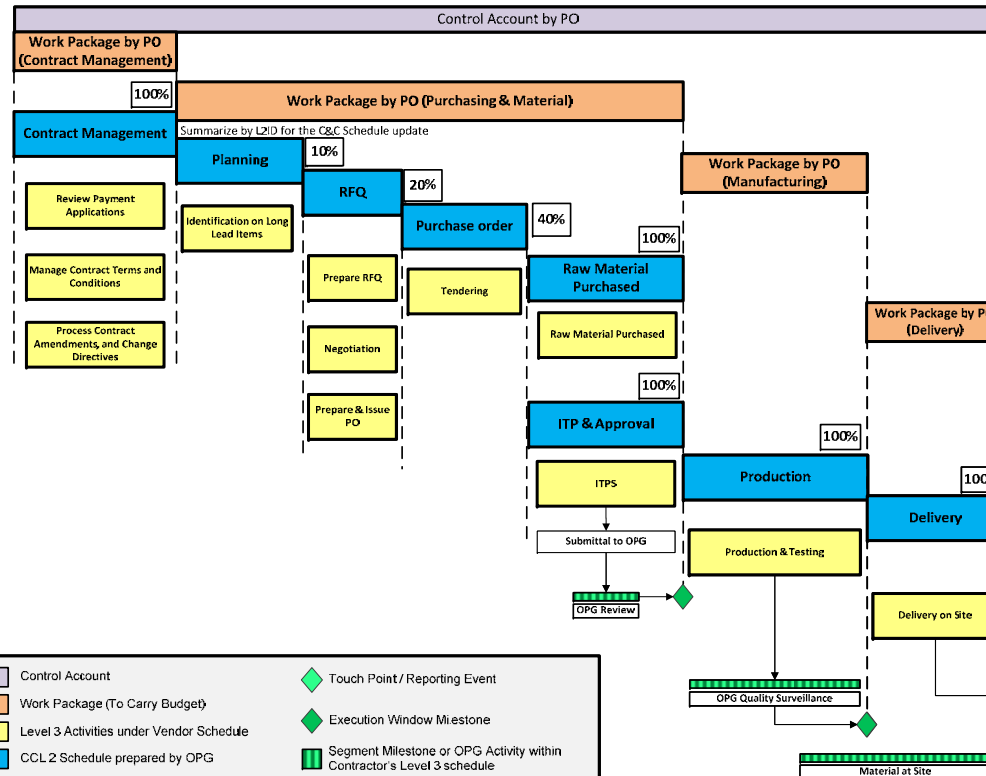

- Step 1** • Create WBS/Work Package for each Purchase Order (PO).
- Step 2** • Estimate total Hours/Dollars by Work Package  
• Establish Earning Rules

##### Primavera

- Step 3** • Load WBS Summary with Total Budget hours (VUL)  
• Contractor prepares Detailed L3 Schedule including OPG interfaces.

##### Proliance

- Step 4** • Establish BCWS dollars.  
• Establish Earning Rules (use generic template). Need adaption for each PO.

#### Earning Rules for Long Lead Items

(Percentages to be agreed upon submittal of L3 Schedule)

WP (Contract Management)	100%	Contract Management	100%
		Planning	5%
		Planning	5%
		RFQ	10%
		Purchase Order	20%
		Raw Material Purchased	50%
		ITP & Approval	50%
WP (Contract Management)	100%	Production	90%
WP (Contract Management)	100%	Delivery	100%

#### Monitor the Progress – Calculate SPI/CPI

##### Oncore/TEMPUS

- Setup TEMPUS & Oncore with Work Package #
- Collect Actual spent by Work Package

##### Primavera

- Update the schedule with status and calculate % complete based on earning rules
- Project CSAs to prepare status and % complete by Work Package to Proliance

##### BI Reporting

- SPI/CPI will be calculated for every Work Package

### Darlington Refurbishment Program

#### Earned Value Process – Rev00 – Vendor Procurement

All values are guidelines to be finalized between contractor and OPG upon Level 3 Schedule Approval. WBS, earned value (EV) percentages, and EV analysis frequency are to be agreed upon. L3 Schedule shall be resource loaded.

#### Set the Planned Value (PV) in Primavera/Prolance

##### WBS Structure/Other

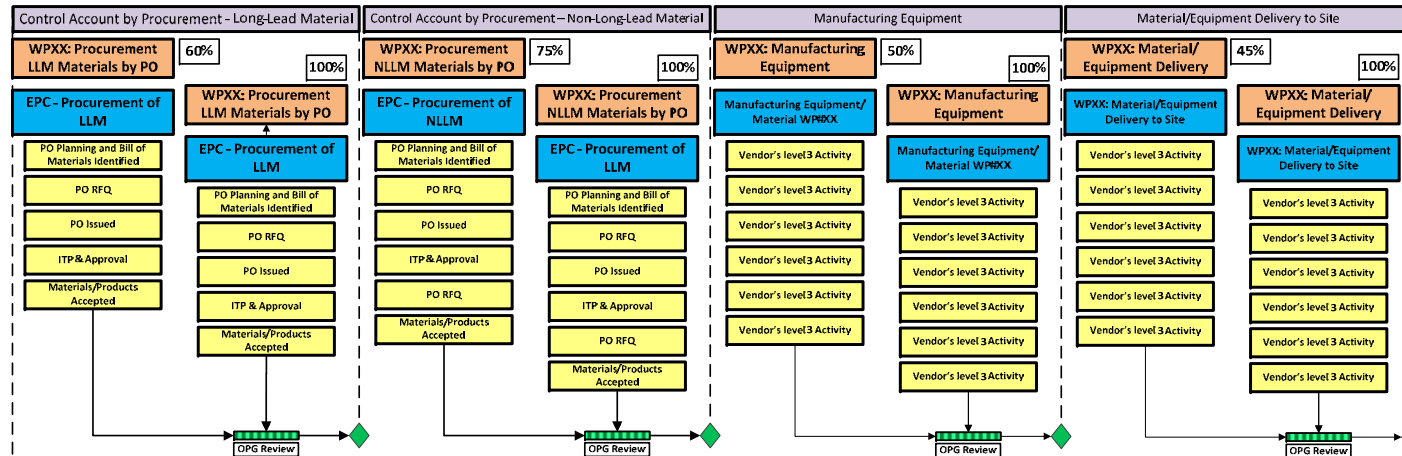

- Step 1**
- Create WBS/Work Package for each phases requirements and strategies.
- Step 2**
- Estimate total Hours/Dollars by Work Package
  - Establish Earning Rules

##### Primavera

- Step 3**
- Load WBS Summary with Total Budget hours (VUL)
  - Contractor prepares Detailed L3 Schedule including OPG interfaces.

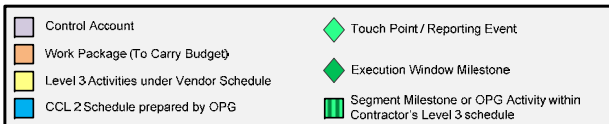

##### Prolance

- Step 4**
- Establish BCWS dollars.
  - Establish Earning Rules (use generic template). Need adaption for each PO.

#### NOTE:

Material/Equipment Delivery to Site Milestone (from Vendor's Schedules) needs to be linked into all associated "Execution Windows" Readiness Milestones

#### Earning Rules for Vendor Procurement

(Percentages to be agreed upon submittal of L3 Schedule)

LLM Procurement	100%	WPXX: Procurement LLM Materials by PO	60%
		WPXX: Procurement LLM Materials by PO	100%
Non-LLM Procurement	100%	WPXX: Procurement Non-LLM Materials by PO	75%
		WPXX: Procurement Non-LLM Materials by PO	100%
Manufacturing Equipment	100%	WPXX: Manufacturing Equipment/Material	50%
		WPXX: Manufacturing Equipment/Material	100%
Material/Equipment Delivery to Site	100%	WPXX: Material/Equipment Delivery	45%
		WPXX: Material/Equipment Delivery	100%

#### Monitor the Progress – Calculate SPV/CPI

##### Oncore/TEMPUS

- Setup TEMPUS & Oncore with Work Package #
- Collect Actual spent by Work Package

##### Primavera

- Update the schedule with status and calculate % complete based on earning rules
- Project CSAs to prepare status and % complete by Work Package to Prolance

##### BI Reporting

- SPV/CPI will be calculated for every Work Package

Title: <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

## 1.0 OVERVIEW

In order to sufficiently prepare and efficiently implement the Darlington Nuclear Refurbishment Program, a multi level scheduling approach is applied, including

- Level 0: Program Milestone Schedule
- Level 1: Program Integrated Master Schedule
- Level 2: Program Coordination & Control Schedules
- Level 3: Project Detailed Production Schedules

The Darlington Refurbishment Program Milestone & Integrated Master Schedule (PMIMS, NK38-PLAN-00300-10000) is the preamble of the Program Level 0 Schedule and Program Level 1 Schedule, and it describes

- The Program Milestone Dates and Owners
- The Responsibility Allocation and Control Accounts
- Assumptions
- Alignment with station and planned outages

All Project Bundles and functional groups have Control Accounts (Level 1 Activities) shown on the Program Level 1 Schedule. These Control Accounts are further broken down to Work Packages (Level 2 Activities) in Program Level 2 Schedules.

The Level 1 Activities (Control Accounts) in the Program Level 1 Schedule and Level 2 Activities (Work Packages) in Program Level 2 Schedules are logically tied to relevant Program Milestones, where applicable.

The PMIMS Revision 3 has been developed with current contracting strategies for each project bundle. Once a contract is awarded, an assessment against the Program Milestones will be performed. Program Milestones are re-evaluated when necessary and on an annual basis.

## 2.0 DESCRIPTION

The Darlington Refurbishment Program Integrated Master Schedule Revision 0 (R000) was approved in December 2010, Revision 1 (R001) was approved in January 2012, and Revision 2 (R002) was approved in January 2014.

Revision 3 (R003) is required based on the following changes,

**Plan**

Internal Use Only		
Document Number: <b>NK38-PLAN-00300-10000</b>		Usage Classification:
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>6 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

- The unit refurb outage sequence order identified in the Darlington Life Extension Model shows the unit sequence order being unit 2, unit 1, unit 3 and unit 4. Based on current planning assumptions, a different unit order has been confirmed by OPG and is now Unit 2, Unit 3, Unit 1 and Unit 4. This change has been formally communicated with CNSC. Please refer to **Darlington Refurbishment – Unit Outage Sequence Update** (File: NK38-00531 P, CD#: NK38-CORR-00531-17008);
- This new sequence order has no impact on the planned unit outage dates associated with the Nuclear Refurbishment Program also identified in the Darlington Life Extension Model;
- Every refurb outage is broken into 4 segments: Lead-in Segment, Removal Segment, Inspection & Installation Segment and Lead-out Segment, so that the project teams will focus on the specific segment, and integration can be achieved segment by segment;
- Accordingly, segmentised Outage Preparation Milestones are added and they are documented in NK38-MAN-09701-10005, Nuclear Refurbishment Planned Outage Management.

The PMIMS Revision 3 documents have been updated to reflect these changes and to provide additional details as the planning phase is further developed.

### 3.0 RESPONSIBILITY ALLOCATION

Following the matrix structure of the Darlington Refurb Program Work, the responsibility allocation is stated as,

Project Bundles	Scope of Work	Responsible	Accountable
<b>R&amp;FR</b>	<ul style="list-style-type: none"> <li>Tooling for R&amp;FR</li> <li>Mock-up &amp; Training for R&amp;FR</li> <li>Retube and Feeder Replacement work</li> </ul>	Project Manager	VP, Refurb Execution
<b>Turbine Generator</b>	<ul style="list-style-type: none"> <li>TG Engineering Services and Equipment Supply work</li> <li>TG Minor Procurement and TG Refurb Construction work</li> <li>TG Inspections and Repairs</li> </ul>	Project Manager	VP, Refurb Execution
<b>Steam Generator</b>	<ul style="list-style-type: none"> <li>SG EPC Contract work, including Primary Side Cleaning, SG Water Lancing, SG Access Port, SG Tube and Divider Inspections and SG Minor Projects</li> <li>SG Inspections and Repairs</li> </ul>	Project Manager	VP, Refurb Execution
<b>Fuel Handling &amp; Defueling Bundle</b>	<ul style="list-style-type: none"> <li>Defueling Preparations</li> <li>Fuel Handling Refurb</li> <li>Fuel Handling Specialised Projects</li> </ul>	Project Manager	VP, Refurb Execution
<b>Balance of Plant</b>	<ul style="list-style-type: none"> <li>BOP Common Systems Refurb</li> <li>BOP Nuclear Systems Refurb</li> <li>BOP Conventional Systems Refurb</li> </ul>	Project Manager	VP, Refurb Execution
<b>Islanding</b>	<ul style="list-style-type: none"> <li>Bulkhead &amp; Containment Isolation</li> <li>Barriers Project</li> <li>Islanding Pre-Outage Modifications</li> <li>Islanding Outage Modifications</li> </ul>	Project Manager	VP, Refurb Execution
<b>Shutdown, Layup and Services</b>	<ul style="list-style-type: none"> <li>Unit Takeover from the Station</li> <li>Unit Shutdown</li> <li>Shutdown Pre-Req. Modifications</li> <li>Shutdown Outage Mods.</li> <li>Unit Layup Services</li> </ul>	Project Manager	VP, Refurb Execution

#### 4.0 PROGRAM PHASES

10 Phases were defined for the Darlington Nuclear Refurbishment Program as follows, for financial release purposes.

- Phase 1: Program Initiation Phase, 2007-2008
- Phase 2: Program Approval Phase, 2008-2009
- Phase 3: Preliminary Planning Phase, 2009-2011
- Phase 4: Detailed Engineering & Refurb Scope Definition Phase, 2012-2014
- Phase 5: Outage Preparation Phase, 2014-2015
- Phase 6: Unit 2 Refurb Outage Phase/U2 Release Quality Estimate, 2015-2019
- Phase 7: Unit 3 Refurb Outage Phase/U3 Release Quality Estimate, 2018-2023
- Phase 8: Unit 1 Refurb Outage Phase/U1 Release Quality Estimate, 2020-2024
- Phase 9: Unit 4 Refurb Outage Phase/U4 Release Quality Estimate, 2021-2025
- Phase 10: Program Closure Phase, 2024-2026

**Note:** this diagram shows only Definition Phase and the 4 Unit Refurb Execution Phases.

## 5.0 PROGRAM MILESTONE DEFINITIONS

As per N-MAN-00120-10001-SCH-06, each individual milestone definition sheet is issued as a record in AssetSuite.

Program Milestone Definitions of PMIMS Revision 3 can be found in PowerSearch and AssetSuite via using the Milestone ID with "NK38-REF-09701-" pre-fix as the record number.

For the Program Milestones and Key Dates, please refer to Appendix B.

## 6.0 ALIGNMENT WITH STATION PLANNED OUTAGES AND OPERATING WORK PROGRAM

### 6.1 Pre-Refurb Work in Station Planned Outages

There are pre-refurb work activities that must be completed in the Darlington planned outages leading up to Refurb. It is the responsibility of the Nuclear Refurb Team to identify these Work Orders and ensure scope rationalization is provided prior to Planned Outage scope freeze. *Planned Outage Management* (N-PROC-MA-0013) will be followed.

### 6.2 Pre-Refurb Work in the On-Line Work Schedule

There is work that can be completed in Darlington's on-line program (IPG). This work is being integrated into the IPG work program, following the *Integrated On-Line Work Schedule* (N-PROC-MA-0022).

<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

**7.0 ASSUMPTIONS**

The Program Integrated Master Schedule (R003) is based on the following assumptions,

- EPC Contractors will undertake the major work nuclear refurbish work while OPG establishes a team to oversight and support the refurb work.
- OPG will undertake cyclical maintenance work and unit commissioning & start-up.
- There will be no resource demand conflict due to other nuclear stations' refurb program/projects, i.e., the major contractors will have sufficient resources to complete the work for NR Program.
- There will be no further strategic change on the sequence of the four Unit Outages, as described in detail in Section 2.0 and Section 4.0.
- PIMS is developed in a progressive elaboration approach. The Level 1 Activities in the PIMS are originally *instructive version*, and they become *control version* when the relevant work is released and the contractors' detailed schedule is summarised and baselined.

For detailed assumptions and risks of each project bundle, please refer to Nuclear Refurbishment Actions, Issues, Decisions and Key Assumptions Management (N-MAN-0120-10001-RISK-07).

<b>Title:</b> <b>DARLINGTON REFURBISHMENT PROGRAM MILESTONE &amp; INTEGRATED MASTER SCHEDULE</b>		

**Appendix C: Segmentised Reoccurring Milestones Example (Tier 4)**

The table below is a summary of Segment Preparation milestones that are tied to/occur with the start of each of the 4 segments (as defined in the Outage level 1) with Unit 2 Lead-in Segment example titles and Milestone ID's in PMSS -C.

Segment Start – XX Months	Title	Owner	PMSS ID (U2 Segment 1 example)
SS-13	U2 Lead-in Segment At Risk Materials List Generated	VP, NR Execution	OP2300S1
SS-08	All U2 Lead-in Segment Documentation Ready	VP, NR Execution	OP2160S1
SS-06.5	All U2 Lead-in Segment Holds Removed	VP, NR Engineering	OP2310S1
SS-06	U2 Lead-in Segment Work Package Assessment Complete	Unit Director	OP2070S1
SS-05.5	U2 Lead-in Segment Detailed Outage Segment Permitry Level 1 Plan Complete	Director, NR O&M	OP2200S1
SS-03	U2 Lead-in Segment Dose Estimate Complete	Director, NR O&M	OP2350S1
SS-03	U2 Lead-in Segment Readiness Assessment Finished	VP, NR Execution	OP2060S1
SS-03	All U2 Lead-in Segment Materials On-Site or Dispositioned	VP, NR Execution	OP2330S1
SS-03	U2 Lead-in Segment Work Permits Prepared & Reviewed and Challenge Meeting Held by Operations	Director, NR O&M	OP2230S1
SS-01.5	U2 Lead-in Segment Materials Staged and Tools on Site	VP, NR Execution	OP2100S1
SS-01	U2 Lead-in Segment Reactor Safety Challenge Meeting	Director, Nuclear Safety	OP2260S1
SS-00.5	All U2 Lead-in Segment Applicable Walk-downs Complete	VP, NR Execution	OP2320S1

**Note:** Milestones OP2350, OP2230, OP2330 and OP2320 will occur 3 times for Segment 2 and twice for Segment 3. Refer to NK38-MAN-09701-10005 for more details.

**DARLINGTON REFURBISHMENT PROGRAM MANAGEMENT PLAN STRUCTURE**

## 1.0 PURPOSE

The purpose of this document is to set the framework for the Darlington Refurbishment Program Management Plans (PgMPs) which describe how the Darlington Refurbishment Program meets the intent of OPG's Nuclear Management System while establishing program-specific requirements.

Darlington Refurbishment Program Management Plans are designed to provide assurance that all aspects of the Program (e.g. engineering, procurement, construction, turnover, and program life cycle phases) will be conducted in accordance with the requirements of:

- Canadian Standards Association Standard N286-05, Management System Requirements for Nuclear Power Plants;
- Canadian Nuclear Safety Commission's Regulatory Document RD-360, Life Extension of Nuclear Power Plants;
- N-CHAR-AS-0002, Nuclear Management System; and
- OPG Corporate and Nuclear governance.

Darlington Refurbishment PgMPs integrate requirements from other Management System standards for health, safety, environment, security, economics and quality and is defined to meet the principle that safety is the paramount consideration guiding all decisions and actions.

## 2.0 DIRECTION

Owners of Darlington Refurbishment PgMPs are to follow the minimum structure and content requirements specified in this document to ensure consistency across the entire suite of Darlington Refurbishment PgMPs.

### 2.1 Darlington Refurbishment Program Management Plans

The following are the criteria for when a PgMP is required:

- Where a Nuclear management system program exists and is executed within the Darlington Refurbishment program, and
- Where there are unique Darlington Refurbishment processes, programs or organizations that are required to be defined for the Darlington Refurbishment program. Or
- As deemed required by the Senior Vice President, Nuclear Projects for any program phase.

Darlington Refurbishment PgMPs are accessible to all staff that have access to OPG's Information Management System through Asset Suite. They can also be accessed through Power Search or on the Darlington Refurbishment SharePoint Team Site which are both linked to Asset Suite.

Title:

**DARLINGTON REFURBISHMENT PROGRAM MANAGEMENT PLAN STRUCTURE**

### **2.1.1 Darlington Refurbishment Program Framework**

The hierarchy of Darlington Refurbishment Program documents is shown in Figure 1.

As shown in the above figure, the top tier document of the Darlington Refurbishment Program is D-PCH-09701-10000, Darlington Refurbishment Project Charter. The 2<sup>nd</sup> tier documents consist of this document and the remaining PgMPs in the form of sheets to NK38-NR-PLAN-09701-10001. The 3<sup>rd</sup> tier documents (not shown in the framework) include documents such as Manuals, Guides, Instructions, Plans, Contractor/Owner Interface Requirements and Forms which are considered "*Process Support Controlled Documents*" as defined in NK38-MAN-09701-10006, Nuclear Refurbishment - Requirements for Process Support Controlled Documents.

As per the requirement of CSA N286 and N-CHAR-AS-0002, Nuclear Management System, the Darlington Refurbishment Program also makes extensive use of Corporate and Nuclear Line of Business management system documents where applicable.

### **2.1.2 Program Management Plan Section Requirements**

The Darlington Refurbishment PgMPs stipulate function-specific requirements and processes for Darlington Refurbishment project execution.

The PgMPs are meant to convey how employees working within the Darlington Refurbishment Program will do their work while meeting the intent of the existing OPG Management System.

The structure and minimum content requirements for PgMPs are as follows:

#### **Section 1.0, Purpose**

- A clear and concise description of the fundamental intent or focus of the Program Management Plan.
- Limit rationale, background and process details.

#### **Section 2.0, Program Requirements**

This section is the most important section of the PgMP and should be considered a "roadmap" which conveys how employees working within the Darlington Refurbishment Program will meet the Program's requirements.

- Identify and briefly describe any Nuclear, Corporate, or other business unit governance, governance support and non-governance documents that provide implementing details for requirements, activities and processes described by the PgMP.
- State requirements which have been mandated by Darlington Refurbishment Functions for Darlington Refurbishment Projects to follow as part of contract development and project execution.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0001</b>		Revision Number: <b>R002</b>		Page: <b>9 of 12</b>	

Title:

### **DARLINGTON REFURBISHMENT PROGRAM MANAGEMENT PLAN STRUCTURE**

- Include a figure illustrating the entire PgMP framework, including implementing and interfacing documents.
- Specify the performance indicators or monitoring activities that are necessary to ensure the overall PgMP requirements are met.

#### Section 3.0, Roles & Accountabilities

- Identify and provide a high-level summary of accountabilities for Manager Level (Stratum IV) or higher positions or roles concerning the accomplishment of activities related to the implementation of the document.
- Do not:
  - ❖ Duplicate actions, activities or tasks already covered by Section 2.0 of the PgMP.
  - ❖ Use personal names.

#### Section 4.0, Definitions & Acronyms

##### **Definitions**

- If there are no definitions, state "None".
- Limit each definition to one or two sentences.
- Place definitions in alphabetical order.
- Do not define:
  - ❖ Generic terms if the dictionary definition conveys the meaning of a term.
  - ❖ Terms commonly used within the applicable business area.
  - ❖ Organizational positions or roles.

##### **Acronyms**

- If there are no acronyms, state "None".
- List acronyms used within the document along with their expanded forms.
- Place acronyms in alphabetical order.

#### Section 5.0, References

- Only list those documents the user **needs** to use in conjunction with the PgMP.
- Identify each reference document number and title in alpha-numeric order. Do not include revision numbers.

## **2.2 Project Management Plan**

Project Management Plans (PMPs) describe how specific projects will develop the scope and execute the work. When Darlington Refurbishment Project Teams are developing or revising their PMPs they will reference relevant sections from applicable PgMPs.

The PMPs follow the requirements of N-PROG-AS-0007, Project Management , and the associated governance.

Sheet Number: <b>0001</b>	Revision Number: <b>R002</b>	Page: <b>10 of 12</b>

Title:

### **DARLINGTON REFURBISHMENT PROGRAM MANAGEMENT PLAN STRUCTURE**

## **2.3 Functional Management Plan**

Functional Management Plans (FMPs) describe in detail how the function will execute the requirements outlined in PgMP over the life-cycle of the program. It identifies the work programs and the resource requirements of each function which are in alignment with the currently approved Funding Release plan. The FMP takes authority from the PgMP and should be referenced in the PgMP.

Darlington Refurbishment FMP structure and minimum content requirements are established in NK38-GUID-09701-10023, Functional Management Plan Guide.

## **2.4 Revision Cycle Requirement**

The default revision cycle requirement for the PgMPs is 3 years, or as required at the completion of U2 refurbishment and before start of U3 refurbishment.

## **2.5 Darlington Refurbishment PgMPs and Owners**

The following table summarizes the various Darlington Refurbishment PgMPs and their owners.

**Table 1: Darlington Refurbishment PgMPs (NK38-NR-PLAN-09701-10001)**

### **3.0 ROLES AND ACCOUNTABILITIES**

#### **3.1 Director, Refurbishment Management System Oversight**

Is the document owner and is accountable for its definition and implementation.

#### **3.2 Darlington Refurbishment Function Teams**

Are accountable for ensuring that PgMPs and subtier documents owned by the Function Team are in compliance with existing Management Systems and that any gaps are resolved to meet the needs of the Darlington Refurbishment Program.

#### **3.3 Darlington Refurbishment Project Teams**

Are accountable for the development and maintenance of project-specific PMPs.

Are accountable for executing projects to PgMP requirements and for providing input to PgMP owners if any gaps or incompatibilities exist.

## DARLINGTON REFURBISHMENT PROGRAM MANAGEMENT PLAN STRUCTURE

### 4.0 DEFINITIONS AND ACRONYMS

#### 4.1 Definitions

**Program Management Plan** The document that describes how function supports the Refurbishment Program with specific requirements that meet the intent of the Nuclear Management System.

**Project Management Plan** The document that describes how the project in Darlington Refurbishment Program will be planned, executed, monitored and controlled, and closed.

**Functional Management Plan** The document that describes the resource requirement to support the Darlington Refurbishment Program.

**Function** The matrix organization grouped by areas of specialization. The function is accountable for developing and maintaining functional excellence, setting standards, and providing required service to Darlington Refurbishment Program.

#### 4.2 Acronyms

**PgMP** - Program Management Plan  
**PMP** - Project Management Plan  
**FMP** - Functional Management Plan

<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The purpose of this Management Plan is to clearly define the planning assumptions, strategies, and processes associated with the provision of the Project Planning and Controls (PP&C) functions for the Darlington Refurbishment Program (DRP).

The Project Planning and Controls Program Management Plan provides a strategic overview of the various project planning and project control processes adopted by DRP in compliance with N-STD-AS-0028 Project Management Standard. This plan is applicable to all projects funded by the DRP and is supported by the Project Planning and Controls Functional Management Plan NK38-PLAN-09701-10223-SHT0008-R000.

The hierarchy of the Project Planning and Controls Program Management Plan is shown in Appendix A.

## 2.0 PROGRAM REQUIREMENTS

PP&C is an integral part of the preparation and execution of the DRP as it must establish a solid project management and controls environment to build and support the organization in setting the project and program baseline plan and then monitoring and controlling the program. PP&C has established an organizational model and appropriate procedures consistent with industry best standards including recommended practices from the Project Management Institute (PMI), the Construction Industry Institute (CII), and the Association for the Advancement of Cost Engineering (AACE). PP&C, where appropriate, also adopted operating experience from many large scale Nuclear and non-Nuclear projects. These practices and experience form the basis for this plan.

### 2.1 Scope

Defining project scope is a critical step to project success as it establishes the basis for project cost, schedule, risk management, contracts, and decisions. Improved scope detail leads to improved cost estimate and schedule accuracy.

N-MAN-00120-10001-SCOPE, Nuclear Projects Scoping Process, outlines the scope principles and requirements to be utilized for the DRP.

Project scope includes the set of project deliverables based on the project requirements, assumptions, exclusions, and constraints. The scoping process is integrated with the project phases and gating process. The scope of work for the next project phase should be well defined compared to the scope for the balance of the project in future phases. The scoping process, particularly developing and defining the scope, is a continuous process in the project lifecycle.

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>6 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

Scope for the DRP was develop and is controlled through the Darlington Scope Request (DSR) Database.

## Plan

Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>7 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

## 2.2 Schedule

Establishing an accurate and realistic schedule is a critical planning tool for a project. The schedule is the main planning tool used to understand and communicate how a project will be executed and includes the interrelationships and dependencies among project activities and deliverables, and the status of the work. The schedule is critical to properly strategize, plan and prepare for upcoming project work, to determine resource requirements, to understand how work is progressing and to apply corrective actions as required.

N-MAN-00120-10001-SCH, Nuclear Projects Schedule Management, outlines scheduling management principles and requirements for DRP which are applicable to both OPG project teams within the DRP and to contractors whom are performing work for DRP. Schedules are to be developed with inputs from all stakeholders and are monitored and updated throughout the project lifecycle. Schedule detail must be developed at an appropriate level to allow the project team to communicate the plan, monitor project progress and as an input into cost performance metrics in order to make accurate forecasts and to strategize and plan for upcoming work.

Refurbishment uses a multi level schedule structure (L0, L1, L2 and L3) and a standardized Work Breakdown Structure in accordance with best practices. The Program Milestones for Darlington Refurbishment are identified and maintained in the Program Integrated Master Schedule (PIMS). The schedule is maintained regularly and activities are tracked to a baseline. Variances are tracked, reported and mitigated and/or recovery plans developed when required. Critical path to Breaker Open and Breaker Open to Breaker Closed are identified, monitored and reviewed for potential impacts.

The Level 2 Control & Coordination (C&C) schedule is the level of detail that integrates all program work for all units and all bundles. The work packages, (the lowest level in the WBS structure) are represented in the C&C schedule by at least 1 activity and tied to the level 1 milestone schedule. All activities in the C&C schedule are logically tied according to the sequence of work.

Contractors prepare schedules in accordance with N-MAN-00120-10001-SCH-09, Nuclear Projects Scheduling Requirements from EPC Contractors. Level 3 schedules are integrated and aligned with Level 2 and PIMS. Vendors will self perform their schedule updates and maintenance with oversight from the OPG Master Scheduler and the Refurbishment Project Office.

The integrated Level 3 Schedule provides further breakdown of the work below the work package level and shows all interfaces and shared resources between contractors and OPG. All activities in the level 3 schedules are logically tied according to the sequence of work and summarized to the Level 2 activity level.

Milestones are baselined in accordance with N-MAN-00120-10001-SCH-06, Nuclear Refurbishment Milestone Definition Framework. The Milestones are grouped by tiers based on the authority to approve changes.

<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

## 2.2.1 Schedule Update and Monitoring

On a regular basis, according to the reporting cycle plan, all Level 3 Schedules shall be updated by the person or group who is performing the work (i.e. contractors or OPG). As a product of these updates, schedule progress at the Work Package level for all scheduled work is translated into the cost management system for the purposes of calculating earned value.

The progress data is verified and reviewed by OPG. Once reviewed, a variance analysis is produced to provide reasons for any schedule slippages and to determine necessary corrective action/recovery plans when needed. A critical path analysis is also produced using level 3 schedule details.

## 2.2.2 Schedule and Cost Integration

The Work Package is the lowest level of the WBS that integrates cost and schedule. Once the schedule updates are progressed and statused by work package, the physical percent complete, actual start, actual finish, forecast start and forecast finish are integrated into the cost management system used for earned value calculation in accordance with N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management.

## 2.2.3 Schedule Reporting

When the monthly and weekly updating cycle is complete, all schedules/layouts are posted in SharePoint and accessed by all OPG staff through the Scheduling Link. Reporting requirements will be established based on the phase of the Program and the nature of the work being performed by the vendor.

## 2.3 Cost Management

Cost Management includes the processes required for planning, funding, managing, recording, forecasting, and controlling costs, including contingency management, at the program and project/function levels within approved budgets.

The DRP Cost Management process is currently defined in N-MAN-00120-10001-PC, Project Controls with desktops established below the manual level in the areas of cost management and cost forecasting.

The Cost Management System EcoSys EPC contains the project life cycle cost information (i.e. budget, actual cost, earned value, and forecast) for each work package. The released amount for each work package approved via the Gated Process (N-MAN-00120-10001 Sht: GRB) is also documented in the cost system.

Program releases will also establish contingency funding. The program strategies for managing contingency are detailed in Sections 2.4 and 2.5 of this document. Release of contingency is controlled via the change management process as described in sections 2.3.3.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>9 of 20</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

The program has established and will maintain a systematic and hierarchical Cost Breakdown Structure (CBS) that identifies all Control Accounts used by the Program. The CBS mirrors the Program Work Breakdown Structure (WBS) and includes cost only accounts not contained in the schedule (e.g. Contingency, Interest). Each Control Account contains one or more Work Packages (WP). Budget is established at the WP level and the associated actual costs are also collected at the respective WP level to support cost performance monitoring. Progress is input into the cost management system based on the progress of each work package. . The process to import progress directly from Primavera to the cost management system is under development.

### 2.3.1 Earned Value Management

Earned Value Management methodology, as defined in N-MAN-00120-1000-SCH-07, Nuclear Refurbishment Earned Value Management is utilized as the primary architecture for cost management. Planned Value (PV) is established at the Work Package level, recorded as a dollar value in cost management tool (EcoSys), and rigorously controlled via the Change Management practices as outlined in Section 2.3.3. Earned Value (EV) is derived via schedule progress and recorded as a dollar value in the cost management tool. Actual Cost (AC) is exported from the financial system, via BI (Business Intelligence) through the cost management tool at the Work Package level.

Standard earning rules are defined for all phases of work (Engineering, Procurement, Construction, Commissioning and Closeout) and shall be rolled out to each contractor before baselining the Level 3 schedule.

Plan

<b>Internal Use Only</b>

Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>10 of 20</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

### 2.3.2 Estimating

Cost estimating is the process of determining the expected total cost of labour, materials, equipment, professional fees, and other resources required for the execution of a project. Detailed guidance on estimating for Darlington Refurbishment is provided in N-MAN-00120-10001-EST, Nuclear Projects Cost Estimating.

Project cost estimates for Engineer/Procure/Construct (EPC) scopes of work are prepared internally to support the following processes:

- EPC contract Request for Proposal (RFP) and bid evaluation
- Program/Project life cycle and release planning

In addition, once EPC vendor contracts are in place, internal estimating expertise is utilized to:

- Review vendor Estimate Proposal
- Provide independent review and validation of vendor estimates supplied to OPG as projects progress from definition through execution phases
- Estimate OPG Oversight, services and functions cost supporting the project
- Review and validate any change requests (CCF of CCB) submitted by Project Team
- Support project funding requests.
- Support the Project Team in negotiating with Contractors and Sub Contractors

### 2.3.3 Change Management

Change Management is the Project Management process used to review and disposition all change requests, and manage changes to contingencies and changes to the baseline scope, costs and schedule. Change Management is implemented to maintain the integrity of the project baseline and control cost, and schedule creep.

The DRP Change Management process is currently defined in N-MAN-00120-10001-PC-12, Nuclear Refurbishment Program Change Management. The associated Change Control Form N-FORM-11252: Nuclear Refurbishment Change Control Form has been issued for use and is currently used for all NR funded Projects.

.Changes are rigorously identified, categorized, and recorded in the cost management system in order to effectively maintain project and program baselines and track cost performance against approved plans and budgets.

Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

#### 2.3.4 Performance Measurement

Cost performance is measured using standard industry metrics at the program, project, and functional levels. Utilizing the Earned Value Management System, the following standard metrics are calculated from the cost management tool and reported via the Business Intelligence (BI) reporting tool:

- **Schedule Performance Index (SPI):** SPI is a measure of schedule efficiency expressed as the ratio of earned value to planned value (EV/PV).
- **Cost Performance Index (CPI):** CPI is a measure of cost efficiency of budgeted resources expressed as the ratio of earned value to actual cost (EV/AC).
- **Cost Variance:** The difference between the earned value and the actual cost of that work. It is expressed as AC - EV. A positive value indicates an unfavorable condition and a negative value indicates a favorable condition.
- **Budget Variance:** The difference between the planned value and the actual cost of work performed. It is expressed as AC - PV. A positive value indicates an unfavorable condition and a negative value indicates a favorable condition.

Cost performance is monitored for various program periods, including life-to-date (LTD), life cycle, current gate, and annual release. Standard BI reports are produced at the program and project levels for these periods.

SPI, CPI, and variance metrics are all past-performance oriented. The program also utilizes forecasts at the program and project levels against approved life cycle estimates in order to proactively assess future success and take early corrective action where ever required.

#### 2.4 Risk

N-MAN-00120-10001-RISK-R003, Nuclear Projects Risk Management, provides a systematic approach on risk management; ensuring risks are identified, assessed, analyzed, mitigated with adequate risk response, and monitored to a robust and consistent standard to ensure that project objectives are achieved.

Risk management provides projects with forward-looking actions and metrics to reduce the likelihood and minimize the impact of undesirable events during the project life cycle. The goal of risk management is to remove obstacles to project success before they occur in order to minimize their consequential effect on project costs, schedule, quality, and safety targets.

Proactive risk management is used to understand the characteristics of the risk, how to manage them, and plan for *contingency* based on the *residual risks*. As such, risk management can have a significant impact on the financial health of the project.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>12 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

N-MAN-00120-10001-RISK-R003, Nuclear Refurbishment Risk Management, provides guidance on how to use the risk register to identify, update and close risks in the program and project risk registers. It also defines the Darlington Refurbishment risk assessment criteria and scales, risk assessment heat map and minimum risk review frequency. It sets the expectations for preparing Project Risk Management Plans (RMP) by contractors and refurbishment projects. Risks that only apply to the contractor are the responsibility of the contractor to manage. Oversight is provided by OPG to ensure an effective RMP is in place.

### 2.4.1 Risk Register Administration

The Risk Management (RM) organization is accountable to create and maintain standards, procedures, tools, and shared services resources to facilitate effective risk management within the Nuclear Refurbishment project. Risk Management facilitates the "Knowledge Management" functionality for NR, specifically the documentation and archiving of major risk influencing items such as operating experience, lessons learned integration, planning assumptions, major decisions, actions, and issues. This documentation of these elements will be executed in the form of project logs in the Risk Management and Oversight (RMO) tool.

### 2.4.2 Risk Reporting

(a) As part of the monthly reporting cycle, risks are reported in:

- Top Risks from each Bundle and Function in the Monthly Quad Charts
- Key DRP Program Risks

**Note:** For each risk being reported on quad charts or program risk reports, the following information should be communicated:

- Risk ID
- Risk Title
- Risk Description
- Risk Response Strategy and Status
- Current Risk Score
- Post-Risk Response Risk Score
- Target Completion Date of reaching Post-Risk Response Risk Score

(b) The following reports are communicated to senior management:

- Top DRP Risks reported quarterly in the Nuclear Oversight Committee (NOC) and Executive Advisory Committee (EAC) reports.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>13 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

- Key Program risks are reported to ERM using the BURSA template. See OPG-PROC-0094, Enterprise Risk Management Report.
- Risks that are jointly being addressed by the Darlington Station and DRP are presented and discussed on a quarterly basis at the Darlington & Darlington Refurbishment Common Risk Challenge Meeting.

## 2.5 Contingency

N-MAN-00120-10001-RISK-R005, Nuclear Refurbishment Contingency, Development and Management, provides direction for contingent funds development. For the purposes of contingency determination, projects utilize quantitative analysis based on their identified risks.

Contingency development is an integral part of estimating, scheduling and risk management processes. Contingent funds to address uncertainties in a project should be proportionate to the project size, duration and complexity, risk exposure and tolerance, organization's prior experience with the work, and confidence levels set by management. At DRP, there are two main classifications of contingent funds to address different types of uncertainties – contingency and management reserve.

Contingency at DRP is further sub-divided into Project Contingency and Program Contingency to address uncertainties in project bundles and functional groups, respectively. It is not intended for changes in scope or extraordinary major social or natural events such as war, strikes, flood and earthquakes, which are addressed by Management Reserve.

Contingency is managed according to the Change Management process described in section 2.3.3.

## 2.6 Documentation and Project Closure

Records, documents and data collectively form the memory of the Darlington Refurbishment Program. They constitute the business and intellectual assets of critical importance, and must be managed to meet both regulatory and business requirements.

Documents shall be managed throughout their life cycle e.g. project planning, execution and program closure in accordance with OPG-PROC-0178, Records and Document Control.

In addition to the standards and procedures described in N-PROG-AS-0006, Nuclear Refurbishment has developed electronic document control processes in conjunction with the implementation of an Electronic Document Management System (EDMS).

N-MAN-00120-10001-RDM, Nuclear Project Records and Document Management, provides the direction related to electronic management of information.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>14 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

### 2.6.1 Document Creation

Requirements for creating, reviewing, approving and issuing Darlington Refurbishment process support controlled documents will be documented in NK38-NR-MAN-09701-10001, Darlington Refurbishment – Requirements for Process Support Controlled Documents (pending issuance).

Process support controlled documents are those documents which support the definition or implementation of a process (e.g. Program Management Plans, Manuals, Guides, Instructions and refurbishment-specific technical documents/procedures developed under N-PROC-AS-0028).

### 2.6.2 Filing and Retention of DRP Records

All records generated as a result of executing work under the DRP Program, must have a documented plan for filing and retention. It is the responsibility of the process owner to confirm the filing and retention requirements.

### 2.6.3 Submission

All Supplier documentation deliverables must be submitted electronically to OPG using the official document filing system. Exceptions apply when the format of the deliverable does not support electronic submission.

### 2.6.4 Review and Acceptance or Approval

Submittals are routed electronically within EDMS for review. Reviews will be conducted by the appropriate stakeholders in accordance with the Gate Review Process described in N-MAN-00120-10001-GRB. Review comments are stored within EDMS, and returned to the submitter within contractually agreed due dates. OPG Records and Document Management (RDM) staff workflow, track, and report on processing dates.

Documents are routed electronically for acceptance or approval (with some exceptions). Once accepted, a document becomes an official project record at which time it is processed by RDM staff into an Approved Information Management System (e.g. Asset-suite).

### 2.6.5 Communicating OPG Requirements to Suppliers

The Communication Protocol document provides direction on how project correspondence and documentation deliverables are managed, and points to the process support documents and tools that the Supplier must reference in order to be compliant.

Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>15 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

## 2.7 Project Management Logs

The Risk Management Oversight (RMO) toll is a repository for Actions, risks, key issues, decisions and assumptions for Darlington Refurbishment Program that will be managed throughout the project lifecycle. The purpose of documenting Actions, Issues, Decisions, and Key Assumptions is to ensure that they are relevant to Darlington Refurbishment and are widely accessible by staff and to maintain an auditable trail for review, reference and monitoring.

N-MAN-00120-10001 Sht. RISK, provides guidance on how to document, review, approve and manage Actions. Risk, Issues, Decisions, and Key Assumptions associated with Darlington Refurbishment.

## 2.8 Reporting

### 2.8.1 Reporting Approach

Timely and effective reporting supports the successful execution of the Darlington Refurbishment Program. Specifically, reporting will support management decision processes, measure progress against established business objectives, and flag any performance gaps that require management attention.

Reporting will follow the same principles for all phases of the program, though the specific metrics and reports may vary to align to the business needs of each phase.

A comprehensive, tiered metrics infrastructure has been established and will be maintained at program, project, and functional levels to measure progress in the areas of:

- Environment, Health, and Safety
- Scope
- Schedule
- Cost
- Quality

The program has established a repository within the Integrated Database (IDB) for metrics and reporting data. This dataset ensures that reports consistently utilise data from the approved single source of truth, and that data fidelity is maintained. Microsoft Business Intelligence (BI) is being used as the program report generation engine to the extent possible. An NR Reporting Website is maintained and utilised across the organization as a repository for approved reports.

### 2.8.2 Standard Reports

A set of standard reports are currently produced to communicate program and project performance to suit various stakeholder needs. These reports will be adjusted as

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>16 of 20</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

required based on the project phase and key program focus areas. Standard reports currently produced include:

- (a) Board Update is a high level program status report prepared for the Ontario Power Generation (OPG) Board of Directors (BOD).
- (b) Periodic program level performance reports are prepared for senior OPG management audiences (e.g. Nuclear Oversight Committee, Nuclear Executive Committee).
- (c) Major Darlington Refurbishment milestones and performance targets are included in corporate, Nuclear, Nuclear Projects, and Darlington Refurbishment level Report Cards produced on a monthly basis by the corporate Finance function.
- (d) Program Status Report is prepared monthly for senior Darlington Refurbishment management. This report summarizes safety, schedule, cost, and quality performance at the program level.
- (e) Project and Function level Quad Charts are prepared monthly. These reports summarize safety, schedule, cost, and quality performance.
- (f) The Controllership Financial & Oversight Report is produced monthly by nuclear finance. This report is a comparison of actual and forecast costs against the approved Business Plan.
- (g) Standard monthly Earned Value performance reports at all levels from the program down to Work Packages are produced by the BI reporting tool for use by line managers to support ongoing monitoring and control of work programs and projects.
- (h) Joint OPG/Vendor scorecards are produced for all major refurbishment contracts. These scorecards assess performance against the terms and conditions of the contracts.

## 2.9 IT Tools and Applications

For a large project such as Darlington Refurbishment, maintaining and managing project data and Project Information Technology (IT) tools is very important throughout the life of the project. Critical project databases are supported by Chief Information Office (CIO) supported data repositories. The demands, priority and business requirements for IT projects and base services and associated benefits of such services are identified by Darlington Refurbishment. For Line of Business (LOB) funded projects, DRP will approve the business case and release funds before CIO undertakes project work. For the CIO funded projects, CIO will approve the business case and release funds after obtaining concurrence of project sponsor. CIO will document the business case in both cases.

Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0002</b>	Revision Number: <b>R002</b>	Page: <b>17 of 20</b>
Title: <b>DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN</b>		

In support of Darlington Refurbishment, the CIO will:

- Prepare an annual demand plan for new projects and base service changes for incorporation into the CIO and DRP business plans.
- Develop and maintain longer term systems strategy and roadmap with collaboration and participation from all levels of Nuclear Projects.
- Execute new projects and base services within the agreed scope, schedule and cost while adhering to the established IT Standards/Strategy, IT Business Plan, IT Project Delivery Framework and OPG investment guidelines.
- Establish technology standards and select vendor and technology for specific projects. DRP will provide input into technology standards and vendor/technology selection decisions. CIO will demonstrate that its decision is the most optimal for OPG.

DRP will provide input into the service levels and quality metrics for the base services. Service levels will be jointly developed and agreed upon with regular reviews and adjustments to meet the evolving needs of business and IT.

### 3.0 ROLES AND ACCOUNTABILITIES

#### 3.1 Director, Planning and Controls, DRP

Ensures that effective managed systems are in place for the planning, execution, monitoring, and reporting of scope, schedule, cost, risk, Operating Experience, Gated Process and records management.

Accountable for the provision of accurate, timely performance reports to senior OPG management and stakeholders.

Is the owner of this document and is accountable for its definition, implementation and continual improvement.

#### 3.2 Manager, Project Reporting and Infrastructure, DRP

The Manager of Nuclear Refurbishment Reporting reports to the Director of Planning and Control. Establishes the process that ensures quality, control and confidentiality where appropriate are maintained regarding cost, schedule and project updates. The manager provides sole source on direction and clarity around Stakeholder required reports to the section manager, report building and writing staff.

#### 3.3 Manager Project Risk, DRP

Establish the processes, instructions, and tools necessary to execute risk and contingency management and operating experience.

Plan

Plan	Internal Use Only		
	Document Number: NK38-NR-PLAN-09701-10001		Usage Classification: N/A
	Sheet Number: 0002	Revision Number: R002	Page: 18 of 20
Title: DARLINGTON REFURBISHMENT PROJECT PLANNING AND CONTROLS PROGRAM MANAGEMENT PLAN			

Provide expert support to Darlington Refurbishment client groups in the execution of risk and contingency management and operating experience.

### 3.4 Manager Project Scheduling, DRP

Establish the processes, instructions, and tools necessary to execute schedule management.

Provide expert support to Darlington Refurbishment client groups in the execution of schedule management.

### 3.5 Project Controls Leads, DRP

Prepare, monitor, and control function/project budgets and ensure costs are appropriately charged to the right budget item.

Provide inputs to scope, schedule, cost, risk, and Operating Experience systems to support effective monitoring, reporting, and control to meet program objectives.

Review performance reports and take corrective action in accordance with established thresholds and business goals.

## 4.0 DEFINITIONS & ACRONYMS

**Actual Costs (AC)** is the realized costs incurred for the work performed during a specified time period.

**Earned Value (EV)** is the measure of work performed expressed in terms of the budget authorized for that work.

**Forecast** is an estimate or prediction of conditions and events in the project's future based on information and knowledge available at the time of the forecast. The information is based on the project's past performance and expected future performance, and includes information that could impact the project in the future, such as estimate at completion and estimate to complete.

**Planned Value (PV)** is the authorized budget assigned to scheduled work.

**Work Breakdown Structure (WBS)** is the hierarchical decomposition of the work to be carried out to accomplish the objectives and create the required deliverables.

**Work Package (WP)** is the work defined at the lowest level of the Work Breakdown Structure (WBS) for which cost and duration can be estimated and managed.

**AIDA** Actions, Issues, Decisions, and Key Assumptions  
**BI** Business Intelligence  
**BOD** Board of Directors

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

## **1.0 PURPOSE**

This Return to Service Management Plan describes the processes, procedures and organization that will be used during the Darlington Refurbishment Project to manage the modification commissioning and restart activities. The Return to Service Management Plan and Return to Service (RTS) process documents are compliant with the Canadian Standards Association (CSA) N286-05 Management System Requirements for Nuclear Power Plants and other applicable codes, standards, and laws.

## **2.0 RETURN TO SERVICE PROGRAM REQUIREMENTS**

The RTS portion of the refurbishment outage covers the range of activities from completion of installation work by the contractor to reactor power at 100%, including modification commissioning and restart activities.

The RTS Department will be part of Nuclear Refurbishment – Operations & Maintenance. The RTS Department will:

- (1) Develop and manage RTS processes and procedures (described in Section 2.3).
- (2) Develop an integrated RTS logic that coordinates restart testing and modification commissioning activities.
- (3) Oversee the preparation of modification commissioning and restart instructions.
- (4) Coordinate the execution of modification commissioning and return to service activities by Operations and Maintenance resources. Contractors/Vendors will provide a supporting role during modification commissioning.

During the outage preparation phase, the RTS organization will be comprised of a Department Manager and Section Manager. These individuals will focus on items 1 and 2 (above).

As the organization transitions from preparation to execution, the RTS Department will have resources that will focus on items 2 and 3 (above). The mature organization will have three sections – Preparation, Execution, and Completion Assurance (described in Section 3.0). See Appendix B for a graphical representation of the organization.

## Plan

Title:

## **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

### 2.1 Return to Service Phases

The RTS activities will occur in 4 phases:

- (1) **Phase A:** restart activities prior to fuel load
- (2) **Phase B:** fuel load and activities leading up to, but not including, guaranteed shutdown state (GSS) removal and first approach to critical (ATC)
- (3) **Phase C:** ATC and low power testing (<1%)
- (4) **Phase D:** high power testing and power escalation to full power

During these phases, a test program will integrate:

- normal start-up testing
- non-standard tests that are unique to a refurbishment outage
- outstanding modification commissioning tests

### 2.2 Basis for Return to Service

#### 2.2.1 Refurbishment Categories

The extent of return to service activities required for a System, Structure or Component (SSC) will be commensurate with the scope and duration of the refurbishment work. The following three categories, which are based on the scope of work performed during the refurbishment outage, will be used:

- (1) SSC remained in normal operation:

These are SSCs that remained in normal operation with continued system health and routine maintenance program activities. All OPG or contractor maintenance work shall follow the current normal OPG processes for operating equipment.

- (2) SSC shutdown and/or laid-up:

These are SSCs that were laid-up or in normal shutdown during the refurbishment outage. This category also includes SSCs that were disconnected or dismantled to provide access to perform work during the outage. All OPG or contractor maintenance work shall follow the OPG processes for outage work. If a modification was required to place the SSC in shutdown or lay-up, the modification would be categorized as a "New or Modified SSC" as described below.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>7 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

#### (3) New or Modified SSC:

These are newly installed SSCs or existing SSCs that have undergone significant repairs, replacement or modifications, including temporary modifications. All temporary and permanent modifications shall be performed as per OPG's Modification Process, N-PROC-MP-0090.

Strategies will be developed for identification of islanded, shutdown/laid up, and operating equipment in the field and may include physical barriers around the equipment, field tagging, and equipment status logs.

### **2.2.2 Return to Service Elements**

RTS activities are comprised of two elements, which will be integrated into the restart logic:

#### (1) Modification Commissioning:

This is the testing of modified or new equipment, including temporary modifications to confirm their design basis and license requirements are met.

#### (2) Restart:

This is returning equipment and systems to normal operation at the end of the outage. Generally, this equipment would have been in operation or in lay-up during the outage. Equipment specific functional tests and system level tests will confirm the normal operation of the system and ensure that the design basis had not changed from the original design and licensing requirements. This may be accomplished through review of previous modification commissioning reports and baseline data. Additional testing requirements may be identified for systems which were shutdown/laid up and these test requirements will be identified through preparation of a Detailed Restart Specification described in Section 2.3.6.

### **2.3 Return to Service Processes and Procedures**

The following documents are existing OPG governance to be used in the RTS process:

- Modification Process (N-PROC-MP-0090)
- Detailed Commissioning Specifications and Commissioning Reports (N-INS-00960-10000)

A suite of procedures has been issued to define the RTS requirements to ensure the activities are performed in a systematic sequence from pre-operational tests on individual pieces of equipment to integrated system testing and ultimately declaring the Unit in-service. The following documents were prepared for RTS of refurbished units:

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>8 of 23</b>	
Title: <b>DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN</b>					

- Nuclear Refurbishment Construction Check and Test Requirements (N-GUID-09701-10019)
- Nuclear Refurbishment Construction Completion Declaration (N-GUID-09701-10021)
- Nuclear Refurbishment Return to Service Process Overview (N-GUID-09701-10020)
- Nuclear Refurbishment Preparation of Detailed Restart Specifications and Restart Reports (NK38-INS-09701-10002)
- Nuclear Refurbishment System Available for Service Process (NK38-INS-09701-10005)
- Nuclear Refurbishment Unit Readiness for Service (NK38-INS-09701-10006)

The process flow of RTS activities is shown in Appendix A.

**Note:** No document referenced by this Return to Service Management Plan, NK38-NR-PLAN-09701-10001 Sheet 0003, should contravene or supersede any engineering change control process governance requirements (as found in N-PROG-MP-0001, Engineering Change Control, or N-PROC-MP-0090, Modification Process, and its referenced governance) or planned outage management governance (as found in N-PROC-MA-0013, Planned Outage Management). Any conflicts between documents referenced by this Return to Service Management Plan, NK38-NR-PLAN-09701-10001 Sheet 0003, and the engineering change control governance or planned outage management governance shall be resolved in favour of the OPGN governance.

Compliance with CSA N286-05 is demonstrated and documented in OPGN governance documents as per N-LIST-08130-10023, CSA N286-05 to OPGN Governance Cross Matrix. RTS documents are non-governing documents that add additional guidance and enhancements to N-PROG-MP-0001, Engineering Change Control, and N-PROC-MA-0013, Planned Outage Management Procedure, and align to CSA N286-05 clauses 6.7 to 6.10 and CNSC Regulatory Document RD-360.

### 2.3.1 Return to Service Process Overview

The overall return to service process for Refurbishment is described in N-GUID-09701-10020, Nuclear Refurbishment Return to Service Process Overview. It contains the process to integrate modification commissioning and restart testing for return to service of the unit. In addition to the RTS Phases described in Section 2.1 of this plan, this process includes the basis for modification commissioning and restart testing, extent of modification commissioning and restart testing, conduct of testing, and evaluation of test results. Details on the use of Restart Control Hold Point (RCHPs), Section 2.3.1.1, and documentation such as System Restart Plans (SRPs), Section 2.3.1.2, is also included.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>9 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

#### **2.3.1.1 Restart Control Hold Points (RCHPs)**

Restart Control Hold Points (RCHPs) will be used to ensure prerequisites are complete and approvals are obtained prior to transitioning from one state to another. The hold points will be controlled by the Director Operations and Maintenance, Nuclear Refurbishment. Hold points will be identified in the schedule.

The following table lists the RCHPs, their associated phase, and if they are regulatory.

Phase	Phase Description	RCHP	RCHP Description	Regulatory Hold Point
Phase A	Restart activities prior to fuel load	RCHP 1	Prior to Moderator Fill	No
		RCHP 2	Prior to Fuel Load	Yes
Phase B	Fuel load and activities prior to guaranteed shutdown state (GSS) removal	RCHP 3	Prior to Bulkhead Removal	No
		RCHP4	Prior to Heat Transport System Fill	No
		RCHP 5	Prior to GSS Removal	Yes
Phase C	Approach to critical and low power testing (<1% full power)	RCHP 6	Prior to Exceeding 1% Full Power	Yes
Phase D	High power testing and power escalation to full power	RCHP 7	Prior to Turbine Testing & First Synchronization	No
		RCHP 8	Prior to Exceeding 35% Full Power	Yes
		RCHP 9	Prior to Unit Available for Commercial Operation	No

Criteria for release of a hold point are described in Nuclear Refurbishment Unit Readiness for Service, NK38-INS-09701-10006, and written confirmation for regulatory hold points will be provided to the CNSC identifying the following:

- All related project commitments tied to the hold point, as identified in the return to service plan have been completed
- All systems required for safe operation beyond the hold point are available
- All specified operating procedures have been formally validated
- Specified training has been completed and staff qualified
- All non-conformances and unexpected results identified leading up to the end of the phase are addressed
- All SSCs being returned to service meet the quality and completion requirements of N286-05 clause 6.9 and Annex D.3 through completion of CCD, MAFS and SAFS
- Other information as appropriate

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>10 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

#### **2.3.1.2 System Restart Plans (SRPs)**

System Restart Plans (SRPs) will be prepared for field execution to satisfy the requirements of the detailed restart specification. System Engineers will be responsible for the preparation of restart instructions.

The SRPs will be prepared in three levels of detail:

- (1) SRP2- provide a Level 2 logic overview of the test activities, durations and manpower required to commission or test each SSC. It integrates commissioning of modified equipment and testing of shutdown/laid up or normal operating equipment, identifies major prerequisites and provides the interfaces to other systems required to support system restart. SRP2s are flowchart format logic diagrams.
- (2) SRP3 - provide a more detailed Level 3 logic of the SRP2 test activities, sequence, durations and manpower required to commission or test each SSC or group of systems. SRP3s are flowchart format logic diagrams with a greater level of detail than a SRP2.
- (3) SRP4 (or coordination work plan) - written for a step or a group of steps in a SRP3. SRP4s provide the field executable details required by Operations, Maintenance and other staff to perform the modification commissioning or testing activities for each SSC. For simple modification commissioning/tests, work order task instructions may be used.

#### **2.3.2 Construction Check Out and Test**

At the completion of modification activities by a contractor and prior to acceptance by OPG, the contractor will perform a suite of "check-out & test" (COAT) activities on the SSC. The intent is to confirm that equipment has been installed as per the design requirements. COAT activities are generally static in nature, demonstrate the adequacy of the installation and workmanship, and are performed prior to placing the equipment in service. They are completed as a pre-requisite to the commissioning of modifications and are generally identified and verified in an Inspection and Test Plan (ITP).

The COAT process is described in N-GUID-09701-10019, Nuclear Refurbishment Construction Check and Test Requirements. It identifies a suite of COAT requirements for various types of equipment. The contractor produces the COAT requirements, instructions, and acceptance criteria in accordance with the contractor's quality assurance program.

#### **2.3.3 Construction Completion Declaration**

The Nuclear Refurbishment Construction Completion Declaration, N-GUID-09701-10021, process describes the requirements to be followed during the refurbishment of each Darlington unit following the completion of construction/installation activities performed on a given SSC. The Construction Completion Declaration (CCD) is

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>11 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

confirmation that construction and installation activities are sufficiently complete and that it is safe to proceed with modification commissioning and restart testing on affected SSCs. Included in the CCD package is documentation on the boundaries and contents of the work, status of the work, field changes, non-conformance reports, marked-up drawings, and so on. OPG provides oversight in the preparation of the CCD package. The package will be reviewed and accepted by the Nuclear Refurbishment Project Manager and in turn the Return to Service Manager as a pre-requisite to initiating modification commissioning and RTS activities. The CCD includes non-modification work through references to work orders completed in Asset Suite 7 in order for the RTS organization to integrate both the non-modification work completed on a SSC and the modification work completed on a SSC into modification commissioning or restart plans. The contractor is expected to follow all OPG nuclear processes and procedures when performing non-modification work including post maintenance testing.

#### **2.3.4 Detailed Commissioning Specifications and Commissioning Reports**

All new or modified SSCs will be commissioned to confirm that the SSC meets the design specifications and performance criteria. The basis for the modification commissioning will be a Detailed Commissioning Specifications (DCS). The DCS will specify the critical parameters to be proven during modification commissioning and will include the acceptance criteria. Modification commissioning results will be documented in a Commissioning Report (CR) as per the Modification Process, N-PROC-MP-0090. The CR will record any non-conformances identified during modification commissioning and address these to ensure safety analysis assumptions and safe operating envelope margin impact is known and dispositioned or updated as required.

A DCS will not be prepared for an SSC that was not modified, since this equipment would have been commissioned during original unit start-up, this equipment will be subjected to a Detailed Restart Specification (DRS) as per Section 2.3.6.

#### **2.3.5 Commissioning and Modification Available for Service**

Commissioning is the process during which SSC of a facility, having been constructed or modified, are made operational and verified to be in accordance with design specifications and to have met the performance criteria. Commissioning of new or modified equipment is performed as per OPG's existing Modification Process, N-PROC-MP-0090. Temporary modifications will be controlled as per N-PROC-MP-0090, Modification Process.

Modification commissioning will be executed by Nuclear Refurbishment Operations & Maintenance staff and Engineering, with support from the Contractor. Some modification commissioning activities may be deferred until the required system conditions have been established. In those circumstances, the outstanding modification commissioning activities will be integrated with restart testing described in Section 2.4. Modification commissioning activities are performed per unit and tracked on a per unit basis. The modification commissioning documentation shall be compliant with the applicable requirements specified in Annex D.2 to the CSA N286-05 standard.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0003</b>	Revision Number: <b>R001</b>	Page: <b>12 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

After completion of modification commissioning, the OPG Project Team will prepare a Modification Available for Service Package (MAFS) for each modification for acceptance by the Refurbishment Operations Manager. Generally, a MAFS meeting will be held with the stakeholders to review the MAFS package and confirm the modification has been installed and commissioned to meet the design and performance requirements and is available to be placed in service. In some instances, the MAFS meeting may be waived by the Nuclear Refurbishment Director of Operations and Maintenance, but the MAFS must still be signed off. Darlington Refurbishment will follow the existing MAFS process as detailed in N-PROC-MP-0090, Modification Process.

#### **2.3.6 Detailed Restart Specifications and Restart Reports**

Many SSCs will not be modified during the Refurbishment outage, but may not have operated in a normal configuration for a significant period of time. A Detailed Restart Specification (DRS) will be prepared as per Nuclear Refurbishment Preparation of Detailed Restart Specifications and Restart Reports, NK38-INS-09701-10002, for all systems to identify equipment functional tests and system level tests that will confirm the normal operation of the system. These tests may be specified as routine Safety Related System Tests or operating manual procedures. In some cases, the tests will require development of non-routine instructions.(e.g. confirm logic functions, operate handswitches, test run pumps, stroke/exercise valves, system fill and flush and verification of system chemistry).

Refurbishment System Engineers will be responsible for preparation of the DRS and associated execution instructions. For maintenance activities included as part of refurbishment scope, the components will generally be returned to service using normal station processes such as post maintenance testing.

Refurbishment System Engineers will be responsible for preparation of a Restart Report as per Nuclear Refurbishment Preparation of Detailed Restart Specifications and Restart Reports, NK38-INS-09701-10002, to document results of detailed restart testing activities performed to meet the DRS. The reports will record the results of the tests, identify and adequately disposition any non-conformances identified during execution of the Restart testing. The reports will be incorporated into the System Available for Service package and referenced in the Completion Assurance Document (CAD) as described in Section 2.6.3.

#### **2.3.7 System Available for Service**

A System Available for Service (SAFS) process will be followed to restart systems when unit conditions are appropriate. The restarting of systems will integrate with modification commissioning when applicable. Restart of systems means returning them to the normal operating condition – removing lay-up, realigning valves, filling pipework, performing normal start-up testing, etc. The SAFS Declaration means that individual systems, or group of systems, can be credited to safely and reliably perform their design functions for continued unit operation. The SAFS will include a review of items such as backlogs, pre-defines, system health, scope of work completed, regulatory commitments, aging management, training, procedures, design basis (i.e.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>13 of 23</b>	

Title:

## **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

Environmental Qualification, Seismic Qualification, Fire Safe Shutdown Program, etc.), OP&Ps and Safety Report. The Director Operations & Maintenance, Nuclear Refurbishment, as the senior unit licensee, provides final overall approval of the SAFS declaration as per Nuclear Refurbishment System Available for Service Process, NK38-INS-09701-10005.

### **2.3.8 Unit Readiness for Service**

A Unit Readiness for Service (RFS) process will be used to document and control how the unit is restarted as per Nuclear Refurbishment Readiness for Service Process, NK38-INS-09701-10006. The RFS process will provide assurance at identified restart milestones that integrated system testing is complete and that systems, conditions and pre-requisites are acceptable to progress past the milestone. There will be a number of RFS meetings scheduled as the unit progresses through the restart phases. For example, RFS meetings will be held prior to loading fuel, prior to removing the containment bulkhead and prior to approach to critical. This process and meetings will be similar to the RFS process used for a normal planned outage, but will also consider the readiness to execute unique requirements of a refurbishment outage, such as on-power tests, non-standard start-up tests and required approvals.

### **2.3.9 Return to Service Performance Indicators**

RTS performance indicators are in the table below.

Process	Indicator	Measure
Construction Completion Declaration	CCD open items	Number of CCD open items
	CCD rejections	Number of CCD rejections
System AFS	System AFS open items	Number of System AFS open items
	System AFS rejections	Number of System AFS rejections

## **2.4 Restart Testing During Start-up**

A full suite of restart tests will be executed through the return to service phases. The tests will consist of existing Station tests/procedures and a set of non-standard test workplans used to prove the design basis and license requirements have been met. A comprehensive restart testing plan will be developed. Any outstanding modification commissioning tests will be integrated with the restart testing and scheduled for execution when the appropriate unit conditions are established. Additional restart testing guidance will be provided to document detailed processes for items such as; non-conformances, contingency planning (i.e. emergency response, backouts etc.), control of workplan changes, design changes as a result of restart testing, training, re-test and impact to operating units. Restart testing activities are performed per unit and tracked on a per unit basis.

A detailed reactor physics plan will be developed for restart Phases A, B, C and D, as defined in Section 2.1, the plan will include a review of procedures and OPEX from other recent CANDU refurbishment projects.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0003</b>	Revision Number: <b>R001</b>	Page: <b>14 of 23</b>	

Title:

## **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

### **2.4.1.1 Safety Analysis**

Safety analysis will be required to assist in validating design basis and the DNGS Safe Operating Envelope. It will also support Refurbishment modifications to confirm safety, design and operating margins. OPG will develop a process for addressing any nonconformity between the safety analysis assumptions and the modification commissioning results. OPG will update the Probabilistic Risk Assessment to incorporate any major changes to the plant configuration. Reliability models will be updated utilizing system baseline data obtained as per Section 2.4.1.3.

### **2.4.1.2 Operating Policies and Principles Strategy**

Operating Policies and Principles (OP&P) revisions will reflect the applicable boundaries of the Safe Operating Envelope. OP&P revisions are expected in three basic areas: Organization and Authority, Conduct of Operations (including Maintenance and Engineering), and Technical Specifications. The changes will be made to incorporate the expected roles and responsibilities of the Nuclear Refurbishment organization and its interface with the authorities of the operating plant, and to revise conduct requirements and technical specifications as appropriate with the various evolutions, configurations, and refurbishment states such as unit defueling evolution, unit defueled state, changes to the station containment envelope, non-irradiated fuel condition, pre-equilibrium core condition, and return to service activities as required. This work is being coordinated by Nuclear Safety, with input from Nuclear Refurbishment Operations and Maintenance, Engineering, Licensing, and Darlington Station.

### **2.4.1.3 System Baseline Data**

System baseline data will be established as follows:

#### Modified Equipment

- Modification commissioning activities will obtain baseline data through testing or inaugural inspections

#### Non-Modified equipment

- Existing baseline data will be reviewed and compared to the testing results obtained through execution of the DRS. If required, new baseline data will be obtained or inspections performed to re-baseline the SSCs.

### **2.4.1.4 Aging Management Reviews**

Darlington Refurbishment will layup certain systems to maintain the asset during the Refurbishment outage work. Layup technical requirements will be prepared for each laid up system and these layup technical requirements will address aging management as per RD-334, Aging Management for Nuclear Power Plants.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>15 of 23</b>	

Title:

## **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

### **2.4.1.5 Open Item Management**

During execution of the RTS process open items will be identified in the preparation of the RTS documentation (CCD, MAFS, SAFS, and RFS). Rigorous tracking and completion of open items is necessary to ensure the safe operation of the reactor following return to service. During preparation of each of the RTS documents open items are documented, evaluated and actioned or dispositioned appropriately prior to acceptance of the documents and prior to proceeding with operation of the SSCs.

## **2.5 Return to Service Program Management Approach**

### **2.5.1 Site Transition and Department Transfer Plans**

The effectiveness of transitioning between Station Operations and Refurbishment Operations - and subsequently from Refurbishment to Station operations - is critical to the overall success of the Darlington Refurbishment. Transition planning for Darlington Refurbishment is described in the following document:

- NK38-PLAN-09701-10097, Interface Agreement Between Nuclear Refurbishment and Darlington Nuclear

The Interface Agreement clarifies overall roles and responsibilities that are required to achieve the Refurbishment Program objectives, which includes the completion of all identified scope. It also identifies the need for a comprehensive Site Integrated Transition Plan and for Departmental Ownership Transfer Plans.

The Site Integrated Transition Plan will be developed. It will ensure that all the Station and Refurbishment staff are aligned and have a clear understanding of the specific deliverables required to support the transition to Refurbishment and back to Station Operations.

Department Ownership Transfer Plans have been prepared. They ensure that personnel in a department have a clear understanding of specific activities and responsibilities associated with the transition to Refurbishment and back to Station Operations.

### **2.5.2 Records Management**

A large volume of records will be produced during RTS. A process will be developed to manage the volume and processing time with the accuracy needed in order that the records are correct, complete, traceable, and retrievable. Records will be available for the following step of return to service process so that staff can make accurate assessments of the readiness of the equipment and where applicable, support the release of hold points.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>

Title:

## **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

### **2.6 Regulatory Interface**

#### **2.6.1 Regulatory Scope**

In accordance with N-PROC-LE-0007, Nuclear Refurbishment – Global Assessment Report and Integrated Implementation Plan, Darlington, and as per RD-360, Life Extension of Nuclear Power Plants, the Integrated Implementation Plan (IIP) will identify the regulatory scope and implementation schedule.

The IIP scope includes actions to address Component Condition Assessment recommendations and issues requiring resolution from the Integrated Safety Review as well as mitigating measures from the Environmental Assessment. The activities identified in the IIP will bring the plant into closer alignment with modern codes, standards, and practices, and to further ensure that operation of the facility continues to pose minimal risk to the health and safety of persons, to the environment, to national security.

OPG will monitor the project for progress, safety, and quality at all phases of execution and shall provide the CNSC with updates at a mutually agreed frequency regarding the progress of refurbishment. Progress updates may include such information as:

- A listing of IIP items that have been completed;
- Documentary evidence that these items have been closed; and
- Proposed changes to the scope or implementation schedule for open IIP commitments.

As commitments are completed, formal correspondence will be submitted to the CNSC documenting the information required to demonstrate compliance and seeking CNSC concurrence. Any changes to the IIP scope or implementation schedule will follow the change control process to be developed and submitted to the CNSC, NK38-CORR-00531-16568 "Request for CNSC Acceptance of the Darlington NGS Global Assessment Report (GAR) and Integrated Implementation Plan (IIP)".

#### **2.6.2 Regulatory Commitments**

Refurbishment regulatory commitments will be monitored and tracked in accordance with N-PROC-RA-0006, Regulatory Action Management.

Regulatory commitments include:

- Regulatory Scope
- Any other refurbishment-related commitment made by OPG through formal correspondence.

Refurbishment regulatory commitments will be linked to Restart Control Hold Points (RCHP) as appropriate.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>17 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

Removal of Regulatory Hold Points will be contingent on having received CNSC approval following submission to the CNSC of the information required to demonstrate that all related regulatory commitments have been met up to that hold point.

### **2.6.3 Completion Assurance Documents**

As per Regulatory Document RD-360, completion assurance documents (CADs) will be submitted to the CNSC in support of a request to remove the hold points identified as regulatory. The CAD will contain references to the documentation that provides confirmation that all pre-requisites, modification commissioning, testing, system restart activities and commitments have been completed to allow release of the specific hold point. It is expected that OPG will prepare several CAD documents to support removal of a regulatory hold point and these documents will be submitted to the CNSC for review and acceptance as work is completed throughout the various phases of the refurbishment outage. The CAD provides confirmation to the CNSC that refurbishment activities required for a specified hold point have been successfully completed (design, installation, maintenance, testing, modification commissioning).

Acceptance of the CADs will be tracked and once all CADs associated with a particular regulatory hold point have been completed OPG will request final approval to proceed past the hold point. It is expected that OPG regularly update the CNSC on the outage progress and status of CADs in order to reduce the time required to receive final regulatory hold point release.

The CAD will include reference to the following reports with detail applicable to the specific activities associated with the milestone:

- Construction Completion Declarations
- Modification Commissioning Reports
- System Available for Service Packages
- Restart Reports

In addition, CNSC Regulatory Document RD-360, Section 8.0 requires the licensee to submit design completion assurance reports. The design completion assurance reports for modifications identified in the Integrated Implementation Plan will be prepared per NK38-GUID-01900-10001, "Darlington Refurbishment: Design Completion Assurance" and submitted to the CNSC by Darlington Refurbishment Engineering well in advance of the Construction Completion Declaration.

OPG will perform a safety assessment for any remaining unknown conditions or outstanding deficiencies related to the Component Condition Assessments of safety related SSCs. These assessments will be submitted to the CNSC for acceptance as a prerequisite to removing regulatory hold point for progression past Phase A (prior to fuel load) RTS activities.

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

## **3.0 ROLES AND ACCOUNTABILITIES**

### **3.1 Director, Refurbishment Operations and Maintenance**

The Director, Refurbishment Operations and Maintenance, is the document owner and is accountable for its definition and implementation.

### **3.2 Manager, Return to Service**

The Manager, Return to Service, is accountable for oversight and coordination of commissioning and return to service activities.

The mature RTS organization, led by the manager, will consist of the following three sections.

#### **3.2.1.1 Return to Service: Preparation Section**

The RTS Preparation Section will develop RTS processes and procedures. It will also oversee the preparation of execution plans for modification commissioning and return to service activities.

#### **3.2.1.2 Return to Service: Execution Section**

This section will be staffed for the Execution Phase and be responsible for coordinating the execution of the modification commissioning and return to service activities.

#### **3.2.1.3 Return to Service: Completion Assurance Section**

As each project progresses during the Execution Phase, this section will coordinate MAFS and SAFS preparation. It will assemble system available for service documentation in support of Unit readiness for service. This section will also interface with the contractor for system turnover for modification commissioning.

## **4.0 DEFINITIONS AND ACRONYMS**

### **4.1 Definitions**

***Aging Management*** – refers to the process of ensuring that SSC continue to function as per design given that, with time or use, their characteristics can change or their performance can degrade.

***Commissioning*** – refers to the process during which SSC of a facility, having been constructed or modified, are made operational and verified to be in accordance with design specifications and to have met the performance criteria.

***Contractor*** – refers to non-OPG personnel assigned to perform work on the refurbishment project.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0003</b>		Revision Number: <b>R001</b>		Page: <b>19 of 23</b>	

Title:

### **DARLINGTON REFURBISHMENT RETURN TO SERVICE PROGRAM MANAGEMENT PLAN**

**Functional Testing** – refers to equipment testing performed as per restart specifications to confirm equipment operation as per design.

**Inspection and Test Plan** – refers to instructions prepared for the execution of check out and test activities.

**Islanding** – refers to a process of isolating the refurbished unit as much as possible and identifying out of service equipment boundaries to reduce any impact to the operating units and to provide a safe work area for refurbishment contractors and OPG workers.

**Modification** – refers to temporary and permanent changes to any SSC in the plant, all modifications are performed as per OPG's current Risk Based Modification Process N-PROC-MP-0090.

**Open Items** – refers to items which are identified as required for completion of a completion assurance package (CCD, MAFS, SAFS, RFS) but have been evaluated and accepted as items that can be done at a later date and tied to a future milestone. Open item management is a key process for return to service and open items need to be tracked and monitored with rigour to ensure that they do not impact safe operation of the unit.

**Reactor Physics Plan** – refers to a detailed plan prepared to identify testing required for confirmation of reactor core configuration post-refurbishment, includes checks and tests to confirm reactor physics and neutronic instrumentation prior to and after approach to critical.

**Restart** – refers to process established for returning systems back to service after system layup or shutdown, in general normal station processes would be used to restart equipment however due to extended layup/shutdown additional testing may be required to confirm systems operate as designed. Specifications are prepared for each system requiring restart and restart testing plan is developed to meet the specifications.

**Return to Service** – refers to the process of restarting the refurbished unit and covers the range of activities from completion of installation work by the contractor to reactor power at 100%, including modification commissioning and restart activities. The process also includes confirmation of physical work completed, configuration management confirmed and safety analysis/assessments completed as per N286-05.

**System Baseline** – refers to established operating characteristics, design specifications and operating performance of a system that is used to monitor the performance of the system and monitor for degradation in system components. This is generally established through routine testing, inspections and pre-defined maintenance of the system and may require non-routine testing or modification commissioning to establish new baseline data.

**System Testing** – refers to integrated restart testing used to confirm operation of a system as per the restart specifications.

Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The Nuclear Refurbishment (NR) Environmental Program Management Plan (EMP) describes how environmental issues will be managed for the NR Program. It establishes a framework for the Environmental Management System (EMS) for NR Projects, Departments and Vendors/Contractors in accordance to defined goals, objectives and expectations for the NR Program.

The *Environmental Mission* is to effectively manage all Environmental Aspects during the NR project, in accordance with the EMS.

## 2.0 PROGRAM REQUIREMENTS

This plan will provide NR and other business unit support staff with clear understanding of the environmental management requirements for the NR Program including:

- Environmental Goals and Objectives
- Environmental Management System Framework
- Significant Environmental Aspects
- Roles and Responsibilities

The changes that will occur as a result of the NR project have the potential to cause Environmental Impacts.

### 2.1 Goals

To effectively manage environmental performance during the Refurbishment Project. Specific goals include:

- Operate **As Low As Reasonably Achievable** (ALARA) to minimize radiation exposure of the **Public** and the **Environment** (PE-ALARA);
- Zero reportable spills and Environmental Infractions;
- Maximize landfill diversion of conventional waste in alignment with regional objectives; and,
- Maintain top quartile performance for the generation of **Low and Intermediate Level Radioactive Waste** (LILRW) during the NR Project and sustain top decile performance following the project.

#### 2.1.1 Objectives

To provide Environmental Oversight for the NR Project by:

1. Identifying potential environmental impacts that are related to Significant Environmental Aspects (SEA) within a project;
2. Maintaining compliance with all legal and other requirements;

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>5 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

3. Monitoring the performance of a project against specific environmental objectives and targets; and,
4. Reviewing and participating in the modification process during a project.

## 2.2 Strategy

Due to the unique requirements associated with the large scope and duration of the NR Project, and the multi-employer configuration, it is recognized that an environmental program must be in place to ensure that the Significant Environmental Aspects are project focus areas and are managed appropriately.

The *Environmental Policy* [R-1] and *Environmental Management System* [R-2] ensure that Significant Environmental Aspects are identified within OPG (*Environmental Aspects Identification and Significance* [R-3]). These Significant Environmental Aspects are reviewed and ranked across OPG.

The Significant Environmental Aspects that are focus areas for Nuclear Refurbishment include tritium emissions, spills, and radioactive and conventional waste. In addition, OPEX has identified contractor oversight as another key focus area. A summary of these aspects and the management of them are found in Table 1.

Sheet Number: <b>0004</b>	Revision: <b>R002</b>
Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>	

## 2.3 Environmental Management System (EMS) Framework

OPG's Environmental Policy includes a commitment to register the Environmental Management System under the ISO 14001 Standard. Accordingly, OPG is committed to establish, implement, maintain, and continually improve this EMS in accordance with the Standard. In addition to the standard, the CNSC Regulatory Standard (S-296) applies.

The scope of the EMS includes activities associated with the construction, operation, emissions, effluent and waste management, decommissioning and demolition of associated buildings and structures solely owned by OPG and operated by OPG or sites operated by OPG on behalf of OPG's partner owners.

In order to ensure the EMS is maintained, Nuclear Refurbishment Environment will follow a Centre Led single EMS and embody the principles through the use of the Environmental Framework Documents (outlined in Appendices B and C, accordingly). These principles are implemented through the Environmental Interface Process (Appendix D).

## 2.4 Requirements for Environmental Management

It must be demonstrated that an Environmental Management System is able to meet the OPG EMS standard (ISO 14001). With respect to the NR Project, the standard requires that any person performing work or services on a site, which has the potential to cause a significant environmental impact, should be aware of the requirements and importance of the EMS and are competent to perform the job assigned. In addition, any operation or activity that has potential environmental impacts that are significant is to be controlled using documented procedures. Regardless of whom performs the work (e.g., OPG staff, contractors, subcontractors, etc.), compliance is required.

Whether or not OPG is the Constructor of a project or the project is an Owner only project, OPG can be found liable for environmental regulatory infractions. The Project Manager is responsible for ensuring environmental requirement specifications are prepared, approved and followed. This must be done with full knowledge of the degree of environmental risk inherent to the construction or maintenance activities involved in the project (including environmental impact risks, stakeholder risks and legal risks).

The Project Manager's assessment of the *Environmental Aspects* and potential *Environmental Impacts* will be unique to their project. This assessment will be integrated into the Contractor's Environmental Management Program (CEMP). The assessment provides assurance to the workplace parties that the environmental risks unique to the project have been identified and that adequate controls to eliminate or mitigate the risks are in place before work commences.

This Program Management Plan provides the Project Manager with an understanding of the environmental risks of the project and in conjunction with the *Nuclear Projects – Environmental Requirements Guideline* [R-4], which provides expectations and specific requirements for the CEMP.

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>8 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

## 2.5 Risk Management

Environmental risks are proactively identified and managed in order to ensure environmental safety during a project. Once a risk is identified, it is assessed and maintained in the Risk Management Oversight (RMO) Tool as per the *Nuclear Projects Risk Management* [R-11] process. This tool is well aligned with the requirements of the recently revised ISO 14001:2015 standards, which emphasize an alignment between significant environmental aspects and the environmental risks associated with threats and obligations. Appendix A provides a snapshot of the entries in the Risk Management Oversight Tool at the time of this document update.

### 2.5.1 Risk Identification and Analysis

Environmental risks to a project can be identified from a number of sources. Information gathering for input to the risk register is taken from issues arising from Darlington Environmental Review Team meetings, OPEX, Contractor risk identification, as well as other appropriate sources.

The significance of each risk is the product of its impact and probability. These factors are assessed by NR Environment, the appropriate stakeholders for each risk and when needed with help from expert advice.

Environmental risks which have been identified are managed through the RMO tool. Emerging risks are added to the RMO tool, as required. Currently, the largest risks to the ensuring all environmental requirements are met include:

- Frequent turnover of contractor staff challenge the completion of work consistently meeting environmental requirements of the work as described in Environmental Management Plans;
- Oversight of contractors and their subcontractors is inconsistent when compared to OPG expectations particularly with respect to timely notification of events and response; and
- Processes described in OPG EMS are not mature in terms of environmental performance of contract staff.

A snapshot of Environmental risks is included in Appendix A. The identified risks have associated actions in order to manage the risks. Risks that are not unique to NR Environment include OPG and contractor staff retention, qualifications, and engagement.

### 2.5.2 OPEX

The amount of OPEX from major construction projects and the resulting mitigation of their environmental effects are assessed as part of risk identification and work planning processes. Recent and applicable OPG OPEX that are readily transferrable to the Project include:

- D-2009-14668 – HP Event - ECI IWST overfilled with ESW Water causing spill to environment

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>9 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

- N-2015-25855 – Lessons Learned Arising from Darlington Vacuum Building Outage (VBO) Execution Issues
- Niagara Tunnel and Lower Mattagami River Projects – Lesson Learned (file NAW130-00120 TS)
- NR Risk Management and Oversight tool – OPEX Log 00002539 HTO Niagara Tunnel and Lower Matagami River Projects – Environment

In order to benefit from lessons learned, events will be documented in the SCR database. SCRs are reviewed, typically twice per week, with the senior manager to identify adverse trends and areas for improvement.

## 2.6 Environmental Performance Metrics and Targets

A single, consistent set of Environmental Metrics (measures and targets) for Nuclear Refurbishment and Contractors at the Program and Project levels is provided in the *Darlington Refurbishment - Chemistry & Environment Metrics* [R-12].

NR Senior Line Management, NR Project Teams and Contractors will use the metrics to identify unsatisfactory performance against prescribed targets and identify methods to eliminate causes for unsatisfactory safety performance.

Program and Project Environment metrics will be tracked on a prescribed frequency and reported graphically, or otherwise, through the NR Program Monthly Status Report and Project Manager Status Reports.

## 2.7 Environmental Oversight and Monitoring

Environmental oversight and monitoring requirements for Nuclear Projects will be established under direction of the *Project Oversight Standard* [R-13]. Environmental oversight criteria are identified in the *Nuclear Refurbishment – Environmental Requirements Guideline* [R-4]. Environmental oversight focus areas are outlined in the *Guideline for Chemistry & Environment Oversight* [R-14] and will be included in the Project Oversight Plans (POPs).

A Darlington Environmental Review Team (DERT) has been established and will be a key environmental compliance oversight mechanism for the Program Roles & Accountabilities (*DERT – Terms of Reference* [R-15]).

## 2.8 Project Focus Areas

### 2.8.1 Environmental Interface

On a project by project basis, Significant Environmental Aspects are identified during various phases of a project (note: some work, e.g., soil management, although not a project, is benefiting from this approach). NR Environment is involved throughout a project, as illustrated in Appendix D. These general phases include Scoping/Planning, Plan Reviews, Field Oversight, and Monitor/Measure/Report. All of these phases

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>10 of 21</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

support the Requirements [e.g., Environmental Management System, Environmental Policy, requirements from external regulatory agencies (e.g., Ministry of Environment and Climate Change)].

Once the aspects have been identified, the project is required to determine methods of minimizing the impact and managing the aspect. Nuclear Refurbishment Environment provides support to the project to determine a method for managing the aspect based on extensive knowledge and dedication to excellence.

During a project, the *Modification Process* [R-16] is followed. Within the process there are steps must be completed and requirements fulfilled, which initiate review of a project by Nuclear Refurbishment Environment. These include, but are not limited to: Environmental Impact Worksheets, Contractor/Owner Interface Requirements [R-10], Master Engineering Changes, and Design Scoping Checklists.

Plans that are prepared as part of a project may include Work Plans, Comprehensive Work Packages, Commissioning and Test Plans, in addition to the Contractor Environmental Management Plans (CEMP) (this is a requirement of the COIR). If, during the preparation of the CEMP, it is noted that a specific environmental aspect needs further oversight, a more specific plan will be developed and reviewed by Nuclear Refurbishment Environment (e.g., soil management plan, spills prevention and contingency plan, waste management plan, water management plan). If required, Centre Led Environment may provide additional expertise.

## 2.8.2 Tritium Emissions Management (Air and Water)

*Monitoring Of Nuclear And Hazardous Substances In Effluents* [R-4] establishes minimum requirements for the monitoring of nuclear and hazardous substances in airborne and waterborne effluents from OPGN facilities operating under normal and abnormal operating conditions.

The requirement to review and determine the potential to impact or change radioactive emissions is captured throughout a project. These requirements that cause the investigation into radioactive emissions include: *Nuclear Projects - Environmental Requirements Guideline* [R-4], Contractor Environmental Management Plans, and MPER calculations review.

Once an impact or change to radioactive emissions has been determined, performance objectives, targets, and measures are developed and incorporated into Darlington's metrics. These are reviewed by upper management to ensure that the overall emissions profile for OPGN meet the commitment to the community. The contribution to site emissions is included in a monthly report.

A Tritium Emission Mitigation Strategy has been incorporated in the Darlington Refurbishment – Environmental Tactical Plan[R-17].

This strategy will describe elements and processes which will be used to manage tritium emissions. These elements include the following:

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>11 of 21</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

1. Moderator flushing: three system flushes are expected to reduce contaminant concentrations by more than 70 times, reducing the amount of tritium in the water from 12 Ci to 0.3 Ci;
2. Drying skids: newly designed skids for drying the drained primary side systems are being developed to condense and capture tritium from the system and to minimize the amount that is being released as airborne emissions (MEC 118767 for PHT, MEC 118768 for Moderator);
3. Spill carts: new spill carts based on Bruce OPEX (Bruce encountered 3 heavy water spills) are being designed and will be available for any heavy water spills, including larger spills, or to house equipment to contain smaller spills;
4. Fuel End Cap Fittings: plastic end caps will be used to reduce leakage or air ingress into the PHT system over the range of design conditions until retubing activities commence;
5. Vault Vapour Recovery System (VVRS): dryer 5 (DR5) will be bypassed due to increased breathing air load. Aggressive leak control will be required and dryers (i.e., Munter-type dryers) will need to function at a high efficiency and reliability;
6. Temporary Heavy Water Storage Facility: the design requirements of this facility include methods to minimize emissions. MPER calculations determined that any off-gassing of the temporary tanks would not significantly impact the station's tritium emissions minimization plan; and
7. Human Performance: HU tools will be used throughout planning and execution phases, which will include checking execution plans, surveillance, response procedures and proper training.

### 2.8.3 Spill Prevention and Management

*Spill Management* [R-6] provides directions to manage spills to land, air and water at OPGN facilities in accordance with Ontario Regulations. Nuclear Refurbishment follows the *Darlington Spill Prevention and Contingency Plan* [R-7] to monitor and report spills. Spill Management is also discussed in the Darlington Refurbishment – Environmental Tactical Plan [R-17].

The requirement to review and determine the potential impact to the environment due to spills and the likelihood of a spill is determined as part of the Contractor Environmental Spill Plan. This plan is developed by the Contractor with reviews by Nuclear Refurbishment Environment. Once the plan has been accepted by the project, the prevention measures are put in place prior to beginning work and walk downs performed on a predetermined basis to ensure that the work area is in good repair.

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>12 of 21</b>
<small>Title:</small> <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

The DNGS Projects Contract Management Office, DNGS Maintenance Contract Management Office, and Construction Oversight provides a day-to-day liaison with the contractor in the field. If there are any events, the contractor contacts their respective (either Projects or Maintenance) DNGS Contract Administrator, who then contacts Nuclear Refurbishment Environment. Construction Oversight would also contact Nuclear Refurbishment Environment if an event is observed. The event is reviewed and recorded, and, if required, reported. Monthly, the spills are reviewed and input into the Electronic Performance Report. Any trends or anomalies in either the numbers or types of spills are reviewed for further investigation. Opportunities for improvement are sought and implemented where feasible.

#### 2.8.4 Radioactive and Conventional Waste Minimization

*The Darlington Refurbishment Waste Plan, Logistics and Guidelines [R-8]* was developed to integrate waste minimization strategies and plans for waste generation, processing and shipping. Radioactive waste can have negative impacts on the environment, presents a significant legacy issue for future generations, and can be challenging financially and from a human resource perspective. In addition, Low and Intermediate Level Radioactive Waste is a Significant Environmental Aspect in OPG's Environmental Management System.<sup>1</sup>

Waste minimization initiatives are in development and will be implemented to support the Nuclear Refurbishment in order to reduce the potential for Low Level Waste associated with the Project including, de-packaging in the Darlington East Warehouse, a de-packaging area in the powerhouse, and the use re-washable PPE.

The majority of the Nuclear Refurbishment Radioactive Personnel Protective Equipment, supplied by OPG, will be re-washable including plastic suits, gloves, booties and Anti-Cs. All of these washable products will be made available at specially marked laundry silos at the airlocks and at various locations throughout the islanded unit. The use of these re-washable products will minimize the amount of radioactive waste generated. The expectation for these products is that they will be placed in the specially marked laundry bins at the airlocks and rubber areas after use (regardless of their condition), and NOT in the Active Waste Collection Area.

To assist with these processes, job aids will be available, as well as assistance from trained and knowledgeable Field Supervisors, Radiation Protection Coordinators, Nuclear Refurbishment Civil Maintenance, and the Nuclear Refurbishment Waste SPOC.

The Retube and Feeder Replacement (RFR) project is a major contributor to the amount of waste generated during the Project. A Volume Reduction System is an initiative to minimize the amount of waste using the Retube Waste Processing Building (RWPB). This building will reduce and compact Intermediate Level Waste (ILW) produced from the removal of reactor core components. This building will also be used to store contaminated tooling (on an interim basis) after the first unit

<sup>1</sup> N.B. There are Maintenance Milestones in place to develop and implement a process for managing LILRW (Milestones DNRU2B2020 and DNRU2B2023).

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>

Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

refurbishment. This tooling will be reused on subsequent unit refurbishments, diverting potential radioactive waste until the end of the Project.

In addition, a new waste collection process will be implemented for the islanded unit (Breaker Open – Return to Service) to promote a pro-active approach to segregation and waste minimization, by utilizing a central Active Waste Collection Area that contractors and staff will bring their waste to for disposal. The expectation is that personnel segregate waste (incinerable, compactable, non-processible, laundry) at the source and dispose of it at the central location. Solid Active Waste will be processed and shipped through the RWPB, which will not be available until after Unit 2 is defueled and dewatered. As a result, waste will continue to be staged and shipped at the Common Services Area (Unit 0) Waste Handling Facility until the commissioning of the RWPB.

Targets and projections for waste are incorporated in the Darlington Refurbishment – Environmental Tactical Plan [R-17].

### 3.0 ROLES & ACCOUNTABILITIES

For the Nuclear Refurbishment Program, safety is a shared responsibility.

#### 3.1 All OPG and Contractor employees:

- Have accountability for safety. This includes making conservative decisions regarding refurbishment operation and construction activities as they relate to the health and safety of our employees and the environment.
- Are accountable for performing work safely and for identifying, communicating and, where appropriate, correcting workplace hazards in order to protect themselves, their co-workers, other contractors or the environment from harm.

#### 3.2 OPG Nuclear Refurbishment is accountable for:

The role and responsibility of the *Owner/Constructor*:

#### 3.3 All OPG and Contractor line management are accountable for:

- The safety of their employees at OPG workplaces and ensuring their activities do not harm any employees or the environment.
- Ensuring the work environment is designed to protect workers and the environment.
- Ensuring that work is planned and performed to protect workers and the environment.
- Providing employees with the information, training, tools, procedures and support required to do their job safely and without harming other workers or the environment.

Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

### 3.4 Requirements for Environmental Management

OPG expects that all operations are conducted in order to protect the welfare of site staff and the environment. The processes and procedures shall be subject to competent scrutiny through the supply chain. Environmental programs and/or operations that do not meet these expectations, and in particular where there are opportunities that have not been utilized to improve the use of good environmental practice and/or eliminate/reduce significant risks, shall not be deemed acceptable (subject to assessments of reasonable practicability).

Where design is part of the works, the following list of requirements shall be considered:

- All environmental requirements are fully incorporated into the Engineering, Procurement and Construction (EPC) process;
- There is clear allocation of responsibility and authority for environmental management matters;
- There is an effective interface with regulators, including obtaining relevant licences, consents and permits;
- These requirements are clearly communicated through their supply chain, and reflected in the Contractor Environmental Management Program (CEMP);
- Ensure that all personnel are competent and sufficiently resourced to work to the required standards;
- Ensure compliance with site as well as their own requirements by their personnel, subcontractors personnel and visitors;
- There is cooperation with the Project Manager and Environment Advisor;
- There is cooperation and participation in environmental programs for contractors;
- There are mechanisms in place to ensure cooperation and exchange of information on neighbouring/shared risks and logistics;
- Ensure that relevant information on work in the area designated as under their control is provided to OPG to facilitate coordination, so that the activity of any party does not result in undue risk;
- Members of the team have access to appropriate, competent environmental management advice and support; and
- Monitoring and reporting including the completion of the monthly Environment Scorecard and reporting of incidents and accidents.

### 4.0 DEFINITIONS & ACRONYMS

Below is a list of definitions and acronyms

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0004</b>	Revision Number: <b>R002</b>	Page: <b>15 of 21</b>
Title: <b>DARLINGTON REFURBISHMENT - ENVIRONMENTAL PROGRAM MANAGEMENT PLAN</b>		

#### 4.1 Definitions

- **Environment Aspect:** Element of an organization's activities, products or services that can interact with the environment
- **Environmental Impact:** A change in the environment that could have a negative effect on the ecosystem.
- **EMS:** Management of an organization's environmental programs in a comprehensive, systematic, planned and documented manner. It includes the organization structure, planning and resources for developing, implementing and maintaining policy for environmental protection. See Appendix B for a model schematic.
- **Environment Policy:** refers to the commitment of an organization to the laws, regulations and other policy mechanisms concerning environmental issues and sustainability

#### 4.2 Acronyms

- **ALARA** – As low As Reasonable Achievable
- **CEMP** – Contractor Environmental Management Program
- **COIR** – Contractor/Owner Interface Requirements
- **DETR** – Darlington Environmental Review Team
- **EMP** – Environment Management Plan
- **EMS** – Environment Management System
- **EPC** – Engineering, Procurement and Construction
- **ILW** – Intermediate Level Waste
- **LILRW** – Low and Intermediate Level Radioactive Waste
- **NR** – Nuclear Refurbishment
- **POP** – Project Oversight Plans
- **RFR** – Retube and Feeder Replacement
- **RWPB** – Retube Waste Processing Building

Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

## 1.0 PURPOSE

The Darlington Refurbishment Health & Safety Program Management Plan describes how OPG and Contractors will manage the health and safety of all workers associated with the Nuclear Refurbishment Project. It establishes an integrated framework for the management of worker health and safety in accordance with defined health and safety values, goals, objectives and expectations for the Nuclear Refurbishment Project.

## 2.0 PROGRAM REQUIREMENTS

The over-arching Nuclear Refurbishment Health and Safety Program Management Plan provides NR and other business unit support staff with a clear understanding of the H&S management requirements for the entire Nuclear Refurbishment Project including:

- H&S Management Framework and Processes
- Program Plan and Key Deliverables

### 2.1 H&S Management Framework and Processes

#### 2.1.1 H&S Management Framework

To define and articulate the joint commitment and responsibility for health and safety within the project, all parties require a common framework that provides everyone with what effective H&S management looks like before refurbishment work even begins. See Appendix A for a flow chart of the framework of the NR H&S Program.

This framework provides each NR Project with one common core value for safety, one common safety policy, one set of common safety rules, a single set of integrated, specific safety principles, objectives, responsibilities, expectations, performance measures, evaluations and verifications for the management of H&S by OPG and its Contractors.

Nuclear Refurbishment has specified the framework for health and safety in standard contract Safety Exhibit clauses and ES MSA worksheets that include reference to N-GUID-09701-10011 (Safety Management Essentials for DN Refurbishment). This guide is intended to serve as OPG's H&S performance measure for all Contractors providing the basis for the health & safety requirements that the Contractor Safety Program and Project Specific Safety Plans are to demonstrate equivalency to.

This guide applies to OPG EPC/ES MSA Contractors and its requirements will be integrated into their Health & Safety Programs and Project Specific Safety Plans. The EPC/ES MSA Program shall include specific EPC Contractor developed safety plans associated with managing safety risk for every major project phase and associated work tasks. The Contractor Health and Safety Programs (including Project Specific

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0005</b>	Revision Number: <b>R002</b>	Page: <b>5 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

Safety Plans) will be reviewed by NR Health and Safety for compliance with N-GUID-09701-10011 using N-FORM-11623 (Gap Analysis Sheets).

In addition, this guide provides a framework of OPG's expectations for project H&S field oversight and evaluation of the quality of the Contractor's H&S Program, Project Specific Safety Plans and safe work practices. This is an integral part of the Project Oversight Plans for each project. Contractors are also expected to apply the N-GUID-09701-10011 as part of their own H&S oversight program and plans.

Together, the Contract (including N-GUID-09701-10011), the Project Safety Management Plan and the EPC/ES MSA Contractor's Safety Program (including Project Specific Safety Plans) form the basis of the Health and Safety Management framework for the Nuclear Refurbishment Program.

## 2.1.2 Health and Safety Management Processes

The processes within OPG that Health and Safety Management will establish for the Nuclear Refurbishment Program are described in the following sections.

### 2.1.2.1 Contracting Requirements for H&S Management

- Standard Project contract clauses (Safety Exhibit) and supporting documents (addendums) identifying OPG's expectations for H&S management by Contractors. Current H&S policy and program standards will apply to all contractors to ensure the same level of H&S quality is maintained throughout the refurbishment.
- Performance based H&S specification (N-GUID-09701-10011) included as a contract addendum that will identify the H&S management requirements and safety outcomes that must be satisfied by the contractors on the project. For example, the performance-based specification will be the basis document for the contractors' H&S programs, (e.g. regulatory basis and standards to which the project will subscribe (CSA, CAN/ULC, etc.), and will outline training basis, safety performance reporting standards, incident/accident investigation, hazard specific performance specifications, prescribed OPG governance, and Industry OPEX Focus Areas (e.g. Falling Objects).
- Contractors (employers as defined by OH&SA) are pre-qualified using stringent Health and Safety criteria. This pre-qualification will demonstrate the contractor's commitment to safety as well as their senior management's commitment to safety. All Contractors and Subcontractors will be pre-qualified in ISNetworld prior to executing work on NR, unless specific exemption criteria have been met.
- Contractor H&S management system programs are reviewed as part of the bidding process and constructive feedback on areas for improvement is provided.
- Post Bid/Award of Contract includes the requirement for contractors to develop and implement integrated plan(s) to incorporate OPG NR Safety Management Essentials and Project Safety Management Plans into their H&S Program and Project Specific Safety Plans which will be reviewed by NR Health and Safety

Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0005</b>	Revision Number: <b>R002</b>	Page: <b>6 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

### 2.1.2.2 Program & Project/Departmental H&S Risks

Program and Project H&S risk information is input into the Refurbishment Program Risk Register (PROGRAM RADAR) and the Refurbishment Project/Departmental Risk Register (PROJECTRADAR) in the Risk Management and Oversight (RMO) Tool.

### 2.1.2.3 H&S Performance Metrics and Targets

A single, consistent set of H&S Performance Metrics (measures and targets) for Nuclear Refurbishment Contractors at the Program and Project levels have been approved for use. These metrics are established in NK38-REP-09701-10127 (Darlington Refurbishment Program - Health and Safety Metrics) and are included in N-GUID-09701-10011. NR H&S metrics will be tracked on a prescribed frequency and reported graphically, or otherwise, through the Refurbishment Program Monthly Status Report, Project Manager Status Reports and the MSO Oversight Trend Report.

NR Senior Line Management, Project Teams, Safety Group and Contractors will compare the metrics to prescribed targets to determine the safety performance of the project. These metrics, combined with field observations will be used to identify and eliminate causes for unsatisfactory safety performance and to develop corrective actions, oversight strategies and safety communications.

### 2.1.2.4 NR Design Packages and Field Procedures

H&S requirements will be defined in NR design packages and field procedures.

### 2.1.2.5 H&S Training

Health and Safety training for Nuclear Refurbishment Contractors is defined in NK38-PLAN-09701-10007 (Darlington Refurbishment - Project Training Work Plan) and N-TQD-510-00001 (Supplemental BTU, Direct Hire and Contract Management Training and Qualification Description). Contractors are required to complete all training to comply with their respective safety management systems, as well as any additional training needed to complete a give scope of work safely and ensure their staff has completed all regulatory training requirements.

### 2.1.2.6 NR Conventional Safety Support Function and Services

The activities and accountabilities identified in this plan include support for planned H&S activities identified in NR Operations and Maintenance P6 H&S Plan including (but not limited to):

- Support to NR Project Managers e.g. development of H&S expectations for Contractors, H&S clause for contracts, support for development of Project Managers' Safety Management Plans
- Participate in the review and acceptance of Contractor H&S Program, Project Specific Safety Plans as a pre-qualification to execution of work

Title:

**DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT**

- Review Contractor Safe Work Planning documents as required
- Support to NR Function Managers to develop and issue H&S specifications, provide input into H&S training requirements, produce oversight and surveillance criteria and other H&S standards for the DN Refurbishment project
- Support program and project risk management activities
- Produce and implement H&S oversight and surveillance processes, criteria and job aids for NR Projects
- Conduct Oversight, Surveillance and Inspection of contractor H&S practices to ensure compliance to OPG's expectations for NR Projects. Observations are recorded in the Field Inspections Log.
- Participate in incident investigations and reviews by providing subject matter experts to appropriately assign and track the disposition of corrective actions
- Support to implementation and tracking/reporting of H&S Contractor Performance Metrics and Trends for Nuclear Refurbishment Project
- Analyzing safety input data (from observations log, oversight data, O&C data) to determine emerging safety trends and risk areas to implement corrective actions
- Establishing and supporting the roles and duties of the Darlington JHSC, BTU JHSC and WTC for Nuclear Refurbishment
- Host daily NR alignment call with all NR Contractors to communicate and resolve field safety issues
- Support NR Execution organization, Construction Oversight & Project Field Support, Project Managers and NR Regulatory Affairs with regulatory requirements and interfaces (Notice of Project, MoL investigations and visits, CNSC requests).
- Act as the single point of contact for NR Safety related regulator interfaces (NR H&S Program Manager)
- Develop and implement the Refurbishment Industrial Hygiene (IH) Testing and Sampling Program for NR Projects
- Develop and schedule Safety Communications plans and schedule for NR and NR Contractors
- Participate in delivery of NR Constructor Awareness Sessions and development of continuing training for OPG staff
- Hire and train NR Conventional Safety personnel as required to support the NR Readiness, Execution and Return to Service phases of the program

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0005</b>	Revision Number: <b>R002</b>	Page: <b>8 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

- Manage NR Conventional Safety staff personnel performance throughout the duration of the project
- Monitor for regulatory changes, benchmarking information and relevant OPEX

### 2.1.2.7 Contractor Health and Safety Representative

Each contractor will provide a qualified and experienced full time health and safety representative for the NR Project that will act as the single point of contact for the Vendor with respect to health and safety on the NR Project. The H&S representative's responsibilities include:

- Ensuring that the Contractor complies with their H&S Program and all applicable laws and obligations as they relate to the health and safety of their workers
- Training of the Contractor's Personnel and other persons on site
- Maintaining, reviewing and revising the H&S Program and PSSP
- Maintaining and rolling up safety performance metrics and trend data for the Project for all trades

### 2.1.2.8 H&S Oversight and Monitoring

H&S oversight and monitoring requirements for Nuclear Projects will be established under direction of N-STD-AS-0030 Project Oversight Standard. NR H&S oversight activities are described in NK38-PLAN-09701-10269 - Darlington Refurbishment Conventional Safety Oversight Plan and will be included in Project Oversight Plans. H&S Oversight criteria are based on N-GUID-09701-10011 and are included in NK38-LIST-09701-10001 Project Safety Oversight Criteria.

In addition to the NR Conventional Safety department, health and safety oversight will be conducted by Project Management, Construction Oversight and Project Field Support, Operations and Maintenance, Managed Systems Oversight (MSO) and the JHSC.

### 2.1.2.9 H&S Communications

As part of the NR Operations & Maintenance (O&M) H&S P6 Plan, an activity is allocated to implement a joint H&S Communications Plan, where both OPG and Contractors will continually communicate a consistent message to all staff that "Safety is the **CORE** Value of the Darlington Refurbishment Project" ("Safety" includes Nuclear, Conventional, Radiological and Environmental safety).

Issues and trends identified through oversight activities, observation and coaching, and Safety performance metrics will be used to develop communications that will be delivered to NR staff. See Appendix B for Safety Analysis Corrective Action and Feedback flow chart.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0005</b>	Revision Number: <b>R002</b>	Page: <b>9 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

H&S Communications are also shared between OPG and NR Contractors through the daily Project Control Centre (PCC) Meetings and the NR Projects Conventional Safety Alignment Calls.

### 2.1.2.10 Joint Health and Safety Committee

There will not be a NR specific JHSC. Instead, the Darlington Station JHSC will support O&M issues on the islanded units and additional representation is not anticipated to be required. Additional construction regulations training will be sourced and supplied to the Darlington JHSC.

The BTU JHSC will be expanded and will support NR project areas. It will include OPG and BTU co-chairs. This committee will include Contractor Management and BTU voting members.

Additionally, the Worker Trades Committee (WTC) consisting of representatives from all trades on site, with no management representation, will meet a week before the BTU JHSC meetings and will report unresolved issues to BTU JHSC.

The NR H&S department will provide support to all of the JHSC's supporting NR but will not be a member of any of the committees.

### 2.1.2.11 H&S Information Management

Formal H&S Management documentation shall follow OPG-PROG-0001 (Information Management) and N-MAN-00120-10001-RDM (Nuclear Projects Records and Document Management).

### 2.1.3 Health and Safety Management Documents for Program

- Darlington Refurbishment Health and Safety Program Management Plan: NK38-NR-PLAN-09701-10001 Sht: 0005
- Darlington Refurbishment - Safety Management Essentials: N-GUID-09701-10011
- Darlington Refurbishment Program Health and Safety Metrics: NK38-REP-09701-10127
- Conventional Safety - Ownership Transfer Plan: NK38-PLAN-09701-10113 Sht: SFY-01

## 2.2 Program Plan and Key Deliverables

Key dates and deliverables to support the completion of the Program Health and Safety Management Plan are identified in the NR O&M H&S P6 Plan (73018) and include activities that the Program Manager and others will perform to support the plan. The NR O&M H&S P6 Plan is a live plan and is updated on a monthly basis.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0005</b>	Revision Number: <b>R002</b>	Page: <b>10 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

The Nuclear Refurbishment H&S Management System is subject to regular review to ensure compliance with the requirements of NR oversight governance. It is designed to manage, rather than eliminate, the risk of failure to achieve project objectives.

This plan is part of the ongoing process in place to identify, assess, manage, monitor and report health and safety risks.

The Darlington Refurbishment H&S Program Management Plan is a live document, to be maintained by the Program Manager, or delegate. It is to be used as a guideline for reporting to senior management.

### 3.0 ROLES AND ACCOUNTABILITIES

#### 3.1 Director of Corporate Health and Safety

The Director of Corporate Health and Safety is the document owner and is accountable for its definition and implementation.

#### 3.2 Darlington Refurbishment Project Managers

Project Managers are accountable for their project specific Safety Management Plans which will contain the unique requirements for management of H&S risks associated with specific project activities. These plans will provide NR Project Teams and support staff with a clear understanding of the H&S management requirements for the project(s).

#### 3.3 General

All OPG and Contractor employees:

- Have accountability for Health and Safety. This includes making conservative decisions regarding refurbishment operation and construction activities as they relate to the health and safety of our employees and the public.
- Are accountable for performing work safely and for identifying, communicating and, where appropriate, correcting workplace hazards in order to protect themselves, their co-workers and the public from harm.

OPG Nuclear Refurbishment is designated as *Owner/Constructor* and is accountable for the associated roles and responsibilities.

All OPG and Contractor line management are accountable for:

- The health and safety of their employees at OPG workplaces and for ensuring their activities do not harm any employees or the public.
- Ensuring the work environment is designed to protect workers and the public;

Title: <b>DARLINGTON REFURBISHMENT HEALTH AND SAFETY PROGRAM MANAGEMENT</b>		

- Ensuring that work is planned and performed to protect workers and the public;
- Providing employees with the information, training, tools, procedures and support required to do their job safely and without harming other workers or the public.

Overall, for the Nuclear Refurbishment Program, health and safety is a shared responsibility.

## 4.0 DEFINITIONS AND ACRONYMS

### 4.1 Definitions

*Owner/Constructor* – An Owner is a workplace party who owns a workplace or construction project. Owner/Constructor includes an Owner who undertakes all or part of the project by itself or by more than one employer.

Title: <b>DARLINGTON REFURBISHMENT - CHEMISTRY PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The NR, Chemistry Program Management Plan (PgMP) confirms that employees working within the Darlington Refurbishment Program will perform their work while conforming to the existing OPG Management System, specifically *Chemistry Program*, N-PROG-OP-0004.

## 2.0 PROGRAM REQUIREMENTS

The NR Chemistry Program will adhere to the Nuclear Chemistry Program (Chemistry Program, N-PROG-OP-0004) which specifies processes, requirements, and staff accountabilities to ensure effective control of plant chemistry, including provision of analytical services and control of chemicals. Furthermore, it is applicable across the OPGN fleet, including the refurbishment units.

NR Technical documentation will require review by NR Chemistry in order to comply with OPG Chemistry Control Program requirements. These document reviews and potential revisions shall follow N-PROG-AS-0001, Managed Systems, N-PROG-AS-0006, Records and Document Control and any other appropriate governance.

Title: <b>DARLINGTON REFURBISHMENT - CHEMISTRY PROGRAM MANAGEMENT PLAN</b>		

## 2.1 New Governance and supporting documentation specific to the NR Project

The following documents have been prepared or modified to meet the requirements of the NR Chemistry Program.

*Darlington Refurbishment – Chemistry Shutdown and Lay-up Specifications and Rationale*, NK38-SPEC-09701-10032 specifies the shut down and lay-up chemistry specifications, sampling frequencies, and action levels for the refurbishment unit. It is intended to augment specific scenarios / configurations that will occur to support refurbishment activities.

*Darlington Operating Manual Chemistry Control*, NK38-OM-09160 will have refurbishment specific information added to provide decision making criteria to maintain chemistry specifications.<sup>1</sup>

*Nuclear Projects – Chemistry Requirements Guide*, N-GUID-09701-10024 provides an outline of the expectations for NR Project Managers for directing Contractors regarding the Nuclear Chemistry Program. Contractor oversight requirements to meet the objectives of the Project Oversight Plan (POP) are also included in this document.

*Chemistry Ownership Transfer Plan*, NK38-PLAN-09701-10113 Sht: CHE-02 describes the Matrix organization that NR, Chemistry Technical operates within, and how it interfaces with the DNGS Chemistry Laboratory, DNGS Chemistry Technical Department and CWMD.

## 2.2 Goals and Objectives for the NR, Chemistry Technical Department

- Maintain system chemistry during Lay-Up as per OPG NR Specification to ensure the integrity of system components upon RTS by ensuring:
  - Sampling, chemical analysis and data recording are done in a timely manner; and
  - Appropriate Quality Assurance and rigor are applied.
- Prevent a Chemistry Excursion on start-up by ensuring:
  - Cleanliness Specifications are followed during major component maintenance.
- Control the use of consumables and chemical products to ensure;
  - Only approved OPG Chemicals and Chemical Products are used, and
  - Chemical Color Classification requirements are followed to prevent incompatible chemicals from being used on station systems.

<sup>1</sup> Note: this information will be transferred from Refurbishment Chemistry Control, NK38-OM-09701.

Sheet Number: <b>0006</b>	Revision Number: <b>R003</b>	Page: <b>6 of 7</b>
Title: <b>DARLINGTON REFURBISHMENT - CHEMISTRY PROGRAM MANAGEMENT PLAN</b>		

## 2.3 Metrics

The following metrics enable NR Senior Line Management, NR Project Teams and Contractors to identify opportunities for improvement and illustrate successful execution of targets.

- “NR, Chemistry Technical Readiness for Execution Metrics” is used to track the departments’ progress preparing for refurbishment activities. It is updated monthly and is located on the shared drive.
- The “Control of Refurbishment Chemistry Metrics” will be used during the “Execution phase” to track oversight of the NR, Chemistry Program on a system by system basis. It will be updated monthly and is located on the shared drive.
- Additionally NR Chemistry Technical will monitor the WANO CPI for RTS and the hours out of specification will be recorded in EPR.

## 3.0 ROLES & ACCOUNTABILITIES

The Roles and Accountabilities for all NR, Chemistry Program stakeholders are described in detail in the Chemistry Ownership Transfer Plan, NK38-PLAN-09701-10113 CHE-02.

**DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN**

### Revision Summary

Revision Number	Date	Comments
R002	2016-08-30	Licensing Management Plan was refreshed for minor updates including staffing changes, document updates, etc.
R001	2015-03-06	Licensing Management Plan was revised to incorporate the following: (a) To address observations made in Self Assessment RF14-000625. Section 2 was expanded to incorporate additional specific licensing management requirements and the Licensing process framework.  (b) Additional miscellaneous revisions made to the plan to bring it up to date.
R000	2014-01-29	NK38-PLAN-09701-10067 Sheet 0015 R001 has been superseded by moving its content to this document.  An additional section, Section 2.2, Licensing Basis was added and minor non-intent changes with respect to security classification and document number were made.

Title: <b>DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The purpose of this document is to ensure a clear understanding of the regulatory requirements for the Darlington Refurbishment Program with respect to the Nuclear Safety Control Act and Regulations and the management of the regulatory interface with the Canadian Nuclear Safety Commission (CNSC).

## 2.0 PROGRAM REQUIREMENTS

### 2.1 Nuclear Safety Control Act and Regulations

Under the Nuclear Safety Control Act and Regulations, the Darlington Refurbishment Program is subject to the requirements of all applicable laws and regulations, including the requirements established through the Darlington Nuclear Generating Station (NGS) Power Reactor Operating Licence (PROL).

### 2.2 Licensing Basis

The Refurbishment Licensing Support Department (RLSD) was established within Nuclear Regulatory Affairs to support the definition of the licensing basis specific to refurbishment activities and to ensure communication of the licensing basis such that it is sustained throughout refurbishment. For further information on the current licensing basis for the Darlington station, refer to Part II, Section 1.1 *Licensing Basis for the Licensed Activities*, in the Darlington Licence Conditions Handbook (LCH, [R-1]).

### 2.3 CNSC Communications

All communications with the CNSC, specific to refurbishment, are coordinated by RLSD and reviewed to ensure consistency with the licensing basis and N-PROC-RA-0047. RLSD is also responsible for identifying any requested changes to the licensing basis and confirming that the request is supported by information that meets CNSC expectations.

### 2.4 CNSC Regulatory Approvals and Notifications

RLSD is responsible to support refurbishment project teams in identifying CNSC approvals, acceptances/concurrences and notifications required through all phases of the project. Unit specific approvals, acceptances/concurrences and notifications will be targeted for submission to the CNSC no later than 9 months prior to breaker-open to ensure regulatory certainty for refurbishment activities. It is anticipated that any required approvals would be received 3 months prior to breaker-open. These regulatory milestones are tracked in the Darlington Refurbishment Integrated Master Schedule.

Title: <b>DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN</b>		

## 2.5 Licensing Management Plan Process Framework

The Licensing Management Plan process framework, including implementing and interfacing documents, is shown in Figure 1 below.

**Figure 1**  
**Licensing Management Plan Process Framework**

## 2.6 N-PROG-RA-0002, Conduct of Regulatory Affairs

The overall program document governing management of the OPG CNSC interface is N-PROG-RA-0002. This program applies across the OPG Nuclear fleet as well as the Darlington Refurbishment Program. It includes broad guidelines to ensure effective and efficient compliance with regulatory requirements and to ensure open, honest and

**Plan**

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0007</b>	Revision Number: <b>R002</b>	Page: <b>7 of 11</b>
Title: <b>DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN</b>		

timely communications. This program defines a set of processes to ensure these expectations are met.

**2.7 NK38-GUID-09701-10004, Darlington Nuclear Refurbishment – Request for CNSC Approval, Consent, Acceptance or Notification**

The purpose of this guide is to clarify the requirements for the Darlington Refurbishment Program in determining when CNSC approval, consent, acceptance or notification is required. Guidance is also provided to understand the deliverables needed to support such requests.

This guide is applicable to all changes to the licensing basis, including changes to plant design, the processes used by OPG to operate and maintain the plant, and qualifications and complement of personnel necessary to ensure safe operation of the plant.

**2.8 N-PROG-RA-0015, Nuclear Safeguards**

Safeguards equipment installed in the Darlington NGS is subject to the requirements outlined in N-PROG-RA-0015, Nuclear Safeguards, and its implementing standard N-STD-RA-0024, Nuclear Safeguards Implementation.

**2.9 Performance Indicators**

**2.9.1 Metrics**

In addition to Departmental Event Free Resets, Regulatory Affairs Departments use a consistent set of performance indicators as outlined below as per N-PROG-RA-0002. The metrics are for quality of CNSC submissions and commitment management. They are tracked monthly and are used to identify and correct unsatisfactory performance.

Quality of CNSC Submissions:

- (a) Correspondence errors after submission (error requiring a retraction or correction letter).
- (b) Correspondence near miss errors caught prior to submittal (errors caught during final signatory review that could have required a retraction or correction letter).

Commitment Management:

Missed Regulatory Obligations (REGO) and Regulatory Commitments (REGC).

Number of occasions when the REGO, REGC, or Regulatory Management Action (REGM) committed date required a change.

Title: <b>DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN</b>		

### 2.9.2 Metric Development

Additional performance indicators for the Darlington Refurbishment Program are in development and will be in use for refurbishment execution.

## 3.0 ROLES AND ACCOUNTABILITIES

This section briefly and succinctly describes the scope and responsibilities of the Stratum IV and V positions related to the implementation of this document.

### 3.1 Vice President, Nuclear Regulatory Affairs and Stakeholder Relations

The Vice President of Nuclear Regulatory Affairs and Stakeholder Relations performs the following roles and accountabilities specific to the Darlington Refurbishment Program:

- Provides oversight of the regulatory interface, compliance with regulatory requirements and regulatory issue resolution.
- Establishes expectations for all Regulatory Affairs Departments (Pickering, Darlington, Nuclear Waste and Nuclear Refurbishment).
- Coordinates activities for licence amendments and renewals.

### 3.2 Regulatory Affairs Managers

As the *Designated Licensing Authority* (DLA), OPG Regulatory Affairs Managers are responsibilities include:

- Ensure compliance with Nuclear Safety & Control Act and regulatory requirements.
- Identify and report on key regulatory matters to stakeholders.
- Provide advice and support on the management and resolution of regulatory issues.
- Interpret specific regulatory and legislative requirements.
- Ensure regulatory commitments are identified, assigned, and monitored to completion.
- Coordinate OPG appearances at CNSC public meetings and public hearings.
- Manage all verbal and written communications with the CNSC.
- Assess impacts of licence and permit applications and amendments.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0007</b>	Revision Number: <b>R002</b>	Page: <b>9 of 11</b>
Title: <b>DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN</b>		

- Manage the interface with the CNSC.
- Coordinate timely receipt for regulatory approvals, concurrences/acceptance and notifications.

### 3.3 Manager, Nuclear Refurbishment Licencing Support

The Manager, Nuclear Refurbishment Licencing Support is the owner of this document and is accountable for its definition and implementation. In addition to the generic accountabilities identified in Section, 3.2, this position is also accountable to:

- Act as the *Designated Licensing Authority (DLA)* for the CNSC for Refurbishment during Refurbishment planning, preparation, and execution on the first unit.
- For Refurbishment submissions requiring signature of the Site Vice President, Darlington Nuclear, prepare and/or review and route submissions to the Darlington Regulatory Affairs Department (DRAD) for processing.
- Support refurbishment project teams in identifying regulatory approvals and notifications required through all phases of the project, developing strategies to obtain the required approvals and coordinate the application for approvals.
- Coordinate with DRAD as required to ensure no negative regulatory impact on Darlington NGS is introduced through refurbishment licensing activities.
- Support DRAD applications for licence renewals or amendments.
- Ensure the CNSC is informed of project status and needs through routine meetings with the CNSC Project Manager and CNSC Senior Management as well as focused meetings with the CNSC specialist organizations.
- Meet with the CNSC site supervisor, as required, to provide updates on project status.

### 3.4 Manager, Darlington Regulatory Affairs

In addition to the generic accountabilities identified in Section 3.2, the Darlington Regulatory Affairs Manager is also accountable to:

- Act as *DLA* for the CNSC for Darlington NGS and, post first unit return to service, for Darlington Refurbishment.
- Complete and issue all unscheduled reports for non-islanded units and scheduled reports to the CNSC in accordance with REGDOC 3.1.1 [R-2]. The responsibility for unscheduled reports on islanded units has been determined and documented in [R-3].

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0007</b>	Revision Number: <b>R002</b>	Page: <b>10 of 11</b>
Title: <b>DARLINGTON REFURBISHMENT LICENSING MANAGEMENT PLAN</b>		

- Prepare requests for renewal of, and amendments to, the station's operating licence(s).
- Act as the *DLA* for the CNSC for all changes to the LCH except for notifications of changes to nuclear level documents.
- Control revisions to Operating Policies and Principles.

### 3.5 Darlington Refurbishment Function Managers

Function Managers are accountable for understanding and complying with the program requirements as described in Section 2 and providing status updates to CNSC staff, as required.

### 3.6 Darlington Refurbishment Project Managers

Project Managers are accountable for understanding and complying with the program requirements as described in Section 2 and providing status updates to CNSC staff, as required. Project Managers are also responsible for ensuring contractors are aware of these requirements.

### 3.7 Darlington Fuel Handling Manager

The Darlington Fuel Handling Manager ensures the site safeguards program is adhered to and appoints a responsible system engineer as the licensed facility Safeguards Officer. The Safeguards Officer is the single point of contact with the CNSC and the International Atomic Energy Agency on informal communications, and as a minimum, reviews all formal safeguards site communications.

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SHT 0008</b>	Revision Number: <b>R002</b>	Page: <b>4 of 23</b>
Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

### 1.0 PURPOSE

The Engineering Program Management Plan (PgMP) describes how Engineering will manage the engineering of Refurbishment projects. It establishes a framework for the management of engineering by Engineering and Contractors in accordance with expectations established by the Chief Nuclear Engineer and defined goals, objectives and expectations for the Nuclear Refurbishment Program.

This PgMP obtains its authority from D-PCH-09701-10000, Darlington Refurbishment Charter, and aligns with Nuclear, Corporate, and other business unit governance. The Engineering PgMP is part of a framework of process support documentation established in NK38-NR-PLAN-09701-10001 SHT 0001, Darlington Refurbishment Program Structure. The Refurbishment Engineering Functional Management Plan NK38-PLAN-09701-10223, sht 004 supports the PgMP and provides additional detail.

### 2.0 PROGRAM REQUIREMENTS

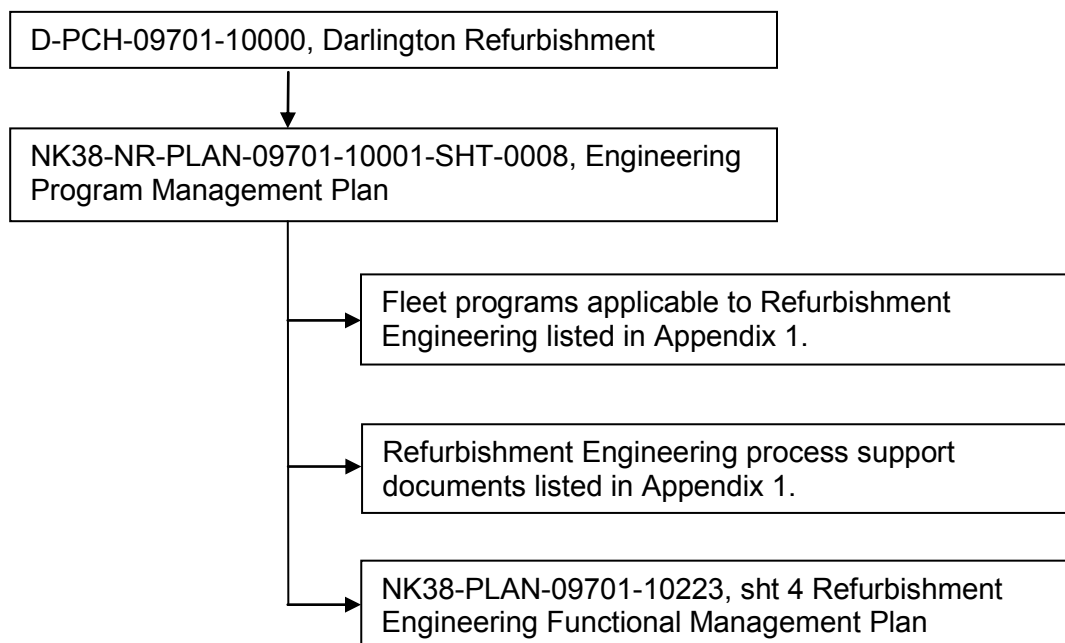

Engineering is governed by requirements established for the OPG Nuclear fleet as defined in the engineering programs specified in Appendix 1. These programs apply to Refurbishment design activities, and to Structures, Systems and Components (SSCs) that have been turned over to Engineering. Engineering also uses process support documents that are specifically created for the Darlington Refurbishment Program (DRP) listed in Appendix 1. NK38-PLAN-09701-10223, sht 004 Refurbishment Engineering Functional Management Plan provides the framework and overall direction for Engineering.

Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

**Figure 1 Hierarchy of Engineering Governing and Process Support Documentation**

## 2.1 Fleet Engineering Programs Applicable to Engineering

The OPG Nuclear fleet engineering programs that are applicable to Engineering are listed in Appendix 1. The fleet requirements apply to Engineering in two ways as noted in the Appendix.

- Engineering design work in collaboration with Engineer, Procure, Construct (EPC) Contractors
- Engineering support work that occurs on SSCs while they are turned over to the Refurbishment organization

Additional requirements and processes that are unique to Engineering are listed in Appendix 1.

Engineering will execute engineering work within the governance structure and expectations set out by the OPG Chief Nuclear Engineer. Engineering governance may be developed to interpret and apply OPG governance in the refurbishment context. EPC contractor governance will be applied to EPC work only after Engineering has confirmed the Contractor governance meets the requirements of OPG governance as per Contract Owner Interface Requirements (COIR) for Nuclear, N-COI-00120-00001).

Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

## **2.2 Performance Measurement and Reporting**

Performance measures are used to assess the extent to which performance is achieving the intended targets. If targets are at risk of not being met, corrective action is taken. As defined in NK38-NR-PLAN-09701-10001 sht 0002, Darlington Refurbishment Planning and Controls Program Management Plan, a set of standard reports are produced for communicating program and project level performance to various stakeholders. A project status report provides a visual tool to quickly identify areas of good and poor performance in each focus area.

Engineering has implemented performance measures and reporting for the areas of engineering completion, performance of engineering, project engineering, event free day reset, engineering contractors' performance, and corrective action performance. Details of these performance measures are discussed in NK38-PLAN-09701-10223, sht 004 Nuclear Refurbishment Engineering Functional Management Plan.

Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

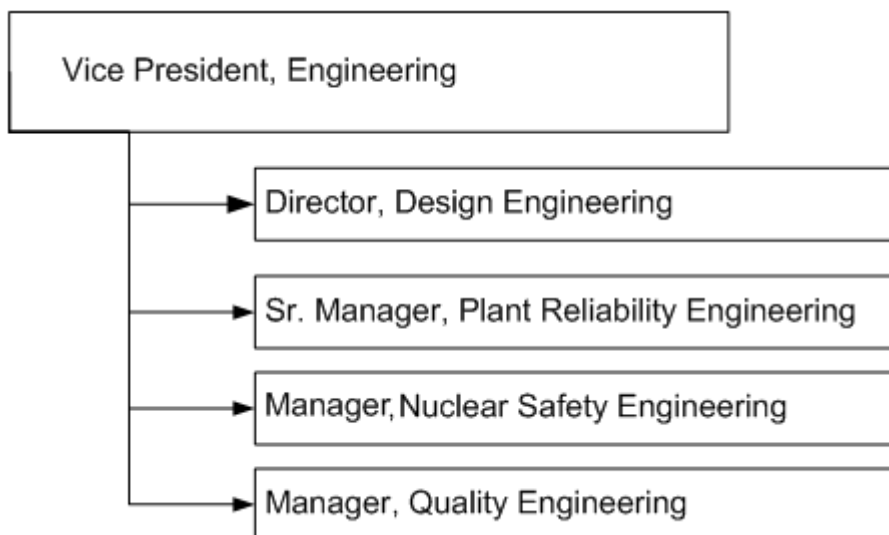

### 3.0 ROLES AND ACCOUNTABILITIES

Engineering executes engineering work within the governance structure and expectations set out by the Chief Nuclear Engineer as per N-STD-MP-0024, Engineering and Design Authority. The Chief Nuclear Engineer delegates Engineering Authority to VP, Engineering and delegates Refurbishment Design Authority to Director, Design Engineering.

#### 3.1 Organization and Responsibilities

Within Engineering, there are two Divisions and two Departments; who together are collectively responsible to deliver engineering products and provide engineering Oversight to support the Project Execution teams.

**Figure 2: Engineering Organization**

**Note:** NK38-GUID-01900-10003, Engineering Interface Requirements, provides additional clarity on individual roles and responsibilities in NR Engineering.

**PLAN**

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SHT 0008</b>	Revision Number: <b>R002</b>	Page: <b>8 of 23</b>
Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

### **3.1.1 Vice President, Engineering**

The Vice President, Engineering is the Engineering Authority for all refurbishment project related activities.

Accountabilities for the Vice President, Engineering are defined in the role document N-MAN-08131-10000 SHT S5-0120, Vice President Engineering. Of note, the VP Engineering acts as Engineering Authority for Engineering as prescribed by N-STD-MP-0024, Engineering and Design Authority.

### **3.1.2 Director, Design Engineering Division**

The Director, Design Engineering is the Design Authority for all refurbishment project related activities.

The Design Engineering Division provides functional and modification support for the overall refurbishment project, including Campus Plan and Safety Improvement Opportunity (SIO) projects. A focused design engineering support is also provided for the RFR project.

#### **3.1.2.1 Design Authority**

Design Engineering provides the design function for Nuclear Refurbishment, including the role of Design Authority.

As defined in N-STD-MP-0024, Engineering and Design Authority, the Chief Nuclear Engineer delegates Refurbishment Design Authority to Director, Design Engineering, who is responsible for design control and design change management. Design Authority also approves all permanent and temporary design changes such that no change renders inaccurate the descriptions and analyses in the safety report or any document listed in the licensing basis. Additionally, Design Authority responsibilities for modifications include authorization of Design Plans and Modification Design Requirements, approval of Modification Outline and Non-Identical Component Replacement packages, acceptance of Design Completion Assurance Verification Review declarations, approval of Design Engineering Change releases as applicable, and approval of Modification Available for Service declarations. Modification Outlines require Design Authority approval of the design, and Director of Operations and Maintenance approval for the installation.

### **3.1.3 Sr. Manager, Plant Reliability Engineering Division**

The Sr. Manager, Plant Reliability Engineering ensures that all system and component activities and programs are implemented in compliance with all applicable codes, standards, license requirements and OPG governance for SSCs to validate operation within the Safe Operating Envelope, Design Basis, and Licensing Basis and to

**PLAN**

<b>Internal Use Only</b>

Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

demonstrate that appropriate margins exist and can be sustained. These programs include the implementation of Life Cycle Plans, Periodic Inspection Programs and In-Service Inspection Programs during the Nuclear Refurbishment Project.

Plant Reliability Engineering accountabilities are as follows:

1. System Engineering and Components & Equipment departments provide functional systems and component engineering support to DRP projects along with matrix engineering resources to the project execution teams as defined in D-INS-09701-10004, Nuclear Refurbishment System Engineering Roles and Responsibilities.
2. System Engineering and Components & Equipment departments provide engineering leads to the DRP projects.
3. Components and Equipment department provides Major Components programmatic requirements support for all major components.
4. The Component and Equipment Engineering department interfaces and ensures alignment among DRP, the central Components Engineering Division and the Darlington Station Components department. The System Engineering department interface and ensures alignment among DRP and Station Performance Engineering.
5. The Return to Service (RTS) Engineering department provides engineering support for modification commissioning, Available for Service (AFS), System Available for Service (SAFS), Construction Completion Declaration (CCD), and the Restart Control Hold Points (RCHP's). This department also interfaces and ensures alignment with DRP Return to Service.

#### **3.1.4 Manager, Nuclear Safety Engineering Department**

The Manager, Nuclear Safety Engineering Department is accountable for:

1. Procurement of services for:
  - a. Nuclear Safety Analysis Department which provides support to the DRP by providing Outage Safety Assessments and Analysis, Deterministic Safety Analysis and Probabilistic Safety Analysis associated with the modifications and operations evolutions. Additionally, Nuclear Safety Analysis provides Reactor Safety support of the modification program and the maintenance and inspection programs for the refurbishment outage.

Title: <b>ENGINEERING PROGRAM MANAGEMENT PLAN</b>		

- b. All nuclear design assists safety analysis, either directly or through verifying and accepting Contractor work.
- c. Refurbishment outage unit system reliability systems testing (SRST) scheduling and review, along with fault tracking and reporting in support of the S-98 Annual Reliability Report.

### **3.1.5 Manager, Quality Engineering Department**

The Manager, Quality Engineering Department is accountable for process improvements to EPC contractor interfaces, overall Engineering Quality improvements, Quality Engineering dashboard, prepare/approve applicable NR Engineering governance, Station Condition Record and Corrective Action Programs, self assessments, benchmarking, operating experience reviews, Quality Surveillance, Human Performance improvement, training coordination support and management/oversight of the Integrated Implementation Plan (IIP). Quality Engineering is the primary interface between Nuclear Engineering Governance and Engineering to ensure that the unique needs of the DRP are being considered in the creation or ongoing revision of engineering process support documents. In addition, Quality Engineering is accountable for the creation of any process support documents required to provide program specific direction for implementation of engineering requirements in the EPC environment of Nuclear Refurbishment.

NK38-PLAN-09701-10218, Darlington Refurbishment Quality Engineering Plan, defines the processes, roles and responsibilities of the Quality Engineering function. This document provides an overview of the scope of the Quality Engineering function and the methods used to implement Quality Engineering processes and programs throughout the refurbishment life cycle.

## **4.0 DEFINITIONS AND ACRONYMS**

### **Definitions**

DRP is the Darlington Refurbishment Program which is being executed by the “Nuclear Refurbishment” organization. Consequently the acronym NRP for Nuclear Refurbishment Program is sometimes also used to refer to the DRP.

### **Acronyms**

DNGS	Darlington Nuclear Generating Station
DRP	Darlington Refurbishment Program
EFDR	Event Free Day Reset
EPC	Engineer, Procure, Construct
FMP	Functional Management Plan
NR	Nuclear Refurbishment
NRP	Nuclear Refurbishment Program
OPG	Ontario Power Generation
PgMP	Program Management Plan
RFR	Retube and Feeder Replacement
SSC	Structure, System, or Component
IIP	Integrated Implementation Plan

### Appendix A: Fleet Governance and Process Support Documents<sup>1</sup> applicable to Nuclear Engineering

The following table lists fleet governance and Engineering process support documentation. Fleet governance is listed upfront followed by process support documentation that is specific to Engineering.

Document Number	Document Title	Applicable to Fleet (including Engineering) or Engineering specific	Applicability to Engineering
N-PROG-MA-0013	Welding	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program establishes controlled processes and standardized welding practices to safely and efficiently make sound welds that meet safety, structural integrity, code, and licensing requirements.
N-PROG-MA-0016	Fuel	Fleet. Applies to SSCs while they are turned over to Refurbishment.	This program establishes a formal and systematic process in OPG Nuclear for integrating and reviewing information related to fuel, and reporting its performance, condition, and compliance with fuel design basis documents.
N-PROG-MA-0017	Components and Equipment Surveillance	Fleet Applies to SSCs while they are turned over to Refurbishment.	This document describes the program elements that establish a focused surveillance monitoring process component and equipment health including inspection, maintenance, certification, and testing. It includes both component health and program management aspects. Important interfaces with other engineering programs that can affect component and equipment health are also identified. Implementation of these program requirements provides a consistent methodology for performing component and equipment surveillance for select components at all OPG sites.
N-PROG-MA-0025	Major Components	Fleet. Applies to SSCs while they are turned over to Refurbishment.	This program establishes a formal and systematic process in OPG Nuclear, for managing information related to four major component areas: Feeders, Steam Generators, Fuel Channels and Reactor Components and Structures. This program provides a framework for integrating and reviewing existing governance and reporting of the component performance, condition, and compliance with design basis documents. This hierarchy of documents, procedures, and other governance ensures the four major components perform safely and reliably over the life of the stations maintaining the design and licensing basis and the operational safety requirements while

<sup>1</sup> Additional documents are generated as the need is identified

			optimizing production and cost-effectiveness.
N-PROG-MA-0026	Equipment Reliability	Fleet Applies to SSCs while they are turned over to Refurbishment.	This program ensures ongoing high levels of reliable performance of components important to nuclear safety, production, and environmental protection. Reliable performance means component failures are infrequent, degraded equipment condition is minimized, and redundancy is maintained on key systems. This is achieved by adopting the Institute of Nuclear Power Operations Equipment Reliability Process Description, AP 913.
N-PROG-MP-0001	Engineering Change Control	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program establishes the processes for plant modification from the engineering change request through installation, commissioning, and closeout. The Engineering Change Control program defines a systematic process and methodology for controlling design modifications to plant SSCs. The Engineering Change Control process systematically controls design changes from inception to design package completion, ensuring that they are designed, installed, commissioned, and placed in service within the Safe Operating Envelope, design bases, and plant licensing conditions.
N-PROC-MP-0005	Configuration Management	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program ensures OPG Nuclear facilities are operated, maintained, and modified in conformance with their design and licensing basis. It applies to: (a) Facility physical configuration, supporting hardware, and software, including: station SSCs, waste management facilities, training simulators, engineered tools, nuclear fuel, and station process computers (b) Policies, programs and procedures which contain information that could impact the design and licensing basis, physical configuration, or any configuration item or information. (c) Staff that support operation and preservation of OPG assets including contract service providers.
N-PROG-MP-0006	Software	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program identifies the processes and overall requirements for an effective software program that supports safe and efficient plant operation. It complies with N286-05, Management System Requirements for Nuclear Power Plants and N286.7-99, Quality Assurance of Analytical, Scientific, and Design Computer Programs for Nuclear Power Plants. This program applies to software classified as a) Real-Time Process Computing, b) Scientific, Engineering and Safety Analysis Software or c) Software Engineering Tools in OPG

			Nuclear. This program identifies processes and overall requirements for classification of software and identifies governing standards for each software classification defining requirements for software development, maintenance, procurement, qualification, use and retirement including security of Real-Time Process Computing critical cyber assets.
N-PROG-MP-0007	Conduct of Engineering	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program, and interfacing engineering programs, standards, and procedures are consistent with the expectations established in: N-CHAR-AS-0002, Nuclear Management System N-POL-0001, Nuclear Safety Policy Codes and standards of record, including those of the Canadian Standards Association Applicable regulatory and statutory requirements, including those of the Canadian Nuclear Safety Commission Guidelines of the Institute of Nuclear Power Operations and the World Association of Nuclear Operators. This program establishes a series of requirements, standards and procedures for performing engineering activities in a consistent manner to ensure plant configuration is maintained in accordance with the design and licensing bases and operated within the Safe Operating Envelope. It establishes the engineering management expectations relative to the engineering safety culture necessary to protect the assets.
N-PROG-MP-0008	Integrated Aging Management	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program establishes requirements for the timely detection and mitigation of significant aging effects in structures, systems and components important to plant safety, reliability and economics. It provides the sound technical basis for the achievement of design life and possible life extension. It defines requirements for Plant condition assessments of Darlington SSCs.
N-PROG-MP-0009	Design Management	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program provides the framework for assurance that design and procedure changes to nuclear stations are introduced in a manner consistent with the plant design and licensing bases. The design management process, initiated under the control of Engineering Change Control, defines requirements for design planning, identifying design inputs, generating requirements for design

			change, translating design inputs into design outputs and verifying design outputs against requirements. This program applies to activities, including design and procedure change activities, required to maintain plant design bases and design outputs within approved safety margins and regulatory requirements.
N-PROG-MP-0011	Procurement Engineering	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	Procurement Engineering shall establish requirements for a managed process of creating procurement specifications for materials, systems, components, and services. The Procurement Engineering function is to specify clear and adequate procurement requirements. The Procurement Engineering activities shall interface with other programs within the procurement chain in order to ensure purchased items perform their intended end-use design function(s).
N-PROG-MP-0014	Reactor Safety Program	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program defines organizational responsibilities and key program elements for the management of issues related to Nuclear Safety Analysis, in particular Generic Action Items, and the following major components of safe operation: Safety Analysis Basis (Safety Report and Analysis of Record) Safe Operating Envelope Severe Accident Management
N-PROG-OP-0004	Chemistry	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	The purpose of this program is to specify processes, requirements, and staff accountabilities to ensure effective control of plant chemistry, including provision of analytical services. This includes: <ul style="list-style-type: none"> <li>• Identification of issues or conditions that may impact on chemistry control performance</li> <li>• Maintenance of specifications for chemistry control</li> <li>• Control of laboratory methods</li> <li>• Sampling and analysis</li> <li>• Data management</li> <li>• Application of actions to maintain or restore chemistry control</li> <li>• Performance monitoring, including data review</li> <li>• Control process chemical quality</li> </ul>
N-PROG-RA-0006	Environmental Qualification	Fleet. Applies to design work and to SSCs while they are turned over	This program establishes an integrated and comprehensive set of requirements that provide assurance that essential equipment can perform as required if exposed to harsh Design Basis Accident conditions and this capability is preserved over the life of plant units.

		to Refurbishment.	The program provides consistent methodology, programmatic controls, and interfaces for establishing and maintaining environmental qualification of equipment and components at OPG Nuclear generating stations.
N-PROG-RA-0016	Risk and Reliability Program	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	The purpose of the program is to provide organizational accountabilities, interfaces, and key program elements to ensure that risks from nuclear accidents are identified, monitored and controlled consistent with OPG Nuclear Safety Policy, Nuclear Management System and best practice in the industry.
N-COI-00120-00001	Contractor, Owner Interface Requirements for Nuclear	Fleet Applies to design work.	The purpose of the COIR is to facilitate the successful implementation of work at OPG Nuclear by ensuring that Engineering, Procurement, and Construction activities are in conformance with OPG and regulatory requirements.
N-STD-AS-0031	Field Engineering	Fleet. Applies to design work and to SSCs while they are turned over to Refurbishment.	This program describes Quality Control and Quality Surveillance processes that ensure services provided by Field Engineering comply with requirements of Canadian Standards Association CSA N286-05, Management System Requirements for Nuclear Power Plants. This program applies to construction and modification work where Field Engineering performs Quality Control and Quality Surveillance activities. This program does not apply to Pressure Boundary activities that must meet the requirements of CSA N285.0, General Requirements for Pressure-Retaining Systems and Components in CANDU Nuclear Power Plants. The Pressure Boundary activities shall be performed in accordance with N-PROG-MP-0004, Pressure Boundary.
D-GUID-01920-10000	Guideline for Engineering Oversight	Engineering specific	This guideline communicates best practices and lessons learned from both internal and external nuclear projects to assist Engineering staff in identifying and specifying adequate engineering oversight activities using a graded approach based on the engineering risks.
D-GUID-09701-10004	Engineering Product Review	Engineering specific	A quarterly review of engineering products will be conducted as a self assessment using a cross functional engineering team as per D-GUID-09701-10004, Engineering Product Quality Review. The results of these self assessments will be reviewed at the Engineering Review Board with corrective actions assigned for adverse events or trends. Modifications are not included, as there is a standing mature process for reporting, trending and correcting of EC metrics.
N-GUID-00700-	Desktop Guide for the	Engineering specific	This guide ensures consistency when preparing Needs Documents

10002	Preparation for a Needs Document		for Darlington Refurbishment as derived from the DSR. The Needs Document should be issued in Asset Suite and referenced in the Engineering Change Request (ECR). This document is not part of the governing hierarchy. It is a guideline published to aid in producing high quality Needs Documents as a supplement to N-PROC-MP-0090. N-PROC-MP- 0090 contains the authority.
N-GUID-01920-10000	Guide for Engineering Oversight	Engineering specific	This guideline communicates best practices and lessons learned from both internal and external nuclear projects to assist OPGN Engineering staff in identifying and specifying adequate engineering oversight activities using a graded approach based on the engineering risks.
N-GUID-09701-10020	Nuclear Refurbishment Commissioning Process	Engineering specific	Describes the commissioning process to be followed for new and/or modified SSCs during the restart program of each Darlington unit following the completion of refurbishment. Commissioning requirements for refurbishment projects are similar to those of a new build, as commissioning of modifications, commissioning of new SSCs and re-start of systems must all be coordinated with a start-up schedule that basically follows the schedule of a new build.
N-GUID-09701-10021	Nuclear Refurbishment Construction Completion Declaration	Engineering specific	This instruction describes the Construction Completion Declaration (CCD) Process and requirements to be followed for SSCs during the refurbishment of each Darlington unit following the completion of construction/installation activities performed on a given system. It provides the basis as to why the process is described as it is, the responsibilities of key personnel involved in the process, the forms to be used to provide proper documentation of construction completion, and the record keeping requirements.
N-QG-403-00001	Nuclear Safety Reactor Safety Engineering Qualifications Guide Description	Engineering specific	This QG is specifically applicable to Nuclear Safety Reactor Safety Engineering staff at OPGN. The information presented in this document includes duty area qualifications and continuing training requirements only.
N-QG-403-00003	Nuclear Procurement Engineering Qualification Description	Engineering specific	This QG is specifically applicable to Nuclear Procurement Engineering staff at OPGN. The information presented in this document includes duty area qualifications and continuing training requirements only.
N-QG-403-00008	Nuclear Plant Design Engineering Qualification Description	Engineering specific	This QG is specifically applicable to Plant Design staff at OPGN. The information presented in this document includes duty area qualifications and continuing training requirements only.

			Refurbishment Program Stakeholders.
NK38-GUID-09701-10028 and associated D-FORM-10947	Darlington Refurbishment – Field Initiated Change Request	Engineering specific	This Guideline describes the process of initiating, processing and managing a Field Initiated Change (FIC) request. This Guideline allows installation to proceed at risk once a hard copy approval of the FIC request (D-FORM-10947) is received. This Guideline applies to a non-intent revision made to an approved or active Design Engineering Change (EC), Project EC, Non-Identical Component Replacement (NICR) EC, or Master NICR EC prior to Available for Service (AFS).
NK38-GUID-09701-10003	Nuclear Refurbishment Operations And Maintenance Procedure Process	Engineering specific	This Guideline is a description of how OPG and the OPG Contractors will interact with each other, dividing up the process of updating technical procedures and who will do what requirements as described in N-PROC-AS-0028.
NK38-GUID-09701-10020	Generic Process For Execution Of Darlington Refurbishment Services Conceptual Studies	Engineering specific	Describes a standard process that can be applied during the development of conceptual studies for provision of services required during the execution of Darlington Refurbishment Project. The output from these conceptual studies will facilitate and support the preparation of a subsequent Engineering Change Requests and Scopes of Work.
NK38-GUID-09701-10021	Guideline For Training Oversight (Refurbishment)	Engineering specific	This Guideline provides assistance to OPG Nuclear Projects Training staff in the selection and application of training oversight activities required to support the Nuclear Refurbishment Project Manager in the preparation of the Project Oversight Plan and to provide recommended practices for the preparation, execution and documentation of training oversight activities.
NK38-GUID-09701-10023	Functional Management Plan Guideline	Engineering specific	The Guideline describes the requirements for structure and content during preparation of comprehensive Management Plans for each Function. The Function Management Plan gets its authority from the Program Management Plan (PgMP). It describes in detail how the Function will execute the requirements outlined in PgMP over the life-cycle of the program.
NK38-GUID-09701-10024	Refurbishment Guideline For Comprehensive Work Packages	Engineering specific	This Guideline recommends the layout and content for the creation of Comprehensive Work Packages (CWP) to be used on the Darlington Refurbishment Project. The intended audience are the OPG Project Managers and their respective Contractors who are tasked with getting the work done safely, meeting quality

Title: <b>DARLINGTON REFURBISHMENT - MAINTENANCE PROGRAM MANAGEMENT PLAN</b>			

## 1.0 PURPOSE

The Nuclear Refurbishment (NR) Project will result in significant physical changes to the Darlington site. It is important that degradation of critical components, such as motor, pumps, valves and monitoring equipment, be avoided while these changes are being made. As well, it is vital that SSC's be maintained from the view of system health and safety as well as preventing foreign material from entering plant systems. These requirements along with the need for timely support form DNGS maintenance are recognized by our stakeholders.

This Maintenance Management Plan provides NR and other business unit support staff with clear understanding of the maintenance management requirements for the entire NR Program. The plan is linked to N-PROG-MA-0004: Conduct of Maintenance which describes the goals of the NR Maintenance Program along with expectations of contractors. The goals of the program are:

- To establish an effective Maintenance Program that ensures safe and reliable operation of plant equipment within the refurbishment unit. This applies to OPG and contractor staff.
- To ensure any deviations from N-PROG-MA-0004 are first presented to the NR Maintenance Manager for review and then to the Director – Center led Functional Area Manager (CFAM) for Approval, before implementation of the changes.

## 2.0 PROGRAM REQUIREMENTS

N-PROG-MA-0004: Conduct of Maintenance, remains the overall program document for the maintenance of operating units across OPG, Nuclear fleet as well as refurbishment units. The hierarchy of the governing documents and the relationship of these documents to the maintenance program objects are shown in Appendix A. This plan does not supersede existing governing documents but has a dotted line relationship.

The Maintenance Program ensures personnel and public safety, protection of the environment, and reliable operation. The program includes work planning, work execution, and tool calibration and control.

The transfer of staff, training, staffing and work program is covered under NK38-NR-PLAN-09701-10113 SHT-MTC 01 Maintenance Ownership transfer plan.

**DARLINGTON REFURBISHMENT - MAINTENANCE PROGRAM MANAGEMENT PLAN**

## 2.1 Maintenance Vision

The Nuclear Refurbishment vision is:

- Safe Production, error free through job planning and event prevention framework.
- A high performance team of maintenance professionals who value:
  - Precise execution of plans.
  - High standards.
  - Self Critical through peer coaching.
  - Collectively learning from industry such that the sum total leads the industry in results. Cooperative effort within OPG and with Vendors

Title:  
**DARLINGTON REFURBISHMENT - MAINTENANCE PROGRAM MANAGEMENT PLAN**

## 2.2 Maintenance Performance Metrics

A single, consistent set of Maintenance Performance Metrics (measures and targets) for Nuclear Refurbishment and Contractors is compiled using existing Darlington performance metrics. The set includes the following items

Safety
Last LTA (SCR & date) per Conventional Safety Report
Last Medically Treated Injury (SCR & date) per Conventional Safety Report
WP Events, Reportable, Mtce Related
WP Events, Low Level, Mtce Related
Maintenance Rad Dose (YTD)
Human Performance and Leadership
Last [Mtce specific] Station EFDR (SCR & date)
Department EFDR (YE Target = 24)
Expired Qualifications (YE Target = 7)
Number of SCR's Generated - YTD
Average days to complete CAP (Station target 35)
Overdue CAPs - YTD
Reliability
Schedule Adherence (Station Target = 85%)
Schedule Completion (Station Target = 95%)
Scope Stability (Station Target = 92%)
Injected / Carry over tasks
Crit 1&2 PM - Completion   Deferrals
PM with feedback
PdM missed/saved failures
CM Backlog WO/Unit (CC+CN)
Station Leaks
Rework (In Process Mtce+Failed PMT+Repeat Mtce)
Value for Money
YTD Budget Variance \$k (Base & Outage OM&A vs. Target)
YTD Overtime Variance \$k (Base OM&A vs. Target)

Maintenance performance metrics will be tracked on a prescribed frequency and reported graphically, or otherwise, through the refurbishment monthly status reports as well as the project manager status reports.

Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0009</b>	Revision Number: <b>R001</b>	Page: <b>8 of 10</b>	

Title:  
**DARLINGTON REFURBISHMENT - MAINTENANCE PROGRAM MANAGEMENT PLAN**

NR Senior Line Management, NR Project Teams and Contractors will use the metrics to identify unsatisfactory performance against prescribed targets and identify corrective actions to eliminate causes

### **3.0 ROLES AND ACCOUNTABILITIES**

#### **3.1 Manager, NR, Maintenance Department**

Maintenance oversight and monitoring requirements for Nuclear Projects will be the responsibility of the Manager, NR, Maintenance Department. Ensure that any deviations to N-PROG-MA-0004 or related procedures have been reviewed and concurred with by SME's before presentation to the Director CFAM for approval.

#### **3.2 Manager, DNGS, Maintenance Department**

The Manager, DNGS Maintenance, will assist in ensuring if required qualified staffs are available to support the overall NR maintenance program.

#### **3.3 Section Manager NR, Maintenance Department**

The Section Manager has the accountability for monitoring and trending performance metrics, along with ensuring for the safety and quality of field maintenance activities.

#### **3.4 Director – CFAM Maintenance, Fleet Maintenance**

Approve deviations from N-PROG-MA-0004 or any related procedures ensuring that a thorough review has been completed to their satisfaction.

#### **3.5 Project Manager, NR**

Project managers are required to notify in writing any deviations to N-PROG-MA-0004 to the Manager, NR, and Maintenance Department and to not proceed with the activity that requires the deviation until written approval has been obtained.

### **4.0 DEFINITIONS AND ACRONYMS**

#### **4.1 Definitions**

**DARLINGTON REFURBISHMENT MANAGEMENT SYSTEMS AND PERFORMANCE  
IMPROVEMENT PROGRAM MANAGEMENT PLAN**

## **1.0 PURPOSE AND SCOPE**

The purpose of this document is to define the requirements and processes used to carry out the Management Systems and Performance Improvement programs functions in Managed Systems Oversight (MSO), a department in Project Assurance and Contract Management (PACM) division, of Nuclear Projects. The Program Assurance related functions of MSO are described in NK38-NR-PLAN-09701-10001 Sht 0011, Darlington Refurbishment Program Assurance Program Management Plan.

## **2.0 PROGRAM REQUIREMENTS**

Figure 1 below shows the implementing documents associated with the MSO Program Management Plan.

# DARLINGTON REFRUBISHMENT MANAGEMENT SYSTEMS AND PERFORMANCE IMPROVEMENT PROGRAM MANAGEMENT PLAN

## Nuclear Refurbishment – Management System Process Support Documents

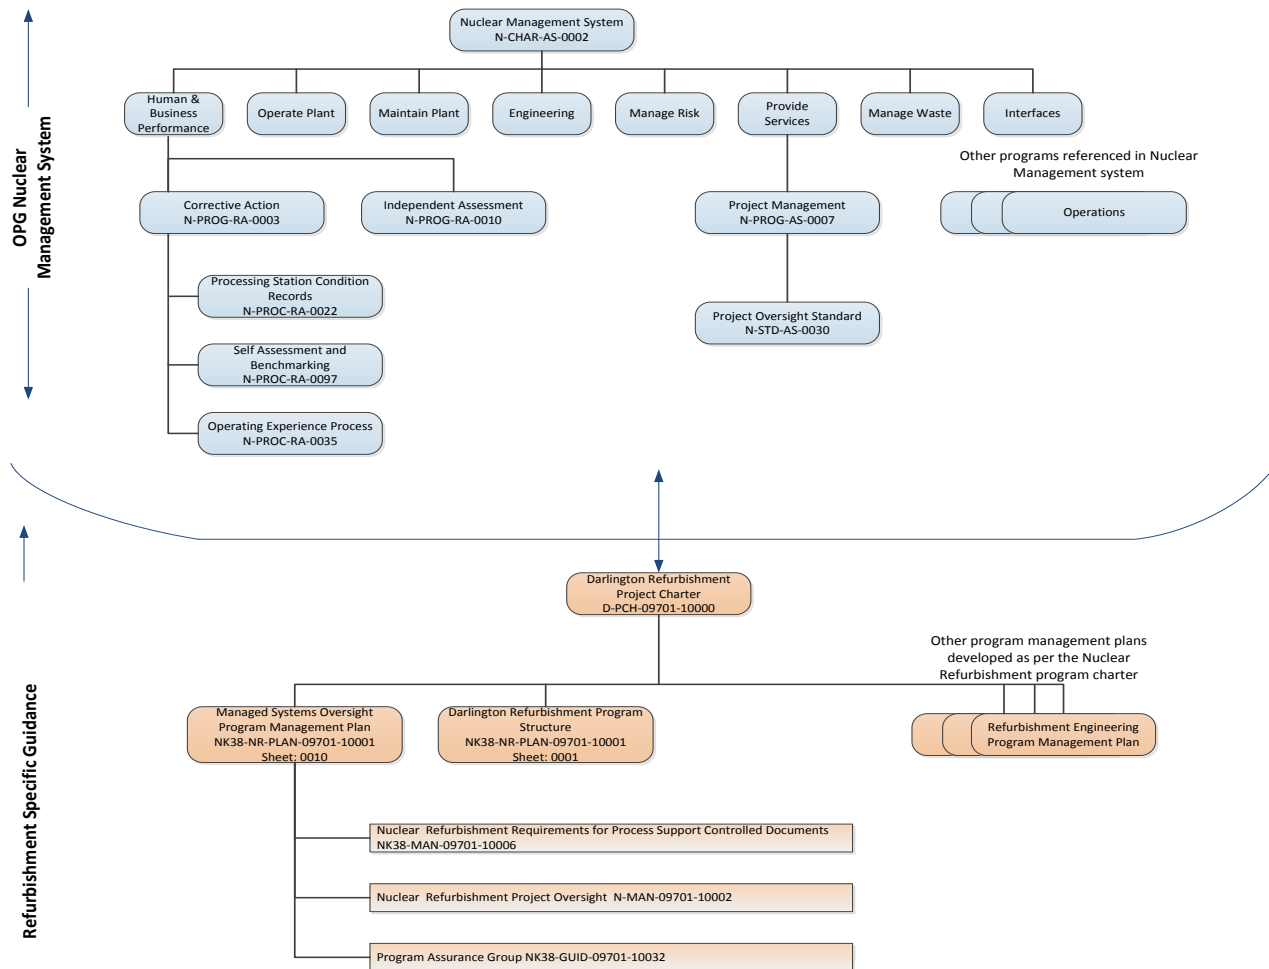

Figure 1 – MSO Program Management Plan Hierarchy

## 2.1 Management Systems

### 2.1.1 Darlington Refurbishment Program Framework

D-PCH-09701-10000, Darlington Refurbishment Project Charter, establishes the high level direction on the scope, objectives, timing, cost, and resources for execution of the project. To fulfill this direction, the Program Management Program (NK38-NR-PLAN-09701-10001 Sheets 0001-0023) was established. The Program Management Plan sheets are intended to convey requirements and processes used within the DR Program to meet the intent of the existing OPG Management System and document approved deviations to existing OPG governance.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0010</b>	Revision Number: <b>003</b>	Page: <b>7 of 11</b>

Title:

### **DARLINGTON REFURBISHMENT MANAGEMENT SYSTEMS AND PERFORMANCE IMPROVEMENT PROGRAM MANAGEMENT PLAN**

The following sections document the requirements and processes used by MSO.

## **2.1.2 Governance of the Darlington Refurbishment Program**

The role of MSO is to provide Oversight of the overall Management System for the DR Project and to ensure alignment in accordance with the DR Project Charter. As per NK38-MAN-09701-10006, Nuclear Refurbishment – Requirements for Process Support Controlled Documents, this includes monitoring the:

- creation, revision, superseding, and obsolescing of new controlled documentation/processes,
- implementation of controlled documentation/processes, and
- effectiveness of controlled documentation/processes.

## **2.2 Program Assurance**

### **2.2.1 Program Assurance**

Program Assurance is conducted following NK38-NR-PLAN-09701-10001 Sht 0011, Darlington Refurbishment Program Assurance Program Management Plan.

## **2.3 Performance Improvement**

### **2.3.1 Corrective Action Program for Darlington Refurbishment**

Per Section 5.11 of the Canadian Standards Association (CSA) N286-05 standard, designs, documents, tools, materials, parts, processes, services, and practices that do not meet requirements shall be identified and recorded as problems. This standard also emphasizes the importance of not only using a Corrective Action Process (CAP) but to assess its effectiveness. Since Engineer Procure Construct (EPC) contractors supporting the DR Program must meet the requirements outlined in CSA N286-05, they too must be held to this standard. OPG and each of its EPC contractors are operating in a partnership. The specific requirements regarding use of contractors' managed systems, including use of contractors' corrective action processes, will be included in the respective contracts, where relevant. For work performed by vendors under their own managed systems, there is a need to specify the framework regarding adverse conditions that would trigger the use of OPG's CAP versus leveraging the EPC contractors' CAP. For example, if one of OPG's processes were to fail, the onus is on OPG to use its CAP to resolve the issue. If an EPC contractor's process were to fail, the EPC contractor's CAP is used to resolve the issue.

#### **2.3.1.1 Use of OPG's CAP Program**

Within the DR Program, N-PROC-RA-0022, Processing Station Condition Records, will be used by OPG staff to document day-to-day adverse conditions for their own work and for all breakthrough quality issues. The CAP will be used to resolve the noted adverse conditions and breakthrough quality issues. The corrective actions may be used to modify a specific project's POP or, if common to all projects, all POPs.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0010</b>	Revision Number: <b>003</b>	Page: <b>8 of 11</b>	

Title:

### **DARLINGTON REFURBISHMENT MANAGEMENT SYSTEMS AND PERFORMANCE IMPROVEMENT PROGRAM MANAGEMENT PLAN**

OPG's and contractors' corrective action processes will interface only for specific types of adverse conditions. Using OPG CAP for contractor events will proactively manage NR project risk by verifying that significant adverse trends are being identified and effectively addressed, actions taken to preclude recurrence, and appropriate levels project management teams are notified.

For circumstances where the contractors' adverse conditions are reported within OPG's CAP (specifically Significance Level 1 and 2 issues), Station Condition Records (SCRs) will be processed according to N-PROC-RA-0022, "Processing Station Condition Records" and use the SCR database to document adverse conditions. OPG may request the contractor representatives attend the Corrective Action Review Board (CARB) to present the corrective actions and/or effectiveness reviews (Reference N-GUID-00120-10012, Use of OPG Corrective Action Program for Contractor Issues.)

For contractors' adverse conditions, the following are examples that will lead to the use of OPG's CAP:

- an adverse condition that significantly impacts the ability to safely operate and/or maintain the plant, or represents an actual conventional or radiation safety, operability, or environmental concern, or that represents a condition reportable under the Power Reactor Operating Licence (PROL), or under other regulatory requirements (e.g. OSHA, CNSC REGDOC-3.1.1 (formerly S-99), Ministry of Environment),
- damage to equipment or systems outside of contractor's Scope Of Work (SOW),
- a significant adverse trend or reoccurrence observed by OPG through oversight activities – the threshold of reporting will depend on the consequences of the adverse events that may arise or the consequences of the reoccurrence on relevant business drivers (e.g. quality, safety, cost, and schedule).

The category and significance level of an SCR will be based on assessed risks and consequences of the adverse conditions and/or reoccurrence. The corrective actions may be tracked through other established processes and protocols (e.g. project management processes, contract management processes, oversight processes etc.), outside of the SCR process.

### **2.3.1.2 Use of Contractor's CAP Program**

The contractors use their own management systems and corrective action programs in order to comply with CSA N286 regulatory standards include the need to demonstrate that "Experience is sought, shared and used" and "Problems are identified and resolved".

OPG Supply Chain Quality Services (SCQS) conducts contractor prequalification assessments and Approved Supplier List (ASL) audits to verify that all contractors' management systems meet the requirements of CSA N286. Non-conformance and Corrective Action Requests (NCAR) are generated to the vendor for response and resolution of deficiencies or issues as needed and project teams will monitor vendor responses and closeout of actions.

Title:

### **DARLINGTON REFURBISHMENT MANAGEMENT SYSTEMS AND PERFORMANCE IMPROVEMENT PROGRAM MANAGEMENT PLAN**

#### **2.3.2 OPEX and Lessons Learned**

DR OPEX is managed in accordance with OPG Nuclear N-PROC-RA-0035, Operating Experience Process. This identifies, evaluates, and takes action based on internal and external industry lessons learned in order to improve project and plant safety, reliability and performance.

N-MAN-00120-10001-RISK-06, Nuclear Refurbishment Processing Operating Experience, and Key Lessons Learned, provides guidance on the process to integrate relevant Project and Contract Management OPEX and Key Lessons Learned into the planning and execution phases of the DR program.

#### **2.3.3 Self-Assessments for the Darlington Refurbishment Program**

On an annual basis, the DR business unit will develop and publish a Divisional Level Self-Assessment and Benchmarking schedule. It is the accountability of MSO to develop and publish the Self-Assessment schedule in accordance to N-PROC-RA-0097, Self Assessment and Benchmarking.

MSO participates on Divisional Level Self-assessments, as required, and monitors Department Level Self-assessments.

#### **2.3.4 Trending**

Trending shall be conducted using OPGN governance.

#### **2.3.5 Oversight of Risk Management and Oversight Tool Actions**

PI will monitor the issues log on a quarterly basis for compliance and Coach individuals that are not compliant with the definition of issues in the guide.

PI will continue to monitor and trend RMO issues log on a quarterly basis and to determine if a cognitive trend is discovered. Statistical trending conducted by P and C in their standard report may also be used. Cognitive trending will be recorded by the PI. Results of trending to be included in the quarterly PI report.

PI will hold monthly DR leadership review meetings of External Oversight and Nuclear Oversight Audit actions

### **2.4 Performance Indicators**

Metrics are used to monitor the performance of key components in Nuclear Refurbishment. Metrics for the Corrective Action Program are monitored and reported through CARB. Additional metrics for governance and to support the DR managed systems are being established.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>

# **DARLINGTON REFURBISHMENT MANAGEMENT SYSTEMS AND PERFORMANCE IMPROVEMENT PROGRAM MANAGEMENT PLAN**

## **3.0 ROLES AND ACCOUNTABILITIES**

### **3.1 Vice President Project Assurance and Contract Management**

Reports directly to the Senior Vice President, Nuclear Projects and is accountable for the management of PACM. This includes oversight of the DR Program by the MSO Department.

### **3.2 Director, Management Systems Oversight**

Responsible to the Vice President, PACM, for Program Assurance within the DR Project, and ensures that the management system and performance Improvement functions are in place and working effectively.

#### **3.2.1 Manager, PI**

Responsible to the Director, MSO, for:

- Managing the Corrective Action Program (N-PROG-RA-0003) in the DR Program
- Coordinating the development of the DR Division-level Self-assessment Plan and participates in all Division-level Self-assessments
- Conducting and assisting with Root Cause Evaluations for Nuclear Refurbishment
- Facilitating internal and external audits and communicates internal audit results to the Darlington Refurbishment CARB
- Managing the OPEX and Lessons Learned processes in the DR program
- Facilitating and coordinating external oversight (RCRB).

#### **3.2.2 Manager, PA**

Responsible to the Director, MSO, for:

- establishing the framework for the DR Program as per charter D-PCH-09701-10000 and monitors and maintains the framework.

### Revision Summary

Revision Number	Date	Comments
R002	2016-02-15	General update to reflect latest organizational structure and processes.
R001	2015-09-01	Program Assurance Group (PAG) model updated to match PAG framework. Added definition for Oversight from INPO 09-002. Added reference to Refurbishment Construction Review Board (RCRB). Added process support document framework in Appendix B.
R000	2014-01-31	This document supersedes NK38-PLAN-09701-10067 Sheet 0011. The changes between NK38-PLAN-09701-10067 Sheet 0011 and this document are as follows: <ul style="list-style-type: none"> <li>The document number has been changed to meet the requirements of NK38-NR-MAN-09701-10001,</li> <li>The security classification has been removed so that the document can be submitted to the CNSC, and</li> <li>References have been updated.</li> </ul>

# DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN

## 1.0 PURPOSE AND SCOPE

The purpose of this document is to explain how assurance is achieved in the Darlington Refurbishment Program (DRP). Assurance for the purpose of this document is defined as a set of tools, organizations, and processes that have been implemented to ensure that all DR business objectives are achieved.

The scope of this document is for the DRP only. This program management plan takes its authority from the D-PCH-09701-10000, Darlington Refurbishment Project Charter.

The flow of information and the organizational hierarchy of oversight and assurance providers are captured in Figure 1 below. The details of the role of each of the oversight and assurance providers are available in Appendix A.

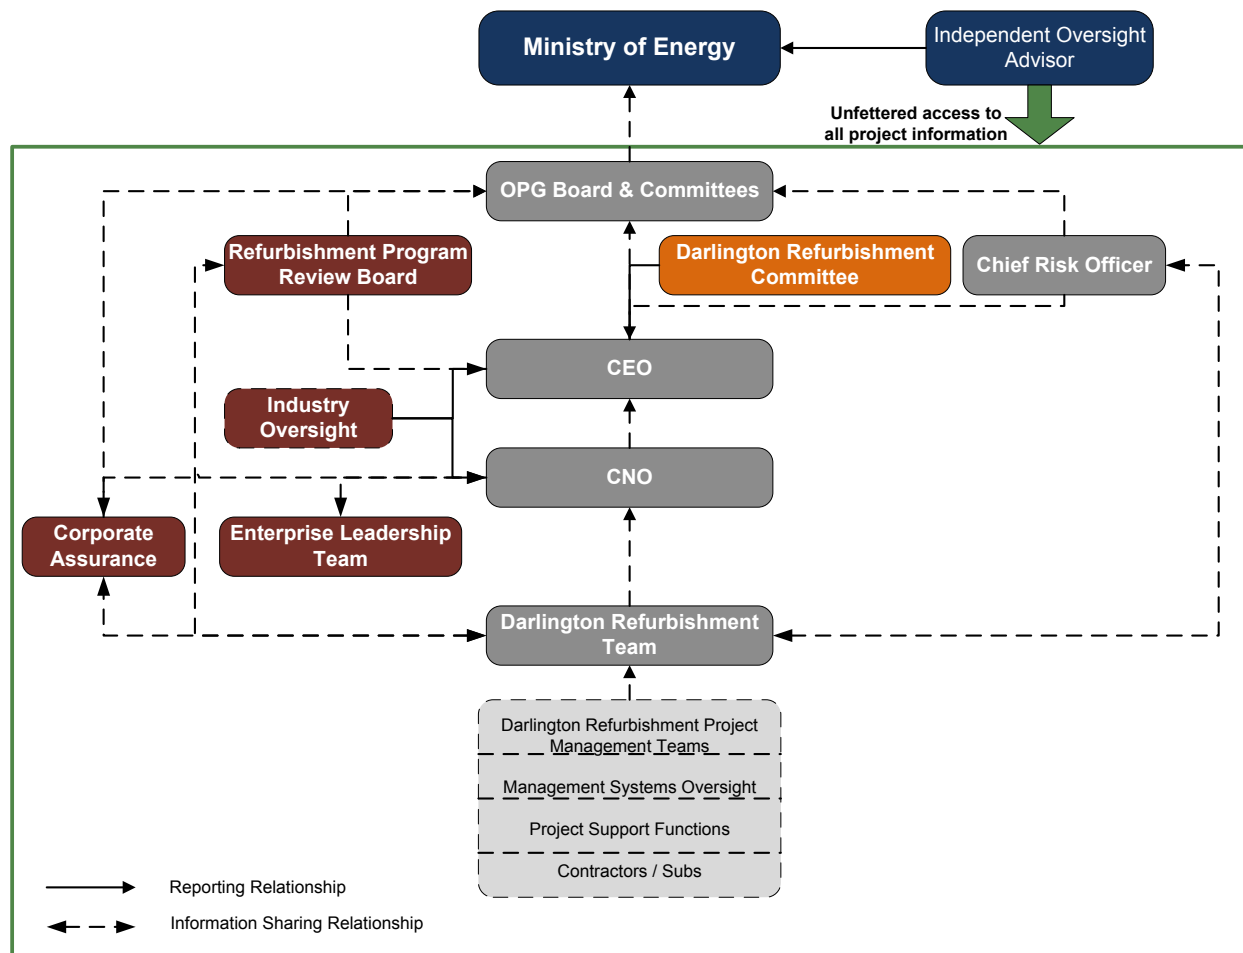

Figure 1 – Hierarchy of Oversight and Assurance Providers

## Plan

Sheet Number: <b>0011</b>	Revision Number: <b>R00</b>	Page: <b>6 of 19</b>

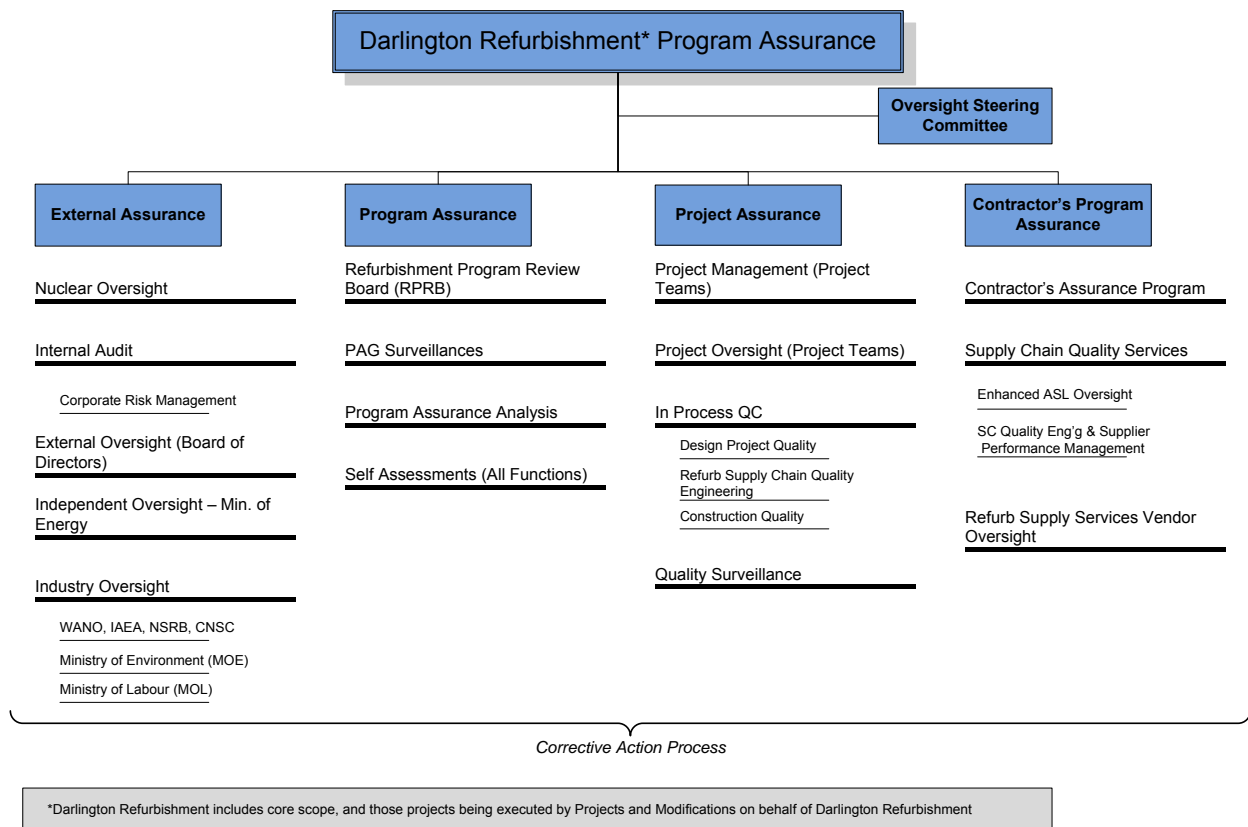

Title:

# DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN

## 2.0 PROGRAM REQUIREMENTS

As per Institute of Nuclear Power Operations (INPO) 11-007 Principles for Strong Governance and Oversight of Nuclear Power Organizations, Oversight is defined as “...the verification that the standards, expectations, and goals established through governance of the organization are met...; [all employees] identify performance gaps for corrective action, monitor the effectiveness of corrective actions, and escalate issues to higher levels of line management when necessary. Oversight—through its fundamental elements of audit, evaluation, monitoring, inspection, and investigation—enhances organizational effectiveness, productivity, and integrity.”

Darlington Refurbishment Program Assurance is comprised of four main separate elements: External Assurance, Program Assurance, Project Assurance, and Contractor’s Program Assurance, see Figure 2. Each element plays an important role in providing assurance to the stakeholders that the project is being executed safely, to the required quality, on time, and on budget.

**Figure 2 – Darlington Refurbishment Program Assurance Model**

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0011</b>	Revision Number: <b>R00</b>	Page: <b>7 of 19</b>	

Title:

# **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

The Darlington Refurbishment Program Assurance Model, by design, incorporates multiple layers of oversight to support building and maintaining internal and external confidence. The intent of the Program Assurance Model for the DRP is to ensure the refurbishment program (1) meets all safety, quality, cost, and schedule expectations; (2) that any issues will be identified and resolved expeditiously; and (3) that transparent and accurate information flows up to the Board in a way that supports Board oversight effectiveness and decision making. The following sections explain key requirements the DRP which focus to establish consistency in oversight across the program.

## **2.1 External Assurance**

### **2.1.1 Nuclear Oversight (NO)**

NO's audit mandate includes audit of the Darlington Refurbishment Project. The role of this group is to audit the OPG Management System to ensure that it meets the requirements of N286 and N-CHAR-AS-0002, Nuclear Management System. The audit results are shared with the OPG Darlington Refurbishment Management Team and when required, the results are escalated to the Senior Management Team.

### **2.1.2 Internal Audit (IA)**

IA's audit mandate is to ensure that the risks for the company are being adequately managed through proper planning, cost control and schedule adherence. This group audits Enterprise Risk Management processes in accordance with the Strategic Audit Plan approved by the Board. This audit plan includes risk-based audits aligned with the top strategic and enterprise risks per the assurance section in OPG-PROG-0004, Enterprise Risk Management. In addition periodic audits of business processes are also performed.

### **2.1.3 External Oversight**

The Board of Directors (BOD) has a layer of assurance comprised of External Assessors reporting directly to them. The role of the External Assessors is to conduct oversight of the Darlington Refurbishment Management Team to ensure that the Project's leadership reflects a competent team capable of managing a mega project to achieve the Program's objectives. Their focus is also to ensure that the project's processes and compliance reflects the Industry best Project Management practices.

### **2.1.4 Independent Oversight**

A MOE appointed person has been embedded in the DRC sub-committee of the BOD. This person reports out to the MOE on Darlington Refurbishment results.

### **2.1.5 Industry Oversight**

Industry regulatory and oversight bodies, including Canadian Nuclear Safety Commission (CNSC) and World Association of Nuclear Operators (WANO) perform

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0011</b>	Revision Number: <b>R00</b>	Page: <b>8 of 19</b>	

Title:

## **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

routine audits, assessments, and inspections of the Darlington Nuclear Generating Station (DNGS) performance. As the DR Project progresses, these reviews will include insights into the project's compliance with our Power Reactor Operating License (PROL) and WANO best practices. The Ministry of Environment and Climate Change and the Ministry of Labour will also provide oversight during the Darlington Refurbishment Project as required.

## **2.2 Program Assurance**

### **2.2.1 Refurbishment Program Review Board**

The Refurbishment Program Review Board (RPRB) advises OPG on overall project management, as well as management of specific projects within the DRP. The RPRB makes impartial assessments to help ensure that the project teams' actions are meeting expectations, and that commitments and industry-proven project management practices are in place in all areas of safety, human performance, cost, schedule, and quality.

The RPRB is comprised of external members who have expertise in nuclear plant operations, regulatory matters, and construction mega-projects. It conducts quarterly site visits and reports on the results of its assessments to management, including recommendations on actions for improving performance. The Chair of the RPRB presents a summary of findings to the DRC annually.

### **2.2.2 Program Assurance Group**

Program Assurance Group (PAG) leads horizontal surveillances (across the projects) with support from Refurbishment Functions. This programmatic oversight is based on risks and themes emerging from project oversight data, program and project risks, and OPEX. These surveillances are evaluated against INPO 09-007 Principles for Excellence in Nuclear Project Construction.

The goal of PAG surveillances is to create sustainable value for the organization. Surveillances are focused on identifying emerging problems and opportunities in time to do something about them, including: process improvement, lessons learned and providing coaching and assistance to the project team and Contractors as part of an effective risk management culture.<sup>1</sup>

The PAG baseline schedule is developed on a yearly basis. The schedule outlines surveillance topics by quarter. The topics are selected based on refurbishment program and project risks and vulnerabilities associated with the work in the coming year. In order to ensure a balanced and representative sampling, a cross project/functional approach is used to identify the surveillance topics. The finalized PAG schedule is approved by the Director of Management Systems Oversight (MSO). Progress and results of the surveillances are reported at the monthly Oversight Steering Committee (OSC).

<sup>1</sup> Derived from [www.mosaicprojects.com.au](http://www.mosaicprojects.com.au) White Paper "Proactive Project Surveillance".

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0011</b>	Revision Number: <b>R00</b>	Page: <b>9 of 19</b>	

Title:

### **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

The schedule is reviewed on a quarterly basis to ensure selected surveillance topics are still in alignment with project risks. Changes to the schedule are approved by the Director MSO.

PAG surveillance results are recorded in the Risk Management and Oversight database (RMO) for tracking of scope, objectives, assigned team members, timing, and for documenting any findings and corrective actions required. Further guidance on the PAG is documented in NK38-GUID-09701-10032, Program Assurance Group Guide .

PAG facilitates coordination of external audits and surveillances to minimize disruption of ongoing project work. A PAG plan is developed to document all planned, non-routine project oversight to ensure any overlap or potential interferences are determined early on for review and disposition.

#### **2.2.3 Program Assurance Analysis**

Performance monitoring and reporting are key components of the assurance model and process controls. Regular performance reviews and status meetings are held to ensure processes are implemented as designed, results are achieved as anticipated, and corrective actions are identified where results are not meeting expectations. Various performance reports are provided to all levels of the organization and the stakeholders to assist them in executing their oversight roles. Program Management Plans for each function provide more detail on specific metrics being tracked.

DRP Assurance metrics are designed to evaluate the execution and effectiveness of the planned oversight. RMO database is the primary source of data for Program Assurance metrics. Surveillance execution per planned schedule, surveillance quality, corrective action completion and corrective action effectiveness are some examples of planned metrics to be tracked for improvement.

Reporting of trends from all Darlington Refurbishment oversight is captured in a Monthly Report issued by MSO.

#### **2.2.4 Self-Assessment**

Self-assessments are an element of the DRP Assurance. Self-assessments place an increased emphasis on individual accountability and robust management systems. Self-assessments and benchmarking evaluations provide a structured method to compare performance with management expectations, industry standards of excellence, and regulatory requirements to identify areas needing improvement. Self-assessments are conducted in accordance with N-PROC-RA-0097, Self-Assessment and Benchmarking.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>

Title:

## **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

### **2.3 Project Assurance**

OPG Project staff interface directly with their contractors and subcontractors, and are most familiar with the risks faced by the project. Project Assurance makes use of this knowledge to provide assurance.

#### **2.3.1 Project Management**

Each Project has matrixed resources who are equipped with the expertise to provide clarity around the contracted requirements, and who are able to judge the competency of the Contractor's resources. Project Management is the day to day interactions of the project and removal barriers when required to progress work. The focus of this layer is to keep the projects moving while ensuring that they meet the quality requirements within contract cost & timing.

#### **2.3.2 Project Oversight**

The intent of Project Oversight is the examination of the Contractor's readiness to perform the work based on risk. Project Oversight is proactive in nature and is referred to as the vertical oversight assessing the specific requirements stipulated in the contract. This oversight is performed by the Projects with assistance from the functions when required.

Project Oversight Plans (POP) are developed in accordance with N-STD-AS-0030, Project Oversight Standard. The POP outlines the strategy for oversight activities. Guidance for POPs is provided in N-MAN-09701-10002, Nuclear Projects Oversight Guide. The oversight results, performance metrics, Station Condition Records (SCR), and trends may be reviewed to determine if there is an unidentified risk or opportunity surfacing across the projects. This may result in changes to the POPs.

Project oversight activities and findings are recorded in the RMO database. The monthly OSC meeting is one forum used by the projects to share oversight results.

#### **2.3.3 In Process Quality Control**

One of the assurance elements is the In Process Quality Control (QC) for Engineering, Procurement and Construction. OPG has stipulated in the Contractor Owner Interface Requirements (COIR) a number of quality hold points to confirm that the products meet all requirements before advancing to the next stage. The hold points are based on OPEX along with Lessons Learned from working with contractors over the years.

#### **2.3.4 Quality Surveillance (QS)**

The last layer of Project Assurance is Quality Surveillance (QS). Project personnel conduct surveillances on the Contractor's QC activities to verify the integrity of the Contractor's QC process. This is an important process to verify that the Contractor's resources are adhering to their own QC processes and are identifying areas which have failed within their corrective action program.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>

Title:

# **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

## **2.4 Contractor's Program Assurance**

### **2.4.1 Contractor's Assurance Program**

Each of the contracts requires that the prime contractors and their sub-contractors have a Quality Program which complies with Canadian Standards Association (CSA) N286, Management System Requirements for Nuclear Power Plants. It is a contractual requirement that the Contractor's Quality Organization will provide sufficient oversight to confirm that their management system is rigorously followed and that all deficiencies are documented in their corrective action system. It is further expected that the Contractor Quality organization is independent of production pressures.

This layer of assurance reviews all Contractors' and Subcontractors' Management Systems to ensure they meet the requirements of CSA N286. The audits look for programmatic issues that could negatively impact the success of the overall project.

### **2.4.2 Supply Chain Quality Services**

#### **2.4.2.1 Approved Supplier List Audits**

Nuclear Supply Chain (NSC) is accountable for the Approved Supplier List (ASL) for OPG. Supplier qualification is established by a graded approach for each type and scope of item or service based on Codes, Standards, and OPGN Design and Quality requirements. Supply Chain shall not be permitted to place a purchase order with any supplier requiring a Quality Program until an acceptable qualification status has been established by Supply Chain Quality Services (SCQS). Requirements of N-PROC-MM-0010, Establishing and Maintaining OPG ASL apply to both Safety Related and Augmented Quality items and services suppliers.

#### **2.4.2.2 Quality Engineering & Supplier Performance Management**

Supply Chain is accountable for measuring and managing supplier's quality performance, investigation and management of supplier corrective actions related to SCR and Operating Experience (OPEX), reduction of initial receipt inspection material quarantine, management of supplier reported non-conformances and development of suppliers. This includes maintaining ASL Critical Supplier List, Quality Key Performance Indicators, ASL Critical Supplier Quality Health Index, and supplier quality escalation process per N-PROC-MM-0041, Quality Engineering and Supplier Performance Management.

### **2.4.3 Refurbishment Supply Services Vendor Oversight**

The Refurbishment Supply Services Vendor Oversight supports the project teams with oversight of all procurement related quality activities. These oversights provide key inputs to NSC ASL Audit Group and Quality Engineering and Supplier Performance.

# DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN

## 2.5 Oversight Steering Committee

The OSC provides a monthly cross-project and cross-functional forum to review various aspects of DR oversight. Topics discussed include project-specific, phase-specific, and Contractor-specific OPEX and lessons learned.

## 2.6 Corrective Action Program

DRP follows N-PROG-RA-0003, Corrective Action Program (CAP). OPG and each of its Engineer Procure Construct (EPC) contractors have requirements to address adverse conditions that trigger the use of OPG's, and/or EPC contractors' CAP Programs, see NK38-NR-PLAN-09701-10001 Sheet 0010, Nuclear Projects Oversight Program Management Plan and N-GUID-00120-10012, Use of OPG Corrective Action Program for Contractor Issues for further details.

## 3.0 ROLES AND ACCOUNTABILITIES

Refer to Appendix A for details.

## 4.0 DEFINITIONS & ACRONYMS

### 4.1 Definitions

**Oversight:** Oversight is the accountability to critically monitor, assess, and evaluate the conduct of the project managers and their organizations. This includes the review of action plans that address gaps between current performance and governance standards, as well as the independent analysis of trends, data, and performance information that provides assurance that functional outcomes are achieved and policy boundaries are being respected.<sup>2</sup>

**DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

## **Appendix A: Organizational Accountabilities**

### **A.1.0 DARLINGTON REFURBISHMENT TEAM**

The DR organization is comprised of Project and Function organizations. The organization design is based on a *Strong Matrix* principle where function staff will be assigned to support the project teams in achieving the project deliverables. The DRP uses EPC contractors to perform the majority of the work. This work is overseen by the project teams. Project Management is in accordance with N-PROG-AS-0007, Project Management and N-STD-AS-0028, Project Management Standard.

#### **A.1.1 DR Project Management Teams**

There are seven DR Projects within the program. They are:

- (1) Retube and Feeder Replacement
- (2) Turbine and Generator Upgrades
- (3) Islanding
- (4) Lay-up and Services
- (5) Steam Generators
- (6) Fuel Handling
- (7) Balance of Plant

Each project is led by a Project Manager or Director and is assisted by additional project staff. The Project Manager is accountable for the planning and execution of their project. The Project Managers are accountable to ensure that the EPC contractor(s) delivers the contracted products and services to the quality specified, on time and on budget, and conduct oversight in accordance with their POP. The Project Managers will request from the function organizations additional or specialized resources when required to plan and execute oversight activities.

#### **A.1.2 DR Project Support Functions**

There are Nine DR Functions within the program. They are:

- (1) Engineering
- (2) Planning and Controls
- (3) Supply Chain
- (4) Contract Management\*
- (5) Management Systems\*
- (6) Operations and Maintenance
- (7) Construction Oversight
- (8) Quality Management
- (9) Center Led Functions

\*Sub-departments of *Project Assurance and Contract Management*

Functions are led by a Director or Vice President. Functions set standards for projects and provide function support for the execution of the project. Functional organizations collaborate with the Project Teams in the development of the POP, and when required

## Plan

Title:

## **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

provide specialized or additional resources to execute the oversight activities. In addition to oversight, Function Leads are responsible for:

- Fulfilling Project Managers' resource requests by assigning required staff with the right skill-sets
- Forecasting resource demands and remedying gaps appropriately (e.g., hiring more people, negotiating with Project Managers to sequence demand)
- Establishing and enforcing project-wide safety and QA standards
- Establishing project-wide technical standards in their areas of accountability

### A.1.3 Management Systems Oversight (MSO)

MSO's main role is to ensure that the management system is in place and working effectively for the DRP. Specific accountabilities include:

- Execution of the PAG program. This includes performing process surveillances of the DRP and associated projects, and providing feedback to the Function Leads and Project Managers and RPRB.
- Providing support and assistance to project staff performing oversight activities of EPC Contractors.
- Supporting External Oversight reviews and evaluations.
- Managing the Corrective Action Program for DR.
- Coordinating the development and providing support for the execution of the Divisional Level Self-assessment schedule.
- Managing internal and external OPEX and Lessons Learned for DRP.

### A.1.4 Senior Vice President (SVP) Nuclear Projects

SVP Nuclear Projects provides direction and oversight to the entire Nuclear Projects organization. The SVP has overall accountability for oversight of the DRP with support from the Nuclear Project Executive Team (NPET). The SVP uses reports and updates from the Project Management Team and findings from IA, NO, and the Chief Risk Officer (CRO) to manage the DRP. The SVP is accountable for:

- Planning, directing, and providing vision and leadership for all aspects of the DR organization. These include producing a Release Quality Estimate (RQE) and schedule for the refurbishment project(s) and ultimately delivering a successful implementation of approved projects.
- Establishing performance standards for DR activities and functions.

### A.2.0 CHIEF NUCLEAR OFFICER (CNO)

CNO manages OPG's nuclear generation assets and resources in accordance with the approved business plan, producing targeted performance and results in a safe, reliable, and cost effective manner. The CNOs portfolio includes the DRP.

CNO provides the CEO with specialized advice and guidance regarding the nuclear generation business.

## Plan

## **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

### **A.3.0 CHIEF EXECUTIVE OFFICER (CEO)**

OPG CEO has overall responsibility for corporate performance. The CEO provides executive direction to the DRP in the context of business oversight. The CEO uses reports from the SVP Nuclear Projects on program status, audit reports from IA, NO, External Oversight groups and risk reports from the CRO to assist in executing his oversight accountabilities.

### **A.4.0 OPG BOARD OF DIRECTORS AND COMMITTEES**

OPG's BOD and Committees have an advisory and decision role in the operations of OPG business. The BOD uses the following information to provide direction to the DRP:

- Reports from the CEO and SVP Nuclear Projects on project status
- Risk reports from the CRO
- Audit and NO reports
- External Oversight reports

#### **A.4.1 Darlington Refurbishment Committee (DRC)**

The DRC is a sub-committee of the BOD. They provide oversight of the Darlington Refurbishment project.

### **A.5.0 ENTERPRISE LEADERSHIP TEAM (ELT)**

The ELT uses program updates from the SVP and Project Management Team to advise and support the SVP Nuclear Projects.

The core objective is to communicate the status of the DRP and to ensure alignment of objectives between the project team and its stakeholders. Additional objectives in support of this include:

- Communicating project and program level updates
- Sharing information, and when required, seek advice
- Confirming stakeholder support for deliverables required by the project, i.e. project financing
- Providing a forum for healthy challenges between stakeholders and the project teams

### **A.6.0 CORPORATE ASSURANCE**

Corporate Assurance is a centre led organization consisting of two divisions: IA and NO. The scope of their activities includes the evaluation of the effectiveness and efficiency of OPG's governance, risk management and control processes.

#### **A.6.1 Nuclear Oversight**

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>
Sheet Number: <b>0011</b>	Revision Number: <b>R00</b>	Page: <b>18 of 19</b>	

Title:

### **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

NO scope includes assessments of programs under the Nuclear Management System, N-CHAR-AS-0002, as per N-PROG-RA-0010, Independent Assessment. A 3-year rolling audit schedule is produced to align audit activities with station activities or evolutions to confirm the continuing effectiveness of the management system. Oversight processes and reviews performed by the Supply Chain quality function and the external Nuclear Safety Review Board are also covered within this program.

Specific to DR, NO conducts audits and assessments are conducted for all phases of the program including Project Definition, Preliminary Planning, Detailed Planning, Execution and Project Closeout.

N-PROC-RA-0048, Conducting Audits establishes the methodology and requirements for planning, scheduling, staffing, preparing, performing, reporting and follow-up of audits and surveillances performed by NO. Additional guidance is provided in N-GUID-01070-10001, Nuclear Oversight Audit Handbook

#### **A.6.2 Internal Audit**

The IA organization reports directly to the CEO and BOD. OPG internal audits are identified through the Integrated Annual Audit Plan for OPG that is approved by the Audit and Finance Committee (AFC) of the BOD.

Independent objective assurance by IA assists the Board in fulfilling its strategic oversight responsibilities. IA helps OPG accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of the organization's risk management, control, and governance processes.

#### **A.7.0 INDUSTRY OVERSIGHT**

Industry regulatory and oversight bodies, including CNSC and WANO perform routine audits, assessments, and inspections of the DNGS performance. As the DR Project progresses, these reviews will include insights into the project's compliance with our PROL and WANO best practices. The Ministry of Environment and Climate Change and the Ministry of Labour will also provide oversight during the Darlington Refurbishment Project as required.

#### **A.8.0 REFURBISHMENT PROGRAM REVIEW BOARD (RPRB)**

RPRB is responsible for making impartial assessments of the Refurbishment Project to ensure that the team's actions are meeting expectations, commitments and are following industry proven project management practices. The RPRB executes specific monitoring, reviews and oversight to ensure that the Project remains on track, and that interfaces with Nuclear Operations and other key support functions (i.e., Supply Chain, People & Culture) are effective. The RPRB provides periodic reports to OPG Executives.

## Plan

Title:

### **DARLINGTON REFURBISHMENT PROGRAM ASSURANCE PROGRAM MANAGEMENT PLAN**

#### **A.8.1 External Oversight**

The Darlington Refurbishment Committee (DRC) sub-committee of the board uses External Oversight (EO) as an independent external organization to assist in fulfilling their mandate by providing independent assessments on the performance of the DRP.

The scope of the external evaluations or assessments may include:

- Reviewing and monitoring the definition, development and risk management of the Refurbishment Program
- Monitoring the progress of the Refurbishment Program against cost, schedule, financing, risk, safety and other targets
- Reviewing execution performance of the Refurbishment Program
- Review of relevant Refurbishment Program project management documentation

#### **A.9.0 CHIEF RISK OFFICER (CRO)**

The BOD approved Corporate Risk Management Policy holds the CRO accountable for independently overseeing risk management and mitigation programs within OPG.

The Enterprise Risk Management (ERM) group is accountable for performing oversight on behalf of the CRO. For OPG's destiny projects, ERM will focus on project risks which could significantly impact the achievement of corporate objectives.

#### **A.10.0 INDEPENDENT OVERSIGHT ADVISOR**

The Minister of Energy has contracted an Independent Oversight Advisor (IOA). The advisor has full access to the DRP. The IOA is embedded in the DRC.

The purpose of the IOA is to advise the Minister of Energy on the effectiveness of execution of the Refurbishment Program with respect to risks associated with the Refurbishment Program budget and schedule.

#### **A.11.0 MINISTRY OF ENERGY/GOVERNMENT OF ONTARIO (MOE)**

OPG's sole shareholder is the Government of Ontario. The shareholder expects the DRP to be on time, on budget and with high safety and quality performance. The shareholder uses reports from the CEO and EVP Nuclear Projects on project status, including External Oversight reports and access to External Oversight firms.

**DARLINGTON REFURBISHMENT CONSTRUCTION PROGRAM MANAGEMENT PLAN**

## 1.0 PURPOSE

The purpose of this Program Management Plan (PgMP) is to define how Construction Management will occur for the refurbishment program.

Construction Management is the responsibility of the individual EPC contractors. The OPG Refurbishment Execution Organization is structured to support each of the major project bundles within the Refurbishment program by providing each bundle with an experienced Construction Manager, Safety Team, and Materials Support for the purposes of performing field support and oversight. The project bundles are as follows:

1. Shut down, Lay up and Services
2. Islanding
3. Fuel Handling
4. Retube and Feeder Replacement
5. Turbines and Generators
6. Steam Generators
7. Balance of Plant

OPG Construction Managers, reporting to the OPG Director of Construction, has a matrix reporting relationship to each of the OPG Project Managers for the length of the Refurbishment Project.

The OPG Construction Execution Team provides risk based oversight as laid out in each individual Project Oversight Plan (POP). Construction Execution Oversight of Supplemental Personnel is accomplished through N-STD-AS-0032, Oversight of Supplemental Personnel and NK38-GUID-09701-10043, Refurbishment Construction Execution And Field Support-Supplemental Worker Oversight which are aligned to AP-930, INPO Supplemental Worker Process.

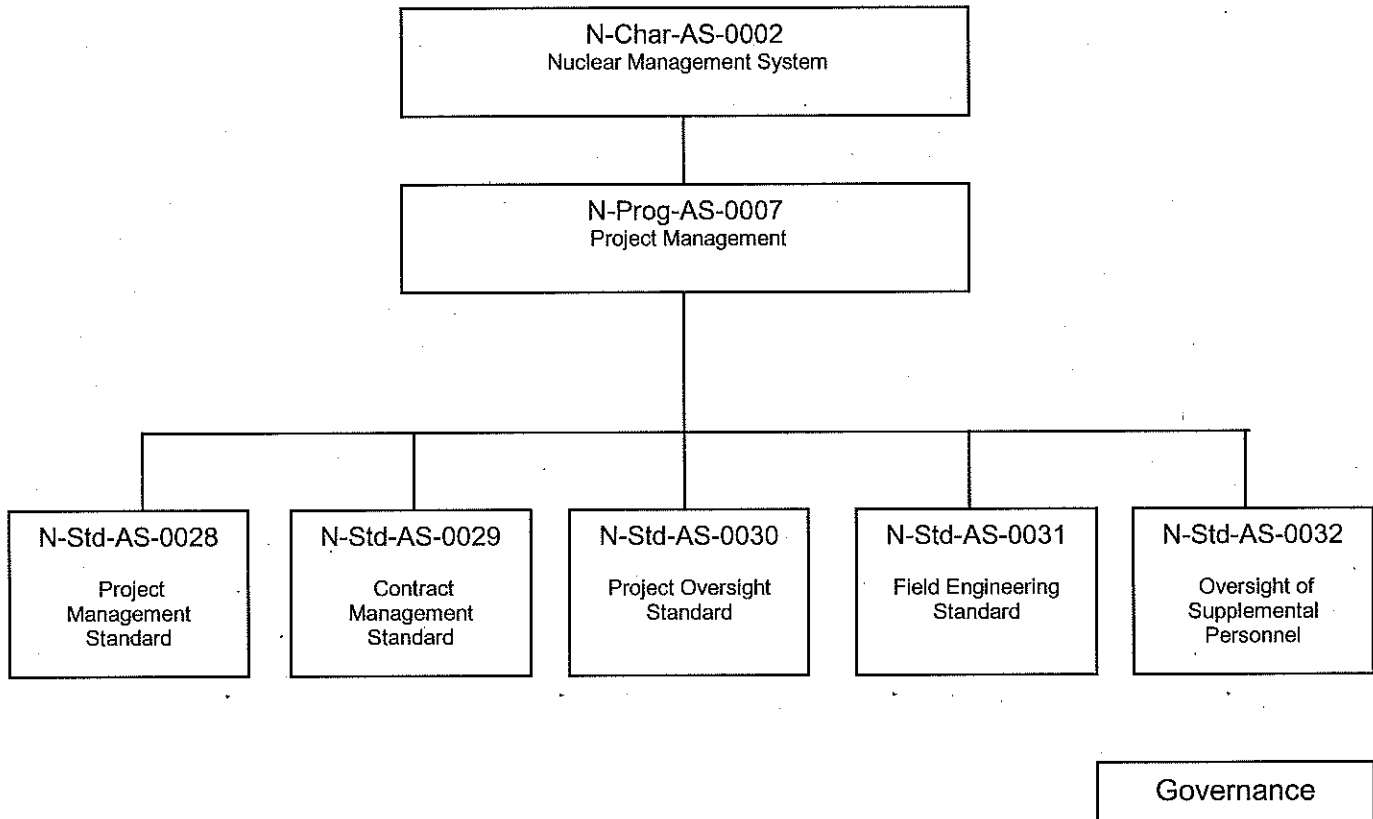

## 2.0 PROGRAM REQUIREMENTS

This Construction PgMP aligns with Corporate, Nuclear, and other business unit governance, governance support and non-governance documentation. Figure 1 shows the framework of documents that impact this PgMP.

Non-Governance

## 2.1 Construction Execution Processes

Construction Execution produces and implements methods and processes which clarify expectations and requirements of both OPG and Vendors. Documentation produced including guides and memorandums which will further support industry best practices, efficiencies, and alignment between Vendors (e.g. Construction Lookahead team as defined in NK38-GUID-09701-10043, Refurbishment Construction Execution And Field Support-Supplemental Worker Oversight).

NK38-GUID-09701-10031, Darlington Refurbishment Construction Execution Guideline For Vendors And Field Support, is a "living document" identifying processes, strategies, direction and expectations related to field execution activities, considering the Refurbishment Contractor/Owner Interface Requirements (N-COI-00120-00001),

Plan

Plan

Sheet Number: 0012	Revision Number: R001	Page: 7 of 10

Title:  
DARLINGTON REFURBISHMENT CONSTRUCTION PROGRAM MANAGEMENT PLAN

INPO Principals for Excellence in Nuclear Project Construction, and significant Operating Experience (OPEX) from other large refurbishments as well as internal OPEX.

D-GUID-09701-10037 Comprehensive Work Packages provides recommendations on creation (layout and content) of Comprehensive Work Packages (CWP) to be used on the Darlington Nuclear Refurbishment (DNR) project.

Work stoppage events on the Darlington Nuclear Refurbishment Project, pose significant risks to the refurbishment cost and schedule. To mitigate these risks, strategies must be implemented for event management and event recovery. NK38-GUID-09701-10036 Nuclear Refurbishment Work Stoppage/Reporting and Recovery details recovery strategies to reduce the impact.

## 2.2 Construction Execution Oversight

There are four Fundamental Support and Oversight Accountabilities as described below. Oversight staff in each of the groups work cross-functionally in support of the four fundamentals and accountabilities:

1. Financial/Commercial Aspects: Project Director/Project Manager accountability utilizing Project Planning and Control staff.
2. Field Support and Vendor Behaviours: Construction Execution Director accountability utilizing Construction Oversight Personnel
3. Field Monitoring of Quality Program: Quality Director accountability utilizing Quality Surveillance staff.
4. Refurbishment Program Assurance: Managed System Oversight Director accountability utilizing Program Assurance Group (PAG) staff.

Additional details are captured in following Program Management Plans

- NK38-NR-PLAN-09701-10001 Sht 002, Darlington Refurbishment Planning And Controls Program Management Plan
- NK38-NR-PLAN-09701-10001 Sht 0023, Darlington Refurbishment Quality Program Management Plan
- NK38-NR-PLAN-09701-10001 Sht 0011, Darlington Refurbishment Program Assurance Program Management Plan

The POP includes oversight to confirm:

- Work is adequately planned and executed event free.
- Quality requirements are satisfied.

## Plan

Sheet Number: <b>0012</b>	Revision Number: <b>R001</b>	Page: <b>8 of 10</b>

Title:  
**DARLINGTON REFURBISHMENT CONSTRUCTION PROGRAM MANAGEMENT PLAN**

- Industry best practices workmanship standards are maintained.
- Contractor Supervision is Capable, Competent, and Qualified.

### 2.3 Performance Indicators and Monitoring Activities

The following is a list of Construction performance indicators/monitoring activities tracked and trended on the Construction Dashboard:

- Vendor Safety Performance
- Oversight Observations
- Construction Readiness
- Field Initiated Changes
- Overdue Actions
- Work Efficiencies
- Hall Metrics
- Cost

## 3.0 ROLES & ACCOUNTABILITIES

### 3.1 Director of Construction

- 3.1.1 Provides leadership, strategic direction and support to the field execution teams.
- 3.1.2 Ensures OPG Construction Managers are providing the required oversight of contractors employed on the Darlington Refurbishment project.
- 3.1.3 Provides direction to the OPG Construction Managers on oversight of contractors with regards to performing work safely, effectively and in a manner consistent with the terms of the respective contract and the requirements as laid out in the POP and NK38-GUID-09701-10043, Refurbishment Construction Execution And Field Support-Supplemental Worker Oversight.
- 3.1.4 Provides assurance to the Vice President Refurbishment Execution that risk based Construction oversight is being provided in accordance with the project POPs and the contract standards.
- 3.1.5 Provides the governance and guidance for construction oversight and is the document owner and is responsible for the definition and implementation of this document.

### 3.2 Project Director/Manager

Provides the Construction Manager with direction on day to day accountabilities per the POP.

### 3.3 Construction Manager

- 3.3.1 Reports to the Construction Director while functionally reporting to the respective Project Manager and provides Construction support and oversight for the specific

Title: <b>DARLINGTON REFURBISHMENT COMMUNICATIONS PROGRAM MANAGEMENT PLAN</b>
--

### Revision Summary

Revision Number	Date	Comments
R003	2016-09-06	Updated and revised. Minor adjustments to wording and to reflect name changes and reporting structures.
R002	2015-08-24	Revised to include Management Systems Oversight as a reviewer required in NK38-MAN-09701-10006: Nuclear Refurbishment- Requirements for Process Support
R001	2015-01-16	Revised to incorporate Communication Program Process Support Document flowchart and Stakeholder Management
R000	2014-01-31	<p>This document supersedes NK38-PLAN-09701-10067 Sheet 0007. The changes between NK38-PLAN-09701-10067 Sheet 0007 and this document are as follows:</p> <ul style="list-style-type: none"> <li>The document number has been changed to meet the requirements of NK38-NR-MAN-09701-10001,</li> <li>The security classification has been removed so that the document can be submitted to the CNSC, and</li> <li>References have been updated</li> </ul>

Title: <b>DARLINGTON REFURBISHMENT COMMUNICATIONS PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The purpose of the Refurbishment Program Communication Management Plan is to ensure that all Refurbishment Program information, which is considered an asset, is managed such that information is communicated to those who need the information in a manner that ensures the information is current, correct, and timely.

The Refurbishment Program Communications Management Plan provides overall direction on communications, information management and reputational management for internal and external audiences.

## 2.0 PROGRAM REQUIREMENTS

This Communication Management Plan aligns with Nuclear, Corporate, and other business unit governance, governance support and non-governance documentation. Figure 1 shows the framework of documents that impact this Management Plan.

The program is further aligned with the Refurbishment Execution organization and leadership team.

All methods and forms of communication by or on behalf of the Project including written, oral, and electronic communications shall be processed in accordance with the managed system illustrated in Figure 1.

Stakeholder's needs are analyzed when determining communications actions.

To ensure overall Refurbishment Program requirements are being met as specified, communication effectiveness is monitored through: leadership forms, performance indicators such as quantitative and qualitative surveys, stakeholder feedback and management team opinion.

Title: <b>DARLINGTON REFURBISHMENT COMMUNICATIONS PROGRAM MANAGEMENT PLAN</b>		

## 2.1 INTERNAL COMMUNICATIONS

All internal communications shall be executed in a professional manner that is open, honest, accurate and timely. Unless specifically noted, all communications shall adopt the most effective communication channels and methods to ensure correct and current information is provided in time to the people who need it.

Communications Relations and Communications (CRC) will ensure alignment in communications with Corporate CRC, Refurbishment Organization and with line-base support through the Refurbishment Execution organization.

Major events or Program changes may require the development of an event specific communication plan. Event specific communication plans are reviewed for acceptance by the Director, Planning and Controls (P&C) and Director, Nuclear CRC following consultation with the appropriate Executive Management.

### 2.1.1 Ontario Power Generation Executive Management

The VP Planning & Project Controls, shall, with the SVP, Nuclear Projects, coordinate internal communications between the Project and OPG Executive Management. The Director shall produce, write and coordinate submissions to the OPG Board of Directors and other Board and Executive Committees, including the Nuclear Projects Executive Team (NPET) and ensure the timely and appropriate committee scheduling for corporate review and approval of designated items.

### 2.1.2 Project Team Communications

Open communication is essential for timely decision-making and efficient execution of the Refurbishment Program, a 'no surprises' approach to Project execution is desired. Key elements of Project Team communications include, but are not limited to:

- Planning meetings involving key Project Team members to define the scope of work and establish baseline budgets and schedules for future work.
- Monthly progress meetings involving key Project Team members to review cost and schedule performance versus the baseline plan.
- Lessons Learned meetings, at appropriate points, to review lessons learned and implement identified improvements.
- Project Execution Update meetings, convened by the SVP Refurbishment Execution, involving status of various projects.
- Other team meetings as required.
- Face-to-face forums.
- Intranet and SharePoint sites dedicated to the Project.
- E-mail interface.

Where appropriate, efforts of the Project Team will be coordinated and integrated to facilitate effective communication. Meeting Notes should be used to document the purpose, date, location, attendance, file number, summary of the discussion, results, and follow-up actions required; and prepared and issued by the meeting organizer

Sheet Number: <b>0014</b>	Revision Number: <b>R003</b>	Page: <b>7 of 12</b>
Title: <b>DARLINGTON REFURBISHMENT COMMUNICATIONS PROGRAM MANAGEMENT PLAN</b>		

within one week after the meeting. A copy of the Meeting Notes is to be filed in the Project Records Centre by the meeting organizer. Action items identified at meetings will be issued using the Refurbishment database Action Log to all Program Team members to enhance the level of communications and understanding of the Project development.

### 2.1.3 Nuclear and OPG Employees

Some Refurbishment Program communications may also be targeted at all Nuclear employees as well as OPG Employees as appropriate. Refurbishment communications shall be developed by CRC in consultation with the Program, and issued by the SVP, Refurbishment Program.

### 2.1.4 Darlington Nuclear Generation Station Employees

Lessons learned and Operating Experience supports the creation of a separate communications organization from the plant, for major projects such as a refurbishment. As the Refurbishment program has progressed so has interface with the Darlington Nuclear Generating Station. The alignment between the Refurbishment Program and the Station will continue to grow and become increasingly integrated and aligned as we approach the first unit outage in 2016. Key elements of station integration communications include, but are not limited to:

- updates in the Darlington Director of Operations and Maintenance weekly employee message.
- Joint senior leadership messages including: organizational announcements, station events, human performance messages and informational updates.
- Intranet articles on Nuclear News, accessible for Darlington Employees.
- Intranet spotlight on Nuclear News titled "Site Activities", dedicated to construction updates regarding the Projects and Modifications projects (also referred to as Campus Plan Projects, and Refurbishment Pre-Requisite Projects) projects located within and outside the Darlington Public Area.
- Refurbishment spot light in all station outage communications including: Refurbishment Outage Manager Message regarding Refurbishment outage activities.
- Target vision slides including site updates regarding Refurbishment Pre-Requisite Projects, risk management slides, and other timely Refurbishment updates.
- Refurbishment quarterly updates at the Darlington Stratum 3/4/5/ monthly meetings.
- Bi-weekly Newsletters, posters, site-wide emails, face-to-face communications, presentations and outage briefing materials.

Title: <b>DARLINGTON REFURBISHMENT COMMUNICATIONS PROGRAM MANAGEMENT PLAN</b>		

## 2.2 External Communications

All external communications shall be made in a professional manner that is open and transparent and which supports effective reputational management. External Project communications will typically be driven by key regulatory steps and phases, initiation of work phases and outage segments, semi-annual reporting, major milestones and proactive media/external communication opportunities such as stories on employees, innovation and technology. Major events (key Project announcements, schedule changes, etc.) may require the development of an event specific communication plan.

Event specific communication plans are to be developed and reviewed for acceptance by the Director, Planning and Controls (P&C) and Director, Nuclear CRC following consultation with the appropriate internal stakeholders such as Nuclear Project Executive Team (NPET) members.

Darlington Refurbishment communications build on the extensive work and existing relationships in the host communities, communities of interest, industry and with other relevant stakeholders. These provide a solid foundation for the Darlington Nuclear Refurbishment Program to build upon and will help mitigate challenges and issues should they arise.

### 2.2.1 External Communications Audience

External Refurbishment Program communications includes the sharing of information with the public, external stakeholders and audiences, which can include:

- First Nations and Métis communities,
- Host communities, the general public, elected officials and opinion leaders within the host communities,
- Industry partners and OCI members,
- Other local communities, municipalities and other communities of interest,
- Key industry stakeholders, including COG and CNA,
- OPG employee unions and other organizations of civil society,
- Federal Ministers, Members of Parliament, and senior officials within the Federal departments and Regulatory Agencies,
- Government of Ontario and other Provincial Agencies,
- Engaged activists and Project followers,
- Others with an interest in the Project due to its locations, costs or effects, and
- Media.

### 2.2.2 Key External Communication Goals

The key goals of Refurbishment Program external communications are:

- Provide a communications platform that is, and is seen as open, transparent and meeting the needs of the audience;

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0014</b>	Revision Number: <b>R003</b>	Page: <b>9 of 12</b>
Title: <b>DARLINGTON REFURBISHMENT COMMUNICATIONS PROGRAM MANAGEMENT PLAN</b>		

- Ensure all regulatory requirements regarding communications and/or public consultation are satisfied;
- Develop and maintain support for the Program through proactive engagement of relevant stakeholders; and
- Protect and maintain OPG's reputation by demonstrating OPG's commitment to accountability and that the Program is well-managed.

### 2.2.3 Key Principles

Consideration will be given to:

**Timing:** Timely, accurate notification of key program milestones, commencement of refurbishment activities, EA milestones and Program completion.

**Relationships:** Notification of and responsiveness to stakeholder interests including government, media, interest groups, neighbours, general public and host community opinion leaders, First Nation and Métis communities.

**Communication Vehicles:** Effective use of various proven communications media (print, web-based, social media, broadcast and other media to deliver messages) as well as community committees, and other forums for face-to-face communication.

### 2.3 External Communications – Regulatory

All official communication with the Canadian Nuclear Safety Commission and other Regulatory Agencies will be through the OPG Nuclear Regulatory Affairs Division. N-PROC-RA-0047 Communications with the CNSC, and N-PROC-RA-0006 Regulatory Action Management, are used to manage all regulatory communications.

### 2.4 External Communications - Engineer, Procure, and Construct/Vendor Company Communications

All official communications with the EPC/Vendor Companies will be through the VP, Project Execution or persons designated by the VP. All methods and forms of communication with the EPC, by or on behalf of Darlington Refurbishment, including written, oral, and electronic communications, event reporting and notifications and receipt of reports from EPC shall be processed in accordance with the Vendor Communication expectations as outlined in the specific Refurbishment Project Management Plans.

### 2.5 Stakeholder Management

OPG will engage with external stakeholders about the project. The strategy for engagement will build on the foundation established through extensive work and relationships over the past several years. These strong relationships and existing processes provide the ground work and allow Corporate Relations and Communications to build and to mitigate challenges and issues as they arise.

Stakeholder Group	Includes	Role
Groups	followers, others with an interest in the Project due to its locations, costs or effects, OPG employee unions and other organizations of civil society, etc.	nature and direction of a project.

## 2.6 Indigenous Communities

OPG recognizes that it must conduct its business in a manner that is both socially and environmentally responsible. OPG's demonstration of this commitment is founded within a corporate-wide policy that provides a framework for engaging with Aboriginal Peoples and supporting programs, committees and community initiatives that reflect its tenets and puts the philosophy into practice.

These principles (among others) form the basis of communication and engagement efforts with First Nation and Métis communities and help direct the establishment of long-term mutually beneficial working relationships with communities in proximity to its present and future operations.

## 3.0 ROLES AND ACCOUNTABILITIES

Corporate Relations and Communications [CRC] is a centre-led function responsible for establishing corporate policies and standards to be used in communications management. Additionally, the function is accountable for performing activities relevant to their function in consultation and agreement with the Project.

The Manager, Nuclear Corporate Relations and Communications (CRC), is responsible to plan, manage and control communications regarding the Project, consistent with Project needs, in accordance with appropriate corporate standards, and as per CNSC requirements where applicable.

Nuclear Regulatory Affairs Division is accountable for all official communication with the Canadian Nuclear Safety Commission and other Regulatory Agencies.

## 3.1 Program Communications Management Plan Approvals

CRC will oversee Refurbishment Program communications with reviews and approvals by the SVP, Nuclear Refurbishment, Director, CRC and the SVP, Nuclear Projects.

CRC will ensure alignment with the communications support between Darlington Station and the communications line-based effort for the project generated under the

Sheet Number: <b>0015</b>	Revision Number: <b>R001</b>	Page: <b>4 of 6</b>	
Title: <b>DARLINGTON REFURBISHMENT SUPPLY CHAIN PROGRAM MANAGEMENT PLAN</b>			

## 1.0 PURPOSE

This Program Management Plan defines the Program Requirements and Roles and Accountabilities for Refurbishment Supply Chain (RSC) for the Darlington Refurbishment (DR) Project, and within the framework of sheets of this document, describes the Supply Chain elements of the program as it applies to DR.

RSC reports to the centre led Business Administrative Services (BAS) Supply Chain. RSC is matrixed to the NR Program, and is also supported by Projects and Modifications SC, Vendor Oversight, and Darlington SC.

This Program Management Plan aligns with Nuclear, Corporate, and other business unit governance, governance support and non-governance documentation.

## 2.0 PROGRAM REQUIREMENTS

Procedure OPG-PROC-0164: Procurement Activities: Projects, outlines the processes used by Ontario Power Generation Inc. (OPG) to procure services (including engineering, procurement, and construction) related solely to support construction projects . This includes work related to hydro/thermal generating facilities, nuclear facilities including nuclear waste, Darlington refurbishment, and real estate projects such as new building construction. Procurement processes include planning, creating and issuing a Request for Information (RFI), Request for Quotations (RFQ) or Request for Proposals (RFP), receipt and evaluation of quotations or proposals from suppliers, negotiation, selection of a supplier, and the finalization and award of a contract.

### 2.1 Core Principles for Procurement Activities

OPG shall acquire items and/or services required to meet OPG's requirements in the most safe, economical and efficient manner. Specifically, OPG shall adhere to the following principles:

- a) Vendor Access, Transparency, and Fairness. Access for suppliers to compete for OPG's business and the procurement process shall be conducted in a transparent manner, providing fair treatment to suppliers. Conflict of interest, both real and perceived, shall be avoided during the procurement process and the ensuing contract, ensuring continuous reliance on a particular supplier for a particular kind of work is avoided.
- b) Value for Money. Items and services shall be procured only after consideration of OPG's business requirements, alternatives, timing, supply strategy, and procurement method.
- c) Responsible Management. The procurement of items and services shall be responsibly and effectively managed through appropriate organization structures, systems, policies, processes, and procedures.

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>			Usage Classification: <b>N/A</b>		
Sheet Number: <b>0015</b>		Revision Number: <b>R001</b>		Page: <b>5 of 6</b>	
Title: <b>DARLINGTON REFURBISHMENT SUPPLY CHAIN PROGRAM MANAGEMENT PLAN</b>					

- d) Geographic Neutrality and Reciprocal Non-Discrimination. To the extent OPG is subject to any Ontario trade agreements with other jurisdictions, OPG shall also ensure that access for suppliers to compete for OPG's business is geographically neutral with respect to other jurisdictions that practice reciprocal non-discrimination with Ontario.

OPG shall use a competitive procurement process. Single source/sole source shall be used as an exception to the normal competitive procurement process.

OPG shall not take any action(s), such as subdividing projects or contracts and awarding multiple consecutive contracts to the same supplier, thereby reducing the value of a purchase with the potential to avoid any requirements regarding competition, approvals, or reporting.

### 3.0 PROCUREMENT OVERSIGHT

Guideline N-GUID-09701-10022: Supply Chain Oversight, outlines the processes used for planning, conducting and reporting of oversight performed by Supply Chain on Procurement contracts. This guide takes authority from N-STD-AS-0030, Projects Oversight Standard.

Oversight is based on a graded and risk based approach. The frequency of the oversight is applied strategically based on project complexity, risks, and contractor performance, as documented in respective Project Oversight Plans.

### 4.0 ROLES AND ACCOUNTABILITIES

#### 4.1 Vice President, Supply Services, Refurbishment Supply Chain

Ensure that Supply Chain staff (including temporary employees or contractors) complies with the requirements of OPG-PROC-0164.

Ensure the integrity of OPG is managed to ensure the Code of Business Conduct is upheld and all suppliers and proponents are treated fairly, ethically and responsibly.

#### 4.2 Director, Supply Services – OPG Projects

Ensures requirements for proposals, quotations and supplier quotation / proposal evaluations are adhered to by appropriate staff.

#### 4.3 Senior Manager, Supply Services – OPG Projects

Ensure requirements for proposals, quotations and supplier quotation / proposal evaluations are adhered to by appropriate staff.

Title: <b>DARLINGTON REFURBISHMENT STAFFING PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

This document describes the plan for staffing the Darlington Refurbishment Program and the processes to manage staffing and succession planning over the life of the Program. This includes hiring of OPG employees as well as contract staff, succession planning and performance development. This plan references existing OPG and refurbishment planning processes, People, Culture & Communications policies, Supply Chain policies, and applicable Collective Agreements that may be used for program staffing. In this plan, the term “Staffing” is used broadly to define the staffing life-cycle from recruitment and selection, on-boarding, succession planning, performance development, retention and employee terminations. This document addresses Darlington Refurbishment (DR) resources as well as those external to the program (within or outside the organization). Given the nature of the work program, it is anticipated that program staffing needs will evolve and change as work scope, milestones and external factors change. Nothing in this plan is intended to limit management’s ability to alter staffing plans and resourcing needs associated with the Project.

## 2.0 PROGRAM REQUIREMENTS

### 2.1 Staffing Assumptions

As an over-riding principle, and from a business efficiency and project continuity perspective, it is OPG’s intent to maintain qualified personnel within the DR Program or replace with existing, qualified OPG personnel. Contractors and temporary staff should be used to augment base staffing levels and manage peaks in demand or address areas where there is a shortage of critical resources or qualified and experienced staff.

Existing OPG job documents will be used to staff the Project, except where new, specific job documents are required to address organizational needs. In such cases, OPG job evaluation processes will be used to create new job documents as needed.

OPG’s core business is operating and managing the maintenance of its generating assets. As a result, OPG does not have the requisite project management expertise to take on various critical roles within the Projects and DR Organizations. To address this need, OPG’s plan is to utilize external industry expertise in areas that are not core to its business. There are, however, several external factors impacting OPG’s ability to adequately staff the Project such as competition for resources from external organizations, an EPC model that is new to existing OPG staff and government restrictions on compensation that make it difficult to attract external talent and retain existing talent, especially at the Management Group level. Section 2.2 details the approach for staffing into the Project given the existence of these external factors which are impacting the DR Project.

It is understood that a robust succession planning process and defined development plans and career paths are needed to ensure that staff are retained and promoted

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0016</b>	Revision Number: <b>R003</b>	Page: <b>6 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT STAFFING PROGRAM MANAGEMENT PLAN</b>		

within the organization and utilized from across the fleet. While program ownership of the Succession Planning process lies with People, Culture & Communications, line management must take accountability for the process, its significance and associated deliverables.

## 2.2 Staffing and Resource Requirements

Staffing and resource requirements will change as the program progresses through the definition phase. Keeping in mind the staffing assumptions noted in Section 2.1, this document will be updated as required to prepare for upcoming phase changes.

The Darlington Refurbishment Project may be resourced in a number of ways, ensuring compliance with OPG policies and relevant Collective Agreements:

- (a) Direct OPG staff reporting to the Darlington Refurbishment organization and contributing to deliverables for the Darlington Refurbishment program. These staff may be full-time, temporary or on rotational assignments into the organization.
- (b) Support from other OPG Business Units in a “matrix” (functional staff working in project teams), as planned in the Business Planning process and documented in individual procedures and/or interface agreements. Partnering and interface agreements will document and formalize the working relationships amongst all groups.
- (c) External purchased services contracts for the provision of specialized technical, project management and other staff/services including Augmented Staff, specialized contracts and managed task contracts. At the time of writing, these include Ian Martin, CPUS, AMEC, Worley Parsons, F&G and others. All external purchased services must comply with relevant Supply Chain procedures and Collective Agreements, Union settlements and Memorandums of Understanding.

Details of the staff and resources are contained within the Program Business Plan, which is part of OPG’s Business Plan, as outlined in N-PROG-AS-0005 Nuclear Business Planning, and it’s supporting Business Planning process, N-PROC-AS-0080.

## 2.3 Staffing Processes and Strategic Elements

Darlington Refurbishment will follow OPG People, Culture & Communications staffing processes and relevant Supply Chain contract staff processes with support from local Human Resources. Documents related to staffing are available to supervisors via the OPG intranet, Manager Self Serve, the HR Service Centre and local HR Offices. Staffing will be in compliance with all labour requirements/collective agreements and be aligned with corporate goals relating to Business Transformation and organizational designs.

In addition to relevant collective agreements, Functional Line Managers shall ensure compliance with all People, Culture & Communications and Supply Chain policies and

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0016</b>	Revision Number: <b>R003</b>	Page: <b>7 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT STAFFING PROGRAM MANAGEMENT PLAN</b>		

procedures (e.g. Hours of Work, Overtime, etc.) as well as the Organizational Change Control Procedure (N-PROC-AS-0068).

DR will participate in the corporate workforce planning process. Functional Line Managers should also ensure they are familiar with the DR On-Boarding process and the OPG Staff Orientation package found on the OPG Human Resources webpage.

## 2.4 Darlington Refurbishment Staffing and Succession Plan (DRSSP)

Succession Planning efforts at the nuclear level are enshrined in the current Nuclear Executive Committee (NEC) Succession Planning process and the Peer Team processes. NEC examines those positions identified as Priority 1 roles, while the respective Peer Teams review positions identified as Priority 2 roles. See Appendix A for an illustration of this process and the roles reviewed.

Succession planning efforts in DR take place at the Nuclear Projects level and by organization in DR. They are not intended to replace discussions held at the fleet level on this topic, either at the NEC Succession Planning meetings or via the Peer Teams. In order to be successful and ensure a wide breadth of opportunities and development for staff, integration of the DR Succession Planning efforts into broader efforts is critical. The DR process will establish some rigour and oversight into performance development and talent growth for the Project. It is expected that Integration should occur in three ways: in HR via the VP, Nuclear Business Partners who attends the NEC Succession Planning meetings, with the SVP, Nuclear Refurbishment who also attends such meetings and the DOM and VP, Engineering in DR who attend the Nuclear Fleet Peer Team discussions on succession planning. Integration with Projects & Modifications has taken place via formal succession planning meetings with an aim to assessing and cultivating project management talent across the broader Nuclear Projects organization.

The DR Staffing and Succession Planning process will focus on High priority positions specific to DR and critical job families required for the successful completion of DR (known as Priority 3 roles). Consideration for whether positions are deemed critical follow the centre-led model. In order to address succession planning in DR and staffing for critical roles, a formalized Succession Planning Process has been developed.

The DR Staffing and Succession Planning Process will also focus on the creation of mitigation plans as needed for critical job families in the Project. Functional Line Managers shall have ownership of these plans which will be reviewed quarterly at the formal succession planning meetings as required.

### 2.4.1 Program Plan and Set-Up Phase

Program staffing and resourcing profiles for each Refurbishment department and project have been developed as part of the Definition Phase planning effort. At the time of Board approval of Release 4D, the staffing plans were baselined.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0016</b>	Revision Number: <b>R003</b>	Page: <b>8 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT STAFFING PROGRAM MANAGEMENT PLAN</b>		

Further changes/increases to the staffing plan baseline approved for Release 4D) will be through the Refurbishment Cost and Schedule Change Control process, N-MAN-00120-10001-PC-01 and the Project Gated Process, N-MAN-00120-10001-GRB.

## 2.5 Defining Program Staffing and Resources Requirements

Staffing and Resources requirements for the Project are based on the scope, the existing matrixed organization as defined in Section 2.2 (b), and the need to provide oversight to Engineering Procurement Construction (EPC) contractors.

Program Staffing Requirements include:

- Refurbishment Program Executive Team
- Administrative support
- Corporate support (strategic e.g. Law, Regulatory Affairs, Finance, People, Culture & Communications)
- Functional Management, including Program Planning & Control, Managed Systems Oversight, Engineering
- Project Managers and staff, including matrixed staff, for each of the Program's Projects
- OBU support (technical e.g. Nuclear Engineering, Finance)

Each Function and Project requires an overall resource plan that is included in their Management plans that support Business Planning.

## 2.6 Program Organization

The Darlington Refurbishment Program Organization can be found in the Darlington Refurbishment Project Charter (D-PCH-09701-10000).

## 2.7 Program Staff Tracking and Management

Darlington Refurbishment Program staff will use OPG Nuclear's standard time reporting system, TEMPUS, for timekeeping and time management related needs, such as vacations.

Darlington Refurbishment supervisors will use OPG Nuclear's standard Human Resource tools and processes for performance monitoring; e.g. Performance Planning & Review (PPR). Clear linkages to development planning and Annual Incentive Plans (where applicable) will be formally documented as part of the PPR process. It is expected that Managers endeavour to hold quarterly performance review meetings with their staff to assist in this activity and entrench a culture of continuous development.

## 2.8 Replacement of Program Staff

Refurbishment Program staff vacancies are addressed through the normal OPG hiring processes as outlined in Section 2.2 of this plan.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0016</b>	Revision Number: <b>R003</b>	Page: <b>9 of 14</b>
Title: <b>DARLINGTON REFURBISHMENT STAFFING PROGRAM MANAGEMENT PLAN</b>		

## 2.9 Program staff Transition at Program Commencement and Execution through to Completion

A plan will be developed to transition staff to and from the Refurbishment Program and to Nuclear Operations during the phases of the Project. The Integrated Workforce Transition Team under DR Operations & Maintenance contemplates how these “swing staff” will be selected and staffed from the Fleet. This will be complete as part of the transition plans that are being developed for each organization. Further planning will be required for core Darlington Refurbishment Program staff (NK38-PLAN-09701-10113 Sht: OPS-01).

## 2.10 Approved Organization Changes

Organization changes will be processed per N-PROC-AS-0068 Organizational Change Control.

## 3.0 ROLES AND ACCOUNTABILITIES

Responsibility for staff and resource planning lies with the Functional Line Manager with support from the Human Resources Manager, the Director, Planning and Controls and the Controller. The Functional Line Manager is accountable for resource planning and identification of staffing needs as part of the overall planning process. This includes alignment with business planning and headcount targets. It is expected that the Functional Line Managers periodically review their staffing needs and ensure alignment with their work programs. Fiscal responsibility and adherence to OPG values and behaviours is required where increases or decreases to staff numbers are necessary. Roles and responsibilities are defined at all levels of the organization and are available in Passport under series N-MAN-08131-10000.

### 3.1 Senior Manager, Human Resources Nuclear Projects

Is the document owner and is accountable for its definition, implementation and continual improvement.

## 4.0 DEFINITIONS & ACRONYMS

### 4.1 Definitions

None.

## Appendix B: Decision Support for Critical Positions Tool

### Decision Support for Critical Positions

*A guideline for Human Resources to support their clients in determining what a "Critical Position" is in Succession Planning.*

Decision Support Considerations		Indicate Impact		
Position: _____		High	Med	Low
		Score		
		5	3	1
<b>Critical Tasks and Decision Making</b>	The position exerts critical decision making and influence to OPG's operational/strategic objectives and performance outcomes			
	The level of impact on bottom-line results			
	The position is important to the future delivery of projects, programs and services			
	The extent to which position manages other critical positions			
	A vacancy in the position would cause substantial disruption to the functioning of OPG's operations productivity, performance and level of service			
<b>Hard to Recruit</b>	The position is specialized or requires unique expertise that is difficult to replace			
	The position demands a high level of competency limiting the ability to "start as a rookie"; the development process to qualify a candidate for the position is lengthy			
	In the current job market, the position is a less attractive option for high potential talent (in the terms of status, profile, perceived developmental value)			
	Degree of Competition for this position in the marketplace (Consult with Recruiting to answer this question)			
	Current market value of the position (Consult with Compensation & Recruiting to answer question)			
	The geographic location is unattractive or the least attractive of similar roles			
<b>Knowledge at Risk</b>	The position is in danger of "knowledge" drain due to forecasted attrition			
<b>Total</b>		<b>0</b>	<b>0</b>	<b>0</b>

**Risk Rating Legend:**

	Score
	High 40 - 50
	Med 30 - 39
	Low 20 - 29

## Appendix C: Individual Development Plan Template

# Individual Development Plan

Individual Development Plans using SMART objectives enable the achievement of both business and career goals. Employees are expected to take responsibility for their learning and development. During the performance reviews, managers and employees will review the development plan and agree on development activities for the year. Managers are expected to support development and monitor employees' development activities and coach them by giving timely on-the-job and formal feedback throughout the year.

Employee Name:		Employee Number:	
Employee Department:		Employee Work Location:	
Time in current role:		Employee Job Title:	
Manager's Name:		Date of Completion:	

Begin your development planning by selecting 2-3 behaviours and development goals that you feel are most important to address. These may be selected in order to leverage existing strengths or to address gaps. Use the [Identifying your Development Priorities Worksheet](#) to help you prioritize your development priorities.

<b>OPG Behaviour</b> What behaviour do I want to work on?			
<b>Area for Development</b> This could include strengths to build on.			
<b>Development Actions</b> What specifically will I do and what will it achieve?  What are the best development activities for my identified area for development?			
<b>Target Completion Date</b>			
<b>Measure of Success</b> How will I measure my development?			
<b>Support and Feedback</b> What support do I need and from whom?  Who will give me feedback?			
<b>Areas of Interest</b>			
<b>Target Positions</b>

Title: <b>DARLINGTON REFURBISHMENT - OPERATIONS PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

N-PROG-OP-0001 [R1] *Nuclear Operations* implements for Ontario Power Generation, Nuclear a series of standards and procedures to ensure safety of public, environment, plant personnel, and plant equipment.

This program establishes safe, uniform, and efficient operating practices and processes within Nuclear facilities that provide nuclear professionals the ability to ensure facilities are operated in such a manner that Reactor Operating License, Operating Policies and Principles, and other applicable regulations and standards are followed.

During refurbishment preparation phase operations team members will be:

- Developing and maintaining OPEX, Risk Management and SOER programs
- Work Protection and Ops Execution for pre requisite and scope definition inspections and maintenance work
- Operations Scoping and Assessment
- Design Package Review and Approval
- Work Plan Review and Approval
- Support for Shutdown and Lay Up, Balance of Plant, Return to Service , Fuel Handling, Retube and Feeder Replacement, Turbine Generator and Boiler refurbishment groups
- Document Reviews and Governance Development and Revisions
- Strategic Plans and Schedules Development & Reviews

This Darlington Refurbishment Operations Program Management Plan (PgMP) confirms that employees working within the Darlington Refurbishment Program will perform their work while conforming to the existing OPG Management System, specifically N-PROG-OP-0001.

For refurbishment, changes have been made to the current Operating Policies and Principles and License Condition Handbook (LCH). The changes were processed and approved in accordance with N-PROG-AS-0001, *Managed Systems*, N-PROG-AS-0006, *Records and Document Control* and any other appropriate governance

Title: <b>DARLINGTON REFURBISHMENT - OPERATIONS PROGRAM MANAGEMENT PLAN</b>		

## 2.0 PROGRAM REQUIREMENTS

Nuclear operations are governed by program document N-PROG-OP-0001 *Nuclear Operations* and all of the supporting standards and procedures.

The Nuclear Operations program is organized by six focus areas: Operations Management and Leadership, Conduct of Operations, Operator Skill and Knowledge, Operator Procedures and Documentation, Operations Facilities and Equipment, Plant Status and Configuration Control. This relationship is illustrated in N-PROG-OP-0001, *Fig 1. - Nuclear Operations Program Interfaces*. Any changes to the interfacing programs will be documented in Program specific Program Management Plans. The hierarchy of the governing documents and the relationship of these documents to the operations program objectives are shown in N-PROG-OP-0001 Fig. 1.1 *Nuclear Operations Programs Governing Documents Hierarchy* and transposed in Appendix A.

As stated in NK38-PLAN-09701-10113 Operations Ownership Transfer Plan [R-2] some of these supporting documents will require revision in order to meet the needs of Darlington Refurbishment.

Actual changes will follow N-PROG-AS-0001, *Managed Systems*, N-PROG-AS-0006, *Records and Document Control* and any other appropriate governance.

### 2.1 New Governance Specific to the NR Project

The requirement for new governance outside the hierarchy of documentation specified in N-PROG-OP-0001 is not anticipated. Some of the existing governance within this hierarchy will require updates to accommodate Nuclear Refurbishment. A scoping assessment of LCH referenced licensee documents was completed for revisions that may be required due to proposed OP&P changes.

Changes proposed in this OPP revision affect documents related to:

- authority and organization
- conduct of operations and maintenance
- certified staff requirements (later submission)
- specific states and evolutions (example; defueling)

Nuclear safety assessments for modifications, evolutions, and specific refurbishment unit states are to follow and will affect licence limits and documents detailing safety requirements

### 2.2 Governance Updates

NR Operations has performed an exhaustive review of the listed standard, procedures and instruction that fall under hierarchy of N-PROG-OP-0001. As a result of this review it is apparent that many of the documents require no updates at all however multiple documents require updates ranging from minor to intent. It has also become apparent

that some of these changes are awaiting regulatory approval of refurbishment OP&P's and the License Condition Handbook. Action tracking item # 28168336 has been created to track the review and update process.

### 2.3 Methodology of Change Implementation

In order to implement the changes to the existing governance under N-PROG-OP-0001 that will be required to accommodate nuclear refurbishment in its various states a methodology has been developed that will achieve the desired results, within the refurbishment timelines without overwhelming the document owners. Refurbishment operations will review the documents and edit the required sections. They will also review the required timelines for change implementation and compare it to the documents normal review schedule. If the review schedule meets refurbishment timelines then the changes will be submitted to the doc author for incorporation during the next review. If the review cycle does not meet refurbishments timelines then NR will contact the doc owner and arrange to have the document released to refurbishment for updates. Once updated the document will be sent through it's normal review process. All changes will follow N-PROG-AS-0001, *Managed Systems*, N-PROG-AS-0006, *Records and Document Control* and any other appropriate governance.

### 2.4 Performance Indicators

Most Operations activities are to support other refurbishment groups and as such have no performance metrics. All governance changes and document development required to support nuclear refurbishment have been identified through a review process and are tracked on the Level 3 Operations and Maintenance Program schedule and tied to the OP-00-1410 milestone. Action tracking items have been created for individual procedure updates and progress is monitored bi weekly during progress review meetings conducted by the Refurbishment Operations Manager. The L3 O&M Program Schedule is reviewed and updated monthly and reported on at the integrated schedule review meeting. A listing of the various AR# has been appended. All have been completed and signed off in Action Tracking.

Title:

**DARLINGTON REFURBISHMENT - OPERATIONS PROGRAM MANAGEMENT PLAN**

### **3.0 ROLES AND ACCOUNTABILITIES**

#### **3.1 Director Operations and Maintenance -DNGS**

Ensures qualified staff is in place to implement requirements of N-PROG-OP-0001 and support Nuclear Refurbishment

#### **3.2 Director Operation and Maintenance –NR**

Ensures qualified staff is in place to specifically implement requirements of N-PROG-OP-0001 with respect to Nuclear Refurbishment

#### **3.3 Manager - Operations DNGS**

Reporting to the Darlington Director of Operations and Maintenance is responsible for Station Operations, including the operating units, excluding the units that are in refurbishment and turned over to the NR Operations Manager. During the preparation phase of refurbishment the DNGS Operations Manager will review and approve new governance generated for refurbishment.

Primary contact point for the NR Operations Manager for interface and coordination strategy between Darlington Station Operations and NR Operations.

#### **3.4 Manager - Operations- NR**

Reporting to the Director of Operations and Maintenance, Nuclear Refurbishment, is responsible for the planning, preparation and execution phases of Operations for the refurbishment unit(s), and to ensure that appropriate governance and other documentation is in place to support this effort.

Title: <b>DARLINGTON REFURBISHMENT - RADIATION PROTECTION PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

N-PROG-RA-0013 *Radiation Protection (RP) Program* [R-1], implements a series of standards and procedures for the conduct of activities within nuclear sites and with radioactive materials, intended to achieve and maintain high standards of RP.

This Darlington Refurbishment Radiation Protection Program Management Plan (PgMP) stipulates radiation protection requirements and processes specific to the Darlington Refurbishment Project execution. It conveys how employees working within the Darlington Refurbishment Program will do their work while meeting the intent of the existing the OPG Management System, specifically N-PROG-RA-0013.

## 2.0 PROGRAM REQUIREMENTS

N-PROG-RA-0013 *Radiation Protection (RP) Program* remains the overall program document for operating units across the OPG Nuclear fleet including refurbishment units. The hierarchy of the governing documents and the relationship of these documents to the program objectives are shown in N-PROG-RA-0013, Fig.1.0 *Radiation Protection Program Implementing and Interfacing Documents*

Some RP governance and supporting documents may require revision in order to meet the needs of Darlington Refurbishment. The Nuclear Refurbishment Radiation Protection Department shall receive and review any requests for governance revisions. These document reviews and potential revisions shall follow N-PROG-AS-0001, *Managed Systems*, N-PROG-AS-0006, *Records and Document Control* and any other appropriate governance. Nuclear Refurbishment Radiation Protection has a set of P6 L3 schedule items (NR.FN.OM.06.U2.73444.6.02.01) to perform reviews of the RP Program and governance to identify any potential revisions required.

Any program changes will be documented in future revisions of this Plan.

### 2.1 New Governance Specific to the NR Project

The implementation and strategy description of the Radiation Protection program in Nuclear Refurbishment is documented in NK38-REP-09701-10088 "Darlington Nuclear Refurbishment -Radiation Protection Strategy" [R-2].

### 2.2 Ownership Transfer Plans

NK38-PLAN-09701-10113 Sht: RAD-01 "Radiation Protection - Ownership Transfer Plan" [R-3] documents the issues and interfaces between the Nuclear Refurbishment Radiation Protection Department and the DNGS Radiation Protection Department.

### 3.0 ROLES AND ACCOUNTABILITIES

#### 3.1 Director, Radiation Safety

With respect to the Darlington Refurbishment Project:

- Assumes Program Owner roles and accountabilities outlined in N-PROG-AS-0001 for the RP program.
- Implements the RP program framework including setting standards of RP performance and ALARA.

#### 3.2 Department Manager, Radiation Protection – Nuclear Refurbishment

Provide and maintain Nuclear Refurbishment RP direction, programs, procedures and services pertaining to Health Physics, Occupational RP, and Nuclear Refurbishment RP coverage.

Roles and Responsibilities are detailed in NK38-PLAN-09701-10113 Sht: RAD-01 "Radiation Protection - Ownership Transfer Plan" [R-3]

Title: <b>DARLINGTON REFURBISHMENT - TRAINING PROGRAM MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The purpose of this Program Management Plan (PgMP) is to provide the Darlington Refurbishment Organization and other business unit support staff with a clear understanding of the training requirements for the Darlington Refurbishment Project.

This PgMP aligns with the requirements of NK38-NR-PLAN-09701-10001 Sht: 0001, Darlington Refurbishment Program Structure and takes its authority from D-PCH-09701-10000, Darlington Refurbishment Project Charter.

## 2.0 PROGRAM REQUIREMENTS

Due to the unique requirements associated with a refurbishment outage (multi-employer, owner-only islanding, Owner/Constructor configuration, the large scope and duration of the project, etc.), it is recognized that a dedicated training program is required for Darlington Refurbishment.

The Darlington Refurbishment Training Program has been developed consistent with the requirements of Nuclear and Corporate governance. The figure in Appendix A illustrates the relationship between Nuclear Governance specific to training and training documentation developed specifically for the Darlington Refurbishment Project.

An overall Darlington Refurbishment Project Training Work Plan (NK38-PLAN-09701-10007) has been established to define the activities and tasks required to fulfill the training requirements for the Darlington Refurbishment Project. The Project Training Work Plan identifies the key elements and steps necessary for training the various staff at various phases of the Darlington Refurbishment Project. As the Darlington Refurbishment Project progresses through its various phases, the Training Work Plan will be reviewed and revised as required.

The Darlington Refurbishment Training Program is structured to address the following three areas:

- (1) Supplemental personnel on-boarding training;
- (2) Supplemental personnel Project/Job Specific Training;
- (3) OPG Personnel Training
  - a) Operations & Maintenance Personnel Training;
  - b) Engineering Training;
  - c) Modifications and Return to Service Training.

## Plan

<b>OPG Proprietary</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0019</b>	Revision Number: <b>R003</b>	Page: <b>6 of 12</b>
Title: <b>DARLINGTON REFURBISHMENT - TRAINING PROGRAM MANAGEMENT PLAN</b>		

*N-PROG-TR-0005, Training:* Remains the overall training program document and provides the structure, processes, and tools for defining, developing, implementing, documenting, assessing, and improving the training required to ensure Nuclear staff have the appropriate knowledge and skills. This program document describes the structure and content of OPG Nuclear Training Governance and from this framework, additional tiered supporting Training Governance exists.

*N-TQD-901-00001, Nuclear Projects Training and Qualification Description:* This TQD describes the training requirements for OPG (Darlington Refurbishment, Project and Modifications and Fleet) personnel.

**Note:** For OPG personnel, N-TQD-901-00001 specifies the **incremental** training requirements – such as Interface and Islanding training, Oversight training, etc. – in addition to existing OPG TQDs applicable consistent with the tasks that staff is performing.

*N-TQD-510-00001 Supplemental BTU Direct Hire And Contract Management Training And Qualification Description* defines the incremental training and qualification requirements for the BTU Direct hire and Contractor Personnel associated with Nuclear Refurbishment project

*NK38-GUID-09701-10021, Guideline for Training Oversight (Refurbishment):* This guideline assists OPG Nuclear Projects Training staff in the selection and application of training oversight activities required to support OPG Darlington Refurbishment Project Managers in the preparation of the Project Oversight Plan and to provide recommended practices for the preparation, execution and documentation of training oversight activities.

*N-GUID-09701-10118, Nuclear Refurbishment Training Change Control:* Each modification associated with Darlington Refurbishment can potentially result in the need for new or modified training. The process detailed in N-GUID-09701-10118 covers:

- The preliminary review of each modification to determine if training action will be required;
- The appropriate actions to initiate detailed training assessments (Training Needs Analyses);
- The process for tracking training issues associated with each modification;
- The responsibilities of involved staff/stakeholders.

It should be noted that existing governance covers the processes outlined above primarily in N-PROC-MP-0090, Modification Process, and N-PROC-TR-0008, Systematic Approach to Training. N-GUID-09701-10118 only identifies the specific implementation details associated with Darlington Refurbishment.

## Plan

OPG Proprietary		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0019</b>	Revision Number: <b>R003</b>	Page: <b>7 of 12</b>
Title: <b>DARLINGTON REFURBISHMENT - TRAINING PROGRAM MANAGEMENT PLAN</b>		

*N-GUID-09701-10122, Guideline for Nuclear Refurbishment - Training Plan*

*Development:* The purpose of this document is to provide guidance on the practice of developing a Training Plan and to describe the practice overview, requirements, activities, and key terms related to these requirements.

This document applies to Darlington Refurbishment Projects and Darlington Refurbishment related projects and modifications.

There are two scenarios where a training plan is required:

- Vendor Training Program Training Plan - Training developed and delivered by Vendor to their own staff (i.e. under Vendor QA Program);
- OPG Training Program Training Plan - Training developed and delivered by Vendor to OPG staff (operators, maintainers, engineers, etc.) (i.e., under OPG QA Program).

### 3.0 ROLES AND ACCOUNTABILITIES

#### 3.1 Contractor/Vendor/Manufacturer

- Provide OPG with a training plan that clearly shows how each trade will be processed and trained to meet the requirements to work at an OPG nuclear station;
- Train their personnel to be competent to perform the work they are assigned;
- Provide training to own staff for rehearsal on the mock-up;
- Maintain documented evidence of all training provided to their staff including examinations, training attendance, assessments, certificates, course correspondence, and objectives;
- Provide to OPG a summary of qualified personnel, training rosters, examinations, assignments, and evaluations;
- Accountable for the QA of training provided to their staff;
- Provide own facilities for any training conducted under their accountability;
- Accountable for the scheduling and rostering of their training.

Plan

<b>OPG Proprietary</b>

Sheet Number: <b>0019</b>	Revision Number: <b>R003</b>	Page: <b>8 of 12</b>
Title: <b>DARLINGTON REFURBISHMENT - TRAINING PROGRAM MANAGEMENT PLAN</b>		

- **Vendors must demonstrate and ensure all workers are qualified and competent to perform assigned work. One of the most important principles of personnel qualification is the qualification being traceable.**
- Vendors must utilize TIMS or their own program that incorporates the principles of a robust Qualification tracking process to adequately demonstrate worker qualifications. Holders of Record and Supervisory competence must also be robust. This means that when someone is qualified, a declaration of competency form completed by the Contractor organization must be submitted to OPG, and the associated records including examinations must be available. Qualification of Workers will be a focus area for OPG and their respective Oversight Groups. Refer to OHSA and N-GUID-09701-10011 Safety Essentials Guide. Appendix A and N-TQD-510-00001 Supplemental BTU Direct Hire and Contract Management Training and Qualification Description – 1.8.1. Contract Personnel Training and Qualification Traceability.

### 3.2 Project Manager

- Oversee the training plans provided by the vendor, with support from NR Training;
- Provide oversight of the development and delivery of specialized training.

### 3.3 Director, Nuclear Refurbishment Training

- Is the owner of this document and is accountable for its definition, implementation and continuous improvement;
- Manages and provides oversight of Darlington Refurbishment training plans and programs;
- Provide support in overseeing contractor developed training material and delivery.

### 3.4 Senior Officer Training Technologist, Darlington Refurbishment Training

- Provide support in overseeing contractor training plans and programs including accountability for monitoring and trending performance metrics;
- Provide support in overseeing contractor development and delivery of training material.

### 3.5 Training Section Manager, Refurbishment Training Change Control (TCC)

- Oversee the training analysis of modification and procedure revisions;

- Accountable for the initial update/incorporation of the contractor/vendor/ manufacturer training plans and training materials;
- Accountable for turning vendor training materials into the OPG training material collection and issue in Asset Suite;
- Maintain implementation documents (INS, GUIDE) for the NR TCC Centre;
- Supervise NR TCC Centre staff and contractors;
- Single Point of Contact for working with Fleet Learning & Development to ensure NR Modification training is included in existing training schedules for OPG staff;
- Accountable for developing and maintaining reporting metrics which to ensure training in support of operational readiness and training completion to ensure qualified personnel for AFS/RTS.

### 3.6 Training Officers and Authorized Training Supervisor (NR-TCC)

- Conduct and document the training analysis requirements for O&M/Engineering, etc. on modifications and procedure changes;
- Update NR TCC database for tracking each Master Engineering Change;
- Run compliance reports for action tracking to ensure milestones are on track;
- Design Technical Updates briefings to inform personnel whose skills will be not be affected by the modification, as required;
- Review training plans received from vendor and accept on behalf of OPG;
- Review training materials received from Vendors and accept on behalf of OPG;
- Issue revised vendor-developed training materials as approved OPG training materials in Asset Suite;
- Provide incremental development and delivery as required, based on vendor capabilities (e.g. simulator-based training) as required.

### 3.7 Learning & Development Division

- Provide incremental development and delivery as required, based on vendor capabilities (e.g. simulator-based training).

Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

The purpose of this Darlington Nuclear Refurbishment (NR) Human Performance (Hu) Management Plan is to improve human performance by developing an execution strategy that stipulates Hu initiatives, requirements and processes specific to the Darlington Nuclear Refurbishment Project.

With the successful execution of this strategy, it is anticipated that error-likely situations shall be reduced and potential challenges identified and addressed by establishing, promoting and reinforcing positive behaviours, while operating with a defense-in-depth philosophy.

### 1.1 Vision

Nuclear Refurbishments vision is to achieve Excellence in human performance by proactively minimizing the severity of events through the rigorous use of error prevention techniques, with a defense-in-depth philosophy.

## 2.0 REQUIREMENTS

This Hu plan aligns with N-PROG-AS-0002, 'Human Performance Program' and the 2016 – 2018 Fleet Human Performance Excellence Plan N-PLAN-09030-10000, which provides the foundation to guide OPGN toward Hu Excellence. For the 2016-2018 Business Plan, OPG is targeting a significant improvement in Hu by achieving reductions in human errors by focusing on three vital Hu strategic focus areas to drive improvements across the OPGN fleet.

The key initiatives described herein support and are built on the same three strategic foundations with detailed actions specific to the Refurbishment functional area;

### 1. Leadership Accountability

- Leaders understand, and model the behaviours expected from all staff, and continuously communicate and reinforce expectations.
- Leaders effectively communicate to the organization with a strong bias for safety and quality as opposed to results only.
- Leaders consistently use Human Performance and Lessons Learned to gain understanding, and ensure individuals', supervisors' and organizational learning.

### 2. Supervisor Effectiveness

- Supervisors set and communicate clear expectations to positively influence Hu behaviours and appropriate use of Hu tools.

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>7 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

- Supervisors value the time spent with staff "in their field", and provide quality coaching.

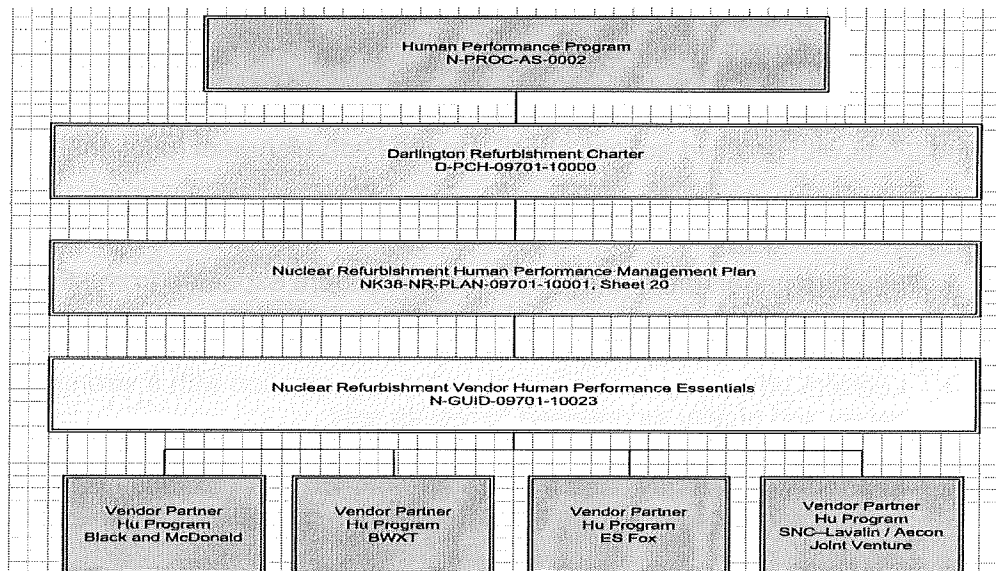

### 3. Procedure Use and Adherence

Supervisors create and maintain a culture where:

- Individuals at all levels value, and follow procedures to prevent events.
- Individuals understand the procedure's intent and purpose.
- If the procedure cannot be followed as written then the individuals STOP and have it corrected.
- Procedures are fixed rapidly, and are available for next use.

The Nuclear Refurbishment Hu Manager shall receive and review any requests for governance revisions to support the program. These document reviews and potential revisions shall follow N-PROC-AS-0001, 'Managed Systems', OPG-PROG-0001, 'Records and Document Control' and any other appropriate governance.

**Figure 1**  
**Hu Governance Framework for the NR Project.**

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>8 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

## **2.1 Hu Governance Specific to the NR Project**

This Hu Management Plan applies to all OPG and Vendor Partners working on the Darlington Nuclear Refurbishment Project.

Nuclear Refurbishment Construction Execution in conjunction with Vendor Partner Senior Leadership has the overall accountability for ensuring Hu initiatives are in place and implemented effectively for the NR Project.

The Project Bundles that comprise the aggregate of the NR Project are as follows:

1. Shut down, Lay-up and Services
2. Islanding
3. Fuel Handling
4. Retube and Feeder Replacement
5. Turbines and Generators
6. Steam Generators
7. Balance of Plant

Additionally, Refurbishment AISC Projects executed by Projects & Modifications will be supported by the NR Project.

## **2.2 Hu Alignment with OPGN Fleet**

The Hu Manager for the NR Project is an active member of the OPGN Hu Peer Team and is aligned with Hu Corporate Functional Area Manager (CFAM) on the program dashboard and improvement initiatives; understands and executes Peer Team long-term goals and plans, and maintains open communication with Functional Team and fleet peers.

## **2.3 Hu Alignment with Darlington Nuclear Generating Station (DNGS)**

The Hu Manager's for DNGS and NR Project will meet regularly and conduct periodic walk-downs to demonstrate integration and collaboration. As Hu professionals continually strive to ensure open and effective communication and strategically cross pollinate and support Hu initiatives where required.

NR Project will ensure the Hu Manager or delegate attends the DNGS Hu Steering Committee Meeting and the Journey of Excellence meetings.

Additionally, the Hu Managers will participate in significant event investigations, and work seamlessly to ensure alignment and appropriate lessons learned are utilized across DNGS.

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>9 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

## **2.4 Nuclear Refurbishment and Vendor Partner Integration**

A Nuclear Refurbishment and Vendor Partner Integration strategy is required to foster 'One Team', alignment and to assist in achieving excellence in Hu throughout the NR Project.

In support of this integration strategy, the NR Leadership 'One Team' comprised of OPG and Vendor Partners will demonstrate alignment and focus on Hu initiatives, trends and subsequent metrics at the monthly Project Steering Committee and Vendor Summit meetings to strive for Excellence in Hu.

## **2.5 Leadership Accountability**

Managing Hu proactively requires accountability and ownership with a desire by management, including vendor partners' management to improve Hu throughout the NR Project.

Leadership behaviours shall demonstrate and model the desired behaviours that are expected of all personnel working on the NR Project and at Darlington Nuclear Generating Station.

Leaders are consistently communicating and reinforcing desired behaviours and expectations with a strong bias for the NR Project Pillars; Safety, Quality, Schedule and Cost. 'At Risk' behaviours are immediately corrected by on the spot coaching.

## **2.6 Performance Measures**

Common performance measures create the ability to make some comparisons of changing performance through trending and analysis of data. This will be accomplished utilizing data from the Vendor Partners Event Free Day Reset (EFDR) and Observation and Coaching (O&C) programs.

These metrics will be used internally and shared externally to identify trends, whether positive or adverse and will be reviewed for subsequent corrective actions. The vendor will discuss, on a regular basis, the corrective actions and their effectiveness.

OPG will conduct or request at least annually from its Vendor Partners, focused self assessments around the health of their HU program to gauge effectiveness of their HU Program implementation, culture and to identify Areas for Improvement (AFI's) and to ensure the overall Program Management Plan (PgMP) requirements are met. (NK38-NR-PLAN-09701-10001 Sht. 1)

### **2.6.1 EFDR Targets**

These targets are subject to change based on analysis of performance.

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>10 of 20</b>
<b>Title:</b> <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

Additionally, when Unit 2 is defueled and declared a 'Construction Island' the EFDR Criteria (N-INS-09030-10002) will be changed and updated to reflect the construction focus unique to the NR project activities.

The following measures will be used to evaluate the overall health, reliability and robustness of our NR Hu Management Plan:

a) Nuclear Refurbishment Project EFDR Target

NR Project Targets	2016	2017	2018	2019
(NR P-EFDR)	1	3	2	1

b) Department EFDR Targets: Number of days between resets and Average number of days between resets will be tracked.

\*Targets subject to change on next revision to this Plan.

NR Project Department Targets	2016	2017	2018	2019
Shut down, Lay-up and Services	1	2	2	1
Islanding	4	4	2	-
Fuel Handling	6	10	2	-
Retube and Feeder Replacement	4	30	25	20
Turbines and Generators	2	15	10	2
Steam Generators	2	10	10	2
Balance of Plant	2	25	18	15
Operations	4	14	14	8
Maintenance	4	20	18	14
Radiation Protection	2	20	18	14
Project Office	2	5	5	3
Construction Oversight	1	5	5	3
Engineering (not Bundle related)	3	7	7	5

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>11 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

- c) Crew Event Free Day Reset – Steering Committee Meetings / Vendor Summit
- d) At least annual Self Assessments of Hu Program

Additional metrics will be used to monitor and evaluate Hu trends for the NR Project.

#### 2.6.2 Event Free Day Reset Structure

The Event Free Day Reset (EFDR), also referred to as 'Clock Reset', is an essential Hu component that shall measure the NR Projects' human performance and evaluate performance (adverse) trends that will enable the team to pursue Excellence in human performance by proactively implementing corrective actions to prevent recurrence. (INPO 08-004)

In the spirit of 'ONE Team', if an event triggers the EFDR Criteria (N-INS-09030-10002) an EFD Reset will be appropriated, regardless of the contributing organization. EFD Reset will be structured as follows for the NR Project:

#### 2.6.3 Station Level Threshold:

- NR Project will be set at the OPGN Station Level threshold to capture (potential) significant events and will be managed by NR Senior Leadership with support from the Hu Manager.
- NR Project stoplights will be strategically placed throughout the NR Project to provide a visual aid to all personnel on performance status. These stoplights will vary and be distinctive to DNGS to avoid confusion and will be appropriately identified as NR Project.

#### 2.6.4 Department Level Threshold:

- Project Bundles along with supporting departments will administer their own EFD Reset. The criteria will be set at the OPGN Department Level threshold, and will be managed by the Project Director with support from the Hu Manager.

#### 2.6.5 Crew Level Threshold:

Low level reporting is crucial to minimizing the frequency and severity of consequential events, and supports a Just Culture, where individuals report near miss incidents and this desired behaviour is reinforced by the organization.

- Vendor Partners who have the lion share of higher risk work activities shall implement crew level EFDR criteria to mitigate and eliminate significant and consequential events.

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>12 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

## **2.6.6 DNGS Station Event Free Day Reset:**

- The DNGS Station resets will be observed by the NR Project and subsequent lessons learned will be disseminated throughout the NR Project, to prevent recurrence of similar events.

## **2.7 Event Communication Protocol**

NR Projects Hu reporting protocol will utilize the OPG Human Performance Lessons Learned (HuLL) process (N-INS-09030-10001) when significant issues or events occur, and as requested by Senior Leadership.

Line will lead the development and communication efforts in conjunction with robust and SMART corrective actions to prevent recurrence of events.

## **2.8 Lessons Learned / Operating Experience**

As a learning organization, Operating Experience (OPEX) is a vital component to ensure event free performance. Relevant OPEX shall be incorporated and embedded into planning, training and execution of work activities via comprehensive work packages.

Human Performance Lessons Learned (HuLL's) as indicated above, will be the basis for internal OPEX to prevent recurrence of events.

## **3.0 ROLES AND ACCOUNTABILITIES**

### **3.1 Nuclear Refurbishment Leadership (Including Vendor Partners)**

The Nuclear Refurbishment operates as ONE TEAM, and the NR Leadership shall advocate OPG corporate behaviours, values and nuclear safety traits to create an environment that promotes, encourages and rewards Excellence in human performance.

### **3.2 Project Bundle Directors and Managers**

- Promote Hu and defense-in-depth throughout all work evolutions
- Evaluate Hu events based on significance and determine applicability to EFDR criteria
- Support and endorse Hu at Steering Committee and Vendor Summit forums
- Actively support Hu Advocates in their roles

### **3.3 Human Performance Manager**

Refurb Execution Human Performance

- Develops, implements, and maintains NR Hu governance

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>13 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

- Provides oversight to ensure consistency across Project Bundles
- Develop Hu strategic initiatives, to align with overall Hu Excellence Plan, action plans, performance measurements, and oversight to accomplish goals aimed at improving human performance, especially for risk-important systems and related activities
- Monitors and assesses station trends in Hu for relevant OPEX to share with NR
- Integrates and Collaborates with vendor partners, CFAM Hu, DNGS Hu
- Industry benchmarking
- Executing the programs, processes and procedure outlined in governance
- Aligning with the Hu CFAM on the program dashboard and improvement initiatives

### 3.4 Nuclear Refurbishment Personnel

Consciously and rigoursly utilize event free tools with robust defenses when performing work activities to mitigate human error and prevent events.

### 3.5 Hu Working Committee

Hu Advocates and Hu Professionals will meet regularly to integrate and collaborate on key Hu initiatives to improve Hu across NR Project.

## 4.0 DEFINITIONS AND ACRONYMS

### 4.1 Definitions

**Behaviour:** Observable (movement, speech) and non-observable (perception, thought, decision, emotional response and activity) by an individual. The mental and physical efforts to perform a task.

**Coaching:** The purpose of facilitating changes in behavior of another person through direct interaction, feedback, collaboration and positive relationships.

**Defense-in-Depth:** The physical plant's and administrative system's built-in capacity to detect or prevent errors without suffering undesirable consequences; the multiple functions and associated techniques existing within the human performance system to protect people from error and protect the physical plant from people's actions.

**Defense:** A measure, including expected behavior that protects against various hazards or mitigates the consequences of a hazard.

**Event:** An unwanted, undesirable consequence/change in the state of plant structures, systems or components or human/organizational conditions that exceeds established significance criteria and involves human action or inaction in the causal chain.

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>14 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

### Human Performance:

**1) Individual Sense** – A series of behaviours executed to accomplish specific task objectives.

**2) Organizational Sense** – The sum of what people (individuals, leaders, managers) are doing and what people have done; the aggregate system of processes, influences, behaviours, and their ultimate results that eventually become manifest in the physical plant. (Note: What some people have done affects what others will be doing later; a “result” for one person may be a “factor” for another)

**Near Miss:** Any occurrence that could have resulted in undesirable consequences but did not; ranging from minor breaches in defenses to incidents where all available safeguards were defeated, but no actual losses were sustained.

**Procedure Adherence:** The expectation that approved written guidance is followed as written and as intended.

**Vendor Partner(s):** Contractor organizations procured for the purposes of Engineering, Procurement, and / or Construction services for the Nuclear Refurbishment Project.

## 6.0 HUMAN PERFORMANCE INITIATIVES FOR NUCLEAR REFURBISHMENT

The path to Hu Excellence is an iterative process, and this Hu Management Plan will be a living document. The following Hu initiatives tabled below are paramount to achieving Excellence in Hu for the NR Project, and support the OPGN Excellence Plans' three strategic foundations; Leadership Accountability, Supervisor Effectiveness and Procedure Use and Adherence.

Many of these actions are in progress and will be tracked using a Hu Metrics Dashboard in conjunction with self assessments.

Hu Initiatives	Action / Description	Date Required	Owner
Human Performance Working Committee	Comprised of Hu leaders and Hu Advocates Meets as per ToR with Quorum <ul style="list-style-type: none"> <li>Quorum metrics tracked for Project Steering Committee meetings</li> </ul>	Established - Ongoing	K. Brining
Hu at Project Steering Committee meetings	Project Steering Committees meetings agenda will be updated to include Hu <ul style="list-style-type: none"> <li>Share metrics and Hu initiatives</li> </ul>	Established - Ongoing	Leadership

Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

## 7.0 HUMAN PERFORMANCE PHASES (FOCUS AREAS)

As we progress into the NR Project, there will be key phases to ensure that all personnel are re-calibrated to ensure individual and organizational behaviours are maintained to standards and expectations.

Below are proposed phases that are subject to change due to performance indicators, such as EFDR and Observation & Coaching trends:

### 7.1 Phase 1

October to December 2016:

- Senior Leadership Joint Walk-downs
- Rapid Trending to CORE 4
- Communications (Stand-ups, Signage) supporting rapid trending
- Safety Ambassador with strong Hu Advocacy focus)
- Construction Oversight -continuous throughout U2 NR

### 7.2 Phase 2

January to March 2017:

- Why I work safely campaign
- Situational Awareness (D1711)
- Peer Checking
- Increased Field Supervision with Paired O&C's

### 7.3 Phase 3

April to July 2017

- Campaign focused on lessons learned to date (TBD)
- Situation Awareness (D1711)
- Peer Checking and Co-worker coaching
- Increased Field Supervision

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>SHT 0020</b>	Revision Number: <b>R001</b>	Page: <b>19 of 20</b>
Title: <b>NUCLEAR REFURBISHMENT HUMAN PERFORMANCE MANAGEMENT PLAN</b>		

## 7.4 Phase 4

(August - TBD)

- Determine focus areas based on lessons learned from previous Hu phases

## 8.0 HUMAN PERFORMANCE CAUTIONS

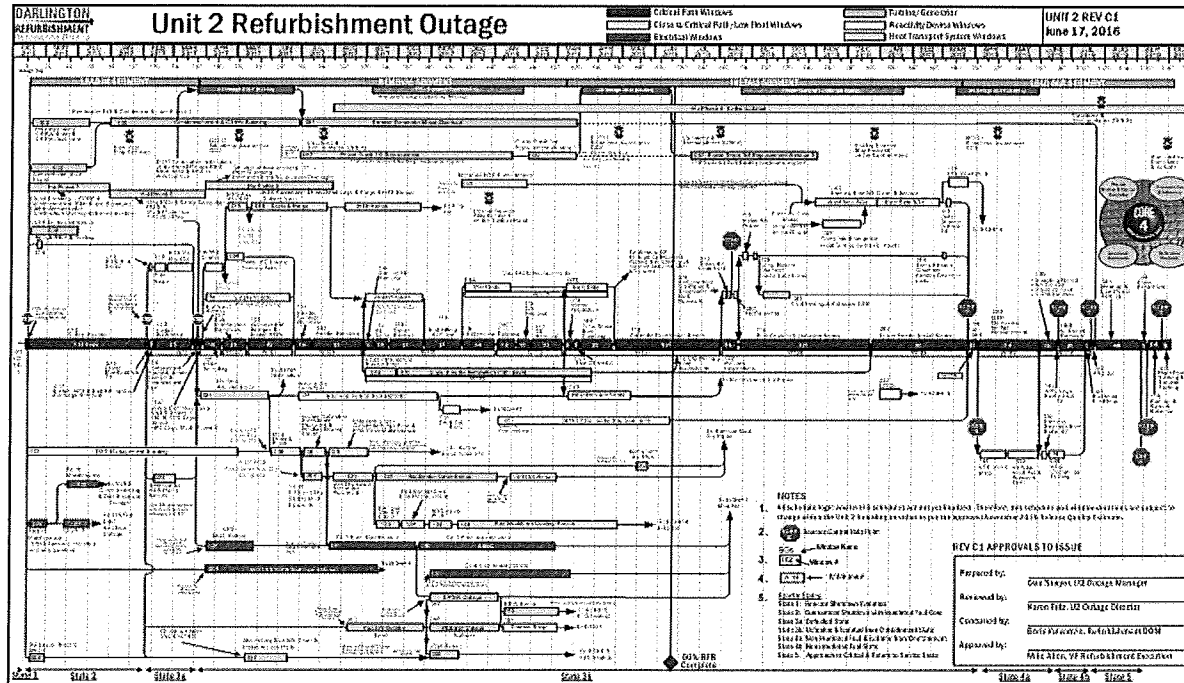

Hu Cautions are a visual aid (Yellow Stoplight) along with Leadership presence to alert workers to potential error-likely situations. When workers consciously and rigoursly utilize various error prevention tools and techniques events will be mitigated.

The following proposed cautions are deliberately embedded into the schedule and subject to change depending on focus areas, adverse trends and NR Leadership discretion.

1. December 21, 2016 to January 4 2017: Holidays and New Year (Situational awareness (SA), eliminating distractions)
2. March 2017: D1711 (Importance of SA and Correct Component Verification (CCV))
3. June 30, 2017: Canada Day long weekend, changes in weather, and vacation schedules (Focus on Teamwork and implementing Heat Stress lessons learned)
4. December 22, 2017 to January 2, 2018: Holidays and New Year (Situational awareness (SA), eliminating distractions)
5. March 2018: D1831(Importance of SA and Correct Component Verification (CCV))
6. June 30, 2018: Canada Day long weekend, changes in weather, and vacation schedules (Focus on Teamwork and implementing Heat Stress lessons learned)
7. December 22, 2018 to January 2, 2019: Holidays and New Year (Situational awareness (SA), eliminating distractions)
8. March 2019: D1941(Importance of SA and Correct Component Verification (CCV))
9. June 28, 2019 Canada Day long weekend, changes in weather, and vacation schedules (Focus on Teamwork and implementing Heat Stress lessons learned)
10. September 2019: Summit Fever (Complacency and shortcuts)

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

### 1.0 PURPOSE

The purpose of this Quality Plan (QP) is to address the quality requirements as they relate to the Darlington Refurbishment Program (DRP) per D-PCH-09701-10000, Darlington Refurbishment Charter. The objective of this QP is to outline continuous quality surveillance that will be conducted on a sampling basis to address the quality and regulatory requirements through all of the DRP phases, provide assurance that project completion assurance is obtained and to interface with the project staff and regulator.

This QP provides a link between the Ontario Power Generation's (OPG) Nuclear Management System and the quality systems of the contractors engaged in the DRP. Figure 1 depicts the overall quality management system hierarchy as implemented in OPG.

Work performed for the DRP will be subject to additional quality surveillance to ensure requirements of the Darlington Refurbishment Charter (D-PCH-09701-10000) are met. See Figure 2.

The preparation, approval, issue, distribution and revision of this QP is in accordance with OPG's Nuclear Management System. This QP, referenced OPG processes and Refurbishment procedures collectively meet the applicable requirements of CSA Standards and ISO (the International Organization for Standardization).

## Plan

Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>8 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

## 2.0 REQUIREMENTS

### 2.1 Background

OPG's Board of Directors and the Ontario Government approved the Refurbishment of the Darlington Nuclear Generating Station. The refurbished Darlington station will provide 30 plus years of clean, reliable, base load power, at a cost lower than other alternatives considered.

The Darlington Refurbishment Project (DRP) has applied industry experience on the planning and execution of major projects, including considerable project management expertise of other OPG operation groups.

Major contracts have been awarded using a commercial strategy as follows:

- There is more than one prime contractor. OPG has a separate contract for each prime. They are responsible for the completion of work under their particular contract.
- OPG is the integrator between the prime contractors and is responsible for the entire project.
- OPG and the contractors are aligned on common goals.
- OPG retains project management responsibility and design authority for the DRP.

### 2.2 Objectives

The objectives of the DRP are:

- i. Refurbish the Darlington Nuclear Generation Station to extend its operational life 30 years.
- ii. Complete preparations for the Refurbishment planned outages as follows:
  - Unit 2 – October 2016 to September 2019 (35 months)
  - Unit 3 – October 2019 to August 2022 (34 months)
  - Unit 1 – January 2021 to October 2023 (33 months)
  - Unit 4 – September 2022 to May 2025 (32 months)
- iii. Complete all Refurbishment Outages within the planned period with appropriate consideration to all aspects of the management of the facility

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>9 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

including health, safety, environment, security, economics, quality and regulatory compliance.

- iv. Complete the DRP within the planned budget as approved by the OPG Board of Directors.
- v. Complete all Refurbishment Outages with zero lost time accidents or restricted work injuries.

DRP requirements are:

- i. Refurbishment activities will be conducted in accordance with applicable federal, provincial and OPG requirements.
- ii. All refurbishment deliverables shall meet applicable Canadian Nuclear Safety Commission (CNSC) licensing requirements.
- iii. Environmental releases will be minimized and acceptable under all normal, abnormal and accident conditions in accordance with approved requirements.
- iv. Personnel exposures will be As Low as Reasonably Achievable (ALARA) through all phases (i.e., design, construction, commissioning, available for service and unit readiness) in accordance with Radiation Protection requirements.
- v. An integrated project schedule will be developed and maintained through the entire life of the DRP to ensure project design, verification, licensing, purchasing, fabrication, installation, construction, testing, commissioning and turnover activities are completed as scheduled.
- vi. The QP will be implemented to ensure all elements of the overall DRP are carried out as required and additional surveillance is conducted on the Refurbishment work.

## 2.3 Policy

To ensure refurbishment is completed in a safe, timely, economic sound manner and to the required quality expectations, the DRP implements the Darlington Refurbishment Charter (D-PCH-09701-10000) to perform work in accordance with the managed systems defined in:

- OPG-POL-0033, OPG Business Model,
- N-POL-0001, Nuclear Safety Policy,
- N-CHAR-AS-0002, Nuclear Management System.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>10 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

All DRP project work will be conducted under the authority of OPG consistent with the licensing basis and in accordance with the OPG Nuclear Management System.

## 2.4 Licence Requirements

Per the Darlington Nuclear Generating Station Nuclear Power Reactor Operating Licence (PROL), the licensee is required to implement and maintain a management system in accordance with Canadian Standards Association (CSA) Standard N286-12, Management System Requirements for Nuclear Facilities. Figure 3 provides an overview of the regulatory requirements, project governance, and project executable processes.

For each Licence Condition (LC) in the PROL, the Licence Conditions Handbook (LCH) provides mandatory compliance verification criteria that the licensee must follow to meet the conditions in the licence, operational limits and information regarding delegation of authority and applicable version of documents referenced in the licence.

N-LIST-08130-10025, CSA N286-12 to OPGN Governance Cross Matrix provides a mapping of OPG Nuclear (OPGN) governance to CSA N286-12 to demonstrate the Nuclear Management System (N-CHAR-AS-0002) compliance.

## 2.5 Organization

### 2.5.1 Project Organization

The Darlington Refurbishment Project Organization structure is described in the DRP Charter (D-PCH-09701-10000).

### 2.5.2 Project Quality Management Organization

The Project Quality Management Organization is depicted in Figure 4. This group will perform the following:

- Develop, maintain and implement a DRP Quality Plan that ensures the quality and management system requirements for the DRP are executed and completed.
- Establish and execute a project Quality Management Organization that:
  - a. Monitors, observes and performs continuous quality surveillance on each phase of DRP as a matrixed organization.
  - b. Provides assurance through the continuous quality surveillance activities that Project Completion Assurance is obtained.
  - c. Can escalate and implement corrective actions for critical issues.
  - d. Can stop or direct stoppage of work.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>11 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

e. Interfaces with other DRP internal and external independent assessment activities to coordinate and optimize the required quality surveillance activities for DRP.

- Establish metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.
- Oversee management of records of changes to the units during refurbishment.

The Darlington Refurbishment Program Quality Management Organization Functional Management Plan (NK38-PLAN-09701-10223 SHT 0014) details the scope, responsibilities and staffing plan for the Quality Management Organization. See Figure 5 for Quality Management organization process documents.

### 2.5.2.1 Quality Surveillance

The Project Quality Management Organization will conduct continuous quality surveillance activities based on sampling and oversight of the Refurbishment projects during the following phases (See Figure 6):

1. Shutdown/Layup
2. Design
3. Procurement
4. Construction
5. Commissioning
6. Available for Service
7. Unit Readiness
8. Closeout

Details associated with the above surveillance activities and records generated are outlined in NK38-GUID-09701-10038, Darlington Refurbishment Program Quality Surveillance Guide.

### 2.5.2.2 Project Priority List and Surveillance Schedule

The focus areas for surveillance performed by the Quality Management organization are as follows:

- (a) Safety Significant Items
  - i. Systems Important to Safety (SIS)
  - ii. Safe Operating Envelope (SOE) Systems

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>12 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

- (b) Regulatory Items
  - i. Safety Improvement Opportunities (SIOs)
  - ii. Integrated Implementation Plan (IIP)
  - iii. Regulatory Hold Points
- (c) Other Production and Reliability related project items
  - i. Restart Hold Points
  - ii. Impediments to Breaker Open and Breaker Closed
  - iii. Project Risk and issues

Based on these focus areas, the project quality surveillance prioritization is established using a risk graded approach. This approach takes into account the focus areas, vendor performance, cost, schedule and nature of work (First of a Kind and First in a While). Details of the process and list of priority projects are outlined in NK38-CORR-09701-0598247, Quality Management - Unit 2 Refurbishment Project Priority List.

The Quality Management organization will utilize the priority list of the projects to schedule Quality Management surveillance activities. Surveillances will be performed on the identified projects in the Engineering, Procurement and Field Execution areas; including review of required documents.

Quality Management surveillance schedule will be reviewed by the Quality Management organization on a regular basis and is subject to change to take into account changes in the project schedule, any risks, issues, Quality Management metrics and other oversight activities

### 2.5.2.3 Quality Management Metrics and Reporting

Surveillance observations and findings will be reviewed by the Quality Management organization on a regular basis. The assessment of the data will be documented as metrics and reported to the project. The process for developing issuance of Quality Management Metrics (including trending) and Reports are outlined in NK38-GUID-09701-10050, Darlington Refurbishment Quality Management Metrics Trending and Reporting Guide.

### 2.5.2.4 STOP Work Authority

Stop work authority for refurbishment is designed to provide employees and contractors with the responsibility and obligation to **stop work** when a perceived unsafe condition or behaviour may result in an unwanted result or event. See Appendix C for details.

### 2.5.2.5 Escalation of Issues

Escalation of issues by Quality Management organization related to the Darlington Nuclear Refurbishment (DNR) Project will be initiated after the issue has been approved for escalation by the Director Quality Management. Appendix D outlines the implementing process for escalation of issues.

Plan

<b>Internal Use Only</b>

Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>13 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

## 2.6 Personnel Capability

This work will be implemented by utilizing qualified OPG staff, contractors and subcontractors in accordance with N-TQD-901-00001, Nuclear Refurbishment Training and Qualification Description.

OPG has contracted a number of Engineering, Procurement and Construction Contractors for portions of the project scope. Consistent with OPG-POL-0033, OPG Business Model, all Contractors are on OPG's Approved Supplier's List (ASL).

## 2.7 Project Interfaces

The refurbishment project interfaces will occur between various organizations and contractors. The project shall develop a project execution plan, specific procedures, instructions, and guides, etc. to control the interfaces.

Interfaces will occur between:

- Refurbishment Project Team
- Darlington Station Organization
- OPG Nuclear Engineering
- Contractors
- Regulator (CNSC, TSSA, MOE, MOL etc.)
- Other utilities (Bruce Power, New Brunswick Power, etc.)

The Division of Responsibilities (DoR) outlining the interfaces with the various oversight groups will be documented in the "Refurbishment Project – DoR Execution Activities – Post Breaker Open" and is being tracked via an action in the Risk Management and Oversight Tool (RMO Action 00008847).

In accordance with the Contract Agreement, interface requirements between OPG and the Contractor are outlined in the Contractor Owner Interface Requirements (COIR). The following lists the key COIR documents associated with the DRP:

- N-COI-00120-0001, Contractor Owner Interface Requirements for Nuclear
- NK38-DAI-09701-10008, Retube Feeder Replacement Project Contractor Owner Interface Requirements

Any deviations to the interface agreement will be processed in accordance with OPG Nuclear Management System.

Table 1 outlines the contractors supplying services related to the DRP.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>14 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

## 2.8 Documentation and Data Control

### 2.8.1 Records and Documentation Control

OPG's process for management of nuclear records and documents throughout their life cycle is addressed in OPG-PROG-0001, Information Management.

The intention is to use existing OPG processes as required. Quality Records prepared by the Contractor will be provided to OPG in accordance with the Contract Agreement. Vendor technical documents will be processed according to N-PROC-MP-0078, Specification Review, Acceptance and Use of Vendor Technical Documents.

### 2.8.2 Information Management

The OPG process for management of OPG's information is addressed in OPG-PROG-0001, Information Management.

## 2.9 Business Planning

OPG-POL-0033, OPG Business Model defines how OPG operates its business. The business planning framework to ensure compliance with OPG Nuclear Management System is identified in N-PROG-AS-0005, Business Planning. This program ensures organization alignment and defines desired results in sufficient detail to support accountability, and ensures constrains, the availability of resources, and business risks are adequately addressed.

## 2.10 Communication

Communication of this plan will be implemented in accordance with the Darlington Refurbishment Charter (D-PCH-09701-10000).

## 2.11 Design and Development

The framework for assurance that design and procedure changes are consistent with the plant design and licensing bases is outlined in N-PROG-MP-0009, Design Management.

The process for plant modification from the engineering change request through installation, commissioning and closeout is defined in N-PROG-MP-0001, Engineering Change Control.

As part of the detailed design process, the need for Inspection and Test Plans and regulatory control points (Verification, Witness and Hold) are required to be defined. Guideline providing the process to be followed by OPG in the review, acceptance and field execution of Inspection and Test Plans (ITPs) prepared by the Engineering Procurement and Construction (EPC) vendors using their Quality Assurance Program and Certificate of Authorization in executing work on the Darlington Refurbishment Project is outlined in NK38-GUID-09701-10042.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>15 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

The Contractor will conduct design, modification, installation, support commissioning and closeout activities in accordance with the contract agreement.

### 2.12 Materials Management (including identification and traceability)

For material procured by OPG to meet the DRP scope requirements, the general identification and traceability control is provided in OPG-PROG-0009, Items and Services Management.

For materials procured by the Contractor, the requirements for material identification, shipping and traceability are in accordance with the Contract Agreement.

### 2.13 Corrective Action

The process to ensure that deficiencies, nonconformance, weakness with a process, document or service or conditions that adversely impact, or may adversely impact plant operation, personnel, Nuclear safety, the environment or equipment and component reliability are promptly identified and corrected is addressed in N-PROG-RA-0003, Corrective Action.

This program also provides the process to ensure in-house and external Operating Experience (OPEX) evaluation and assessment including actions to improve plant safety and reliability. Effective self-assessment and benchmarking process are also implemented by this program to promote continuous performance improvement.

Contractors will manage corrective actions in accordance with the Contractor Agreement.

### 2.14 Independent Assessments

N-PROG-RA-0010, Independent Assessments provides the processes for performing comprehensive and critical evaluation of all activities affecting Nuclear facilities (i.e., independent assessments performed by Nuclear Oversight and Nuclear Safety Review Board). The Program is owned and implemented on behalf of the Chief Nuclear Officer (CNO) by the Nuclear Oversight organization in accordance with N-PROC-RA-0048.

External assessments are also performed by groups outside of OPG such as WANO, CNSC, Refurbishment Construction Review Board (RCRB), Ministry of Labour (MOL), Ministry of Environment (MOE) etc.

### 3.0 ROLES AND ACCOUNTABILITIES

This QP identifies the Director, Quality Manager's role and responsibilities. Further details of project team roles and responsibilities are contained in approved role documents, project execution plans and other project documents.

Contractors will manage responsibilities in accordance with their contract agreement.

#### 3.1 Director, Quality Management

- Responsible for ensuring the oversight of quality and management system requirements for the DRP are executed and completed.
- Responsible for ensuring oversight by sampling of documentation related to configuration management.
- Responsible for ensuring continuous quality surveillance on a sampling basis is performed during each phase of DRP.
- Responsible for providing assurance through the quality surveillance activities that Project Completion Assurance is obtained.
- Can stop or direct stoppage of any work activity that in the Director's sole opinion creates an unacceptable business risk.
- Can escalate and implement corrective actions for critical issues.
- Responsible for the interfaces with other DRP internal and external assessment activities to coordinate and optimize the required quality surveillance activities for DRP.
- Communicate issues and findings as a result of surveillances with other Darlington Refurbishment Project Directors and leadership team.
- Establish and maintain interface with vendor Quality Assurance managers to communicate quality related issues and support required for resolution.
- Responsible for establishing metrics and reporting requirements that assess effectiveness of the DRP Quality Plan and surveillance activities performed.
- Can direct specific quality surveillance activities to prevent incidences based on risk and OPEX.
- Recruitment and staffing for the Quality Management organization.
- Budget for the Quality Management organization.

Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

### 3.2 Manager, Field Execution Surveillance & Completion Assurance

- Oversee the following Quality Management organization groups:
  - Field Execution Surveillance
  - Integration & Reporting
  - Documentation and Parts Oversight
- Interface with the following matrixed Quality Management groups in implementing the overall mandate of the organization:
  - Quality Engineering
  - Procurement Oversight
  - Refurbishment Licensing Support
- Plan, schedule and complete quality surveillance activities for the projects identified in the Project Priority List (NK38-CORR-09701-0598247) for the Field Execution Surveillance & Completion Assurance group.
- Ensure non-conformances related to quality surveillance are identified and critical issues are escalated to the Director, Quality Management.
- Recommend strategies for issue resolution and corrective actions related to quality surveillance activities.
- Take direction from Director, Quality Management.
- Integrate Quality Management Schedule.
- Oversee Records & Records Retrievably to ensure configuration management.
- Oversee preparation of all Quality Management reports and metrics.

## Appendix C: STOP Work Authority for Darlington Refurbishment

Stop work authority for refurbishment is designed to provide employees and contractors with the responsibility and obligation to **stop work** when a perceived unsafe condition or behaviour may result in an unwanted result or event.

### **SAFETY**

***Any employee or contractors have the right to stop work for unsafe work conditions or unexpected equipment conditions. See References below for details and conditions.***

### **QUALITY**

Similarly if an employee or contractor encounters a condition as described in the examples provided in (1) and (2) below, it should be brought to the attention of the applicable Project Director, Construction Execution Director, Engineering Design Authority, and the Director, Quality Management for stopping work.

In addition, any other work activity to items (1) and (2) noted below that in the Director, Quality Management sole opinion creates an unacceptable risk to the Project, will initiate a stop work in conjunction with the applicable Project Director and Construction Execution Director.

- 1) Significant Pressure Boundary deficiencies that;
  - a) Impact on system design integrity
  - b) Impact on overpressure protection requirements for the system
  - c) Violation of Pressure Boundary requirements per the Standards (CSA N285.0, ASME Section III, NCA-4000)
- 2) Significant Configuration Management deficiencies;
  - a) Inadequate or incorrect installed components in a safety system that pose an immediate threat to the safe continuation of installation or commissioning of a modification / repair, or results in an unsafe operation.
  - b) Discrepancies with documentation and field installation that impact the license condition and/or return to service requirements.

In the event a stop work decision is made per the conditions noted above for either Safety or Quality, the event response, reporting and recovery requirements are provided in NK38-GUID-09701-10036, Nuclear Refurbishment Work Stoppage / Reporting and Recovery. A SCR will be raised as required per Section 3.2 of NK38-GUID-09701-10036. In addition the appropriate internal and external notification(s) will be made dependent on the event as directed by N-PROC-RA-0020, Preliminary Event Notification.

As important as it is to stop work for said reasons, it is extremely important for OPG and the affected Contractor to rectify the situation to enable timely progression of work in a safe and quality manner.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>31 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

The decision to resume work will involve the stakeholders mentioned above (Construction Director, Project Director, Engineering Design Authority and Director Quality Management) via the Project Control Centre (PCC).

### References:

COIRs (N-COI-00120-00001 and NK38-DAI-09701-10008)

The safety of OPG's personnel, the Contractor's personnel, individuals at or near the Sites, and the public is of paramount concern to OPG. **OPG will require that Contractors and their Subcontractors maintain a level of safety equivalent to that of OPG employees while at OPG workplaces.**

### Corporate Safety Rules

All employees have accountability for Health and Safety. This includes making conservative decisions regarding our operations as they relate to the health and safety of our employees, contractors and the public. Also accountable for maintaining or taking positive steps to achieve a state of health that is consistent with the demands of his/her occupation. They are also **accountable for performing work safely and for identifying, communicating and, where appropriate, correcting workplace hazards in order to protect themselves, their co-workers, or the public from harm.**

**Authority to Stop Work - where a workplace is unsafe, or where "dangerous circumstances"\* exist** (Dangerous Circumstances: as defined by the Occupational Health and Safety Act, Section 44).

N-INS-08965-10016, Safety Hazard and Worker Safety Concern Resolution, Section 1.1.3

All *workers* have a responsibility to ensure they do not perform work in an unsafe manner and to identify and report:

- Unsafe conditions and work practices
- Defects in any equipment of which the *worker* is aware
- Contraventions of the OHSA and Regulations
- Existence of any hazard of which the *worker* is aware

### INPO 12-012, Traits of a Healthy Nuclear Safety Culture

Principle QA.2 (e) – Individuals stop work activities when confronted with an unexpected condition, communicate with supervisors, and resolve the condition prior to continuing work activities. When appropriate, individuals consult system and equipment experts.

**Plan**

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>

## Appendix D: Escalation of Issues by Quality Management

Escalation of issues by Quality Management department related to the Darlington Nuclear Refurbishment (DNR) Project will be initiated after the issue has been approved for escalation by the Director Quality Management.

Issues that potentially require *escalation* include, but not limited to:

1. **Items related to records issues, significant safety** (Nuclear, Radiological, Environmental or Conventional), **regulatory or quality issues**.
2. **Failure to implement or untimely implementation** of corrective actions.
3. **Significant recurring deficiencies (i.e., Level 2 Station Condition Record (SCR)) or management's inability to correct** adverse performance trend(s). For example:
  - a) Continuing non-compliance with Nuclear Management System requirements.
  - b) Identification of substantial deficiencies that result in a determination that DNR Project can no longer be assured of effective implementation.
4. A concern that has been the focus of, or potentially can become a significant project operating experience (OPEX) or regulatory issue.
5. Other areas of concern deemed necessary by the Director, Quality Management.

### **Initiation of Escalation Notice:**

1. Once an issue has been identified for escalation, QM shall input an *Issue* in the Risk Management Oversight (RMO) Tool. The Issue Title should be input with the following preceding words "**QM ESCALATION ISSUE**".
2. QM shall:
  - a) Notify the accountable Project Manager and Project Director of the escalation issue via email. The email should contain:
    - Details of the issue (i.e., draft SCR).
    - RMO Issue ID Number.
  - b) Initiate an SCR.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0023</b>	Revision Number: <b>R001</b>	Page: <b>34 of 34</b>
Title: <b>DARLINGTON REFURBISHMENT PROGRAM QUALITY PLAN</b>		

### **Response to an Escalation Notice**

1. The accountable Project Manager receiving the escalation notice shall prepare a response that includes the following:
  - a) Detailed corrective actions to be taken to address the escalated issue. The corrective actions shall include immediate and interim compensatory actions and long term solutions to address the issue.
2. Schedule for the corrective actions identified.

### **Escalation Monitoring and Reporting**

The Director, Quality Management shall monitor the status of corrective actions and the Project Director shall present status updates at the Refurbishment Issues and Opportunities Meeting.

**Board Staff Interrogatory #49**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh A2-1-1 Attachment 5, page 55

Ref: Exh D2-2-3, Attachment 6, RFR Contract, Article 16.2

Ref: Exh A1-6-1 Attachment 1, O. Reg 53/05, page 3

The first reference above provides the total commitments related to DRP, should OPG close the project, as \$284M. The second reference details the payments due by OPG to the RFR contractor should the contract be terminated early by OPG. The third reference is the regulation directing the OEB to ensure that OPG recovers firm financial commitments incurred with respect to DRP, if OPG makes the financial commitments prudently.

- a) Please provide details of what is included in the \$284M from reference one.
- b) Does the \$284M include all the payments to all contractors that OPG would be responsible for upon termination, such as those outlined in the second reference above?

**Response**

- a) The \$284M total commitments related to DRP, should OPG close the project, includes \$134M in accruals as at December 31, 2015. It also includes an estimate of \$150M as at December 31, 2015 for commitments not recorded as project costs. These include procurement commitments, costs to place the work in a safe state, as well as the costs of demobilizing the contractors from the DRP.
- b) The \$284M includes all the payments to contractors that OPG would be responsible for upon termination, consistent with the termination clauses in the contracts as at December 31, 2015.

**Board Staff Interrogatory #50**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Reference:**

Ref: Exh D2-2-3, Chart 1

**Interrogatory**

- a) Describe all “off ramps” for each major work bundle. What is the governing process for OPG to determine whether to exercise the off-ramps? How will this decision be communicated to all interested parties? What are the cost categories that will be payable to the contractors upon execution of each of the off-ramps?
- b) Describe what information OPG will gather, who will receive the information, when the information will be provided, and how the decision will be made whether to exercise the off-ramp during or after the completion of Unit 2. Provide the same information for all of the other units and the process OPG will use to assess whether to exercise the off-ramps throughout the project.
- c) Describe the governing process regarding the off-ramp for when a prime contractor is substantially below expectation. What does “substantially below expectation” mean? What information will this determination be based on? Who will have access to that information, when will it be provided, and who will make that decision?
- d) What actions must the contractors take to recover in the event of a project schedule delay for which the contractor is responsible?

**Response**

- a) OPG has incorporated both a termination for convenience and a termination for default clause in each of its major work bundle contracts. This allows OPG to take an “off ramp” at any time and terminate its contracts:

**Termination for Default:** If the contractor defaults, OPG will be entitled to terminate the agreement and exercise a number of self-help remedies. Termination for default would permit OPG to make a claim against the contractor for full contractual damages (subject to a percentage cap formula that is linked to the total contract price and certain other amounts).

**Termination for Convenience:** The agreement permits OPG to terminate the agreement for convenience at any time. Certain types of direct damages (but not full contractual

1 damages) will be payable by OPG to the contractor in such circumstances. Examples of  
2 direct damages under the contracts (with some variation between the contracts) are:

- 3
- 4 • work that has been performed to the date of the termination and for which OPG has
  - 5 not yet made payment;
  - 6 • an equitable portion of any fees which would have otherwise been payable on the
  - 7 next milestone date;
  - 8 • any contractor costs incurred in providing any work in progress; and
  - 9 • reasonable extra direct damages suffered by the contractor arising from the
  - 10 termination (such as out of pocket costs for demobilization).
- 11

12 Each circumstance will be dealt with as appropriate based on the facts. There is no  
13 special governance process required other than compliance with the contractual terms.  
14 Formal communications will be made in accordance with the contract terms; additional  
15 communications will be made as appropriate. Prior to terminating any contract, the OPG  
16 Project Manager will request a review by OPG's Senior Management team, which  
17 includes Finance, Law and Supply Chain.

18  
19 Upon decision to terminate for convenience, OPG is to provide written notice to the  
20 contractor, as set out in the contracts.

- 21
- 22 b) As discussed in L-4.3-1 Staff-44, beyond being guided by the 2013 LTEP principles for  
23 nuclear refurbishment, OPG has no insights into what factors the Government of Ontario  
24 would consider in making a decision to direct OPG to take an off-ramp.

25  
26 Internally, if Unit 2, or any other Unit, was forecasting to be over budget beyond a certain  
27 threshold, OPG would be required to issue a superseding business case summary. The  
28 superseding business case summary would include information such as updated cost  
29 estimates, LUEC, and alternative proposals. The option to take an off-ramp may be one  
30 of many considered alternatives. Approval of any superseding business case summary  
31 would be sought from OPG's Board of Directors.

- 32
- 33 c) If a contractor is performing "substantially below expectation", OPG likely would terminate  
34 the agreement for default as opposed to termination for convenience.

35  
36 Performance that is "substantially below expectation" will be determined on a case-by-  
37 case basis, but will include evaluation of the contractor's performance on safety, quality,  
38 schedule and cost aspects of the work being undertaken as well as their actions, or lack  
39 of action, taken to recover the performance gap.

- 40
- 41 d) OPG expects contractors to be on plan for their work. Recovery plans are required if a  
42 contractor deviates from plan and a milestone is at risk of being missed. Steering  
43 Committees consisting of senior management from both OPG and the contractor provide  
44 oversight on all aspects of contractor performance. OPG expects all defective parts of the  
45 project to be corrected at the contractor's cost. In some contracts, a schedule

1 incentive/disincentive regime is in place to encourage the contractors to be on or ahead  
2 of schedule.

**Board Staff Interrogatory #51**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-3, Chart 2

The above reference provides an overview of the Major Work Bundles for DRP. For those contracts that use a pricing model of a target price:

- a) Please confirm that no overheads are included in the estimated costs, and
- b) Please explain how OPG will ensure that no overheads are included in the actual costs.

**Response**

- a) Contractor overheads are included in the estimated costs set out in Chart 2 of Ex. D2-2-3. This Chart includes the total "Value of Contract" for each contract.
- b) OPG's target cost contracts include a cost allocation table that sets out the allowed and disallowed costs that a contractor may seek reimbursement from OPG for as actual costs. During the invoicing process, OPG reviews each invoice and compares the contractor's charges to the cost allocation table to determine if the charges are allowable and appropriate.

The target price contracts also require the contractors to provide OPG with full and open access to all financial and other records relating to the Darlington Refurbishment Program. In addition, the contracts provide OPG with extensive audit rights for all financial and other records that relate to work that is being prepared on a reimbursable cost basis, with few restrictions on the lookback periods for audits and readjustment of contractor cost claims. OPG has exercised these rights and will continue to do so to ensure that contractors comply with the contracts.

**Board Staff Interrogatory #52**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-4, page 3

The above reference indicates that OPG reviewed past CANDU and other nuclear refurbishments such as Point Lepreau refurbishment, OPG's Pickering 'A' return to service and safe storage projects, Bruce Power's Unit 1 and 2 refurbishments, and Korea Hydro & Nuclear Power's Wolsong-1 refurbishment.

Please describe, in general terms, the similarities and differences between the DRP and these other refurbishment projects.

**Response**

In. Ex. D2-2-4, p. 3, OPG indicates that, other than nuclear refurbishments, OPG's planning efforts included operational experience from OPG's nuclear and hydroelectric projects. OPG's Pickering A Return-to-Service and Pickering Safe Store were not refurbishment projects and are, therefore, quite different from the other projects cited.

The primary similarity between the Pt. Lepreau, Bruce Power Units 1 and 2, Korean Hydro and Nuclear Power's (KHNP's) Wolsong 1 refurbishment and the Darlington Refurbishment Program (DRP) is that the core scope included replacement of the fuel channels and all or most of the feeder pipes.

Bruce Units 1 and 2 are the most similar to DRP in that they are part of a multi-unit station. However, these units had been cold and defueled for several years prior to commencement of refurbishment in 2005. These two units, which form a Unit Pair, were effectively refurbished in parallel. The number of fuel channels is the same as at Darlington (480 fuel channels per reactor). Other similar scope included refurbishment of the turbine-generator sets and significant balance of plant work. Steam generators were replaced at Bruce Units 1 and 2, which is a significant difference from DRP. Islanding challenges were not as significant as at DRP because at DRP a unit under refurbishment will be immediately adjacent to an operating unit in that unit pair (see Ex. L4.3-1 Staff-59).

Pt. Lepreau is a single unit station (known as the CANDU 6 design) with a smaller reactor core (380 fuel channels) than the Darlington and Bruce units. Islanding of the unit was not

1 required. OPG's understanding is that there was minimal balance of plant scope carried out  
2 at Pt. Lepreau.

3  
4 Wolsong Unit 1 is a CANDU 6 design with the same number of fuel channels as Pt. Lepreau.  
5 Although it is part of a multi-unit station, the CANDU 6 design has its own dedicated fuelling  
6 machines, therefore the islanding challenges (discussed in Ex. L-4.3-1 Staff-59) were not as  
7 significant as at DRP.

8  
9 The timing of the refurbishment of the units is also a difference. Bruce Units 1 and 2 were  
10 completed over the period of 2005 to 2012. The Pt. Lepreau refurbishment was completed  
11 over 2008 to 2012 and the Wolsong refurbishment was completed over the period of 2009 to  
12 2011.

13  
14 To OPG's knowledge, the Bruce Units 1 and 2 and Pt. Lepreau projects employed a general  
15 contractor to co-ordinate all sub-contractors. OPG's multi-prime contracting model for the  
16 DRP, where the owner retains control and is the general contractor, is a further difference  
17 compared to these two projects.

**Board Staff Interrogatory #54**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-4, Figure 1

The above reference shows the total definition phase expenditures to be \$2.2B.

- a) Please provide a variance of the actual amount of \$2.2B to the budgeted amount for the definition phase.
- b) Please provide the amount of the \$2.2B that is attributable to Unit 2 versus supporting the entire four unit DRP.
- c) Please provide details, i.e. projects and amounts, of the \$2.2B that has been put in-service to the end of 2015.

**Response**

- a) The \$2.2B actual amount for the Definition Phase represents a variance of \$0.3B below the budgeted amount of \$2.548B, as shown in Ex. D2-2-8, Attachment 1, p. 5.
- b) All of the Definition Phase costs to be placed into service with Unit 2 (i.e. \$2.2B) relate to preparation and planning work which was required to allow OPG to be ready to refurbish Unit 2. Figure 1 of Ex. D2-2-4 shows that the \$2.2B Definition Phase expenditures were spent on the following:
  - RFR Mock-up and Tooling
  - Turbine Generator Parts
  - Vendor/EPC Definition Phase Planning
  - Facilities & Infrastructure (F&IP) and Refurbishment Support Facilities Projects
  - Safety Improvement Opportunities (SIO) Projects
  - OPG Definition Phase Planning and Support Services
  - Interest

Approximately \$1B, the largest portion of the \$2.2B, is associated with the Early In-service Projects, F&IP, and SIO. The Early In-service Projects are assets arising from work performed for the unit refurbishments that will be placed in service and included in rate base before the refurbishment of the first unit because they provide immediate benefit to the station ahead of the Unit 2 return to service. As committed within the Environmental Assessment and Integrated Implementation Plan, the SIO are to be

placed into service upon completion and are useful to OPG's current and future nuclear operations independent of whether the DRP is completed. The F&IP are pre-requisites for unit refurbishments and will be placed in service and included in rate base when they are used and useful to OPG. As discussed in Ex. D2-2-10, p. 7 and Ex. L-4.3-1 Staff-44, the F&IP are expected to be useful to OPG's current and future nuclear operations independent of whether the DRP is completed.

The planning costs for all subsequent units will be lower than that of Unit 2. Much of the planning for those units will be a replication of the work done for Unit 2. For example: (i) detailed design engineering packages will only need to be replicated with unit specific information for Units 3, 4, and 1; (ii) the database infrastructure which has been implemented to facilitate project controls will already be in place for subsequent units; and, (iii) the contracting strategy has been developed and contracts are in place for all four units.

- c) \$0.3B of \$2.2B has been put in-service to the end of 2015. The details are provided in the following table.

Project	LTD 2015 In-service Amounts
Heavy Water Facility	\$14.6M
Water & Sewer	\$43.7M
Darlington Energy Complex	\$82.5M
Retube Feeder Replacement Island Support Annex	\$1.7M
Refurbishment Project Office	\$94.3M
Electrical Power Distribution System	\$18.1M
Vehicle Screening Facility	\$4.1M
Third Emergency Power Generator	\$9.7M
Powerhouse Steam Venting System Improvements	\$5.2M
Emergency Service Water Buried Services	\$13.3M
IFB Heat Exchanger Plate Replacement	\$6.2M
Other Station Modifications	\$1.2M
<b>Total<sup>1</sup></b>	<b>\$294.8M</b>

## **DARLINGTON REFURBISHMENT - UNIT 2 EXECUTION**

### **DECISION REQUIRED**

The purpose of this memo is to provide a summary of the Darlington Refurbishment Program (DRP) Unit 2 cost and schedule estimates and key risks, and request approval for:

- Commencement of Unit 2 refurbishment in October 2016;
- The Unit 2 budget and schedule; and
- Release of additional funds in the amount of \$2,876 Million, which includes \$635 Million of contingency to execute the Unit 2 refurbishment.

### **ISSUE**

In November 2015, OPG's Board of Directors approved the Release Quality Estimate (RQE), representing the overall 4-unit high confidence budget, schedule and release strategy to refurbish the four Darlington units.

Since that time, as management continued with the detailed planning and preparations for execution of the Unit 2 refurbishment, management has further developed the Unit 2 cost estimate and schedule and performed an updated risk analyses. Consistent with the approved funding strategy, Management is now requesting Board approval to proceed with the refurbishment of Unit 2 starting in October 2016 and to release the required funding to complete the refurbishment of Unit 2.

### **ANALYSIS**

The current Unit 2 Execution Estimate (U2EE) is an update to RQE, which takes into consideration additional planning and work executed over the past 8 months, and incorporates the following:

- Revised estimates for scope that has progressed from a Class V or IV estimate to a Class III and II.
- Updated base cost estimates to reflect the development of comprehensive execution work packages and an enhanced understanding of the cost to perform the work, which is a direct outcome of estimate development and actual field work.
- Updated risk profile, and resultant contingency required for residual risks.
- Assessment of the actual costs to date and the estimate-to-complete (ETC) for all work packages.
- Review of the cash flow, including interest and escalation requirements, against the current schedule.

All of these items have been compiled into the current U2EE, as well as a review of the 4-unit overall cost estimate. The following sections summarize this analysis.

#### **1. Management is adequately prepared and ready to proceed with the execution of Unit 2.**

Management has provided an update on the status of the DRP to the Darlington Refurbishment Committee (DRC) at its August 11, 2016 meeting. In the report, Management indicates that the DRP remains on track to commence the execution and refurbishment of Unit 2 in October 2016.

Management is executing all pre-requisite projects in order to be ready to commence the refurbishment of Unit 2. Some of these projects are currently behind schedule; however, all critical projects required to enable the start of refurbishment are expected to be complete prior to their need date.

Management is focused on applying lessons learned from the Ready to Execute (RTE) test period, where processes for managing in-plant execution of work were tested and refined, to increase the productivity and schedule compliance of all work being performed in the field. Although many of the pre-requisite projects are not required for the start of refurbishment, management remains focused on the delivery of these projects as quickly as reasonably feasible while managing safety, quality, and cost.

**2. Unit 2 scope has been clearly specified, engineering is complete, and comprehensive work plans are in place.**

Since RQE, there have been no major scope changes to the DRP.

Detailed design engineering is substantially complete for all field work to be executed during Unit 2.

Management has focused on the completion of Phase 1 Comprehensive Work Packages (CWPs) that describe the details of the work to be executed in the field. The CWPs for all the project bundles are now essentially complete with a few minor exceptions. Completion of the CWPs took an additional month beyond what was planned due primarily to station interfaces for the Re-tube & Feeder Replacement (RFR) project not being fully understood by the vendor; however, they have been completed with quality, and provide the necessary information to complete field execution of all project work.

**3. Regulatory certainty has been achieved.**

The Integrated Implementation Plan (IIP) identifies the regulatory scope required to be completed during the refurbishment period, including work being done by the station.

The 51 Integrated Implementation Plan (IIP) tasks that have been committed to the Canadian Nuclear Safety Commission (CNSC) for completion in 2016 are on track. To date, 17 items are complete and field work for an additional 10 is complete with document closeout underway.

OPG has received all remaining regulatory approvals from the CNSC required to support the start of Unit 2 refurbishment. No additional approvals are required to commence refurbishment of Unit 2.

OPG has committed in the IIP to have the 3<sup>rd</sup> Emergency Power Generator (EPG) and Containment Filtered Venting System (CFVS) in-service prior to the start of the Unit 2 refurbishment, and continues to demonstrate to the CNSC that completion of these projects is a high priority. The CNSC is being kept informed of the project complexities, including commissioning and site integration of the 3<sup>rd</sup> EPG, and is aware of the potential risk to the in-service date. In the event that the IIP commitment cannot be achieved, the IIP Change Control Process will be initiated.

The regulatory hold-points for returning the units to service, after refurbishment, have been agreed to with the CNSC. Development of a decision and escalation protocol with the CNSC, to ensure scope and schedule commitments are effectively managed, is being considered.

**4. The Unit 2 high confidence schedule duration, consistent with RQE, remains at 40 months; the 4-unit schedule remains at 112 months.**

The Unit 2 high confidence schedule duration of 40 months remains consistent with RQE.

The only significant change to the high confidence 4-unit schedule since RQE was the de-lapping of Unit 3 from Unit 2, to be consistent with the Province's Long Term Energy Plan (LTEP) requirement to complete Unit 2 prior to commencing any subsequent units.

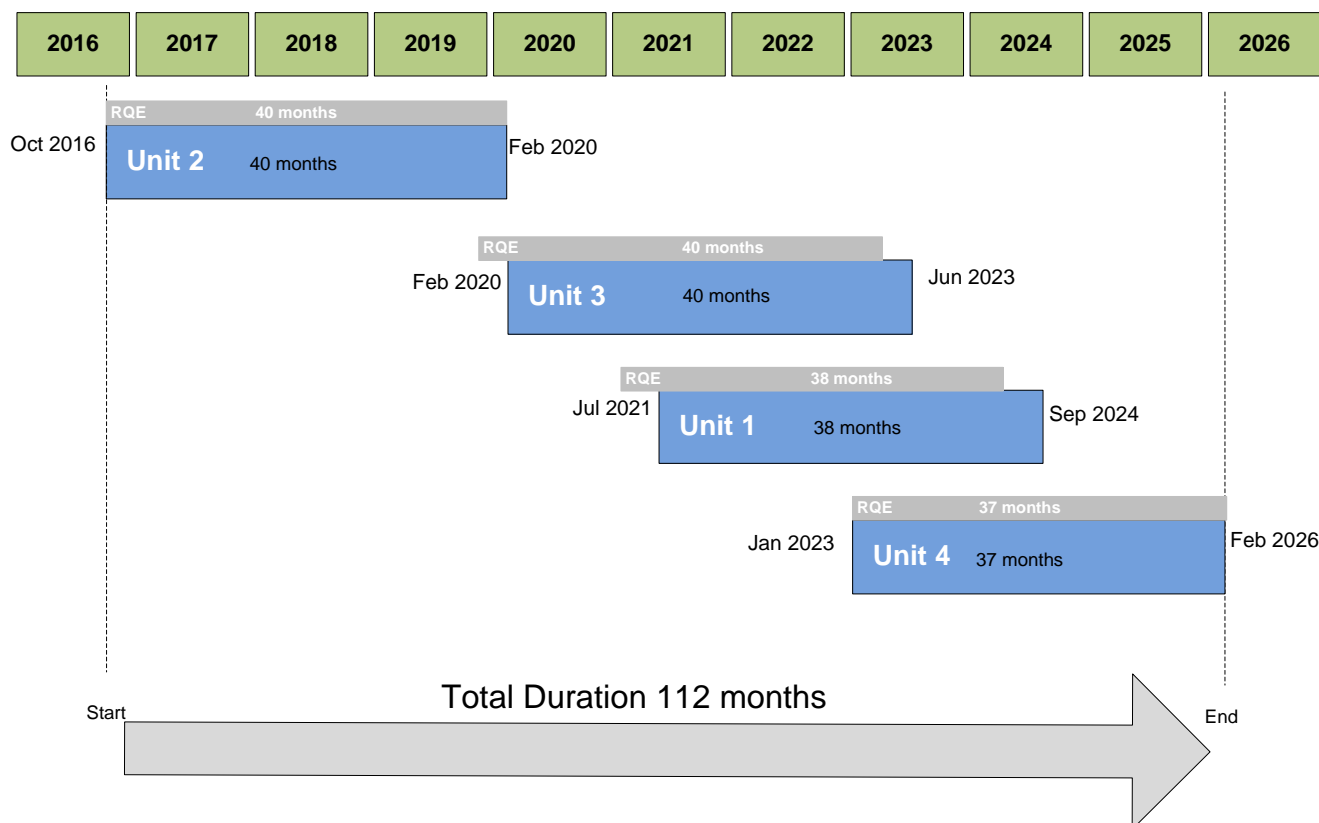

The overall 4-unit high confidence schedule duration remains at 112 months per Table 1 below:

**Table 1: Comparison of 4-Unit High Confidence Schedule (RQE vs. U2EE)**

Unit	High Confidence at RQE			High Confidence (U2EE)			Variance From RQE
	Start	Finish	Duration (Months)	Start	Finish	Duration (Months)	
Unit 2	15-Oct-16	15-Feb-20	40	15-Oct-16	15-Feb-20	40	0
Unit 3	15-Dec-19	15-Apr-23	40	15-Feb-20	15-June-23	40	0
Unit 1	15-Apr-21	15-Jun-24	38	15-Jul-21	15-Sep-24	38	0
Unit 4	15-Jan-23	15-Feb-26	37	15-Jan-23	15-Feb-26	37	0
<b>4 Units</b>	<b>15-Oct-16</b>	<b>15-Feb-26</b>	<b>112</b>	<b>15-Oct-16</b>	<b>15-Feb-26</b>	<b>112</b>	

The U2EE High Confidence schedule and comparison to RQE as noted above in Table 2, is illustrated in the following Figure A:

**Figure A: Refurbishment 4-Unit High Confidence Project Schedule**

High Confidence durations are shown above. Unit 2 project performance will however get managed against an aggressive planned outage duration (working schedule) of 35 months. Since RQE, detailed schedules have been further developed, and have resulted in a minor 10 day increase for activities within the removal and installation series. A copy of the Level 1 schedule is included as Appendix 1.

The planned outage duration is based on a detailed evaluation of the schedule risks for each segment of the critical path, including discrete technical risks such as a Primary Heat Transport pump motor failure during defueling and requirements for Primary Heat Transport system flush and Hot Conditioning on unit startup. Management is, and will continue to, look for opportunities to reduce schedule durations.

The high confidence schedule is the basis for the Release Quality Estimate, which is the program level control budget and this schedule is the schedule from which project success will be assessed. Management will report on the performance of the DRP to the DRC on a quarterly basis, against both the Unit 2 working schedule and the high confidence schedule, with clear indications of project status and contingency utilization.

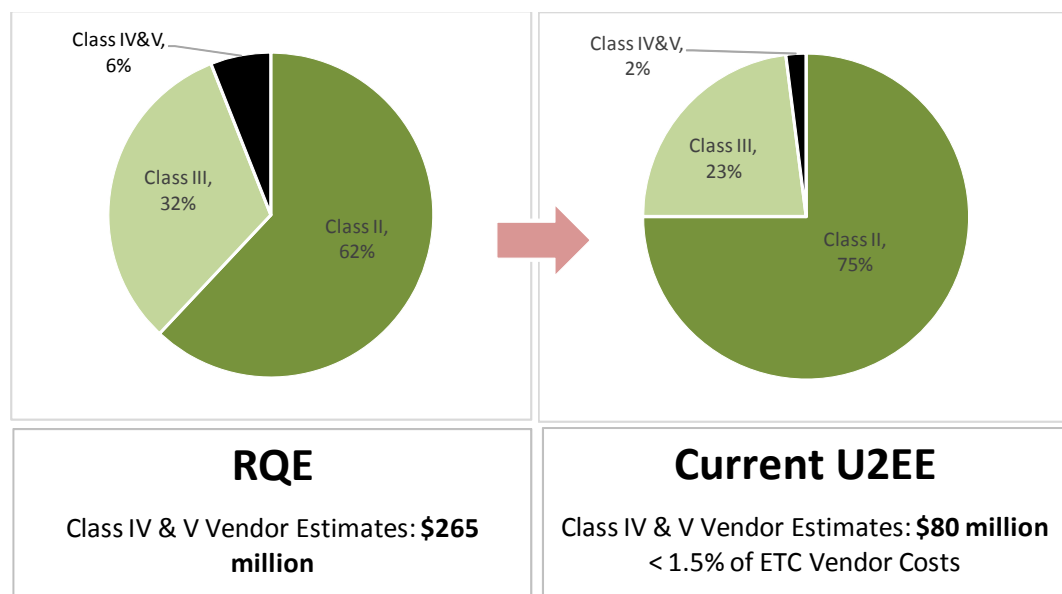

Final detailed schedule reviews are now underway in order to ensure all potential interferences between vendors are eliminated and labour resources are effectively balanced. The final baseline Unit 2 working schedule will be issued in mid September. This schedule will contain over 75,000 tasks for OPG and the vendors.

**5. A detailed review of Unit 2 execution phase risks and contingencies is now complete.**

Management has finalized its review of schedule and cost risks. Since the RQE analysis in October, a reduction in cost estimating uncertainty contingency requirements has been observed, which reflects the progression of project estimates and the integration of lessons learned from the Ready to Execute test period.

As shown in Figure B, the percentage of project costs where the estimate is at Class III or better has increased since RQE from 94% to 98%. For those projects not yet at Class III, adequate contingency has been carried to reflect the remaining uncertainty with these projects.

**Figure B: Estimate Classification Summary**

(1) Figures above represent 4-Unit estimates. Actions are already underway to finalize these estimates to Class III or II prior to work release and execution.

The contingency analysis summarized in Table 2 was derived through a detailed analysis and modeling of the current risk profile across the entire program. The assessed contingency is based on the residual risks contained within the DRP and excludes the \$61 Million of contingency allocated since RQE. In addition to the continuous monitoring of contingency draw-downs, a thorough assessment of the risk profile and impact on contingency will be performed quarterly.

The outcome of Management's contingency analysis yielded that, at a high confidence, the estimate should include \$2,006 Million of contingency for the DRP, including \$677 Million for Unit 2.

There is no significant change to the anticipated contingency calculated at RQE. For clarity, RQE consisted of \$1,706 Million of contingency in 2015 dollars, plus \$300 Million of inflation and interest,

which totals \$2,006 Million. Contingency on Unit 3 has increased due to a shift of risks from Unit 2 to Unit 3 related to the Turbine Controls installation on Unit 3.

Below, in Table 3, is a breakdown of the \$2,006 Million of contingency, by unit and contingency type.

**Table 2: 4-Unit Contingency Summary**

Unit	RQE (\$M)	Current U2EE (\$M)	Changes since RQE (\$M)
Campus Plan Program Total, *plus \$41mil of add'l contingency included with projects	32	18	-14
Unit 2 Total	690	677	-13
Unit 3 Total	516	557	41
Unit 1 Total	419	409	-10
Unit 4 Total	350	345	-5
<b>4-Unit Contingency (\$M)</b>	<b>2,006</b>	<b>2,006</b>	<b>0</b>

**Table 3: 4-Unit Contingency Summary by Type**

Level	Contingency Type	Updated 4-Unit Contingency (\$M)	Facility and SIO Projects (\$M)	U2 (\$M)	U3 (\$M)	U1 (\$M)	U4 (\$M)
<b>PROJECT</b>	<b>Project Discrete Risks</b> - Specific to Bundles	658	18	216	177	135	112
	<b>Project Level Estimating Uncertainty</b> - Project Bundles and Resources	192	-	67	54	38	33
	<b>Critical Path Schedule Contingency</b> - for the Working Schedule Duration	438	-	149	122	91	76
	<b>Critical Path Schedule Contingency</b> - to High Confidence Duration	192	-	66	55	38	33
<b>PROGRAM</b>	<b>Program Discrete Risks</b> - Functional Risks	458	-	153	129	95	81
	<b>Program Level Estimating Uncertainty</b> - Functional Resources	68	-	26	20	12	10
	<b>Total Contingency \$M</b>	<b>2,006</b>	<b>18</b>	<b>677</b>	<b>557</b>	<b>409</b>	<b>345</b>

The contingency of \$2,006 Million represents 23% of the Execution Phase Estimate-to-Complete cost of \$8,300 Million, or 32% of the external vendors' estimate of \$6,000 Million. With 98% of vendor cost estimates well defined at Class III or better, Management believes that the contingency amount is sufficient.

**6. OPG's oversight requirement has been assessed and is deemed to be appropriately sized.**

Since RQE, OPG's role as the General Contractor performing integration and oversight of safety, quality, schedule, cost and risk, with consideration of current field experience, has been evaluated.

Lessons learned from the pre-requisite projects have been evaluated and OPG has added resources in each of the following areas:

- Field construction support and oversight;
- Quality surveillance;
- Work control;
- Source surveillance and vendor procurement; and
- Contract and claims management.

Management is further evaluating its organization and looking for further opportunities to streamline processes and reduce oversight staff. Also, OPG's investment in vendor training, including supervisor training, is expected to improve performance and in time should have a positive impact on resources.

Due to the under spend in OPG labour of approximately \$40 Million to date, management believes that these increases can be managed and will not impact the Unit 2 estimate. However, Management is also carrying \$77 Million of contingency (per Unit) for risks and an uncertainty associated with higher owner's costs, which management believes is sufficient.

Management has put in place processes required to plan and forecast staff demands and will closely monitor all labour demands and variances during execution of the DRP to mitigate any further cost growth related to OPG's oversight.

The overall histograms of OPG and vendor resources are shown in Appendix 5A and 5B.

**7. The Unit 2 high confidence cost estimate is \$3.4 Billion including contingency, consistent with the estimate provided at RQE.**

The high confidence cost estimate to execute Unit 2, including contingency is \$3.4 Billion and is \$24 Million higher than presented at RQE due several vendor changes, increase in OPG staffing, but offset by lower anticipated contingency needs.

Furthermore, the in-service amount of \$4.8 Billion reported at RQE has been maintained.

Appendix 3 provides a project bundle level analysis of the current cost estimate and as compared to RQE.

**8. The overall budget remains within the \$12.8 Billion set at RQE.**

As shown in Appendix 2, the overall 4-Unit high confidence cost estimate remains at \$12.8 Billion.

**Table 4: Refurbishment Current Estimate Compared to Prior Estimates**

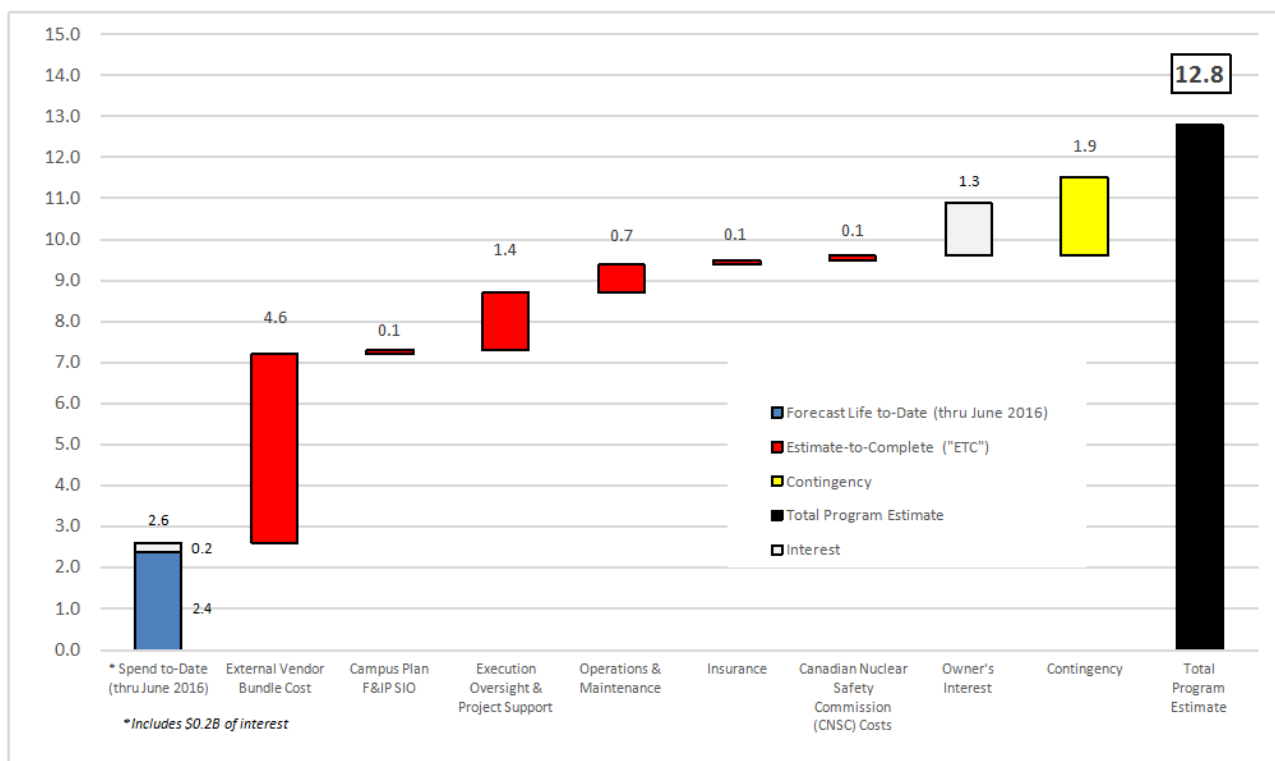

2009 Estimate	2015 RQE High Confidence Estimate	Current High Confidence Estimate
\$14.0 Billion <sup>(1,2)</sup>	\$12.8 Billion <sup>(2)</sup>	<b>\$12.8 Billion<sup>(2)</sup></b>

(1) The 2009 estimate was reported as \$10 Billion in \$2009, excluding interest and inflation. When interest and inflation is included, the estimate was \$14 Billion.

(2) Estimate includes interest and inflation. Inflation is estimated at 2% and interest is estimated using 5% to 2021 and 6% thereafter.

Figure C below provides a summary of the cost elements that build up to the high confidence 4-unit cost estimate. Each cost element now includes allocated inflation.

**Figure C: 4-Unit Cost Estimate Build-up**

Appendix 2A and 2B provides a more detailed breakdown of the overall cost.

**9. Funding is requested in the amount of \$2.9 Billion to complete Unit 2 refurbishment.**

The cumulative release at RQE was \$3,228 Million including \$723 Million for Unit 2 activities. The current high confidence cost estimate for the Unit 2 refurbishment, including \$677 Million of contingency, is \$3,417 Million. Management is requesting incremental funding of \$2,876 Million to complete the refurbishment of Unit 2 as well as the Facility & Infrastructure, Safety Improvement, and other in-plant pre-requisite projects, for a total cumulative release of \$6,104 Million. Details of the release amount are included in Appendix 6.

**Table 5: Program Funding Releases**

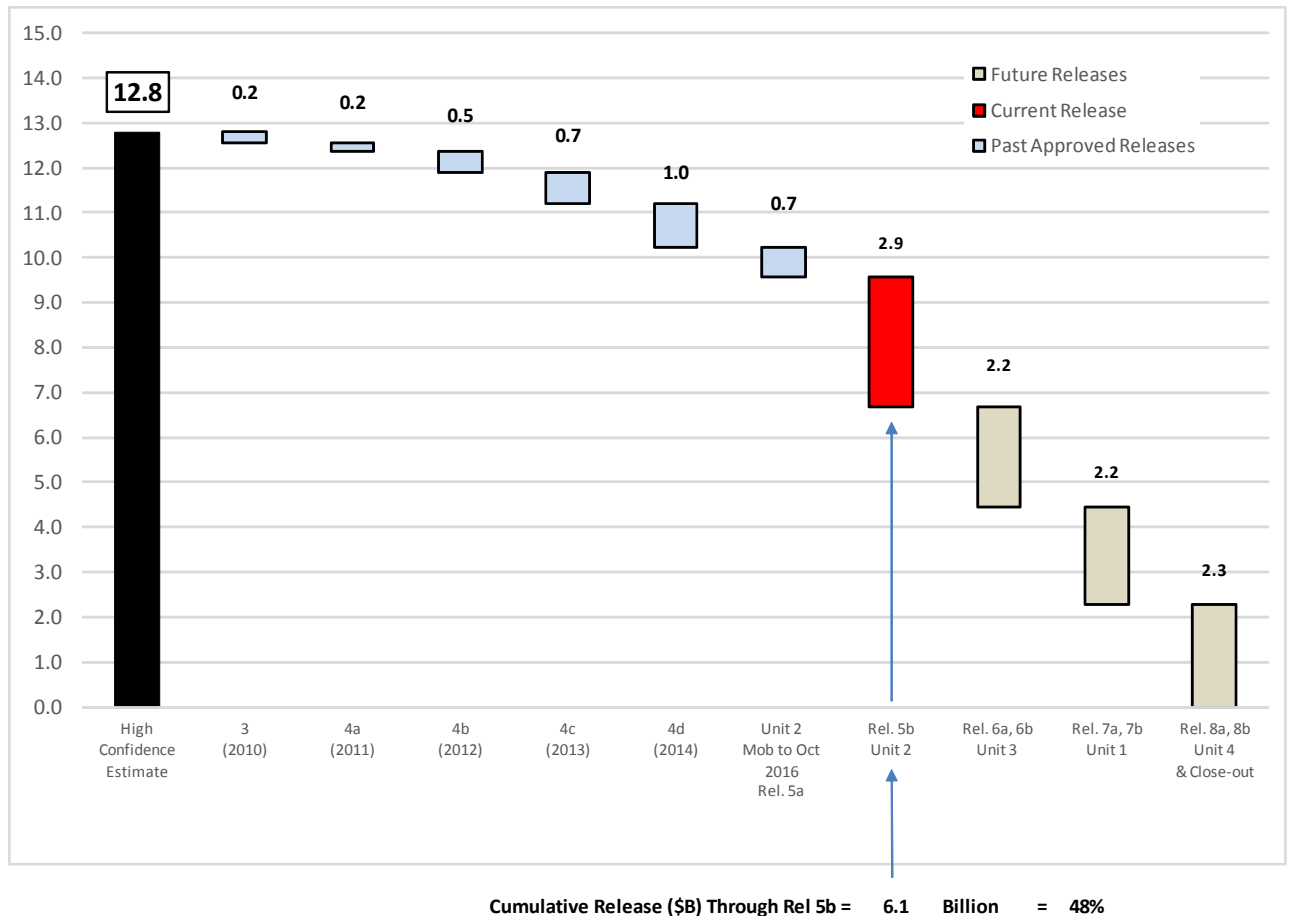

Previous Approved Funding Cumulative through Release 5a (at RQE)	Current Funding Request, Release 5b for U2 Execution	Cumulative Funding through end of Unit 2
3,228	2,876	6,104
Values in \$Million		

Release 5a funding, approved by the Board in November 2015, included approximately \$102 Million for a portion of subsequent unit planning, primarily for long lead materials for the Turbine Generator Control system, which will be installed initially on Unit 3, and the Re-tube and Feeder Replacement project.

Figure D below provides a summary of the cumulative releases to the DRP to date.

**Figure D: Program Funding Releases**

In 2017, Management will request additional funding to commence preliminary planning for subsequent unit refurbishments. This will include funding to complete engineering and to initiate long lead procurement for Unit 3. A dedicated team will be put in place to lead the Unit 3 planning effort.

**10. The LUEC of refurbishing and continuing to operate the Darlington units for a further 30 years remains at 8.1 ¢/kWh (2015\$).**

There is no anticipated change to the economic assessment, and the LUEC of refurbishing and continuing to operate the Darlington station for a further 30 years remains at 8.1 ¢/kWh (2015\$).

The DRP continues to contribute 3.3 ¢/kWh (\$2015) to the LUEC estimate, and the post-refurbishment operations and support costs necessary to run the plant, including fuel, continue to contribute 4.8 ¢/kWh (\$2015) to the total LUEC.

**11. Management will commence reporting to the DRC on the status of the Unit 2 Execution Phase in November 2016.**

The Unit 2 refurbishment baseline working schedule will be issued in mid September. At that time, Management will make any needed adjustments to the Unit 2 cost flows and control budget, which will then be used for performance monitoring and reporting.

## RECOMMENDATION / RESOLUTION

Management is requesting that the Board of Directors approve the following items related to the DRP:

- Approval to commence Unit 2 refurbishment in October 2016;
- Approval of the Unit 2 high confidence cost estimate (\$3.417 Billion) and high confidence schedule (40 months); and
- Approval of a release of funds in the amount of \$2,876 Million, which includes \$635 Million of contingency to execute the Unit 2 refurbishment.

**Recommended by:**

**Approved for submission to  
the Board of Directors by:**

\_\_\_\_\_  
Dietmar Reiner  
Senior Vice President, Nuclear Projects

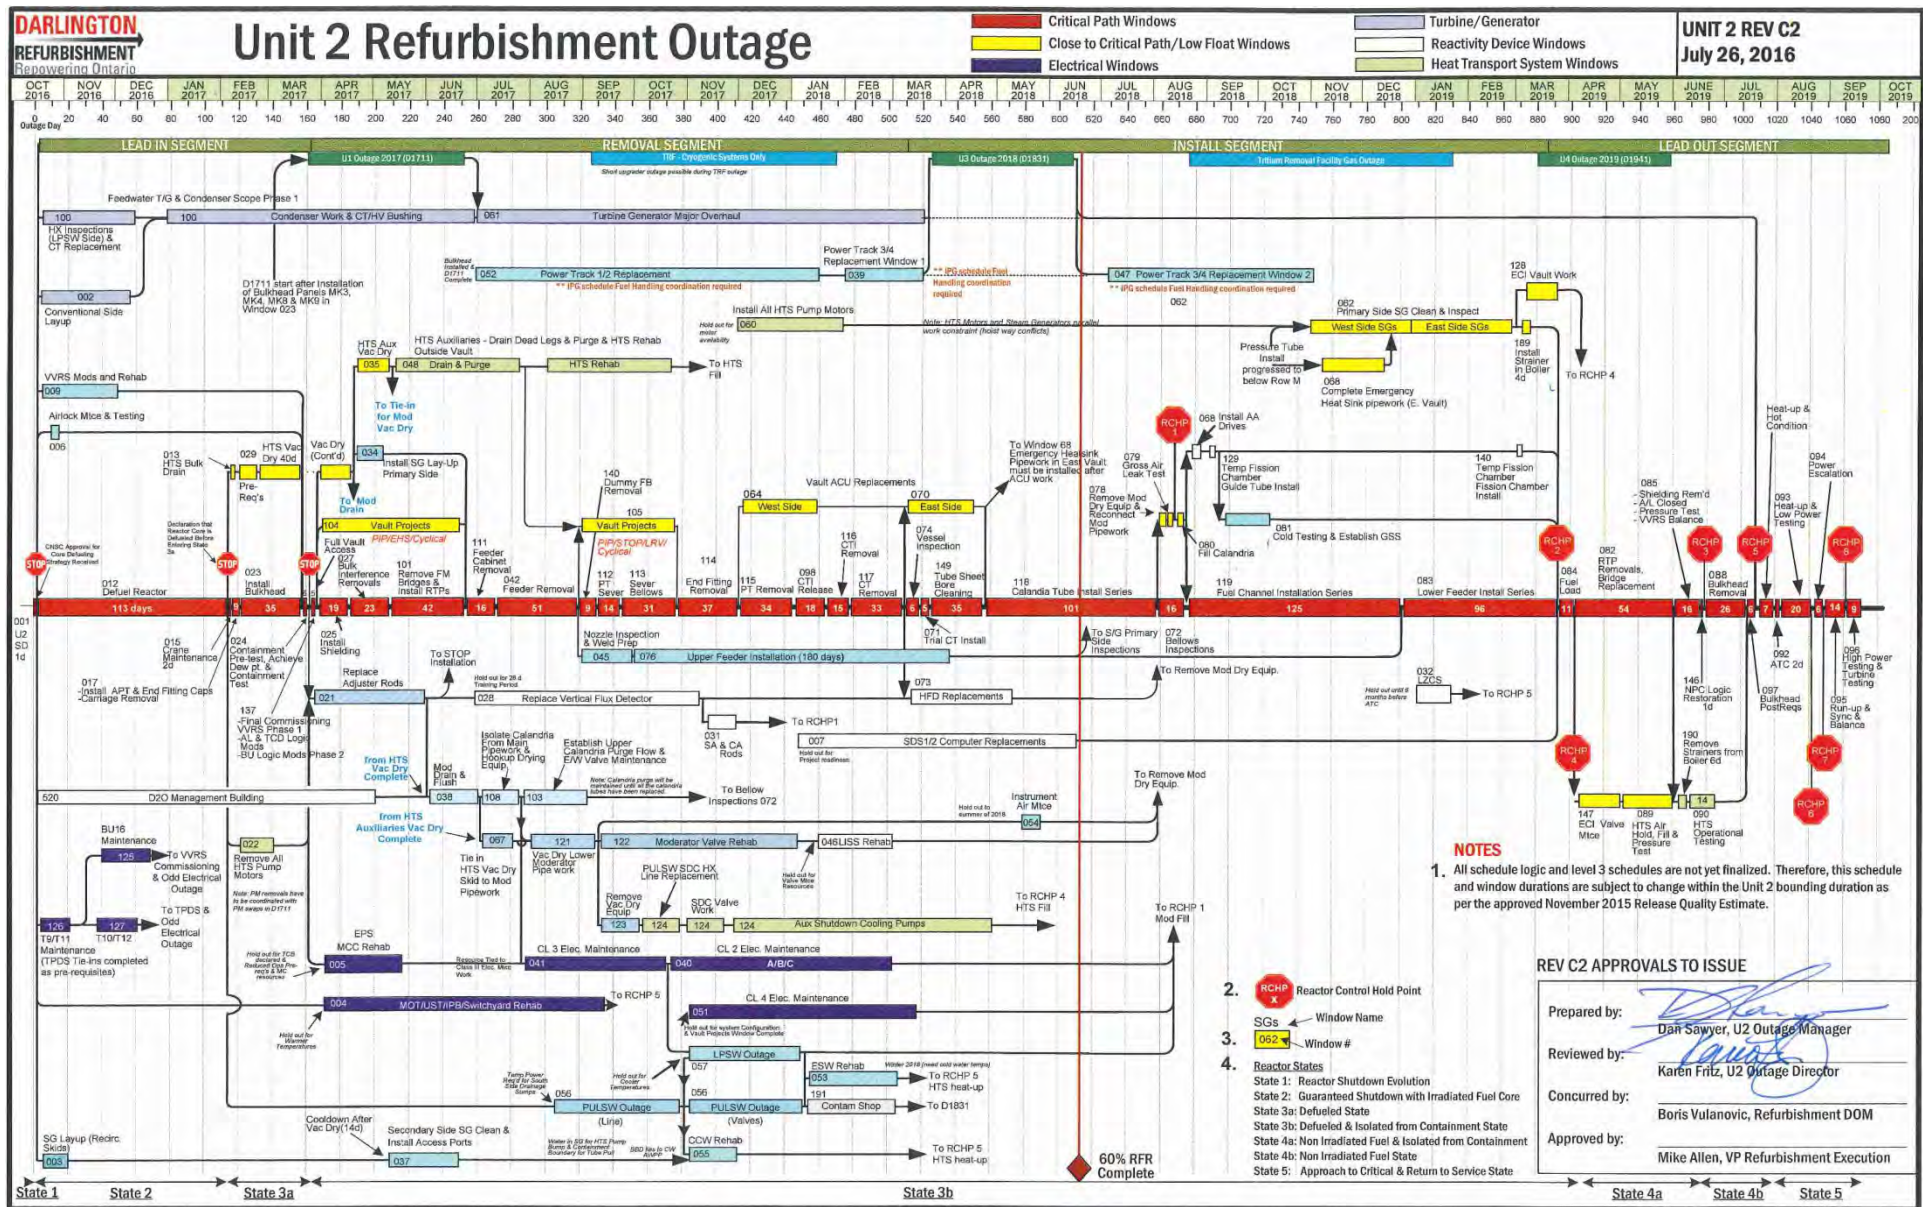

\_\_\_\_\_  
Jeff Lyash  
President and CEO

This Board memo was reviewed and approved for submission to the Board of Directors by the  
Darlington Refurbishment Committee at their meeting of August 11, 2016.

- (1) All figures now include inflation & interest (RQE reported base costs in 2015, with inflation & interest "below-the-line")
- (2) Campus Plan F&IP + SIO Projects (Unit F and Unit S) excluded from "Unit 2", but are included in the overall Release 5b funding request.
- (3) Estimate to Complete (ETC) costs for Unit 0 (Common Work) and Unit D (Definition Phase Work) are excluded from the above, but are included in the overall Release 5b funding request.

## APPENDIX 4: UNIT 2 KEY RISK & CONTINGENCY SUMMARY

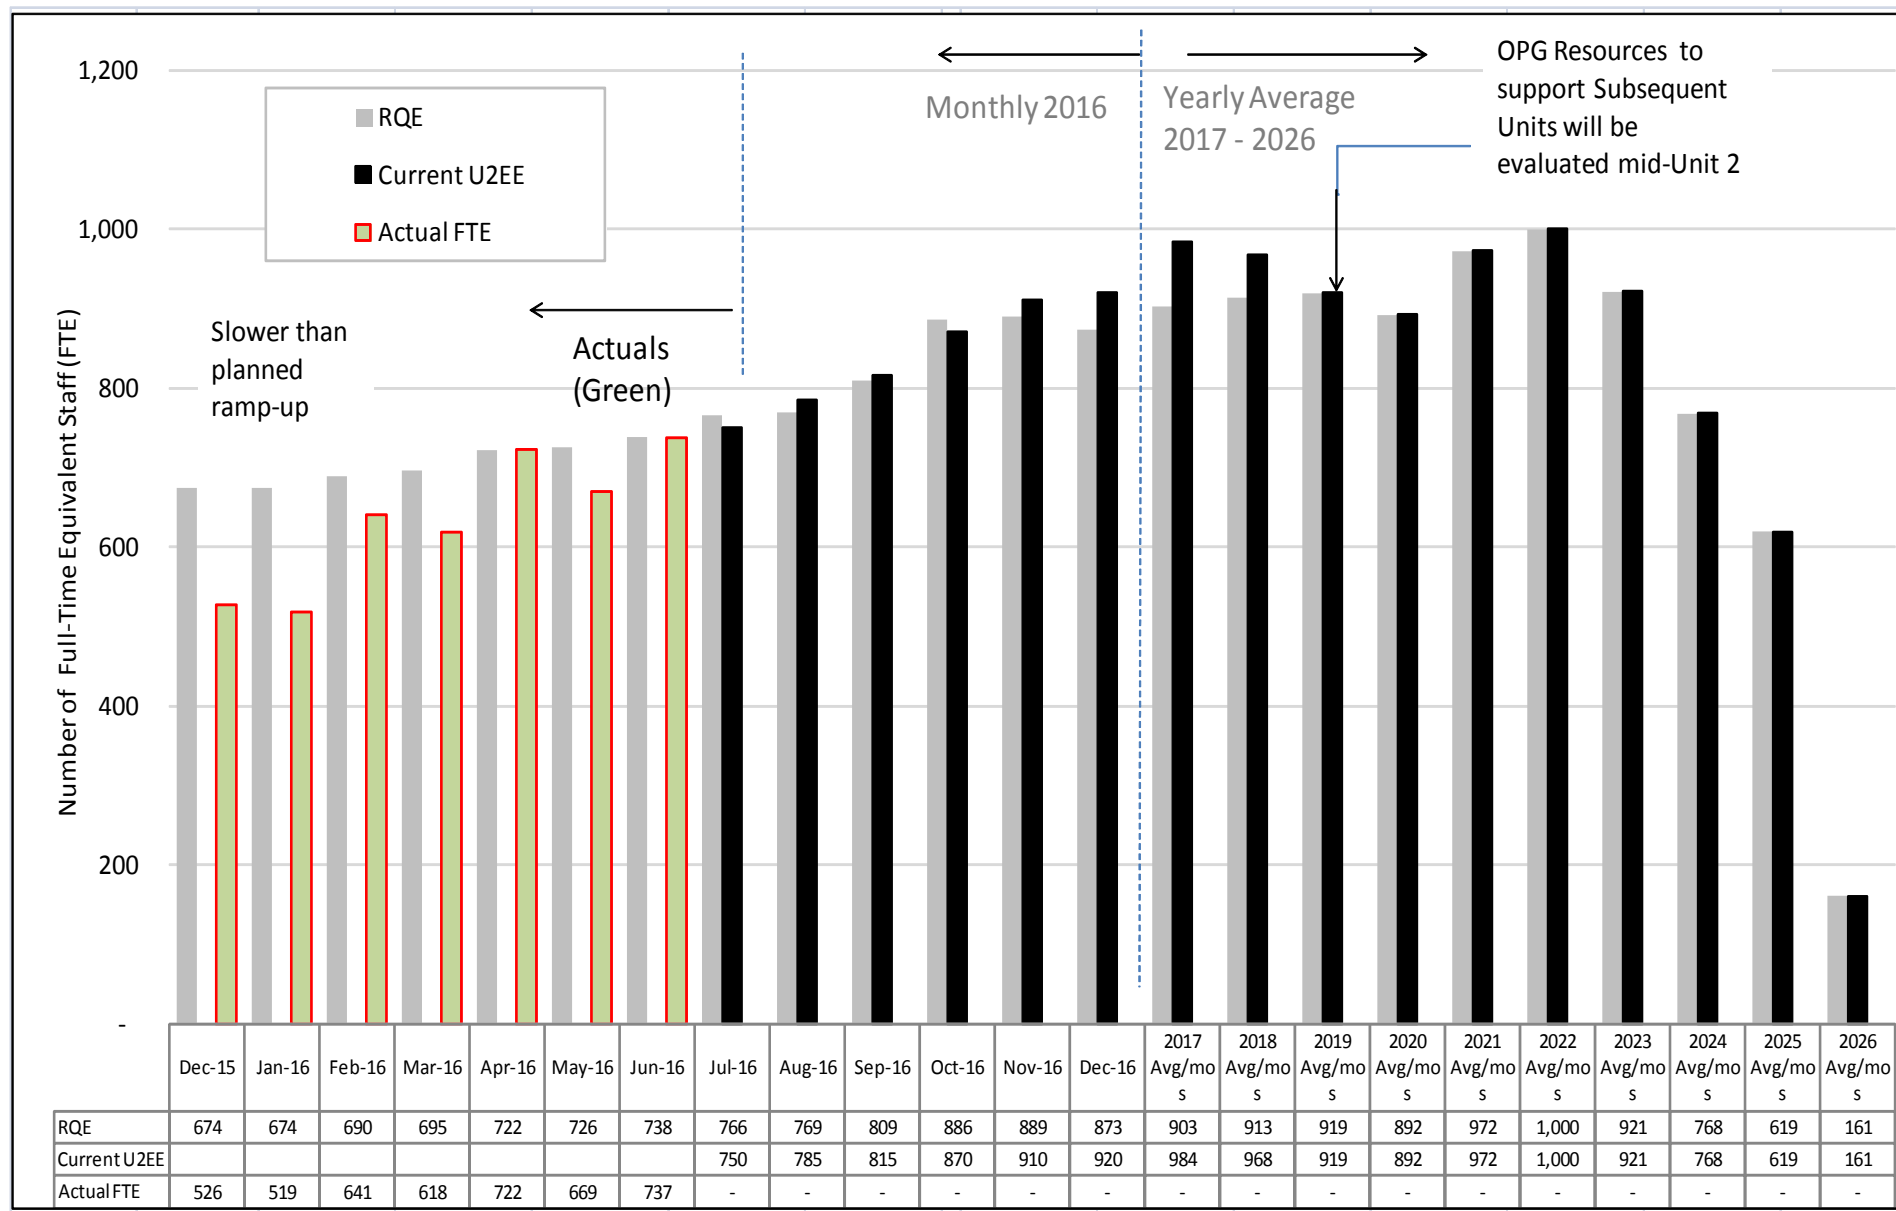

Unit 2 Discrete Top Risks by \$ Value

Bucket	Bundle / Functional	ID	Description	U2EE Unit 2 \$k
Discrete Risks	Retube and Feeder	13325	Concealed Conditions [ Window 167, 168]	20,565
Discrete Risks	Refurbishment Execution	683	Refurb Construction - Poor EPC Vendor performance may require additional oversight during all phases	18,381
Discrete Risks	Refurbishment Execution	783	Refurb Construction - Estimated Cost of General Services contract may be underestimated	17,190
Discrete Risks	Refurbishment Execution	TBD	Trough Management	16,487
Discrete Risks	Program Support	751	Foreign Exchange	16,006
Discrete Risks	Balance of Plant	13663	Additional BoP Resource Risk due to lack of Vendor EPC Experience	12,225
Discrete Risks	Turbine Generator	11250	TG Discovery work scope caused by inspections with impact on long lead items or major repairs	8,063
Discrete Risks	Retube and Feeder	13329	Claims from Retube and Feeder Replacement (RFR) Vendor Not already Covered in the Contract	6,594
Discrete Risks	Balance of Plant	14413	73750 Phase 2 cost escalation (Windows 122, 124, 029, 057)	6,579
Discrete Risks	Operations and Maintenance	708	Materials budget for emergent broke-fix maintenance during Shutdown, Layup and Runup	6,141
Discrete Risks	Operations and Maintenance	564	Large Potential Worker Doses due to Inadequate Internal (Alpha etc.) Hazard Characterization	6,045
Discrete Risks	Refurbishment Execution	717	Refurb Construction - Estimated Cost of RPPE Laundry may be underestimated	5,847
Discrete Risks	Retube and Feeder	13917	Insufficient Tool Quantities or Spares for RFR Execution - all causes [Potential Window 160-188]	5,619
Discrete Risks	Retube and Feeder	13860	Owner Specified Material (OSM) pricing from Unit-to-Unit Procurement [No Window Related]	4,956
Discrete Risks	Shutdown and Layup - Services	13619	SDLU Pre-requisite projects delays [No Window Related]	4,874
Discrete Risks	Shutdown and Layup - Services	14318	Quality Issues [No Window Related]	4,495
Discrete Risks	Retube and Feeder	14115	Feeder fabrication schedule delay as a result of flow element (I690) weldability challenges.	3,773
Discrete Risks	Operations and Maintenance	839	Valve Program Vendor Contract not Secured	3,690
Discrete Risks	Balance of Plant	13263	73639 - PHT & Auxiliaries - PHT & Aux - PHT Pumps Will Require Repairs	3,461

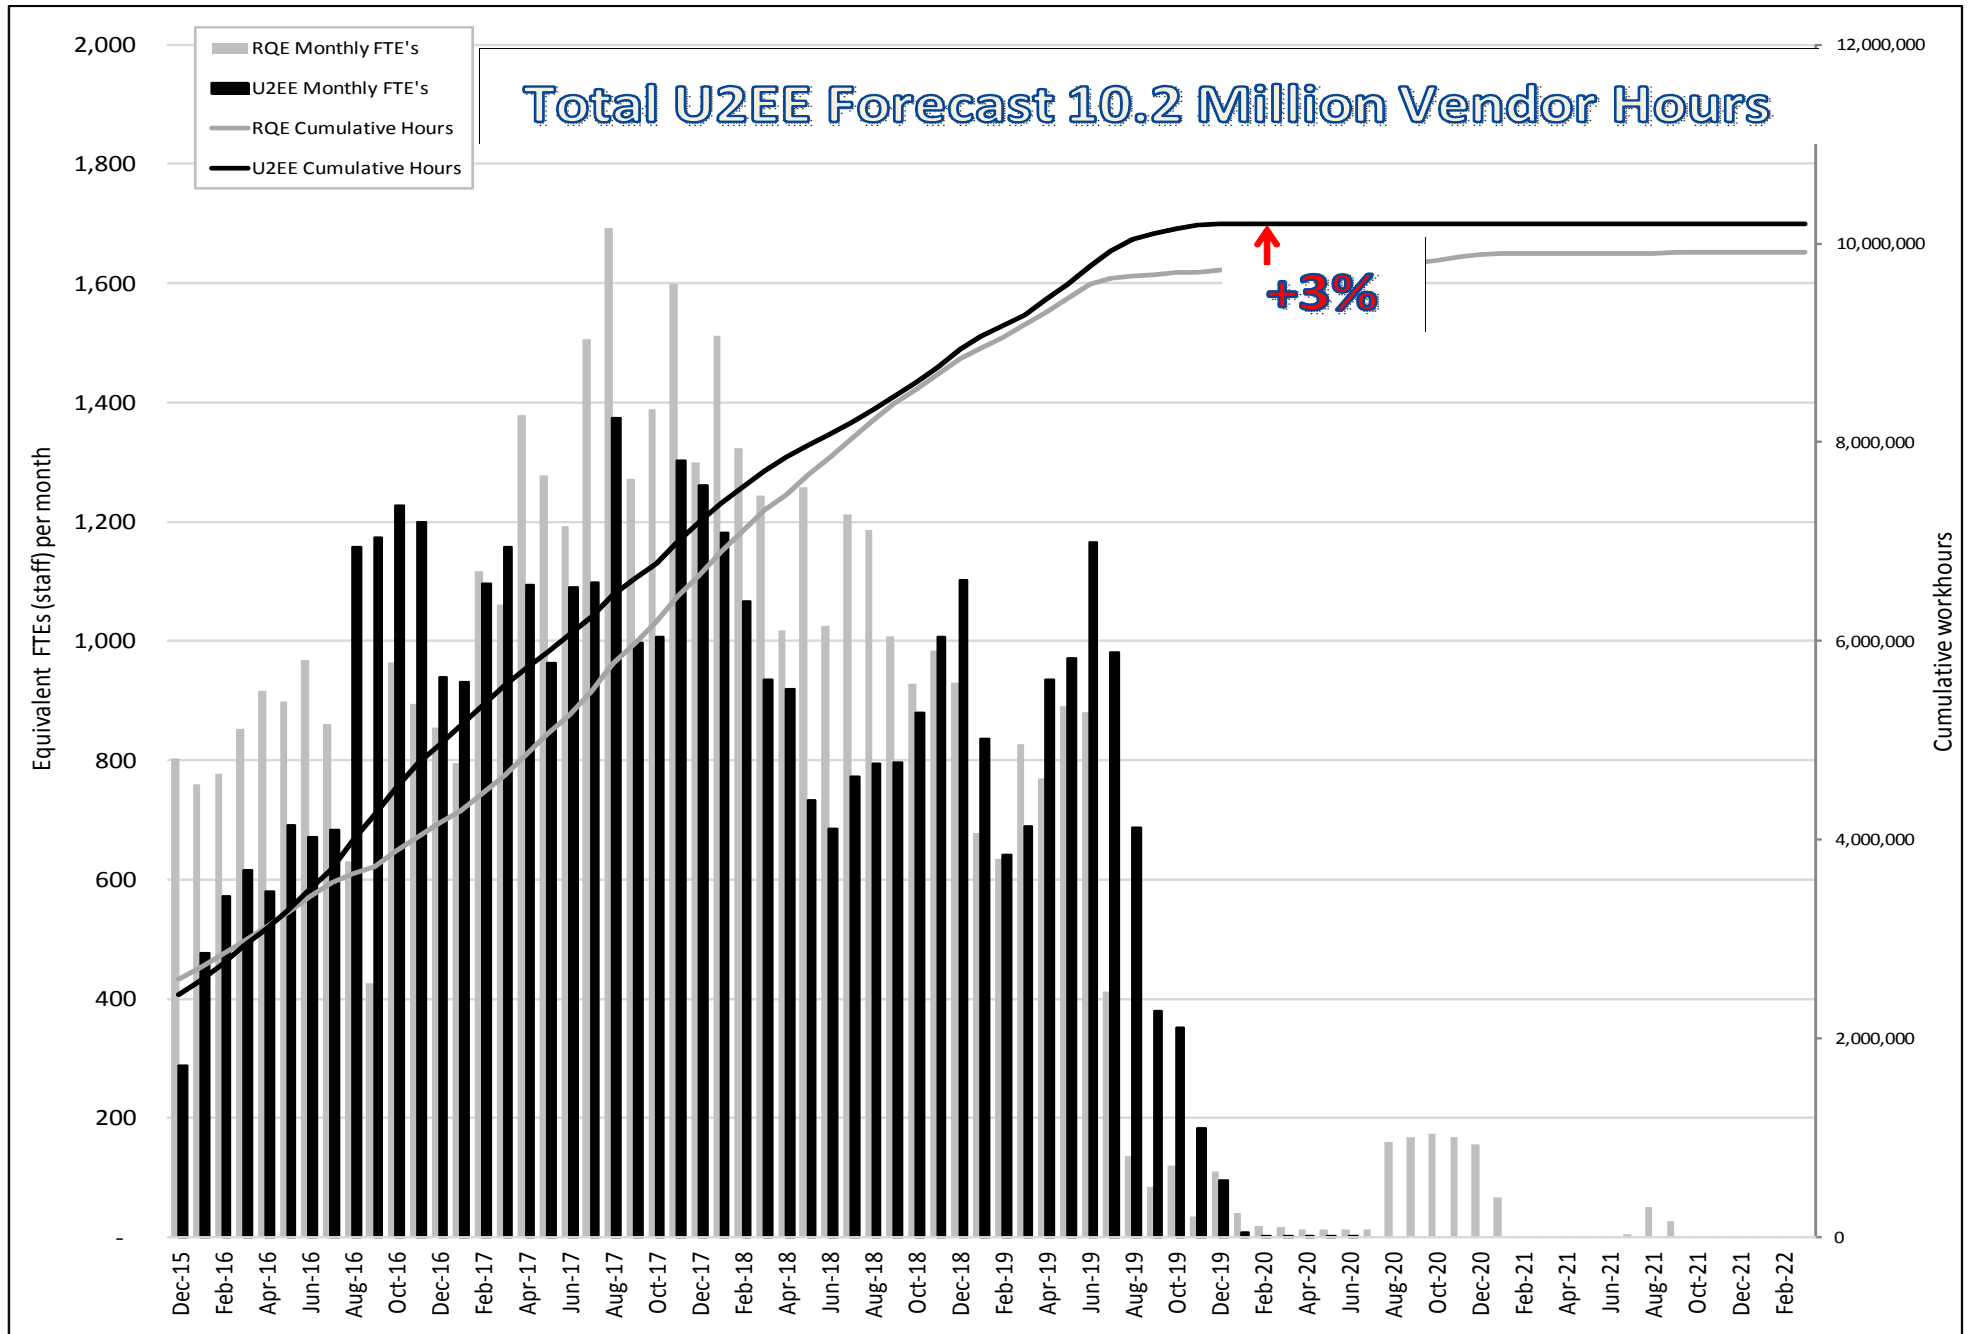

## APPENDIX 5A: RESOURCE ANALYSIS – OPG RESOURCES: U2EE vs. RQE

The following chart includes OPG Project Management, Oversight and Functional Support, plus Operations & Maintenance

APPENDIX 5B: RESOURCE ANALYSIS – VENDOR RESOURCES: U2EE vs. RQE (UNIT 2)

**APPENDIX 6: FUNDING RELEASE CALCULATION**

Requested 5b **2,876,047**

**Board Staff Interrogatory #56**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8, Chart 2

The above reference states that the overall Release Quality Estimate (RQE) is a Class 3 and provides the individual class estimate levels for the major work bundles. The RQE is dated November 13, 2015.

Have any of the major work bundle estimates been revised to a higher class estimate since release of the RQE? If so, please provide details.

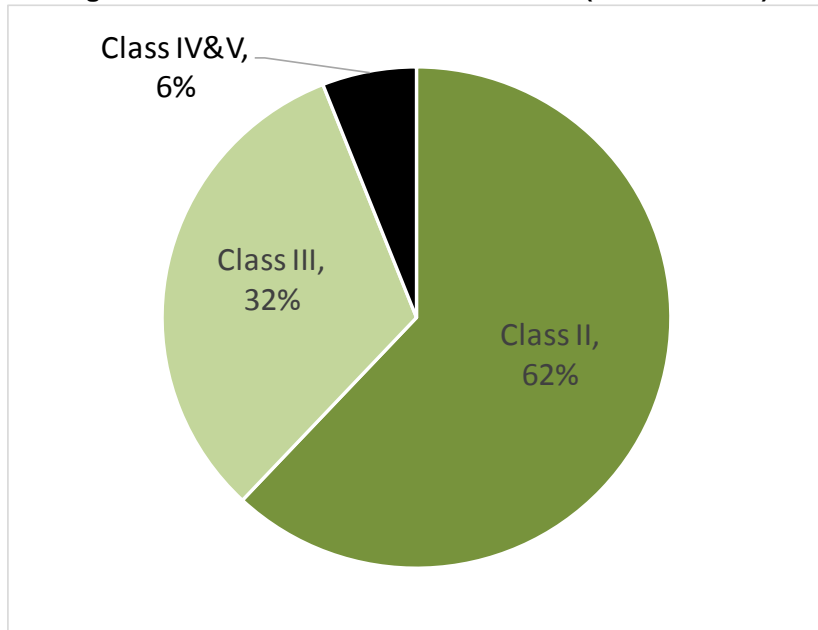

**Response**

Projects within the major work bundles have been revised to a higher class of estimates since the release of the RQE.

Refining of estimates for projects within the major work bundles has continued since the RQE with a particular focus on those estimates that were at Class 4 and 5. Figures 1 and 2 below compare the percentage of estimates for the major work bundles which were in the various estimate classes at RQE and in the August 2016 Unit 2 Execution Estimate (see Ex. L-4.3-1 Staff-55). As can be seen, as a percentage of overall value of the estimate, Class II estimates increased to 75% from 62%, Class III estimates shrunk from 32% to 23%, and Class IV and V estimates shrunk from 6% to 2%.

1

**Figure 1 - Estimate Classification at RQE (October 2015)**

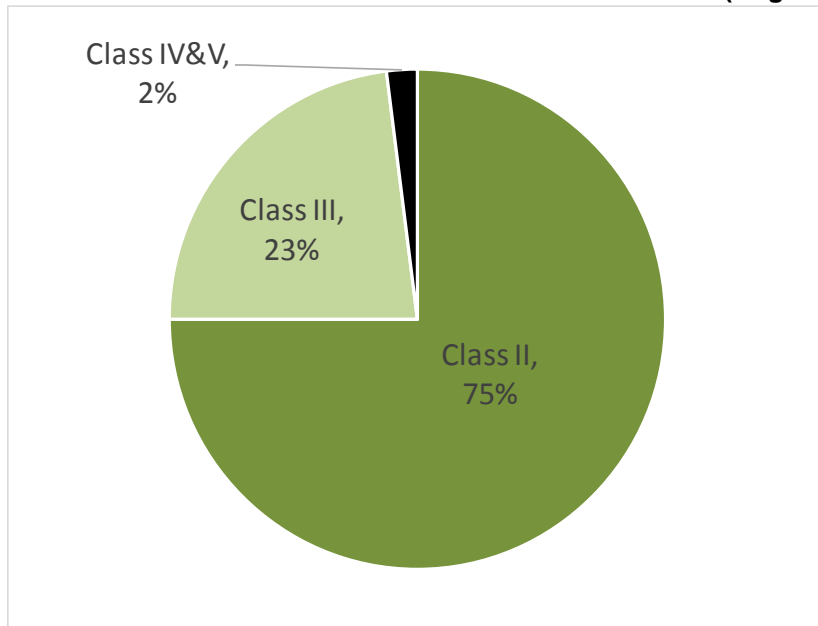

2

3

5

**Figure 2 - Estimate Classification at Unit 2 Execution Estimate (August 2016)**

6

**Board Staff Interrogatory #57**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8, Attachment 1

OPG has provided a Release Quality Estimate (RQE) as part of the DRP Execution Phase Business Case Summary.

- a) How will OPG determine whether it is necessary to reforecast the RQE? Provide all written processes and procedures regarding cost reforecast process.
- b) How will OPG track cost trends and contingency? Provide all written processes and procedures.
- c) What reporting tools for earned value, budget status, safety and project status will OPG use? What is the format and content for these reports? Who is responsible for generating these reports? Who will receive these reports and with what frequency?
- d) For each Unit, identify what is the value and percentage of contingency applied to each major work bundle.
- e) What is management contingency above the project contingency – how is it distributed across the projects?

**Response**

- a) OPG will develop an estimate for each subsequent unit's refurbishment prior to seeking a release for execution of that unit. As part of that process, OPG will update its estimate for the completion of the Darlington Refurbishment Program (similar to the RQE). The process will include a review of the actual costs and schedule from previous units, applying lessons learned, updating risks and contingency and validation of contractors' estimates. The estimating process is documented in Nuclear Projects Cost Estimating Process NR N-MAN-00120-10001-EST-R002 (L-4.3-1 Staff-48a, Attachment 23).
- b) OPG tracks cost performance against budgets on a monthly basis and performs trend analysis using earned value management. On a monthly basis, cost performance reports are issued and project managers will identify and analyze variances to plan, trends, and items requiring corrective actions. When these trends indicate that contingency is

1 required to mitigate a risk, issue, trend, or other, then the change management process  
2 will be followed to drawdown/return contingency. Cost management reporting is  
3 documented in Nuclear Refurbishment Cost Management and Reporting N-MAN-00120-  
4 10001-PC-13-R000 (L-04.3-1 Staff-48a, Attachment 26), while Nuclear Refurbishment  
5 program change management is documented in Nuclear Refurbishment – Program  
6 Change Management N-MAN-00120-10001-PC-12-R001 (L-043-1 Staff-48a, Attachment  
7 27).  
8

9 c) OPG has established a robust cost management and project reporting solution.

- 10  
11 • The reporting tools used for earned value are the cost system [Ecosys], the  
12 scheduling software [Primavera 6], the information storage database [Integrated  
13 Database] and report building software [Microsoft Report Builder and Microsoft  
14 Business Intelligence (BI)].  
15
- 16 • For cost based Earned Value, work packages in Primavera P6 are progressed with  
17 their physical % complete (based on pre-established earning rules or unit counts).  
18 This % complete is loaded into Ecosys, and an earned value (in \$) is calculated  
19 based on an approved planned value to calculate CPI (Cost Performance Index). An  
20 automated routine runs to transfer the information within Ecosys into an Integrated  
21 Database such that automated reporting algorithms can read and utilize the data  
22 consistently to produce standardized progress and performance reports using  
23 Microsoft Business Intelligence (BI).  
24
- 25 • For schedule based Earned Value, the same initial process occurs as above (work  
26 packages in Primavera P6 are progressed with their physical % complete), however,  
27 this information, as well as other schedule resource information is utilized to calculate  
28 SPI (Schedule Performance Index). An automated routine runs each night to transfer  
29 the information within Primavera P6 into an Integrated Database such that automated  
30 reporting algorithms can read and utilize the data consistently to produce  
31 standardized progress and performance reports using Microsoft Business Intelligence  
32 (BI).  
33
- 34 • The reporting tools for budget status are the cost system [Ecosys], the information  
35 storage database [Integrated Database] and report building software [Microsoft  
36 Report Builder and Microsoft Business Intelligence (BI)].  
37
- 38 • The reporting tools for safety are the Station Condition Record (SCR) Database, and  
39 excel files maintained within secure SharePoint locations by the Safety department.  
40
- 41 • The primary reporting tools for Project Status are Primavera P6 (for project progress  
42 and schedule status) and Ecosys (for budget, cost, and change management status),  
43 as well as the Integrated Database and report building software using Microsoft  
44 Business Intelligence (BI). There are secondary systems that provide additional  
45 information, such as scope tracking, and work management. The information from

1 these secondary systems is utilized by the Integrated Database to ensure a complete  
2 set of reports and metrics are available.  
3

- 4 • Reporting within Nuclear Refurbishment follows a tiered structure where the  
5 information is gathered and reported on at the lowest level of granularity with rollups  
6 for tiered reporting to a variety of different reporting levels. For example, schedule  
7 progress is reported against activities in Primavera P6, rolled up to a work package  
8 where earned value is measured and costs are collected and reported. Work  
9 packages are rolled up to cost elements, vendors, projects, scope bundles, and the  
10 unit. The Nuclear Projects Executive Team will make decisions based on the overall  
11 progress of the refurbishment, which is a direct roll up of a progressed activity on the  
12 schedule and a work package in the costs system.  
13
- 14 • Reports are developed by the Project Planning & Controls Reporting department.  
15 These reports go through a stringent development and acceptance testing process to  
16 ensure that the reports accurately reflect the data that is entered. The project teams  
17 are responsible to ensure that the data entered within the key source systems (such  
18 as Primavera 6 and Ecosys) accurately reflect the status of their project. In addition to  
19 daily/weekly reviews within the project teams, there is a review and challenge process  
20 built into the month-end reporting cycle. The information within the automated reports  
21 is the basis for all executive reporting. Depending on the report, the analysis and text  
22 write-up on the status is performed by the appropriate individuals such as the Project  
23 Managers.  
24

25 The report audience and frequency of report generation is also tiered. The project teams  
26 receive schedule information on a daily and weekly frequency. Any safety events will also  
27 be reported on immediately. The Nuclear Projects Executive Team will receive schedule  
28 progress information on a weekly frequency. Cost performance is collected weekly and  
29 reported monthly.

1 d) The values are provided in the chart below:

2

<b>Contingency Summary Unit Detail (2015 \$M)</b> (Ref: Ex. D2-2-8, Attachment 1, Table C2 and Ex. D2-2-7, Chart 1)

<b>Total</b>	<b>1,706</b>	<b>42</b>	<b>100%</b>	<b>645</b>	<b>100%</b>	<b>429</b>	<b>100%</b>	<b>323</b>	<b>100%</b>	<b>267</b>	<b>100%</b>

3

4 e) OPG interprets the question to mean what is Program Contingency above the Project  
5 Contingency. OPG notes that Ex. D2-2-7 Chart 1 and Ex. D2-2-8, Attachment 1, Table  
6 C2 displays both Project Contingency and Program Contingency, distributed by Major  
7 Work Bundles and Execution Support Functions. Project contingency is related to  
8 discrete project risks, and is distributed to Projects and is available for Project Managers  
9 through the use of the Change Management process. Program Contingency is  
10 overarching contingency that is not directly attributable to a single project and, as such, it  
11 is held at the Program level. Program contingency can be released to a project through  
12 the Change Management process; however, its use must be authorized by senior project  
13 executives prior to drawdown.

14

15 If by "management contingency" what was meant was management reserve, OPG notes  
16 that there is no specific amount above the total \$1.7B (2015\$) contingency determined  
17 for management reserve. OPG does not expect the Darlington Refurbishment Program to  
18 exceed its high confidence estimate of \$12.8B. If low probability, high consequence risks  
19 outside of the control of the Darlington Refurbishment Program management occur,  
20 management would evaluate the impacts and make a recommendation to the OPG  
21 Board of Directors on the appropriate response.

**Board Staff Interrogatory #58**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-6 and D2-2-8

- a) What is the process that OPG will use to make DRP decisions impacting cost and schedule?
- b) Who within the project management organization has what type and level of decision-making authority?
- c) Describe OPG's strategy to work through disagreements with contractors that have cost and schedule impact, i.e. explain how these issues will be identified, escalated and resolved? What data will be provided to the person(s) with decision making authority? What is the timeline for this process?

**Response**

- a) Darlington Refurbishment Program (DRP) decisions impacting cost and schedule are made in accordance with the change management process discussed in Ex. D2-2-9, Attachment 1, and L-4.3-1 Staff-48, Attachments 25-27.
- b) OPG assumes the question is referring to decision-making authority over changes to cost and schedule.

**Schedule Changes:** Only the Senior Vice President, Execution and Senior Vice President, Nuclear Projects can authorize changes which impact the critical path schedule. They may release schedule contingency within the following limits:

- Project schedule contingency within the planned outage duration (target duration) is released via the Change Control Board, where the Senior Vice President, Execution can approve up to a 5 day impact on critical path and the Senior Vice President, Nuclear Projects must approve impacts greater than 5 days.
- Program schedule contingency within the high confidence schedule is released via the Program Change Control Board, where the Senior Vice President, Nuclear Projects may authorize up to 5 days of impact on critical path. All critical path impacts

1 above that threshold will require the approval of the Chief Nuclear Officer and Chief  
2 Executive Officer.

3  
4 **Cost Changes:** Provided the appropriate change management approval process is  
5 followed, cost contingency may be released as follows:

- 6  
7 • Project managers, project directors and senior project directors can release up to  
8 \$1M, \$2M and \$5M, respectively if they have budgeted contingency available to  
9 them.  
10 • Contingency releases over \$5M require Senior Vice President, Execution's approval  
11 at the Change Control Board.  
12 • Program Cost Contingency is discussed at the Program Change Control Board,  
13 where the Senior Vice President, Execution must authorize the release of cost  
14 estimating uncertainty contingency, and the Senior Vice President, Nuclear Projects  
15 may authorize release of contingency for discrete program risks.  
16

17 The Vice President, Project Planning and Controls, owns and administers the Change  
18 Management Process. The Project Planning and Controls organization will ensure that  
19 the Change Control Process at both the project level and program level are appropriately  
20 administered, ensure that all changes are documented, and will generate and issue  
21 contingency drawdown reports to Management and the Board of Directors.  
22

- 23 c) The Darlington Refurbishment Contract Management Plan has been provided as  
24 Attachment 7 to L-4.3-1 Staff-048.  
25

26 For each of OPG's major work bundle contracts, OPG has weekly meetings both  
27 internally and with its contractors to identify any issues. Such issues are tracked in issues  
28 logs and are shared between both organizations. Each contract has terms limiting the  
29 ability for the contractors to initiate project changes, which manages and reduces OPG's  
30 risk exposure to changes in target costs, target schedules or fixed fees. As set out in the  
31 Darlington Refurbishment Contract Management Plan, if any project change is proposed,  
32 Contract Management or Project Management is to confer with OPG Law and Supply  
33 Chain, as well as People and Culture and Finance as required, to determine whether a  
34 project change or contract amendment is appropriate.  
35

36 If there is a dispute between OPG and the contractor with respect to any changes that  
37 have cost or schedule impact, including allowable and disallowable costs, changes to the  
38 cost allocation table, and schedule relief for delays, each contract sets out the process for  
39 resolution of disputes. The dispute resolution process escalates the disputes from project  
40 managers, to the Steering Committee, to formal and binding arbitration. Timelines are  
41 set out in each contract for escalating a dispute to the next stage. Each contract also  
42 limits the recourse of the contractor and OPG to the ordinary courts.  
43

44 The information to be provided to the person(s) with the decision making authority differs  
45 depending on the circumstances. Key details pertinent to the dispute will be provided. For

- 1 example, contractor requirements and obligations as set out in the contract, purchase
- 2 orders or submittal schedules will be provided.

**Board Staff Interrogatory #59**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8, Attachment 2, page 24

The above referenced Modus report states that "The various islanding projects are relatively small in cost but significant to the DR Project's success. The design of the Darlington plant, in particular the fueling bay that runs below the reactors, makes isolating a single unit for refurbishment a challenge."

- a) Please confirm that the isolating of a single unit from the operating units is unique to the DRP (i.e. that it has not been done on prior nuclear refurbishments).
- b) What special precautions have been taken to ensure that the operation of the remaining units does not interfere with the refurbishment of Unit 2 and vice-versa?
- c) How much has been spent to date on the islanding project compared to budget?
- d) What contingency has been provided for the various islanding projects?

**Response**

- a) OPG does not confirm that "isolating a single unit from the operating units is unique to the DRP." The reference cited in the question speaks to the particular challenges associated with islanding given that the duct in which the shared fueling machines travel runs below the reactors. OPG does confirm that the DRP is unique in that it is the first CANDU station where fueling machines are shared among the units, and where a unit under refurbishment will be immediately adjacent to an operating unit in that unit pair.

The Bruce A Station's design is similar to the Darlington design in that there are shared fuelling machines travelling in a fueling duct servicing all of the units. However, during the Bruce A Units 1 and 2 refurbishments between 2005 and 2012, both units were shutdown and refurbished, effectively in parallel. Units 3 and 4 (not immediately adjacent) were operating.

Units 1 to 4 at Pickering were retubed (pressure tubes replaced) in the mid-to-late 1980s and early 1990s. At various times during that refurbishment, the immediately adjacent unit was operating. However, the Pickering units all have dedicated fuelling machines and no

1 fuelling duct which accesses all of the units.

2  
3 Pt. Lepreau is a single unit station and, therefore, there was no or minimal islanding to be  
4 carried out.

5  
6 Wolsong is a multi-unit station and was refurbished while the immediately adjacent unit  
7 was operating; however, like the Pickering units (and Pt. Lepreau), the Wolsong units  
8 have dedicated fuelling machines.

- 9  
10 b) Many special precautions have been taken to ensure that the operation of the remaining  
11 units does not interfere with the refurbishment of Unit 2 and vice versa. As noted in Ex.  
12 D2-2-8, Attachment 2, p. 24: (i) a bulkhead will be installed to isolate the refurbishment  
13 unit reactor vault from the remainder of station containment once the de-fuelling of Unit 2  
14 is complete, (ii) barriers and access controls have been installed to ensure that staff  
15 working on refurbishment do not enter the operating areas and vice versa (unless  
16 required), and (iii) operating station systems have been isolated from the refurbishment  
17 units to the extent possible.

18  
19 In addition to physical barriers, as discussed in Ex. D2-2-9, pp. 5-6, the DRP includes a  
20 dedicated Operations and Maintenance Function which provides support to the major  
21 work bundles of the unit being refurbished and also serves as the custodian of the  
22 operating units in the plant by ensuring that the refurbishment work does not adversely  
23 impact those operating units. Daily interface meetings have been taking place which  
24 involve both refurbishment staff and operating staff to ensure that all work is well  
25 coordinated and there are no, or minimal, interferences.

26  
27 Special tiered training has also been developed for site staff as well as staff who are not  
28 normally at the station site but who access the station from time to time, to ensure that  
29 they are familiar with, and obey, the barriers and signage which have been put in place to  
30 avoid interference between the refurbishment unit staff and operating staff.

- 31  
32 c) As of August 2016, expenditures on the Islanding project were \$46.2M compared to a  
33 control budget of \$47.7M.
- 34  
35 d) The contingency amount of \$21M referenced in Ex. D2-2-8, Attachment 2, p. 24, is made  
36 up of two components:
- 37  
38 i. Cost uncertainty represents \$2M of the total and includes \$1.5M for the Bulkhead  
39 project, \$0.2M for the Barriers projects, \$0.2M for Project Management Support,  
40 with the remainder distributed to various other smaller projects.
- 41  
42 ii. The remaining \$19M represents contingency for discrete risks associated with the  
43 Islanding project. The largest of the discrete risks relates to the Bulkhead project,  
which is on critical path; \$14M contingency was provided for that risk.

**Board Staff Interrogatory #60**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8, Attachment 1, Figure A1

The above referenced Release Strategy shows work on Unit 3 starting immediately after Unit 2 returns to service.

Please explain how this schedule will enable OPG to internalize and apply the lessons learned from Unit 2 going forward.

**Response**

The preparation and execution for each unit occurs in phases. For example, lessons learned during the completion of detailed design engineering for Unit 2 will be applied to Unit 3 as replication of engineering for Unit 3 will be completed in advance of breaker open on Unit 3.

Similarly, the execution of Unit 3 will occur in phases (see Figure 2 of Ex. D2-2-6 and Attachment 1 of Ex. D2-2-6). For example, the defueling of Unit 3 will start approximately 3 years after the completion of defueling on Unit 2, allowing significant time to incorporate lessons learned. Similarly the removal segment of the Unit 3 refurbishment will start over two years after the end of the removal segment on Unit 2, again allowing significant time to apply the lessons learned on Unit 2 to Unit 3. This same approach to lessons learned will be applied to all phases of the execution of Unit 3 and to the units following.

**Board Staff Interrogatory #61**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-3, Attachment 1, page 6

For the DRP Execution Phase, calculation and payment of all cost incentives and disincentives will be done on an aggregate basis for all completed units.

- a) Please explain how this will work in practical terms with the CRVA for DRP. For example, will the CRVA only be cleared at the completion of all four units?
- b) Were any incentive or disincentive payments made during the definition phase?

**Response**

- a) The costs of the DRP will reflect accrued incentives and disincentives at the completion of each unit as per OPG accounting process in accordance with US GAAP. The CRVA treatment of these amounts will be the same as for other sources of variance from OEB-approved capital and non-capital costs. Variances in non-capital costs are included in the CRVA as incurred, and the revenue requirement of variances in capital costs is included in the CRVA on the basis of variances in amounts placed in service. OPG anticipates that the CRVA balance would be cleared periodically in the normal course in conjunction with other deferral and variance account balances.
- b) While OPG's Definition Phase concluded at the end of 2015, some vendor Definition Phase activities are still ongoing as contemplated in their agreements, and in some cases, will continue to September, 2017. It is not currently anticipated that any incentive payments will be made by OPG. OPG will assess potential disincentives at the time of completion. Notwithstanding the above, with respect to the Retube and Feeder Replacement contract, a \$1,000,000 lump sum disincentive payment was paid to OPG as consideration for the movement of the target date for a limited number of Definition Phase work activities. Less than 2% (approximately \$18M) of work was outstanding to meet the milestone. In addition to the disincentive payment, OPG also established realistic but aggressive milestones and associated disincentives for the remaining Definition Phase work so as to incentivize the contractor to complete the work.

**Board Staff Interrogatory #62**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Reference: D2-2-8, page 8

The above reference states that OPG will complete the Unit 2 refurbishments within the total budget envelope of \$4.8B.

- a) How does that fit in with the Capital Refurbishment Variance Account (CRVA)? I.e. if Unit 2 in service additions are greater than \$4.8B, will those costs go into the CRVA?
- b) When OPG comes in for its next application for 2022 will there be a reforecast of the remaining DRP costs?

**Response**

- a) As stated at Ex. H1-1-1, pp. 12-13, lines 27-30, 1-5:

the Capacity Refurbishment Variance Account was originally approved in EB-2007-0905... to record variances between the actual capital and non-capital costs and firm financial commitments incurred to increase the output of, refurbish or add operating capacity to a prescribed generation facility ... **In 2015, O. Reg. 53/05 was amended to affirm that the scope of this account includes the capital and non-capital costs and firm financial commitments incurred in respect of the Darlington Refurbishment Program.** [Emphasis added].

If actual in service additions are different (greater or less) than amounts approved by the OEB in this proceeding, including the \$4.8B forecast for Unit 2 in-service addition, the cost impact of the difference will be booked to the Capacity Refurbishment Variance Account.

- b) Yes. In OPG's next payment amounts application, the evidence will include the best available forecast of the remaining DRP costs.

**Board Staff Interrogatory #63**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh A1-2-2

Ref: Exh D2-2-8, Attachment 1

In the current application OPG seeks the addition to rate base of \$4.8B related to Unit 2 in 2020 and \$743M related to supporting projects. OPG states that if actual additions to rate base are different from forecast amounts, the cost impact of the difference will be recorded in the CRVA. The evidence states that any amounts greater than the forecast amounts added to rate base will be subject to a prudence review in a future proceeding. While not stated in evidence, presumably any amounts less than forecast would be recorded in the CRVA and credited to ratepayers when the account is dispositioned.

What is the incentive for OPG to reduce costs for the Unit 2 refurbishment or for the entire \$12.8B DRP?

**Response**

OPG is an OBCA corporation whose mandate states that "OPG shall leverage its assets and expertise to generate new revenues on a commercially sound basis...."<sup>1</sup> Given the large percentage of OPG's assets that are regulated, a significant potential source of new revenues is the expansion of its regulated asset base. The Darlington Refurbishment Project (DRP) is a singular opportunity to renew and expand OPG's regulated asset base. This opportunity and the resulting revenues will only be realized if OPG is able to complete the entire DRP. The fact that the Government is expected to assess the on-going feasibility of DRP based on the performance of the Unit 2 refurbishment, creates a strong incentive for OPG to control costs and maintain the project schedule, consistent with safety.

The oversight provided by the OEB on this rate application and any subsequent prudence review of DRP costs in excess of forecast, will determine the amount that OPG recovers for DRP. Any cost disallowance ultimately would reduce the revenues that the company earns on its investment in DRP. Furthermore, if the project is over budget or late, management's performance will be scrutinized by OPG's Board of Directors (which has retained independent experts to provide oversight) and the Shareholder. This oversight (See Ex. D2-2-9, pp. 10 to 13), combined with OPG's management incentive program and contractor incentives included in the contracts, also drives OPG to safely complete the Unit 2 Refurbishment as quickly as possible and at the lowest possible cost.

---

<sup>1</sup> Ex. A1-4-1 Attachment 2, page 4.

1  
2 The DRP is a destiny project for OPG, for the CANDU nuclear program, and for the Province  
3 of Ontario. OPG's management team and OPG's employees recognize that. If the DRP were  
4 not to succeed, there will be no, or a severely limited, future nuclear program for OPG and  
5 the Province of Ontario.

**Board Staff Interrogatory #64**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8 Attachment 1, page 2

The above reference states that OPG's current Levelized Unit Energy Cost (LUEC) estimate of 8.1 ¢/kWh (2015\$) for the DRP is within the previously communicated estimate of 8 ¢/kWh in 2009\$.

- a) What total cost can the DRP rise to in 2026\$ that would still be equivalent to the LUEC 2009 at less than 8 ¢/kWh?
- b) Please calculate the LUEC when the full \$12.8B is used.
- c) Please calculate the LUEC when the costs related to previous DRP projects that have been moved to Nuclear Operations is added back.

**Response**

- a) OPG interprets this question to be: "to what amount can the DRP cost of \$12.8B (which includes interest and escalation) rise, all other factors being equal, and maintain the LUEC at less than 8¢/kWh (2009\$)?" The reference to 2026\$ is confusing, as the \$12.8B is expended over many years in dollars of those years, not in 2026\$.

The DRP cost could rise to \$16.3B (including interest and escalation), all other factors being equal, and the LUEC for the DRP would remain less than 8 ¢/kWh (2009\$).

- b) The LUEC of 8.1¢/kWh (2015\$) provided in Ex. D2-2-8 Attachment 1 is calculated using the full \$12.8B.
- c) If the costs for the projects reclassified to Nuclear Operations (see Ex. D2-2-10 p. 10-11) were to be added to the DRP costs, the LUEC would increase to approximately 8.25¢/kWh (2015\$).

Please refer to L-04.3-1 Staff-8, part c), and L-04.3-2 AMPCO-105 for the reclassification rationale.

**Board Staff Interrogatory #65**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8 Attachment 1, page 28

OPG indicates that benchmarking has been done against other CANDU refurbishment projects at Point Lepreau and the Bruce 1& 2 Units. Please provide details.

**Response**

Please see Ex. L-4.3-1 Staff-053.

**Board Staff Interrogatory #66**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8, Attachment 1 page 31

The above reference states that \$503M of the \$1.7B contingency is for schedule extension.

What is the worst case scenario (i.e. how many months past the current 112 months schedule) that this dollar amount of contingency will cover? For instance, would it cover a six month increase in duration of the overall schedule? If so, explain why the LUEC would increase by 0.1 cent/kWh with a 6 month increase in schedule.

**Response**

As stated in Ex. D2-2-8, Attachment 1, p. 31, the \$503M contingency for schedule extension is "to cover the risk of delay up to the high confidence schedule duration." The high confidence schedule is 112 months; therefore, if the final duration is as long as the high confidence schedule, the entire \$503M would be expended.

As noted on Ex. D2-2-6, p. 5, lines 6-10, OPG plans to manage day-to-day performance using the planned outage duration (target duration) (please see Ex. D2-2-6, Attachment 1), not the high confidence schedule. For Unit 2, the target duration is 35 months and the high confidence schedule is 40 months.

The calculated LUEC increase of 0.1¢/kWh for a six month schedule increase (1.5 months per unit) discussed in Ex. D2-2-8, Attachment 1, p. 38, is a sensitivity analysis on LUEC where the assumption is that the Darlington Refurbishment Program exceeds 112 months. The reason for the increases is that the longer duration is assumed to result in higher costs for Darlington Refurbishment Program execution, as well as a delay to energy production, resulting in impacts to the LUEC.

**Board Staff Interrogatory #67**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh: D2-2-8, Attachment 1, page 31

\$50M contingency is provided to retain critical trades and leadership resources between work on units. There are a number of other projects which are identified as possible other work.

- a) How did OPG determine the \$50M contingency amount? Please provide assumptions and references for any calculations.
- b) If work on other projects does not proceed, how does OPG intend to use the \$50M?
- c) Does OPG forecast spending any of the \$50M contingency in the 2017-2021 period?

**Response**

a) Two significant periods of reduced demand for planned contractor resources were identified (i) June 2019 through January 2020, i.e., as Unit 2 is completed and work transitions to Unit 3, and (ii) June 2022 through January 2023 between Unit 1 and Unit 4. This was estimated to be approximately 280 and 235 staff for each of these 8-month periods, respectively. The total potential bridging cost was calculated to be \$55 million, which would retain staffing levels at approximately 70% of core staff across these two periods. At 90% probability applied to this estimated cost, this equated to \$50M in contingency.

b) Contingency for these risks would be released using OPG's change management process as set out in Ex. L-4.3-001 Staff-58(b). Should the assignment of the retained resources to the Nuclear project portfolio work, fleet unit outage work, or Darlington 'Life Extension' work during this period be not possible, these resources would be utilized to enhance those resources performing planning, training and readiness-to-execute activities for the refurbishment of the subsequent units.

OPG would seek to minimize the cost impact to the extent possible. A loss of these resources would have a much greater impact on the refurbishment of Unit 3 as many of these resources may not return if relieved from Unit 2 duties, resulting in increased re-training and risks of a new workforce without the equivalent experience of those that worked on Unit 2.

- 1  
2 c) OPG does not forecast whether a specific risk will materialize and an associated  
3 contingency amount spent. As set out in Ex. D2-2-7, OPG expects to spend the  
4 contingency included in RQE. Any release of contingency would follow OPG's change  
5 management process as set out in Ex. L-4.3-001 Staff 58(b).

**Board Staff Interrogatory #68**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-8, Attachments 2, 3 and 4

In Attachment 2, BMCD/Modus made recommendations associated with certain components of the Release Quality Estimate (RQE). Similarly, in Attachment 3 KPMG identified a number of gaps and risks. In Attachment 4 the Expert Panel made eight recommendations.

- a) Please provide a status update on OPG's work in addressing BMCD/Modus' recommendations.
- b) Please describe how OPG is addressing the gaps and risks identified by KPMG.
- c) Please provide a status update on OPG's work in addressing the Expert Panel's recommendations. Specifically, what adjustments were made to the project schedule, productivity expectations and project management plans subsequent to the receipt of the Expert Panel's report.
- d) On page 14 of Attachment 4, it states "it will take vigilant project management and worker productivity not generally experienced on retube projects in Canada to achieve a schedule equivalent to or shorter than the P50 schedule". Please describe how OPG has determined that its worker productivity expectations are reasonable.

**Response**

- a) Between August, 2013 and December, 2015, 154 recommendations were initiated from the Burns McDonnell/Modus quarterly reports. These recommendations were addressed, dispositioned and closed out except for one which is at 'in-progress' status and due for closure this month. In the period from July, 2014 to December, 2015, Burns McDonnell/Modus conducted and reported on twelve (12) assessments. Seventy six (76) recommendations were addressed, dispositioned and closed out except for one which is also at 'in-progress' status and due for closure this month.
- b) OPG reviewed the recommendations provided by KPMG and, where required, built many of the recommendations into the Unit 2 Execution Estimate. Attachment 1 provides a listing of how each finding was dispositioned.

- 1 c) Please see Attachment 2. No changes to schedule, productivity or plans resulted from the  
2 Expert Panel's review, nor was the scope of the work of the Panel and the resulting  
3 actions related to the question. The objective of the Panel was to ascertain whether the  
4 product of the Class 2 estimate met their tests for do-ability. The Panel's conclusion was  
5 that it did; in addition, the Panel made suggestions related primarily to risk management,  
6 and other recommendations on areas to keep a close watch on, and areas for  
7 improvement. Those actions were input into OPG's Risk Management Oversight tool and  
8 have been acted on. Please see Ex. L-4.3-15 SEC-34 for further information regarding  
9 OPG's response to the Expert Panel's report.  
10
- 11 d) For the Retube and Feeder Replacement work, which is what the cited quote from Ex. D2-  
12 2-8, Attachment 4, p. 14 is referring to, the schedule is based on actual tests of the tools in  
13 the mock-up. Therefore, OPG believes worker productivity assumptions to be reasonable.  
14 Also, when compared to the durations of other refurbishments, and in consideration of the  
15 level of planning that OPG has completed compared to other CANDU refurbishments, OPG  
16 believes the schedule to be reasonable. However, OPG has assessed and recognized that  
17 risks may occur and is carrying schedule contingency for any amounts of schedule delay or  
18 productivity challenges that cannot be fully mitigated.

NK38-REP-09701-0568865 OPG DNRP - Independent Estimating Review Services - Consolidated Main Report - November 6 2015 FINAL  
NK38-REP-09701-0564969 RQE Quality Assessment Report  
Modus RQE Assessment Report Final r1 Executed

As part of U2EE, a comprehensive review of the RQE oversight reports was performed by Planning & Controls. As part of the review process, a consolidated listing of observations & recommendations was developed in MS Excel in order to categorize and provide referencing of common and/or duplicative observations. Further reviews with multiple Functional owners and project subject matter experts ensured 1.) appropriate treatment of observations and recommendations, 2.) completeness of the scope of actions and traceability to duplicative and common items; and 3.) appropriateness of actions based on the plan for Unit 2 cost/schedule/risk finalization.

This MS Excel file contains the consolidated listing of action closeout.

<a href="#">5984</a>	<a href="#">MODUS 1</a>	Gary ROSE	Lindsay GREENLAND	Construction management metrics and systems for tracking progress of the work are currently only conceptual and should be tested and proven; this is particularly important for the RFR reactor face Series work which is presented in the schedule at only a row-by-row level of detail. A significant amount of development time is being spent on metrics for measuring the plan creation and planning effort and not enough on the work performance metrics. On projects across all phases of work, increased focus is needed to align construction metrics with schedule performance for more predictable outcomes. For RFR work, the gap year activities, or rehearsals, taking place on the mock-up should be utilized to test the metrics and systems – providing confidence in the ability to accurately track performance and update the schedule utilizing these systems; OPG should consider measuring performance on the rehearsal activities like a “mini” retube outage, utilizing all necessary systems, processes, procedures, and metrics necessary to accurately reflect progress and performance. An effort is already underway to address the need for Earned Value metrics from a previous report. These actions are in addition to and in support of this program.	See RMO Link	REPORTING	An Integrated Reporting Plan is in development. This plan will identify the various reporting elements for NR from tactical reports to Executive and Shareholder reports. IRP structure has been presented to NPET, and comments are being incorporated. Strawmodels for critical reports are being generated. This includes commodity, resource and cost tracking.	CLOSED
<a href="#">5979</a>	<a href="#">MODUS 2</a>	Gary ROSE	Derek MCAULEY to Karen Fritz Feb 15th	The DR Project Team is currently in the mode of planning and detailing DR Project pre-requisite work in both the Asset Suite (AS7) and P6 and is adhering to the MA-0022 procedure during this process. This process contains a significant number of steps to get through the entire planning process and is requiring significant time and dedicated resources to complete. The planning processes in MA-022 appears to be more for individual on-line maintenance activities, rather than project planning. MA-0013 is more in line with what we would expect for projects such as the Campus Plan and DR Projects. We have concerns that the DR schedule cannot be completely developed in a timely manner utilizing this process and having less than a year until breaker open. DR Program Outage Management is recommending that MA-0013 become the procedural guidance utilized to complete the prerequisite planning process. Making this change would require significantly less time and resources to complete and is better suited for the scope of work being planned. We are in agreement with this guidance change and believe the DR Program team should be supported in their desire to change the process.	See RMO Link	WORK CONTROL AND PLANNING	Modus is correct - the U2 Refurbishment Projects were not planned far enough in advance to an established, rigorous process to ensure readiness. Each Project Team has been using the MA0022 Process (Station Online readiness process) for their projects. Due to the magnitude and volume of preparation work in the Unit 2 'proper' that is following a project deliverable milestone set, the Prerequisite milestones are different for each prerequisite project. This is a significant lesson learned for Unit 3 and will be incorporated in the preparation milestones for that Unit by the Director, Unit 3 and the Project Office. The Unit 2 Director has put a dedicated Prerequisite Project Team in place, led by a Manager and supported by 3 WCTLs and the PCC. It is too late at this time for Unit 2 to introduce the MA0013-style milestone set to the Prereq projects, however, the team is tracking all deliverables for all 53 windows in a report card and weekly & daily readiness meetings with the project teams. The team is tracking progress and keeping action logs for outstanding deliverables, together with the Construction department, to ensure all deliverables are met. The Prereq Team is tracking a 'readiness' milestone for each project. This team will be in place until Unit 2 Breaker Open. The team has introduced a protocol with the station, provided a T-X weekly meeting schedule and Terms of Reference for each meeting. The project teams are attending meetings and following the expected process. MA-0013 is not a Refurbishment document, therefore it will never be the document of reference on Refurbishment for any work. N-MAN-10005 is being rewritten to reflect the current reality and processes and will continue to evolve until the Unit 3 milestones are established at a detailed project deliverable level. -10005 includes more that MA-0013 due to the EPC	CLOSED
<a href="#">5978</a>	<a href="#">MODUS 3</a>	Gary ROSE	Derek McAuley	Currently, there are too many milestone constraints causing artificial critical paths that only impact downstream activities inside that specific project and have no visible external impact to the DR Project as a whole. These artificial critical paths could be diverting attention away from other areas of the project that require greater focus. This is of immediate concern in the Campus Plan projects where we have observed constrained finish dates and other critical milestones. For Revision C to be considered a success, a critical path must be generated that is repeatable, has no hard constraints and is traceable through the project from beginning to end. This includes for the critical Campus Plan project schedules (EPG3, D2O and RWPB). Secondary and tertiary paths must possess the same qualities. A concerted effort is required to determine whether these paths should be showing as critical or whether a management decision or schedule adjustment can be made to take attention from those paths. The outage planning team is currently focused on this exercise for the outage schedule, but management needs to understand the paths through the prerequisite phase as well. The exercise of removing the hard constraints and identifying the paths through the pre-requisite phase must be the priority because of the number of paths that could affect breaker open and other near-term milestones.	See RMO Link	SCHEDULE	All Campus Plan milestones constraints are turned to soft constraint (allows the milestone to move with the logic), two remaining hard constrained milestones are linkages to Refurbishment Execution Windows for the D2O Storage to identify Ready to Accept PHT Water.  A weekly Milestone Constraint Report has been generated to monitor all hard constraints added to Campus Plan and Refurbishment projects.	CLOSED

<a href="#">5977</a>	<a href="#">MODUS 4</a>	Gary ROSE	Carlos BARRIOS	The DR Team has chosen to utilize a new cost management platform supplied by EcoSys. The DR Team needs to have a detailed written plan for implementation of the new system that is mindful of: The reasonable amount of time implementing the new system will require; The need to maintain parallel systems until the new system is functioning; Changes in metrics and reporting that are likely to occur.	See RMO Link	COST	The plan to implement Ecosys has been approved and the vendor, discussed by OPG and approved internally by the CIO and the VP of Planning and Control. The implementation will be done by phases (phase 1, 2 and 3) and the first phase will be completed by April 29, 2016 according to the plan. Ecosys is successfully placed in service with improvements and optimizations being identified by users and implemented.
<a href="#">5975</a>	<a href="#">MODUS 5</a>	Gary ROSE	Lisa REN	The RQE process has been a rigorous effort. Often in such situations, the bases and justifications for decisions are not well documented. Impact estimate values and ranges can play a role in future budget management matters and in dealing with challenges from external (and internal) sources. Individually, the bases for such numbers may not be important. However, the overall quality of the program may be challenged if justifications for input values are weak or non-existent. Establish simple criteria for documenting the bases for input values such as qualitative risk impact values and ranges. Review the Contingency input sheets to assess the quality of reasonableness and defensibility of justifications; and address inadequate basis documentation where appropriate. This must be accomplished while the personal source of the input is available. Ensure that justification is well documented for applying correlation, calculating burn rates, and other similar matters. With respect to contingency, quantitative cost impacts of discrete risks have been generated by project and functional teams and managers. Many were developed in the accelerated process of creating contingency input for RQE. Because of time constraints, inputs may not have received a rigorous independent review. The effect of this on the	See RMO Link	RISK	Steps are now in place based on the recommendations from Modus.  1. Established a simple criteria for documenting the basis for input values such as qualitative risk impact values and ranges. Risk personnel have provided a shelf check list to Risk Initiators to use when doing a monthly review of existing risks. 2. The Risk team continues to review the QUALITY of reasonability and defensibility of justifications; and addressing missing rationale by having the initiator provide further details where they were required. 3. Independent review was completed by the RISK review team off all submitted for contingency risks both prior to RQE deadline and ongoing by the Risk team staff. 4. More formal project team reviews took place in preparation for the U2 EEE Milestone to review material changes to contingency flagged risks. · Work closely with CCB process, to reconcile contingency withdraws to risks · Work closely with Risk SPOC to update Post RQE risk impacts, and monitor new risks impacts via defined template · Post –RQE contingency inputs files are set up and were reviewed in preparation of U2EE. · Scheduled challenge meetings executed. · Palisade consultant was onsite for May-Jun on–site visit and provided ongoing
<a href="#">5970</a>	<a href="#">MODUS 6</a>	Gary ROSE	Robert OBERTREIS	The ramp-up of qualified estimators for RQE resulted in acquiring estimators from multiple companies who were unfamiliar with OPG procedures and standards. By relying on outside resources with varying skill sets, the learning curve for outsiders was much steeper than it should have been. Moreover, OPG will need to maintain the estimating function through the Unit 2 Execution Phase and prepare for subsequent units. Continuity will be more critical for future estimating efforts. For the Unit 2 estimate and subsequent unit estimates, OPG should consider cost estimating a function worthy of permanent staffing and consider long-term retention of resources. The work of the estimating team could reasonably expand to evaluating the results and lessons from Unit 2 for subsequent unit estimates.	See RMO Link	ESTIMATING	A planning effort for establishing Nuclear Projects Estimate Centre of Excellence is underway. Insofar as NR, evaluation of staffing is in progress with submission of resource requirements to resource management group. Key positions including estimating leads and an analyst for the iTWO estimate software are part the requirements. Ongoing requirements are being planned based upon Nuclear Projects organizational development. U2EE was successfully completed with continuity of the same resources that supported RQE development. This was a benefit in understanding and familiarity with scope and vendors.
<a href="#">5969</a>	<a href="#">MODUS 7</a>	Gary ROSE	Robert OBERTREIS	The RQE cost data resides in the Master Consolidated File (MCF), which is a series of excel spreadsheets with few controls around the data and its traceability from point A to point B during development of the RQE. It also appears the spreadsheets were not password protected during data assembly. Our understanding is US Cost is being modified for the purpose of centralizing inputs to the Unit 2 estimate. For the Unit 2 estimate, OPG should consider a standardized cost system platform that deters use of manual intervention and has data security controls and version controls in place.	See RMO Link	INTEGRATION	iTWO estimating software has been selected as standardized system with implementation in progress. <b>All U2EE estimates are stored in iTwo.</b>
<a href="#">5968</a>	<a href="#">MODUS 8</a>	Gary ROSE	Robert OBERTREIS	The DR Team did not complete all of the deliverables or reach the maturity level for all aspects of the control budget that were planned. With the completion of the RQE, the team should consider using lessons learned from the RQE effort to develop a comprehensive Plan for estimating Unit 2. The DR Team's Unit 2 Estimating plan should clearly identify assignments and accountabilities across the full organization. The schedule for reviews and NPET involvement should be worked out well in advance with the goal for all deliverables to be provided (minimum) 3 days ahead of time). Time, location and extent of reviews should consider the engagement needed from senior management. NPET should also provide feedback to the Project Controls team regarding the materials used for the NPET presentations and any future changes that could improve the future review cycle. Include the requirements for Quality Assessment and reporting requirements including: reference to an assurance plan and systemic monitoring of QA during preparation of the estimate. Provide an assessment of the underlying data in coordination with the BOE. Recommend that the	See RMO Link	INTEGRATION	Unit 2 Execution Estimate Development Plan developed to incorporate these comments.

<a href="#">5966</a>	<a href="#">MODUS 9</a>	Gary ROSE	Judith WILLETTE	The DR Team should ensure that the RQE documentation needed to substantiate its decisions during development of the RQE is properly archived and available for future needs, including the unit-specific estimates and future regulatory proceedings. OPG's archiving of the documents should consider: All documents that support the RQE should be identified with a document number that is consistent with applicable OPG NR governance (i.e. NK38-NR....). The documents should be well organized in a controlled environment. The complete RQE package should include the source documentation for necessary for the traceability of all cost numbers. Once prepared, the sufficiency of OPG's system for document maintenance needs to be tested through audit/assessment.	See RMO Link	INTEGRATION	RQE documentation to substantiate decisions during RQE development is considered complete and properly archived. The attached snapshot of NK38-REF-09701-0584627 RQE Board Submission Package - Approval & Supporting Items summarizes the documents used to produce the RQE and their location. Document locations include sharepoint, and, where appropriate, Asset Suite, with the appropriate document number consistent with OPG NR governance. Source documentation for cost numbers is found in the Estimating database. The attached "RQE Board Submission Package-Approval and Supporting Items Document Structure" is a visual representation of these documents to aid in understanding the interrelationships between the documents throughout the RQE process. A summary of status notes that were made over the course of completing this Action are attached. Document maintenance within OPG is audited and assessed periodically following current OPG governance. U2EE was compiled and will be documented in the same structure in alignment with OPG records management program.	CLOSED
<a href="#">6063</a>	OPG-PR1	Gary ROSE	Robert OBERTREIS	PR1: Program Release and Estimate Planning Based on RQE lessons learned, produce a plan for the Unit 2 Project Execution Estimate that is focused on the use and integration of existing OPG business processes and tools. The plan should also explicitly address database sources, data integrity assurance, and data consolidation methodologies.	See RMO Link	INTEGRATION	The finalization of Unit 2 costs, schedule and risks is based upon utilizing the current process and tools as follows:  1. progression of the schedule from Rev B through to Rev C and Rev 0 utilized standard outage processes and primavera P6 implemented by the Refurbishment Work Management team,  2. costs are finalized: a.) using RQE as a control baseline with changes managed through the change management process and procedure; b.) integrated as part of project cost status and forecasting within the cost management tool with traceability to changes, and c.) implemented by NR Cost Management.  3. risks are updated with a contingency analysis in accordance with the standard risk processes and tools by NR Risk Management.  The plan and deliverables for Unit 2 Execution Estimate and Board Submission is recorded within action 00007276 Unit 2 Execution Estimate Process/Dates.	CLOSED
<a href="#">6064</a>	OPG-PR2	Gary ROSE	Robert OBERTREIS	PR2: Monitoring and Control To better anticipate, identify, and mitigate the types of estimate execution issues experienced in RQE, it is recommended that more structured monitoring and control mechanisms be established early in the estimating cycle. Consideration should be given to metrics development, clarity of accountabilities, standardized meeting agendas that include schedule and deliverable reviews, as well as the use of structured recovery plans for missed/threatened milestones and deliverables.	See RMO Link	ESTIMATING	The observations have been implemented as follows:  1. Plan documented within Execution Expectation and RMO Actions and rolled out to each bundle and action owner,  2. Weekly meetings with agendas and minutes,  3. RMO utilized to record deliverables and actions required to support the plan,  4. Changes to direction and plan recorded and decision documented,  5. Control mechanism in place for changes via change management process. 6. Gated process is applied to finalize and baseline the plan for ongoing monitoring and performance measurement.	CLOSED
<a href="#">6065</a>	OPG-PR3	Carlos Barrios	Gary Rose	PR3: Process Integration In addition to planning for integration, the project management processes, including scheduling, cost management, change control, gating and estimating need to be integrated to support a consolidated program estimate. <b>It is recommended that a process review be performed</b> and that the requirements and mechanisms for process integration to achieve a program release estimate be documented and communicated to relevant participants and stakeholders.	See RMO Link	INTEGRATION	<b>For Process Integration, Work Package coding is the unique identifier for Refurb project control system, cost is estimated in iTwo and the dates will planned in P6 and Ecosys will marry the two together, through common works packages. Also, collaborative approach has been considered to improve the communication between participants and stakeholders.</b> Now that the Gated Process has been roll out to all Nuclear projects, a follow up audit will be done in all PP&C processes and governance to ensure:  1) Alignment and Integration to the Gated Process  2) Alignment and Integration to PM Standard 0028  3) Alignment and Integration among all processes	CLOSED

<a href="#">6066</a>	OPG-PR4	Gary ROSE	Robert OBERTREIS	PR4: Estimate Source With the evolution of Cost Management and Estimating software, the future source of the program estimate, and any required transition plan, are not currently defined. There needs to be clear direction regarding the estimate source prior to the start of the Unit 2 Project Execution Estimate cycle, supported by a change management plan.	See RMO Link	ESTIMATING	Refer to response to item 5969 for details on estimate source and management for U2EE.	CLOSED
<a href="#">6067</a>	OPG-PR5	Lisa REN	Estimating Group/Risk Group (Donna Flewell)	PR5: Integrated Action Plan It is recommended that DNRP management develop a comprehensive action plan, including target completion dates, that addresses the findings of this assessment, those of the Independent Estimating Review as well as any other internal and external oversight reviews. This action plan should be incorporated into the Unit 2 Project Execution Estimate Plan.	See RMO Link	INTEGRATION	This Matrix outlines the response to this action. All identified actions were added to RMO tool for tracking as listed in Memo NK38-REP-09701-0575373, dated December 17, 2015. RQE Observations and Lessons Learned Matrix was finalized and select items updated to reflected status after development and approval of U2EE.	CLOSED
<a href="#">6069</a>	OPG-SR1	Gary ROSE	Robert OBERTREIS	SR1: This assessment report has not evaluated Class 4 & 5 Project estimates. Recommendation that these become Class 3 estimates and schedule before 2016 Unit 2 execution.	See RMO Link	ESTIMATING	The Unit 2 EE included progression of estimates from \$265M in Class 4/5 estimates at RQE to \$80M for the U2EE. This represents a very small percentage of the \$12.8B program. The Gated Process will ensure all project > AACE class 3 in line with regular project progression independent of the Unit 2 Execution Estimate Approval.	CLOSED
<a href="#">6070</a>	OPG-SR2	Gary ROSE	Robert OBERTREIS	SR2: Recommendation that OPG Estimating Team evaluate Campus Plan's existing projects "most likely" estimates and schedules to avoid project delay and vendor potential claims in the future.	See RMO Link	ESTIMATING	Significant management effort and involvement with estimating support underway on an ongoing basis to support the performance evaluation of Campus Plan projects. The final approved estimates to complete (i.e. forecasts) were included in the Unit 2 Execution Estimate, these forecasts were informed by updated project schedules.	CLOSED
<a href="#">6072</a>	OPG-SR3	Gary ROSE	Robert OBERTREIS	SR3: Recommendation that an overall cost reduction analysis strategy be incorporated within the estimate planning.	See RMO Link	ESTIMATING	RQE Utilized N-MAN-00120-10001-EST-03 NR Project Estimate Oversight, Review and Validation that leverages a detailed line by line cost review for the purpose of cost reduction opportunities (as well as under-estimates) with a comment & disposition process to ensure traceability to items identified and their dispositions to ensure the cost estimates are appropriate and accurate within the range defined by their estimate class.  Insofar as supporting cost reductions, OPEX, metrics and ratio's are utilized where applicable and where enough basis exists to support comparative analyses.  EST-06 provides commodity code standards from which to perform benchmarking and comparative analyses.	CLOSED
<a href="#">6073</a>	OPG-SR4	Gary ROSE	Ryan Smith	SR4: Develop an enhanced utilization of benchmarking by senior management. It is recommended that DNRP senior management effectively incorporate benchmarking checks as part of their vetting and review process.	See RMO Link	INTEGRATION	The recommendation to incorporate benchmarking checks as part of DNRP senior management's vetting and review process will be added as an action for addressing within the Project Excellence Initiative as one of the improvement initiatives specific to NR that will be applied to the Unit 3 Release Quality Estimate. OPEX from previous refurbishments was a fundamental component of both the RQE and Unit 2 Execution Estimate. Expansive OPEX review was incorporated into the RFR Class 2 Estimate that was used for the RQE and U2EE. The related proposed initiative deliverable is: Common knowledge base comprising industry best practices, processes and tools. Include the use of benchmarking. Target end Q2 2017. Ref RMO action #7790.	CLOSED
<a href="#">6074</a>	OPG-SR5	Gary ROSE	Robert OBERTREIS	SR5: Cost and Resources Reconciliation - Cost Estimate Breakdown and Schedule resources man-hours require reconciliation in a manner that is easy and efficient. The Recommendation is that estimating and scheduling demonstrate further detail to support BOE described, e.g. labour hours, labour rates, labour productivity in each WBS item, nuclear labour factors, shift, etc.	See RMO Link	ESTIMATING	Standard for Basis of Estimate, N-MAN-00120-10001-EST-04, specifies required basis details including labour hours, rates, and productivity factors etc., and the data structures are implemented as part of ECOSYS and iTWO systems and will now be at the Work Package Level.	CLOSED
KPMG	7.2-1	Robert Obertreis	Robert OBERTREIS	Project Cost Classifications (i.e., refurbishment vs. maintenance work): Build an OPG owned bottom up estimate without "non-refurbishment" scope items – a detailed review will likely lead to identifying cost reduction opportunities.	Finance review of classification of work will be included as part of RQE	INTEGRATION	Thorough review of O&M scope was performed between RQE and U2EE, resulting in revisions to Ops and Maint budgets and classification of NR scope to Cyclic/Maint scope, and adjustments were made accordingly. Ops increased (vis CCF) and program is still awaiting reduction of Maint scope for items deemed DO (Darlington Outage/cyclic funded). FMP's, and bases updates are in Action tracking and being coordinated by Art Maki and our PP&C teams.	CLOSED
KPMG	7.2-2	Robert Obertreis	Robert OBERTREIS	Opportunity for Owner Oversight Optimization: Improve collabouration between Project Managers and Functional Team leaders to identify optimization and streamlining opportunities within the functions to optimize program wide functional costs.	Phase 1 functional review complete. Phase 2 functional review by December 2015.	INTEGRATION	Continued integration and collaboration has occurred since RQE, to revise Functional group estimates and resources deemed necessary to execute Unit 2. CCF's have been processed as part of the U2EE estimate updates. Many functions increased in cost (+65mil for U2), however current and projected under-spends (\$40mil as of June 2016) were identified. Unit 314 resources for OPG functions will be evaluated mid-Unit2 execution. FMP's are currently being updated, with a plan completion (in Action Tracking) mid-September	CLOSED

Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPONSE
KPMG	7.2-3	Robert Obertreis	Estimating Group	Increase Project Manager Accountability by ‘Projectizing Functional Costs’: Create short-term goals, clarify accountabilities and define intermediate steps to help drive the RQE schedule.□	Within each bundle/function, list the responsible persons for the overall project execution plan, cost estimate, and schedule	INTEGRATION	Management has determined that this is not the approach that will be taken on the NR Program. Again, FMP’s with responsibilities and deliverables mapped staff positions are underway, FMP’s are to be a new item a in action tracking.
KPMG	7.2-4	Robert Obertreis	Estimating Group	Consistency of Indirects’ Classification: Clarify the definitions for project indirect costs and functional indirect costs. In addition, functional team leaders need to know what level of support is required by the bundles.	Provide a more consistent definition of indirect costs classification.	ESTIMATING	For estimates submitted by contractors for RQE and previous releases, the structure of costs, including the composition of indirect costs has been governed by existing contracts and contractor standard operating procedures and, for specific estimates, documented within the BOE’s. To establish consistency, the categorization of cost items is set out within the estimating standard N-MAN-00120-10001-EST-06 Nuclear Refurbishment Estimate Commodity Code Standards .
KPMG	7.2-5	Robert Obertreis	Estimating Group	Improve visibility on the maturity of the estimates: Implement IDB to increase transparency with respect to the status of estimates.	Create a tracking document to show the status and version of each estimate/ schedule to be included in RQE.	ESTIMATING	Tracking of estimate classification is performed within iTWO and documented using estimate checklists per estimating and gating governance. Schedule Level is assigned per schedule management governance and checklists. Reporting of estimating and scheduling status is performed as part of management reporting processes, meetings and action tracking.
KPMG	7.2-6	Ryan Smith		Cost Risk Sharing- ESMSA: Ensure that the RQE fully evaluates, quantifies and includes the risk of overruns for current ESMSA contractors.	Demonstrate how historical campus plan cost overruns with ESMSA have been taken into account when calculating contingency in risk analysis for BOP and SDLU projects, ensure contingency analysis includes experience of ESMSA contractors.	RISK	The risk analysis for the RQE includes substantial cost estimating uncertainty and discrete risk contingency, both at the project and program level associated with ESMSA work. This was true for RQE and is further reinforced with increased ESMSA performance cost contingency for U2EE.
KPMG	7.2-7	Ryan Smith		Contract Risk Sharing- Joint Venture EPC: Incorporate scenario analysis of the risk of OPG borne cost overruns based on the terms of the contract into the contingency.	Incorporate scenario analysis of the risk of OPG cost overruns based on termof the contract into the contingency RFR	RISK	This was included in the schedule analysis for RQE. Risks related to OPG imposed delays on the contractor were assessed by OPG leadership and included where appropriate with a schedule impact and associated contingency assigned to this type of event.
KPMG	7.3- PCC#1-1	Robert Obertreis	Robert OBERTREIS	Owner estimate requirement including accuracy and review/approval timing.	RQE Management plan does not reference timing of reviews/approvals.Provide a cross-reference in RQE MP to the latest version of the RQE Roadmap. This cross-reference has been provided in the RQE MP (rev 2), which needs to be approved and issued.	ESTIMATING	Part of lessons learned for next unit RQE. NK38-PLAN-09701-10235 RQE Cost Estimate Development Plan, provided the scope, roles and responsibilities across the organization for the estimate development efforts. Included within the plan were roadmaps that outlined the timing of each bundle's progression and integration into overall RQE. The nature of finalizing Unit 2 cost, schedule and risk deliverables differs from RQE in that RQE was a bottoms up cost estimate development effort to establish the program's control budget and Unit 2 is a confirmation of RQE using standard project controls and change management processes. As such, the Unit 2 effort and deliverables is captured and monitored using RMO Action Log starting with Action ID 7276 which provides the framework for completing U2EE and subsequent actions for each P&C functional area. The U2EE was assembled and approved by the board of directors in August 2016. Prior to execution of Unit 2, all projects will go through Gate 3A to be baselined for performance and ongoing monitoring.

KPMG	7.3-PPC#2-8	Tracy Leung	Tracy Leung	Estimate material is filed and maintained according to the WBS	WBS in which the program estimate has been presented to date requires further definition of the controls accounts in order to be effectively used as a control budget for execution purposes (i.e. tracking construction performance and measuring cost variances). Ongoing activities to further develop the control accounts and design a full CBS (Cost Breakdown Structure) prior to execution. An intermediate level WBS is also being developed (control accounts). These control accounts should be refined through 2016 and prior to commencement of the US outage as the estimate continues to evolve and gain maturity/increased definition.	ESTIMATING	The estimating detail is being recorded in alignment with the WBS, and is aligned at the project number level. Ongoing efforts to align to the PEPCCC and work package level is underway but is not 100% complete for Unit 2 EE board approval. This is a requirement for projects to progress through Gate 3A which all projects must pass through by September 30th.
KPMG	7.3-PPC#2-9	Robert Obertreis	Robert OBERTREIS	Bulk Commodity Material Quantities	Produce a program level PEP, or equivalent document, and update the program document to include aEstimating plan will be updated for the RQE Check Estimate to specify more clearly the requirements around material quantity estimates and ensure progression of current estimates that have not achieved class 3. The PM's can update the PEP's if they do not include the detailed contracting strategy, or the PgMP for the contracting strategy could be updated to reflect quantity estimates and the status of the RQE. summary of the contracting strategy.	ESTIMATING	A check estimate is not being performed and this suggestion forms part of lessons learned for next unit RQE. Projects that did not pass through a gate 3 nor completed class 3 estimates at the time of RQE are progressing towards Class 3 estimates and gate 3's utilizing estimating and gating process/governance. Bundle Project plans are a pre-requisite to progressing through gate 3 and functional management plans are refreshed as part of Unit 2 finalization.
KPMG	7.3-PPC#2-10	Robert Obertreis	Robert OBERTREIS	Bulk Material Quantity Take-Off Allowances (Design Development Allowance)	OPG, in conjunction with scope reviews by project teams, are vetting the EPC Contractors' material quantity estimates and the design development allowance to improve the quality of the final estimate produced, it is important for the EPC Contractor to follow AACE recommended practices (i.e., describe the rationale for estimate allowances in relation to the level of engineering definition) to promote transparency in how the quantity estimates were developedEstimating plan will be updated for the RQE Check Estimate to specify more clearly the requirements around material quantity estimates and ensure progression of current estimates that have not achieved class.	ESTIMATING	Basis of estimates address design basis, allowances and utilization of assembly level and quantities. Almost all of submitted class 3 estimates have Bulk Material Quantity Take-Off Allowances
KPMG	7.3-PPC#2-11	Robert Obertreis	Robert OBERTREIS	Bulk Material Construction Waste Allowances	OPG, in conjunction with scope reviews by project teams, are vetting the EPC Contractors' material quantity estimates and the construction waste allowance to improve the quality of the final estimate produced, it is important for the EPC Contractor to follow AACE recommended practices (i.e., describe the rationale for estimate allowances) to promote transparency in how the quantity estimates were developed.Estimating plan will be updated for the RQE Check Estimate to specify more clearly the requirements around design allowances and ensure vendors provide clear rationale on the use of design (and other) allowances.	ESTIMATING	For most of the U2EE projects, wastage allowance is included in the material quantities, this has minor affect on the total cost.

KPMG	7.3-PPC#2-12	Robert Obertreis	Robert OBERTREIS	Bulk Commodity Material Pricing	OPG, in conjunction with scope reviews by project teams, are vetting the EPC Contractors' material pricingto improve the quality of the final estimate produced, as well as keep audit ready records of this relevant information it is important for the EPC Contractor to follow AACE recommended practices and provide a table that summarizes the source of the pricing information (i.e, budget quotes, firm quotes, in-house estimates, etc.) to promote transparency.Estimating plan will be updated for the RQE Check Estimate to specify more clearly the requirements around material pricing estimates and ensure vendors provide clear support for pricing.	ESTIMATING	All the BOE have a section for material pricing and all the pricing sources have been attached as appendices. This suggestion(adding a table) forms part of lessons learned for next unit RQE	ALL FOR UNIT 3 RQE
KPMG	7.3-PPC#2-13	Robert Obertreis	Robert OBERTREIS		Identified as Closed in KPMG Final Report. No Recommendations Identified.		Identified as Closed in KPMG Final Report. No Recommendations Identified.	CLOSED
KPMG	7.3-PPC#2-14	Robert Obertreis	Robert OBERTREIS	Freight	OPG, in conjunction with scope reviews by project teams, are vetting the EPC Contractors' freight costs to improve the quality of the final estimate produced, as well as keep audit ready records of this relevant information.BOE will reflect the basis of costs re: field engineering costs identified. EPC Contractor should also follow AACE recommended practices and identify the cost and pricing sources for foreign and domestic freight.	ESTIMATING	Basis of Estimate template has been revised to specifically address Freight within the contents, <b>most of the revised estimate has item for Freight</b> . A table also has been added to include all line items that are subject to Currency Exchange rates.	CLOSED
KPMG	7.3-PPC#2-15	Robert Obertreis	Robert OBERTREIS	Adjustments to productivity for labour density	The Work Management Function is analyzing logistical issues and scope interfaces around RFR. Any labour density issues would be considered by Work Management. In addition the RFR function should review how this has been considered in the estimate. Estimating plan will be updated for the RQE Check Estimate and will specify the productivity plan as required by OPG governance	ESTIMATING	The effort to identify conflicts and optimize resourcing is undergone through Schedule Integration Development and the progression of the integrated schedule from Rev bravo, Charlie and through to Rev zero (final unit execution schedule). Through the work package assessing and schedule progressions, any changes to the vendor's execution plan is initiated through the change management process. There are no "factors" applied to adjust productivity plan for labour density.	CLOSED
KPMG	7.3-PPC#2-16	Robert Obertreis	Robert OBERTREIS	Adjustments to productivity for excessive shifts	The final shift schedules need to include in the Project Execution Plan, or equivalent document. It is assumed that this change is being incorporated into the schedulesReview PEP (or equivalent document) to ensure the relevant information is included. Align, summarize and make visible the relevant information.	ESTIMATING	The shift patterns utilized as basis for the work execution are recorded in the basis of estimate for each project submission and verified through the estimate review process. Shifts are reflected within the execution schedules. Any change in shifts during the finalization of planning and Unit 2 execution cost/schedule, will initiated through change management process.	CLOSED
KPMG	7.3-PPC#2-17	Robert Obertreis	Robert OBERTREIS	Description of the base productivity calculation	Productivity Plan has not been identified. But it is a document required by OPG governance. This should be specified in the RFR Rev B schedule because it is the integrated, resource loaded schedule all the way through to breaker close to be validated when issued. BOE will reflect the basis of costs re: productivity calculations.	ESTIMATING	RFR BOE reflects cost basis and productivity factors utilized and agreed upon. Refer to; 509407-0000-00000-33RA-0168	CLOSED

KPMG	7.3-PPC#2-18	Robert Obertreis	Robert OBERTREIS	Indicate the construction work week basis and applicable shift schedules (i.e.: 8 hours per day x 5 days per week.)	The final shift schedules need to include in the Project Execution Plan, or equivalent document. It is assumed that this change is being incorporated into the schedules.Work week basis will depend on the contract. However, all the work week and shift schedule should be incorporated into the Rev B schedule and will be validated when issued. The shift schedules need to be included in the PEP.	ESTIMATING	The construction work week basis is i1ncorporated into Rev B schedule. Recent move to 5x8s from 4x10s was considered and assessed for Unit 2 execution estimate, impacts are expected to be marginal both on cost and productivity. Negligible impact on Unit 2 EE costs.	CLOSED
KPMG	7.3-PPC#2-19	Robert Obertreis	Robert OBERTREIS	Identify how commissioning and start-up costs are determined	The AACE guidelines specify that an explanation of how commissioning and start-up costs will be determined should be provided, and a brief description of the related scope is required. KPMG has not seen adocument that states how the commissioning and start-up costs are to be determined.Estimating plan will be updated for the RQE Check Estimate to specify more clearly the requirements around commissioning and start up detailed estimates as a progression from current functional estimates. OPG hascommissioning specs for all systems and return to service procedures and this would govern activities and the associated estimate.	ESTIMATING	Estimate submissions covered by Execution Functional Management Plan and the O&M Return-to-Service organization. Commissioning conducted by OPG Operations and supported by contractors whom have submitted commissioning support costs as part of estimate submissions based on agreed to support requirements. OPG direct commissioning efforts developed as part of work package assessing deliverables.	CLOSED
KPMG	7.3-PPC#2-20	Robert Obertreis	Robert OBERTREIS	Show how the engineering labour plans are built-up	As part of the Planning documents there is no staffing plan. There are higher level figures that cover the overall staffing. As noted about each of the FMP and PMP have their own staffing requirements included in their respective documents but there is no global document. Project managers are not responsible for the staff that is being applied to the job as the cost resides elsewhere.Verify engineering labour plans within functional estimates.	ESTIMATING	Staffing plans, organizations and FMP's, providing the basis of which have been submitted, reviewed and approved through Senior Management. All changes from RQE have been collated and documented using the change management process.	CLOSED
KPMG	7.3-PPC#2-21	Robert Obertreis	Robert OBERTREIS	Identify how other office costs and fees will be covered.	The individual projects are not being charged for G&A costs. This is not a construction industry best practice.Identify home office cost treatment	ESTIMATING	Treatment of G&A and fees are negotiated as part of each vendor's contract and the ESMSA.	CLOSED
KPMG	7.3-PPC#2-22	Robert Obertreis	Robert OBERTREIS	Identify the intended sources of benchmark data	RFR and other bundles have incorporated some benchmark data and OPG has several benchmarking documents, but missing direct sources of how benchmark data will be found and compiled into a report to support the program.Continue to benchmark direct costs against similar projects where meaningful comparatives are available.	ESTIMATING	Completed for RQE. Main source of benchmarking data is OPG's OPEX and historical work orders within Passport. Refer to item response for 6073 for more detail.	CLOSED

KPMG	7.3-PPC#2-27	Robert Obertreis	Robert OBERTREIS		Identified as Closed in KPMG Final Report. No Recommendations Identified.		Identified as Closed in KPMG Final Report. No Recommendations Identified.
KPMG	7.3-PCC#3-1	Robert Obertreis	Robert OBERTREIS	BOE Purpose	Cost Estimating professionals need the BOE in order to understand and assess the estimate itself. In addition, the BOE is a record of communications and record of documentation utilized to prepare the estimate. More importantly the BOE should contain a greater level of detail for brownfield projects than for greenfield projects, and the larger the project, the more detail it requires. The BOE is also a legally supporting document. AACE specifies that this section should contain a brief and concise description of the total project (i.e. type of project, Scope, overall timing etc.). The purpose section does not clearly summarize the total project, which makes it difficult for the reader / reviewer to understand the context of the BOE. OPG is producing a Program level Basis of Estimate which will consolidate assumptions and project level basis of estimates from all projects into a comprehensive Program level Basis of Estimate. This will continue to be updated as project level estimates and basis of estimates are updated. A first	ESTIMATING	Program, Project Bundle and Functional BOE's aligned to AACE. The size, complexity and organization of the DRP has led to a portfolio of projects aggregated to twelve project bundles and twelve functional bundles. Within the twelve project bundles, there are approx 86 projects that relate to physical work in the field, each of which if not already completed as part of infrastructure projects, have a basis of estimate that was submitted for RQE along side the cost estimate itself. The objectives stated within this finding has been fulfilled by each project estimate and basis of estimate submission - as example, RFR Estimate and BOE submission comprised in excess of 55, 000 pages and 28 Chapter Reports that articulate the basis of the estimate. Additionally, the BOE's and estimates were reviewed in accordance with the estimating governance before acceptance. The nature of the number of projects has made it challenging to aggregate information in a manner that is consumable in "one sitting"; as such, the program BOE has relied upon referencing other documentation while providing enough context to provide the overview of the program. As an improvement, each bundle will have a Unit 2 BOE that will summarize that bundle and contribute to the overall Unit 2 BOE.
KPMG	7.3-PCC#3-2	Robert Obertreis	Robert OBERTREIS	BOE Methodology	Nuclear Projects Estimating Manual, N-MAN-00120-10001-EST-R002 provides the requirement for Basis of Estimate and a template within App C. This was rolled out through supply chain to the ESMSA contractors coordinated through the bundles and project management.Program Basis of Estimate is prepared and finalized upon completion of the estimate development process.	ESTIMATING	No Action taken. Program, Project Bundle and Functional BOE's aligned to AACE requirements and best practices.
KPMG	7.3-PCC#3-3	Robert Obertreis	Robert OBERTREIS	Estimate Classification	Identified as Closed in KPMG Final Report. No Recommendations Identified.	ESTIMATING	Identified as Closed in KPMG Final Report. No Recommendations Identified.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	7.3-PCC#3-4	Robert Obertreis	Robert OBERTREIS	Design Basis	This section should identify the types and status of engineering and design deliverables that were used to prepare the estimate. In addition, the AACE guideline recommends that two attachments be provided 1.) An estimate deliverables checklist and 2.) The list of all engineering drawings. The AACE guidelines also recommends documenting specific quantity metrics such as overall piping quantities etc. Current methodology for estimate classification is Nuclear Refurbishment Estimate Classification Requirement and Assignment N-MAN-00120-10001-EST-02-R001 2015-04-01 R000 was developed in DEC 2014 and this revision per date. Will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities, Containments, and Estimate Quality Assurance	ESTIMATING	No Action taken. Program, Project Bundle and Functional BOE's aligned to AACE requirements and best practices.
KPMG	7.3-PCC#3-5	Robert Obertreis	Robert OBERTREIS	Cost Basis	It is not clear as to how the functional project indirects are allocated to each bundle. Thus, it would be difficult for stakeholders to assess the actual indirect costs for each bundle. Under the current methodology, it might to unclear to stakeholders as to what are actual direct costs vs indirect costs. This section does not describe the methods and sources used for determining all material, labour, and subcontract pricing Will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities, Containments, and Estimate Quality Assurance Estimating plan will be updated for the RQE Check Estimate and will establish assumptions, risks and opportunities as well as allowances and reserves.	ESTIMATING	Functional costs are allocated through individual project numbers and tracked accordingly. Program, Project Bundle and Functional BOE's aligned to AACE best practices. As this is a mega program, certain costs for centralized support are not directly attributable to one bundle or the other and fractional cost allocations to bundles cannot be practically applied.
KPMG	7.3-PCC#3-6	Robert Obertreis	Robert OBERTREIS	Allowances	This section should identify the level and types of allowances used in the estimate (i.e. Material Take-off Allowances). This section should also describe any other costs that have not been detailed in the estimate (i.e. Lump sum allowances for specific areas of scope) The program RQE BOE will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities Containments, and Estimate Quality Assurance	ESTIMATING	Project BOE's and estimates have identified allowances and factors that have been reviewed in accordance with the estimating governance. Certain allowances such as small tools, consumables, rework etc are prescribed by the contracts in place (ES MSA, JV EPC Agreement etc).

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	7.3-PCC#3-7	Robert Obertreis	Robert OBERTREIS	Assumptions	The AACE guidelines specify that the assumptions should be included in this section. A person who is reviewing the 4D BOE cannot make an assessment of the assumptions since they are documented in external sources outside of the 4D BOE documentThe program RQE BOE will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities Containments, and Estimate Quality Assurance	ESTIMATING	Release 4D was not developed as per a fully integrated estimating effort and no formal BOE was developed. For the purpose of RQE, the templates were reviewed for Program, Project Bundle and Functional Plans that form BOE's to ensure alignment to AACE including assumptions. Additionally, an RQE assumptions log was created to ensure the capture of assumptions that formed the basis of RQE. The U2EE was a change control process that was implemented from the cost and schedule outlined in the RQE.
KPMG	7.3-PCC#3-8	Robert Obertreis	Robert OBERTREIS	Exclusions	While it appears OPG intends to meet the AACE guidelines, this section has been noted as an Area For Improvement.The program RQE BOE will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities, Containments, and Estimate Quality Assurance	ESTIMATING	Although vendor BOE's have a specific topic for Exclusions, the section often refers back to assumptions where statements of exclusion have been made together with assumptions. This is an area under continual improvement and will form lessons learned for the next Unit RQE.
KPMG	7.3-PCC#3-9	Robert Obertreis	Robert OBERTREIS	Exceptions	The AACE guidelines specify that the exceptions should be included in this section or as a checklist and attachment to the BOEThe program RQE BOE will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities, Containments, and Estimate Quality Assurance.	ESTIMATING	RQE Program BOE includes a list of exceptions.
KPMG	7.3-PCC#3-10	Robert Obertreis	Robert OBERTREIS	Risks and Opportunities	The AACE guidelines specify that the risks and opportunities should be included in this section and a risk analysis report should be provided as an attachment to the BOE.The program RQE BOE will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities, Containments, and Estimate Quality Assurance.	ESTIMATING	A detailed RQE Contingency Development Plan and Report was prepared outlining the basis of risk and quantification of contingencies for the project bundles and the program as a whole. This has been updated for U2EE as well and is referenced in the Program BOE. Refer to Unit 2 Execution Estimate Contingency Development Plan NK38-PLAN-09701-10275.
KPMG	7.3-PCC#3-12	Robert Obertreis	Robert OBERTREIS	Reconciliation	A Program level Basis of Estimate will be prepared prior to the finalization of RQE. This document will incorporate a reconciliation of RQE against previous estimates and a summary breakdown by projects, functions, phases and major cost element.The program RQE BOE will specify Purpose, Methodology, Estimate Classification, Design Basis, Cost Basis, Allowances, Assumptions, Exclusions, Exceptions, Risk and Opportunities, Containments, and Estimate Quality Assurance.	ESTIMATING	As part of the RQE effort, reconciliations to past estimates & releases were provided and reported upon in board submissions (documented in records). The reconciliation of Unit 2 execution estimate to RQE will be part of the reporting and presentations in accordance with board and other external reporting, outlining major changes and evolutions to the project estimate. This will include base work as well as risk and contingency progressions and comparisons to RQE.

Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	8.4-RFR-03	Robert Obertreis	Robert OBERTREIS	Labour rates for CWP match to 7 x 10 (2 shift) instead of 4 x 10 (2 shift). The rates for boiler maker JM in the document DFL Summary Report - Series (509407-0000-00000-33RA-0147.pdf), Appendix E are different than the rates used in the estimate excel (\$81.76/hr has been used for estimation rather than \$84.63/hour as quoted in the rate schedule).	Rev 0 ■ Labour rates that should be used within the CWP excels have been confirmed via OPG interview, which also confirms our findings. Rev 1 Labour rates should be made consistent between the labour rates mentioned in the Appendix C of the DFL chapter summary report and the estimate excel for all the CWPs	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Labor rates, build-ups, factors and shifts have been confirmed for the REV 01 Submission.
KPMG	8.4-RFR-04	Robert Obertreis	Robert OBERTREIS	OPG has stated that there should be different rates (7 x 10 and 4 x 10) used for critical and non-critical path items, there is no documentation that confirms this verbal statement Regardless of which rate is used, JV should have written documentation about which spefici rates will be used under which specific cicumstance (Ie. critical and non critical activities).	Rev 0 ■ JV to update their documentation to clarify under what scenarios the different shift structures (7 x 10 vs. 4 x 10) are used, and provide documentation for this assumption. Rev 1 ■ As of Rev 1, excel documents rates are now all 7 x 10 shift rates, but the Chapter Reports still state they are 4 x 10 shift rates. The CWP variance report also indicates usage of 7X10X2 shifts ■ JV to confirm which rates are correct. Documentation sources should match	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Labor rates, build-ups, factors and shifts have been confirmed for the REV 01 Submission. Based on the CWP work activities and work schedule, different shift patterns have been used in the estimate. This is defined in each CWP description.
KPMG	8.4- RFR-05	Robert Obertreis	Robert OBERTREIS	Training Cost Review: No source for dollar cost estimate. The Excel documents only break down the estimated hours. A list of all hourly rates and how and where they are applied is required	Rev 0 ■ KPMG to review evidence that hours for Training Cost Review match hours in Milestone Report and relevant Chapter Summary reports. Rev 1 ■ For Training Series, timberline data has not been supplied and the supporting Appendix B excel file's total cost numbers do not align with Chapter Summary. Appendix B shows that the “project total cost for training is \$80,793,723”, and when cross referenced to the Appendix F Training Series Chapter Summary Labour cost amount of \$80,649,945 (page 6), it differs by \$143,778. Additionally, it appears that the Appendix B total was the amount official approved. In the file entitled “Final Cost Build Uptraining Seris Signed R02.pdf”, there is a signoff on the amount of \$80,793,724, which matches the Appendix B File total and not the chapter summary. ■ JV to reconcile the supporting excel file to the Chapter Summary Report	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Training cost build up reviewed and errors identified were corrected, reviewed and accepted in Rev01 through estimating review process.
KPMG	8.4-RFR-09	Robert Obertreis	Robert OBERTREIS	■ The JV is charging a 10% margin on top of the OSM Costs. OPG is paying for PMT hours to purchase the OSM. OPG is paying for the PMT labour, OSM costs, and profit, which makes it appear to double count the profit costs	Rev 0 ■ OPG to confirm if these are acceptable profit margins. If not, JV to revise pricing structure. Rev 1 ■ OPG to still confirm if these are acceptable profit margins.	ESTIMATING	This cost outline is as per the established contract.
KPMG	8.4-RFR-10	Robert Obertreis	Robert OBERTREIS	■ The average overall overhead is 12.8%, which is higher than industry average. Additionally, this overhead percentage should be a relatively consistent percentage between each cost component, but is not as it is with PMT at 48%.	Rev 0 ■ OPG to confirm if these are acceptable overhead margins. If not, JV to revise pricing structure Rev 1 ■ OPG to still confirm if these are acceptable overhead margins.	ESTIMATING	This cost outline is as per the established contract.
KPMG	8.4-RFR-19	Robert Obertreis	Robert OBERTREIS	■ Training Onboarding estimate seems highly conservative (high) as it assumes that at the start of each unit, and at each increase in resource loading, all individuals will require onboarding training. There is no discussion surrounding resource-leveling and minimizing training by keeping those already trained in-service through scheduling. There could be a potential cost overestimation assumption.	Rev 0 ■ OPG to provide evidence regarding the decrease in training onboarding costs, and provide in Rev.1 submission. Rev 1 ■ From Appendix E of the Chapter Report, initial onboarding training is still being conducted at the beginning of each unit execution but the percentage of total labour that will onboard the project that have transferrable qualifications will scale down from 60% on Unit 2 to 50% on Unit 4 (previously it was a flat 60%). This would represent a minimizing of training hours through use of previously trained personnel. ■ This issue is now downgraded to C.	ESTIMATING	Training & on boarding cost build up was thoroughly reviewed and accepted through estimating war team review process leading up to RQE.

Oversight Closeout Spreadsheet

Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE	Status
KPMG	8.4-RFR-26	Robert Obertreis	Robert OBERTREIS	Training Series: Attrition hours seem to be included twice in the Chapter Summary, if these inflated hours used for the cost estimate (no source to check) then additional costs may be included in estimate.	Rev 0 ■ JV to confirm that Attrition hours are not double counted. If they have been counted twice, JV to correct for Rev.1 submission.  Rev 1 ■ Although it has been explicitly stated that no attrition costs will be included from section 3.1 of the Training Series Chapter Report, it still exists within the excel sheet calculation within Appendix B. ■ JV to fix calculation for next draft.	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Training & on boarding cost build up was thoroughly reviewed and accepted through estimating war team review process leading up to RQE and finalized in the R01 Estimate.	CLOSED
KPMG	8.4-RFR-30	Robert Obertreis	Robert OBERTREIS	OSM: ■ There are no explicit \$/part values available in the excel document provided, that should go into each line's \$/part x quantity calculation. Additionally, when the \$/part values are reverse calculated, they are not consistently applied amongst all the units.	Rev 0 ■ JV to update documentation for Rev.1 submission. Rev 1 ■ With the updated Rev 1 documentation, there has been no changes to the status of this gap issue. \$/part values are still not fully inputted. JV to update documentation.	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Majority of PO's for OSM had been issued before the final comprehensive review process. This was finalized in the R01 estimate and reconfirmed through RQE and U2EE.	CLOSED
KPMG	8.4-RFR-37	Robert Obertreis	Robert OBERTREIS	Contingency: ■ Figure A-5 on page A.1 of Appendix A of document 509407-0000~00000-33RA~0172.pdf indicates that the contingency cost delay to schedule is \$155.31 million. Table 2 on page 9 indicates that the schedule contingency delays would be 394 days and the last paragraph on page 8 indicates that \$350,000 per day has been used to quantify the schedule delays. The multiplication of these two numbers result in total cost of \$137.9 million. The difference of \$17.41 million is unaccounted for the one unit, which can be extrapolated to a total \$68 million difference across the four units.	Rev 0 ■ JV to confirm which value is correct and update document for Rev.1 submission. REV 1 The total cost of Unit 2 excluding contingency and Commissioning - Not part of the Target Cost when divided by 8234 days results in a deaily rate of \$ 398,582. This when muliplied by the 305 contingency days result in total cost of \$ 121.5 million which is significantly higher than the estimated contingency of \$103.8 million. It appears that the contingency cost has been underestimated. ■ The burn rate indicated in Burn rate tab of excel "Cost Risk Analysis Submittal Unit 1 Rev.1" is \$319,599.15. This when multiplied by 305 contingency days gives an estimated value of \$97.5 million. Adding the SS&E contingency of \$4 million gives a total contingency of \$ 101 million which is \$3 million less than the total contingency of \$103.8 million.	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Risk and contingency build up thoroughly reviewed and accepted through estimating war team review process and issued in Revision 1. A final contingency was submitted, reviewed and accepted by OPG Project Management, Estimating, and Risk Management team and is available for review. OPG reviewed jointly, first in a daylong detailed review by the risk department and then upon final approval of the contingency estimate and target cost and schedule.	CLOSED
KPMG	8.4-RFR-38	Robert Obertreis	Robert OBERTREIS	OSM: ■ The Parts List contained in the SOW was found to be lacking and had to be amended/reconcile d (appendix C of OSM Chapter Summary). The estimate is based on scope of work and it does not account for extra items required based on the Appendix C list.	Rev 0 ■ JV to update OSM estimate file and make an allowance for parts and materials. Rev 1 ■ With the updated Rev 1 documentation, there has not been a change to the status of this gap issue. It continues to state under Section 2 Scope that "It was further found that some items (refer to Appendix C) that meet the definition of OSM and are to be used in the Work, are not actually subject to purchase by the JV under the terms of the Agreement. These items are not included in the estimate. The reconciliation of OSM is further detailed in Appendix C of this Chapter." ■ Additionally, the \$/Part prices are still not inputted into the supporting excel file, and therefore the \$/Parts, Unit Prices, and Total Costs are not built up via formula. ■ JV to update OSM estimate file and make an allowance for parts and materials.	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Majority of PO's for OSM had been issued before the final comprehensive review process.	CLOSED

KPMG	8.4-RFR-41	Robert Obertreis	Robert OBERTREIS	OSM: ■ Unit costs missing for many major parts, unit price fluctuates for caladria/tubes between units due to removal of sum for PPQ and Spares not equal to the average per unit cost. Unit costs should not be missing, and unit prices should not be fluctuating without proper explanation through documentation.	Rev 0 ■ JV to update documentation for Rev.1 submission. Rev 1 ■ With the updated Rev 1 documentation, there has been no changes to the status of this gap issue. A comparison of the line item's Total Cost divided by # of Parts to another comparable line item still shows differences. Therefore there are differences in the unit pricing per unit. ■ JV to update documentation for Rev 1 submission	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. OSM summary reviewed and a cost build up included in Rev 01 submission. The estimate is substantiated with required level of detail and PO's.	CLOSED
KPMG	8.4-RFR-44	Robert Obertreis	Robert OBERTREIS	CWPs: There are hardcoded numbers within the CWP excel files and that cannot be validated by documentation.	Rev 0 ■ JV to update documentation for explanations within the Rev.1 submission. Rev 1 ■ The number of workers required (located from “CWP_2145_S3 1_R3 (GHR9)(MBR2).xlsx”, “Main” tab, Column H), and hours required (Column I) are hardcoded. Interviews with OPG indicated that the timelines are based on the experience of working on similar projects. However, assumptions regarding the number of crew required and the number of days have not been discussed in the chapter summary for the respective CWPs. ■ PMT costs were consistent and traceable from the overall costs reported in the RFR Execution Phase (Class 2 Estimate)(R12) Aug 31 (i.e., the Milestone Report), through the source documents. However, trace ultimately leads to the CWP Summary Spreadsheet - Class 2 - Rev 01 document where the values for both PMT hours and costs are hardcoded and cannot be tied to any source data. ■ The number of workers required (CWP_2172_S3.A_R1(GHR8)(MB).xlsx “, Main” tab, Column H), hours required (Column I) is hardcoded. Interviews with OPG indicated that the timelines are based on the experience of working on similar projects. However, assumptions regarding the number of crew required and the number of days have not been	ESTIMATING	CWP's and cost estimates were thoroughly reviewed and accepted through estimating war team review process and issued in Revision 01. CWP's represent the lowest level of data input and, as such, have data values inputted directly.	CLOSED
KPMG	8.4-RFR-48	Robert Obertreis	Robert OBERTREIS	OSM: ■ OSM Chapter Summary does not include reference to: • engineering specifications • Specifications provided to the Supplier • Suppliers response to specifications. Although it is stated that engineering is complete, it is difficult to determine which individual project engineering specifications or requirements have obtained a quote, and therefore puts in question level of certainty that can be placed on the estimates	Rev 0 ■ Specify which specifications were followed when purchasing materials. Rev 1 ■ The updated Rev 1 document for the OSM Chapter Summary has remained the same in regards to this gap issue. Without reference to the level of detail listed for the engineering specifications provided to suppliers and their response to those specifications, the level of risk in terms of material pricing cannot be adequately gauged. ■ JV to specify which specifications were followed when purchasing materials.	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Scope and engineering specifications for OSM completed and documented as part of the definition phase of the project. These items are referenced in the final approved R01 of the estimate.	CLOSED
KPMG	8.4-RFR-49	Robert Obertreis	Robert OBERTREIS	■ Class 2 estimate for Unit 2 has increased by \$58M from Class 3 due to new scope and higher accuracy (percentage change of 26%). However, there is a significant portion that is a budgetary number and is still subject to higher fluctuation. There should be a consideration for the remaining budgetary numbers to be validated.	Rev 1 ■ Within the OSM Material Spreadsheet (Class 2) Rev 02 (GH-AL) - Sept 10(SAMAD).xlsx file, column D identifies if the line item's source is from a budget, a PO, or RFQ. There currently are 106 line items that are currently labelled as budgetary pricing for OSM, and 166 line items for Goods, which indicates that the budgetary pricing may still be too high for the Class 2 estimate. ■ JV to update documentation for actual quotes when obtained.	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. Results of this estimate refinement has been incorporated as part of Unit 2 Execution Estimate finalization, forecasting, and change process. Update documentation for actual quotes will be part of reporting and cost control. 83% of OSM cost was based on existing POs reference JV doc# 509407-0000-00000-33RA-0144	CLOSED

Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPONSE
KPMG	8.4-RFR-30	Robert Obertreis	Robert OBERTREIS	■ The backup or rationale for using an unnamed factor within the CWP excel file that cannot be traced as this has been linked to a different file. This factor takes form as an undescribed column with hardcoded numbers that directly impact the	Rev 0 ■ Update documentation and clearly specify when factors are to be used. Rev 1 ■ The Labour hours for work activities sourced from “CWP_2145_S3 1_R3 (GHR9)(MBR2).xlsx”s “Main” tab, Row 30 to Row 605, Column I (Hours) are calculated by using factors from Column AG and multiplying it with Cell AI607. While the numbers in Column AG have been sourced from a different worksheet	ESTIMATING	This observation was identified prior to finalization of the Rev01 Class 2 Estimate, approved by both JV and OPG. The CWP estimate was calculated based on a duration derived from TPG results and a crew basis, then allocated for the quantity of operations. These TPG results and other relevant basis sheets for activity durations are documented.
KPMG	8.4-RFR-57	Robert Obertreis	Robert OBERTREIS	■ Base rates in the Timberline reports does not match the PMT rates table in Appendix E of the Chapter Summary. No assumptions or explanations are apparent for this discrepancy.	Rev 1 ■ JV has updated the estimate spreadsheet for Rev.1 to ensure traceability based on the Timberline data. ■ Under the Direct Site Labour, the base rates per hour contained in the Timberline data do not always match up with the PMT Rates from Appendix E. ■ Based on comments received from OPG, it is understood that the difference in labour rates has been addressed post-Rev 1, as per the Milestone Report (Section 8, item #4). JV to provide evidence that this change has been applied, and that rates used match those in Appendix E.	ESTIMATING	Rates were reviewed for consistency and accepted in Revision 1.
KPMG	9.4-BOP-01	Dereck McCauley	Dereck McCauley	Missing Logic in the schedule could potentially degrade the ability to analyze critical path with a reasonable level of confidence.	Require the Vendor to verify and validate the critical path to ensure mostly Finish to Start logic with very few lags, no gaps, etc.; and ■ OPG should confirm that the Vendor has provided greater detail in the next revision of the estimate package.	SCHEDULING	Detailed planning is an iterative process. Rev A gave us the major time lines and sequence of the windows and critical path. Rev B was based on the JV RFR Level 5 schedule and the Level 2 schedules from the other bundles. Rev C is based on the detailed assessing of the Comprehensive Work Packages. Rev C also included Horizontal views of the Windows through a number of Off Site session with OPG and the Vendors. With each issuance of the of the Revised Level 1, the amount of detail, the logic ties and the resource requirements improved and gaps are identified with actions to close. Currently the Vertical Slice sessions are taking place to identify conflicts in logic and resource allocation. Rev 0 will be our baseline based on detailed planning and resource leveling.
KPMG	9.4-BOP-02	Dereck McCauley	Dereck McCauley	Critical Path that has too many activities relative to the total number indicates a schedule with increased risk due to less ability to implement mitigation planning required from actual changes in durations or dates.	Require the Vendor to verify and validate the critical path to ensure mostly Finish to Start logic with very few lags, no gaps, etc.; and ■ OPG should confirm that the Vendor has provided greater detail in the next revision of the estimate package.	SCHEDULING	Most of the critical path goes through the Retube and Feeder Replacement project therefore many of their tasks are critical path .The contractual requirements were to produce a detailed schedule in support of their Class 2 estimate which made up the largest part of the RQE for execution. The details are also based on detailed Logic Flow Diagrams which identify step by step the tasks and logic required to remove and install the fuel channels. Since the RQE, the other Bundles have developed their detailed schedules which has increased the number of non-critical tasks. The Program made a strategic decision to ensure that the bulk of the non-RFR work is completed prior to the point at which RFR is 60% complete. This strategy allows for mitigation and contingency strategies on the non critical path work (such as BOP) to be implemented without impacting the overall program critical path.
KPMG	9.4-BOP-03	Dereck McCauley	Dereck McCauley	■ Using ‘Hard Constraints’ in the schedule will interfere with Critical Path analysis and cloud visibility in forecasting, and level of confidence.	■ Require the Vendor to provide an explanation in the estimate package as to why they are necessary, remove the ‘Hard Constraints’ or replace them with ‘Soft Constraints’ such as Start of Finish on or before/after; and ■ OPG should confirm that the Vendor has provided greater detail in the next revision of the estimate package.	SCHEDULING	For long term, large projects and complex programs, there needs to be way points. There needs to be a small number of midway milestones that are deadlines. Any activities that cannot meet the mid-way milestones should also be identified and focused. A project over 3 years long will have too many Level 3 activities to properly identify and manage critical path. We have to segment the long duration into intervals, and constrain a small number of milestones. In each interval, critical activities can be identified. Our contracting strategies require us to provide the vendors a structure aligned to the project they have been awarded . They require control over their schedule. The vendors are connected logically through interface milestones. Assuming you can get it, any small error happens on one of the critical path activities, will collapse all L3 Schedules. Each window is represent buy control Accounts and Work packages. Base on this structure, a Level 2 plan is also created. By constraining the dates associated with milestones, the critical path can be determined for major schedule intervals (windows) in addition to the entire project. Float can also be calculated on each schedule interval. This segmentation of the project schedule into intervals allows earlier indication of schedule problems and a better view into the activities whose completion is critical.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	9.4-BOP-04	Dereck McCauley	Dereck McCauley	Leads (negative lags) in the schedule indicates logic sequences that are not precedence relative and will cloud/interfere with Critical Path analysis.	■ Require the Vendor to provide an explanation in the estimate package as to why they are necessary or delete them and if needed replace them with appropriate activities and/or logic ties; and ■ OPG should confirm that the Vendor has provided greater detail in the next revision of the estimate package.	SCHEDULING	As part of the Baslineing process associate with Rev 0, all schedules will go through the Acumen Fuse tool. This tool identifies all leads and negative lags. Any unnecessary leads or lags will be replaced with logic
KPMG	9.4-BOP-06	Dereck McCauley	Dereck McCauley	Negative Float identifies specific logic chains with significant potential to impact the planned completion of the project.	■ Require the Vendor to provide an explanation in the estimate package as to why they are necessary or delete them and if needed replace them with appropriate activities and/or logic ties; and ■ OPG should confirm that the Vendor has provided greater detail in the next revision of the estimate package.	SCHEDULING	The schedule will not be baselines with negative float in the schedule. Any identified negative float in execution will be managed and monitored by the Window Manager and the Project Manger with support from Work Control and Planning and Controls. A Report has been developed to identify negative float by project.
KPMG	9.4-BOP-07	Robert Obertreis	Robert OBERTREIS	■ A high level comparison illustrated several discrepancies between the labour hours in the cost estimate and schedule with regards to Construction, Engineering and Project Management Team for the three projects which is an indicator that cost could be understated in the RQE. For example, on average the Engineering estimate hours were 80% less than the P6 schedule labour hours.	Actions Taken ■ OPG provided cost profile documents and updated estimates which address some of the discrepancies. For example, the Engineering discrepancies in particular, were due to the fact that Engineering hours (for Phase 1) were rolled up in a “Project Defined’ (Summary worksheet, Row 13) cost account. Now, the discrepancy in engineering hours is approximately 12%; ■ However, for Adjuster Rods, the labour hours in the estimate file is still significant (+67%) higher than the labour hours in the P6 because the Vendor has not submitted an updated schedule; and ■ OPG should confirm that the Vendor submits the revised P6 schedule with updated labour hours (this is why it is still open as a Category C). Further Actions ■ To increase the level of confidence in the BOP cost estimates OPG could consider notifying the Vendor of these quality issues and request that the Vendor revise and resubmit estimates / schedules of an acceptable quality.	SCHEDULING	This effort is integrated with the Schedule Integration development and is reviewed as part of Unit 2 finalization with progression of schedule from Rev B, C, 0 and final Unit 2 Baseline. All projects including the BOP projects will go through Gate 3A prior to breaker open to ensure alignment of cost estimate, P6 hours, and ecosys load.
KPMG	9.4-BOP-08	Robert Obertreis	Robert OBERTREIS	■ The Vendor’s estimate does not appear to define any potential critical activities in the schedule or explain how the Vendor plans to deal with any potential interferences.	■ If there are critical activities as OPG’s SOW seems to suggest then OPG should require the Vendor to include a section in the estimate package that describes such activities and explains how the Vendor plans to deal with them; and ■ OPG should confirm that the Vendor has provided greater detail with respect to the critical activities in the next revision of the estimate package.	SCHEDULING	The critical path activities, and JV integration with other entities doing work in and near their execution windows are being resolved through a series of vertical slice reviews that are ongoing. These review will continue until the issuance of the Rev 0 schedule in August 2016. In alignment with scheduling standards the vendors are providing detailed level activities specifically showing the critical activities in the windows.
KPMG	9.4-BOP-09	scott guthrie	tbd	■ Although the vendor’s estimate (i.e. Unit 2 tab, under Indirect Labour header) includes indirect cost, these values appear to be hardcoded (e.g., for Containment, HSSE row 281, Construction Indirect row 291) and there does not appear to be an explanation for the hours, weeks etc.	The vendor should provide greater detail regarding the basis and source of indirect costs in the next revision of the estimate; and ■ OPG should confirm that the Vendor has provided greater detail with respect to the source / basis of indirect costs in the next revision of the estimate package.	ESTIMATING	Agreed; In general indirect cost is high and deliverable level is unclear. A separate team has been assigned to review the total indirect hours across the boundless and opportunities to share the resources. This process continues with the goal of continuous estimate improvement.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPONSE
KPMG	9.4-BOP-10	scott guthrie	tbd	■ Indirect costs for small tools, consumables and equipment rental are calculated by using hardcoded factors (i.e. % with no source / basis) that are applied to the total direct labour cost.	OPG could consider validating the hardcoded factors to ensure that they are in-line with the commercial terms of the Vendor's agreement (i.e., ESMSA agreement) or OPEX; and ■ Also, due to the uncertain nature of the Vendor's parametric estimating approach in the current estimate package, OPG should also consider reviewing in detail the Vendor's indirect costs, overhead costs and other assumptions when the vendor submits the next revision of the estimate (i.e., bottoms up activity based estimates).	ESTIMATING	Each estimate submitted is reviewed in detail and includes indirects, allowances, etc in addition to direct costs. With respect to small tools and consumables, the allowance has been aligned to consistent percentages with any exceptions addressed within the BOE.
KPMG	9.4-BOP-11	scott guthrie	tbd	■ It is unclear how the cost for general project facilities are accounted for in the estimate.	OPG should confirm that the Vendor has provided greater detail with respect to how the Vendor is handling 'general project facilities' costs in the next revision of the estimate package.	ESTIMATING	This is outlined in the terms of the ESMSA contract.
KPMG	9.4-BOP-12	Robert Obertreis	Robert OBERTREIS	■ No mention of insurance policies that will be used. 'Project Insurance' is included as a line item in the estimate (i.e. J412 Unit #2) but has no cost. There does not appear to be any explanation for project securities in the BOE or the vendor's 'Step 5' presentation.	The Vendor should clarify the approach to project insurance. If the intent is for the contractor to purchase insurance then that should be explained in the BOE and reflected in the cost estimate. However, if the intent is for OPG to secure project insurance at the program level (i.e., DNRP) then that should be explained in the project BOE and a reference provided to the program BOE for further details and insurance costs.	ESTIMATING	Project Insurance cost has a separate BOE (prepared by Refurb Estimating group) and all costs are collect in the BOE estimate tables .
KPMG	9.4-BOP-13	Robert Obertreis	Robert OBERTREIS	■ There does not appear to be any information in OPG's SOW or the vendor's estimate with respect to what year the pricing is in (i.e. 2015 dollars) or how the escalation item will be handled	■ The Vendor should provide greater detail for its sources of cost data (i.e. year) and how escalation will be handled in the next revision of the estimate.	ESTIMATING	The year of the estimate is documented within the final Basis of Estimate documentation.
KPMG	9.4-BOP-14	Robert Obertreis	Robert OBERTREIS	■ There does not appear to be any productivity factors (e.g., labour, tool performance) used in the three BOP estimates that were reviewed for the BOP vertical slice.	The vendor should reference the source for all labour hours and clarify if there are any productivity adjustments in the next revision of the estimate. For example, productivity rates associated with training on the adjuster rod mock-up	ESTIMATING	Productivity factor has been removed from the estimate based on the project team request (and agreed by OPG Estimating team), and included with hours norms, this has no affect on the total cost
KPMG	9.4-BOP-15	Robert Obertreis	Robert OBERTREIS	■ Although the Vendor's 'Step 5' presentation references the SOW, there appears to be a discrepancy in the numbers (i.e. quantity of flux detectors). It appears the Vendor's estimate uses more actual FD's than is necessary, not including the spare parts; and ■ The SOW specifies 82 VFDs and 51 HFDs. However the Vendor's Excel estimate workbook in one location (i.e., electrical tab) specifies 84 VFD removals and 85 VFD installations, and in another location (i.e., the mechanical tab). The mechanical tab specifies 84 VFD installations.	■ OPG's internal estimates for the flux detectors are as follows: -98 vertical FDs and -3 horizontal FDs; ■ Even though there appears to be a discrepancy in the quantities between the vendor's estimate and OPG's internal worksheet there does not appear to be a significant discrepancy in the estimated build-up of hours. The total difference in calculated man hours between OPG (18,223 hours) and the Vendor (18,362 hours) is approximately 1%; and ■ OPG should consider checking to make sure that the Vendor has ascertained the correct quantities of flux detectors in the next revised estimate submission.	ESTIMATING	Agreed. The quantity issue still exist for U2EE and it has a minor impact on the cost. To be monitored in the next revision
KPMG	9.4-BOP-16	Robert Obertreis	Robert OBERTREIS	■ In the 'Mechanical' tab the cutting of the 84 VFDs and 51 HFDs is clearly outlined, however due to inconsistent terminology and descriptions in the Excel cost estimate workbook it is not clear how the removal of the additional 17 detectors is accounted for in the estimate.	OPG should consider checking to make sure that the Vendor has used consistent terminology and that the Vendor has ascertained the correct quantities in the next revised estimate submission.	ESTIMATING	Agreed. The quantity issue still exist for U2EE and it has a minor impact on the cost. To be monitored in the next revision
KPMG	9.4-BOP-17	Robert Obertreis	Robert OBERTREIS	■ There appears to be approximately 4,900 hours for estimated for VFD waste handling activities. However, there does not appear to be any direct labour hours allocated to HFD waste handling in the Excel cost estimate workbook.	■ All the hours for waste handling on the 'Mechanical' tab of the estimate worksheet appears to have been allocated to VFD waste handling. OPG should confirm in the vendor's revised estimate that cost (i.e., hours) has been accounted for HFD waste handling.	ESTIMATING	Agreed. The quantity issue still exist for U2EE and it has a minor impact on the cost. To be monitored in the next revision

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	9.4-BOP-18	scott guthrie	tbd	■ The vendor has provided costs (~\$531K) for Phase 3 commissioning / closeout in the estimate (Summary Sheet, K51). The majority of the cost is allocated to Mod Team Leader ("MTL") (i.e. 3520 hours / \$422,400). It is unclear how this level of	■ The vendor should provide an activity based detailed estimate in the next revision of the estimate for commissioning and close out activities; and ■ Also, the Vendor should clarify if Phase 3 costs have been resource levelled across the BOP bundle.	ESTIMATING	BOE Revision incorporates changes. Will be monitored in subsequent revisions. In general OPG estimating team noticed PMT hours are high subsequently a separate team has been assigned to review the total PMT hours across the bundles. OPG is reviewing strategy to centralize the PMT costs for ESMSA vendor support.
KPMG	9.4-BOP-19	Robert Obertreis	Robert OBERTREIS	■ It is not clear how freight has been accounted for in the estimate. For example it is unclear whether the \$12,000 cost for each Flux Detector includes freight cost.	■ The Vendor should clarify in the cost estimate how the cost of freight has been accounted for in the estimate.	ESTIMATING	BOE new template includes freight cost changes. Will be monitored in subsequent revisions. <b>(This item has no cost impact since the cost was included in the estimate)</b>
KPMG	9.4-BOP-20	scott guthrie	tbd	The vendor has provided costs (~\$1.4M) for Phase 3 commissioning / closeout in the estimate (Summary Sheet, K51). It is unclear how this level of effort was determined.	■ The vendor should provide an activity based detailed estimate in the next revision of the estimate for commissioning and close out activities; and ■ Also, the Vendor should clarify if Phase 3 costs have been resource levelled across the BOP bundle.	ESTIMATING	The cost breakdown is provided, 96% of the cost is PMT cost. Refer to item 9.4-BOP-18 for detail on PMT strategies in development to reduce costs.
KPMG	9.4-BOP-21	Robert Obertreis	Robert OBERTREIS	■ It is not clear how freight or taxes have been accounted for in the estimate. There is a line item for freight in the unit tabs but it has a zero dollar impact on the estimate.	The vendor should provide greater detail with respect to how the costs of freight or taxes have been accounted for in the next revision of the estimate.	ESTIMATING	Freight cost need to be added to the BOE. Tax is not included. Will be monitored in subsequent revisions. <b>(This item has no cost impact since the cost was included in the estimate)</b>
KPMG	9.4-BOP-23	scott guthrie	tbd	■ In the Vendor's BOE, it was indicated that the procurement for all major components was done in Phase 1, and Phase 1 costs is a hard coded value in the estimate file (PEPC 'Project Defined' cost account ~\$2.7M).	Actions Taken ■ In a meeting with the BOP team on August 18th, 2015 the BOP team provided an internal OPG working document that provided the breakdown for the ~\$2.7M 'Project Defined' costs as follows: WBS 10000 – Proj Mgmt: \$358K WBS 30400 – Detailed Eng: \$1,184K WBS 30700 – Work Plans: \$529K WBS 40000 – Procurement: \$651K; and Further Actions ■ OPG could consider requiring that the Vendor breakdown the 'Project Defined' costs into their appropriate WBS structure so that an accurate breakdown of costs and 'cost ratios' (PMT / Direct cost) can be evaluated by the OPG project team in the next revision of the estimate.	ESTIMATING	Phase-1 is definition phase and reflect the actual cost. The procurement cost is documented in the BOE, refer to section 2.3 for details.
KPMG	9.4-BOP-24	scott guthrie	tbd	The vendor has provided costs (~\$123K) for Phase 3 commissioning / closeout in the estimate (Summary Sheet, K51). The majority of the cost is attributed to Project Manager Phase 3 (i.e. 365 hours / \$40,128) and Project Coordinator Phase 3 (i.e. 365 hours / \$43,776). It is unclear how this level of effort was determined as the only reference in the BOE is a 'multi-disciplinary trade support and engineering support as required will be provided' (ref BOE, Section 2.8)	The vendor should provide an activity based detailed estimate in the next revision of the estimate for commissioning and close out activities; and ■ Also, the Vendor should clarify if Phase 3 costs have been resource levelled across the BOP bundle.	ESTIMATING	Refer to response to item 9.4-BOP-18.
KPMG	9.4-BOP-25	Robert Obertreis	Robert OBERTREIS	It is not clear how freight has been accounted for in the estimate.	■ The vendor should provide greater detail on how freight has been accounted for in the next revision of the estimate.	ESTIMATING	BOE Revision incorporates changes. Will be monitored in subsequent revisions. <b>(This item has no cost impact since the cost was included in the estimate)</b>
KPMG	9.4-BOP-26	scott guthrie	tbd	There does not appear to be any assumptions / clarifications documented for subcontractors (i.e. Crossby Dewar) as it was done in the other BOP projects reviewed.	OPG could consider requiring that the Vendor clarify and fully document its assumptions / clarifications in the next revision of the estimate.	ESTIMATING	BOE Revision incorporates changes, the level of detail for subcontractor (i.e. Crossby Dewar) is acceptable and assumptions are documented in the estimate sheet.
KPMG	9.4-BOP-27	Robert Obertreis	Robert OBERTREIS	There does not appear to be a comprehensive document listing all engineering deliverables received by OPG.	The Vendor should provide a comprehensive document listing all engineering deliverables and their status (i.e., % complete) should be provided in the next revision of the estimate.	ESTIMATING	No Project EC is required.
KPMG	9.4-BOP-28	Robert Obertreis	Robert OBERTREIS	■ The BOE does not appear to be self-contained or provide sufficient detail to support the estimate in accordance with best practice.	As per the AACE guidelines for developing a Basis of Estimate document, several sections such as 'Methodology', 'Estimate Classification', 'Planning Basis', 'Design Basis' etc. should be included in the BOE. Also information from the Vendor's 'Step 5' collabouration presentation should be transferred and incorporated into the BOE and flushed out in greater detail in the next revsion of the estimate.	ESTIMATING	BOE Revision incorporates changes. Will be monitored in subsequent revisions. The new BOE included all recommended section by AACE as well as extra info required by OPG.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPONSE
KPMG	9.4-BOP-29	Robert Obertreis	Robert OBERTREIS	■ No section for "Design Basis" or anything similar in the BOE.	■ As per the AACE guidelines a completed estimate deliverables checklist indicating the project deliverables should be provided as an attachment to the BOE to support the preparation of the estimate and the associated estimate classification.	ESTIMATING	BOE Revision incorporates changes. The design basis provided in Section 2 of BOE.
KPMG	9.4-BOP-30	Robert Obertreis	Robert OBERTREIS	■ In the BOE, there is an "Assumptions" section where some assumptions made by the Vendor are listed. However, this does not appear to be a current or comprehensive list. For example, there are assumptions and clarifications listed in the Vendor's 'Step 5' document which are different from what is listed in the BOE	■ The BOE should be updated and reconciled with the 'Step 5' presentation. Also it should be made clear how these assumptions have impacted the estimate. Furthermore clarifications from the subcontractor should be incorporated into the BOE assumptions Section so as to ensure there is universal documentation of assumptions in the next revision of the estimate.	ESTIMATING	Assumption is documented. Project BOE met the minimum AACE requirement. The Assumptions are sufficient to classify the estimate. Will be monitored for improvement in subsequent revisions.
KPMG	9.4-BOP-31	scott guthrie	tbd	■ In terms of PMT and indirect costs levelling it is unclear at this point what the contracting strategy is - .i.e. whether one ESMSA vendor will be substantially responsible for all of the BOP work or whether the work will be it will be split up among more than one ESMSA vendor.	■ The vendor should clarify its approach to resource levelling the PMT / Indirects (i.e. treating the BOP projects individually or as one 'big' project) in the next revision of the estimate.	ESTIMATING	This has been addressed. The ESMSA vendors have been asked, and have provided at the time of U2EE, a consolidated PMT picture outlining by name the individuals supporting the projects to ensure cost and management efficiency of the work. A separate team has been assigned to review the total PMT hours across the bundles.
KPMG	9.4-BOP-32	Robert Obertreis	Robert OBERTREIS	There appears to be some high level assumptions for work week/scheduling for direct labour in the Vendor's 'Step 5' presentation.	The vendor should provide greater detail about work week / scheduling after the CWP's are assessed and revised schedules are submitted in the next revision of the estimate.	ESTIMATING	Effort integrated as part of the outage schedule integration development and horizontal and vertical slice meeting. Revision 0 of the U2 integrated schedule was issued August 25th. The schedule provided as attachment to BOE was preliminary and is now integrated.
KPMG	9.4-BOP-33	Robert Obertreis	Robert OBERTREIS	While the BOE does have a separate section called 'Exclusions' it refers the reader to the Assumptions section.	■ As per the AACE guidelines for developing a BOE, OPG should consider requiring that the Vendor to develop the "Exclusions" section of the BOE so as to make it clearer what the exclusions are in the next revision of the estimate.	ESTIMATING	The BOE issued for U2EE have list of exclusions in the right section.
KPMG	9.4-BOP-34	Robert Obertreis	Robert OBERTREIS	■ The vendor's 'Step 5' presentation identifies the major items involved in this project. For example, for the Containment project the major items identified are the fan / electrical package (Scope 7011), installation of two containment valves (Scope 7012), and wiring / instrumentation and control installation (Scope 7010).	The information from the vendor's 'Step 5' presentation should be consolidated with the estimate package (i.e., transferred into the BOE) in the next revision of the estimate.	ESTIMATING	The list as provided in the BOE was for major items only, details are listed in the attached detail estimate sheet that accompanies the BOE.
KPMG	9.4-BOP-35	Robert Obertreis	Robert OBERTREIS	■ The Vendor's Step 5 presentation appears to provide more detailed information than the Vendor's BOE with respect to the project's planning basis; and ■ Even with this additional detail, there are several inconsistencies in the Vendor's naming convention for certain activities throughout the estimate documentation. For example in the Adjuster Rods project the Vendor's Step 5 presentation specifies 'Remove Mechanism: 1	■ The Vendor should consolidate the estimate documentation and provide a comprehensive BOE; and ■ Also, OPG should require the Vendor to reconcile activity naming / labelling inconsistencies in the next revision of the estimate.	ESTIMATING	Will be monitored in subsequent revisions to consolidate the estimate documentation and receive a comprehensive BOE
KPMG	9.4-BOP-36	Robert Obertreis	Robert OBERTREIS	■ There are no exclusions listed in the BOE. While there is an exclusions section heading in the BOE, there is no information related to exclusions listed.	■ As per the AACE guidelines for developing a BOE, OPG should consider requiring the Vendor to develop the "Exclusions" section so as to make it clearer which exclusions exist in the next revision of the estimate.	ESTIMATING	The BOE's issued in support of U2EE have list of exclusions in the right section.
KPMG	9.4-BOP-37 (no 38-41)	Robert Obertreis	Robert OBERTREIS	■ There does not appear to be a planning basis in the BOE document for resources (i.e. resource plan).	■ OPG could consider requiring that the Vendor clarify its basis and assumptions for resources and labour productivity rates in the next revision of the estimate.	ESTIMATING	As per AACE- 34; the resource plan is not required to be as a separate section. The resource basis requirements are included and managed by scheduling and other OPG groups. PMT hours have been aligned with estimated hours and is integrated with the scheduling efforts to ensure they are suitable based on the work and timelines.
KPMG	9.4-BOP-42	Robert Obertreis	Robert OBERTREIS	■ Risk Register has been received and it appears to be in-line with best practice and OPG governance. However, many of the risks contain probabilities of 50% or higher.	■ This is an indication that the 'Base Plans' need improvement or further development; and ■ OPG should revise the risk register after the next revision of the estimate.	Risk	Unit 2 Execution Estimate risk challenge process has addressed this item. The demonstrated performance of the ESMSA contractors during the RTE period has indicated high risk of quality and rework issues and this is accurately reflected in the risk register and contingency estimate.
KPMG	9.4-BOP-43	Robert Obertreis	Robert OBERTREIS	■ Links to external files contained outside of the estimate file workbooks. For example, all links in the Crossby Dewar tab are traced back to an external file – UM('C:\Users\rob\AppData \Local\Microsoft\Windows\Temporary Internet Files\Content.Outlook\LVH 866E9\{D-0704-14 (P2014-0070) Flux Detector Rehabilitation Rev 2.xlsx}\Scaffolding Scope\M20:M23)	■ The vendor should provide all the information necessary for the cost estimate in the Excel cost estimate file (i.e. it is not best practice to have links to external files contained outside of the estimate file workbooks) in the next revision of the estimate.	ESTIMATING	Corrected in the current submission.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	9.4-BOP-44	scott guthrie	tbd	■ Factors are applied to costs for key activities without explanation. (e.g. In the Flux Detectors project, for example, the PEPC procurement cost account for Vendor: Non-Long Purchasing and Materials for Unit 2 in the Summary sheet (Cell J30) has been calculated by multiplying the material cost (K409 in Unit 2 sheet) by 4.5% and adding Non Long Lead Equipment Phase 2 (K119, Unit 2 sheet under 2nd Tier Subcontractors).	■ The vendor should provide greater detail with respect to how factors are applied to costs for key activities in-line with the Vendor's agreement (i.e., the ESMSA agreement) in the next revision of the estimate.	ESTIMATING	These factors are the contractually agreed ESMSA OH, Profit and markup. BOE mentioned the estimate is based on ESMSA Agreement.
KPMG	9.4-BOP-45	scott guthrie	tbd	■ Factors are applied to costs for key activities without explanation. (e.g., in the Flux Detectors project, for example, the project management cost area for Unit 2 in the Summary sheet (Cell J16) has been increased by 12% to arrive at the cost in respective cells in Column J and it is unclear on what basis this adjustment was made.	■ The vendor should provide greater detail with respect to how factors are applied to costs for key activities in-line with the Vendor's agreement (i.e., the ESMSA agreement) in the next revision of the estimate.	ESTIMATING	These factors are the contractually agreed ESMSA OH, Profit and markup. BOE mentioned the estimate is based on ESMSA Agreement.
KPMG	9.4-BOP-46	Robert Obertreis	Robert OBERTREIS	■ It is unclear how some total costs have been apportioned to separate PEPC accounts. For example, all Job Expenses have been apportioned between Construction Support Work and Construction Indirects using a 90/10 allocation, respectively. This calculation cannot be traced back to any assumptions in the Vendor's estimate package. ■ In another example, it is unclear how the Vendor has apportioned 'additional costs' (such as material handling, cleaning, training, etc.) to OPG's control accounts (i.e., Scope IDs). It appears that the Vendor has apportioned the 'Additional Costs' to specific Scope IDs based on the Scope ID's direct-to-total man hour ratio.	■ The vendor should provide greater detail with respect to how certain costs have been apportioned between various PEPC accounts in the next revision of the estimate.	ESTIMATING	Job Expenses is divided between construction and commissioning support work using a 90/10 allocation. This level of detail is meeting the AACE requirements and it has been accepted as reasonable by the estimating department.
KPMG	9.4-BOP-47	Robert Obertreis	Robert OBERTREIS	■ The estimate is broken down to the 'Full Time Equivalent ("FTE") Level' for direct labour and a blended rate is used to calculate the direct labour cost. The direct labour has not been broken down to the trade level.	■ While OPG's SOW does not appear to provide the Vendor with requirements (i.e., bottoms up estimating) for estimating direct labour, prior to execution the vendor should provide a bottoms up estimate for determining the number and types of craft labour required in the next revision of the estimate.	ESTIMATING	Labour blended rate calculated considering the DFL percentage for each trade level. The calculation provided in the BOE. This method is acceptable per AACE and does not effect the cost.
KPMG	9.4-BOP-48	Robert Obertreis	Robert OBERTREIS	■ The pricing source for wage rates does not appear to be defined in the vendor's estimate package. It is not clear if the labour rates used can be sourced back to EPSCA (I.e., collective agreement) and there does not seem to be a reference year (I.e. 2015) for the rates.	■ The vendor should reference the source for the labour rates and the reference year. OPG should verify that the vendor is using the correct rates (and year) for calculating labour costs in the next revision of the estimate.	ESTIMATING	The labour rates for BOP ESMSA executed work have been checked and they are based on ESMSA contract terms, and Oncore actual that OPG incur for this support.
KPMG	9.4-BOP-49	Robert Obertreis	Robert OBERTREIS	The unit labour hours can be traced back to the 'Functional' tabs of the Vendor's Excel estimate file. However, these hours are hard coded and there does not appear to be a basis for their build-up	■ The vendor should reference the source for all labour hours and clarify if there are any productivity adjustments in the next revision of the estimate.	ESTIMATING	These have been raised to vendor through comment and disposition sheet and OPG received detail behind hard coded numbers. The BOE template has been updated to eliminate this feature.
KPMG	9.4-BOP-50	Robert Obertreis	Robert OBERTREIS	The craft mix has not been defined in the estimate. The vendor's estimate for labour is based on parametric estimating i.e. Level of effort based on hours and full time equivalents ("FTE").	The vendor's labour estimate is based on parametric estimating. OPG should review the vendor's crew mix when the vendor submits its detailed activity based (bottom up) estimates in the next revision of the estimate.	ESTIMATING	The crew mixes have been provided in the rate calculation table and CWP detail estimate.
KPMG	9.4-BOP-51	Robert Obertreis	Robert OBERTREIS	■ Pricing source and methodology for construction indirect costs (and hours) is unclear; and ■ For example, in the Flux Detector project cost estimate, a significant amount of the hour and rates used for Indirect Labour appear to be hardcoded. For construction indirect costs specifically, the construction / site manager and superintendent rates (Ref Unit 2 tab Cell H290 – 295) have been hardcoded whereas the rates for the other areas such as the general foremen (Ref Unit 2 tab Cell H296) can be traced back to the labour calculation worksheet where the hours for the various trades and the blended rates have been calculated.	The vendor should provide greater details for the pricing source and methodology for construction indirect costs in the next revision of the estimate.	ESTIMATING	These have been raised to vendor through comment and disposition sheet for each project ( whenever is applicable) and the comment is not disposition in most of the projects. OPG project team took the action to monitor the work at field.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	9.4-BOP-52	Robert Obertreis	Robert OBERTREIS	Material costs exist in the Vendor's Excel cost estimate workbook, but with no cost basis (i.e., market, budget, historical) or reference year for the price. ■ For example, there does not appear to be any pricing sources for major equipment in the flux detector project. The estimate contains hardcoded, round number costs for the detectors (i.e. \$12,000 ea.). it is unclear whether this is based on historical, budgetary quotes or market prices etc.	The Vendor should provide pricing sources for all major equipment e.g. flux detectors (vendor quotes, historical data – year of historical data and so on) in the next revision of the estimate.	ESTIMATING	The contractor did not provide pricing source however , they provided basis for most and major items and the material cost has been checked against OPG Asset Suit. Will be monitored in subsequent revisions.
KPMG	9.4-BOP-53	Robert Obertreis	Robert OBERTREIS	There does not appear to be any pricing sources for commodities and bulk materials.	■ The Vendor should provide bulk material and commodity pricing sources in the next revision of the estimate.	ESTIMATING	The contractor did not provide pricing source however , they provided basis for most and major items and the material cost has been checked against OPG Asset Suit. Will be monitored in subsequent revisions.
KPMG	9.4-BOP-54	scott guthrie	tbd	The Pricing source for home office costs (project management, engineering, etc.) is unclear. Project management – overhead and profit is calculated as a percentage of direct and indirect labour (7% and 5% respectively) – ref. 'Unit 2' worksheet, rows 414 and 415; ■ Indirect labour includes PMT costs. Engineering design – part of the cost for the first tier subcontractor (engineering) is a hard coded number on the 'Summary' worksheet, row 13 (called 'Project Defined'). However, this amount includes more than just engineering cost, it also includes PMT and procurement costs. For example, the 'Project Defined' cost is \$2.3M, however, per the Bundle Integration Review this amount includes \$238K of PMT and \$1.6M of procurement cost; and ■ It is unclear why the engineering costs are not included in Unit 2 worksheet for the first tier subcontractor costs (phase 1 engineering) as all these costs are zero (\$0) – ref. Unit 2 worksheet, rows 76 and 77.	■ The Vendor should clarify where the percentages (i.e. 5% ad 7%) are coming from for Overhead and Profit (i.e. reference the applicable section of the ESMSA agreement) in the next revision of the estimate; and ■ The Vendor should also allocate Phase 1 costs to the appropriate WBS category, i.e. – break down the 'Project Defined' costs per the correct WBS category (e.g., allocate \$238K to PMT, allocate \$2.3M to procurement) so that an accurate picture of the key ratios can be presented (e.g., Vendor PMT cost ratio vs. direct work, Engineering cost ration vs. direct work) in the next revision of the estimate.	ESTIMATING	The percentages are based on the ESMSA contract, and referenced in the BOE. Other comments are addressed through Comment and disposition sheet. Sufficient information has been provided on the project basis and issued in the approved estimate.
KPMG	9.4-BOP-55	Robert Obertreis	Robert OBERTREIS	While there appears to be budgetary quotes for some of the costs (18", 8" and 6" 3-Way Valve Assembly and the 24" BF Valve assembly), others costs that are hardcoded appear to have no basis. For example, the fan/damper control panel cost of \$50,000 (ref O15, Electrical tab); and ■ Furthermore in the estimate Excel file, the cost for the Blower Fans 1 and 2 and Roll Up doors have been indicated to be from budgetary quotes, however their source is not clear.	The vendor should provide the back-up / sources for major materials / equipment in the next revision of the estimate.	ESTIMATING	The quotes are not provided, will be monitored in subsequent revisions.
KPMG	9.4-BOP-56	Robert Obertreis	Robert OBERTREIS	There does not appear to be any pricing sources for commodities and bulk materials. For example, the cost for the globe valve (\$45K) andspool pieces (\$20K) have been hardcoded with no basis / source. (ref Cell Z30, Z59 Piping Tab)	The Vendor should provide bulk material and commodity pricing sources in the next revision of the estimate.	ESTIMATING	The issues identified were resolved through the comment and disposition process. Pricing sources were identified where available and any absences were reflected in the assignment of estimate class.
KPMG	9.4-BOP-57	Robert Obertreis	Robert OBERTREIS	The pricing sources for major equipment is not clear. In the BOE, it was indicated that the procurement for all major components was done in Phase 1, and Phase 1 costs is a hard coded value in the estimate file (~\$2.7M); and ■ On a minor note for the second tier contractor, there does not appear to be any pricing sources for the Procurement of Long & Non-Long Lead materials and it is a hardcoded value (Tier 2 ENG tab)	The vendor should provide the back-ups / sources for major materials / equipment in the next revision of the estimate.	ESTIMATING	The issues identified were resolved through the comment and disposition process. Pricing sources were identified where available and any absences were reflected in the assignment of estimate class.
KPMG	9.4-BOP-58	Robert Obertreis	Robert OBERTREIS	There does not appear to be any pricing sources for commodities and bulk materials.	■ The Vendor should provide bulk material and commodity pricing sources in the next revision of the estimate.	ESTIMATING	The contractor did not provide pricing source however , they provided basis for most and major items and the material cost has been checked against OPG Asset Suit. Will be monitored in subsequent revisions.
KPMG	9.4-BOP-59	Robert Obertreis	Robert OBERTREIS	This project involves tooling and it does not appear that the vendor has had an opportunity to perform training on the mock-up yet so the durations/productivity rates could be uncertain until the testing and training has been carried out.	The vendor should provide greater details with respect to the durations and productivity rates of the work activities after the testing and training has been completed in the next revision of the estimate.	ESTIMATING	Training cost was included in the estimate to degree known/understood and was approved estimate class reflected that level of definition.

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPONSE
KPMG	9.4-BOP-60	Robert Obertreis	Robert OBERTREIS	In general the vendor's estimate reflects the project objectives and scope of work. However, there are many quality issues (i.e. BOE is incomplete and not comprehensive and there are approximately 60 Category B and C issues outstanding)	■ OPG should work with the Vendor to continue to improve the quality of estimates. This will likely require the Vendor to employ a more detailed, accurate and bottom-up approach estimation methodology	ESTIMATING	OPG has worked with the vendor to improve the quality revisions and requirements were outlined in the revised BOE template. Revised, approved estimates of good quality for BOP were included in the U2EE estimate
KPMG	9.4-BOP-61	Robert Obertreis	Robert OBERTREIS	There does not appear to be any cost for equipment in the vendor's estimate. In addition, there does not seem to be any assumptions in the Vendor's estimate as to where all the equipment required to lift and move equipment and transport materials are presumed to be available from.	OPG could consider requiring that the Vendor clarify its basis and assumptions for the equipment required to lift and move equipment and transport materials in the next revision of the estimate.	ESTIMATING	Costs for all Equipment that Contractor intends to use to move/lift material has been included as factor applied to DFL and it is not based on deliverables. Will be monitored in subsequent revisions.
KPMG	9.4-BOP-62	Robert Obertreis	Robert OBERTREIS	There does not appear to be any cost for equipment in the vendor's Excel cost estimate (see Unit 2 worksheet, Rows 384 - 403). However, according to the BOE (ref. BOE, Section 4 (assumptions), #23) the Vendor appears to be planning to purchase equipment (e.g., tow motors and cranes) to execute the work.	OPG could consider requiring the Vendor to clarify its equipment purchasing plan and confirm that it is reflected in the next revision of the estimate.	ESTIMATING	Costs for all Equipment that Contractor intends to use to move/lift material has been included as factor applied to DFL and it is not based on deliverables. This was aligned with the approved estimate class at the time of review.
KPMG	10.4 OM-1	Robert Obertreis	P&C Lead	Labour rates used in the estimate are in 2013, 2015, and 2016 dollars.	At the time of writing, the OPG Finance team indicated that a new consolidated 'master' Excel functional cost estimate file was created using the inputs from the individual subfunctions' Excel cost estimate files. It was also discussed that OPG has reviewed and consolidated the labour rates in the new master file; and ■ Although it had previously been requested, at the time of writing, the KPMG team had yet received a copy of the consolidated master cost estimate file for review and to confirm this information from the interviews.	ESTIMATING	<b>This rates are correct, within the Master Consolidated File (MCF) rev 4 there are two different rate table worksheets; one for \$2015 and one escalated to \$DOY (dollar of the year). Each of these worksheets contains three tables:</b> <b>1. Labour rates for OPG w/o OT (not used for any calculations)</b> <b>2. Labour rates for OPG with OT (Factor of 2% in 2016 and 2026, 4% from 2017 to 2025) Excluding management positions.</b> <b>3. Labour rates for Augmented staff (Aug Staff Mark up of 15% on Labour rates for OPG w/o OT)</b>  <b>All FTE costs in the MCF "Flat Data" worksheet are calculated using these rate tables. There is a consistent formula in the worksheet that calculates the FTE cost. Every FTE line item is costed out in both \$2015 and \$DOY.</b>
KPMG	10.4 OM-2	Robert Obertreis	P&C Lead	■ There are fluctuations in the level of effort "LOE" allocated to each unit that are random, and not traceable back to the O&M Functional Management Plans or supporting documentation; and ■ Any learning curve effects, efficiencies, risks should be stated in assumptions and applied methodically. Discrepancies that cannot be justified with such assumptions should be reconciled through an estimate review process.	At the time or writing, the Operation, Maintenance, and Radiation Protection ("RP") team leads indicated that they were going to review LOE allocated to all units, check for inconsistencies and document the reasons for fluctuations in their respective estimate documentation; and ■ The Operation and Maintenance leads provided work-in-progress documentation and verbal explanation for the fluctuations in their respective estimate documentation. It is anticipated that the documentation of the assumptions will be finalized prior to the 'check estimate' in 2016.	ESTIMATING	1. Labour rates for OPG w/o OT (not used for any calculations)

Oversight Closeout Spreadsheet							
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE
KPMG	10.4 OM-3	Robert Obertreis	P&C Lead	There are a number of discrepancies between the positions and levels of effort presented in the operations organizational chart versus the ones presented in the RQE Template spreadsheet.	Follow-up meetings with the Operation, Maintenance, and Radiation Protection (“RP”) leads the discrepancies were discussed. The Operations and RP teams indicated that they are going to examine FTEs allocated to different functions to identify if the organizational requirements have been accurately reflected in the estimate; ■ The O&M / Finance team explained that (a) the organizational chart is more of a conceptual representation that is used to communicate requirements to the station and (b) the number of positions fluctuates throughout the course of the program so a point in time snapshot of the staffing levels could be misleading. Therefore, the organization charts were not intended to be relied on to identify the number of positions required (and they were not used for RQE purposes – the excel cost templates were used for RQE purposes). The number of positions and levels of effort should be accurately reflected in the costestimate spreadsheets which were used as the basis for the RQE; and	ESTIMATING	2. Labour rates for OPG with OT (Factor of 2% in 2016 and 2026, 4% from 2017 to 2025) Excluding management positions.
KPMG	10.4 OM-4	Robert Obertreis	P&C Lead	There is a potential 15%- 30% factor applied to all O&M RQE Resource Estimates that does not get stated in the planning instruction tab. This potential factor is applied to each role in every month or year.	The OPG Finance team indicated that a new consolidated ‘master’ Excel functional cost estimate file was created using the inputs from the individual sub-functions’ Excel cost estimate files. It was also discussed in the meeting that OPG has reviewed and consistently applied the factors/ multipliers (i.e., multipliers for augmented staff costs) in the new master file. Although KPMG had requested the document multiple times, at the time of writing KPMG had yet to receive a copy of the consolidated master cost estimate file for review.	ESTIMATING	3. Labour rates for Augmented staff (Aug Staff Mark up of 15% on Labour rates for OPG w/o OT
KPMG	10.4 OM-5	Robert Obertreis	P&C Lead	The scope of work for the operations function, as defined in the Functional Management Plan and Ownership Transfer Plan, do not seem to be reflected in the estimate.	Lack of a comprehensive SOW for O&M was discussed with O&M functional leads. Operations and RP teams indicated that they are going to work towards generating supporting documentation that link LOE to specific O&M tasks. The maintenance team stated that their estimate is not SOW driven and doesn't need to be modified or linked to SOW.	ESTIMATING	
KPMG	10.4 OM-6	Robert Obertreis	P&C Lead	The lack of an integrated schedule poses an issue for interfacing with RFR, BOP, and other projects during their critical path activity or peak planning for capacity.	Those activities that interface with critical path activities, and occur during peak capacity periods should be scheduled if possible to provide the opportunity to conduct further schedule analysis.	ESTIMATING	All FTE costs in the MCF “Flat Data” worksheet are calculated using these rate tables. There is a consistent formula in the worksheet that calculates the FTE cost using the Job Family (Resource Type L4) and the Resource Type L3 (which specifies Aug, Regular, etc) to determine which rate table to pull the rate from. Every FTE line item is costed out in both \$2015 and \$DOY.

Oversight Closeout Spreadsheet								
Org	Auditor Findings	Owner	Delegate	Finding Description/ISSUE	Action Required	FUNCTIONAL AREA	TOPIC REPSONSE	
KPMG	10.4 OM-7	Robert Obertreis	P&C Lead	Job titles are not standardized among O&M documentation.	Consistent terminology should be used throughout the estimate files and supporting documentation, such as Ownership Transfer Plan.	ESTIMATING		CLOSED
KPMG	10.4 OM-9 (there is no 8)	Robert Obertreis	P&C Lead	Assumptions / Basis recorded in the RMO tool are not easily identified within the RQE Template spreadsheet or clearly linked to scope in the FMP or OTP.	Any assumptions should be stated explicitly in the Planning Instructions tab, and it should be clear where they are applied.	ESTIMATING	Planning Assumptions are identified in the FMP and detailed in the RMO tool	CLOSED
KPMG	10.4 OM-10	Robert Obertreis	P&C Lead	The calculations in the Output-Life cycle cash flow tab appear to possess some issues with data integrity: hard coded factors are applied, and disaggregation of costs into monthly amounts is hard-coded into cells. While all sheets are linked, the model appears to be lacking in best practices. Some values in the formulas are hard coded, and some of the assumptions cannot be traced back to supporting documentation.	Review and properly document RQE estimate inputs, definitions, factors, and structure.	ESTIMATING	All tables are pivot tables based on Unit 2 EE raw data from a consistently applied template used by all departments.	CLOSED
KPMG	10.4 OM-11	Robert Obertreis	P&C Lead	It is not clear how the Resource Breakdown Structure used in the RQE Template spreadsheet corresponds with the Organizational Structure for O&M functions.	It would be difficult at this time to resequence the WBS structure of functions, meaning emphasis should be made on standardizing the subcategorization of the 6-digit WBS number so that it is easy to trace similar sub-categories from one functional estimate to another.	ESTIMATING	Action complete; U2EE estimate contains an aligned O&M-WBS, and the resources have been standardized per JF2.	CLOSED
KPMG	10.4 OM-12	Robert Obertreis	P&C Lead	The RQE workbook does not contain strong definitions that align with Organizational Structure, Scope of Work, WorkBreakdown Structure, or supporting documentation such as the Ownership Transfer Plan.	Consistent terminology should be used throughout the estimate files and supporting documentation, such as Ownership Transfer Plan.	ESTIMATING	FMP's, PMP's, BOE's and all input templates follow a standardised format for U2EE.	CLOSED

## Attachment to L-04.3-1 Staff 68, part c)

### Expert Panel Review recommendations and responses

**Recommendation 1:** *The Panel recommends the JV continue efforts to refine their understanding of the project risks within their scope of work over the next several months and continue effort on mitigation strategies through the standby phase and into construction.*

Closed - June-14-2016. "Mobilization plan work continues and results are reviewed against the risk register at regular risk review meetings held bi-weekly at the working level and monthly at the manager level. The mobilization plan is part of the project P6 schedule and our risk review process is mature. For the purposes of RMO this action is considered to be handled via our schedule review process and should be considered complete from an RMO perspective." \*  
Ongoing, no new risks identified.

**Recommendation 2:** *The Panel recommends OPG continue efforts to refine their understanding of the complete envelope of all risks related to the RFR Project, including risk ownership, to avoid gaps and duplication over the next several months; and continue effort on mitigation strategies through the standby phase and into construction.*

Closed - Class 2 ensured this was done plus FOAK/FAW.

**Recommendation 3:** *A realistic working schedule with duration between the best achievable and the most likely schedule needs to be established to align project planning in both organizations. The earlier this schedule is in place, the more effectively the impact of task and logic changes can be managed going forward.*

No specific disposition found for this action; however, the project has completed significant work in this area

**Recommendation 4:** *The Panel believes retube waste processing remains a significant risk to the project. The Panel recommends OPG and the JV put in place a program to perform additional performance tests after factory acceptance testing and then to plan and allow time for comprehensive commissioning and "shake down" tests when the lines are assembled at site.*

Closed - April 4 - Plan in place, JV to continue until tool shipment. Complete. Plan established, PCD underway.

**Recommendation 5:** *As the Darlington RFR Project moves toward the implementation phase, it is important create a constructive working relationship between OPG Operations, the OPG Project Team and the JV.*

Closed - Recent workshop successfully held with JV with external 3rd party. Suites of escalation and/or alignment meetings are underway. For the time being this item can be considered closed, will resurrect if future issues dictate. Action complete. October 18, 2016 April 4 – JV & OPG continue to work towards a more constructive relationship. Escalation process now in place to discuss weekly issues.

**Recommendation 6:** *The impact of the contracting strategy on project execution and teamwork should be examined as it plays an important role in shaping behaviors of the parties.*

## Attachment to L-04.3-1 Staff 68, part c)

Closed - Although we have a few outstanding commercial issues there are currently no disputes relative to contractor behaviour at present. The pending process VP PACM is putting in place for rapid and timely resolution going forward will be the feedstock for any postulated changes to the contract should they be deemed necessary. Action closed. October 18, 2016. Several forums have been established between the Joint Venture and OPG to enable active and timely discussion of commercial issues. PCD'S are discussed weekly, a Senior Management Escalation meeting has been established and we are in the process of getting approval for a Directors alignment meeting.

Lastly, outstanding is building the runstream and expectations for formally managing the runstream for all issues. Performance will be measured by conformance with timelines for issues resolution as the primary metric. Action remains in progress.

**Recommendation 7:** *Establish a Darlington RFR RP organization early with streamlined project specific procedures. Invest in technology to increase RP effectiveness and reduce dose to both RP technicians and workers.*

In-progress TCD 2016 Dec 15- Further work to fully incorporate RP remains outstanding. A working committee has been established to identify, track and manage outstanding RP issues. It is suspected this committee will be mature by end of 4th quarter, this action to remain in progress until the process can be relied on to address all concerns. New due date of December 15. L. Laking for R. Brown October 18, 2016 RP staff have been embedded at the DEC and are working as part of the mobilization plan by overseeing mockup activities, actively participating in some field work. Effort to bolster the support will engage post the current Darlington outage. Further integration with the train the trainer and training will occur later 4<sup>th</sup> quarter. Action remains in progress.

**Recommendation 8:** *The mock-ups at the DEC are far superior to anything used on past retube projects. The Panel recommends the DEC be used to its full potential throughout the coming year to refine the processes and challenge the tooling to be used. Some aspects of the concerns identified by the Panel elsewhere in this report can be addressed through a well-executed Standby Plan.*

Closed - June 9 - Plan in P6, part of current work program. Mobilization plan in place. Post completion of Hard Preps, rehearsals & enhanced training will commence.

**Board Staff Interrogatory #69**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-9, page 7

The above reference refers to the use of Earned Value Management as the primary method for DRP cost management and monitoring.

- a) How will OPG monitor and track earned value for all contractors? Provide all written governing process and procedures and a narrative explanation including an example of how OPG will calculate SPI and CPI.
- b) How is OPG going to track the Project's schedule and the progress of contractors pursuant to the schedule? Provide all applicable written policies and procedures.
- c) How often are the contractors providing a schedule update to OPG?
- d) Describe OPG's process for managing or releasing float. Provide the written governance process, if any.
- e) Describe OPG's process for re-baselining the schedule, if necessary. Provide the written process and procedure, if any.
- f) Explain the float built into the overall project schedule and how it is allocated for each Unit.

**Response**

- a) Please see also the response to Ex. L-4.3-1 Staff-057:
  - The earned value management process is documented within Nuclear Refurbishment Earned Value Management N-MAN-00120-10001-SCH-007-R002 (see Ex. L-4.3-1 Staff-48a, Attachment 45).
  - All work completed within Nuclear Refurbishment (including all work performed by contractors) is completed under a work package. All direct work related work packages (i.e., work packages that include work done in the field) are planned in the scheduling system (Primavera 6). All work packages, including direct work related

- 1 work packages and level of effort work packages (i.e., Project Management), are  
2 captured in the cost tool (Ecosys).
- 3 • During definition of the projects, earning rules were established for each work  
4 package, including contractor work packages. These earning rules provide direction  
5 on what percent progress can be applied to a work package (and ultimately how  
6 much can be earned for a particular deliverable). The guidelines for the earning rules  
7 are included in the N-MAN-00120-10001-SCH-007-R002 (see Ex. L-04.3-1 Staff-  
8 48a, Attachment 45).
  - 9 • On a daily basis, schedule activities are updated indicating the status of work. The  
10 overall integrated schedule is updated (refreshed) once per week. The status of all  
11 activities (which is the lowest level of granularity within a schedule) is updated, and  
12 the percent complete for each work package is established. Once the vendors have  
13 submitted the work package percentage complete (in alignment with their earning  
14 rules), the project teams verify the reported progress. This percentage progress  
15 forms the basis of 'earned value'.
  - 16 • The Schedule Performance Index (SPI) is calculated by the percentage complete of  
17 the planned value to determine earned value. SPI is calculated as the Earned Value  
18 divided by the Planned Value in the schedule.
  - 19 • To calculate Cost Performance Index (CPI), Earned Value is determined by  
20 multiplying the percentage complete from the schedule by the cost planned value at  
21 the work package level. Cost Performance Index is calculated as the Earned Value  
22 divided by Actual Cost, as shown in Ecosys.
- 23
- 24 b) All contractors' schedules are integrated into a single Primavera 6 scheduling tool,  
25 controlled by OPG. Each schedule is linked by interface milestones and logically tied.  
26 Each contractor developed their schedule following a standard set of schedule codes as  
27 directed by OPG. They must also follow the same update cycle in order to measure  
28 progress and determine Earned Value. Refurbishment uses multi-level scheduling as  
29 described in Ex. D2-2-6, Figure 1, p. 3. Each Level 3 execution schedule is updated daily.  
30 Level 2 Work Packages are updated weekly as described in part a). A project baseline  
31 has been established for all contractors and schedule variance from baseline is measured  
32 on a weekly basis. Requirements are set out in N-MAN-00120-10001 SCH-11 Darlington  
33 Refurbishment: Schedule Management Plan for Integrated Level 3 Execution (Ex. L-4.3-1  
34 Staff 48a, Attachment 28).
- 35
- 36 c) As noted in parts a) and b) each Level 3 execution schedule (activities) is updated daily  
37 and the Level 2 Schedules (work packages) are updated weekly.
- 38
- 39 d) Schedule contingency is owned by OPG. Project schedule contingency within the planned  
40 outage duration (target duration) of the schedule is released via the Change Control  
41 Board, where the SVP Execution can approve up to a 5-day impact on critical path, and  
42 the SVP Nuclear Projects must authorize critical path impacts of over 5 days. Program  
43 schedule contingency beyond the target duration (i.e., within the high confidence  
44 schedule) is released via the Program Change Control Board, where the SVP Nuclear  
45 Projects has the authority to approve up to a 5-day impact on critical path. All schedule  
46 contingency released above that threshold will require CNO and CEO approval. Both the

1 Change Control Board and the Program Change Control Board are managed by the  
2 Project Planning and Controls Function to provide the first layer of independence on the  
3 schedule and to ensure appropriate record keeping and transparency of information flow.  
4 All changes are documented in a standard form.  
5

6 e) Schedule re-baselining is a controlled process managed under the Nuclear Refurbishment  
7 change management process documented in NR Program Change Management N-MAN-  
8 00120-10001-PC-12-R001 (Ex. L-4.3-1 Staff-48a, Attachment 27). Approval authority of  
9 the schedule change is dependent on the materiality of the impact to the Darlington  
10 Refurbishment Program, as noted in Part d) above. Baseline changes to program  
11 milestones are approved at the Change Control Board. Critical impact milestones and  
12 OPG Board commitment milestones are approved at the Program Control Board. Please  
13 see Nuclear Project Schedule Management N-MAN-00120-10001-SCH-R001 (Ex. L-4.3-1  
14 Staff 48a, Attachment 25) for additional information.  
15

16 f) At Release Quality Estimate (RQE) (November 2015), the contingency built into the high  
17 confidence schedule for Unit 2 was 5 months. Please see Ex. D2-2-8, Attachment 1, p.  
18 32, which shows the high confidence schedule for Unit 2 at 40 months and Ex. D2-2-6,  
19 Attachment 1, which shows the target duration for Unit 2 at 35 months. In the Unit 2  
20 Execution Estimate dated August 2015, filed at Ex. L-4.3-1 Staff-055, Attachment 1, the  
21 high confidence and target durations remained at 40 months and 35 months respectively.

**Board Staff Interrogatory #70**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-9, Attachment 2 page 12

Ref: Exh D2-2-6, Attachment 1

The first reference states that “[t]he current assessment from the Defueling team shows the best case for defueling is 90 days, the most likely (i.e. P50) is 113 days, and the 90% confidence level duration is 134 days.” The second reference shows the duration of Defueling as 113 days. OPG states in numerous locations in the evidence that it has a high level of confidence (P90) in the total DRP schedule.

Please explain the high level of confidence with the duration of the defueling of the unit (a critical path component) at 113 days.

**Response**

Exhibit D2-2-6, Attachment 1, depicts the planned outage duration (target duration), and not the high confidence schedule. Similarly, the reference to 113 days in Ex. D2-2-9, Attachment 2, p. 12 refers to the target duration for the defueling activities, and not the high confidence duration. The high confidence duration for the defueling activities is 134 days and includes contingencies for risks. An example of one of these risks is that, should a Primary Heat Transport Pump fail, it would significantly affect the target duration for defueling. Therefore, this risk is included as one of the risks in the determination of the high confidence duration using OPG’s methodology for calculating schedule contingency as described in Ex. D2-2-7.

OPG discusses the differences between the planned outage duration (target duration) and the high confidence schedule in Ex. D2-2-6, p. 5. Specifically, OPG states that it will manage day-to-day performance using the target duration, and that that schedule will be used to determine contractor incentives and disincentives.

**Board Staff Interrogatory #71**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-10, Chart 1

OPG has indicated that it has reclassified a number of projects from DRP to the Nuclear Operations Portfolio.

- a) Please confirm that the following table shows all the projects that have been reclassified and the correct total cost.

Project	Project #	Total Project Cost (\$M)
Darlington Operations Support Building Refurbishment	25619	62.7
Darlington Auxiliary Heating System	34000	99.5
Emergency Service Water Pipe and Component Replacement	73397	6.7
Primary Heat Transport Pump Motor Replacements/Overhaul	73556/80144	129.5
Highway 401 & Holt Road Interchange	73706	31
Total		329.4

- b) As noted in the EB-2013-0321 Decision with Reasons, issued November 20, 2014, the estimated total cost of the DRP at that time was \$12.9B (including interest and escalation). OPG has removed projects from the DRP scope, yet the total cost for the DRP is still \$12.8B (including interest and escalation) (reference D2-2-8, Chart 3). Please explain why the total cost of the DRP has not been reduced for these reclassified projects.
- c) Please explain further the rationale for reclassifying these projects from the DRP to the Nuclear Operations portfolio. Does OPG anticipate reclassifying any further projects?

Response

a) OPG confirms that the table shows all capital projects that have been reclassified as Nuclear Operations portfolio capital projects, as noted in Ex. D2-2-10, pp. 10-11. With the exception of the Highway 401 & Holt Road Interchange, the total project cost for all other projects listed in the table is correct. As stated in Line 32 of Table 1 in Ex. D2-1-3, the total project cost for the Highway 401 & Holt Road Interchange is \$28.6M.

b) The main purpose of the Release Quality Estimate (RQE) was to prepare a high confidence cost and schedule estimate based on the final scope to be managed during the Darlington Refurbishment Program (DRP). The results of RQE are a high confidence estimate for which the DRP's performance will be measured against.

The DRP cost estimate considered in EB-2013-0321 was prepared while the project was still in the Definition Phase. The cost and schedule estimates were not as well developed with several estimates still at the conceptual levels (Class 5 or 4). The final scope for DRP had not been established. For the 2015 RQE Business Case, OPG had an overall Class 3 estimate with the majority of projects at Class 3 or 2 based on a fully defined project scope, and had developed an initial integrated schedule including all contractors and scopes of work and was able to determine the critical path through the Unit 2 schedule (see L-04.3-2 AMPCO-85).

There were a large number of changes in the DRP estimate, including removal of the reclassified projects, between the estimate considered in EB-2013-0321 and the high confidence RQE.

c) Please see L-2.2-1 Staff-008, part c).

As part of the development of the RQE, OPG evaluated DRP scope to ensure that it was work that had to be done to extend the life of the Darlington units and that the work could not be done as part of normal life cycle management program. Where work could be done at another time and/or where it could be done as part of the normal station life cycle management program, it was reclassified to the Nuclear Operations portfolio.

Darlington Operations Support Building (OSB) Refurbishment was reclassified because it provides services that support the daily operations of the entire station. The project provides office space for operations support staff, technical services, security systems, IT, telephone network hub etc. to the station.

Darlington (DN) Auxiliary Heating System was reclassified because it provides reliable back-up steam to the entire station when it was placed in service. Back-up steam is needed to support irregular conditions such as an event where all four turbine units are shut down in the winter, to mitigate potential major equipment damage due to freezing.

1 The Emergency Service Water Pipe and Component Replacement was reclassified  
2 because the project was required to ensure a safe and reliable supply of emergency  
3 service water before, during and after refurbishment.  
4

5 The Primary Heat Transport Pump Motor Replacements/Overhaul was reclassified  
6 because the work was required to be completed as soon as possible (prior to  
7 refurbishment outages on certain units) in order to maintain station reliability.  
8

9 The Highway 401 and Holt Road Interchange Project was reclassified because the  
10 completion of this project was necessary to provide improved traffic flow for peak staffing  
11 during regular planned outages as well as during refurbishment.  
12

13 Now that the scope of the DRP is set as per the RQE, OPG does not anticipate  
14 reclassifying any further projects.

**Board Staff Interrogatory #72**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exhs D2-2-7, D2-2-8 and D2-2-10

OPG has provided copies of third party reports in the above referenced exhibits.

- a) Please provide a copy of any other third party reports regarding the DRP prepared during the planning phase that have not already been filed by OPG in EB-2016- 0152.
- b) Please provide a copy of all audit reports regarding the DRP.
- c) Will OPG receive reports from any other third party independent oversight groups involved in the DRP during the execution phase? What is the frequency? Will they generate written reports? Who will receive the reports?
- d) What is OPG's Audit program during the execution phase of the DRP? What areas will be audited? What is the schedule for the audits during the execution phase of the DRP? Who will receive the reports?

**Response**

- a) There are an extensive amount of third party reports regarding the Darlington Refurbishment Program (DRP) that cover technical details on a variety of topics. The following is a list of third party oversight reports regarding the DRP:

1) Modus/Burns & McDonnell – Definition Phase

Reports are provided as Attachments as listed:

- 1. Initial Project Assessment – Darlington Nuclear Refurbishment Project (August 13, 2013)
- 2. Report to Nuclear Oversight Committee – 4<sup>th</sup> Quarter 2013
- 3. Report to Nuclear Oversight Committee – 1<sup>st</sup> Quarter 2014
- 4. Report to Nuclear Oversight Committee – 2nd Quarter 2014
- 5. Report to Nuclear Oversight Committee – 3rd Quarter 2014
- 6. Report to Nuclear Oversight Committee – 4<sup>th</sup> Quarter 2014

7. Supplemental Report to Nuclear Oversight Committee Observations Regarding 4d Cost Estimate - 4<sup>th</sup> Quarter 2014
8. Report to Nuclear Oversight Committee – 1st Quarter 2015
9. Report to Nuclear Oversight Committee – 2nd Quarter 2015
10. Report to Darlington Nuclear Refurbishment Project – 3Q 2015
11. Report to Darlington Review Committee of OPG Board of Directors
12. Nuclear External Oversight Assessment Report Cost Management & Earned Value
13. Nuclear External Oversight Assessment Report Assessment of 4c Estimate and Cost Management
14. Nuclear External Oversight Review of OPG Risk Management Practices and Procedures – February 2015
15. Report to Board of Directors Board Retreat October 1-2, 2015
16. BMcD/Modus Recommendations 2Q 2015 Report to NOC
17. Nuclear External Oversight Assessment of OPG Operating Experience & Lessons Learned Practices and Procedures
18. Nuclear External Oversight Review of Darlington Refurbishment Schedule Management Practices and Procedures
19. Attachment B – Update of BMcD/Modus Recommendations from Initial Project Assessment of August 2013
20. Nuclear External Oversight Assessment Report of DR Team's Process for Developing the RQE Estimate (already filed at Ex. D2-2-8, Attachment 2)
21. Independent Oversight Team – Assessment of OPG Scope Definition and Management Process

2) Previous Ontario Minister of Energy - Independent Advisor

Reports are provided as Attachments as listed:

22. Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program - Q3 2014
23. Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program - Q4 2014
24. Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program - Q1 2015
25. Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program - Q2 2015
26. Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program - Q3 2015
27. Report to the Minister of Energy on the Oversight of the Darlington Refurbishment Program – Q4 2015

- b) OPG produces two types of audit reports that are applicable to the DRP: (1) Nuclear Oversight reports, and, (2) Internal Audit reports:

1) Nuclear Oversight

During the period of January 1, 2014 to September 30, 2016, Nuclear Oversight performed 45 Audits and Assessments (34 Audits, 11 Assessments) that included Darlington Nuclear Refurbishment in scope. Of those, 13 identified issues requiring corrective action within Refurbishment.

Nuclear Oversight works closely with the Line organizations being evaluated, including implementing processes that provide acknowledgement of the issues identified and achieving agreement and ownership of corrective actions.

The issues identified during this period consisted of deficiencies/gaps from a fleet or station perspective as well as specific to the refurbishment project. The areas requiring further corrective action included assessment of planning and design activities, conduct and implementation of plant activities, as well as assessment of programmatic effectiveness.

The following chart contains the list of the Nuclear Oversight Audits and Assessments that included Darlington Nuclear Refurbishment in Scope. All findings and associated management actions relevant to the DRP are provided in Attachment 28.

**Chart 1 – Nuclear Oversight Audits**

Audit #	Audit Title
2014-005	Work Protection
2014-006	Pressure Boundary Section 18
2014-008	PB Program Review (incl. CAP review surveillance)
2014-011	Procurement Engineering
2014-012	Human Performance
2014-017	Fire Protection Program
2014-018	Environment Programs
2014-020	PB Design Control (including PB Procurement Engineering)
2014-021	PB Control of Processes & Test Control and Material Management
2015-013	Software Program – Real Time Process Computing
2015-014	Environmental Management
2015-016	Fire Protection
2015-018	PB Design Control (incl: PB Procurement Eng. Aspects)
2015-020	Pressure Boundary Audit - Section 18
2015-021	Reactor Safety Program
2015-022	Project Management
2015-024	Items & Services Management, including Pressure Boundary
2015-029	Heavy Water Management

2016-028	DNR Project Management
2016-029	DNR Conduct of Engineering
2016-031	DNR Emergency Preparedness

**Chart 2 – Nuclear Oversight Assessments**

Assessment #	Assessment Title
2014-200	Darlington Nuclear Refurbishment (DNR) Engineering Activities
2014-204	Darlington Performance Assessing - Operations & Maintenance Readiness for DNR
2014-310	Contract Administration Assessment
2014-319	Fleet Performance Assessing - CMO 180 Day Follow
2015-202	Darlington Nuclear Refurbishment Chemistry
2015-205	DNR - Engineering
2015-206	DNR Contractor Safety Plan
2015-208	Darlington NLO Initial Training
2015-321	Follow-up to Human Performance Audit NO-2014-012
2016-208	Pressure Boundary Darlington Refurbishment
2016-209	SATM & Housekeeping Darlington Nuclear Generating Station ("DNCS")

2) Internal Audit

During the period of January 1, 2014 to September 30, 2016, Internal Audit performed 17 audits that included DRP in scope.

The issues identified during this period include (but are not limited to) deficiencies with documentation, unclear organizational accountabilities, contractor non-compliances, planning and scheduling issues, and financial controls.

The following table contains the list of the Internal Audit reports relating to DRP. All findings and associated management action plans relevant to the DRP are provided in Attachment 29 (confidential).

**Chart 3 – Internal Audit Reports**

Audit #	Audit Title
14-15	Administration of Contractual Documentation - Refurbishment
14-17	Finance's Control Over Darlington Refurbishment
14-18	Turbine Generator (TG) Critical Parts Procurement – Darlington Refurbishment Project
14-26	Darlington Station Readiness for Refurbishment
15-17	EPC Contractor Procurement Review – Darlington Nuclear Refurbishment Project
15-24	Invoice Review & Approval Process – DRP Projects
15-47	ES MSA Recovery negotiations Audit - Follow-up on 2013 Auditor General Findings
16-07	Darlington Nuclear Refurbishment Project Management Audit
16-08	Darlington Nuclear Refurbishment – Contractor Invoicing Audit
16-09	Darlington Nuclear Refurbishment On boarding
16-13	Darlington Nuclear Refurbishment Contractor and Subcontractor Management Audit
16-23	Darlington Nuclear Refurbishment– Retube & Feeder Replacement Construction and Tooling Audit
16-24	Darlington Nuclear Refurbishment Turbine Generator Engineering Audit
16-25	Darlington Nuclear Refurbishment Integrated Database for Project Reporting Audit
16-39	DNR Contractor Procurement – R&FR Project Audit

c) External oversight of the DRP is being conducted on behalf of the Board of Directors, the Ontario Minister of Energy, and OPG's President and CEO. This will continue throughout the Execution Phase:

- 1) Darlington Refurbishment Committee of the OPG Board of Directors- Burns and McDonnell

OPG's Board of Directors recently re-engaged Burns and McDonnell with Modus as subcontractors to provide independent oversight services during the Execution Phase. The Burns and McDonnell reports are submitted to the Darlington Refurbishment Committee of the OPG Board of Directors at their quarterly meetings.

2) Ontario Minister of Energy - Independent Advisor

Please see Ex. L-4.3-1 Staff-222 for description of the Ontario Minister of Energy's oversight during Execution Phase.

3) OPG President and CEO-Refurbishment Construction Review Board (RCRB)

Please see Ex. L-4.3-1 Staff-222 for a description of the RCRB. Reports are provided to OPG's President and CEO.

d) OPG's Audit program during the Execution Phase of the DRP is as follows:

1) Nuclear Oversight

Nuclear Oversight Rolling Audit Schedule Q3 2016 - Q3 2017 (Attachment 30) represents the current Nuclear Oversight Audit plan for the next five quarters. The DRP (see: Darlington Nuclear Refurbishment (DNR) column on the attached) is in scope for the majority of the planned audits. The Nuclear Oversight 2017-2019 Audit Plan is below:

**Chart 4 – Nuclear Oversight 2017-2019 Audit Plan**

AUDITS	2017	2018	2019
Pressure Boundary	X	X	X

Darlington Nuclear Refurbishment			
Year	2017	2018	2019
Program Management	Program Oversight & Reporting	Program Oversight & Reporting	Program Oversight & Reporting
	Vendor Productivity	Quality Management Program	-
Core Project Execution – Project Management	Retube & Feeder Replacement (“R&FR”) – Project Execution	Steam Generator – Project Execution	R&FR – Project Execution
	Fuel Handling – Project Execution	Turbine Generator – Project Execution	Turbine Generator – Project Execution
	Balance of Plant – Project Execution	-	Balance of Plant – Project Execution

The distribution for Internal Audit reports is as follows:

Reports are directed to:

- SVP, Nuclear Projects
- Other Executive Leadership Team Members (as applicable if their organization has ownership for actions)
- Process Owner for the Audit

Other stakeholders included on the distribution (copied) are:

- President & Chief Executive Officer
- SVP Finance, Strategy, and Chief Financial Officer
- Nuclear President & Chief Nuclear Officer
- SVP Nuclear Refurbishment
- VP Nuclear Finance
- Director Refurbishment Systems Oversight
- Director Nuclear Oversight
- Other impacted stakeholders (as applicable)

# Darlington Refurbishment Oversight Report

Solutions for Managing Project Risk

August 13, 2013

# Primary Conclusions

In our *Project Assessment of the Darlington Nuclear Refurbishment Project*, BMcD/Modus has found that the DR Project is appropriately advanced at this stage, with processes and procedures that comport with industry standards. The DR Project is also benefitting from:

- Scope Rationalization – Current efforts to right-size the Project's scope are occurring at an appropriate time and are necessary to remove stress from Engineering.
- Schedule – The schedule embedded in the 2014 Business Plan's revised planning assumptions appears to be reasonably calculated at reducing the Project's overall risk and likelihood for success.

The Project Team has an intense effort ahead and there is still an enormous amount of work to be done over the next year – both in planning and field execution (Campus and Outage Work) that will require significant focus, coordination and effort.

# Major Recommendations

## Scope and Schedule Optimization

- The DR Project's Scope needs to meet OPG's core commitments; process needs to be in place for life-cycle management and non-core scope removed from DR Project.
- Potential risks / opportunities related to revised schedule assumptions need thorough vetting.
- Scope optimization should be completed as soon as practicable to avoid unnecessary work and allow maximum time for planning of needed scope.

## Re-tube and Feeder Replacement (RFR)

- The next phase of estimating will shift from OPEX based on Wolsong/Lepreau to SNC/Aecon's specific plan for the DR Project – need more project-focused information to increase confidence in plan/estimate.
- DR Team should seek/obtain increased transparency from SNC/Aecon regarding risks, contingency and schedule/work flow to obtain best achievable schedule in Class 3 submissions.
- OPG and SNC/Aecon need to clarify requirements for project controls and reporting.

## Balance of Plant (BOP)

- Begin detailed design as soon as practicable to improve likelihood of mature cost estimate at RQE.
- Consider changing the procurement model to assign smaller bundles of work to the ESMSA contractors under existing terms and conditions.
- Provide more visibility to potential budget/schedule risks from upcoming scope defining inspections.

# Major Recommendations

## Campus Plan

- Significant management focus will be needed due to size, breadth and schedule urgency of Campus Plan work.
- Apply OPEX from D20 Storage Facility regarding upfront planning, schedule development, procurement and engineering and performance of ESMSA Vendors.
- Eliminate unnecessary projects from the program.

## Engineering

- Improve metrics for engineering to provide management with comprehensive view of progress.
- Progress work to detailed design as expeditiously as possible, including shoulder-to-shoulder work between OSS and EPC vendors.
- Prepare organization for oversight of detailed design and multiple review cycles.

## Budget and Schedule Development

- The 2014 Business Plan methodology will suffice for the Project's current level of maturity; however, we recommend that next year's 2015 Business Plan should be a full-program reforecast.
- Adherence to processes and procedures for developing cost estimates will assist management in understanding nature and risks of cost estimates.
- The current Level 2 Coordination & Control Schedule ultimately needs to merge into a single detailed Level 3 schedule for the Execution Phase.

# Recommendations – Functional Groups

## Project Management

- OPG's roles as (1) integrator and manager of a multi-prime project and (2) Design Authority need to be better understood by the Project Team.
- Break down silos and move toward managing as a Program rather than 7 independent projects.
- Right-size the Project Team and processes to incorporate and embrace OPG's oversight role on the Project.
- Build-up and involve construction team as early as possible.
- Clarify reporting lines of authority for matrixed Project Controls personnel to assert P&C's independence from Projects.

## Risk Management

- Risk collection and identification needs significant vetting to eliminate management concerns and appropriate score/evaluate risks.
- Raise level of importance within the DR Team by creating a separate, risk-focused functional group with a dedicated leader and a formal training program.

# Recommendations—Major Projects

## Turbine Generator

- Continue vetting of options for Turbine Generator work schedule and scope
- Increase focus on risk identification

## OPG Critical Path Work

- Review and vet schedule activities and look for risk/opportunities.
- Continue improvements to Fuel Handling system prior to start of DR Project .
- Continue Site Integration efforts.
- Review OPEX from upcoming unit outage.

# Next Steps – 3Q 2013

## Functional Groups

- Engineering – review of quality program and organizational changes.
- Project Management – Organizational review of the Project Team's needed resources/capabilities.
- Commercial Management – continue review of commercial options for multiple scopes.

## Project Controls

- Vet 2014 Business Plan.
- Review schedule and earned value development.
- Ongoing review of Risk Management Program.

## Major Projects

- RFR - Review plan based on OPEX from Wolsong, etc.; Review portions of estimate and contingency as available; Review commercial options.
- Balance of Plant – review progress/options for improving schedule.
- Campus Plan – review status, progress and potential OPEX.
- OPG Critical Path – vet Project Team's analysis; review of Outage performance.

## I. Executive Summary

On February 25, 2013 Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMcD/Modus") were retained by Ontario Power Generation ("OPG") to provide External Oversight of the Darlington Nuclear Generating Station's Refurbishment Project ("Project" or "DR Project"). As part of our services, BMcD/Modus provides the following Project Assessment of the DR Project in which we examine the DR Project's current status; evaluate the methodology the DR Project team ("DR Team") is employing for planning and executing the work; review and assess the DR Project's risks and challenges; and, provide certain recommendations where applicable for the DR Team and OPG's management to consider.

The DR Project is a complex undertaking for any utility. Fortunately, OPG is positioned to be the beneficiary of lessons learned from a number of critical past projects, most notably the Pickering A Unit 4/1 Return to Service ("PARTS"), as well as the prior CANDU life extension refurbishments that have been executed at Bruce Power, Point Lepreau and Wolsong. In fact, Wolsong provides the reference plant that is being utilized by the SNC-Lavalin Nuclear, Inc./AECOM Construction Group, Inc. Joint Venture ("SNC/Aecon") for purposes of formulating its estimate for the retube and feeder replacement ("RFR") work. For these reasons, BMcD/Modus has focused significant attention in this Independent Project Assessment ("Project Assessment") on the DR Team's incorporation of appropriate lessons learned and operational experience ("OPEX") into the DR Project's plan. In any event, the DR Project has many "first of a kind" aspects which must be taken into account in the planning and execution phases.

Based on our observations to date, BMcD/Modus believes the DR Project is appropriately advanced at this time to support its major goal of producing a Release Quality Estimate ("RQE") for final Board of Directors and Shareholder approval by October 15, 2015. However, the DR Team needs to effectively and efficiently manage a number of significant risks in order to achieve the necessary level of definition and project maturity required for the RQE.

The following is a brief summary of our observations regarding the DR Project's current and most significant challenges and risks.

- **Project Management Roles, Responsibilities and Readiness:** Thus far in the DR Project's development, the team has been working on developing the component projects (RFR, Turbine Generator, Balance of Plant and the like) as separate, individual projects. This approach is appropriate during the planning phase in order to ready each Project Bundle for execution. However, the challenge for the DR Team will be to shift from the "silo" mentality to operating as an integrated Project. Moreover, the choice of using a significantly different project delivery method (multiple Engineer, Procure and Construct ("EPC") contractors) than OPG has utilized on past capital projects means the DR Team has to define the processes, level of staffing and qualifications necessary for effectively managing the work.

The DR Team may experience some challenges in integrating and operating as a single, integrated, oversight management team. In our experience, the DR Team's current growing pains are commonly experienced by owners who engage in large EPC contracts for the first time. OPG's oversight of the Detailed Engineering and Planning & Assessing phases pose perhaps the most significant near-term risks, as these functions have typically been performed in-house by OPG on past projects. Moreover, OPG's most vital role during the Execution Phase will be to manage and coordinate the work of the multiple EPC contractors, a condition that typically provides a ready

source of change orders, delays and commercial disputes on projects of this type. Now that the scoping work is nearly complete, the challenge for the DR Team will be to migrate toward integration of the work into one unified Program—and such integration should occur as soon as possible.

The DR Team also needs to ensure that it has individuals with the expertise to manage the Execution Phase. Thus the DR Team should be looking to add those individuals who will be responsible for the construction of the DR Project sooner rather than later and integrate them into the Project planning process. It is important that the DR Team require the EPC Contractors do this as well.

- **Scope Definition and Budget/Schedule Status:** On March 5, 2010, Management identified the following DR Project's goals to the Board: (1) replacement of life-limiting components (such as pressure tubes) to allow OPG to operate the units for an additional 30 years, and; (2) replacement of components most effectively done in an extended outage.<sup>1</sup> Management assured the OPG Board of Directors Nuclear Oversight Committee ("NOC") that the DR Project had processes in place to control scope growth via the Project's Scope Review Board, which will "ensure that appropriate reviews (technical and financial) are being performed to ensure that scope is appropriate and minimized to the extent feasible to avoid increasing the complexity of the project and impacting the project's critical path."<sup>2</sup>

The DR Project's scope was derived from a deliberate process that included review of over 1400 separate Darlington Scope Requests ("DSRs") that were generated primarily by the Station and Project Engineering. These DSRs were reviewed and vetted, and ultimately were presented to the Project's Scope Review Board for disposition. The Project Team was mindful of OPEX from PARTS and intentionally took an expansive view of project scope, with the later intention of reducing that scope through a series of critical challenges, all of which were anticipated by the DR Project's processes.

In 2009, the DR Project's point estimate was \$7.724 B with a publically-announced range of \$6B to \$10B.<sup>3</sup> The DR Project's most current budget assessment, the 2013 Business Plan (as of 3<sup>rd</sup> Quarter 2012), identified a projected Project cost of \$9.273 B, reflecting growth of \$1.548 B, or 20%.<sup>4</sup> Direct work scope considerations within the Project's bundles accounted for \$421 M of this growth although the largest overall cost growth contributor is OPG's indirect management costs, which increased by \$626 M, or 72% over the 2009 budget. A driver for the increase in overhead cost was a decision by OPG to have the DR Project carry the costs for the Operations & Maintenance workers associated with the units being refurbished for the duration of the DR Project. In addition, there has been some ongoing internal debate regarding the scope of the DR Project in light of the Station's high standing with WANO, which may have driven some of the desire to increase scope.

Coinciding with the start of BMcD/Modus's engagement and changes in the DR Project's executive leadership, the DR Team recognized that the velocity of the scope additions and other management costs had the potential to adversely impact the DR Team's ability to execute the Project within the

<sup>1</sup> Update on Darlington Refurbishment Project (March 5, 2010) at p. 1 ("Background").

<sup>2</sup> Update on Darlington Refurbishment Project (May 18, 2010) at p. 2.

<sup>3</sup> DGNS Refurbishment Estimate Analysis (April 25, 2013) at p. 3.

<sup>4</sup> *Id.*

anticipated schedule and budget estimates. Key members of the DR Team were assigned to revisit the DR Project's approved scope with the intent of optimizing the Project's size. These reviews are ongoing at this time with decisions by the Scope Review Board and executive management pending. This "scrubbing" of the scope is timely, appropriate and necessary, and should result in greater confidence in the execution schedule and overall project costs. However, the DR Team must also take appropriate care to ensure that items not included in the Project's scope but are nevertheless needed (in some manner) for the DNGS stations' future operation and performance are captured in future O&M and Capital planning and are not dropped. Moreover, the DR Team must take a critical look at the Project's indirect costs in order to ensure that the associated management team has the proper skill-sets and is right-sized for its role on the Project.

The DR Team is also preparing different planning scenarios intended to achieve greater schedule certainty with less overall risk. The DR Team has adopted new planning assumptions for the 2014 Business Plan budget forecast that model elimination of the scheduled overlap of the execution phase of each unit, and in particular, isolating the performance of Unit 2. Given the past history of CANDU mid-life refurbishments, this appears to be a reasonable strategic decision.

- **Engineering Status:** Engineering for the RFR and Turbine Generator Projects are under EPC contracts that are each advancing with the contractors performing the detailed design work. The remainder of the engineering effort is currently focused on developing the requirements needed for procuring the rest of the DR Project's scope, and in particular, the Balance of Plant ("BOP"). In order for the RQE to be reliable, detailed engineering must be sufficiently progressed by the 2<sup>nd</sup> Quarter of 2015 for the DR Team to develop Class 2 cost estimates (cost estimates that are deemed to meet the criterion of the Association for the Advancement of Cost Engineering ("AACE") cost estimating standards).<sup>5</sup> Per the AACE standards<sup>6</sup>, to achieve a high quality Class 2 Estimate, detailed engineering needs to be between 30% and 75% complete overall in order to realistically determine contingency. The DR Team is mindful of the need to complete sufficient detailed engineering and Planning & Assessing prior to RQE. This goal will require significant work and some changes to procurement method, as discussed below.

The DR Project is currently developing engineering packages known as Modification Design Packages ("MDPs") for work not yet contracted (mostly for BOP work) that are precursors to detailed design. OPG has contracted with two external Owner Support Services ("OSS") vendors, AMEC and WorleyParsons, to augment its staff and develop the MDPs. OPG's engineering team has recognized the potential schedule problems and is attempting to expedite and optimize the efficiency of the MDP preparations as well as start the EPC contractors on detailed design packages. Additional modifications to the procurement process, such as earlier releases of smaller scoping packages, will be required to optimize the schedule and accelerate the beginning of detailed engineering.

As a part of its initial assessment of the DR Project's engineering capabilities, BMCD/Modus has also reviewed: the structure and depth of the OPG engineering organization; processes and procedures;

<sup>5</sup> AACE Class estimates, Class 5 through Class 2, are referred to herein as the "Class X Estimate".

<sup>6</sup> AACE International Recommended Practice No. 17R-97, Cost Estimate Classification System (November 29, 2011) at p. 2; AACE International Recommended Practice No. 18R-97 Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Process Industries (November 29, 2011) at p.2.

metrics for tracking work; and proposed methods for managing the OSS vendors. We have provided some comments and observations directly to the DR Engineering Team regarding optimizing the work flows and the development of Project metrics, and we have witnessed some improvements since the start of our engagement. There has been proper management focus on the issues that are unique to engineering. We will continue to monitor this critical work from a program management perspective as the engineering functions migrate from supporting procurement to project execution.

- **Project Controls:** The primary and associated subset of controls that the DR Team is establishing for tracking the planning and execution of the work are each in various stages of development. The following is a brief summary of the primary performance measurement tools the DR Team is currently developing:
  - Budget Development: The DR Team has a reasonably detailed game plan developed for achieving RQE and is generally following that plan. The current operative budget (2013 Business Plan) was developed on the basis of embryonic project definition and the range of uncertainty associated with that estimate was at no better than Class 5 level. The DR Team is currently in the process of developing its 2014 Business Plan, which is due to be released in the 4<sup>th</sup> Quarter 2013. There are a number of moving parts that could influence cost and schedule development over the next several months, including final determination of scope, optimization of the contracting strategy, the potential “unlapping” of Unit 2, staffing needs, and the like. The Project Controls Team is attempting to increase the level of rigor in the 2014 Business Plan development and this is a work in progress. We would expect the team to significantly ramp-up the level and quality of effort in conjunction with next year’s 2015 Business Plan, as more knowledge about the Project develops. Ramping up the effort will provide higher confidence in the Project prior to RQE.
  - Project Schedule Development and Methodology: The OPG Project Controls team has developed a “Coordination & Control Schedule” (“C&C Schedule”) that tracks the schedule activities at a milestone-based level. Although this tool should be sufficient for the Definition Phase, it is our understanding that the current process indicates that the C&C Schedule will be used through the completion of the Project. We believe that the C&C Schedule may prove to be too cumbersome once the Project moves to the Execution Phase. It is our opinion that the DR Project will ultimately be best served by a single, integrated Level 3 schedule that includes all activities for daily, weekly and monthly project management.
  - Cost and Earned Value Tracking: The DR Project is establishing new systems for tracking and projecting costs as well as tracking earned value (Proliance). The Project Controls Team planned to have these systems in place by spring of 2013 but implementation has proven more difficult than initially planned. In our experience, implementing such systems is frequently problematic, and OPG is doing so at a time when the DR Project is rapidly maturing. Until Proliance is functioning, the DR Team will continue to utilize manually-based controls for tracking costs. BMCD/Modus will continue to monitor the development of these systems and provide input and observations in regard to selected and reasonable “dipstick” checks concerning data fidelity and the like.

- Risk Management: The DR Team is in the process of improving its risk management program. The existing program with some contemplated modifications is generally consistent with what we have seen in the industry at-large. The Project's risk database has been populated by the individual Project and Functional groups and the DR Team has established certain forums (i.e. the Risk Oversight Committee) for evaluating related inputs. However, while the work to date represents a good start, there is significant development work remaining for the DR Team so as to be in a position to ultimately and reasonably address risk and risk mitigation:
  - Risk identification and associated scoring needs to be consistent on how individual risks are identified, evaluated, mitigated and monetized;
  - Per OPG internal procedures,<sup>7</sup> project contingency is to be based in large part on the project risk register. Therefore, it is critical that the risk team properly manage the risk register so as to ensure contingency is properly quantified;
  - The risk database is currently populated with large numbers of items that within the industry at large would ordinarily be viewed as management concerns as opposed to innate risks associated with the work;
  - The RADAR system that the DR Team uses to collect risks is cumbersome and does not interface with other databases—efforts to streamline the above have been very slow;
  - There needs to be some focus on the identification of potential “opportunities” that can be managed within the Risk Program.
  - Management should review its staffing and leadership of the Risk team to ensure that an effective, world class, sufficiently staffed and properly experienced team is in place.
- Electronic Data Management System (“EDMS”): Similar to Proliance, development of the EDMS is lagging behind the DR Team's intended implementation schedule. This, too, is not unexpected, but nevertheless must be cured as soon as possible. The EDMS is supposed to be available in the 3<sup>rd</sup> Quarter 2013. This system is a critical tool for managing the work of the contractors on-site and dealing with the considerable volume of information that is typically generated by a project of this magnitude.

Going-forward, BMcD/Modus recommends OPG consider re-unifying the Project Controls team under one umbrella. In order to maintain the necessary independence, Project Controls personnel should have a direct and singular reporting line to a central Director, and that individual should report directly to the SVP of Darlington Refurbishment.

- **Commercial Development**: OPG has entered into an EPC contract for the Definition Phase of the RFR Project (this includes Project Planning, construction of the Mock-Up facility, and engineering of the Tooling), Engineering and Supply of the Turbine Generator equipment, and intends to enter into several more EPC contracts for much of the remaining work. OPG's intended methodology for contracting the work is one that shifts certain performance risks to multiple EPC vendors for

<sup>7</sup> Nuclear Refurbishment Contingency Development and Management, N-MAN-00120-10001-RISK-05-R000 (July 19, 2012) at p. 4.

individual scopes of work that nonetheless leaves OPG as the overall manager and coordinator of these multiple EPCs. There are no contractual terms that serve to relieve all of the owner's risk, and no contractual penalties intent on causing contractors pain for a failed project that can ever fully compensate an owner for the consequences of such failure. As a result, the DR Team needs to embrace the proactive management of the contractors, which requires the team to effectively and transparently engage the contractors and hold them accountable for their performance, and to manage the interfaces between the various contractors so as to minimize potential disruption, all on an active nuclear site. While OPG has in place a good oversight plan, the key will be the actual execution. As a result, this item bears continuing and close monitoring.

- **Retube and Reactor Feeder Replacement:** The DR Team has devoted significant focus and financial investment in the RFR work, which comprises the DR Project's single-most important evolution and its most significant risk. The commercial agreement with SNC/Aecon establishes a methodology for developing a high-confidence performance schedule and cost estimate for the RFR work's performance that anticipates the submission and acceptance of four iterations of the Project's cost estimate, each with an increasing level of detail and certainty. The first two (Class 4 and 5 estimates) iterations focused on developing a Basis of Estimate that considers OPEX from prior refurbishment projects, and establishes Wolsong as its reference plant in regard to establishing work durations and sequencing. The remaining cost estimate iterations (Class 3 and 2 Estimates) will focus on SNC/Aecon's estimate specifically for Darlington. The Class 3 Estimate is intended to reflect SNC/Aecon's detailed work packages for the DR Project and the Class 2 Estimate will represent the final target price agreement with all risk/reward contingency identified.

However, progress to date in adequately preparing and vetting the RFR estimates has been mixed.

- SNC/Aecon's Class 5 Estimate approval was delayed by 6 months due to an apparent miscommunication between SNC/Aecon and OPG's RFR team. The team worked to recover the time lost by advancing the successor Class 4 Estimate, which OPG approved 1 month early on March 21, 2013. From our review of SNC/Aecon's Class 4 Estimate, it appears that the team has optimized the estimate of an as-built reference plant. However, the current estimate does not reveal significant improvements or maturity related to the quality of costs carried in the Class 4 Estimate as compared to that in the Class 5 Estimate upon which it was based.
- Moreover, the current RFR Class 4 Estimate is not commensurate with AACE's Standards of Practice. In some ways, the RFR Class 4 Estimate exceeds what is normally considered at Class 4 although the RFR Class 4 does not account for the DR Project's engineering definition or contingency. Per its contract with OPG, SNC/Aecon is not required to monetize risk until it prepares and submits the Class 2 cost iteration in May 2015. As a result, until RQE is derived, the overall DR Project cost estimate's largest component is progressing on a separate definition path which is not best practice in nature.

Significant work remains for SNC/Aecon to complete its work plan and associated cost estimate so as to meet the DR Project's standards. Additionally, there is very little room for lost time in the development of the Class 3 Estimate. The DR Team is advised to consider revisiting the method of identifying and monetizing RFR's risks as the overall cost estimate progresses so as to increase confidence in SNC/Aecon's cost estimate and reduce the potential for last-minute surprises emanating from the contractor.

- **Balance of Plant:** The work that comprises the DR Project's BOP scope is varied and split roughly in half between NSSS and conventional plant work. As of the 2013 Business Plan, this scope consists of ~200 DSRs that have been estimated to cost approximately \$503M. These include Core Scope, Non-Core Scope and all contingent items. By its nature, BOP work carries significant risk because it includes work on multiple systems in myriad locations and requires a wide range of craft workers. BOP work coordination is frequently a significant management challenge on a refurbishment project such as this one.

From the outset of our engagement, we have been concerned that the DR Team's intended plan for procuring the BOP was time-challenged, had too many different and unnecessary steps, and could ultimately over-complicate the DR Project if the scope and scale were not right-sized. As noted, Engineering, with the help of seconded staff from the OSS vendors, is developing MDRs for procurement of the BOP work. The DR Team's original plan was to package-up the MDRs into two large bundles (NSSS and Conventional) and put those out for bid between the two Extended Services Master Services Agreement ("ESMSA") vendors, ES Fox and Black & McDonald. Because of the pace of the MDR preparation, these bundles would not be aggregated for this bidding process until well into 2014. As a result, the vendors could not start detailed design and preparation of construction work packages to complete this work in time for OPG to develop a mature, detailed Class 2 Estimate relating to BOP cost in time for derivation of the RQE. The consequence of this would be that the RQE would either be late, or would be of a lower-quality than promised, with the cost estimates, schedules and execution plans for the work having less certainty. This in turn would, obviously, require greater contingency and present significant risk to the actual execution of the work.

The DR Team's leadership is currently examining an alternate method for procuring the BOP work. Since the ESMSA vendors' contracts have already been procured under a competitive process and each is qualified for the work, competitively bidding this work would likely not yield a significant price difference and would, in our view, cost the Project 6-12 months of valuable schedule time. The DR Team is investigating methods to flow work to the ESMSA contractors in smaller packages, in order to eliminate the time originally planned for bundling these packages together and for procurement, bid evaluation, selection and contract negotiation. This would allow the ESMSA vendors to get started now on detailed design instead of waiting until 2014. The DR Team is also looking at practical ways to integrate the ESMSA's design partners in the process as early as possible in order to begin detailed design. Our experience shows that this is the most prudent approach to the BOP work on a project of this type.

Finally, the team is evaluating the current BOP scope review to ensure that what is included in the DR Project meets the intent of the DR Team's commitments, and will be eliminating certain work that does not have to be performed in the DR Project. Each of these measures will help get BOP on track, and all of the above will be needed so as to keep the BOP detailed design off the critical path and improve the chance that the team will have a solid plan and estimate for BOP work in time for adoption of the RQE. In our experience, the method of releasing smaller bundles of BOP work as they become ready is the most prudent and effective means of reducing the risks inherent with BOP work, and in this case, because the ESMSA agreements are in place, would likely be the lowest cost option due to the schedule savings and risk avoidance.

- **OPG Critical Path Activities:** OPG is responsible for planning, directing and executing the work leading up to and after the completion of the RFR work. During the Vault Preparation period (from breaker open to the start of SNC/Aecon's work), OPG is responsible for defuelling and draining all of the systems, and OPG regains the lead in critical path activities in the start-up and commissioning phases. In all, the DR Team estimates that OPG will control the critical path 25% of the time (243 of 968 total days) of the breaker-to-breaker unit duration<sup>8</sup>. Many of the work items in OPG's scope have been performed before; however, some of the work, like defuelling, have never been performed at DNGS or by OPG and will be on the critical path. In addition, DNGS has unique challenges due to the fact the fueling machines that are needed to support the DR Project are also needed to maintain operations of the operating units. The DR Team is very aware of these risks and has made adjustments to the plan, most notably with refurbishment of the fueling machines prior to the opening of the Unit 2 breaker. The team is planning to continue to refine its schedule and sequence of events.

## II. Work Plan And Methodology

In accordance with Schedule 1.1(x) - Scope of Services to the Agreement between Ontario Power Generation ("OPG") and BMcD/Modus for Independent External Oversight Services for the DR Project dated February 25, 2013 (the "Agreement"), BMcD/Modus has developed a recommended Work Plan for the term of its two-year engagement. This plan was presented to the Nuclear Oversight Committee on May 14, 2013. At that time, BMcD/Modus was given authority to proceed with the development of an Initial Project Assessment of the DR Project. BMcD/Modus's Project Assessment is intended to address significant aspects of the DR Project planning and set-up and provide a status baseline as of the time of the report that BMcD/Modus will use to measure the DR Team's progress in future reports. This report will provide the results of our Project Assessment.

In order to develop our Project Assessment, BMcD/Modus has reviewed key project documents, interviewed OPG's key personnel and attended regular and special meetings, including the following:

- **Project Planning:** BMcD/Modus has embedded within the DR Team and has:
  - Attended both regular and special meetings with the DR Team to determine status of project's planning, development and integration of processes and tools, schedule development, contracting strategy and assess prominent risks specific to each project;
  - Reviewed key planning materials and summaries.
- **Processes and Procedures:** We have reviewed the Project Execution Plan and associated Project Management Processes and Procedures regarding their application to the DR Project and how they would be viewed in light of industry best practices.
- **Engineering:** BMcD/Modus attended and initiated meetings with the Engineering team to determine their approach, status, standards and plan for completing both short term (procurement focused activities) and long term (support of the Execution Phase). In addition, BMcD/Modus:
  - Assessed the DR Team's methods for tracking and documenting the status of critical design evolutions to ensure that selected metrics are providing an accurate gauge of engineering progress;

<sup>8</sup> DNGS RFR – Execution Phase Estimate Progression (June 21, 2013).

- Reviewed metrics for tracking engineering deliverables;
  - Reviewed management of external OSS vendors;
  - Provided suggestions, as necessary, to streamline the management of engineering, planning, assessing and procurement;
  - Evaluated whether the DR Team has actually incorporated lessons learned and OPEX into its project scope, and suggest other lessons learned from our team's experience that may be applicable;
  - Sampled general quality of engineering deliverables submitted by EPC Contractors and reviewed OPG's review and approval process;
  - Reviewed the plan to complete detailed engineering supportive of the adoption date of the RQE, which is essential to reducing the potential vulnerability to changes in price and schedule during the Execution Phase.
- **Determined Status/Progress of Scoping Activities:** BMcD/Modus has reviewed the DR Team's process for tracking and maturing scope, including:
    - Reviewing the DR Team's activities and results of scope definition and reviews, including observing and vetting of Gate Review processes.
    - Sampling of work product to determine methodology for scope rationalization;
    - Review of key documents in support of project scope definition, including commitments to BOD and variance reporting.
  - **Reviewed and Assessed OPG's Cost Control Systems and the Program Budget:**
    - Project Estimating
      - Reviewed and assessed the Gate Processes and related estimating of work orders;
      - Reviewed project estimating approach and sampled estimating work product from a form, format and process perspective;
      - Reviewed RFR vendor estimates for work for compliance to OPG's standards and best industry practices.
    - Reviewed and assessed the contracts, systems, processes and procedures the DR Team has in place for commercial conduct, including:
      - Change Management;
      - Notice and Notification of Changes in Scope;
      - Contract Change Orders;
      - Contract Payments.
    - Program Budget:
      - Reviewed the DR Team's processes and methodology for phased development of cost estimates and project schedule leading to the RQE.
      - Evaluated the DR Team's approach to preparing and maintaining the Baseline Schedule and Project Budget, and identified any approaches that might depart from industry-best practice and offer suggestions, as appropriate, regarding the tools and techniques that might be available to improve the overall process.
      - Reviewed and assessed the DR Team's current methodology for determining contingency for the Project.
      - Performed detailed review and vetting of aspects of the DR Project's 2013 Business Plan budget, including a "deep dive" into the details of the RFR Project's estimate.

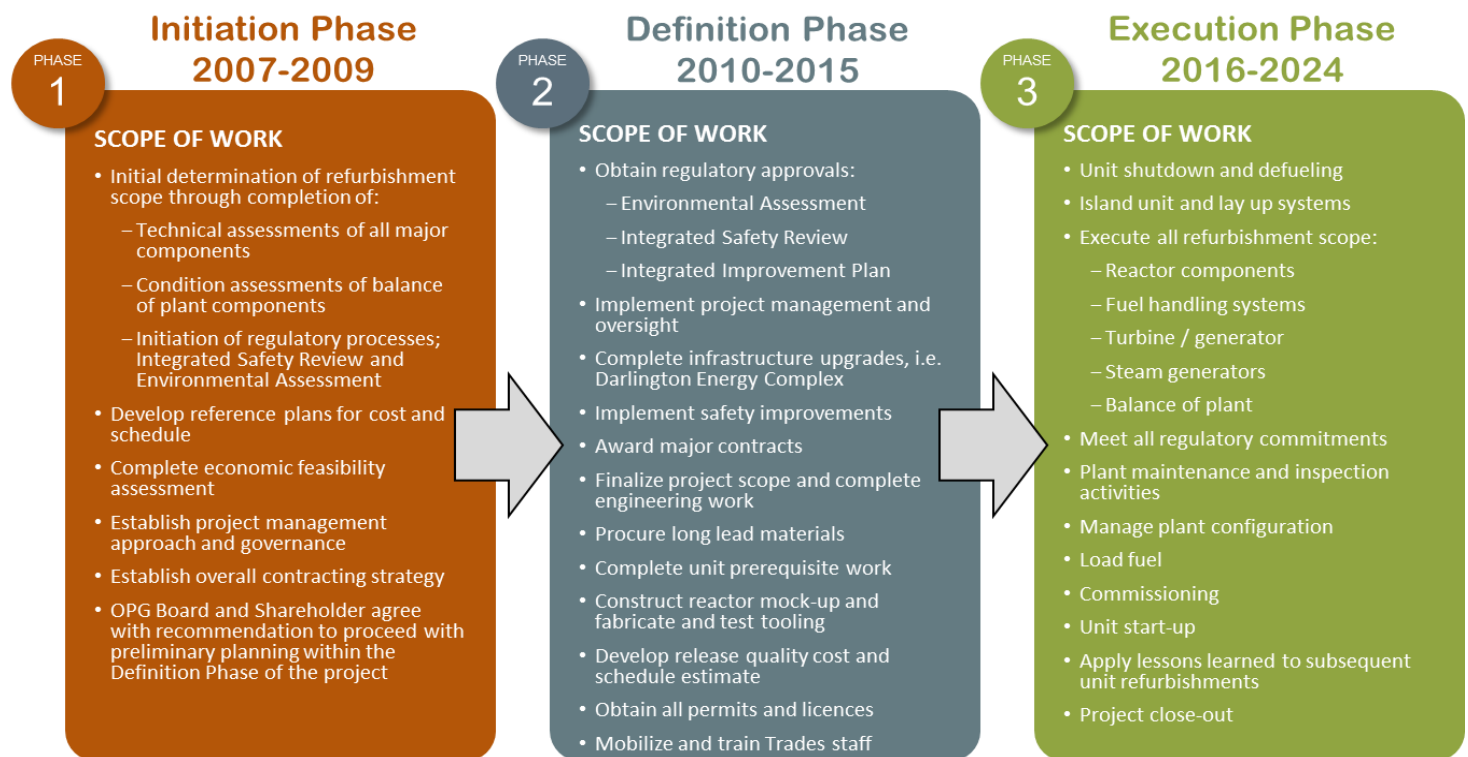

- Assessed development of project earned value system (Proliance)
- **Schedule Assessment:** BMcD/Modus reviewed the DR Team's utilization of scheduling techniques and "rules" in order to evaluate whether there is:
  - Clarity of critical path(s) and sub-critical path(s) for monitoring performance;
  - Proper alignment within the cost system and documented support of the Project estimate;
  - Adherence to proper scheduling practices for integration of P6 enterprise schedule as well as contractors' submission of baseline and updates to the Project Schedule;
  - Proper schedule integration among all projects and subprojects.
  - Review of current status of the DR Team's C&C Schedule.
- **Organization:** BMcD/Modus has identified the risk associated with the role OPG is playing on the DR Project.
  - Reviewed and assessed OPG's ability to provide the appropriate level of project oversight to the Project's EPC contractors without directing the contractors' means, methods and procedures;
  - Reviewed the current and planned staffing levels and generally assessed the team's capabilities;
  - Assessed OPG's ongoing challenges in adapting to a construction project environment and utilizing an integrated P6 schedule instead of using Passport for work management.
- **Contracting Strategy and Contract Terms:**
  - Reviewed Commercial Strategy to determine whether OPG is proceeding on a reasonable path based upon industry experience and practice.
  - Reviewed the RFP process and recommend ways in which the RFP development process can be streamlined, particularly with the BOP Scope.
  - Reviewed Contracts as they are negotiated to determine if OPG has adequately assessed contracting risks.
  - Observed Gate process to identify how commercial risks are being presented and understanding process for allocation of budget/contingency.
- **OPEX and Risk Management:**
  - Assessed the DR Team's processes for establishing and updating the risk management system and reporting emanating from that system:
  - Risk scoring and identification;
  - Risk mitigation and avoidance strategies;
  - Related strategies for same;
  - Contingency development and,
  - Training of DR Team on use of Risk Management tools.
  - OPEX:
    - Reviewed timing and method of OPEX incorporation;
    - Determined whether OPEX is being reasonably incorporated during the planning stage of contractor work by OPG and contractors prior to RQE;
    - Inspected SNC/Aecon Plan on implementation OPEX.

Attachment "A" is listing of the documents BMcD/Modus reviewed in preparation of this Project Assessment.

### III. Project Overview

#### A. Project History

The Darlington Nuclear units are currently predicted to reach their nominal end of service lives in 2019 to 2020. However, various factors from Darlington operations could result in the units reaching the end of life earlier or later than the present predictions indicate. In June 2006, the Ontario Government directed OPG to begin feasibility studies regarding the refurbishment of the Darlington Nuclear plants in order to extend their service lives. In late 2007, OPG commenced “Phase I” of the DR Project called the “Initiation Phase” in order to determine the preliminary scope of work for the Darlington Refurbishment project and to perform an economic feasibility assessment. Phase I was completed in 2009. OPG is currently in “Phase 2”, or the “Definition Phase”, which will continue until “Phase 3” called the “Execution Phase” begins in 2016. The three phases are detailed as follows:

Source: DR Project Team

OPG has chosen to manage the Darlington Refurbishment as a “Program”. According to Project Management Institute (“PMI”), “A Program is a group of related projects managed in a coordinated manner to obtain benefits and control NOT available from managing them individually.”<sup>9</sup> OPG’s stated overall commercial strategy for the Program is premised on OPG acting as the General Contractor and Program Manager for the full Program. Within the Program, there are seven discrete Projects, each with its own project management team (including functions that are matrixed, such as engineers, commercial managers and project controls leads). The seven Projects (also known as “Project Bundles”) encompass the following scopes of work:

- Retube and Feeder Replacement

<sup>9</sup> The Standard for Program Management, 2nd Ed.

- Islanding
- Fuel Handling/Defuelling
- Turbine Generator Maintenance and Controls Upgrade
- Boiler and Auxiliary Systems (Steam Generator Lancing)
- Shutdown, Layup and Services
- Balance of Plant

As of the date of this Project Assessment, the DR Team's major activities revolve around: (1) overseeing SNC/Aecon's development of the RFR Mock-up, detailed engineering and the Execution Phase plan and RQE project estimate; (2) completing procurement of the remaining scopes of work, including the BOP and Fuel Handling, which constitute a significant portion of the work; (3) identifying, and in some cases paring down, the scope of the work that will be performed within the DR Project; (4) preparing for the outages that will proceed the start of Unit 2's refurbishment; (5) developing the Project's schedule and budget for the RQE deadline. In this Project Assessment, BMcD/Modus has focused on these and other areas of risk.

## B. Project Management Development

OPG's ability to successfully plan and execute the DR Project will be due in large part on the DR Team. Therefore, our Project Assessment must necessarily include some preliminary observations regarding the DR Team. As of the date of this Project Assessment, the DR Team has 233 individuals in the following areas<sup>10</sup>:

OPG Staff	Headcount
SVP – NR	2
Engineering	107
Planning & Controls	42
Management Systems Oversight	7
Execution and Construction Planning	41
Operations & Maintenance	34

In addition, there is ongoing involvement and assistance provided from the Projects & Modifications and Station organizations as well as staff from other business units (OBUs) that are matrixed into the DR Project. The DR Team has been established with the responsibility of assessing, making recommendations to OPG's Senior Management with respect to the feasibility of refurbishing the Darlington units, developing the scope, schedule and estimate for the Refurbishment Program, and providing overall program oversight on the execution of all activities associated with refurbishment, including:

- Assessing the technical feasibility of refurbishing Darlington and operating it for an additional 30 years of post-refurbishment operations;
- Making recommendations as to the lead time required to be prepared to refurbish each unit,
- Defining the refurbishment scope;

<sup>10</sup> Program Status Report for Period Ending June 2013 at p. 16.

- Executing project planning including the development of contract management strategies, cost estimates, schedules, a full risk assessment, and a release quality estimate for the Project;
- Managing the refurbishment pre-outage planning and preparation activities;
- Provision of overall program oversight on all execution and commissioning activities; and
- Performing Project Closeout.<sup>11</sup>

The DR Team’s focus to date has been on the planning of the DR Project. We recommend the DR Team accelerate its plans to staff its construction and execution organization and integrate those individuals into the DR Team. At this point in the Project’s maturity (and in particular the RFR project), constructability reviews will be essential for further development of the Project’s Schedule, comprehensive work packages and detailed engineering. Additionally, it is likely that changes will emerge based on the constructability reviews, and the longer the DR Team has to adjust, the better. Getting the right personnel involved with reviewing and developing plans and processes up-front can prevent most (but certainly not all) of the late, high impact issues. OPG needs to insist that the EPC contractors build their Execution Phase organization as well.

### 1. OPG’s Oversight Role

OPG’s current contracting strategy, which will be discussed in more detail below, is dependent on the use of several Engineer, Procure and Construct, or “EPC”, contractors. OPG will take on the role of General Contractor and Program Manager, with the responsibility of contractor oversight and coordination. This is a risk laden role. This contracting strategy represents a considerable change in approach from OPG’s prior Large Capital Projects. The following matrix identifies how this approach differs from OPG’s approach to PARTS Unit 1:

Project Component	Responsible Party	
	PARTS Unit 1	DR Project
Scope Definition	OPG	OPG with assistance from external vendors
Procurement Engineering	OPG	OPG managing outside vendors
Detailed Engineering	OPG	EPC Contractors
Planning & Assessing	OPG	EPC Contractors
Construction	Contractors managed by OPG Construction Management	EPC Contractors with OPG as the Construction/Program Manager
Start-up and Commissioning	OPG	OPG

While the use of the EPC model for large capital projects is common in the industry at-large, it is more prevalent for owners to use a single contractor to perform all of the work. Here, OPG will have several EPC contractors performing discrete scopes of work that will require management and coordination by the DR Team. Furthermore, in our experience, the EPC model can have significant challenges for any organization. Our team has observed some of the typical growing pains on the DR Project that come with such a transition. It will require time for the DR Team to adapt to its roles and responsibilities under this new governance.

There is a “sweet spot” that all owners must find when engaged in EPC contracting for large capital expansion or refurbishing projects. Owners frequently assume that EPC contracts by their nature distribute all of the risk

<sup>11</sup> See Darlington Refurbishment Project Charter, D-PCH-09701-10000 R001 (June 15, 2009) at p.1.

to the contractors and therefore the owner proceeds to only passively engaged in the work. At the other extreme, there are owners who micromanage the work to the point that their invasiveness is tantamount to dictating means and methods to the contractors which usually ends in nothing short of disaster. Both of the above management styles have significant cost and schedule risks for owners, and generally lead to disappointing outcomes – finding the right balance is crucial. Additionally, the DR Project has an added layer of complexity since DR Team will be responsible for managing and coordinating several EPC contractors at the same time—all of which will be competing for the same space, labor and the owner’s time and attention. The DR Team has recognized that its new “oversight” role will be a challenge and its performance in the Definition and Execution Phases will have to be carefully and continuously monitored. We will continue to review the DR Team’s performance on this issue as more contracts are executed.

## **2. DR Team Leadership**

Shortly after beginning our role on the Project in late February 2013, OPG announced that Albert Sweetnam, the EVP of the Refurbishment Project had left the company. Through May 2013, interim management of the Project was assumed by Wayne Robbins, the Chief Nuclear Officer. There were no other changes to the DR Team during this time. BMCD/Modus observed no measurable ill effects from the former EVP’s departure.

In late May 2013, Bill Robinson rejoined the DR Project as the Sr. Vice President of Nuclear Projects after a short term as a project consultant. Robinson’s experience includes: leading the rescue of the Pickering A Return to Service of Unit 4 from significant cost and schedule overruns; management of the successful PARTS Unit 1 Project; leading a seconded team from OPG at Point Lepreau; and early development of the DR Project. His leadership should prove beneficial in the planning stages of the DR Project.

Dietmar Reiner is currently the SVP of Nuclear Refurbishment. Mr. Reiner has an excellent grasp of the Project’s strategy and accomplishments, and is keenly aware of the amount of work in front of the DR Team. He also appears to have the support of his team of direct reports and has instituted goals within the team related to transparency and effective communication.

## **3. Processes**

The DR Team continues to develop and refine the management processes necessary for the Project, many of which are discussed herein. The DR Team has developed, and continues to develop a plethora of process and procedure documents and guidelines—perhaps too many. The risks of having too many processes include needlessly creating work (which requires more people that add cost) and conditions for non-adherence. Additionally, it is our observation that many of the procedures are not fully integrated (within a particular group itself or to other groups within the DR Project), with accurate annotations to reference documents. Currently, the DR Team does not have a matrix or even a complete list of all of the processes, procedures, standards, guidelines, manuals and the like that have been developed for the DR Project. The DR Team has recently embarked on cataloging and re-doing some of the procedures and this, presumably, may clear the air, correct what needs to be corrected and impart clarity to the remaining. The existing Management Systems Oversight group should be able to provide necessary support in this regard. Throughout this Project Assessment we will provide our view of the development of the Project management processes to date and their relative effectiveness, given the current status of the DR Project.

### **C. Scope Definition**

An important early indicator of continued success is the DR Team’s adaptability to right-size and control project scope in order to meet the commitments to the Board of Directors (“BOD”), the Shareholder and the

public. Between the years 2009 to 2012, the DR Project's overall budget has grown by ~\$1.5B (2012 dollars) which is equivalent to ~20% of initial budget. The current point-estimate of ~\$9.3B (\$2012 dollars) in the 2013 Business Plan is approaching the upper boundary of the budgeted range of ~\$10.8B (\$2012) latest approved by the BOD. This total increase represents in large part scope growth of the DR Project. There are many reasons for this growth, including:

- OPEX, in particular from PARTS, which had significant cost overruns and schedule delays due to lack of scope definition at that project's outset has led the DR Team to conservatively identify a broad range of potential refurbishment scope;
- In the scope identification process, there appears to have been a tendency to increase scope to maintain the Station's WANO standing as well as over-commit to regulatory-driven modifications;
- As the scope of the Project has become more in-focus, the size of the Project Team has grown to match the effort represented;
- OPG decided to shift the OPS & Maintenance cost for each unit's operators to the DR Project while under refurbishment, which further added to the overhead costs.

The DR Team's SVPs have a firm understanding that, going forward, if scope is not effectively managed (and in some cases significantly reduced), OPG's management will be hard-pressed to deliver the DR Project at an acceptable cost. Below we discuss the progression of the DR Project's cost estimate, assess the current DR Team effort to examine and vet scope, and provide other recommendations for OPG to consider.

### 1. Budget and Scope History

BMCD/Modus's starting point in reviewing the DR Project's scope was to review the evolution of Management's representations to the BOD. The following summarizes the presentations that Management has given to the BOD regarding the evolution of the DR Project's budget and associated scope:

- On November 18, 2008, the BOD was presented an initial "medium confidence" cost estimate of ~\$4.9B including a 20% contingency. At that time, the basis of the cost estimate included a 2007 Pickering B Assessment; industry studies; and considerations emanating from OPG's own operating experience (OPEX).<sup>12</sup>
- In year 2009, Rev 3 of the cost estimate was developed by the Project Control Team which totaled ~\$7.7B<sup>13</sup>.
- On March 5, 2010, Management committed to the BOD that the DR Project's scope would be limited to: (1) replace life-limiting components (such as pressure tubes) to allow OPG to operate the units for an additional 30 years, and; (2) replacement of components most effectively done in an extended outage. Management assured the NOC that the DR Project had processes in place to control scope growth via the Scope Review Board, which will "ensure that appropriate reviews (technical and financial) are being performed to ensure that scope is appropriate and minimized to the extent feasible to avoid increasing the complexity of the project and impacting the project's critical path."<sup>14</sup>

<sup>12</sup> Report for Submission to Nuclear Generation Projects Committee (November 18, 2008) at p. 8.

<sup>13</sup> Report for Submission to Nuclear Generation Projects Committee (November 17, 2009) at p. 1.

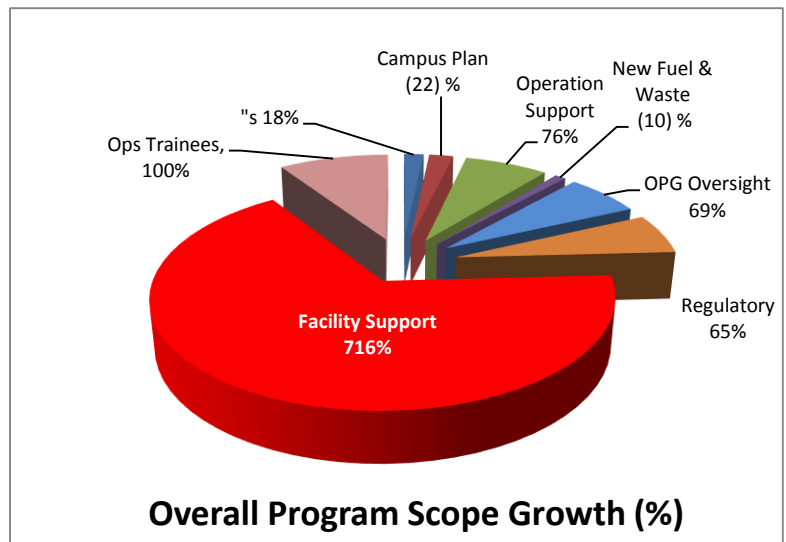

<sup>14</sup> Update on Darlington Refurbishment Project (March 5, 2010) at p. 1.

- On November 17, 2011, the BOD was presented with a cost estimate that was characterized as remaining in the range of ~\$6.3B to ~\$10.5B<sup>15</sup>. Additionally, the DR Team's 2012 Business Plan estimate was ~\$8.7B.
- On November 15, 2012 management presented its 2013 Business Plan cost estimate with a high confidence amount of ~\$9.3B in 2012 dollars, thus including escalation, which remained less than \$10B in 2009\$. There were additional details and explanation of variances within the materials presented with the 2013 Business Plan.<sup>16</sup>

Based on files made available, variances and explanations of overall Program scope growth between 2009 and 2012 are summarized below:<sup>17</sup>

- Operations Support grew by \$386M or 76% based on required human resource profile considerations, all as prepared by Operations and Maintenance Organization.
- OPG project management projections grew by \$443M or 69% based on enhanced definitions and refined organizational characteristics of each department. Currently, the project management estimate is ~20% of total direct costs.
- Regulatory expenses grew by \$71M or 65%, primarily due to CNSC fees.
- Facility Support grew by \$86M or 716%. Projected costs were reflective of corporate real estate (CRED) support costs at the Darlington Energy Center (DEC) along with business trade union (BTU) costs to maintain site facilities.
- Operation Training grew by \$27M or 100%.
- Project Bundles grew by \$568M or 18% overall, resulting from enhanced work definition; increased maturity; increased scope of the Turbine Generator Project and addition of safety improvement opportunity (SIO) projects.
- Campus Plan costs decreased by \$146M or 22% due to improved scope clarity.
- New fuel and Waste work decreased by \$34M or 10% due also to improved scope clarity.

The variances between the 2012 and 2013 Business Plans for the Project Bundles which comprise the bulk of direct costs are summarized below:

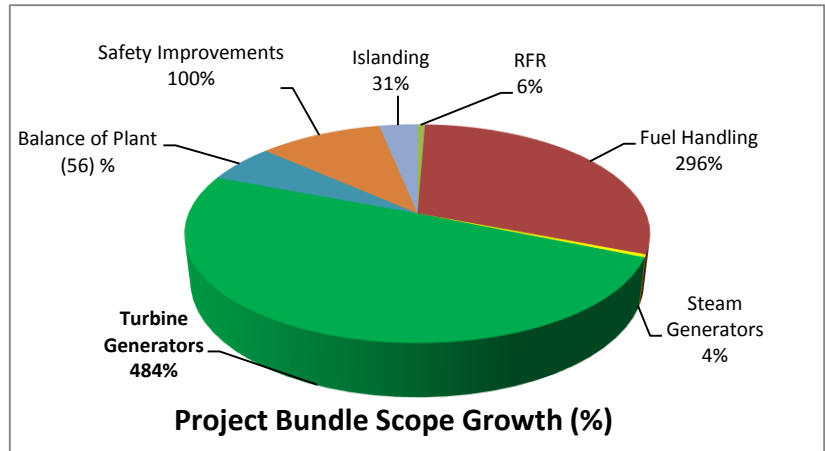

<sup>15</sup> Update on the Darlington Refurbishment Project Economics (November 17, 2011) at p. B-1.

<sup>16</sup> Update on the Darlington Refurbishment Project Economics (November 15, 2012) at p. 3.

<sup>17</sup> See DNGS Refurbishment Estimate Analysis (April 25, 2013) at p. 4.

- The RFR scope grew by \$154M or 6% via improved definition and development of a more refined cost estimate.
- The Fuel Handling scope increased by \$125M or 296% based on detailed review of Fuel Handling – Component Condition Assessment and continued scope clarification.
- The Steam Generator scope grew by \$7M or 4% due to a revised cost estimate.

- The Turbine Generator scope grew by \$287M or 484% due to the addition of the turbine control system and general scope finalization.
- BOP work reduced by \$207M or 56% due to significant validation of work scope placed elsewhere in the program.
- Safety Improvement work increased by \$175M or 100% due to the addition of SIO's.
- Islanding work grew by \$27M or 31% due to scope clarification and the development of associated cost estimates.

Overall, a variance review indicates that the larger cost increases as measured between the 2012 and 2013 Business Plans resided in the Functional groups, not the Project Bundles. This suggests that any attempt by the DR Team or Management to reduce scope must also involve a re-look of the corresponding Functional group costs as well.

## 2. Scope Review Process by DR Team

As noted, the DR Team is currently vetting the approved project scope. The following summarizes the process the team is using to rationalize the scope and right-size the DR Project.

### a. Process for Scope Determination

The DR Project's governance for scope review establishes the following Primary Objectives:

- Successful refurbishment of Darlington Station life-limiting components in order to allow Darlington to operate for 30 years beyond the current predicted end of service life.
- The Refurbishment Project will maintain and return the unit in the condition in which it is turned over.
- A successful refurbishment project requires delivery of all core and approved non-core scope within the high confidence timeline and budget established in the RQE and as documented in the Project Business Case Summary.
- Project cost and schedule as well as post-refurbishment performance will come under extreme scrutiny due to the high profile nature of this project and its impact on OPG's reputation.

- Where scope is approved by Scope Review Board, Nuclear Refurbishment may recommend inclusion of the scope and execution in a pre-refurbishment station outage.

The stated goal of this process is to “ensure that the proposed additions and/or deletions have undergone a thorough assessment based on the return on investment, impacts on plant safety, reliability, project schedule and cost, program resourcing, regulatory requirements and environmental impacts.”<sup>18</sup>

The DR Project’s scope was developed from review and vetting of 1,409 DSRs that were generated by the Station and Refurbishment Engineering. Based on OPEX from past refurbishments, including PARTS Unit 4, the team adopted an intentionally expansive view of potential scope inclusion so as to consider all options and avoid later surprises and/or scope additions that could adversely impact the DR Project’s success.

The process used to date for defining scope was based in part on accepting and classifying “Core” versus “Non-Core” scope. “Core Scope” is “work that must be done to achieve the Primary Objective” including (1) Regulatory; (2) Station Life Limiting Components; (3) Component Upgrades that can only be done in an extended outage; (4) Programmatic Work necessary to maintain the plant’s license; (5) Pre-requisites; and (6) Facilities and Infrastructure to support the DR Project. Non-core scope is defined as work that “Will be performed in the refurbishment period if it has no impact on the Projects Core Scope critical path, does not add risk to the successful completion of core scope, and where cost or resource efficiencies and station priority warrant the work to be executed in the refurbishment period.”<sup>19</sup> The Scope Review Board has been given the role of approving, deferring or rejecting the scope items based on multiple criteria.

#### b. Scope Status as of the 2013 Business Plan

The 2013 Business Plan’s scope definition and maturity level within each Bundle varies considerably. The following summarizes the monetized value of the DR Project’s DSRs for each of the Bundle in the 2013 Business Plan.<sup>20</sup>

Project Bundle	Number of DSRs	2013 Business Plan (\$000)
BOP	208	503,381
Campus Plan Infrastructure	23	234,566
Campus Plan Inside	10	75,569
Campus Plan Outside	17	252,198
Engineering Projects	42	203,443
Fuel Handling	76	237,963
In-Station Infrastructure	14	47,639
RFR	17	2,463,611
Safety Improvement Opportunities	3	103,000
Steam Generators	12	190,780
Shut Down/Layup	26	48,552
Turbine Generator	79	501,286
Unit Islanding	29	125,156

<sup>18</sup> Darlington Nuclear Refurbishment Program-Scope Control NK38-INS-09701-10001-R004 (December 12, 2012) at p. 4.

<sup>19</sup> *Id.*, p.8

<sup>20</sup> Scope Review as of June 20, 2013 at Table 1.

Project Bundle	Number of DSRs	2013 Business Plan (\$000)
Other	3	300
<b>Total</b>	<b>559</b>	<b>4,987,444</b>

The DR Team anticipates that it will generate additional DSRs that will need to be dispositioned and may add to the total end scope. Outside of discovery work that cannot be anticipated until the unit is under construction, the DR Team expects that additional DSRs will largely come from three sources:

- Component Condition Assessments ("CCA's"): The DR Team determined that many of the condition assessments performed in the developing the DSRs were incomplete. Project Engineering is currently re-evaluating the CCAs that appear to have shortcomings. It is not currently expected that these CCAs will yield a significant number of additional DSRs although this process needs to be continuously and closely monitored, and the interim results need visibility.
- Regulatory Requirements: There are certain regulatory issues that will require additional DSRs and/or modifications to existing DSRs. Most notable are additional requirements for fire protection work that was not initially anticipated. These additions are being assessed at this time.
- Scope Defining Inspections: The DR Project will be performing ~40 separate scope defining inspections during the upcoming pre-project outages. While the plan for the Project includes contingent scope and associated budget, there is a risk regarding the work scope that could be generated until these inspections are completed.

Based on our review of the development of the scope, it appears that OPG's methodology has cast a wide net for identifying all of the possible scope that could be included in the Project. The DR Team has developed effective metrics for bringing focus and attention to scope identification status and maturity via its "Health of Scope" ("HOS") reporting. These HOS reports highlight the life of a DSR until it is dispositioned. These metrics have been very helpful in bringing focus to the scope that lacks maturity and requires action.

The challenge for the DR Team now is to weed out the work scope that is not essentially done in refurbishment and ultimately define scope that is balanced to the original commitments to the BOD, the Shareholder and CNSC. Adding unnecessary work not only increases the Project's cost but aggravates complexity and risk. Reasonably balancing the scope with complexity, risk, schedule and budget concerns has the added benefit of allowing the DR Team to focus on the critical path RFR work which has been problematic in prior mid-life refurbishments.

As a result, the DR Team is currently reviewing the previously approved DSRs and bucketing them into one of three categories:

Must Refurbish in DR Project	Possible Deferral to Station for Life-cycle Management	Remove from Scope
<ul style="list-style-type: none"> <li>•Life limited components</li> <li>•Regulatory commitments</li> <li>•Drained/Defuel State</li> <li>•Refurbishment Support</li> <li>•Sustaining scope – 30 year replacements</li> </ul>	<ul style="list-style-type: none"> <li>•Station improvements with positive payback</li> <li>•Sustaining Scope that can be done outside of DR Project</li> <li>•Sustaining Scope – Manage as part of Life-Cycle Management</li> <li>•Sustaining Scope – Service Equipment, can be done online or during normal station outage</li> <li>•Station Support</li> <li>•Station Improvements – Likely payback</li> </ul>	<ul style="list-style-type: none"> <li>•Work not needed for ISR</li> <li>•Inspections determine scope is unnecessary</li> <li>•Work should be done under functional work program</li> <li>•DSR is for purchase of Capital Spares</li> <li>•Work with no relationship to Refurbishment</li> <li>•Work that must be done in VBO</li> <li>•Station Improvements – Payback Unlikely</li> <li>•Clean-up – work superseded</li> </ul>

In our experience, removing scope that was once nominally “in” a project is often a difficult proposition. The DR Team has engaged in two separate reviews, one conducted by key members of the team using the above considerations and a second “cold eye” review by Paul Pasquet, who is reviewing the scope in light of the necessary regulatory commitments. As of the time of this Report, these reviews are ongoing with the intent to present separate recommendations to the Scope Review Board for final review and disposition prior to the DR Team’s 2014 Business Plan presentation. BMcD/Modus has examined these ongoing processes, reviewed interim conclusions (to the extent those are available) and interviewed the principals involved, from which we can conclude that this effort is robust and likely to produce significant recommendations in reducing the Project’s scope.

### 3. Conclusions – Scope Status and Review

Since the inception of our engagement, BMcD/Modus has observed the DR Team’s increased focus on scope and all the related considerations. We have noted the direction and increased focus provided by the DR Team’s leadership. Assuming that the result of this effort is supported by a favorable economic analysis, BMcD/Modus believes these efforts are likely to result in a more achievable project plan with reduced overall risk. The following considerations should be kept in mind as the DR Team prepares its recommendations:

- Cost controls that the DR Team has put in place need to be followed in the future or scope creep will again threaten the success of the DR Project.
- Decisions regarding scope of the DR Project should be made as quickly as practicable so as to avoid the team expending effort on scope that will not be performed in the Project. Currently, Project Engineering is under stress to complete the procurement engineering work associated with undefined DSRs. If the DR Team can winnow down the scope as intended, such changes will reduce this pressure and make the final scoping effort more manageable and increased the likelihood of timely preparation of these packages.
- The remaining scope risks, including those resulting from future scope-defining inspections, need to be tracked in a transparent manner for the BOD so that there are no surprises.
- The results of this review need to be recorded in the AIDA database for future reference for rate proceedings and configuration management.

## IV. Functional Group Status

### A. Engineering

At the outset of our engagement, BMcD/Modus found the DR Project's engineering in a state of flux. The OPG Engineering Team was in the process of instituting new procedures and developing the organization needed to fulfill all of its necessary functions, its metrics and tracking methods of engineering product were in the embryonic stage, and it appeared that engineering was significantly stressed and behind schedule. However, the Engineering Team's performance indicators did not reflect this stress. Over the last several months, we have noted improvements in both reporting and production, though there are many challenges remaining in both areas. In this assessment, we have focused on defining the roles OPG's engineering will play, the current areas of focus, and recommendations for improvements for upcoming phases.

#### 1. Overview of Engineering Roles and Responsibilities

The Engineering Team (with its sub-parts Nuclear Safety, Design Engineering, Component Engineering, Engineering Projects and Reactor Engineering) is the largest of the DR Project's Functional Groups and fulfills a number of significant and evolving functions during the Project's lifecycle. Because OPG has chosen an EPC model, detailed engineering will be provided by the EPC contractors. However, OPG's Engineering Team retains responsibility for:

- Defining project requirements and design elements through development of the Design Modification Packages ("MDP");
- Identification of owner supplied long lead materials;
- Design authority approvals;
- Design completion assurance;
- Construction Completion Declaration
- Commissioning;
- Available for Service;
- DSR Closure.<sup>21</sup>

Currently, the Engineering Team's focus is on preparing procurement-related MDPs that are essential for defining OPG's requirements for the remaining scopes of work. This is an OPG-led function, though the Engineering Team is supplementing its efforts with the OSS Vendors, WorleyParsons and AMEC, in order to achieve a higher level of throughput. Once this phase completes, the Engineering Team will retreat into an oversight role in which its primary function will be to review and approve EPC design documents. OPG will take the lead again as the work moves out of the Execution Phase and into Commissioning. These myriad functions will require the Engineering Team to constantly review the mix of people and their specialties within the team. Management is currently evaluating the structure of the Engineering Team to meet these challenges.

Because OPG and the various EPC vendors each have responsibility for aspects of the design at various stages, answering the seemingly straightforward question of the DR Project's engineering status is a very complex equation. Nonetheless, as discussed below, the Engineering Team should endeavor to improve its reporting

<sup>21</sup> Darlington Refurbishment Project Unit 2 Major Work Streams (undated).

and metrics so that management and the BOD have a better and more precise handle on the status of the DR Project's engineering definition as the DR Project progresses.

## **2. Procurement Engineering - MDP Process**

Since the majority of the Engineering Team's current efforts revolve around the MDP activities, BMcD/Modus has reviewed this process, progress and issues. The OPEX that the Engineering Team has gathered from the MDR/MDP process needs to be considered as the DR Project's design advances.

### **a. Developing MDRs**

As noted, the DR Project's scope was assessed based on a wide variety of plant CCAs, life cycle management reports, system health reports, engineering backlogs and regulatory requirements in order to develop approximately 1400 DSRs. These DSRs were then evaluated to determine if the resulting scope of work would be a Maintenance Work Order, an equivalency evaluation, a Non-Identical Component Replacement or a Modification. If the disposition requires a modification, a Modification Design Requirement ("MDR"), Modification Outline and Conceptual Design Report are developed in accordance with the existing Engineering Change Control ("ECC") process. These evaluations of the DSRs netted 117 MDRs for engineering evaluation.<sup>22</sup>

According to OPG procedures, Engineering must prepare MDRs for the following purposes:

- New or existing Structures, Systems and Components;
- Engineered tooling;
- Permanent or temporary additions to existing facilities; and
- Permanently or temporarily re-defining a system design basis.<sup>23</sup>

In accordance with OPG's ECC process, the actual development of each MDR requires Engineering to review and account for such elements as:

- Nuclear Safety Design, Functional and Performance Requirements
- Interfacing Systems
- Design Limits and Strengths and Seismic Requirements
- Design Constraints and Constructability
- Environmental Qualification/Aging Considerations and Reliability Requirements
- Maintainability/Operability/Human Factor Requirements
- Periodic Inspection Requirements
- Safety Requirements
- Commissioning Requirements
- Standards and Codes
- Comparison with Similar Systems at Other Generating Stations

Initially, OPG planned to prepare the MDR packages with in-house, internal resources. However, OPG could not complete the volume of work and the number of MDRs required without additional engineering help. The

<sup>22</sup> Preparation of Needs Document N-GUID-00700-10002-R001 (2013) at p. 13; Modification Process N-PROC-MP-0090-R009 (2013) at p. 41, Engineering Change Control, N-PROC-MP-0001 (2013).

<sup>23</sup> Preparation of Modification Design Requirements, N-INS-00700-10007-R001 (2013) at p.3.

Engineering Team therefore contracted with the OSS vendors to complete the MDP development as augmented staff workers under OPG to support the RQE milestone. This, however, has led to increased costs for the development of the MDRs.<sup>24</sup>

#### **b. MDR/MDP Status and Metrics**

Despite the fact that the OSS vendors have now been engaged, Engineering is still struggling to meet the schedule for MDP development. In June 2013, OPG's Nuclear Oversight ("NO") group conducted a performance-based audit of the MDR/MDP and Design Quality Oversight process, the objective of which was to determine if the development of MDRs and associated MDP documents comply with governance, and to audit the Engineering team's organization. NO identified the schedule instability for the OSS Vendors work, noting that compliance with the MDR completion dates was "difficult to determine" because of the changing dates and metrics used for tracking engineering work.<sup>25</sup> While the then-current schedule showed engineering essentially on track, NO determined that the OSS vendors were trending well behind in the development of the MDR packages based on a December 31, 2012 schedule labelled as the "baseline." In all, of the 37 remaining MDRs, 19 were scheduled to be complete by June 30, 2013 per the original baseline schedule; though as of the end of June, only one MDR was complete. NO also found additional quality and accountability issues in the OPG Engineering Team's management of the vendor. These audit findings are being addressed by Engineering.

Engineering has ramped up its efforts in developing metrics, though these are still in the embryonic stage. The weekly engineering meeting with the team and the OSS vendors has increasingly focused on schedule performance and project "need" dates. There have been improvements in the reporting by the OSS vendors, though there is still noise within the earned value rules and counting of design products.

#### **3. Engineering Quality Programs**

The Engineering quality program is currently focused on oversight of the EPC vendor in-line with the original implementation model. Since very few of the projects have progressed past the procurement phase, the effectiveness of the quality oversight model implementation has yet to be proven.

OPEX from early implementation of the EPC model on the Campus Plan modification activities has led the Engineering Quality group to look into its methods of oversight activities of the OSS vendors and the MDP development process. Recent actions to address these quality issues include: a Self-Assessment,<sup>26</sup> a Nuclear Oversight Audit Report,<sup>27</sup> and a Common Cause Analysis regarding the quality of design engineering deliverables received from the OSS vendors.<sup>28</sup>

As part of the Common Cause Analysis, fifty-five SCRs were reviewed to determine the bases of the quality issues. The results were broken down into the following categories:

<sup>24</sup> See SCR N-2013-01589.

<sup>25</sup> Nuclear Oversight Audit Report – Darlington Refurbishment – Modification Design Requirements and Design Quality Oversight, OPGN NO-2013-005 T6.

<sup>26</sup> See SA NO13-00005.

<sup>27</sup> See OPGN NO-2013-005 T6.

<sup>28</sup> See Common Cause Analysis SCR N-2013-02294 (June 21, 2013) at p. 6.

SCR Category	# of SCRs	Findings
Quality of Product	27	Human performance error Issues; Lack of rigor during verification; Staff not sufficiently trained/qualified
Delays in Deliverables	16	Original schedule errors; resource availability
Procedure Adherence	13	Lack of understanding; Execution Mistakes
Expectations	5	Poor Communications

The conclusion from this Common Cause Analysis identified two themes related to MDP quality:<sup>29</sup>

- Human performance issues during the preparation and issuance of the design products; and
- Communication issues between OPG staff and the OSS Vendors.

Actions being taken to address the issues identified above are:

- Pursue opportunities to co-locate OPG and OSS vendor engineers at either the DEC or vendor facilities to improve communications;
- Get vendor engineering staff registered in the OPG TIMS system as qualified engineers;
- Refresher training for OSS staff with regard to OPG's ECC process; and
- Team building activities<sup>30</sup>

These issues are indicative of a team that is getting organized on the fly and under duress. The Engineering Team's leadership is taking this OPEX into account and is reshaping the organization, which should result in improvements. The BMcD/Modus team will continue to monitor the OSS and EPC vendors engineering services in these areas as additional MDP packages and EPC detailed design work products become available for review. In addition, we will monitor the Engineering Team's quality processes at the Program level to assess the DR Team's ability to ensure adequate oversight of the upcoming detailed engineering phase.

#### 4. Additional Observations and Recommendations

However its progress is measured, the DR Project's engineering effort is still in a very early phase. Engineering's current activities in developing the procurement packages are projected to continue well into 2014, and the team will have to adapt to monitoring the EPC's detailed design work that is underway. The current rationalization of scope and potential scope expansion from CCAs and regulatory scope will have an impact (both positive and negative) on the Engineering Team's work effort. Moreover, OPG will need to settle into an essentially new role of providing oversight of the detailed design process performed entirely by others.

For these reasons, BMcD/Modus believes it is essential for the Engineering Team to continue to refine its metrics, including earned value and schedule adherence. The reliability and quality of RQE will depend on the DR Team's ability to understand with confidence the Project's underlying level of engineering maturity. Currently, in part due to the fragmented distribution of the engineering activities between OPG, the OSS vendors and the EPC vendors, there is no metric that measures the integrated engineering effort (OPG + OSS

<sup>29</sup> *Id.* at p. 6.

<sup>30</sup> *Id.* at pp.8-10.

Vendor + EPC Vendor) such that the true status of the overall engineering effort is visible and can be understood.

There have been improvements over the last several weeks in the Engineering Team's metrics because the team is relying less on showing progress via work-down curves tracking completion milestones and more on interim key performance indicators such as SPI/CPI. In addition, the metrics better reflect the "need" dates from the various projects. There are still improvements needed and noise to wring out of the data, though the metrics are much accurate now than at the outset of our engagement. As the Project's C&C Schedule matures, we would expect that all of teams' metrics will be schedule-focused.

We have some additional high-level observations:

- As noted and discussed at length in the BOP section, OPG needs to examine a different delivery method for BOP work, one that allows the EPC vendors to begin detailed design as soon as possible. In conjunction with this change, the Engineering Team should review its processes to eliminate or reduce redundancy and the burdensome nature of elements of the MDR package development. One potential solution would be to limit the work by the OSS vendors and transfer some of these requirements to the EPC, so long as OPG's requirements are robustly detailed and established in accordance with ECC.
- The Engineering Team needs to review its and the other OPG groups' turn-around time for design approvals. There have been OPG-caused delays in approval of the OSS vendors' work, and the team needs to eliminate such constrictions where possible. The team should consider expanding its ball-in-court metrics to incorporate more granularity and visibility of the choke points in the chain.
- On the subject of engineering quality, BMcD/Modus recommends that an audit program be utilized to confirm that the EPC engineering vendors are adhering to their own QA/QC programs and that specific OPG quality requirements have been incorporated into the engineering practices utilized by these vendors (e.g.: Requirements Traceability Matrix).
- The Engineering Team should continue to evaluate the methods it will use for overseeing the development of detailed engineering by the EPC vendors. The OPEX from the Campus Plan work is informative in this regard and should be studied carefully.
- Developing comprehensive work packages is another function that has been exported to the EPC vendors. The Engineering Team will need to have sufficient resources available to handle questions and Requests for Information ("RFIs") from these vendors.

As the engineering effort continues, BMcD/Modus will provide both status updates and additional recommendations.

## **B. Commercial/Contracting Strategy**

### **1. Process**

OPG has chosen to use a combination of the multiple-prime and EPC project delivery methods. Here, each EPC "prime" contract equates to a Project within the DR Program. Each EPC prime contractor is responsible for coordinating and delivering the work covered by its particular scope of work (i.e. a Project or some portion

of a Project), but is not responsible for the entire Program.<sup>31</sup> Instead, OPG will take on the role of the Program Manager.

Under OPG's procedures, the Nuclear Commercial Development ("NCD") group coordinates an analysis with each Project Team and relevant stakeholders to develop a "Contracting Strategy" for each major work package. "A comprehensive contracting strategy takes into consideration factors such as the nature and scope of the work, the Supplier marketplace, potential longer term or broader commercial arrangements and results in a recommendation of the procurement approach, contract structure, pricing mechanism and the style and type of management to be adopted for the subsequent contract."<sup>32</sup>

Although each Project Team must perform a separate evaluation to determine the best contracting strategy, OPG has stated a strong preference for the EPC or hybrid versions of the EPC project delivery model, whereby a single contractor will perform the detailed engineering, equipment procurement and construction and installation work for a particular scope of work. OPG's key rationales for this choice are:

- This model gives OPG one point of contact (i.e. fewer interfaces and hand-offs for which the owner would be responsible to coordinate) and is "easier" to monitor and coordinate. From OPG's perspective, this also gives "one point of accountability" for complete delivery.
- This model can provide cost and schedule certainty to the owner prior to commencement of the execution/construction phase. This aligns with the DR Project's goal of having a high-level of definition for RQE.
- This model will enable OPG to concentrate its resources and efforts on rigorous project management and contractor oversight, which will be crucial to the DR Project's success.
- This model aligns with OPG's core business and overall future business direction, including staffing.<sup>33</sup>

Where applicable and relevant, we will discuss individual Project contracting strategies below. At this time, only contracts for the engineering and supply for Defuelling, RFR Definition Phase work (including development of the Tooling, construction of the Mock-Up and pre-construction estimate and schedule development), and the equipment supply and technical services contract for the Turbine Generators have been awarded and fully negotiated. The Execution Phase agreement for the RFR work has technically not yet been awarded (though it is anticipated that this work will be awarded to SNC/AECON upon agreement of the Target Price); and the final Target Price for this agreement will be subject to the ongoing RFR estimate development required by the Definition Phase contract.

Additionally, the ESMSA Contracts for the two intended BOP contractors have been negotiated and pre-Refurbishment work under these agreements is ongoing, although no Execution Phase work has been awarded to date. These contracts were awarded on the basis of competitive bid process, and the terms and conditions of these agreements were established for the purpose of simplifying future awards of the BOP work. The BOP section of this report provides additional detail regarding the commercial considerations in these contracts.

<sup>31</sup> The Campus Plan Projects have been excluded from the scope of the DR Commercial Strategy since they are being managed by Projects & Modifications, rather than the DR Team.

<sup>32</sup> See Program Contract Management Plan, NK38-PLAN-09701-1067- R000 (January 31, 2013) at p.5.

<sup>33</sup> See Darlington Refurbishment Program Commercial Strategy, NK38-REP-00150-10001-R001 (October 1, 2012) at p.11.

## 2. Additional Observations and Recommendations

As with any commercial strategy for a large capital project, there are risks associated with the multi-prime EPC model chosen by OPG for the DR Project. Many of these risks have been recognized and are being monitored by OPG, though they must be discussed on an ongoing basis as realization of some of these risks will impact the success or failure of the DR Project.

- With the multi-prime management approach, Owner's traditionally hire construction managers or program managers to coordinate the EPC contractors' work, and owner's engineers to review program compliance. OPG has chosen to fill these roles, and its success will be dependent its ability to employ a strong, capable and experienced construction management team that is able to effectively coordinate and track the work of such a large, complex project. We would also recommend that the DR Team integrate key construction management individuals into the DR Project Team as early as possible in the Definition Phase.
- OPG's preferred EPC contracting strategy is a new project delivery model introduced for the DR Project. It is also different from that used by OPG's vendors on past projects. Business cultural differences between OPG and vendors' management philosophies will have to be closely managed.
- The RFR contract dwarfs the other major project scopes, and there is a tendency to think of SNC/Aecon as the Project's full-wrap EPC contractor. This is not the case, and management needs to devote attention to the other projects to optimize adjacent project coordination and minimize interferences.
- The ESMSA vendors' performance and OPG's management of the vendors' work on the current Campus Plan scope has been mixed. OPEX from the D20 Storage Facility includes evidence of failures on both OPG's and the vendor's part to recognize that key details were missing from that project's definition which led to unrealistic schedule and readiness expectations<sup>34</sup>. The DR Team should examine these lessons learned going forward.
- The Program/Project approach has the risk of creating "silos" between the Project teams. Although each of the major Project Bundles are self-contained units, the Program must be managed by OPG as a whole, with a single, integrated schedule, cost control system and risk management approach.

Developing a contracting strategy for such a large project has to include a number of key variables. Some contracting approaches are more risky for the owner than others. Some are unsuitable for certain situations. Some strategies work for some owner organizations but do not work for others because the strategy depends on the owner's strengths. There is evidence that OPG took these major considerations into account in deciding on the contracting strategy it is following. However, this strategy will require some significant changes to OPG's prior large capital project mindset, and while growing pains are expected, the Project's success will be largely determined by OPG's willingness to embrace the role and recognize and control the risks associated with the chosen method.

### C. Project Controls

OPG's Project Controls team is responsible for essential functions of Schedule, Budget, Risk Management and Document Control. The following is our assessment of the development of each of these key elements to date.

<sup>34</sup> D20 Storage and Drum Handling Project: Modification Planning Lessons Learned Report, D-LLD-38000-1001 (March 4, 2013)

## 1. Project Controls Team and Structure

After Engineering, the DR Project's Project Controls team is the next largest functional group on the Project, and given the broad range of responsibilities the team has been given, this appears to be entirely appropriate. Project Controls is supporting the project-led approach with a core functional team and matrixed resources that have been embedded within the various Project Bundles. This was done to assist the Bundles in developing their respective schedules and budgets, though the efficacy of this model will likely wane as the Project continues to mature.

Going-forward, BMCD/Modus recommends OPG clarify the reporting lines of authority for Project Controls matrixed staff. Project Controls as essentially an independent function and those charged with that function are tasked with holding project managers accountable to integrated schedule, budget and risk standards. As an example, in the budget process, it is expected that certain puts and takes will occur between the Project Bundles. Project Controls needs to be the first-line-of-defense of the budget and broker these budget shifts with only the Project's overall best interests in mind. The matrixed Project Controls staff could be put in an uncomfortable position, having to work essentially for two bosses. In order to maintain the necessary independence, Project Controls personnel should have a direct and singular reporting line to a central Director, and that individual should report directly to the project's executive.

## 2. Schedule Development

### a. Process and Methodology

The DR Team has chosen a method for developing the Project's schedule that is unique in the industry at large. In accordance with the Program Schedule Management Plan<sup>35</sup>:

The (C&C Schedule) level 2 schedule covers the scope of work by Phase, Unit USI, and Type of work and contains full Critical Path Method (CPM) logic. It is referred to as the C&C schedule, or, Control and Co-ordination schedule, as this is the schedule which will be used, at the Phase and Unit level, to track the overall schedule status of the Program. It will be updated and controlled by OPG and based on the Contractors detailed Level 3 Schedules.<sup>36</sup>

In essence, the DR Team intends to use the Level 2 C&C Schedule as an integrated "look" of the schedule using Level 2 detail that mirrors (or hammers) the level 3 detail that the contractors are developing for work execution. In order to update and further develop the C&C Schedule, OPG's Schedule Team intends to summarize the contractors' level 3 schedule into a separate level 2 that contains an adequate number of activities with realistic activity durations to clearly show the sequence and logic in performing all projects, within the Program, at the Phase and Unit level, in a systematic manner. It will include all interfaces between OPG and contractor, and/or between contractors."<sup>37</sup> Notably, under this plan, the Level 3 detailed schedules from the contractors and respective work groups will not be integrated but only summarized at the milestone level. The eight<sup>38</sup> project bundles will each develop, maintain and update eight separate schedules with no interface logic ties between areas or bundles. The DR Team currently anticipates the C&C Schedule will

<sup>35</sup> NK38-PLAN-09701-10067 (January 31, 2013).

<sup>36</sup> Program Schedule Management Plan, NK38-PLAN-09701-10067-0004-R001 (March 27, 2013) at p.4.

<sup>37</sup> *Id.*

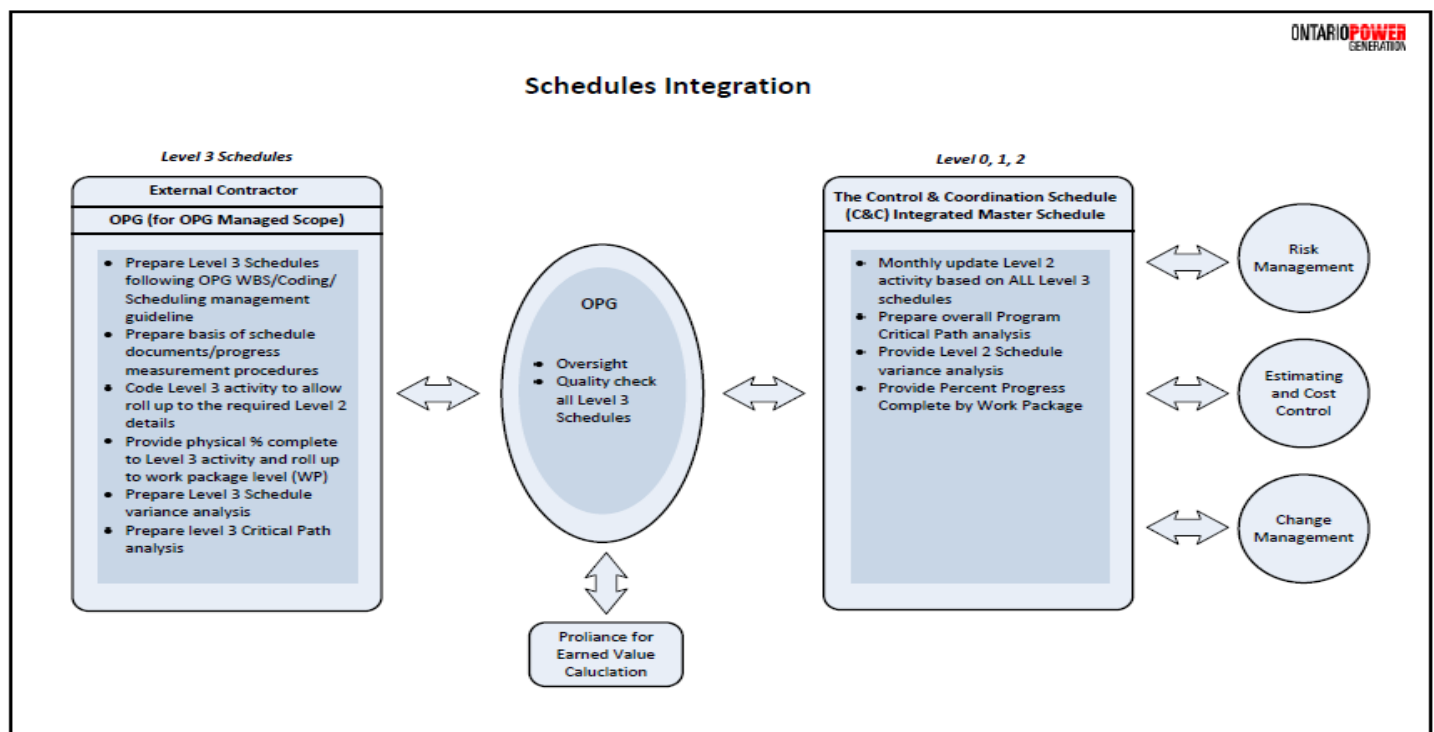

<sup>38</sup> For scheduling purposes, some of the SIO work is in a separate bundle.

consist of 5,000 tasks/activities in the Level 2 format, whereas the level 3 schedule, when developed, will consist of ~50,000 tasks/activities.

As articulated by the Project Team, the key drivers behind this unique methodology are:

- To allow for coordination of schedule activities at the summary milestone level. This is based on the Project Team's preference to manage the interfaces between the contractors and work groups at a higher, less granular level;
- To address OPEX from prior capital projects suggesting that the Project Team needs to manage the Project in a manner different from a conventional maintenance outage;
- To support OPG's desire for the exclusive ability to manage both overall and individual milestones that determine the contractors' schedule start dates, finish dates and float using the C&C Schedule.

OPG's *Program Schedule Management Plan* provides the procedure for developing the C&C Schedule from the Level 3 detailed schedule.<sup>39</sup> The diagram below identifies the flow of information from the Level 3 detailed schedules to the Level 2, C&C Schedule:

Some of OPG's processes follow typical scheduling practices: each bundle will have and update individual detailed Level 3 schedules with integrated Work Breakdown Structures ("WBS"); and assessment of critical paths and status updates will be based on an assessment of physical percent completion. These processes generally conform to frequent industry practices. Moreover, each Project Bundle will be responsible for updating its schedule to show its progress, and OPG will receive and coordinate the interfaces between the

<sup>39</sup> *Id.* at pp. 4-5.

Project Bundles through establishing and maintaining project milestones and touch points contained in the Level 3 Schedule.

While the C&C Schedule will work for the Definition Phase, it is our understanding that the DR Team intends to use the C&C Schedule as its prime schedule management tool through the Execution Phase. However, OPG's intended approach varies from what is typically seen in the industry for project execution in several important respects. By the Project Team's design, there will be no single integrated Level 3 schedule on the Project during the Planning or Execution Phases. Under this plan, instead of enmeshing these eight Project Bundle schedules, OPG has created the Level 2 C&C Schedule which "covers the scope of work by Phase, Unit USI, and Type of work and contains the full Critical Path Method (CPM) logic" and interface points. The DR Team's intent is that the C&C Schedule "will be updated and controlled by OPG and **based on** the Contractors detailed Level 3 Schedules." As shown in the diagram above, in order to monitor schedule progress, BMcD/Modus believes that this will cause OPG to monitor the eight separate Level 3 schedules and summarize the information into the C&C Schedule, as well as capture and record any changes to each bundle's schedule durations, adjacencies and logic (including the critical path). Typically, this level of integration is done electronically via an agreed automated roll-up of the schedule's Level 3 activities into a higher level 2 format. Such a Level 2 Schedule is typically not a stand-alone, calculating schedule, but merely a roll-up of the detailed Level 3 integrated, calculating schedule.

Maintaining a single Level 3 integrated, calculating detailed schedule network in P6 is standard in the industry because it readily provides the level of information needed for day-to-day management of the projects' work. The AACE's Recommended Practice 37R-06, which OPG's Schedule Management Plan uses as a reference document, states that Level 3 is the "first level that a meaningful critical path network can be displayed and the CPM schedule can be used to monitor and manage (control) the overall project work. Level 3 is a good level for the overall project control schedule since it is neither too summarized nor too detailed."<sup>40</sup> AACE recommends that the Level 3 schedule network "reflect the interfaces between key workgroups, disciplines, or crafts involved in the execution of the stage." BMcD/Modus agrees with and endorses AACE's conclusions. In our experience, a schedule for a project of this complexity needs a detailed logic network that is unconstrained and able to freely and readily calculate the critical path and sub-critical paths. As a result of our experience and widespread industry practice, we are skeptical that OPG's efforts at maintaining, updating and administrating the level 2 C&C Schedule will provide the management tool necessary for successfully coordinating and controlling the Execution Phase of the work.

#### **b. Status of Schedule Development**

The DR Team is currently developing the C&C Schedule by populating the detailed schedule network. The Project Information Management System ("PIMS") milestones for schedule development are: (1) Level 3 Schedule, "Revision A", April 15, 2014; (2) Level 3 Schedule, "Revision B", which will form the basis for the RQE, is scheduled to be completed in May 15, 2015; and (3) Final Level 3 Integrated Schedule, April 15, 2016.

The interim C&C Schedule was the basis of the presentation to the Refurbishment Project Executive Team ("RPET") on July 19, 2013. The following is an assessment of the current status of each of the Bundle components of the schedule, based on a review of the materials that were prepared for that presentation:

<sup>40</sup> AACE International Recommended Practice No. 37R-06 Schedule Levels of Detail—As Applied in Engineering, Procurement and Construction (March 20, 2010) at p.2.

<b>C&amp;C Schedule Status as of July 19, 2013</b>	
<b>Project Bundle</b>	<b>Current Status</b>
RFR	Level 3 is resource loaded with contractor staff needs, though there is a concern with contractor staffing to meet the work load in the Fall 2013. Program milestones for 'mock-up construction complete' are misaligned with the contract (by 61 days), with a CCF to be processed. RFR is currently evaluating inter-project ties and inserting outage milestones into the schedule. The RFR team was challenged to evaluate the number of activities with excessive float (600+ days) though the RFR team believes this float is realistic due to early performance of certain work. In addition, RFR will need to examine multiple activities with 500+ days of duration.
BOP	The schedule is currently reflecting pressure from MDR's for scoping, which are showing 89 days late. This may be due to logic ties rather than lack of progress and if so, will be corrected. However, as will be discussed in the BOP section, there is a significant risk that the current schedule logic will not support on-time completion of BOP detailed engineering. In addition, the schedule currently reflects that several inspection preparations are running behind schedule, though the BOP team assures that recovery plans are in place and as-planned completion dates are expected to be maintained.
Fuel Handling	The schedule for Fuel Handling is being revised to reflect the award of the Defuelling contract as well as certain changes that management has directed to move work forward, before the start of the DR Project's Execution Phase.
Turbine Generator	This bundle's schedule is not well developed at this time, as activity definition, sequencing and interface ties all require work. The current preliminary engineering activities are riding the data date with no rationale. The team reported that the RFP negotiations are impacting the schedule at this time.
Steam Generators	This schedule reflects the current maturity level, which is in the pre-contract phase.
Shutdown/Layup	New level 2 schedule was completed at the end of July and will be used as the target. The strategy is to use the existing ESMSA contracts and vendors for the work. The plans to support this procurement strategy are reflected in the target schedule.
<b>Functional Group</b>	<b>Current Status</b>
Operations & Maintenance	Much of the current work is to support project needs yet the activities are not tied (integrated) with the downstream project activities, consequently large amounts of float are shown. Significant O&M work that is required for the projects does not show up on the O&M C&C Schedule, which reflects an interface issue with coding and layout at level 2.
Licensing	Licensing schedule is organized by each project, activities are supposed to be extracted from the project schedules. This schedule needs further refinement from presentation layout to the definition of licensing activities for it to be a usable C&C schedule.

C&C Schedule Status as of July 19, 2013	
Nuclear Safety	There were a number of flaws noted with activity dates, % complete, float, descriptions, among other things. The activities are very short term focused, level of effort type activities. This schedule also needs further refinement for it to be a usable C&C schedule.

In the C&C Schedule meetings held during the week of July 15 2013, the Project Controls Team identified that schedule adherence and variance will be monitored against this version (July) of the level 2 schedule. There was a concern noted that the schedule fragments from OPEX on other projects are not being used to guide the logic and durations of schedule activities, the schedules are being developed from scratch. We noted a distinct difference between Functional and Project groups with the approach and degree of schedule development. The Functional groups in general have much more work ahead in their schedule development, with the Project Bundles being much further along. The current iteration of the Project schedule will be used to drive and measure the Definition Phase for the next 10 months. All schedule performance metrics will use this schedule as the interim baseline for measurement at the milestone level. As the Project Bundles mature, the schedule will continue to be populated with additional Level 3 schedules.

### c. Summary of Risks

Whereas the C&C Schedule is an adequate tool for the Definition Phase of the Project, BMcD/Modus is concerned with the schedule development plan that OPG is pursuing for the DR Project's Execution Phase. The following are some of these concerns:

- OPG intends that its C&C Schedule be its depiction of the interfaces between the eight Level 3 Project Bundle schedules, as described. At a minimum, this approach appears to shift significant burden onto OPG's Project Controls department to update the C&C Schedule to match the Level 3 schedules received from the contractors. This approach creates a risk that the C&C Schedule and the eight Level 3 schedules will not be fully aligned and manipulation of data will most likely be a daily issue as between OPG and its contractors. Moreover, the contractors may not accept the C&C Schedule as the Project's baseline schedule, which would create difficult issues when analyzing potential impacts and mitigation of delays and coordination problems.
- OPG's intent with the C&C Schedule is to give the contractors sufficient latitude to develop and "own" their respective schedules, and reduce the amount of interference (unintentional or otherwise) from OPG. However, in our view, the contracts executed to date do not present clear and unambiguous rules to hold contractors accountable in schedule development. The contracts rely on the parties reaching mutual agreement on the schedule which is a concept fraught with risk and difficult to achieve under the best of circumstances, and one which could ultimately result in the DR Project never having a baseline schedule. The contracts also reference AACE standards rather than identify specific requirements; however, there is a potential for confusion regarding OPG's exact requirements, as not all sections of these AACE standards are applicable and these standards are intended to be used as guidelines in the first place not requirements or obligations that OPG can enforce as the per OPG's Schedule Plan. OPG should consider revisiting its scheduling requirements for the contractors and clearly spell those out in all (current and future) contracts so that these standards are understood and dispositioned upfront and not held over for later mutual agreement.

- OPG's ability to obtain a sufficiently detailed Level 3 schedule from each contractor will depend on the amount of oversight the OPG team applies at a very early stage of development. As an example, the RFR contract requires SNC/Aecon and OPG to have a meeting of the minds on the schedule before it is accepted. OPG will have to similarly engage each contractor and police the schedule updates to ensure none are using techniques that could give OPG's management a false read of the Project's progress.
- As noted, OPG plans to limit the transparency of an integrated schedule in order to manage contractor float. While we recognize the importance of an owner maintaining proper float management when multiple prime contractors are working side-by-side, we do not believe that this is a sufficient reason for not having a fully integrated Level 3 schedule tool for coordinating and controlling the work. As an example, OPG will not be able to hold a "Plan of the Day" meeting with all contractors present because OPG intends to restrict viewing of the overall schedule. Moreover, to the extent that there are touch points between the contractors, and there will be many, OPG will have a difficult management task of communicating separately and individually with each party – even the best in the industry avoid this scenario. In our experience, limiting the transparency of the schedule risks the value of the schedule as an essential planning and communication tool needed to hold the contractors accountable.
- The level of resources OPG needs to maintain the C&C Schedule may be significantly underestimated. Our concern is that OPG will be utilizing resources in summarizing the detailed schedule that would be better focused on vetting of the contractors' schedule input.
- In the event a Project delay occurs in one of the eight bundles requiring a delay mitigation analysis, such analysis would need to use the Level 3 Detailed Schedule. However, if the Level 3 Schedule is not updated with interface logic, such an analysis would prove problematic at best. It would be very difficult if not impossible to perform an effective and convincing delay analysis using the Level 2 Summary Schedule, which was not developed by the contractors but is an owner controlled and developed document, all for the purposes to prove or disprove a delay claim.

In summary, BMCD/Modus sees significant risks associated with the plan for tracking the schedule using the currently adopted process, and we are skeptical that the end-product OPG intends to create will be a useful tool, let alone offset these potential risks.

#### **d. Summary of Recommendations—Schedule**

Based on the above observations, BMCD/Modus recommends the Project Team consider the following path forward with respect to the schedule:

- OPG's Project Controls team should continue populating the Level 2 C&C Schedule in the same manner with each Project Bundle submitting progressively more detailed Level 3 Schedules through RQE;
- OPG's Project Controls team should develop distinct rules for contractors to follow in the development of their level 3 schedules and have these rules clearly imbedded in all of the contracts;
- Continue using the C&C Schedule as a planning tool and as a tool for OPG management to measure the DR Project's status, critical path, and forecasted completion dates, through the current phase of project development until the Level 3 Detailed Schedule is completed;
- Continue developing the touch-points and milestones at Level 2 as the basis for the planning process;

- Once the detailed Level 3 schedule inputs from the contractors are sufficiently mature, OPG should revisit the issue of integrating the schedules from each Project Bundle into a single CPM network using the Level 3 Detailed Schedule;
- OPG should vet the internal resource requirement and model the amount of such that it will need for tracking and managing the schedule under both scenarios. The upcoming 2014 Business Planning review will be important for establishing the level of effort and resources needed for schedule development and maintenance; and
- OPG may choose to continue updating of the C&C Schedule, both as an interim Level 2 Schedule and as tool for OPG management to measure the Project's status, critical path, and forecasted completion dates if doing so provides OPG's management with a useful tool.

In summary, we are of the view that OPG is needlessly exposing itself to extra time, cost and management difficulties in proceeding along its contemplated course of scheduling after RQE. In this deviation from widespread industry practice, we doubt that the action will result in the Project Control tool necessary for tracking the work during the Execution Phase of the DR Project. We recommend that OPG consider developing a fully integrated level 3 schedule using progressive elaboration of the detail as the contractors' plans mature and automatically roll-up of the level 3 detail to the level 2 and summary schedules for management and reporting.

### **3. Budget Process and Status**

#### **a. Processes and Methodology for Cost Management**

BMcD/Modus has reviewed the primary processes, procedures, manuals and guidelines for budgeting and cost controls and found that the intent of these processes to generally comport with industry standards. However, the DR Team should review these documents for consistency and integration. The following summarizes our review of the more significant concerns related to the DR Project's cost control processes.

#### **i. Contingency**

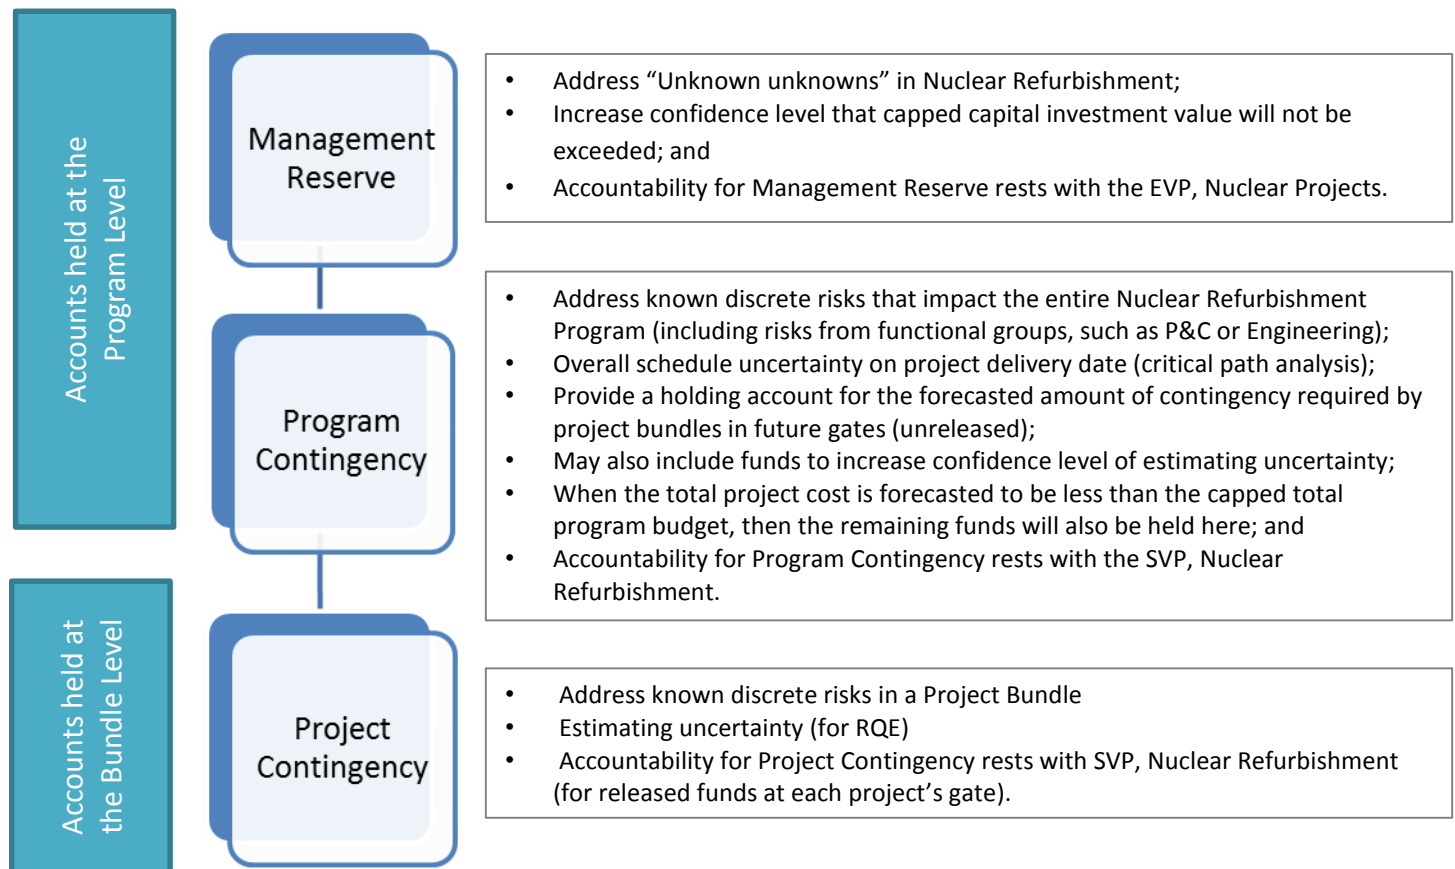

On June 26, 2013, the DR Team issued a "major" revision to its Contingency Development and Management Guide.<sup>41</sup> The revision was issued as work was starting on the 2014 Business Plan Business Plan estimate so that proper guidance could be provided to the Project Teams in developing each of their contingencies. According to the DR Team, Contingency Development and Management should be guided by the following principles:

- a) Uncertainty and risks in projects is a certainty – project managers are expected to identify discrete risks and be provided with the budgets to manage risks.
- b) There should be at least two classifications of funds to manage executive expectations, uncertainty and risks: One to manage identified and documented "known unknowns", and one to manage "unknown unknowns".
- c) Risk management must be a living and iterative process requiring frequent monitoring and control as project circumstances are always changing

<sup>41</sup> Nuclear Refurbishment – Contingency Development and Management Guide, N-MAN-00120-10001 Risk-05 R001 (June 26, 2013).

- d) Contingency development should be based on a justifiable risks, properly documented and determined using an approved process
- e) Contingency usage must be justifiable, properly documented, and requested via an approved process that allows for proper reviews and levels of approval
- f) Contingency or Management Reserve approvers must understand the impact of this usage on the remaining risks on the Project and as well on the overall program.<sup>42</sup>

Based upon these principles, the DR Team has established three contingency pools from which contingency funds may be drawn: 1) Project Contingency; 2) Program Contingency; and 3) Management Reserve. Below is an illustration of the purpose, scope and accountability for each type of contingency:

In determining the appropriate amount of contingency, the guideline recommends the use of a probabilistic approach, or Monte Carlo simulation method, which is the industry standard for mega projects. However, a probabilistic approach depends upon the organization having a comprehensive and reliable risk assessment and risk management program. As a result, the quality and effectiveness of OPG's Risk Management Program is very important for overall cost control.

As we will discuss in more detail below, based upon our review of the operative procedures and guidelines as well as interviews with the Project Managers and the Risk Section Manager, the Risk Management Program is

<sup>42</sup> Gary Rose, "Strategic Direction for Nuclear Refurbishment Contingency Development and Management" (undated).

comprehensive and well within industry standard. However, we have concerns regarding its execution, including risk identification and the updating, scoring, maintenance and management of the risk register, all of which need to be closely integrated. Making OPG's risk register the foundation of the Project contingency analysis potentially transfers quantifying risk and the exercise of estimating contingency not only away from the cost estimating function, but from the contractor to the owner. As yet, we have not had a chance to fully review how the items in the risk register are monetized and how contingency is actually calculated; the opportunity to do so will come with our vetting of the 2014 Business Plan budget process.

## **ii. Gate Review Process**

The Gate Review process is intended to ensure that all work is rigorously defined and adequately vetted at a series of gates which correspond to relative maturity of that sub-project.<sup>43</sup> The ultimate goal, as described by the DR Team, is for all work to meet the standards of Gate 3 prior to approval of funding for execution; further, that all work on the DR Project will be at the requisite level for Gate 3 approval by the RQE date.<sup>44</sup>

Based on our review of the estimating, contingency and gate review processes, the Gate Reviews appears to be adequate for use if all associated paradigms are identified and adhered to. As an example, the Gate Review Board has continuously rejected the Gate 2 submission from the Turbine Generator Team for its lack of completeness and failure to meet the Project's standards. We would recommend RPET to use this as a living example for holding the DR Team accountable as the requirements of the gate reviews increase and more projects will be advancing to Gate 3.

The Gate Review process is consistent with that seen in the industry at large. Nonetheless, as noted in this report, BMcD/Modus has particular concerns regarding the BOP scope's readiness for Gate 3 by October 2015. This has less to do with the gate process than the current schedule and pace of scope definition evident within the BOP work.

## **iii. Cost Management and Project Reporting**

The implementation of Proliance, which the DR Team intends to be the primary tool for reporting earned value, has been delayed and is currently only in the embryonic stages of its development. As a result, we have not yet been able to evaluate it as an effective project tool. Only one Project Bundle RFR, has an earned value process that is up and running and system bugs are still being worked out. Three other projects—BOP, Defuelling, and Turbine Generator—have reportedly been readied for import into the earned value system. However, there is evidence that the Turbine Generator team is not on board with or committed to the earned value process or, more basically, even to Proliance.

It should also be noted that based on our industry experience with clients employing similar systems to Proliance, it will most likely take months or quarters to get the earned value system up, running and purged of reporting noise. Therefore, it could be some time before OPG receives any meaningful data out of Proliance.

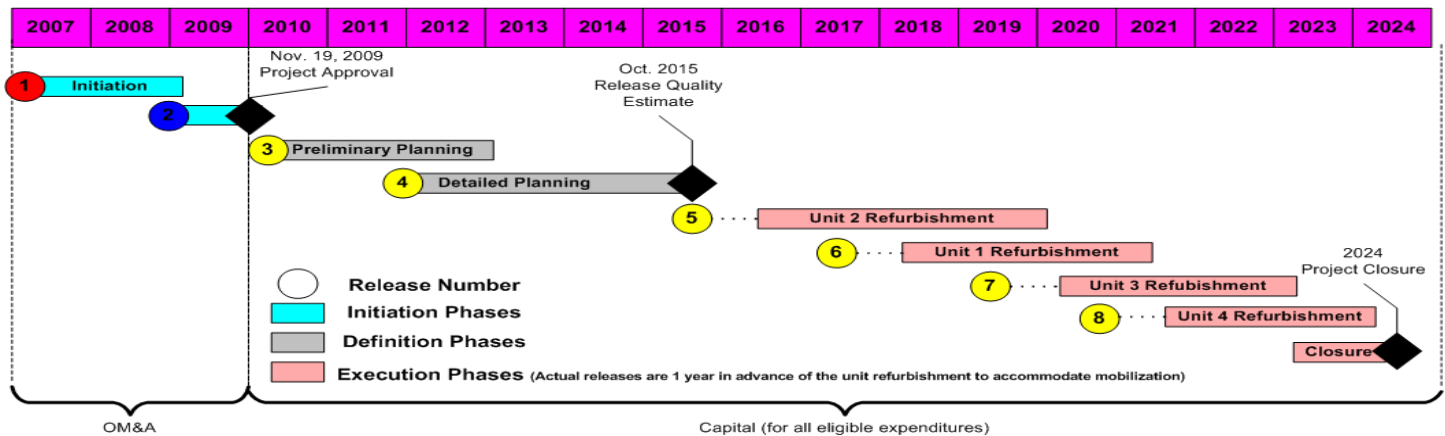

## **b. Review of 2013 Business Plan**

The current DR Project cost estimate is in the form of the 2013 Business Plan which the DR Team presented to the BOD for approval in the 4<sup>th</sup> Quarter of 2012. This Business Plan was the most recent in a series of yearly

<sup>43</sup> Nuclear Projects Gated Process, N-MAN-00120-10001-GRB-R000 (November 28, 2012).

<sup>44</sup> Darlington Program Update, February 27, 2013, at p. 71.

funding requests, the purpose of which is to provide the Board with an update on the status on the DR Project and to request approval of the revised overall release strategy and funding to proceed to Detailed Planning within the Definition Phase of the Project as identified below:

This release strategy provides the BOD with built-in “off ramps” in the event the DR Project’s economics cannot be supported, and requires the DR Team to provide the BOD with yearly requests for Definition Phase funding.

The base assumptions embedded in the 2013 Business Plan are as follows<sup>45</sup>:

- First unit Refurbishment Start date – October 2016
- Duration of Refurbishment (4 units) – 36 months each, 88 months total
- Estimate shown is in overnight \$2012M (excluding interest and escalation)
- Estimate is based on scope approved by the Scope Review Board, contractor cost, and OPG costs
- As contracts are awarded and contractor estimates are refined, the Project estimate is updated
- Contingency is based on an assessment of cost estimate uncertainty (price, quantity, productivity) as well as an assessment of discrete project risks
- Refurbishment will perform oversight of EPC vendors and will operate the unit during the refurbishment period.

The Project Bundle estimates underlying the 2013 Business Plan (exclusive of BOP) were characterized as Class 5, and there is evidence of scope (and scope bucketing) uncertainty in the comments adjoining the estimate’s line items. The estimates for the Functional Groups were drawn from high-to-medium level staffing plans for each of these groups. As noted in the earlier discussion of Scope, the Functional Groups’ plans changed from the 2012 to the 2013 Business Plan, reflecting a larger Execution Team with greater External Oversight, Project Controls and Engineering costs<sup>46</sup>.

<sup>45</sup> *Id.* at p. 18.

<sup>46</sup> *Id.* at p. 17.

### c. 2014 Business Plan

#### i. Revised Planning Assumptions

On June 4, 2013 OPG's Senior Management determined that the DR Team needed to analyze for planning purposes a potential alternative schedule scenario in which:

- Unit 2's Execution Phase would begin as originally planned October 2016
- Unit 1's Execution Phase would begin after the commencement of Unit 2
- Units 1, 3 and 4 construction would overlap by 19 and 17 months
- The total Refurbishment Project window would be 108 months

The drivers behind this new set of planning assumptions include reducing the complexity and risk of performance in as many ways as reasonable and allowing OPG to fully integrate lessons learned from the first Unit into the execution of the remaining Units. As of the time of this Report, the DR Team is engaged in its 2014 Business Plan review in which the team plans to reflect the result of this evaluation. It is our understanding that this work will continue into the 3<sup>rd</sup> Quarter of 2013 and culminate in a recommendation to the BOD to be presented during the October 2013 BOD meeting. We will continue to monitor this effort to its conclusion.

BMCD/Modus recommends the following in tandem and/or support of this decision:

- When presenting information to the BOD, OPG management must adequately document, present and otherwise explain the nature of its cost estimates and appropriately characterize the same before the BOD, all in a transparent manner. The BOD would benefit from the DR Team developing new and meaningful metrics that trace and meaningfully report on scope, cost and planning variances going forward.
- It is our understanding that the DR Team intends to segregate the estimated variances in the 2014 Business Plan estimate that were caused by scope increase/decrease from those emanating from the revised planning assumptions. This will be helpful but the Project Teams and Functional groups must be supportive.
- In keeping with the revised planning assumptions, the DR Team is training a critical eye on BOP scope. As discussed elsewhere in this Report, the DR Team should examine a different project delivery method than originally planned in order to optimize the BOP schedule, in particular the schedule for developing detailed engineering and construction work packages that will form the basis of Class 2 estimates needed for RQE.
- It is likely that if approved, the revised planning assumptions will result in some commercial reworking of the JV Agreement with SNC/Aecon. If Unit 2 is performed as a stand-alone without overlap, there will be some budgetary puts and takes that will likely impact the target price. BMCD/Modus recommends that OPG use this opportunity to consider amending the JV Agreement to incorporate other changes that could result in greater transparency, cooperation and risk reduction in the RFR project.

## **ii. Basis of Estimate**

BMCD/Modus has sampled some of the preliminary materials that are currently being assembled in support of the 2014 Business Plan reviews. Based on this in-flight review, it appears that the vast majority (64%) of the individual estimates that will make-up the 2014 Business Plan are still characterized as Class 5, while 19% are at Class 4 including RFR, which we discuss in detail in the related section. Seventeen percent (17%) of the DSRs have not been estimated to date. Based on this information, it would not appear that the level of maturity has greatly increased from the 2013 Business Plan to the 2014 Business Plan.

## **iii. Process**

The 2014 Business Plan assessment will not be a full re-examination of the DR Project's underlying cost estimates. While at this stage, given the DR Project's overall maturity, this refresh of costs is appropriate, we nevertheless recommend that the DR Team engage in more rigorous effort in connection with next year's 2015 Business Plan cost assessment as a pre-cursor to release of the RQE. Because of the expected leap in clarity in regard to project definition over the next several months, the DR Team should be tasked with considerably narrowing the uncertainty cost band around project cost – there is no reason to delay this to the timing of the of the RQE release.

## **d. Recommendations—Estimating and Budgeting**

In summary, while the DR Team has made reasonably good strides toward establishing cost controls and driving compliance and accountability from a process perspective, there are some areas (scope definition, contingency development and management) where improvements can be made. The following are selected recommendations in this regard:

- The DR Project's estimating process needs to more closely adhere to AACE guidelines, and do so with greater uniformity. Since RFR is the test case for the other project cost estimates, the team needs to ensure that adequate vetting of the RFR estimate is accomplished as the cost estimate moves toward the RFR Class 3.
- The Risk Register needs to be streamlined and otherwise vetted including how and why some categories of risks are translated into contingency.
- Estimating and risk management functions need to be better aligned with regard to deriving contingency.
- Proliance needs to be implemented as soon as possible to ensure the cost and schedule management systems and reporting are aligned and in sync. This is critical to ensure data fidelity as the bundles move through the gate review process and move toward RQE and execution.
- The number, mapping and consistency of the various cost control processes and procedures should be reviewed by the DR Team, with an eye toward simplifying and streamlining such procedures.

In developing and characterizing its cost estimates and contingency, management reserves and allowances, OPG needs to adhere to unified and consistent definitions. In the absence of clarity, the organization will almost certainly continue to use the terms in interchangeable manners and thus run afoul of good practice. OPG has chosen AACE for reference guidelines and it needs to align to them in all cases, both internally and in contractor operations. As we discuss in the section related to RFR, inconsistent application of processes can

lead to unnecessary confusion and thus a misunderstanding at the management level with respect to the rigor behind the cost estimates presented to it.

#### 4. Risk Management/Lessons Learned/OPEX/AIDA

##### a. Status of the Programs

The DR Team has established its Risk Management Program which is generally consistent with those commonly encountered on other projects and complies with published literature such as the Project Management Book of Knowledge (“PMBOK”)<sup>47</sup>. The Risk Management Program focuses on the key elements of: (1) Risk identification; (2) Likelihood of Occurrence; (3) Impact; (4) Mitigation and (5) Monitoring. To date, the DR Team has focused on the following activities:

- Developing written procedures<sup>48</sup> derived from corporate documents<sup>49</sup> and establishing a risk management organization infrastructure;
- Creating a central risk register to assemble and document identified risks, results of assessments, response plans (mitigation activities) and status. The risk register is an Access database called RADAR (Risk Assessment Database and Register), which is maintained by a small Risk Group that is part of the Project Infrastructure section of the Refurbishment Planning and Controls organization;
- Initiating a Risk Oversight Committee (“ROC”) comprised of RPET and various subject-matter experts that meets at least quarterly to provide oversight of program and project risk management activities.

On a separate path, SNC/Aecon and the OPG RFR Project Team are developing and vetting their own risk register as part of the RFR estimating process. Development of this RFR risk register is required under the specific terms of the JV Agreement and is based in large part on the OPEX and lessons learned from prior refurbishments. It will be used for monetizing a component of SNC/Aecon’s target price for the Work.

OPEX and lessons learned are key sources of input for identifying risks within the Risk Management Program. To make full use of the OPEX from past refurbishments, the DR Project has established a formal process and procedure<sup>50</sup> to capture and communicate OPEX and lessons learned that assist in identifying and managing the risks.

In addition to the Risk, OPEX and lessons learned programs, the DR Team also has established a formal program for ensuring that assumptions, actions and decisions associated with the refurbishment are properly

<sup>47</sup> PMBOK is published by the Project Management Institute.

<sup>48</sup> Nuclear Refurbishment Risk Management, N-MAN-00120-10001-RISK-04-R000 (July 25, 2012), Nuclear Projects Risk Management Process, N-MAN-00120-10001-RISK-R001 (November 22, 2012).

<sup>49</sup> Darlington Refurbishment Risk Management Plan NK38-PLAN-09701-10067; Project Risk Management Standard, OPG-STD-0062.

<sup>50</sup> Darlington Refurbishment Lessons Learned And OPEX Management, N-MAN-00120-10001- RISK-06 (July 19, 2012).

assessed and that follow-up actions are documented and managed<sup>51</sup>. This information is collected and recorded in the Assumptions, Issues, Decisions and Actions (“AIDA”) database, which is maintained by the Risk Group. The purposes for recording significant assumptions and decisions include: “To Exhibit prudence and oversight in the decision making process and in the validation of key assumptions impacting NR”; and “To maintain an auditable trail for future review and reference.”<sup>52</sup>

To mitigate cost and schedule risks, the DR Team has established a Contingency Program<sup>53</sup> which provides for developing contingency from quantitative and qualitative analysis of risks residing in the Risk Registers and in functional area business planning. A more detailed analysis of the Contingency Program is discussed in Section IV.C.2.a.i.

## b. Processes and Methodology

The process that the DR Team is using for developing the source data, analysis and presentation of risks is generally consistent with that observed in the industry at large although there are some issues with the quality of the information that DR Team needs to correct. Below we describe the component parts of the Risk Management Program.

### i. Risk Scoring Process

The DR Team has populated the Risk Management Program’s databases through facilitated brainstorming sessions, individual input and review of OPEX and lessons learned from other projects. The Risk Group aggregates and reports specific risks in individual projects or department RADAR files. High level “global” risks that have the potential to impact the viability of the whole Refurbishment Program are included in a Program Risk Register. Each Program risk is “scored” by assigning a number to reflect the probability of occurrence based upon the following rating system:

Probability Rating ->	1	2	3	4	5
Qualitative	Improbable	Unlikely	Possible	Likely	Probable
Quantitative	< 10%	10% - 30%	30% - 70%	70% - 90%	>90%

In addition, the consequence of each risk is “scored” relative to its potential impact on cost as depicted in the table below.

Impact Rating ->	1	2	3	4	5
Qualitative	Minimal	Minor	Notable	Substantial	Major
Quantitative (Cost)	< \$5M	\$5M - \$50M	\$50M - \$200M	\$200M - \$500M	>\$500M

Similar ratings are developed for schedule impact and risk manageability (i.e. ability to mitigate or control the risks). Different rating scales may apply to the individual Project Bundles and Functional groups. The final individual Risk score is determined by multiplying the probability of occurrence by the highest of the impact ratings for cost, schedule or manageability. The “heat map” below is a graphical representation of the probability and impact combinations that yield a risk score. The color coding depicts the severity of the risk relative to likelihood and impact.

<sup>51</sup> Nuclear Refurbishment Assumptions and Decisions Management, N-MAN-00120-10001 RISK-07 (March 5, 2013).

<sup>52</sup> *Id.*

<sup>53</sup> Nuclear Refurbishment – Contingency Development and Management, N-MAN-00120-10001 RISK-05 R001 (June 26, 2012).

Consequence					
5	5	10	15	20	25
4	4	8	12	16	20
3	3	6	9	12	15
2	2	4	6	8	10
1	1	2	3	4	5
	1	2	3	4	5
	Probability				

EPC contractors supporting the DR Project must also prepare a Risk Management Plan for identifying and managing contractor related risks. Scoring of risks can be somewhat subjective as risk tolerance can vary from person to person. In our review of the various Project risk registers, we have observed wide variances in scoring practices. This may lead to difficulty by the management team to accurately identify and assign the proper amount of contingency necessary to cover these risks.

## ii. RADAR and OPEX Databases

The DR Team developed the RADAR database to be the central depository of OPEX and lessons learned from external sources to OPG (e.g. the CANDU Owners Group, Bruce, the Institute for Nuclear Power Operations (“INPO”)) or within OPG (e.g. Pickering, Operations & Maintenance, and the DR Project itself). A refurbishment OPEX management database is maintained by the DR Project’s Program OPEX Single Point of Contact (“SPOC”) in the Refurbishment Planning and Controls Risk Group. The OPEX SPOC gathers and screens OPEX and lessons learned items, enters the information into the database and distributes the new entries to the local departments and projects. Responsible departments and projects then assess applicability and respond to the OPEX SPOC regarding how the item will be addressed. The OPEX SPOC issues a quarterly OPEX/Lessons Learned Summary Report to document quarterly Lessons Learned and actions planned or taken to address significant items.

## iii. AIDA Database

The DR Team has established the AIDA database as storehouse of all of the DR Project’s major assumptions and decisions. This database is intended to support OPG’s future rate proceedings as well as be an adjunct to the plant’s configuration management.

All of the DR Project’s significant assumptions are supposed to be entered into the AIDA database by submittal of a prescribed form to the DR Project Planning & Controls Risk Group. A similar process is used for significant decisions. However, the decision entry process (“Decision Record and Analysis Summary” – DRAS) requires a benefit-cost analysis and progressive approvals based on the potential impact of the decision. The DR Project Planning & Controls Risk Group is responsible for providing oversight and support throughout the assumption and decision management program. Action items that arise from meetings or individual submittals are entered in the actions database, which is also processed and maintained by the DR Project Planning & Controls

Risk Group. As noted below, the DR Team has not fully updated AIDA, which compromises its overall usefulness for its intended purposes.

### c. Summary of Observations

A sound Risk Management Program is critical to the success of a complex project such as the DR Project. The DR Project intends its Risk Management Program to function along such lines. The DR Project's reporting to the BOD and management has been focused on risk identification. While there are good aspects of the DR Project's Risk Management and associated programs, they have not yet been developed to reach their full potential for supporting project objectives. In part, this is due to the maturity level of the DR Project program. A number of the concerns raised herein have been recognized by the DR Project Risk Group and selected action is underway. However, curative actions need attention at this time. The following issues are presented:

- **Risk Identification and Scoring Issues:** Many of the identified risks are really "concerns" stemming from potential inadequate management and thus serve to only clutter the Risk Register – contingency should not be added for poor management, rather, better management should be added. For example, Program Risk No. 300: "The risk is that the Campus Plan schedule may not be fully integrated with the Refurb schedule". Within the industry, the above would only be seen as a risk resulting from poor management, and not an innate work risk. Cluttering the register with false risks is energy consuming and serves no productive purpose. In addition, there is evidence of wide ranging ambiguity and inconsistency in the risk titles and descriptions which leads to uncertainty in understanding the risk that may in turn lead to misplaced mitigations.

Moreover, the rules that the DR Team are using exhibit a broad range of probability (30% - 70%) and could mask serious differences in likelihood of occurrence scoring. A risk with a probability of 31% is given the same score as one with a probability of 69%. While the risk analysis process is not precise, the opportunity exists to inappropriately score a risk in this broad range.

- **Tools for Risk Management Program:** The software systems used for Risk Management and related programs (i.e. RADAR, AIDA, OPEX) are cumbersome with limited capabilities and do not interface well or cross reference with each other. This limits effectiveness as a management tool and causes inefficient use of personnel time. Efforts by the IT group to improve this critical system are essential at this time.

There are a number of shortcomings in the various databases that the Risk Group is tasked with maintaining. For example, the AIDA database is conceptually an excellent tool that should help OPG immeasurably in future rate proceedings. However, our pulsing of AIDA's content identified a number of significant gaps in the information that has been stored within the database. In addition, we noted a number of entries of questionable value (e.g. numerous entries state "the assumption is that identified criteria with regards to (an event) will be met"). Also, many of the entries border on events that should be considered "risks;" however, there is no indication that a corresponding risk was created in the Risk Register.

The OPEX and Lessons Learned program is good, but the OPEX database is not fully integrated with RADAR and AIDA database. This disconnect could cause important OPEX and lessons learned issues to be lost or ineffectively tracked. The DR Project Risk Group's plan for creating an integrated, user friendly and accessible system will remedy this.

- **Opportunities:** A good Risk Management Program also attempts to identify “opportunities” and provide for a proactive response to improve the likelihood of the “opportunity” occurring. No such opportunities have been observed in the DR Project RM Program, suggesting that latent opportunities may be out there.
- **Contingency:** The DR Team is currently implementing a revised contingency process. However, properly implementing and managing the program will be a challenge, considering the above concerns regarding resources in the DR Project Risk Group, training, risk definition ambiguity and RADAR database capabilities. Performing stochastic analyses to calculate contingency is appropriate. However, it is a complex process that could yield inconsistent results. The issues identified herein need resolution in order for the stochastic modeling that will form contingency recommendations to be accurate and consistent.
- **Lack of Metrics:** The Risk Management and associated programs have a less than desirable number of meaningful metrics to provide management with a sense of the maturity or fidelity of the underlying the data and the DR Project’s performance.
- **Staffing and Leadership:** The Refurbishment Planning and Controls Risk Group is lean and staffed with capable but relatively inexperienced individuals - several staff are Co-ops or interns. The DR Project’s philosophy appears to be for the individual projects and departments to perform the majority of Risk Management duties and related work, while the central Risk Group serves only an administrative, support and oversight role. This creates a condition that at the end of the day, risk management is viewed as a collateral duty of project or department personnel which dilutes and diminishes the attention focused on risk management efforts, given other duties of such entities. A recent self-assessment of the DR Project Risk Management program concluded that *“Darlington lacks the resources to achieve the desired dynamic risk culture”*. Despite that conclusion, the accompanying recommendation advocates no curative action.

In a related note, training for Risk Management and related programs is occurring in an ad hoc manner, and the resultant issues addressed in this report reflect its ineffectiveness.

#### d. BMCD/Modus Recommendations—Risk Management Program

Based on the above observations, BMCD/Modus recommends that the Project Team consider the following with respect to the Risk Management and associated programs:

- **Provide Direction on Risk Scoring and Evaluation:** The DR Team should decide whether all Risk Registers “concerns” that rely on existing management processes should be considered innate “risks” with associated analyses, mitigation actions and tracking. The team should also consider whether the definition of risk should include a phrase such as: “...for which there is no management structure of process to address”. The team should vet all DR Project’s Risk Registers and identify those entries which fail to rise to the level of a true risk and consider removing such items as appropriate by closing the risk or transferring it to an action item list.

The team should seek to eliminate ambiguity in risk descriptions, prepare and distribute a short instruction for responsible risk owners to review and revise their risk descriptions. Alternatively, the team should consider assigning several technical writers to review risk descriptions and interface with the responsible risk owners to clarify the descriptions. Also, to avoid inconsistencies and to preclude “gaming”, contingency derivations should be performed across all areas by a qualified centralized

group with adequate resources and detailed procedural requirements. Finally, the team should consider revising probability scoring to include specific points rather than ranges (e.g. 10%, 30%, 50%, 70% and 90%).

- **Address Leadership Issues:** Many of the concerns raised in this section of the report would likely be addressed by appointing or hiring a strong, experienced, and assertive central Risk Program Coordinator with an established track record of success, endorsed by senior management. The risk manager should have well-defined responsibilities (e.g. oversee RM, OPEX, AIDA activities on a day-to-day basis, proactively advocate the documentation of decisions, assumptions, lessons learned, etc., eliminate ambiguity and inaccuracies of database entries, facilitate consistency in risk analysis/scoring and in contingency development, conduct training, etc.). Also, the DR Team should consider performing a staffing analysis to ensure that the Risk Group is right-sized with the appropriate skill sets.

OPG should also consider elevating the Risk Group in the DR Project organization to give it more stature and to demonstrate that senior management considers Risk Management, OPEX Management, Decision and Assumption Programs to be serious and extremely important elements of a successful Nuclear Refurbishment.

- **Expedite the IT organization's efforts with the Various Databases:** The DR Project needs IT support to develop the needed Risk/OPEX/AIDA software systems pursuant to the recommendations of the Risk Group.
- **Address AIDA Database Gaps:** The DR Team should clearly define the requirements of the AIDA Database, review the existing database for conformance with such requirements, and revise the database as required.
- **Training Gaps:** The DR Team should consider developing and executing a comprehensive Risk, OPEX and AIDA training program. This training would foster an understanding and acceptance of the importance of these programs, stimulate proactive participation and encourage the identification of opportunities in the Risk Registers. Once effective training is initiated, consideration should be given to establishing an internal communication program to keep people informed and to sustain appropriate employee interest and participation.
- **Metrics and Trend Charts:** The DR Team should review (and develop or re-develop) appropriate metrics to effectively track various elements of the risk management program.

## V. Major Project Bundles

### A. Retube and Feeder Replacement

The DR Project's largest single cost component is the Retube and Feeder Replacement ("RFR") project, which comprises the Project's critical path and represents the largest risk to the Project's overall execution. OPG is the fourth utility to perform a mid-life refurbishment of CANDU reactors, and all of the prior unit refurbishments have experienced a number of significant delays, cost overruns and/or performance issues. Thus, understanding the risks and lessons learned from these prior projects is an essential part of developing the RFR cost estimates.

The RFR project is organized into three phases:

(1) *Definition Phase*: pre-outage work beginning February 1, 2012 and to be completed before the first plant outage in 2016. It also includes the development of specialized tooling and the design and construction of a reactor mock-up for training purposes, prior to refurbishment.

(2) *Execution Phase*: actual specialized fieldwork associated with each of the station's four reactors, including the removal and replacement of 480 pressure tubes, calandria tubes, 960 end fittings; and 960 feeder pipes the reactor components and includes training and tool maintenance for each of the four DNGS units; and

(3) *Commissioning Phase*: plant commissioning and support as required and directed by OPG.

On March 1, 2012, OPG awarded the RFR contract to SNC/ Aecon (the "JV Agreement"). The JV Agreement is for the Definition Phase of the RFR Project that will be performed from 2013 to mid-2016. The current value of the SNC/Aecon contract is estimated at over \$600 million. Once the Definition Phase is completed, OPG and SNC/Aecon will determine the cost to complete the Execution and Commissioning Phase work and if such cost is acceptable, OPG will award the remaining contract work for the Execution Phase.

### 1. RFR Cost Estimates

The JV Agreement requires SNC/Aecon to develop a series of progressive cost estimates based on AACE *cost estimate Classification System* for the Execution Phase. Per the JV Agreement, the timeline for developing and submitting the progressive cost estimates spans a period of about three years beginning on August 1, 2012. Submission of each progressively classed cost estimate (i.e., Class 4, 3 and 2) is contractually due on June 15 of each year, starting in 2013. The final Class 2 Estimate is intended to form the basis of SNC/Aecon's Target Price for the Execution Phase.

The intent for the progressively classed cost estimates is to absorb all lessons learned through mining-out OPEX along with other information developed during the Project's Definition Phase, all as it becomes available, validated and approved by OPG. The JV Agreement established as part of this progression of estimates a process whereby the successive classes of estimates proceeding to the final Class 2 Estimate specifically exclude consideration of contingency. The JV Agreement at 3.5 states, "Every Execution Phase cost estimate prepared in accordance with this Agreement will not include any contingency amount." However, the JV Agreement also states that the estimates at every level will follow AACE guidelines, and those guidelines include calculation of contingency.

The parties' intent in the JV Agreement is to use the risk register to help develop and manage the Target Cost. OPG and SNC/Aecon will mutually determine and agree on the risks to be included on the risk register. Once there is an agreement, the Target Cost can only be increased for those risks that were identified (unless the risk is an excusable event). As we previously discussed, the procedure dictated by the JV Agreement actually conflicts with the AACE guidelines as well as the processes established by the DR Team for scope and cost "gating."

Nonetheless, as with all cost estimates for the DR Project, as the knowledge that forms the basis of the estimate matures, the RFR Team must present the resulting revised estimate under the DR Project's Gate Process. The intent of this process is to ensure that all important aspects of the estimate under scrutiny have been adequately vetted before proceeding further.

## 2. BMcD/Modus Review of RFR Cost Estimates

BMcD/Modus has examined the two RFR estimates to date to evaluate: (1) the efficacy of the vetting process for the DR Project's most significant scope of work; (2) the status of the RFR's estimate and how it should be viewed by OPG's Management; and, (3) draw broader conclusions regarding the methodology the DR Team has established for review, vetting and challenging estimates in general. To more fully understand the methodology and procedures used for development of the Class 5 and Class 4 Estimates, BMcD/Modus has met with the key members of the OPG RFR estimating team.

In conjunction with its oversight responsibilities, BMcD/Modus has reviewed various OPG's procedural and process documents, certain PowerPoint presentations and the cost estimates. A list of these documents appears in Exhibit A.

### a. Basis of Estimate – Class 5

SNC/Aecon's Class 5 Estimate was initially submitted on August 1, 2012 in accordance with its Project Estimating Plan.<sup>54</sup> OPG observed considerable shortcomings in this initial estimate submission. Most notably, OPG found that contrary to the contractually prescribed methodology for developing the cost estimate, SNC/Aecon embedded several prohibited cost items, such as contingency and overhead within the base cost estimate. As a result, OPG rejected SNC/Aecon's initial Class 5 Estimate. The total of the rejected Class 5 Estimate was \$2.841 B, which OPG determined to be "too high".

As identified in the Estimating Plan, which reflects the current understanding between the parties for the development of the estimates, the root causes of the disconnect between SNC/Aecon and OPG were:

- The detailed basis of estimate were not agreed upon before SNC/Aecon started;
- The original Estimating Plan was too high level;
- SNC/Aecon did not clearly understand the basis for OPG's intended estimating process;
- SNC/Aecon's estimating resources changed, resulting in lost continuity;
- Inadequate and untimely collaboration over details in the estimate.<sup>55</sup>

The remedy for these early process failures was the parties agreed that "schedule and estimate [for the successive estimating packages] to be prepared as ***ideal without risks, contingency & factors per the Agreement.***"<sup>56</sup> The basis for the next iteration of the Class 5 Estimate was a Process Flow Diagram ("PFD") that was derived entirely from OPEX and largely from Wolsong, which was then reviewed and monetized based on the associated level of effort. "In the Class 5 Estimate the critical path activity durations were established on adjusted OPEX durations, based on a percentage average adjustment representing 'ideal' productivity for all [Direct Field Labor or "DFL"] activities equally applied, without contingencies or allowances."<sup>57</sup> The only adjustments to the DFL categories were to adjust the size, scale and to some extent the work rules that represented the difference between Wolsong and Darlington at a very high level.

SNC/Aecon submitted the revised Class 5 Estimate on December 21, 2012. The revised Class 5 was \$1.512 B. Within the industry, the approved Class 5 Estimate would be considered appropriate in defining the reference

<sup>54</sup> DNGS RFR Project—Project Estimating Plan 509407-0000-00000-33IM-0001 R3 (March 21, 2013).

<sup>55</sup> *Id.* at p. 18.

<sup>56</sup> *Id.*

<sup>57</sup> *Id.* at p. 17.

plant for an estimate of this type. The modifications to the process produced what was intended by the JV Agreement—a jumping off point for estimating this work, based on OPEX and in consideration of process improvements that should come from the repetitive nature of this work.

#### **b. Basis of Cost Estimate – Class 4**

The goal for the Class 4 Estimate was for SNC/Aecon to state and OPG to validate the primary costs consisting of vault DFL and the Owner Specified Materials (“OSM”). SNC/Aecon presented an estimate based on “individual OPEX validations” with “100% of all DFL activities on the PFD critical path series. . .analyzed and validated assuming ideal productivity without contingencies or allowances for unforeseen disruptions.”<sup>58</sup> In other words, the Class 4 Estimate was intended to be a validated, perfect-world reference plant with all risks wrung-out. Each DFL activity on the Project’s critical path for the Class 4 Estimate was individually validated, as opposed to the Class 5 Estimate procedure wherein only an average adjustment factor was used, based on OPEX sampling. The vetting of the above described activities was memorialized in specific estimating reports called *Mini-Estimate Reports*.

As stated, each of the Class 5 and Class 4 Estimates utilized information from previous OPG projects (OPEX), *looking backwards*. The primary outside referenced project used for the Basis of Estimate (“BOE”) was Wolsong Unit 1 (2009-2011) OPEX. Below are select estimate considerations:

- OPEX information has been adjusted for quantities and assumed optimum shift work hours and other patterns.
- In the estimate, all work is deemed executed under *ideal* conditions and thus actual *poor productivity* has been excised (based on a review of OPEX information).
- All contingencies and risks have been removed from the estimate.
- OPEX data from the Bruce Restart project and Point Lepreau has been used, as appropriate, when no other data is available.
- OPEX information has been adjusted to reflect existing Ontario Labor Agreements.
- Generally, DFL parallel path activities (i.e., non-critical) have not been robustly re-assessed but have been minimally reviewed so as to determine if they have *gone critical* as a result of CP duration changes made when moving to Class 4 from Class 3.
- Percentage allocation for support services, training and Project Management Team (“PMT”) labor have been carried forward based on the Class 5 Estimate.

Utilization of the above methodology has resulted in a project estimate modeled under *best theoretical* performance conditions. However, the Class 4 Estimate was essentially devoid of more refined cost estimates specifically for Darlington that include productivity factors and contingency identification.

<sup>58</sup> *Id.*

### c. BMcD/Modus's Analysis of SNC/Aecon's Cost Estimates

#### i. Cost Estimate Variance Analysis

The monetary changes noted from the approved Class 5 to Class 4 Estimate were minor: these variances total ~\$139.6M or 9.23% growth from the Class 5 Estimate amount. The most significant difference from Class 5 to Class 4 Estimate were changes to the work day ("WD") durations for critical path work activities in the vault, as summarized below in Table A:

<b>Table A - Critical Path Summary and Variance</b>				
<b>Vault Summary Series</b>	<b>Class 5 Durations (WD)</b>	<b>Class 4 Durations (WD)</b>	<b>Variance (WD)</b>	<b>Basis for Variance</b>
Pre-Requirements	32	92	60	40 WDs added to SNC/Aecon schedule for bulkhead installation; 6 WDs added for PHT work; 14 WDs reconciliation of critical path
Feeder Removal	44	55	11	13 WD added for one parallel task (Feeder Cabinet Removal) changed to critical path; 3 WD added for a new critical path task - Feeder Monorail; -5 WD deleted for reduction of Feeder Removal activity.
Fuel Channel Removal	219	223.5	4.5	Re-evaluation of OPEX related to critical path activities.
Inspection	75	82	7	Re-evaluation of OPEX related to critical path activities
Feeder Installation	97	79	-18	Re-evaluation of OPEX related to critical path activities
Fuel Channel Installation	138	138	0	No changes
Post-Requirements	18	63	45	20 WD added due to the addition of bulkhead removal. 26 WD added due to new execution strategies for four critical activities. -1 WD reduced due to re-evaluation of OPEX related to critical path activities.
<b>TOTAL</b>	<b>623</b>	<b>732.5</b>	<b>109.5</b>	

From a cost perspective, the impacts of these revisions were as follows:

- Bulkhead activities and associated cost in both the Pre-Requirement phase and Post-Requirement phase are now included in Class 4 Estimate whereas these costs were not included as scope in the Class 5 cost estimate (\$73.2M or ~4.84%). OPG has shifted this scope from the Islanding Project to RFR, and thus does not represent a major impact to the overall DR Project's budget.
- Escalation to 2013 dollars is included in the Class 4 Estimate (\$38.4M or 2.54%) per the JV Agreement.
- Other miscellaneous changes (\$29.9M or ~1.85%):
  - OSM decreased based on actual vendor feedback and quotations.
  - Feeder installation duration/hours were significantly reduced as a result of more detailed analysis when compared to the Class 5 Estimate.
  - Tool decontamination and packaging increased in Class 4 level
  - Non-Destructive Examination, Phased Array Testing and Shielding scope was added to the Class 5 Estimate.
  - Letter of Credit costs increased due to a calculation error in the Class 5 Estimate.

The relatively minor change to the cost estimate from Class 5 to Class 4 reflects the parties' goal to perform "100% validation" of the critical path PFD activities that are the foundation of the estimate. It is not clear as to why this work was deferred to the Class 4 Estimate, and the production of the estimates one-after-the-other indicates that this was a continuous effort that may not have justified two separate deliverables or classifications. The variance between the estimates is not reflective of any real increased level of project definition, at least according to AACE Recommended Practices. The most significant change between the two estimates, the bulkhead scope (\$73.2M), was a part of the DR Project, but the scope was shifted to SNC/Aecon after release of the Class 5 Estimate.

BMCD/Modus does not question that SNC/Aecon's estimate is nevertheless better as a result of this validation. However, both OPG and SNC/Aecon should seek to define and classify future estimates with greater precision and traceability to the established processes for the DR Project. If the parties proceed as anticipated in the JV Agreement, this issue will be cured with the Class 3 Estimate, which will be premised more on the specific definition of SNC/Aecon's DR Project Execution Plan and less on the theoretical model that is the heart of the Class 4 Estimate.

## **ii. Estimate Quality Assurance**

The Class 4 Estimate was developed in accordance with SNC/Aecon's Project Quality Assurance Plan. The OPG Estimate Quality Assurance process includes selection of qualified estimating team members who have hands-on experience with CANDU RFR refurbishment beyond available OPEX information. From our review, it appears that the team included or otherwise drew upon Subject Matter Experts with relevant expertise for the purposes of consulting with and advising the OPG estimators. Another level of oversight was provided by SNC/Aecon's Review Team for the purposes of validation of OPEX information and also to ensure complete in-depth scope coverage in the estimates. The cost estimate was also reviewed by a cold-eye Peer Review Team to catch any errors or omissions that SNC/Aecon's Team members may have over looked.

In our view, the OPG cost estimate team exhibits a reasonable composition of talents including experience mix. However, as is true with most nuclear refurbishments, the DR Team will be constantly challenged as the Project progresses.

In order to test the quality of the estimate, BMCD/Modus randomly sampled several line items of cost in the Class 4 Estimate. As a result of this sampling, we found some minor inconsistencies, such that the OPG team should consider assigning a quality resource to scrub estimate sheets for errant inclusions or exclusions, as well as perform quality checks on spreadsheet formulae and the like so as to end up with the most reliable work product reasonable. This is industry best practice particularly on projects involving repetitive work.

### iii. Observations Regarding the RFR Estimates

As noted above, we do not believe that the current SNC/Aecon estimate does not comply with the standard definition of a Class 4 Estimate as such definition is used by AACE, or the industry at large. SNC/Aecon's Class 4 Estimate is based almost entirely on a scale-up of a reference plant (Wolsong) with all known or perceived imperfections removed (an issue itself subject to considerable ambiguity). In developing this "perfect" theoretical estimate, SNC/Aecon and OPG intentionally (and in accordance with the JV Agreement) overlooked central considerations of the AACE guidelines identify for classification of estimates, as summarized below:

- ***The Class 5 through Class 3 Estimates do not include contingencies amounts.*** Per AACE Recommended Practice 18R-97, the expected (+/-) accuracy ranges for Class 1 through Class 5 cost estimates have meaning only after application of contingency (typically at a 50% level of confidence).<sup>59</sup>
- ***Project maturation was not considered in the Class 4 Estimate.*** Per AACE Recommended Practice 18R-97, and in line with industry practice, the maturity level of project definition is the primary determinant of an estimate class – maturity level generally comprises engineering percent complete. For example, in a Class 5 Estimate, the expected level of project definition (as measured by engineering) would range between 0 to 1% of total engineering being complete. For example, a key deliverable for measuring engineering percent complete would be number of completed block flow diagrams. Similarly, for a Class 4 Estimate, the expected level of project definition would range from 1% to 15% of total engineering complete and key design deliverables would include a number of completed block schematics, process flow diagrams (PDFs) for main process systems and preliminary engineered process and equipment lists.
- ***That SNC/Aecon and OPG did not follow AACE for the Class 4 Estimate is intentional, as the JV Agreement's language would preclude classification of these estimates within AACE.*** OPG Management should recognize that this very large and significant portion of the DR Project is being measured, estimated and monetized in a manner that is different from the other scopes of work on the Project. However, as noted, this is by contractual design, as SNC/Aecon is not obligated to provide monetized input regarding the items in the Risk Register until the conclusion of the target price negotiations, which is scheduled for May 2015.
- ***The development of a "perfect" reference plant comes freighted with ambiguity.*** To the uninformed observer, SNC/Aecon's Class 4 Estimate could appear to represent a model for the best possible

<sup>59</sup> AACE International Recommended Practice No. 18R-97 Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Process Industries (November 29, 2011) at p. 2.

outcome (aka optimal performance) for the DR Project. However, the current Class 4 Estimate actually represents a model of “perfect” performance that the DR Team believes is unrealistic to expect in the real world at any location, even perhaps Wolsong. Further, the “reference plant” is actually not Wolsong (which, to date, represents the most successful RFR project from a schedule standpoint) but a modified Wolsong absent approximately 19% of its as-built durations, then scaled-up to match the Darlington parameters. Thus, OPG may well be subject to managing the Project to a wholly unrealistic mile post.

- ***Ultimately, BMcD/Modus recommends that OPG focus on the value derived from the Class 4 Estimates not on whether it meets AACE’s definition of a Class 4 Estimate.*** The RFR work is different from many major construction scopes whereas the AACE classification is ordinarily applied to work that is largely repetitive and akin to a manufacturing process in which tooling, reliability and assembly-line precision is required. Developing an estimate that summarizes the best possible performance of such an operation has significant value.

OPG should be extremely cautious in regard to characterizing its current estimate as being anything other than *current best efforts toward compliance with the AACE estimate classification scheme*. The current estimate nevertheless has great value and should be viewed as a useful benchmark as OPG progresses to an AACE Class 3 Estimate where the cost estimating work product must shine, no excuses allowed.

#### **d. Class 3 Estimate Progression**

The starting point for development of the Class 3 Estimate is the Class 4 Estimate and the Project Estimating Plan. From this point forward, the Class 3 Estimate will be *looking forward* utilizing well-defined Process Flow Diagrams (PFDs), preliminary Construction Work Packages and applicable N-Procedures that are unique to the DR Project and based on SNC/Aecon’s view of constructability. This methodology change could result in task-based duration and man-hours variances; indeed, it could result in improvements from greater knowledge and improvements to the tooling that will be tested in the mock-up. The Class 3 estimate’s efficacy will be determined by the completeness and availability of detail within the design, procurement, mock-up facility and tool testing work efforts, all of which will facilitate progress to the requisite depth and accuracy.

Any developing variances (to the extent existing) will be logged and vetted within the Class 3 Estimate progression cycle. The Class 3 Estimate will be structured as an integrated program to allow for further progression to Class 2 Estimate. OPG expects that the Class 3 Estimate will reflect the SNC/Aecon’s estimate of 100% “wrench time” based on the maturation of the DR Project’s design and the proving-out of the tool set in the mock-up. SNC/Aecon and OPG will further review certain mitigation strategies and actions to reduce risks in the Execution Phase which will be monetized in the Class 2 Estimate.

As stated previously, the Class 3 Estimate will use the Class 4 Estimate as the basis for further development and some important activities and aspects of that effort will include:

- The establishment and maturation of key inputs that will drive the estimate (e.g., Process Flow Diagrams, Engineering and Construction Work Package development and Risk Register).
- A review of the experience and OPEX during the Class 5 and Class 4 Estimate work effort and adjustment of processes and methodology, as appropriate, for continued development of the Class 3 Estimate.

- Compliance with the next level of AACE estimate-classification-requirements as further underscored by OPG procedural documents.
- Identification of major variances as between the Class 4 and Class 3 Estimates.
- Examination, reassessment and refinement of the Risk Register associated with the Class 3 Estimate.

These steps are anticipated by the JV Agreement and should result in a further-refined estimate.

### 3. Risk Program and Contingency Development for Target Cost

The Risk Register plays a very important role in the development of the Target Cost for the Execution Phase of the Project. As discussed above, it is not anticipated that the RFR Contractor's Execution Phase estimate will include contingency until submission of the Class 2 Estimate. The contingency amount will be determined using a probabilistic approach based in large part upon identification of risks on the contractor's risk register. The JV Agreement sets forth the following requirements for the development of SNC/Aecon's development of the Risk Register:

Prior to the submission of each such Submittal, during the preparation of the relevant Risk Register, OPG and the Contractor will work cooperatively towards achieving OPG approval of a final Risk Register by the date specified in the Definition Phase Milestone Schedule. Contractor will develop such Risk Register through a series of workshops that will be facilitated by OPG's authorized representative or an independent third party.

The risk analysis workshops will follow the following methodology:

- (a) Holistic risk analysis;
- (b) Schedule risk analysis;
- (c) Cost risk analysis; and
- (d) Independent third party review.<sup>60</sup>

Additionally, it appears that the final risk register is subject to agreement between the EPC Contractor and OPG. The importance of the risk register is laid out by Section 3.5(g) of the Contract:

(g) **Effect of Agreement on the Risk Register.** Once OPG and the Contractor reach agreement on the Risk Register, no Amendment will be made to the Execution Phase Milestone Schedule, the Execution Phase Target Cost, the Submittal Schedule, the Execution Phase Target Schedule or the Execution Phase Fixed Fee to address a risk that arises during the Execution Phase and that is not identified on the Risk Register attached as Exhibit 3.5(g) (other than risks related to excusable delays as set out in section 5.2(a), or a change in Applicable Laws as described in section 4.4, or as otherwise set out in an approved Project Change Directive or an Amendment). However, OPG will compensate the Contractor for Reimbursable Costs incurred for any Work required to address any such risks that have an impact on the Execution Phase Work and that were not identified on the final Risk Register.

<sup>60</sup> RFR EPC Contract at Exhibit 3.5, Section 14.

SNC/Aecon is progressively refining its Risk Register as the EPC cost estimate progresses through the various AACE estimate classifications. As of May 1, 2013, the Risk Register contained some 329 identified risks. In the further development from Class 5 to Class 4, SNC/Aecon and OPG analyzed 169 (51%) of these initial risks, while 44 (13%) were not analyzed. In addition, the parties agreed to add 116 (31%) additional risks to the register. Of significance, the Risk Register contains non-productive work activities that SNC/Aecon identified from OPEX and stripped from the Reference Plant in Class 4. SNC/Aecon has not fully developed its Risk Register (nor does it have an obligation to do so at this time) to allow OPG to begin vetting the necessary contingency. OPG should consider accelerating the pace at which SNC/Aecon monetizes the Risk Register so that OPG can apply appropriate contingency at the project level sooner than the JV Agreement anticipates.

#### 4. Recommendations – RFR Cost Estimate

Based on our review of the progression of RFR estimates to date and our understanding of the DR Project's next steps, BMCD/Modus has drawn the following conclusions:

- AACE Classifications: Going forward, OPG should seek to clarify the guidelines used for establishing the RFR's BOE which are inconsistent with the terms of the JV Agreement. The primary estimating guidance for SNC/Aecon consists of:
  - AACE Recommended Practice Number 34R-05 - Basis of Estimate with an accuracy band of -30% to +50%.
  - OPG Instruction N-INS-00400-10001 R01 "Estimate Developing"
  - Exhibit 3.5 of the SNC JV Agreement

However, as defined by the JV Agreement, the Class 3 Estimate will not include contingency of any sort and as a result, the associated AACE accuracy bands will not be applicable. From a process standpoint, OPG should seek to clarify the application and appropriate use of these various standards and guidelines in the Class 3 Estimate so as to avoid potential confusion, inconsistency and communication problems during the next phase of the RFR estimate development.

- Metrics for Estimating Progress: The DR Team should strongly consider implementing meaningful metrics that are simple and user-friendly in order to effectively and realistically monitor progression of SNC/Aecon's Class 4 to Class 3 estimate during the next 12 months. Such metrics can track the progression of the estimate in lock-step with the overall maturation of the RFR project, which will have the associated benefit of providing management with key health indicators. One example would be to measure engineering progress by using planned vs. completed drawings in various categories (e.g., P&IDs) on a monthly basis. Another example might be to use work down curves for Engineering and Construction Work Package development.
- Monetizing SNC/Aecon's Project Management Costs: A major outlying cost to be determined in the Class 3 Estimate is SNC/Aecon's management and overhead costs. In Section 1.1.3 of Appendix D-10 of the Class 4 Estimate, the Specific Cost Estimating Report indicates that the percentage cost add-on for foremen management and supervising foreman management and PMT remained unchanged from the Class 5 Estimate. No new information was presented, such as monetization of an organizational chart to support a progression to a Class 4 Estimate. As SNC/Aecon most likely has historical experience suitable for use in meaningfully quantifying these cost items, the earlier the look at it, the better. With respect to SNC/Aecon's Support Services, in Section 1.1.2 of Appendix D-11, of the Class 4 Estimate, the Specific Cost Estimating Report shows that the percentage cost add-on for Support Services (SS)

remained unchanged from Class 5 Estimate. No new information has been presented to suggest a meaningful progression. Again, SNC/Aecon should have historical experience to use and progress the estimate in this regard.

- RFR Risk Register: Considerable work remains in identifying and monetizing risks in the Risk Register specific to the RFR work.
  - The OPG estimating group should be used as a resource to help vet the monetizing of risks as performed by SNC/Aecon. By comparing the SNC/Aecon's assessments to its own, the OPG team will be better equipped to make informed decisions on the reliability of the SNC/Aecon contingency work product.
  - The Execution Phase Risk Register for the Class 4 Estimate contains 329 identified risks at various levels such as low, medium, high and very high. The list is too long and appears redundant yet will most likely grow with the passage of time. As stated elsewhere, for a project of this complexity and importance, OPG should consider bringing on board an experienced risk manager with a solid construction background so as to best manage the Risk Register.
  - As noted, OPG should consider revisiting the contractual scheme that currently prevents SNC/Aecon from monetizing risks until the creation of the Class 2 Estimate and the target price.

## 5. RFR Schedule and Plan Optimization

### a. RFR Schedule Status

RFR's overall schedule development is significantly ahead of the other Project Bundle Teams, particularly in the evolution of the detailed level 3 schedule. The RFR team is involved daily with SNC/Aecon's detailed schedule and monitors development and update progress against the milestones and level 2 activities weekly. Nonetheless, as noted, there are some issues with the RFR's status in the schedule that need to be addressed, including a number of activities with excessive float (600+ days) though the RFR team believes this float is realistic due to early performance of certain work. In addition, RFR will need to examine multiple activities with 500+ days of duration.

Since RFR is on the critical path, it is good that its schedule is farther ahead so that the bugs can be worked out well in advance. Because this team is so far ahead of the others in the planning and schedule development area, the RFR team has encountered technical schedule formation issues that the other teams have not yet encountered. In some cases, Project Controls has not been made aware of some of these issues and is busy establishing rules and criteria for overall project planning and schedule development. These rules do not always address the problems encountered early by the RFR team and are sometimes contradictory to the direction already chosen by this team. As a result the RFR team has to rework previously developed schedules, formats and/or codes. The most affected area of development thus far has been the summary level 2 schedule for RFR. More attention needs to be given to the RFR schedule team's handling of these issues as they are true indications of future project issues.

Some conflict has developed between the RFR Bundle Team and the OPG Project Management Team (and potentially some of the other Bundle Teams) due to this misalignment of progress and not just in the area of scheduling. This conflict is mainly due to the somewhat isolated nature of the teams in the area of project management and schedule development. This is not unusual early in the life of mega-projects like the DR

Project. Because the individual scopes of work are so large and unique that they warrant individual bundle teams, it is the nature of these groups to focus on and attack their scopes somewhat independently. However, we see the issues that have developed with the schedule maturation as further evidence that the DR Team needs to break down silos and move to a unified Program approach.

### **b. Planning Opportunities**

Now that SNC/Aecon has developed the reference plant work plan that forms the basis of its estimate, the team's attention will be focused on developing the specific plan for the DR Project. In doing so, SNC/Aecon and the OPG RFR team should maintain one eye on the OPEX from Wolsong and Lepreau while looking for ways to optimize the plan to move the planning assumptions from *best achieved* to *best achievable* plan. As an example, in our review of the Wolsong OPEX and how it was used in formulating the Class 4 Estimate's BOE, it appears SNC/Aecon has not accounted for the likely productivity improvements OPG will achieve from the revised volume reduction strategy.

From our team's OPEX (Wolsong, Pickering and other relatable plants), there are certain improvements that we believe the team should consider, including:

- In the fuel channel removal, SNC/Aecon should consider a process improvement over Wolsong and remove channels from both sides of the reactor. Doing so could improve the critical path by as much 8-9 days and could lessen overall dose.
- There are certain tool fixes that CANDU Energy made due to performance issues at Wolsong; we will be interested in seeing how these fixes result in better tool performance from the start of the work.
- Distinguishing the Wolsong OPEX from volume reduction from the newly minted plan from SNC/Aecon to see if adequate time and risk has been squeezed from the plan.

As SNC/Aecon's plan is further fleshed-out, we will examine the revised plan for time duration, manpower and manhours for the individual components of the work against the as-built from past refurbishments. In addition, BMcD/Modus has other recommendations for OPG to consider, including:

- Requiring SNC/Aecon to add CANDU Energy personnel who were particularly helpful and effective in the Wolsong project.
- Having a team from OPG working shoulder-to-shoulder with CANDU Energy and tool supply subcontractors in learning the operation of the tools, which we believe will aid OPG in decision-making during the Execution Phase.
- Obtain and rationalize the complete set of Wolsong and other stations' OPEX through the CANDU Owners' Group.
- Begin challenging SNC/Aecon regarding its bandwidth to support multiple refurbishments at once in light of its past performance and likelihood of Bruce Power deciding to go forward.

### **B. Balance of Plant**

Balance of Plant ("BOP") scope for the DR Project consists of DSR's for plant modifications of the following plant areas and systems:

- Pre-refurbishment Work

- Safety & Control Systems
- Reactor Component Systems
- Conventional Systems
- Common Systems
- Special Programs.

For the Execution Phase, the BOP team is working to combine DSRs into these systems to the extent possible. In addition, much of this work is considered “contingent scope” and the necessity of its performance will depend on the outcome of scope defining inspections that will be carried out during upcoming outages. Therefore, as is often the case in refurbishment projects, the scope that comprises the BOP is the most difficult to plan, which can lead to problematic schedule and cost estimate issues.

The DR Team attempted to anticipate the typical issues with BOP in its contracting model, though some of the initial assumptions it made are not materializing. There is a significant risk that absent changes, the BOP work—and in particular, detailed engineering work performed by the EPC contractors—will not advance quickly enough to provide management with a high-quality estimate at RQE.

As a result, the DR Team is currently investigating methods for improving the schedule for BOP scope definition, which in turn should yield a higher quality plan and RQE. However, doing so may require a significant change in the planned project procurement and delivery method. The following summarizes the strategy, status of the BOP work, and recommendations for improvements, many of which are currently being pursued by the DR Team.

### 1. Current Contracting Strategy

As memorialized in DR Team’s Contracting Strategy for Balance of Plant the BOP Team “determined that the preferred approach for [BOP work] is to collate as much bulk work as possible to best leverage existing Extended Services Master Service Agreements (“ESMSA”) and Engineer, Procure, Construct (“EPC”) concepts, and to separate out specialized work by exception for alternative sourcing strategies.”<sup>61</sup> By implementing this strategy, the DR Team seeks to simplify the BOP procurement approach for an “inherently complex collection of work that doesn't fit well into existing DR projects” and minimize the risk inherent in OPG integrating a large number of separate but inter-related packages of plant system work.<sup>62</sup> The ESMSA contractors are ES Fox and Black & McDonald. These contractors were chosen through an RFP process which allowed OPG to negotiate both the contract terms and the rates in a competitive environment. [REDACTED]

After reviewing multiple options for executing this strategy, the DR Team decided to bulk BOP work into two major EPC packages made up of multiple DSRs: (1) nuclear side system work (“NSSS”) and ii) conventional side system work. Scoping of the work is occurring via development of MDR/MDP packages by Project Engineering and the OSS vendors. The BOP Team’s intent is to bid the work between the ESMSA vendors on a “Secondary Compete” basis. The Secondary Compete is intended to identify which of the vendors is most qualified for the work, and the possibility exists for only one vendor to emerge with the

<sup>61</sup> See Contracting Strategy for Balance of Plant, NK38-REP-09701-10102 (March 19, 2013) at p. 4.

<sup>62</sup> *Id.*

entire BOP scope. The BOP Team rejected the option of bidding each individual system in smaller packages due to OPEX that such a method could increase field execution rub points and integration issues and put OPG in the position of having greater management and oversight of the work.

The DR Team's evaluation also considered whether to open competition beyond the ESMSA vendors, though the team concluded that the utilizing the existing vendors had a number of advantages: (1) contracts were already in place based on an open, competitive negotiation; (2) the work under the BOP contracts would be similar in type to the work that the ESMSA contracts were intended to control; and (3) an open bid competition would require significantly more scope definition from OPG than time permits.

The DR Team recognized there were certain risks with this contracting strategy, among which are:

- Because of the scope definition timeframes, the BOP work was already behind the other projects. The DR Team's strategy was premised on "bidding the work via ESMSA secondary compete once scope reaches 70% has been developed" rather than waiting for completed scope definition from the OSS vendors.
- The ESMSA's Terms & Conditions ("T's & C's") existing master agreements were fully negotiated, but there was a risk identified that these contracts "may not be sufficient to address the needs and risks for the BOP project scope of work to be done during refurbishment execution outage." The DR Team is planning on approaching the vendors to see if this is the case.
- The DR Team is concerned that the ESMSA contractors' capability bandwidth may not be large enough, and the team has identified a risk that the vendors may need additional competent resources.
- Labour relations remain a risk as there are still items subject to CPA decisions.
- The DR Team appears to understand that there is a risk of owner interference due to "the large volume of plant system work and the continuing development of project scope."

From a purely strategic basis, OPG's concepts for the BOP model fit within that frequently seen in the industry for such work. However, BMCD/Modus has a significant concern that there is an assumption that enough time exists in the schedule for OPG to: (1) wait to bundle the scope into two large packages of work before even starting the procurement process, which will take some 8-12 months based on current progress; (2) engage in a Secondary Compete between two vendors whose pricing is the same and who have areas of specialty which are likely to dictate which vendor will perform a particular scope of work; and, (3) develop detailed engineering and comprehensive work packages with enough definition to develop a Class 2 Estimate in time for the RQE.

## **2. Scope, Engineering and Schedule Status**

Two major factors are complicating the confidence with the BOP work at this time: (1) scope is still a moving target; and (2) an optimistic, very tight plan for scope definition and procurement of BOP work is currently at risk.

### **a. Current Scope and Possible Reductions**

The work that comprises the DR Project's BOP scope is varied and split roughly in half between NSSS and conventional plant work. As of the 2013 Business Plan, this scope consisted of ~200 DSRs that have been estimated to cost approximately \$503M. It should be noted that the BOP line item for the 2013 Business

Plan reflects a total of only \$161M with a reduction from the 2012 Business Plan of \$207M<sup>63</sup>. This “reduction” was actually a scope shift to the Turbine Generator Bundle, and the remaining BOP scope was in other categories (SIOs and Contingent scope, among others).

In part because BOP is a basket of disparate scopes, it has been subject to increases since the Project’s outset. Based on interviews with the members of the DR Team, the BOP work has expanded to its current state for a number of reasons, including: (1) DSRs were approved for work that should have been considered Life Cycle Management; (2) DSRs were erroneously tagged as Core Scope; and (3) Sustaining Scope definitions were expanded to include items that are outside of the DR Project’s commitments.

There is increasing concern that the BOP scope had grown to such an extent that it was threatening the DR Project’s viability. The result of the observed scope creep, as expressed in the Darlington Refurbishment Independent Scope Review is, “the volume of scope is contributing to an increasing risk to OPG’s ability to successfully refurbish the Darlington units, in terms of cost and schedule. The volume of work will add complexity to the Refurbishment project which may not be necessary, when considering the life-cycle management program at Darlington, i.e. some work may be best performed online or in an outage, managed by the station with utilization of Portfolio funds as required, before or after the refurbishment outage period.”<sup>64</sup>

The DR Team’s review of BOP scope is ongoing at this time. We discuss this review in more detail in Section III.C.2, above. However, we do note here that the review has already netted tangible results. As an example, the BOP team has recently studied the valve program and identified an 80% reduction in the number of valves the team was anticipating replacing.<sup>65</sup> It is likely that the team will reduce the BOP scope overall, which will serve to enhance the chances of the DR Project’s success.

## **b. Schedule Status**

The PIMS Milestone Schedule from January 2012 indicated that detailed design for major components of BOP work would extend well into 2015-6, which is inconsistent with the DR Team’s RQE goal. The C&C Schedule’s iterations have shown some improvement over those dates; however, in April 2013, the C&C Schedule showed MDR preparation for BOP scopes of work was likely to occur through 2013 and into the 1<sup>st</sup> Quarter of 2014, and procurement activities into late 2014.

In addition, the BOP’s actual progress is running late against this extremely tight plan. BOP has missed three major milestones needed for defining its scope due to process-related issues.<sup>66</sup> Current projections (as of June 30<sup>th</sup>) in the C&C Schedule show as many as 89 MDR packages are running later than expected, and that 18 of 40 MDPs needed for BOP procurement were completed. The BOP Project Team has recognized that the current progress with MDR/MDP packages is a significant risk “to support EPC contracting timelines for BOP, leading to schedule delays or the need to proceed with RFPs at risk.”<sup>67</sup> Moreover, the future scope-defining inspections are looming and could create more scope revisions. To

<sup>63</sup> DNGS Refurbishment Estimate Analysis (April 25, 2013) at p. 4.

<sup>64</sup> Terms of Reference Darlington Refurbishment Independent Scope Review, NK38-REF-09701-10004-R000 (May 23, 2013) at p. 2.

<sup>65</sup> See NK38-CORR-09701-0465000 (May 28, 2013).

<sup>66</sup> See Program Status Report for period ending June 2013 at p. 61.

<sup>67</sup> *Id.* at p. 62.

date, 166 of 355 planned scope defining work orders are completed.<sup>68</sup> The BOP Project Team identified “The risk is that BOP scope defining inspections are not completed or completed late resulting in the inability to finalize scope and subsequent delays to awarding EPC contracts.”<sup>69</sup>

### 3. Observations and Risks

By its nature, BOP work carries inherent risks which the DR Team attempted to mitigate with its strategic model. However, the BOP schedule has matured and we are concerned that the scoping work is not moving at a pace necessary to carry out the original plan. In particular, BMcD/Modus sees a significant likelihood that the BOP work will not mature to the extent necessary in time for a high quality estimate at RQE. The most problematic areas and consequences are as follows:

- It does not appear that there is enough time to wait for the MDRs to be finished (even at the 70% level) for bundling of the work into two large BOP packages and enter into a planned Secondary Compete process. The schedule is further tightening due to the later completion of the MDR packages, and the procurement process, even if streamlined, adds 3-6 months to an already tight schedule.
- [REDACTED]
- Because BOP scope is still a moving target, it is entirely likely that even if the scope were “bundled” it would only change again, up or down, and even deductive change orders can be costly and problematic. If bundling the scope is intended to improve the quality of the ESMSA vendors’ plans and estimates for performance, scope uncertainty will negate such an advantage; thus, waiting for the scope to be bundled only delays the start of the detailed design of packages that are sitting on the shelf, some of which are there now.

There are also performance-related concerns that should be examined and mitigated, including:

- There have been questions regarding the ability of the two ESMSA vendors to handle the amount of work that could come from the BOP contracts. This would present an additional reason for avoiding a Secondary Compete process, as it is unlikely OPG would be comfortable with one vendor having a monopoly of the BOP scope. If the work is equitably split between the two vendors, neither vendor would have work that should stretch their capacity.

<sup>68</sup> *Id.*

<sup>69</sup> *Id.* at p. 60.

- There have been questions raised regarding both the contractors' performance on the Campus Plan work and the ESMSA contracts' terms and conditions. These are valid questions, though both vendors have performed larger projects for OPG in the past with success. The DR Team should hone in on the reasons for any suboptimal performance and work out any barriers to success on the broader DR Project scopes, as necessary.
- The nature of BOP work requires schedule and physical coordination between the BOP and the other EPC contractors. OPG needs to recognize its role in this regard of coordinating this work so that interference is limited.

#### **4. Recommendations—Balance of Plant**

The biggest risks to the BOP work right now are scope and schedule. To mitigate the schedule issues, OPG should consider a different contracting approach that would jumpstart the detailed design of the BOP packages; also, consider reducing the scope of those packages to the absolute minimum needed to meet the DR Project's commitments. As part of this strategic refocus, the primary drivers for a revised strategy should be: (1) meeting schedule commitments; (2) reducing potential interference to the RFR contract, and (3) creating flexibility to handle emergent work, schedule perturbations, scope shifting and scope revisions. Without this level of focus on the schedule, it is very likely that the DR Team's commitment to present a high-quality estimate at RQE, at least for the BOP work, will not be met.

As a result, BMcD/Modus recommends that OPG take all reasonable efforts to increase schedule certainty for the BOP work by awarding and assigning smaller packages of the work on a qualifications-based criteria with cost-plus contract terms as soon as reasonable. In this model, the ESMSA could be assigned or awarded projects before the OSS vendor has completed the MDP package for a given modification. This scenario allows for efficiency gains for the ESMSA engineers, who could be involved at an earlier stage of development, which could reduce the re-performance of engineering effort and increase the constructability of the selected modification solution. This structure also allows for easier shifting of packages between the vendors (or other entities) if contractor bandwidth remains a risk. Moreover, if the 2014 Business Plan revised planning assumptions are adopted, the BOP work schedule will have to be the most fluid and allow time for discovery work.

To the extent that there is concern over the cost, OPG could consider using the final as-built price and schedule from Unit 2 to fix or target price more elements of the contract for the later units. By this point, the majority of performance risks will be known and the scope for the remaining units will presumably be substantially identified, allowing for much earlier and more robust planning.

The most pressing problem with the BOP work is the start of detailed engineering necessary for providing management requisite confidence in connection with the RQE. Without changes to the current procurement strategy, this problem will almost certainly manifest itself in a lower quality estimate at RQE than intended. This will cause the DR Team to request greater contingency and have less confidence in the Execution Plan for the work. In our experience, the method of releasing smaller bundles of BOP work is the most prudent and effective means of reducing the risks inherent with BOP work, and in this case, because the ESMSA agreements are in place, would likely be the lowest cost option due to the schedule savings and risk avoidance the DR Project would yield.

## C. Campus Plan

BMcD/Modus has reviewed the status of the ongoing work at the DNGS station that is being performed as pre-requisite work for the DR Project. The Campus Plan work includes a wide variety of infrastructure projects OPG intends to aid in the refurbishment of DNGS or improve the reliability of the station from a life cycle management perspective. The most significant current Campus Plan work consists of the following new facilities that are being designed and built by the ESMSA contractors and managed by the Projects & Modifications group:

- D<sub>2</sub>O Storage Facility
- Low Pressure Service Water Line Relocation
- Water and Sewer
- Maintenance Facility
- Boiler House
- Refurb Island Annex
- Retube Waste Processing Facility
- Power and Electrical.
- OSB Refurbishment
- SIO – Emergency Power Generator (EPG3)
- SIO – Powerhouse Steam Venting System
- SIO – Containment Filtered Venting System<sup>70</sup>

These various scopes of work vary from commercial buildings to more complex technical undertakings, and include work that OPG has performed before (Dry Storage) to entirely new evolutions. The one critical thing these projects have in common is they all must be completed prior to breaker open on Unit 2. Thus, these projects represent a significant risk to the overall DR Project, due in part to the number of projects, their relative complexity and the amount of work left to be done (from planning to execution).

BMcD/Modus sees the evolution of the Campus Plan (including Facilities & Infrastructure Projects) as highly significant for multiple reasons: (1) many of these projects are essential predecessors to the overall DR Project; (2) these projects provide an early test of the capabilities of and new processes employed by the DR Team; (3) these projects allow for an early assessment of the ESMSA contractors' effectiveness and readiness to perform on the broader DR Project; and (4) these projects will provide valuable OPEX for the future work as some of these Campus Plan projects (D<sub>2</sub>O Storage Facility in particular) have encountered significant challenges.

### 1. D<sub>2</sub>O Storage Facility

The following is a summary of the current status of the D<sub>2</sub>O Storage Facility, which is the most significant and mature of the Campus Plan projects. There are some of the significant events that have occurred to date and the lessons learned that have already been captured for the team's examination.

#### a. Background

The D<sub>2</sub>O Storage Facility will provide storage capacity for water removed from the units during refurbishment. The building consists of multiple tanks for Primary Heat Transport (PHT), Moderator and TRF Feed storage,

<sup>70</sup> Projects and Modifications Division Performance Report, June 2013

and has been sized to accommodate the volume of water from two of the Darlington units. This building has a complex design, is time sensitive, has a significant capital cost (\$110 million budget) and employs one of the anticipated key contractors (Black & McDonald) such that its execution provides a good template for much of the work on the DR Project.

The current schedule identifies the following key milestones:

- Detailed Design Complete by Black & McDonald/RCMT by August 30, 2013. The DR Team currently reports that this date will not be met, and mitigation plans are in place to lessen this impact.
- Low Pressure Service Water Line Relocation, which is needed to clear the building's footprint, is planned to be performed during the D1341 Outage and complete by November 9, 2013
- Start of Tank installation – October 9, 2013
- Substantial Completion – February 15, 2015
- Available for Service – April 15, 2015

The DR Team believes that the baseline schedule had approximately 6 months of float, though some of the current design issues will reduce this float. Nonetheless, there are certain delays that have already been incurred that need to be mitigated to ensure the timely completion of the facility. Challenges to date in the planning and design phase have included:

- MDRs Lacked Scope Definition: The initial MDR for procurement of the EPC contract lacked specificity.<sup>71</sup> As a result, OPG's Engineering reworked the MDR with more specific requirements. This experience with MDR resulted in significant process and quality improvements to the MDR process for procurement of the remaining DR Project modification scope, and was a primary driver in Engineering's budget variance against the 2013 Business Plan.
- Project Schedule: The D20 Storage Facility's schedule included unrealistic durations for detailed design work, the root cause of which was the original bid package lacked meaningful information and definition.<sup>72</sup> As a result, Modification Planning, which was scheduled for a scant 2 months, actually required 6 months, and recovery schedules were also missed along the way.<sup>73</sup>
- Completion of Detailed Design: To overcome the earlier schedule issues, OPG's Engineering Team has dedicated five engineers to provide oversight of the drawing preparation. This bears monitoring, as OPG will not have the resources to provide this level of oversight to the EPC vendors for the other Project Bundles.
- Procurement: Black & McDonald's purchasing of long-lead Class 3 valves on-time is also at risk. This is systemic procurement problem, as these valves are in short supply industry-wide.

<sup>71</sup> See D20 Storage and Drum Handling Project: Modification Planning Lessons Learned Report, D-LLD-38000-1001 (March 4, 2013)

<sup>72</sup> *Id.*

<sup>73</sup> *Id.*

- **Planning & Assessing:** The delays to engineering and procurement are likely to ripple into the completion of detailed planning packages. BMcD/Modus will continue to monitor the package development.
- **Construction:** Ellis Don is the civil subcontractor and has been “daylighting” the excavation for some time in order to expose the buried services in this area of the site. Progress has been slower than planned due to the buried lines being found in different locations than shown on the as-built drawings, a configuration management issue dating back to the original construction of DNGS. Also, direct buried cable is being uncovered where cable trenches are shown on the drawings. These issues should be expected where excavations are undertaken in other areas of the site.

The DR Team appears to have responded to these challenges by increasing the active management of the contractor via daily meetings, additional schedule focus and more aggressive review of the engineering product. OPG has also assisted Black & McDonald in correcting some of its safety practices on site.

#### **b. Key OPEX/Lessons Learned/Risks**

The following are critical OPEX from the D20 Storage Facility that DR Team should take into account for the remaining Campus Plan work and the DR Project in full:

- **Corrective Actions to the MDR Process:** D20 Storage Facility was a leading indicator the DR Team used to revise the MDR development process, which is now significantly more robust as a result.
- **Planning Milestones:** A primary finding in the D20 Storage Lessons Learned report is the work for the project was under inordinate time pressure and the team lacked “managerial courage to recognize when [the] schedule is unrealistic for the required deliverable and to escalate.”<sup>74</sup>
- **Management of Contractors:** The mitigation plans in place to recover the D20 Storage Facility have required significant management focus. While these mitigation plans have partially mitigated the impact to the schedule, BMcD/Modus sees a potential concern with the DR Team’s bandwidth to deal with larger and more significant issues that are sure to arise on the DGNS Refurbishment Project. Moreover, the DR Team is evaluating the extent to which the vendor’s performance is contributing to the issues with the D20 Storage Facility, as OPG intends to award a significant amount of work to Black & McDonald.
- **Impact of Design Delays:** As a result of the delays to detailed design, the D20 Storage Facility has lost float and the window for Planning & Assessing is shrinking. A key lesson learned from PARTS Unit 4 is that Planning & Assessing requires adequate time and focus or the field work will suffer.
- **Management of Engineering Deliverables:** The method being used to track engineering deliverables and the metrics used by Projects & Modifications and OPG Engineering should be examined for its effectiveness and possible export to the larger DGNS Refurbishment Project scopes of work. The OPG review cycles and the metrics capturing these cycles should be reviewed.
- **Configuration Management:** There have been buried services and underground conditions that were not accurately captured in the site plans. While it is virtually routine for site work to be adversely

<sup>74</sup> *Id.*, p. 10

impacted by unforeseen underground conditions on a decades-old utility site, the concern is that some of the configuration management issues materialize in other Campus Plan projects.

- **Procurement of Long Lead Valves**: Based on the D20 Storage Facility and the industry at large, the DR Team should examine how it is both determining and tracking long lead materials, whether or not these materials are being supplied by an EPC vendor. The DR Team needs to have proper tracking of such materials in order to establish reasonable schedule milestones and hold the vendors accountable for their performance.
- **ESMSA Performance**: As noted, the D20 Storage Facility as well as the other predecessor Campus Plan work provides an opportunity to fully examine the performance of the ESMSA vendors, and just as importantly, the management techniques that the DR Team is using. To date, the DR Team has added more staff, in particular engineering, and instituted additional accountability forums (more meetings, etc.) to manage this work. The DR Team is examining what has been effective and whether the assumptions in the current management plans for the broader DR Project need to be adjusted. Considering the additional resources and management focus that have been needed thus far on the D20 Storage Facility, BMCD/Modus would also recommend OPG focus on both the qualifications and right-sizing of the DR Team as part of such reviews.

The D20 Storage Facility is the most notable of the Campus Plan projects because of its size, complexity and history of problems to date. Each of the Campus Plan projects present risks, and mitigating those risks will require significant management focus.

## 2. Pre-Requisite Work

A leading indicator of site readiness for the refurbishment is the execution of pre-DR Project work orders during the IPG and planned outages approaching the first unit execution. While planned outage execution of pre-refurbishment work orders has been successful, performance of the normal “T-Week” activities are resource constrained by the station. Subsequently the pre-refurbishment work orders are not getting priority for execution by the station Maintenance organization and are requiring the use of no-station personnel for assessing and work order preparation. The addition of the refurbishment work is straining the organization and will require additional resources and continued focus by the station management for refurbishment work orders to get station priority.

This conclusion is supported by Audit OPGN NO-2013-002, Equipment Reliability determined that performance of the Managed System Controls for sustaining ER is not fully effective (Yellow). Finding 1.1 Deficiencies in Preventive Maintenance Implementation 2) Darlington, found that Preventive Maintenance (PM) was deferred for Fuel Handling (FH) equipment due to lack of parts resulting in equipment failures.<sup>75</sup>

These activities and other Campus Plan work will require additional focus.

## D. Turbine Generator

### 1. Scope

The Turbine Generator Project consists of five scopes of work:

<sup>75</sup> Level 2, SCR D-2013-05089 was initiated to document this finding.

- **Steam Turbines and Turbine Auxiliaries**: inspections, repairs, and/or replacements of High Pressure ("HP") and Low Pressure ("LP") turbine components and a number of turbine auxiliaries;
- **Generator and Generator Auxiliaries**: inspections, repairs, and/or replacements of generator components (including generator stator rewind) and a number of generator auxiliaries,
- **Moisture Separator Reheater ("MSR")**: inspection, overhaul, and/or replacements of MSR internals and auxiliaries (e.g. strainers, valves);
- **Turbine Control Upgrade**: replacement of the obsolete analogue Steam Turbine Electronic Control ("STEC") System, includes entire Turbine Supervisory System with modern design (digital system); and
- **Generator Excitation Upgrade**: replacement of the obsolete Generator Excitation system controls with modern design (digital system) and a set of additional Generator Excitation and Protection equipment to resolve obsolescence.<sup>76</sup>

It is our understanding that the DR Team developed the Turbine Generator Project scope of supply based on a review of the station's operating history and OPG's OPEX with the equipment, and results from CCAs. The Project's Scope Review Board gave its approval for these scopes of work and the Turbine Generator Project Team achieved Project Gate 0 on March 5, 2011.

OPG's original cost estimates anticipated that the total estimated value for the Turbine Generator Project would be approximately \$510M with a base cost of \$365 M<sup>77</sup> and \$150 M for contingency. The contingency amount included cost for scope that may ultimately be required depending on the outcome of certain planned inspections. OPG acknowledged that much of the Turbine Generator scope could be performed as a part of its regular inspection and maintenance program, but decided to add it to the DR Project at that time "for efficiency to minimize outage schedule."<sup>78</sup>

## 2. Contracting Strategy

The original contracting strategy contemplated bundling all of the scopes of work into a single EPC contract. The Original Equipment Manufacturer ("OEM") of the Darlington turbine generator sets, auxiliaries, and controls is Alstom Power ("Alstom").<sup>79</sup> This is highly specialized equipment designed which Alstom designed and supplied as an integrated system for the Darlington Station. Alstom was judged to have the optimal technical knowledge, expertise and full understanding of the complexity of the Turbine Generator Project scope of work. The DR Team identified the following major risks associated with not awarding single source contract to Alstom:

- **Execution Risks**. **Darlington Turbine Generators are specialized and unique in North America custom designed for Darlington**, and the OEM has provided parts, specialized services and engineering for the last 25 years. Hence, if a non-OEM that does not have knowledge or expertise respecting this highly specialized equipment provides the work in question, it will lead to significant execution risks.

<sup>76</sup> Contracting Strategy for Turbine Generators, N K38-REP-09701-10021 (August 31, 2012) at p. 6.

<sup>77</sup> This amount was revised to 346 M with the 2013 Business Plan estimate.

<sup>78</sup> N K38-REP-09701-10021 at p.8.

<sup>79</sup> The Darlington Turbine Generators were actually originally designed, manufactured and installed by Brown Boveri Canada Inc. ("BBC"). BBC was bought by Asea Brown Boveri ("ABB") and subsequently Alstom Power purchased ABB.

- **Integration Risks.** The interface of the Control systems and Generator Excitation with the Turbine Generator Hydraulics is paramount. Turbine and Excitation Controls replacement involves interface with a large number of field devices, components within the hydraulic system and excitation power system, and the respective auxiliaries. **The risks of the said pieces of equipment not integrating properly with each other are significant if a non-OEM provides the work in question.**
- **Compatibility Risks.** Due to excellent performance of the turbines, OPG is able to take advantage of a cost effective **piecemeal retrofit** rather than a complete steam path retrofit. Reverse engineered components may drive compatibility risks, further costs during commissioning, and lost revenue that could be significantly higher than reverse engineering costs.
- **Operational Risks.** If OPG retains a non-OEM to provide the work in question, the resultant mix of OEM and non-OEM components will lead to increased operational risks of the units post refurbishment. In the worst case, forced loss rate may be impacted.<sup>80</sup>

As a result, OPG intended to sole source the Turbine Generator EPC work to Alstom while in parallel, preparing an RFP package that would allow OPG to pursue a competitive bidding process as a backup option in the event that the negotiations with Alstom broke down or stalled.<sup>81</sup>

In fact, OPG was unable to negotiate a full EPC contract with Alstom. [REDACTED]

[REDACTED] As a result, the DR Team revised its strategy so that it sole sourced the engineering and equipment supply to Alstom, and will competitively bid and negotiate the construction portion of the work in the first quarter of 2014.

On March 27, 2013, OPG entered into an Engineering Services and Equipment Supply Agreement with Alstom Power and Transport Canada Inc. [REDACTED]

[REDACTED]. We have not performed our own analysis to verify this fact.

### 3. Summary of Observations/Risks

- The Turbine Generator Project includes scope that is commonly performed in the nuclear industry, and while there are always risks from discovery work and examining the condition of critical components, if the Project is properly scoped and procured, it shouldn't become headline news for the DR Project.
- The award to Alstom on the basis of its unique qualifications to refurbish the DNGS turbines was a sound decision and one that mirrors how other utilities make such decisions. The move to separate the construction from the engineering and procurement parts also appears to be sound, given the price OPG received.
- The DR Team is currently reviewing an option to move the performance of the Turbine Generator control work on Unit 2 to a later time. The key driver for this decision would be to simplify the work in

<sup>80</sup> Memorandum Re: Darlington Refurbishment Turbine Generator Project - Single Source Justification Approval Request by Todd Josifovski, Turbine Generator Project Director (March 18, 2013).

<sup>81</sup> N K38-REP-09701-10021 at p. 8.

Unit 2 and focus the team's attention on RFR execution. BMCD/Modus recognizes the logic behind this option and it should be strongly considered, and management needs to robustly document whatever decisions are made.

## **E. OPG Critical Path Activities**

As noted, the DR Team estimates that OPG will control the critical path 25% of the time (243 of 968 total days) of the breaker-to-breaker unit duration<sup>82</sup>. Many of the work items in OPG's critical path scope have been performed before; however, some of the work, like defueling of the Darlington Units, has never been done by OPG, and here, it will have to be performed under enormous schedule pressure.. The DR Team is very aware of these risks and has made adjustments to the plan, most notably with refurbishment of the fueling machines prior to the opening of the Unit 2 breaker. The team is planning to continue to refine its schedule and sequence of events. The following is a summary of some of the DR Team's current efforts to organize and plan the critical path work.

### **1. Site Integration Planning**

The DR Team's success in managing the critical path will depend on developing a cohesive and well-managed team that integrates the Project and Station personnel. BMCD/Modus monitored the integration plans and activities of the site integration team supporting these efforts.

Site Integration Plan meetings are focused at the management level which is appropriate given the time to the execution window. The initial integration plan was functionally based around the organization being reviewed for transition to refurbishment, Chemistry & Environmental, Safety, Design Engineering, Systems Engineering, EP, Licensing, etc. The initial presentations to the site are complete and while providing a broad based format for discussion of general personnel requirements and management structure, but contained few actionable items.

The Site Integration meeting agenda focuses on the near term actions required for the DR Project readiness with organizational transition plans discussed as a subtopic. The first integration topic covered is "Top Five Milestones." These Milestones were chosen by the leadership team and cover the near term actions, owners and due dates to support the milestone completion:

- Scope Frozen at Work Order level
- Improve Fuel Handling Reliability
- VBO Preparations
- Major Site Projects
- Development of Transition Plans

Once all actions are resolved for these priorities, the Site Integration Team will focus on additional strategic considerations and specific support for each of the DR Project Bundles.

### **2. Defuelling/Fuel Handling/PHTS Bulk Drain**

OPG's portion of the Vault Preparation window is currently assessed at 88 days and consists of the following activities:

<sup>82</sup> DNGS RFR – Execution Phase Estimate Progression, June 21, 2013.

- Breaker Open – 1 Day
- Defuel – 62 Days
- Primary Heat Transport System Bulk Drain – 25 Days
- Airlock Open – 1 Day
- Vault Turn-over – 1 Day
- Moderator Bulk Drain – 25 Days

The DR Team is currently assessing each of these durations. The Fuel Handling systems present unique challenges due to the fact the fueling machines that are needed to support the DR Project are also needed to maintain operations of the operating units. In addition, there is a concern that the station and OPG lack specific operational experience with performing these evolutions under schedule pressure. The team has taken some significant steps since the outset of our engagement to address certain key risks:

- The DR Team's leadership and the CNO recognized the risk of fuel machine reliability and availability could not only impact the project but also the support of the operating units during the project. The FH Team was directed to move forward the work needed to refurbish the fueling machines before the Unit 2 outage.
- Much of the work originally planned for Project will be included in earlier outages or performed on-line.
- Primary responsibility for the defuelling was turned over the Station to manage. There are some risks that have been raised regarding resource availability and support.

B&McD/Modus sees OPG's decision to place the responsibility of the fuel handling system and equipment reliability and for the defuelling of the reactor on Operations as sound and likely to reduce project risk. For the revised plan to work, the Fuelling Machine Operators (FMO's) will need to familiarize themselves with the new Universal Carrier and the different tooling used for defuelling channels with different flow rates. This is a relatively minor addition to the current expertise of the FMO's. BMcD/Modus also sees the benefit of charging the Projects & Modifications and fuel handling maintenance groups with upgrading the fuel handling system and equipment, returning them to the required level of reliability (the as-designed system performance) and for placing the Service Area Rehearsal Facility (SARF) back into service. Consequently, Operations now has the responsibility to turn over a defuelled reactor to the Refurb team.

The planning and organizing of these reliability projects, on top of the routine operations staff work, will need to be addressed from a staffing and funding perspective. Our current observations indicate that the planning for Defuelling tool design is sound, with float included in the schedule for tool design modifications to be made should problems occur during the prototype testing.

Once the breaker is opened, defuelling the reactor core will be the critical path activity. In addition to fuel handling system and equipment reliability there are other key items that should be addressed in order to minimize the time taken to defuel the reactor. B&McD/Modus recommends that the following be considered:

- Staffing for continuous three trolley fuelling/defuelling capability (24 hours/day; 7days/week);
- Fuelling/defuelling across shift changes and breaks.

The remaining Vault Preparation work is being examined for opportunities to improve durations and sequencing.

## VI. Summary of Recommendations

In the foregoing, BMcD/Modus has attempted to identify for the DR Team a number of recommendations based on our current assessment of the Project's risks. The most significant of these recommendations are summarized below:

Issue	Risk/Opportunity	Recommendation
Scope	The DR Project's scope exceeds the commitments made to the BOD and Shareholder.	<ul style="list-style-type: none"> <li>Continue the process of reducing and optimizing the Project's scope.</li> <li>Reach a consensus on the scope as expeditiously and reasonably as possible so as to reduce the DR Team's work load and unneeded churn.</li> <li>Once the scope recommendations are adopted, the team will need to re-review the schedule to ensure the logic network is sound.</li> </ul>
Engineering	The schedule and pace of procurement related activities may not support a high-quality estimate at RQE.	<ul style="list-style-type: none"> <li>Review strategic considerations for procurement of remaining scope.</li> <li>Consider early "shoulder to shoulder" work by EPC design partners to expedite the start of detailed engineering and constructability reviews</li> <li>Review and prepare for likely RFIs from EPC vendors during the Planning and Assessing Phase.</li> </ul>
Project Management	The Project oriented focus has created management silos that could make integrated program management difficult, resulting in contractor/owner interferences.	<ul style="list-style-type: none"> <li>As the Project matures and contracts with vendors are in place, the DR Team should increase the level of program integration.</li> <li>Address the fact that the Execution Phase may require individuals with different skills for OPG to effectively manage the contracts.</li> <li>Clarify reporting lines for matrixed Project Controls Personnel.</li> <li>Actively seek to assemble the Execution Phase team as soon as possible.</li> </ul>
Schedule Development	The DR Team plans to implement a C&C Schedule at Level 2 for management which could create a number of coordination issues during the Execution Phase.	<ul style="list-style-type: none"> <li>Continue development of the C&amp;C Schedule through the Definition Phase and migrate to a fully integrated Level 3 schedule for the Execution Phase.</li> <li>Redirect the Project Controls Team's efforts from the C&amp;C Schedule work to that of monitoring the developing Level 3 schedules from the contractors.</li> </ul>

Issue	Risk/Opportunity	Recommendation
	The current schedule development depends on mutual agreement and acceptance of quality standards that owners typically demand, creating the risk that contractors will not comply.	<ul style="list-style-type: none"> <li>Clarify and include in commercial contracts OPG's requirements for schedule development by the contractors.</li> </ul>
Risk Management	The current methods for scoring risks are inconsistent and the risk register includes "issues" or "concerns" that needlessly dilute management efforts.	<ul style="list-style-type: none"> <li>Provide consistent characterization and scoring of risks.</li> <li>"Concerns" as currently defined should be eliminated from the Risk Management Program.</li> <li>Ensure that all relevant parties have a seat at the risk table while maintaining a measure of centralized control in the approach to risk identification and tracking.</li> <li>Consider revising probability scoring to increase granularity and ranking of risks.</li> </ul>
	Leadership, training and wide acceptance of the importance of the Risk Management Program is lacking and the Project Controls Risk Group is understaffed.	<ul style="list-style-type: none"> <li>Consider bringing in an experienced risk management lead with a demonstrated track record who is singularly focused on the risk function.</li> <li>Review qualifications within the existing risk team.</li> <li>Elevate Risk Management to a stand-alone functional group with the same level of prominence as the Schedule team.</li> <li>Provide training with a focus on the overall importance of the Risk Management Program</li> </ul>
	The various databases that the Risk Group is populating suffer from a number of IT issues and lack of focus.	<ul style="list-style-type: none"> <li>IT needs to resolve the outstanding issues as quickly as possible.</li> <li>Training should include instruction for populating databases.</li> <li>The AIDA database should be examined and updated if it is to be useful for rate proceedings.</li> </ul>
Cost Management	The DR Team is inconsistently applying AACE guidelines and other processes and procedures central to the BOD's understanding of the underlying quality of project cost estimates.	<ul style="list-style-type: none"> <li>Consistently apply AACE guidelines, and where they are not (as in the RFR project estimates), the DR Team should seek to return to a condition of compliance.</li> </ul>
	Revised planning assumptions for	<ul style="list-style-type: none"> <li>Document and characterize the</li> </ul>

Issue	Risk/Opportunity	Recommendation
	The 2014 Business Plan revised assumptions that are currently being assessed—the business case for these assumptions is centered on the opportunity to reduce risk and increase positive outcome.	<p>information for the BOD and consider meaningful reporting metrics.</p> <ul style="list-style-type: none"> <li>• Should OPG adopt the revised assumptions, review commercial agreements so as to identify potential issues that could be impacted by the revised plan, as well as other issues within contracts that can be improved based on current OPEX.</li> <li>• Review capture and documentation of Unit 2 OPEX information so maximum benefit is derived from this revised plan.</li> </ul>
	The 2015 Business Plan Budget review will likely repeat the process for the 2015 Business Plan in which the budget is refreshed.	<ul style="list-style-type: none"> <li>• Perform a full project reforecast for the 2015 Business Plan in order to progress the project's cost estimates as far as possible before the date of the RQE.</li> <li>• Such a reforecast will provide management with a detailed blueprint for all of the work needed to satisfy the RQE with information related to the budget that should match the DR Project's growing level of maturity.</li> </ul>
	Contingency calculations need closer alignment with the Risk Management Program.	<ul style="list-style-type: none"> <li>• Actions summarized above</li> <li>• Create a clear and repeatable process for calculating contingency at all levels and for all program participants.</li> </ul>
<b>Management Processes</b>	OPG's new processes and procedures are in some cases conflicting and repetitive.	<ul style="list-style-type: none"> <li>• Look at reducing the number and optimizing the process map.</li> </ul>
<b>RFR</b>	SNC/Aecon's Class 4 Estimate (by contractual design) does not monetize contingency nor will it until the date of the 2015 Class 2 Estimate; this fogs the budgeting process and could complicate target price negotiations with SNC/Aecon over risk identification.	<ul style="list-style-type: none"> <li>• Consider asking SNC/Aecon to monetize risks at a much earlier stage.</li> </ul>
	The Class 4 Estimate represents perfect performance; thus, it will form the basis for comparison with actual results.	<ul style="list-style-type: none"> <li>• The DR Team needs to document and explain the nature of the Class 4 Estimate so that there is no such confusion.</li> </ul>
	Project maturation specific to the DR Project was not a factor in SNC/Aecon's estimates to date.	<ul style="list-style-type: none"> <li>• The Class 3 Estimate preparation should be expedited if possible.</li> </ul>

Issue	Risk/Opportunity	Recommendation
		<ul style="list-style-type: none"> <li>OPG should seek SNC/Aecon's monetizing of PMT costs.</li> </ul>
	The potential unlapping of the execution of Unit 2 could result in cost increases from SNC/Aecon due to extended overhead and maintaining the workforce for a longer duration.	<ul style="list-style-type: none"> <li>While SNC/Aecon's costs may increase, there are other elements within the contract that should be negotiated that might serve to reduce the overall project's risk.</li> </ul>
	There are technical improvements that should be reviewed based on OPEX.	<ul style="list-style-type: none"> <li>Study opportunities now that the effort is turning to Darlington.</li> </ul>
BOP	The time engineering needs to create MDP packages is delaying the procurement of the work and the commencement of detailed engineering.	<ul style="list-style-type: none"> <li>Accelerate engineering work as necessary / practicable with the OSS vendors.</li> <li>Reduce and optimize BOP scope as soon as reasonably possible to decrease wasted effort.</li> <li>Change procurement method to a packaged approach (see below).</li> <li>Jumpstart detailed engineering by engaging EPC vendors as early as possible in the design process.</li> <li>Eliminate unnecessary duplication of effort between OSS vendors and EPC designers.</li> <li>Review and eliminate OPG delays in approval of design work.</li> </ul>
	The procurement process for BOP is designed around packaging two large bundles of BOP work and a Secondary Compete process which adds time to the schedule; the outcome of this "competition" is essentially already known.	<ul style="list-style-type: none"> <li>Assign work to ESMSA vendors based on qualifications in smaller bundles.</li> <li>Use the existing ESMSA agreements and eliminate bidding process.</li> </ul>
	The ESMSA contractors have experienced performance problems on the Campus Plan work.	<ul style="list-style-type: none"> <li>Ensure that appropriate performance metrics are in place and aggressively address specific performance trends and problems as they arise.</li> <li>Increase flexibility in the assignment of BOP work to give OPG an opportunity to mitigate ESMSA performance issues.</li> </ul>
	There is a risk that scope defining inspections and discovery work during the Execution Phase will add scope not currently	<ul style="list-style-type: none"> <li>Optimize the BOP work so that an appropriate schedule window exists for performance of scope adders.</li> <li>Increase visibility of this potential risk.</li> </ul>

Issue	Risk/Opportunity	Recommendation
	anticipated to the BOP work.	
Campus Plan	<div></div> <div></div> <div></div>	<ul style="list-style-type: none"> <li>Continue to devote adequate resources to recover the D20 Storage Facility's schedule.</li> <li>OPEX from this project should be used to guide management of the future Execution Phase work.</li> </ul>
	Campus Plan work is multi-faceted and schedule driven; the sheer size and timing of the work adds complexity and risk	<ul style="list-style-type: none"> <li>Additional management attention is needed to ensure planning and execution of the work</li> </ul>
	The Campus Plan's scope is too large	<ul style="list-style-type: none"> <li>Continue to review the Campus Plan Scope and eliminate unnecessary projects.</li> </ul>
OPG Critical Path	OPG-directed work is 25% of the Critical Path of the DR Project.	<ul style="list-style-type: none"> <li>Ensure that this work is given proper focus and resources.</li> </ul>

509407-0000-00000-30IM-0001_RPB_Project_Controls_Plan	identifies the required Project Controls systems, processes and procedures	6/15/2012
509407-0000-00000-30IM-0002 RPA - Resources Management Plan 20120515	identifies the required resource management processes utilized for the purposes of this DNGS RFR Project	5/10/2012
509407-0000-00000-30IM-0003 RPA - Scope Management 20120515	includes a change control process so it has been abbreviated as SCP – a short form for Scope and Change control Plan	5/15/2012
509407-0000-00000-30IM-0003_R02 Scope and Change Management Plan	to ensure there is a controlled work process that will document, track and manage all project changes	5/6/2013
509407-0000-00000-30IM-0005 - R00 JV Risk Management Plan	to describe risk management processes that will be implemented; shall describe the application of SLN-Aecon's corporate risk management program	8/28/2012
509407-0000-00000-30IM-0005_RPB_Risk_Management_Plan	shall describe the application of SLN-Aecon's corporate risk mgmt. program as well as OPG's risk management program(s).	6/13/2012
509407-0000-00000-30IM-0008 Proj Admin Plan RPB - 20120601	to describe SLN-Aecon's project admin practices and policies to provide systematic and practical approach for the project admin function	6/4/2012
509407-0000-00000-30IM-0012_R00 Interface Coordination Plan	will focus solely on the technical interfaces of the Project where differing scopes interface with each other during the Definition Phase	4/10/2013
509407-0000-00000-30IM-0013_R00 JV Human Performance Program	shall aim to recognize and address error-likely situations and potential challenges in task performance by establishing, promoting and reinforcing positive behaviours throughout project	3/1/2013
509407-0000-00000-32IM-0001 Schedule Management Plan -	identifies the required management systems, processes and procedures to be utilized by	4/13/2012

DOCUMENT NAME	DOCUMENT DESCRIPTION	DOC. DATE
Apr 13 2012	the DNGS RFR Team	
509407-0000-00000-32IM-0001_R02 Schedule Management Plan	describes the requirements and work processes to be used as they relate to the various schedules	5/6/2013
509407-0000-00000-33IM-0001 RFR - Estimate Plan - Apr 13 2012	to prescribe the processes and the basis of Estimate and requirements for production of the Execution Phase Estimate	4/13/2012
509407-0000-00000-33RA-0035 Apr-23-13_Rev PB JV RFR CL 4 Cost Estimate OSM	TMOD material, supports, hardware, feeder vision system, and miscellaneous items.	5/15/2013
509407-0000-00000-33RA-0035 Apr-23-13_Rev PB	CL-4 Cost Estimate - Owner Specified Materials (OSM)	5/15/2013
509407-0000-00000-34IM-0001_R00_JV Cst_Mgmt_Pln	This Cost Management Plan (CMP) is a component of the Project Controls Plan (PCP). It identifies the required management systems, processes and procedures to be utilized	6/12/2012
509407-0000-00000-40EP-0001 R00 - Engineering Plan	Provide a description of eng. work; how work will be organized; applicable procedures & processes to be used	8/23/2012
509407-0004-00000-60IM-0001_R00 - D1341 Walkdown Plan - 08FEB13 – MASTER	RFR team will perform a series of walkdowns to perform inspections, take measurements and photos to support plant modifications engineering and tooling design	2/7/2013
509407-30CC-I-0224-Letter-Submission of Schedule Management Plan R02	correspondence referring to SMP, Retube & Feeder Replacement	5/27/2013

## **Report to Nuclear Oversight Committee**

**4<sup>th</sup> Quarter 2013**

**Darlington Nuclear Refurbishment Project**

**ONTARIO POWER  
GENERATION**

Burns & McDonnell  
Modus Strategic Solutions

November 12, 2013

## I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company ("BMCD/Modus") provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors ("NOC") regarding the status of the Darlington Nuclear Generating Station's Refurbishment Project ("Project" or "DR Project") as of October 31, 2013. The DR Project continues to advance toward its major goal of producing a Release Quality Estimate ("RQE") for final Board of Directors and Shareholder approval by October 15, 2015.

The following is a brief summary of the Project's most significant developments over the last quarter:

- **Retube & Feeder Replacement Project Risk:** The RFR project remains the DR Project's most notable risk, and the schedule for SNC/Aecon's Tooling and Definition work of the Mock-up has degraded significantly over the last quarter. From July 1 to September 30, 2013, SNC planned to earn \$61.0M. However, during this period, SNC/Aecon earned only \$43.2M (70% of plan). Additionally, SNC/Aecon first claimed that it was entitled to meet its late-finish payment milestones in its contract, a sure way to eat up schedule float and significantly increase the risk that it will not meet its dates to support the planned start of execution in 2016. OPG's RFR Management has rejected that approach and has required SNC/Aecon to develop a recovery plan to restore progress to the plan by May 2014 based on its target schedule. In addition, SNC/Aecon's Class 3 Estimate, which is also due in May 2014, is off to a slow start. The DR Team is committed to holding SNC/Aecon accountable for both a timely and a robust Class 3 Estimate. SNC/Aecon's progress will require close monitoring.
- **4c Cost Estimate Release:** The DR Team completed the Project's request for release of funding as part of the 2014 Business Plan ("4c Cost Estimate"). The DR Team used the 4c Cost Estimate to evaluate the status of the Project and all of its component parts, and address potential risks to the Project's success. In this Report, we provide our comments regarding the 4c Cost Estimate effort and recommendations for the development of the 4d Cost Estimate and related contingency model, which will be an important predecessor to the Release Quality Estimate ("RQE") in 2015.
- **DR Project Scope and Schedule Review:** Project scope and schedule assumptions were vetted and management issued its recommendations for reducing the DR Project's scope and "unlapping" the performance of Unit 2. The 4c Cost Estimate reflects these changes. BMCD/Modus found the process the DR Team used for revising its plan to be robust and in keeping with the Project's core mission and processes. The results achieved – reducing the Project's scope and focusing on a single unit refurbishment – are reasonably calculated to mitigate the Project's overall performance risks.
- **Balance of Plant ("BOP") Contracting Model Change:** BOP planning and related Engineering product are advancing well. Management has moved forward with suggested modifications to the BOP contracting model that should streamline the work and reduce performance risks, as well as advance the work to the detailed engineering phase that underpins a robust and reliable RQE. Engineering has geared up to support the BOP work and has met interim milestones. In addition, the scope reduction should positively impact both BOP and Engineering.
- **Campus Plan Project Risk:** The Campus Plan also remains a significant risk. The work on the D20 Storage Facility excavation has been impacted by unforeseen conditions and ongoing engineering challenges and is projecting to complete four weeks late. Management is taking appropriate action to bring needed focus to this work and the remainder of the Campus Plan scope.

Overall, the DR Team's senior leadership has positively responded to the recommendations in our Initial Project Assessment that we presented to the NOC last quarter as well as ongoing challenges. Attachment A to this Report summarizes the Project's current risks and generally tracks the Team's progress in implementing improvements to the Project's plan.

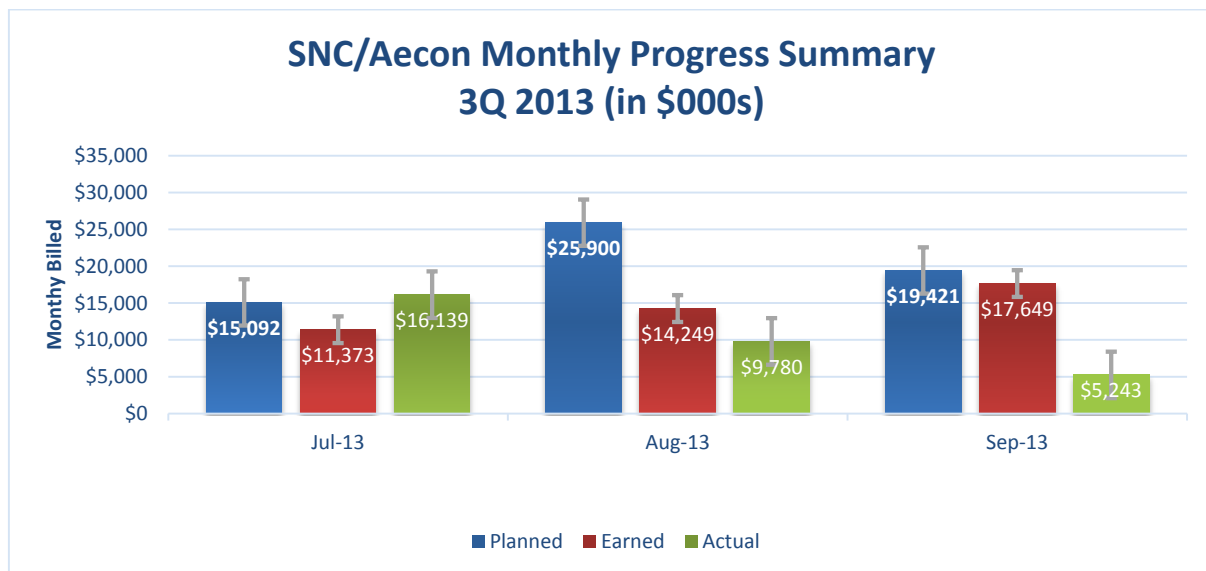

BMCD/Modus has worked with Internal Audit to identify areas within the Project's Assurance Plan that BMCD/Modus is covering in our Independent Oversight role. It is important to note that BMCD/Modus is not performing audits and that this assurance coverage will be performed under our existing reporting and lines of authority. As such, it should provide the DR Team some relief from "audit fatigue." We will continue to work at the NOC's direction in support of OPG's Assurance Plan.

## II. Major Projects – Summary of Key Risks

### A. Retube & Feeder Replacement

#### 1. Work Status – Tooling, Definition and Mock-up

SNC/Aecon is behind schedule in the Definition, Tooling and Mock-Up phases of its work and is continuing to trend downward for these scopes of work. When the DR Team baselined the C&C Schedule in June 2013, SNC/Aecon was essentially on or slightly ahead of plan. OPG's monthly report for July 2013 reflected that SNC/Aecon had planned to earn a total of \$168.6M, earned \$169.4M and expended \$165.7M, yielding a cumulative CPI of 1.02 and an SPI of 1.0. However, in the three months since the baseline, SNC/Aecon's progress has taken a significant turn for the worse. From July 1 to September 30, 2013, SNC planned to earn \$61.0M. During this period, however, SNC/Aecon earned only \$43.2M (70% of plan); notably, they only expended \$31.1M, or 51% of plan, which indicates they are not spending enough to keep pace. The chart below depicts SNC/Aecon's monthly earned and actual billings in comparison to its plan for each month of the 3<sup>rd</sup> Quarter 2013:

Overall, these figures when translated to schedule progress show SNC/Aecon was approximately 30% behind its planned schedule for 3Q 2013. SNC/Aecon's most significant delays appear to be:

- **RT Platform:** Originally planned to complete June 13, 2013; now that the schedule performance is visible, it is now apparent that this work is one year late and slipping; this is the critical path for the mock-up;
- **Procurements of Feeder Tube and Retube Waste Containers:** Originally planned for 2Q 2013, these procurements have slipped to 4Q 2013, and OPG is concerned with locking up key suppliers;
- **Multiple Planning Deliverables:** SNC/Aecon is late in preparing and providing to OPG its suite of processes and procedures for developing the Class 3 Estimate, Tool Quantification, Project Controls and Project Execution.

With respect to Tooling, SNC/Aecon reported on October 7, 2013 that its procurement and engineering were significantly behind schedule, such that SNC/Aecon's cumulative SPI was 0.80. Moreover, SNC/Aecon was projecting that its SPI will bottom out at 0.70 for several months and rise slowly well into next year. SNC/Aecon is projecting to be approximately 11% behind schedule as of May 2014 even with some substantial improvements over its current performance.

[REDACTED]

OPG's RFR Management Team, now led by Roy Brown, has demanded a recovery plan from SNC/Aecon that will close this significant gap and return to the plan by May 2014 (the due date for the Class 3 Estimate and the next major project gate for RFR). In addition, in a Senior Project Management meeting with SNC/Aecon on October 25, 2013, OPG's team required and SNC/Aecon agreed to provide its target schedule as the baseline for the C&C Schedule going-forward. This will substantially increase SNC/Aecon's transparency. The Team has requested SNC/Aecon to support its recovery plan with meaningful data showing how it will obtain and utilize the necessary resources. The RFR team is also increasing its presence in Oakville and is probing SNC/Aecon's progress to ensure greater accountability.

BMcD/Modus draws the following conclusions from the review of project data:

- Management's recent actions with SNC/Aecon have set the proper tone of accountability. This is a very positive step, as OPG's senior project leadership recognizes the importance of working with the contractors to overcome challenges. It was also timely, in that catching these trends now at this early stage allows for course corrections at an opportune time before the teams become entrenched. We will now measure SNC/Aecon's performance against its recovery plan to see whether it has properly received the message.
- The current SNC/Aecon situation shows the importance of tracking contractors based on earning rules that have interim steps based on tracking ongoing physical progress and key commodities. Placing too much importance only on deliverables and completion milestones will result in tremendous peaks and valleys, making forecasting and accurate progress reporting very problematic. BMcD/Modus recommends earning rules to be structured based on a combination of physical progress and milestones, utilizing earned work hours and commodities bought/installed as the basis for earned value.
- The DR Project's reports should have more emphasis on period-over-period performance so that negative trends are more easily discernible from the project's data. The monthly Project Status and Program reports show monthly variances but the metrics focus on cumulative results which can easily mask the velocity of performance changes. Correcting these trends requires their visibility.
- OPG should not hesitate to request the contractors to provide the information it needs to properly manage the work. As an example, OPG will be hampered in gauging SNC/Aecon's recovery plan if it does not receive actual work hours and costs for every activity, regardless of whether the work is part of a fixed-price component. SNC/Aecon will likely have to commit significant resources for recovery and the only way OPG can be assured of SNC/Aecon's commitment will be if SNC/Aecon is transparent in all aspects of the plan and execution.
- Since the RFR Project consists of approximately 45% of the DR Project's overall measured earned value, these poor indices have, and will continue to, drag down the entire Project's earned value until or unless this performance trend is corrected by SNC/Aecon.

BMcD/Modus is closely monitoring this situation, and has been invited to attend progress meetings with SNC/Aecon's management.

## 2. SNC/Aecon Class 3 Estimate Plan

SNC/Aecon is required under the contract to submit its next phase of estimate on May 15, 2014. This estimate has been termed a “Class 3 Estimate” though, as with the earlier SNC/Aecon Class 5/4 estimates, the AACE-based definition for this estimate is imperfect at best. While this Class 3 Estimate will turn the focus from OPEX gathered at other stations to DNGS, it will still not account for risks, nor will it strictly adhere to other AACE requirements. The DR Team recognizes the need to monetize risks in concert with the Class 3 Estimate and will seek visibility to these risk items. The SNC/Aecon and OPG Teams are meeting weekly to reach an agreeable Class 3 Estimate Plan which should put the concerns over the basis of the estimate to rest.

SNC/Aecon’s team announced at the October 28, 2013 project meeting that the Class 3 Estimate development has no float through May 15, 2014. BMcD/Modus identified that SNC/Aecon’s Monthly Report for September 2013 showed SNC/Aecon had earned extremely little time (only 335 hours) in preparing the Class 3 Estimate to date. SNC/Aecon believes that there is an anomaly or error in this report, though the amount of work apparent to date on the Class 3 Estimate suggests that SNC/Aecon needs to significantly ramp-up this effort. This also bears close monitoring over the next quarter.

### B. Scope Rationalization Process / Unlapping of Unit 2

In 2Q 2013, the DR Team’s Senior VPs initiated a process to review, scrutinize, and rationalize the DR Project’s scope. This process was performed by a “Tripartite Review Team” drawn from the Project Team, the station and a team of independent reviewers including VPs external to the DR Project who have knowledge of the plant. The Tripartite Review Team evaluated the DR Project’s scope with a view of the Project’s objectives as well as requirements/commitments that have been made to the CNSC. The Tripartite Review Team’s results were aggregated and presented to the DR Project and DNGS station representatives for future review and disposition by the Project Scope Review Board (“PSRB”).

In all, the Tripartite Review Team reviewed 579 DSRs with an estimated value of \$4.865 B and determined that 210 DSRs with an estimated value of \$212M should be removed from the DR Project’s scope. In addition, 22 DSRs totaling \$125M are slated for further review and potential future action. The chart below summarizes the results of the Tripartite Review Team’s evaluation:

**Tripartite Review Team Recommendations**

Funding Stream	Total DSR Database	Confirmed To Perform in Refurb.	Not Reviewed <sup>1</sup>	Further Review Needed/Potential Further Reduction	Recommended to Cancel
<b>Nuclear Refurbishment</b>	\$4,827	\$4,468 M	\$32 M	\$125 M	\$202 M
<b>Other</b>	\$70 M	\$60 M	\$0	-	\$10 M
<b>Total</b>	<b>\$4,897 M</b>	<b>\$4,528 M</b>	<b>\$32 M</b>	<b>\$125 M</b>	<b>\$212 M</b>

BMcD/Modus has followed this process from its conception and found it to be robust. In fact, the DR Team should review OPEX from this process to improve the gate process. We have the following observations:

<sup>1</sup> These DSRs were not considered by the Tripartite Review Team and thus remain the DR Project’s scope.

- The Tripartite Review Team's findings indicate that significant scope reductions can be achieved in order to reduce risk in certain aspects of the DR Project. In addition, the process has reduced the Project's budget, though not necessarily as much as was initially anticipated.
- The process also challenged the value and overall scope of items that remain in the DR Project, and provided additional guidance for contingent scope items and future potential reductions.

BMCD/Modus has reviewed the documentation and related analyses supporting the scope recommendations and decisions made by Tripartite Review Team and found them to be acceptable and generally complete. There will be considerably more documentation needed for PSRB presentation and disposition, though the preparation of this documentation should not be a cause of delay for the PSRB to render its decisions.

Simultaneous to the Scope Rationalization, the DR Team was instructed by Management to change the planning assumptions for the Project's refurbishment schedule, resulting in the unlapping of Unit 2 from Unit 1. As noted in our Initial Project Assessment, BMCD/Modus sees this change as a positive for the Project so long as there is a strong technical basis for life extension of the remaining units. The revised schedule should substantially reduce the overall risk of the Project and result in valuable lessons learned for the performance of the remaining units.

### C. Campus Plan

The Facilities and Infrastructure Projects that are part of the Campus Plan remain a significant risk to the DR Project. The projected 4 week delay to the D20 Storage Facility's excavation and another one month delay to the building's engineering are just the latest in a series of events. In addition, current estimates have put this sub-project's cost at \$20M above the \$130M budget. While the D20 Storage Facility differs from much of the Campus Plan work in that it is inside the security fence, the risk of this portfolio is its sheer volume and the multitude of tasks that must get done prior to opening breaker on the Unit 2 Outage.

The DR Team's senior leadership is taking action to turn the performance around, including:

- Additional focus on helping the ESMSA vendors' design partners' efforts by co-locating with OPG resources;
- Developing a plan to integrate all of the pre-requisite work into a large project with an integrated schedule so that the ESMSA's can properly plan and resource load the work and OPG can manage the contractors' work load and performance.
- Completion of work allocation to each of the vendors so that the ESMSA can properly plan their work.

The Campus Plan work will require close monitoring over the next several months.

### D. Balance of Plant

In the Initial Project Assessment, BMCD/Modus expressed concerns over the plan for the BOP work, which we believed could have impacted the quality of the RQE. Specifically, we believed the BOP plan had unnecessary steps for procurement and assignment of work that would deprive the ESMSA vendors with requisite time to perform the detailed design, which in turn would increase the risk and variability around the BOP work at RQE.

In our last report to the NOC, we noted that the DR Team's Senior Leadership was fully aligned with our observations and was in the process of moving forward with streamlining the BOP work. The DR Team is planning to direct-assign work to the ESMSA contractors on an equitable basis in keeping with the principles in the ESMSA contracting strategy. In parallel, the BOP Team has been preparing plans for this split of work and Engineering is preparing to support the ESMSA in the engineering phase. Now that this work is moving forward and in the right direction, it will be critical for the DR Team to learn from the OPEX from the D20 Storage Facility and work hand-in-hand with the vendors to produce a quality design product. In addition, many of the changes initiated with the Campus Plan should benefit the BOP work, as this work can

be used as a beta test for many of the processes put in place. The DR Team's actions are encouraging and should lead to a better result.

### **III. Vetting of 4c Cost Estimate**

#### **A. Summary of 4c Cost Estimate**

As noted, the DR Team finalized its 4c Cost Estimate and 2014 Business Plan input and presented the results to the Board for its approval. The 4c Cost Estimate was not a full reforecast of the DR Project's costs; instead, it was developed to show variances from the predecessor 2013 Business Plan ("4b Cost Estimate") which the Board approved. A summary of the 4c Cost Estimate and the results of the variances from the 4b Cost Estimate are summarized in Attachment B. The DR Project's cost estimate currently stands at \$10.8 B including contingency and management reserve.

As the Project progresses toward RQE, the DR Team is working to reduce the Project's cost estimate to \$10 B. This goal appears to be reasonable and can be achieved through: (1) continued maturation of the Project's planning; (2) corresponding reductions of both the Project's overall point cost estimate and related contingency, and; (3) locking down or further reducing scope and determining that results from the remaining scope defining inspections are favorable. The DR Team has currently identified approximately \$158 M of cost reductions that will be specifically scrutinized over the next year. In addition, there are other opportunities for cost reduction and re-allocation that OPG may consider, in particular, the characterization of Operations & Maintenance ("O&M") support costs, which currently total \$871 M. The DR Team is studying the projected "value add" cost that O&M will be providing directly to the Project. OPG should investigate whether it can characterize the remaining O&M cost as a regulatory asset and not burden the Project with that cost.

In reviewing the 4c Cost Estimate, BMcD/Modus focused more on the processes that the DR Team used in developing this estimate than the actual results. In our Initial Project Assessment, we recommended that OPG consider the 4d Cost Estimate that the DR Team will be presenting for next year's Business Plan a "dry run" for RQE, and that recommendation has been embraced by Senior Management. With that understanding, we have looked at the development of the estimate as a way of testing certain key assumptions that OPG has put forth and we will provide recommendations for improving those processes, as necessary.

BMcD/Modus's vetting exercise has focused on the following with respect to the 4c Cost Estimate:

- Reasonable sampling of the 4c Cost Estimate to validate the underlying basis of the estimate;
- Assessing the efficacy of the processes that the DR Team has put in place for scope control, most notably the Gate Process;
- Review of methods used for contingency and management reserve derivations; and,
- Review of systems that the DR Team is developing to report on cost development.

The results of our review and related recommendations for the next phases of cost estimating are summarized below.

#### **B. Sampling and Validating of 4c Cost Estimate**

In our August 12, 2013 report to the NOC, we emphasized the importance of the Project Team properly characterizing the basis of the cost estimates it was putting forward for Board approval. In the case of the 4c Cost Estimate, the DR Team has characterized the estimate as one that generally meets the AACE's definition of a Class 5 or Class 4 estimate. Typical expected accuracy ranges for Class 5 estimates are (-20% to -50%) on the low side, and (+30% to +100%) on the high side, and Class 4 estimates range (-15% to -30%) on the low side, and (+20% to +50%) on the high side.

BMcD/Modus performed some reasonable sampling of the 4c Cost Estimate including:

- Detailed vetting of the current SNC/Aecon cost estimate for the RFR work;
- Review of six DSRs in the BOP scope that total \$67 M, or 14% of the BOP Basis of Estimate cost;
- Review of one DSR in the Turbine Generator sub-project scope that totals \$119 M, or 17% of the projected turbine Basis of Estimate costs.

In all, we considered approximately 64% of the project bundle costs. In this review, we vetted the nature of the driving aspects of these cost estimates, including: work hour derivations, labor and productivity modification factors, allowances, and the like. Our purpose in doing so was to confirm the basis of the estimates' components and the level of maturity underlying the information. In addition, we reviewed the development of the OPG costs for project management and support, which are essentially drawn from head counts of staff and flowed-out over time. This analysis essentially confirmed that the DR Team has prepared and presented an estimate that generally conforms to the AACE Class 5/4 definitions. This characterization is generally confirmed by the DR Project's current overall status at this time.

As noted in our Initial Project Assessment, the 2015 Business Plan ("4d Cost Estimate") will need to reflect an expected leap in Project maturity that will occur over the next 8 to 10 months; thus, we would expect that the quality of OPG's estimate would parallel that increase. BMcD/Modus has the following additional observations and recommendations for development of the 4d Cost Estimate and 2014 Business Plan:

- With the expected ramp-up of the amount of information needed to support estimates, the DR Team should focus on improving traceability, sourcing, vetting and suitability of database information underlying the estimate as this will be even more essential for vetting the Class 3 Estimates.
- Quality control will be critical as the estimates move from ranges to point numbers. The DR Team may consider migrating to a standard estimating platform such as SNC/Aecon is now utilizing for its Class 3 cost estimate.
- Many of the tools Finance and Project Controls developed for reviewing of the 4c Cost Estimate should find their way into the metrics the DR Team uses in an attempt to increase cost consciousness.
- Vetting of OPG costs was impacted by the timing of the 4c Cost Estimate effort, which began in the middle of the summer months. The next phases of estimating should have a schedule of activities and begin earlier in the year, particularly considering the increased complexity expected for the 4d Cost Estimate.

Attachment C provides more details regarding our review of the 4c Cost Estimate. Our comments and recommendations are geared toward helping OPG to strengthen its review of costs for this next critical phase of estimating.

In summary, BMcD/Modus found that the processes the DR Team used to develop the 4c Cost Estimate were robust and generally conformed to customary practices for an AACE Class 4/5 estimate. The DR Team has also properly characterized the nature of the estimate that it has advanced for approval. The DR Team has also conceptually accepted our recommendations regarding its going-forward activities, though implementation of those recommendations will require focus and attention over the next 10-12 months, as development of the 4d Cost Estimate will be an ongoing effort.

### **C. Evaluation of Gate Process**

The DR Team is utilizing the Gate Process for evaluation of cost, scope and schedule [Nuclear Projects Gated Process, N-MAN-00120-10001-GRB-R001]. Each portion of the work as it matures is subject to a "gate" review in order to obtain full funding for the successive phase of the work. To date, majority of the gate reviews have been for projects in early planning stages, though over the next 12 months, passing through gates will require considerably more rigor. Thus, the Gate Process represents an interim step between the cost forecast efforts to evaluate and vet key elements of the Project's cost and maturity level.

BMcD/Modus has evaluated the Gate Process in concept and in practice, as well as participated in a number of Gate Review Board ("GRB") meetings. We have also sampled multiple "gate packages" that the Project Team has prepared.

The process itself is well-formulated and should serve the intended purpose. However, the DR Team's execution within the process should be addressed. From our sampling of the process, we have found the DR Team is not consistently developing the materials needed for the GRB's evaluation. Some comments and recommendations are as follows:

Observation from Gate Review Process	Recommendations
Quality and consistency of the materials in Gate packages should be addressed. Gate review packages are often hastily assembled by the project teams and provided to the GRB only shortly before the gate review meetings.	<ul style="list-style-type: none"> <li>➤ Gate package development should follow the existing schedule and key documents should be delivered well in advance of the GRB.</li> <li>➤ The quality of the gate packages presented to the GRB would be improved by timely delivery of materials prior to pre-vetting sessions within the Project Team.</li> </ul>
Within gate packages, there are requirements for explaining variances in cost estimates, there is no formal controlled process for presenting these changes. We have generally found little consistency between the various files kept on the bundles, and in some cases, the estimates used for gate reviews were not preserved.	<ul style="list-style-type: none"> <li>➤ Improve record keeping and chain of document retention.</li> <li>➤ Provide a reconciliation of the estimates presented with the gate package to prior estimates (i.e., 4b, 4c) and the basis of estimates so that changes can be traced and sources are identifiable.</li> <li>➤ Provide an estimate reconciliation within the standard gate package template.</li> <li>➤ The estimates developed for evaluation at the gates should follow the same general vetting methodology and adhere to the same quality and consistency standards described in <b>Attachment C</b>.</li> </ul>
Although designed to provide a forum for challenging scope and cost estimates, the gate review process has thus far had mixed results for that purpose.	<ul style="list-style-type: none"> <li>➤ In addition to Project Controls, the DR Team should consider utilizing a 3<sup>rd</sup> Party (e.g., Finance and the Controllershship) to provide an independent analysis and examination of the sufficiency of the gate packages. The 3<sup>rd</sup> party can report to the GRB its findings and concerns.</li> </ul>

Now that the Project's scope has essentially been determined, the Team's focus should turn to fully supporting the work that will be done in the Gate Process. We have recommended to Management the need to drive down to the lowest levels of the DR Team the importance of schedule and cost consciousness. Senior Leadership has accepted these recommendations and is implementing changes to the process that should address these concerns.

#### **D. Assessment of Contingency and Management Reserve**

BMCD/Modus undertook a review of contingency to determine how discrete risk elements are accounted for in the 4c Cost Estimate. Our review found that while risks are being identified and analyzed in a reasonable manner, the value of individual risks are not directly traceable or otherwise transparent all the way through the estimate to the bottom line. Instead, management has made a decision to carry Monte Carlo Output risk amounts at a more global level, namely, at the project bundle level only. As a result, discrete risks and associated amounts are merely subsumed into a single contingency number with no tractability back to the individual risk elements.

BMCD/Modus has the following observations regarding the methods the DR Team is using for establishing and managing contingency and management reserve:

- As noted in our Initial Project Assessment, the DR Team needs wider and increased appreciation of the importance of accurately identifying risks and related parameters. Furthermore, as evidenced by a review of the risk register, more than a few DR Team members do not understand the distinction between management performance issues and true project risks. Senior management needs to continue to focus the DR Team on weeding-out unnecessary risk items that take up management time and attention.
- The risk group needs to be more involved and empowered as part of the initial risk identification efforts. Challenge meetings would help to identify true project risks and proactively eliminate false risks and duplicate inputs.
- OPG's choice to aggregate risk at the bundle level is not without precedent in the industry. However, given this choice, OPG will lose transparency as well as the ability to focus on and manage individual post-Monte Carlo risk amounts, which is particularly important for addressing the Project's most significant risks. Without having a discrete risk basis for formulating contingency, project managers will need to request individual Monte Carlo analyses on selected risk items and expend extra effort to track those risks. In addition, such retrospective calculations will not be consistent with the results of bundled-level analyses.
- The distinction between Management Reserve and Contingency needs further definition as do the rules for allocation of funds.
- Future cost estimates should include a composite roll-up of contingent scope so that the extent of the "unknowns" in the estimate are transparent.

At this time, BMcD/Modus have not undertaken an analysis of the specific amounts of contingency and management reserve being held or the adequacy of this reserve. However, as the estimate progresses toward RQE, the derivation of contingency will become increasingly important. Going forward, BMcD/Modus would expect to see contingency dollars for the Project's most significant known risks developed on a deterministic basis with stochastic modeling limited to chances of occurrence. Future reports will focus on how well contingency and management reserve is defined, calculated, managed, and released to the Project.

## **IV. Functional Group Update**

### **A. Schedule**

In our Initial Project Assessment, BMcD/Modus identified several concerns with the DR Team's plan for the development of the Project's Execution Phase schedule. The DR Team is currently populating the schedule utilizing the Coordination & Control ("C&C") Schedule. We questioned the application and efficacy of this approach, particularly for the Execution Phase. Our chief concern with the C&C Schedule was the point of integration between the contractors and other work groups. Per the Team's original Schedule Management Plan, this integration would occur at Level 2 and not at the detailed Level 3, which we saw as problematic, as the determination of a Project's critical path relies on linkage of detailed activities. We also saw that developing the C&C Schedule was diverting the Team's attention from the integration, assessment and reporting of the Level 3 pieces of the schedule. We articulated additional concerns in our Initial Project Assessment regarding earned value tracking and schedule performance.

Subsequent to our Initial Project Assessment, in further examination of the schedule, we noted some additional issues in the DR Team's plans for integration of the DR Project's Execution Phase—including the fact that the Project Managers' expressed preference to integrate and otherwise use the Level 3 schedule as the tool for day-to-day management during the Execution Phase. Additionally, the DR Team's ability to resource load and manage the work force will be an issue of growing significance, as doing so requires the Level 3 details. Since future contracts (most notably RFR and BOP) are based on target price arrangements, it is essential that the operative schedule is resource loaded; otherwise, the Project Team will lack an essential tool for holding the contractors accountable to their budgets. Thus, the DR Team has now recognized that the best use of the C&C Schedule is for developing the plan during the Definition Phase while the integration of the execution schedule should occur at Level 3.

In consultation with the Project Controls Team, we have made certain recommendations related to the path forward for schedule development, including:

- The Master Schedule the Project Team will use to manage the Execution Phase of the DR Project should be populated with fully integrated Level 3 schedules to form the Project's critical path. This Master Schedule should be the primary tool for determining the status of the Project, and include comprehensive critical path and sub-critical paths, as well as full resource loading. The Level 3 activities will be coded to roll-up to Level 2, thus eliminating duplicative effort.
- OPG will continue utilizing the C&C Schedule but not for its originally intended purpose. The DR Team will consider the C&C Schedule as the "Plan for the Plan" that it will use to detail and track the Project Team's efforts to populate the Level 3 schedule. Currently, there are only a small number of executed contracts so fully integrating at Level 3 is not currently possible. As the maturity of the schedule increases, the DR Team can explore further integration at the detailed Level 3. The C&C Schedule will be updated through RQE on a monthly basis, though operative Level 3 execution work, such as the RFR Mockup, Campus Plan and Fuel Handling, will be updated at Level 3 as necessary. This will provide an opportunity for the DR Team to test the schedule well in advance of breaker-open on Unit 2.
- For areas of work for which there is currently no submitted schedule by a contractor, OPG should develop placeholders to the extent necessary. Such placeholder schedules should include enough detail that nature of the work, key milestones and integration points with other work groups are apparent.
- Commercial contracts should reflect specific schedule requirements that govern such things as resource loading, activity durations, float patterns and banning schedule devices that keep a schedule from calculating. To the extent that certain contracts have already been negotiated, OPG should, if necessary, incorporate its expectations for obtaining earned value, including contractor's budgets and actual work hours per schedule activity, as well as schedule development into existing contracts.
- Project Controls will need management support to hold the work groups accountable for developing and utilizing the Master Schedule, including developing forums for discussion of the Execution Phase Master Schedule status and preparation.

To the extent OPG agrees with these recommendations, the Program Schedule Management Plan and related processes will require revision to explain these changes. OPG will also need to address and simplify the WBS coding structure as necessary.

## **B. Engineering**

Engineering continues to make progress in performing the MDR/MDP work that is needed for completing the procurement and scoping of the Project. Engineering reported in October that it had met an interim goal of completing 75 MDRs two months earlier than the milestone date. Engineering's focus on MDP's has resulted in a number of improvements since the start of our engagement:

- Closer working relationships between OPG and the two OSS vendors, AMEC and WorleyParsons;
- Improved quality of the MDP packages;
- Risks are being more closely evaluated, which ultimately will require less contingency in estimates for work;
- Efficiencies have been gained from collocating staff and the 'leaning-out' of the administrative process.

Whereas there is room for further gains in each of these areas, maintaining the current pace of MDP package development will satisfy the schedule needs of the DR Program. There are still 51 remaining MDRs, of which 20 are currently in process. All of these MDRs will need to be completed by April 1, 2014, which means that Engineering will have to continue its focus on producing MDRs/MDPs.

The next challenge for Engineering will be to morph into an organization that can manage the next phases of work, and here remains some concern. Engineering will have multiple roles, from design authority to reviewer of the various EPC contractors' work-product to developing the restart plan for the units. This will require a significant planning effort. However, because the effort needed to produce MDPs has sapped Engineering to such an extent, the knowledge and experience of DR team members is not currently being applied to a forward-look at this next phase of work.

BMcD/Modus has advised the Engineering team to embrace active management of the engineering effort and look for solutions to help the EPC vendors navigate the detailed design phase. We have advised the team to examine certain of the principles in the Construction Industry Institute's (CII) Front End Planning for Revamp and Renovation Projects.

The Engineering Team has completed its review of the phases of engineering and has prepared a new tool for tracking progress and claiming earned value. This work should also help with the Engineering team's attempts to further plan and execute the work.

### **C. Risk**

In our Initial Project Assessment, BMcD/Modus provided our views regarding certain deficiencies in the DR Project's risk program. Since that time, and in concert with the 4c Cost Estimate effort, the DR Team has made an effort to vet the risk database and increase the quality of its content. There has also been an increased effort to adequately train the DR Team on proper Risk Management techniques. This work is ongoing and will require greater focus as the DR Team begins the full reforecast of costs in the next business plan cycle. BMcD/Modus will provide a more detailed status of these efforts in our next report to the NOC.

### **D. Project Team Development**

In the Initial Project Assessment, we stressed the need for the DR Team to recognize the role OPG plays in managing the work, begin to break down the Project-based silos and begin developing the Construction team upon whom the day-to-day management of this Project will reside. Since our last Report, we have seen some steps in this regard, and the Project's Senior Leadership is moving in the right direction. Many of the changes the DR Team is initiating with its scheduling methodology will foster greater focus and a more cohesive view of the Project's development and execution. The DR Team's integration will be of significant focus through RQE and into breaker-open of Unit 2.

## **4Q Risk Perspective**

**Report to Nuclear Oversight Committee**

**4<sup>th</sup> Quarter 2013**

**Darlington Nuclear Refurbishment Project**

## Attachment A – 4Q 2013 Risk Perspective

Area	Observations	Low	Medium	High	Current Status / Mitigation
RFR	<b>SNC/Aecon Performance:</b> Largest Program risk due to overall risk to the DR Project and OPEX				<ul style="list-style-type: none"> <li>Recent performance trend in tooling, procurement and engineering of the mock-up is well below plan</li> <li>Working to late finish milestones, leaving no room for error or delay</li> <li>Project Team has ordered recovery plan by May 15, 2014</li> </ul>
	<b>Class 3 Estimate:</b> Progression to RQE requires SNC/Aecon's Class 3 Estimate to be thoroughly vetted				<ul style="list-style-type: none"> <li>Class 3 Estimate preparation is significantly behind schedule</li> <li>Completing estimate to OPG standards by May 15, 2014 will be challenging</li> <li>OPG team actively engaged in vetting plan and estimate</li> </ul>
	<b>Schedule Development:</b> Level 3 schedule based on payment milestones; task durations and float unrealistic				<ul style="list-style-type: none"> <li>Project Team has taken action and required SNC/Aecon to provided resources loading and measure progress via target schedule</li> <li>Implementing the recovery plan and schedule changes will take transparency and focus</li> </ul>
BOP	<b>Contracting Strategy:</b> Alterations needed to advance work to detailed design as quickly as possible				<ul style="list-style-type: none"> <li>Final approvals for contracting strategy have been obtained</li> <li>Project Team is already working to move work forward</li> <li>Needs final sign-off from all stakeholders</li> <li>More focus by management on engineering and scope coordination</li> </ul>
	<b>ESMSA Performance Issues:</b> Concern over ESMSA contractors' performance and ability to execute BOP work				<ul style="list-style-type: none"> <li>Allocation of work from revised contracting strategy will emphasize each contractor's strengths</li> <li>Risk of ESMSA Performance will continue until improvements on performance issues in Campus Plan are observed</li> </ul>
Scope	<b>Review Period:</b> Urgency mounting for scope review; planning/prep underway for work that may be eliminated; concerns regarding scope				<ul style="list-style-type: none"> <li>Tri-partite review followed a deliberative process and netted positive results</li> <li>Scope removed from DR Project will be engineered and planned</li> <li>Needs final close-out</li> </ul>
Campus Plan	<b>Project Status:</b> D20 Storage Facility work is behind schedule and causing critical path to the TRF				<ul style="list-style-type: none"> <li>Lessons learned are being collected and disseminated</li> <li>Management is taking appropriate action to schedule and plan work</li> <li>Vendor performance/unforeseen issues remain risks</li> </ul>
	<b>Engineering and Planning:</b> D20 provides key lessons learned for remaining Campus Plan and BOP				<ul style="list-style-type: none"> <li>Engineering is co-locating with ESMSA vendors</li> <li>Clarification of RFPs and process ongoing</li> <li>Modifications to planning and scheduling underway</li> </ul>
Schedule	<b>Unlapping and Reduction of Risk:</b> Performance of Unit 2 as a stand-alone will reduce risk				<ul style="list-style-type: none"> <li>Risk avoidance and decision-making prudence have been further quantified</li> <li>Impact on Project plan is being considered</li> <li>Commercial planning and strategy is being developed awaiting BOD</li> </ul>
	<b>Continued Schedule Development:</b> Schedule approach was unproven; integration at appropriate level at risk				<ul style="list-style-type: none"> <li>Project Team has generally accepted BMCD/Modus's recommendations</li> <li>Revised schedule should reflect organizational change to flatten "silos" and manage as a single project</li> </ul>

## **Detailed Observations from 4c Cost Estimate Review**

**Report to Nuclear Oversight Committee**

**4<sup>th</sup> Quarter 2013**

**Darlington Nuclear Refurbishment Project**

## Attachment C

### DETAILED OBSERVATIONS FROM 4C COST ESTIMATE REVIEW

#### Overview

As summarized in our 4Q 2013 Report to the Nuclear Oversight Committee, BMcD/Modus's review of OPG's 4c Cost Estimate consisted of testing and sampling of approximately 64% of the DR Project's costs to determine whether the DR Team followed accepted standards in developing and characterizing the estimate for Management and Board of Directors review and approval. The portions of the 4c Cost Estimate we reviewed were:

- Detailed vetting of the current SNC/Aecon cost estimate for the RFR work;
- Review of six DSRs in the BOP scope that total \$67 M, or 14% of the BOP Basis of Estimate cost;
- Review of one DSR in the Turbine Generator sub-project scope that total \$119 M, or 17% of the projected turbine Basis of Estimate costs.

This document describes the process utilized for our review and the detailed recommendations we have provided to the DR Team for future estimate preparation.

#### Process for Review

##### A. Estimating Process for Project Bundles:

1. The estimates for Release 4c were based on a "refresh" of the Basis of Estimates (BoE) prepared for Release 4b.
2. The BoE's were adjusted to reflect changes resulting from increased definition of the scope of work (SOW), updated vendor quotes, relevant approved Darlington Refurbishment Decision Record and Analysis Summary Forms (DRAS), approved Change Control Forms (CCF's) and the costs impacts resulting from the scope rationalization effort.
3. The BoE's are prepared as independent assessments of costs to meet AACE Class 5/4 classification for use by the Project Team as they advance through the Gating process. Estimators have met with Project Team members and challenged them to refine the DSR scope in an attempt to achieve a Class 5/4 estimate classification.
4. BoE's were prepared according to the following governance documents:
  - a. N-PROC-LE-0011 R000: Nuclear Refurbishment Cost Estimating Procedures.
  - b. N-INS-00400-1001 R000: Nuclear Refurbishment Cost Estimating Instruction
  - c. N-PROC-LE-0017: Darlington Refurbishment Discovery, Contingency and Management Reserve Procedure.
  - d. AACE Recommended Practice No. 17R-97.
5. Typical expected accuracy ranges for Class 5 estimates are (-20% to -50%) on the low side, and (+30% to +100%) on the high side. For Class 4 estimates (-15% to -30%) on the low side, and (+20% to +50%) on the high side.

## Attachment C

### DETAILED OBSERVATIONS FROM 4C COST ESTIMATE REVIEW

6. Estimates are prepared on excel based spreadsheet templates which are slightly modified as necessary to accommodate the SOW involved for each DSR line item.
7. The primary driver of hard costs is direct “norm” labor hours which are sourced from an F+G library of data bases and OPG Model Work Orders held in Passport. When in-house data was not available, third party sources were used as appropriate; such as international standards, OPCA (Oil and Petroleum Contractors Association), DACE (Dutch Association of Cost Engineering) and RS Means.
8. When the SOW was similar to historical norms, labor hours were sourced directly (unfactored) from data bases. However, when SOW’s differed from historical norms, labor hours were “normalized” (i.e. adjusted) by applied factors (% or formula) in the cell of the respective line item.
9. Once labor hours are established they are further adjusted by productivity and height factors and multiplied by the hourly rate to arrive at labor costs.
  - a. Productivity factors (PF) are unique to OPG and have been compiled over the past 3 years while estimating projects. The PF’s are generated by analyzing a basic 10 hours shift and breaking out the amount of downtime or non-productive time to determine the actual productive time. For BOP, the productivity ranged from 35% to 45%.
  - b. Height factors are unique to OPG and used to account how ascending/descending from scaffolding effects labor hours. Generally, the height of work is broken down to (4) parameters; greater than 30ft, between 21-30ft, between 11-20ft and less than 10ft.
10. Once labor hours and costs are established, “estimating metrics” in the form of % of costs or \$/hr are applied, again as factors within a given range, to determine the respective cost elements for Project Management, Engineering, Indirect Costs, Construction Plant, Scaffolding, Training, Commissioning, Small Tools and Profit.
11. The estimating metric factors are a range of values expressed as \$ per labor hour (\$/hr) or percentage (%) of labor costs. The factors were developed based F+G and OPG historical information.
12. Based on the complexity of the SOW, the estimator selects the value of estimating metric (subject to approval of the Lead Estimator) and applies it to each line item of the DSR.
13. All DSR line items have been assessed without any allowance for rework.

## Attachment C

### DETAILED OBSERVATIONS FROM 4C COST ESTIMATE REVIEW

- a. All assumptions detailed in the BoE for labor hours and costs are based on one (1) unit. Experience factors for lessons learned resulting from repeat work advancing from the first unit to the last unit are applied on the first unit; 1<sup>st</sup> Unit – 1.00; 2<sup>nd</sup> Unit – 0.975; 3<sup>rd</sup> Unit – 0.970; 4<sup>th</sup> Unit – 0.965

#### B. Testing/Sampling – Project Bundles

1. Sampled cost elements (Labor, Material, Construction Plant, Small Tools, Scaffolding, etc.) from six (6) DSR line items totaling \$67M or 14% of total Balance of Plant bundle. For the Turbine Generator Basis of Estimate, one (1) DSR was sampled totaling \$119M or 17% of the TG bundle.
2. Since labor hours are the primary cost driver, the estimating team walked through the labor hour entries. Generally, when the scope of work was similar and lined-up with scopes in the estimating data bases, the labor hour entries were hard keyed with no adjustments. However, in circumstances when scope differed from estimating data bases, a factor (judgment call) was applied to the historical norm labor hours to best approximate the given scope.
3. In regard to applying estimating metrics to the labor hours and labor costs, the Team explained that the selection process of the applied factor was based primarily on the complexity of the DSR line item.
4. Several material costs were also tested. Costs were primarily sourced from Work Orders in Passport and adjusted for inflation. Other material costs were validated by vendor quotes.
5. Profit (10%) is applied only to Material Cost and also included in the labor rates per OPG MSA Contracts.

#### **Recommendations for Future Estimating**

The 4d Cost Estimate will need to reflect an expected leap in Project maturity that will occur over the next 8 to 10 months; thus, we would expect that the quality of OPG's estimate would parallel that increase in maturity. BMCD/Modus provided high-level observations and recommendations for development of the 4d Cost Estimate/2014 Business Plan in the 4Q Report that are based on the following detailed observations.

Observation from 4c Cost Estimate	Recommendations
The primary driver of hard costs in the 4c Cost Estimate is direct "norm" labor hours which are sourced from an F+G library of data bases and	<ul style="list-style-type: none"><li>• With the expected ramp-up of the amount of information needed to support estimates, the DR Team</li></ul>

### Attachment C

#### DETAILED OBSERVATIONS FROM 4C COST ESTIMATE REVIEW

Observation from 4c Cost Estimate	Recommendations
OPG Model Work Orders held in Passport. When in-house data was not available, third party sources were used as appropriate; such as international standards, OPCA (Oil and Petroleum Contractors Association), DACE (Dutch Association of Cost Engineering) and RS Means.	should focus on improving traceability, sourcing and vetting of database information underlying the estimate as this will be even more essential for vetting the Class 3 Estimates.
Platform for Cost Estimate: At the heart of the 4c Cost Estimate, the DR Team has utilized a series of spreadsheet the in the 4c Cost Estimate is direct "norm" labor hours which are sourced from an F+G library of data bases and OPG Model Work Orders held in Passport templates. These spreadsheets utilize a large number of "hard-keyed" entries rather than "lookup" or "reference" functions that refer back to the source data. In addition, many cell formulas are unprotected. This method works but can be inefficient and requires extensive QA/QC as the estimate becomes more detailed.	<ul style="list-style-type: none"> <li>➤ DR Team may consider migrating to a standard estimating platform such as SNC/Aecon is now utilizing for its Class 3 cost estimate. Such platforms allow for greater consistency among estimators, though there is a learning curve for effective implementation.</li> <li>➤ If the DR Team does not adopt a standard estimating platform, it should consider utilizing comment boxes and/or text cells to reference the source data or utilize lookup functions to directly refer to input data.</li> <li>➤ In any event, the team will need to dedicate resources and time for running ongoing QA/QC checks, particularly when including linked spreadsheets and contractor-produced database.</li> </ul>
The 4c Cost Estimate relies on a number of estimating factors, some of which are a product of the current level of Project definition (i.e. Class 5/4). Factors have been used to approximate the result that will come with greater Project definition.	<ul style="list-style-type: none"> <li>➤ Utilizing such factors in estimating is common industry practice. However, OPG should increase the level of documentation regarding the factors that are used so that these are traceable when used.</li> <li>➤ Going-forward, OPG will need a more organized set of estimate templates for vetting of Class 3 estimates and target price proposals from contractors. Utilizing a standard estimating platform (like Timberline) could provide an acceptable alternative.</li> </ul>
Labor estimates used in the 4c Cost Estimate are generally based on productivity and include:	<ul style="list-style-type: none"> <li>➤ Traceability of the source of such factors is critical. Industry-based studies for developing productivity factors can be</li> </ul>

#### DETAILED OBSERVATIONS FROM 4C COST ESTIMATE REVIEW

Observation from 4c Cost Estimate	Recommendations
<ul style="list-style-type: none"> <li>a crew sheet that analyzes process flow and work series and</li> <li>height of operations</li> </ul> <p>These factors are unique to OPG and have been developed over the past three years.</p>	<p>distinguishable, as can a contractor's experience when work is not entirely similar.</p> <p>➤ Vetting of these factors and record-keeping related to the source will be critical for Class 3 estimate reviews.</p>
<p>OPG Costs: the major drivers the DR Team examined for the 4c Cost Estimate were:</p> <ul style="list-style-type: none"> <li>Impact of unlapping of Unit 2</li> <li>Scope rationalization and impact on overall size of the Project and associated level of effort.</li> </ul> <p>The different work groups were given a blank template for defining their staffing needs; this was later changed to variance reporting against 4b when it was apparent the work groups were exceeding cost boundaries.</p> <p>Costs were eventually brought in line via vetting and challenge meetings with RPET and the efforts of the Finance and Project Controls groups.</p>	<p>➤ Finance and Project Controls developed metrics for showing cost flows and variances over time that were extremely helpful in determining the right-sizing of the team. These (and similar) tools should be incorporated into the metrics the team is reviewing in an attempt to increase cost consciousness.</p> <p>➤ Vetting of OPG costs was also impacted by the timing of the 4c Cost Estimate effort, which began in the middle of the summer months. The next phases of estimate should have a schedule of activities and begin earlier in the year, particularly considering the increased complexity expected for 4d.</p>

# **Report to Nuclear Oversight Committee**

## **1<sup>st</sup> Quarter 2014**

### **Darlington Nuclear Refurbishment Project**

**Burns & McDonnell  
Modus Strategic Solutions**

**March 4, 2014**

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

### I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company (“BMCD/Modus”) provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors (“NOC”) regarding the status of the Darlington Nuclear Generating Station’s Refurbishment Project (“Project” or “DR Project”) as of February 21, 2014. The DR Project continues to advance toward its major goal of producing a Release Quality Estimate (“RQE”) for final Board of Directors and Shareholder approval by October 15, 2015.

In this report, we provide current updates regarding the DR Project’s most significant risks. In addition, we provide a high level assessment of the DR Project’s compliance with the principles set forth in the Minister of Energy’s December 2013 Long Term Energy Plan (“LTEP”), and identify recommendations for strengthening OPG’s planning for completion of the Release Quality Estimate (“RQE”). We would also like to note that pursuant to the Project’s Assurance Plan approved by the Audit Committee, BMCD/Modus has prepared independent reports documenting the DR Team’s status as well as further recommendations for improvement. This quarter we have issued an Assurance Report based upon our detailed review of the DR Team’s Risk Management Program. Next quarter we will issue three other Assurance Reports relating to: 1) DR Project schedule process and development; 2) the 2013-2014 Business Plan as it relates to the latest project estimate (the “4C Estimate”) and 3) scope status and process. These full reports will be available for the NOC’s review at its convenience. With respect to our ongoing involvement in the Assurance Plan, we will continue to work at the NOC’s direction.

The following is a brief summary of the Project’s most significant developments over the last quarter:

- **Retube & Feeder Replacement Project Risks:** The RFR project remains the DR Project’s most notable risk, though it appears that SNC/Aecon’s progress on the tooling portion of the work is improving. Through January 2014, the contract remained underspent by \$32.7 M, and SNC/Aecon’s SPI for tooling was 0.81, which reduced its cumulative SPI to 0.88. SNC/Aecon’s original plan to complete tooling delivery by June 2014 will not be met; it has implemented a tooling recovery plan that has recovered some of its earlier delays and mitigated some future deliveries that cannot be fully recovered. Based on its current plan, it will take until August 2014 for SNC/Aecon to return to its baseline schedule. Failure to do so will put stress on OPG’s RQE date. The DR Team is closely monitoring SNC/Aecon’s progress and has recommended SNC/Aecon increase schedule reporting and supplier surveillance.

In addition to the tooling set, SNC/Aecon’s other major activities in the Definition Phase focus on the development of the Execution Phase cost estimate and schedule.

Through February 10, 2014, SNC/Aecon had completed only 32% of the work needed to develop the Construction Work Packages (“CWPs”) that form a key part of the estimate, while expending nearly 70% of the allotted schedule time. SNC/Aecon has instituted a recovery plan for the CWPs and remains committed to completing the Class 3 Estimate on time. However, BMCD/Modus is concerned that accelerating the preparation of the Class 3 Estimate may only result in weakening the quality of the product. Regardless of the success of SNC/Aecon’s recovery plan, BMCD/Modus recommends that OPG consider giving SNC/Aecon more time if quality is an issue with the deliverables, and pursue SNC/Aecon developing and monetizing its contingency as a part of the Class 3 Estimate. Under its Contract with OPG, SNC/Aecon is not required to provide any contingency amounts until the Class 2 Estimate phase. As we have stated in previous reports, we are concerned that this increases the risk of a “surprise” in the final Class 2 Estimate and could complicate target price negotiations with SNC/Aecon. Furthermore, OPG could use this information to provide a more mature 4d Cost Estimate in the fall of 2014.

- **Commercial Risks:** We have encouraged the DR Team to evaluate its major contracts to ensure that the proper incentives and disincentives are included in light of the LTEP. As an example, the RFR Contract includes certain incentives and disincentives that were focused on improving performance unit-over-unit. However, the LTEP and OPG’s decision to “unlap” Unit 2, puts more focus on the success of the first unit. The DR Team should therefore

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

revisit these contract incentives and disincentives to ensure such success. Future negotiation of the SNC/Aecon target price for the Execution Phase should include re-examination and clarification of certain elements that could not have been contemplated at the time the parties negotiated the Contract. Similarly, the ESMSA contracts should be evaluated in light of current considerations.

- **Campus Plan Performance Project Risk:** Performance of the Campus Plan work remains a significant risk. The D20 Storage Facility foundation work has been impacted by subsurface conditions and ongoing engineering challenges and is now projected to complete in April 2016. Based on the current schedule, there is now a 3-month delay to the critical path, impacting OPG's ability to open the Unit 2 breaker in October 2016. Additional work on other key Campus Plan facilities is tracking behind schedule and/or over budget. In addition to recovering the schedule delays to the D20 Storage Facility, it is critical for the DR Team to increase the predictability of this work and identify any lessons learned that could impact the Balance of Plant ("BOP") work that will be performed by the same contractors under the ESMSA terms and conditions.

Both Projects & Modifications ("P&M") and the DR Team are increasing their focus on the remainder of the Campus Plan scope. Project controls (schedule and cost) are currently under intense review, as is the process for engineering oversight. BMCD/Modus recommends that as part of its review, the DR Team refresh its understanding of required end dates for these Facility and Infrastructure ("F&I") projects and examine what appears to be poor schedule logic and unrealistic float that could be masking further delays and performance issues. In addition, BMCD/Modus is engaged in a root cause analysis of the systemic budget variances that have become apparent for this work.

- **RQE Preparation:** RQE development remains essentially on schedule, but will be heavily reliant on the quality of the various inputs. It is essential that the DR Team carefully plan and manage the RQE development process. The DR Team has assigned a manager for the planning and development of the multiple pieces that must come together for RQE. The team is developing an RQE planning schedule and further definition for expectations for deliverables. The Blue Ribbon Panel assigned to review the DR Project's scope has completed its work and its final recommendations have resulted in \$179 million of work being removed from the DR Project, some of which has been cancelled entirely.

Other ongoing challenges to the DR Project include the continued development of the BOP work, further refinement of the Risk Management Program and completion of pre-requisite F&I and Fuel Handling work. Attachment "A" provides an update regarding the DR Project's risks.

## II. Project's Conformance to LTEP

### A. LTEP Principles

The LTEP identifies priorities for OPG and Bruce Power to follow in their respective mid-life refurbishments of DNGS Units 1-4 and Bruce Units 2-8. The LTEP supports the refurbishment of DNGS Unit 2, but states that "the province will proceed with caution to ensure both flexibility and ongoing value for Ontario ratepayers," and "(f)inal commitments on subsequent refurbishments will take into account the performance of the initial refurbishments with respect to budget and schedule by establishing appropriate off-ramps." In addition, the LTEP identifies seven priorities for OPG and Bruce Power to follow in their respective refurbishments:

1. Minimize commercial risk on the part of the ratepayers and the government.
2. Mitigate reliability risks by developing contingency plans that include alternative supply options if contract and other objectives are at risk of non-fulfillment.
3. Entrench appropriate and realistic off-ramps and scoping.
4. Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price.

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

5. Make site, project management, regulatory requirements, supply considerations, cost and risk containment the primary factors in developing the implementation plan.
6. Take smaller initial steps to ensure there is an opportunity to incorporate lessons learned from refurbishment including collaboration by operators.
7. Hold private sector operator accountable to the nuclear refurbishment schedule and price (*not applicable to OPG*).

In addition, the LTEP states that “(t)he government will encourage the province’s two nuclear operators, Bruce Power and OPG, to find ways of finding ratepayer savings through leveraging economies of scale in the areas of refurbishment and operations. This could include arrangements with suppliers, procurement of materials, shared training, lessons learned, labour arrangements and asset management strategies.” We are aware that OPG’s management has engaged in such discussions with Bruce Power but to date no progress has been reported.

### B. BMcD/Modus Assessment

The following is our assessment of the extent to which the DR Team is currently in compliance with the LTEP’s principles. We have also identified gaps that may currently exist and recommendations for strengthening OPG’s compliance with these requirements. In this assessment, we have focused solely on the DR Project’s readiness, as BMcD/Modus has not been retained by NOC to assess each of the considerations in the LTEP. In addition, there are LTEP principles that have commonality, which we identify below.

1. Minimizing commercial risks	
Current Initiatives:	<p>The primary commercial risks to the Province from mid-life refurbishments emanate from the potential for unplanned significant cost and schedule overruns. OPG has recognized these risks and others from prior nuclear projects (Pickering A RTS and Pickering A&amp;B Retube) and has implemented an extensive planning effort with its prime contractors during which OPG is:</p> <ul style="list-style-type: none"> <li>• Locking down project scope well in advance of starting construction;</li> <li>• Engaging in a robust pre-outage inspection campaign that utilizes the units’ maintenance and Vacuum Building outages;</li> <li>• Executing refurbishment and improvements to the reliability of the fuel handling machines that service the station;</li> <li>• Planning and executing pre-requisite work that will support the refurbishment as well as unit life extension prior to the start of Unit 2’s outage; this should provide a testing ground for the Execution Phase;</li> <li>• Building a full-scale mockup of the DNGS reactor and vault that will be used for training and proving the tools needed for the removal and replacement of the reactors’ internals;</li> <li>• Fully developing engineering and planning of the work so that it is 100% complete prior to the start of construction;</li> <li>• Developing a Release Quality Estimate (RQE) in phases that incorporates a high-confidence budget and schedule for the work;</li> <li>• “Unlapping” Unit 2 from Unit 1 so that the focus can be entirely on the planning and construction of a single unit and so that OPG can gain confidence and lessons learned in completing the work;</li> </ul>

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

	<ul style="list-style-type: none"> <li>Utilizing target price contracts for the Execution Phase that are based on developing cooperation and transparency with key vendors;</li> <li>Negotiating various off-ramps and stages into the RFR contract with SNC/Aecon, such that SNC/Aecon securing the Execution Phase contract depends on its performance in the Planning Phase and the quality of its estimate and schedule for execution; and</li> <li>Changing its procurement practices for the Balance of Plant ("BOP") work that increases the chances of meeting schedule via direct award of work packages to the ESMSA vendors.</li> </ul>
Potential Gaps:	<ul style="list-style-type: none"> <li>➤ Incentives in the RFR contract were developed and established on the basis of four unit performance, allowing the RFR contractor to make-up cost overruns and schedule delays to the first unit on subsequent units. However, the LTEP prioritizes the urgency of a success on Unit 2.</li> <li>➤ F&amp;I work is behind schedule and is diverting management attention. The ESMSA contractors may require additional review of incentives and conditions for performance on BOP work.</li> </ul>
BMcD/Modus Observations and Recommendations:	<p>With respect to the SNC/Aecon RFR Contract, we recommend revisiting the contractual incentives that were negotiated in 2011-12. The LTEP represents a major strategic revision for the DR Project, such that emphasis on unit-over-unit improvement is much less of a consideration that optimizing performance on Unit 2. Moreover, with the award of the Turbine Generator performance to SNC/Aecon, there are additional opportunities to increase the efficiency and lower the overall cost of SNC/Aecon's work. Similar reviews should be undertaken with the ESMSA vendors to ensure all performance incentives are aligned with the current DR Project goals.</p>
<b>2. Developing contingency plans to mitigate risks</b>	
Current Initiatives:	<p>OPG has considered and developed what appear to be reasonable contingency plans needed to mitigate project risks<sup>1</sup> including:</p> <ul style="list-style-type: none"> <li>OPG's decision to "unlap" Unit 2 from the other units' refurbishment, which predated the LTEP, was intended to mitigate the risk of performance and provide the DR Team with singular focus on one unit's refurbishment at a time.</li> <li>OPG's significant investment in engineering and planning the work in the Definition Phase is the direct result of OPEX from Pickering Unit 4.</li> <li>OPG has made a sizeable investment with the reactor mock-up, during which SNC/Aecon will perform full integration and commissioning testing of the tools needed for refurbishment. The results of those tests will be incorporated into the Tooling Performance Guarantee with SNC/Aecon.</li> <li>The DR Team has developed and implemented a Risk Management Program that is being used to evaluate and prioritize project-related risks and management issues.</li> </ul>
Potential Gaps:	<ul style="list-style-type: none"> <li>➤ SNC/Aecon contract was set-up with the intent of monetizing contingency as part of the target price and not before, and there is currently some ambiguity regarding the pricing of risk in the target price.</li> </ul>

<sup>1</sup> BMcD/Modus has been asked by NOC to evaluate or otherwise assess any aspects of supply.

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

	<ul style="list-style-type: none"> <li>➤ OPG's project risk management identification requires additional leadership, visibility and focus.</li> <li>➤ OPG's transition to actively managing the EPC contractors' engineering work will require significant focus.</li> </ul>
BMcD/Modus Observations and Recommendations:	Our recommendations regarding risk and contingency have been discussed in prior reports. The DR Team's senior management is acting on these recommendations.
<b>3. Entrench appropriate and realistic off-ramps and scoping</b>	
Current Initiatives:	<ul style="list-style-type: none"> <li>• OPG has engaged in a deliberate process with numerous off-ramps for the Definition Phase. This process includes significant BOD oversight and approval of yearly releases of funding, and these funding releases and related details are being vetted by Independent Oversight.</li> <li>• The yearly release strategy and gating process for funding individual project initiatives has wide visibility and adherence within the DR Team.</li> <li>• The contract with SNC/Aecon includes provisions that allow OPG to take over the tooling and the mock-up at the conclusion of the Definition Phase if the parties are unable to negotiate the target price contract for the Execution Phase.</li> <li>• OPG has fully examined the scope of the Unit 2 refurbishment project and redistributed or cancelled work based on OPG's regulatory commitments.</li> <li>• As part of scope review, OPG has designated scope in AISC programs for the station which will be performed over a longer period of time.</li> <li>• OPG simplified the scope of the Turbine Generator work by delaying the installation of the turbine controls for Unit 2 until a future outage.</li> </ul>
Potential Gaps:	<ul style="list-style-type: none"> <li>➤ Finalizing the scope recommendations of the Blue Ribbon Panel and fully documenting those decisions for future prudence review.</li> <li>➤ Ensuring the scope that is required for refurbishment, though performed outside of the DR Project, is staffed, funded and executable.</li> </ul>
BMcD/Modus Observations and Recommendations:	In general, we see that OPG has set up the Project with appropriate measures to reduce or eliminate scope depending on the Shareholder's future needs. Unlapping Unit 2 also provides the DR Team an opportunity to incorporate lessons learned into subsequent units.
<b>4. Require OPG to hold its contractors accountable to the nuclear refurbishment schedule and price</b>	
Current Initiatives:	<ul style="list-style-type: none"> <li>• Contracts with major vendors are being developed and vetted utilizing a deliberate, staged and gated process with requirements for budget, schedule and scope identification at each gate.</li> <li>• The terms and conditions of OPG's contracts generally conform to the industry, and the contracts have specific negotiated incentives and disincentives that are calculated toward promoting the contractors' (and OPG's) responsible management of the work.</li> <li>• OPG has chosen to perform the work in the Execution Phase on a target price basis which increases the contractors' transparency. This will enhance OPG's ability to resolve issues as they arise.</li> </ul>

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

	<ul style="list-style-type: none"> <li>• OPG is implementing a detailed, integrated Level 3 schedule that will encompass all of the contractors' and OPG's work, as well as a rolled-up Level 2 C&amp;C Schedule that is used as a higher level interfacing tool. The schedule allows for planning and coordination of the work.</li> <li>• OPG has implemented cost control systems that are geared toward holding contractors accountable. These systems include earned value and budget controls through the gate process. In addition, OPG's Corporate Finance has increased its focus and resources to handle the volume of the DR Project's work.</li> <li>• OPG performs analyses of all pricing and check estimates for the contractors' work. These estimates are provided by an independent vendor with experience in the industry.</li> <li>• OPG's senior management has established separate regular steering committees with each of the major vendors' executives which provide senior leadership with a forum to discuss progress, potential and real issues impacting performance and commercial issues. These forums are an essential ingredient in managing contractors' work.</li> <li>• OPG has an opportunity through the Campus Plan work to test many of its core processes and controls.</li> </ul>
Potential Gaps:	<ul style="list-style-type: none"> <li>➤ The gate process is very good in principle although it would benefit from some additional focus and attention in practice. BMcD/Modus's recommendations in this regard were part of our 3Q 2013 report to NOC.</li> <li>➤ The estimating process may require some changes depending on the result of the root cause evaluation of Campus Plan budget variances.</li> <li>➤ DR Team's project controls are in an early stage of development and require testing and adherence by the major contractors. In particular, the earned value system will require significant testing and oversight as different pieces of the DR Project progress.</li> <li>➤ F&amp;I work is not using all of the DR Project's core processes, and those it is using lack consistent adherence.</li> </ul>
BMcD/Modus Observations and Recommendations:	<p>The DR Team has struggled with defining its "oversight" role of the contractors. As we have noted in prior reports, since OPG is ultimately responsible for the Project's outcome, it must actively manage the work of its contractors, which requires a detailed understanding of the contractors' work status and the removing of any barriers to performance as quickly and prudently as possible. Active management, however, does not include interfering with or re-performing the work for the contractors. Finding this balance is a difficult task for an owner, particularly an owner such as OPG who has self-performed and self-managed so much of its past large capital projects. The tools the DR Team will rely upon, including the P6 schedule and Proliance, will need significant attention and ongoing maintenance.</p>
<b>5. Make site, project management, regulatory requirements and supply considerations, and cost and risk containment, the primary factors in developing the implementation plan.</b>	
Current Initiatives:	<ul style="list-style-type: none"> <li>• OPG's plan for RQE assumes that all of the factors listed will be fully considered, planned and budgeted in advance of execution of the work. OPG will invest \$2.4 billion in upfront planning and site preparations prior to the breaker of Unit 2 opening in October 2016.</li> </ul>

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

	<ul style="list-style-type: none"> <li>• Taking lessons from Pickering A, the DR Team has committed to completing the identification of all regulatory requirements well in advance of final design and construction.</li> <li>• OPG has also committed to the completion of design, proving of the RFR tools and completing procurement of all necessary components one full year before breaker open.</li> <li>• OPG has implemented project controls and risk management programs and will continue to refine these tools as the outage nears.</li> <li>• OPG has established hard dates for procurement and delivery of all long lead items.</li> <li>• OPG has retained external oversight and engaged other corporate functions in providing input and assurance that the DR Team is meeting its commitments.</li> </ul>
Potential Gaps:	None at this time.
BMcD/Modus Observations and Recommendations:	While OPG's plans for the Definition Phase are robust, execution of these plans will require significant and ongoing effort.
<b>6. Take smaller initial steps to ensure there is an opportunity to incorporate lessons learned from refurbishment including collaboration by operators.</b>	
Current Initiatives:	<ul style="list-style-type: none"> <li>• OPG management approved the unlapping of Unit 2 in advance of the LTEP. As noted, the revised plan will allow for a more measured approach and singular focus on one unit refurbishment at a time.</li> <li>• OPG has filled key positions in its project management team with individuals with direct experience of prior CANDU refurbishments.</li> <li>• OPG has contracted with SNC/Aecon, whose subsidiary, CANDU Energy (formerly AECL), has been associated with each of the prior refurbishments.</li> <li>• SNC/Aecon has invested in studying lessons learned and OPEX from these prior projects and incorporated those into the RFR project. The basis of SNC/Aecon's estimate for DNGS is these past projects with specific understanding and elimination of the issues that caused prior cost and schedule overruns.</li> <li>• The scope rationalization and elimination of Turbine Generator controls installation for Unit 2 should allow the DR Project to establish considerable construction float for BOP work.</li> <li>• OPG has initiated contact with Bruce Power.</li> </ul>
Potential Gaps:	None at this time.
BMcD/Modus Observations and Recommendations:	OPG's management has taken reasonable steps to ensure that the DR Project is proceeding along a deliberate path for success. Execution to that plan is not guaranteed but will be enhanced by the work that OPG has done to date. OPG should continue to explore ways to collaborate with Bruce Power that will be beneficial to both organizations.

In summary, BMcD/Modus believes that OPG is taking prudent steps in fulfilling the LTEP's principles, and these steps largely predated the LTEP's publication. Management also appears to understand the challenges ahead.

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

### III. Major Projects – Summary of Key Risks

#### A. Retube & Feeder Replacement

##### 1. Work Status – Tooling, Definition and Mock-up

SNC/Aecon remains behind schedule in the Definition, Tooling and Mock-Up phases of its work, though it has reversed some of the trends apparent in the 3Q 2013 when it earned only 70% of its planned work. Through the end of October 2013, SNC/Aecon's cumulative SPI was only 0.80, and its CPI was a mere 0.51 for 3Q 2013. Since our last report, SNC/Aecon has improved both its earned value and actual progress. SNC/Aecon's cumulative SPI is now 0.88 and in both December and January, SNC/Aecon earned more than planned for the first time since the schedule was baselined in June 2013.

The following is the current performance trend for the three major procurements that BMCD/Modus began tracking in 3Q 2013:

- **RT Platform:** Originally planned to complete June 13, 2013, it is now scheduled to be complete and delivered on July 25, 2014 and commissioned thereafter; this is the critical path for the tooling prove-out in the mock-up. SNC/Aecon has increased source surveillance at the Rolls Royce's facility and Rolls Royce has subsequently improved its scheduled completion by 4-5 weeks since our last report.
- **Procurements of Feeder Tube and Retube Waste Containers:** Originally planned for 2Q 2013, these procurements slipped to 4Q 2013. SNC/Aecon has ramped-up the design and communication with the suppliers. There is an additional risk from the D20 Storage Facility project's construction, which may cause an access issue.
- **Multiple Planning Deliverables:** SNC/Aecon is late in preparing and providing to OPG its suite of processes and procedures for developing the Class 3 Estimate, Tool Quantification, Project Controls and Project Execution. Part of this delay was caused by SNC/Aecon not claiming sufficient progress on this work due to contractual earning rules that kept them from accurately assessing its status. The DR Team and SNC/Aecon are reviewing these and other earning rules that could fog the contractor's progress.

In our last report, we noted that SNC/Aecon initially claimed it was not behind schedule because it was still meeting its late finish "Contract Milestone Schedule." However, OPG's management has corrected this misconception, and SNC/Aecon is now using its reasonable target schedule as the basis of its schedule reporting. OPG has increased SNC/Aecon's accountability by requiring SNC/Aecon to report on its schedule progress more often and with greater focus on realistic target dates. OPG has also communicated to SNC/Aecon needed criticism of the contractor's project reporting which was minimizing its performance deficiencies. SNC/Aecon has responded by improving its metrics and reports, though this is an evolutionary process. In addition, SNC/Aecon has added experienced resources in key positions and those individuals have made a significant impact to date.

As noted, even with these improvements, SNC/Aecon's original plan to complete tooling delivery by June 2014 will not be met. SNC/Aecon's tooling recovery plan has recovered some of its earlier delays and mitigated the impact and sequence of future sub-vendor deliveries that cannot be fully recovered. SNC/Aecon has also re-prioritized some of its work on the feeder assemblies to partially mitigate the impact of these delays. Based on its recovery plan, SNC/Aecon will now complete tooling delivery by August 2014, meaning that the schedule will require successive improvements to avoid causing compression and delays to the completion of the Definition Phase work.

In our 3Q report, BMCD/Modus stated our concern with SNC/Aecon's progress and many of the behaviors that its team was projecting. In the last quarter, we have seen the immediate positive impact from OPG increasing its management of SNC/Aecon. While the recovery will take several more months, SNC/Aecon has accelerated its progress and has increased the level of its accountability. BMCD/Modus is closely monitoring this situation, and has been invited to attend progress meetings with SNC/Aecon's management.

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

### 2. SNC/Aecon Class 3 Estimate Status

SNC/Aecon's May 15, 2014 milestone for completing the Class 3 Estimate is significantly challenged at this time. As of February 10, 2014, SNC/Aecon was 32% complete in preparing its "Stage 1" CWP, which are a needed predecessor to development of the Class 3 Estimate. SNC/Aecon reported that it had earned approximately 5% in the prior week, which was its best single week to date. If SNC/Aecon were to continue CWP preparation at this rate, it would complete this work in approximately 13 weeks, or *two months later* than its March 14, 2014 milestone. Moreover, the CWPs SNC/Aecon has prepared to date have focused largely on pre and post-outage requirements and not on the critical work, which could be even more time intensive to prepare. Regardless, SNC/Aecon's Class 3 Estimate recovery plan actually assumes it will prepare CWPs at a rate 50% faster than its best single week performance to date.

BMCD/Modus is concerned that SNC/Aecon's attempts to recover its progress on the Class 3 Estimate could be ineffective and that these delays could: (1) degrade the quality of the Class 3 Estimate; (2) impact downstream estimating activities; and/or (3) further complicate SNC/Aecon's preparation and OPG's vetting of the Class 2 Estimate. OPG's management understands and shares these concerns and is maintaining the pressure on SNC/Aecon to complete on time.

The DR Team will have a better idea of exactly how late SNC/Aecon will be in its Class 3 Estimate preparation in the next 4 to 6 weeks. Assuming the recovery of the estimate target remains difficult to attain, BMCD/Modus encourages OPG to:

- Maintain the level of focus on SNC/Aecon's progress and refresh the projected completion dates based on that progress;
- Review mitigation for receiving the Class 3 Estimate later than planned, which could impact the DR Team's initial preparation of the 4d Cost Estimate;
- Request SNC/Aecon to provide all needed resources from its team OPG will need for its review and vetting of the Class 3 Estimate so that OPG's work will not be an excuse for SNC/Aecon's delays; and
- Have SNC/Aecon provide its assessment of project contingency, which is currently not required under the RFR Contract until the end of Class 2.

SNC/Aecon's Class 3 Estimate is an important step for OPG's ability to provide a strong RQE. It is likely that the DR schedule could absorb receiving the Class 3 Estimate 1-2 months late, in particular if that estimate provides a better baseline for the 4d Cost Estimate and SNC/Aecon's Class 2 Estimate. However, the quality of the estimate needs to be fully vetted.

### 3. RFR Commercial Risks

As noted above, at the time OPG and SNC/Aecon negotiated the RFR Contract, it could not have taken into account recent events—in particular the unlapping of Unit 2 and many of the principles identified in the LTEP. The major provisions that the DR Team should review include:

- Performance incentives for unit-over-unit improvement – to the extent that unlapping and the LTEP have increased emphasis on maximum performance in the first unit, the parties should weigh whether the provisions that incentivize SNC/Aecon to improve from one unit to the next will promote the proper focus on successfully completing the first Unit;
- Cost and Schedule incentives and disincentives should be reviewed under the same light;
- With the award of the Turbine Generator performance work to SNC/Aecon, there are potential economies of scale that could lessen the Project's cost and risk;
- OPG and SNC/Aecon also need to agree on the RFR project risks, which risks will be shifted to the contractor, and whether such risks will be covered by the base cost (including the target price neutral band), contingency or allowed contract changes.

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

Because the Execution Phase contract has not technically been awarded, engaging in these discussions should just be part of the final target price negotiations. OPG should consider the timing of starting these discussions so that the current Class 3 Estimate can incorporate the necessary considerations going forward.

### B. Campus Plan

The F&I Campus Plan Projects remain a significant risk to the DR Project. Through January 29, 2014, each of the 15 refurbishment prerequisite projects that are underway (including SIOs), are behind schedule, over budget or both. Some of these projects must complete prior to the VBO outage; others are not essential until Unit 2 breaker-open. However, to date, these projects appear to have been impacted by a combination of poor upfront scoping, engineering delays, lack of planning, insufficient scheduling, and significant misassumptions regarding cost and budget.

The most notable of these projects is the D20 Storage Facility, which has been delayed by unforeseen underground conditions, incomplete scoping of the work, and engineering progress. The following highlight some of the issues the project has encountered:

- Engineering for the D20 Storage Facility was scheduled to be completed by spring of 2013; now that projection is July 2014, over one full year late.
- Late tie-ins to the low pressure service water line have already resulted in a 2 month delay to the Tritium Removal Facility ("TRF") Outage completion. The D20 Storage Facility's delays have the potential to ripple into the construction of the Retube Waste Processing Building, which is being impacted by the waste pile from D20 Storage Facility's excavation.
- All of the schedule float for D20 Storage Facility has been used and if the delays are not mitigated, it will delay breaker open on Unit 2 in 2016. The current completion date for the D20 Storage Facility is projected to be April 2016, which is 6-7 months later than planned and a 3-month delay to the critical path. The operations team needs to receive this building in January 2016 in order to complete commissioning in time for breaker open.
- The budget for the D20 Storage Facility will be exceeded due to increased costs for removal of the soil, delays to the start of the caissons and other scope issues; the DR Team is currently reviewing the extent of the budget overrun.

BMcD/Modus is currently examining the root causes of the significant challenges to the D20 Storage Facility and other F&I projects that are pre-requisites to the DR Project. We have discovered some significant facts that could explain why these projects are so far off their schedule and cost goals:

- The schedule for all the Campus Plan work was initially premised on a DR Project breaker open date of October 2015. When the DR Project's start was postponed one year, these projects had more time but didn't have an additional year of float. However, not only does it appear that some of the original scheduling assumptions were erroneous, the P&M organization did not take advantage of the additional time to improve its front-end planning and reduce the overall performance risk of this work. Instead, work packages and projects simply sat in place and were not aggressively advanced.
- The D20 Storage Facility was the first EPC ESMSA project and the learning curve has been particularly steep. The P&M team appears to have underestimated the impact of the new contracting methodology for performing the work, and has been over-reliant on the ESMSA contractors.
- Initial scope identification was very limited and left open key aspects of the design. The DR Team, having observed the problems with the D20 Storage Facility, changed the process for scope identification for the other modification work, resulting in the development of the MDP packages.
- P&M accepted vendors' quotes for the work that were widely disparate, without a full understanding of what was causing the price differences. Furthermore, even though the work ultimately was to be performed on a cost

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

reimbursable basis, P&M significantly weighted the bid evaluation towards the lowest priced estimate, discounting a bidder's experience, qualifications and understanding of the work.

- P&M assumed that the accepted vendor quote it received could be termed a "Class 2 Estimate" even though engineering had not for advanced commensurate with such a classification. Thus, the contingency released at the D20 Storage Facility's Gate 3b was insufficient to cover the known risks, many of which have already materialized.
- P&M's management was not aggressive enough in requiring the ESMSA contractors to submit reliable Level 3 schedules for performance of the work. Currently there are only 4 schedules loaded into the C&C Schedule from F&I work that have sufficient Level 3 detail. Moreover, it doesn't appear that P&M looked at the composite workload on each of the ESMSA contractors until the DR Team required P&M to integrate its schedules in the fall of 2013.
- F&I schedules currently carry unrealistic float, are tied improperly to ending milestones, and utilize incorrect milestones.
- There may be commercial issues getting in the way of the contractors' efficient performance. The ESMSA contractors had initially complained that the secondary compete process made it impossible for them to plan for the proper size and scale of their operations. In addition, the incentives to manage the engineering process may be lacking.

In summary, BMcD/Modus has found that P&M has clearly struggled with how to manage the ESMSA contractors in an EPC arrangement. As noted above, BMcD/Modus is currently examining the root causes of these issues. We expect to arrive at more definitive conclusions by the next NOC meeting.

In the meantime, the DR Project's and P&M's senior management have taken the initiative to call a summit with the ESMSA contractors to further examine and clear barriers to success that are impacting both the F&I and Balance of Plant ("BOP") work. In addition, P&M's and the DR Team's senior leadership are taking action to turn the performance around, including:

- Co-locating OPG engineering resources at the vendor's shops to answer questions and oversee development of the detailed design work and institute regular Steering Committee meetings with project leadership to remove performance barriers.

Continuing integration of all of the F&I pre-requisite work into a single schedule so that the ESMSA's can properly plan and resource load the work and OPG can manage the contractors' work load and performance. As part of this schedule development, BMcD/Modus sees a critical need for the DR Team, P&M and Plant Operations to conduct a joint review to confirm the latest possible delivery dates for all F&I work. Such a review needs to incorporate requisite commissioning time and resources needed for completion of the work, as well as spread resources in an efficient manner.

- Complete the work allocation to each of the ESMSA vendors so that they can properly plan their work. The DR Team has attempted to allocate the work evenly, though it may become necessary to shift work based on performance and resource availability. This becomes a more complex issue with the BOP work scope also needing attention in the coming months.
- Provide additional and focused project management support from OPG to clear barriers to engineering and execution work.
- Engage in constructive high-level dialogue with the ESMSA's senior management.

OPG Management is taking action to turn around the Campus Plan work, including bringing in new leadership for P&M and fostering greater integration between the F&I and DR Project work. The visibility of the issues P&M has encountered will help the BOP, Islanding and Services projects work with the ESMSA contractors.

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

### C. Balance of Plant and Other Projects

In our 4Q 2013 Report, we discussed the impact of the review by the Blue Ribbon Panel of DR Project scope. The final recommendations have been made and have been reviewed through the Project Scope Review Board process. As noted on our prior reports, the process OPG used for this review was robust and consistent with the DR Project's management processes. With scope essentially locked down, the attention of the BOP, Services and Islanding projects shift to allocating the work to the performing contractors (mostly ESMSA or SNC/Aecon), completing detailed engineering and establishing target price budgets for the work. Some early indications of scope/pricing from the ESMSA have been mixed. For one such work package, the contractor misunderstood OPG's requirements and submitted a bid premised on re-performing a significant amount of the engineering work that OPG had already performed. The DR Team has rejected these proposals and clarified its requirements, which is delaying the issuance of this work package. The DR Team has increased the time for verifying estimates (from one week to two weeks) to ensure the contractors' pricing and scope are properly aligned. We have recommended the DR Team further align this process by requiring the ESMSA provide its detailed estimates in a manner that facilitates comparison with the internal check estimates from Faithful & Gould. These actions should improve the quality of future ESMSA estimates, though this bears close attention.

### IV. Functional Groups Update

#### A. Engineering

##### 1. Scope Definition

The DR Team has placed significant emphasis on defining scope well in advance of RQE and has set critical milestones for measuring scope definition. One such goal is achieving "Health of Scope" to support detailed design work. The DR Team reports that it is on target to achieve Health of Scope 4, in which all modification work will be known, by the October 2014 milestone. The team's ability to meet this milestone was greatly enhanced by the work of the Blue Ribbon Panel.

Through the end of January, 2014, Engineering had completed 112 Modification Design Packages with 27 known packages remaining. This represents excellent progress over the last year, and the May 2014 milestone for completing MDPs should be met.

##### 2. Planning of Engineering Work

As recommended in the BMCD/Modus 4Q 2013 report, OPG's Engineering attention has shifted from the Definition Phase to planning the next design phases, utilizing the Construction Industry Institute's ("CII") **Front End Planning for Revamp and Renovation Projects** as a source of industry best practices. OPG's focus on planning has initiated a 'bottom-up' work hour estimating process for engineering activities that will lead to a more precise resource forecast. Engineering also initiated the use of an engineering deliverables-based blackout chart, the development of which has identified additional issues with the integrated Level 3 schedule that should enhance the coordination of interrelated activities.

Engineering's focus on planning has also brought attention on the engineering partners of the ESMSA vendors who are responsible for the detail design phase for BOP and F&I work. As noted, ESMSA engineering performance on the F&I projects has been lagging. The DR Team is now taking a much more active role in the management and execution of the F&I projects, and has sought alignment between OPG and the ESMSA's engineering companies' senior management.

The EPC requirements in the ESMSA contracts have compelled constructors and engineering companies who were not previously partnered, to join forces. In our experience, joint ventures of this nature can take several years and several project cycles to mature. The ESMSA joint ventures are still on the early part of this learning curve. The shift within OPG to greater reliance upon external service providers has resulted in some duplication of work effort, churn and mistakes by the ESMSA vendors along with OPG's late recognition of its essential role in managing these vendors. OPG Engineering is moving away from a culture of "observation at a distance" to a much more proactive engagement and active management of the engineering service providers. We continue to encourage this shift in role and perspective.

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

### B. Project Controls

#### 1. Schedule

As discussed above, the DR Team's project controls staff has developed a plan for integration of the prerequisite F&I work, calling for full development and integration of the Level 3 schedules for all sub-projects by the responsible ESMSA vendor. This integrated schedule, database in combination with the DR Project integrated schedule, will allow for timely project status and schedule analysis as well as a more cohesive decision making process regarding work flow and resources. This technique is being put in place and utilized by P&M for all of the F&I projects allowing for composite resource analysis, most importantly by the ESMSA vendor resources. Because this process is vitally important to the success of the DR Project, compliance by the P&M organization (including the ESMSA vendors) is imperative.

Until this quarter, the P&M organization has had little success accomplishing the development and integration of the ESMSA vendor schedules. In fact, the number of vendor-developed Level 3 schedules has lagged significantly behind the work. The lack of properly developed, integrated and resource loaded Level 3 schedules has made it impossible to evaluate ESMSA resource needs critical to the DR Project. Furthermore, the lack of an integrated schedule has made critical analysis of the potential impact of delays to the DR Project milestones impossible, and perpetuated the assumption that the F&I work had months of float.

Recent success by the teams working to implement the schedule integration plan has been encouraging and ESMSA scheduling work is improving. P&M and DR Team leadership are now providing clear and concise definition of the division of responsibility between the DR Team, P&M project management and the ESMSA vendors and improving the working model. Meanwhile, the DR Team has identified the points of impact at which the F&I projects could cause delay or changes in execution methodology. These points are now set in the Refurbishment schedules awaiting work ties by the ESMSA vendors so that impacts can be evaluated.

To further facilitate the schedule development, BMcD/Modus recommends that a composite team (DR Team, P&M and Plant Operations) review the F&I schedules developed to date in conjunction with a re-evaluation of the impact points and milestones critical for delivery of the prerequisite projects. This analysis will comprise a review of individual project logic combined with an evaluation of the proper inter-project and milestone logic, sometimes termed a "backwards pass" analysis. This review should also develop a prescriptive plan for final F&I schedule development aligned with the current Level 3 DR Project compliance requirements. The project controls team should prepare a follow-up analysis that focuses on resource loading by the ESMSA vendors. Studies determining regional resource availability requisite with the project needs shall be conducted parallel to this development. Prompt identification of issues related to resource availability have to be quickly identified and fact based in order to properly address and/or provide mitigating actions to alleviate.

#### 2. Project Cost/Estimating

As noted, BMcD/Modus is currently examining the root causes of the budget variances apparent in some of the F&I work. As part of this analysis we will review the initial pricing responses on BOP work to see if they suffer from some of the same noted deficiencies. The DR Team prepares independent estimates of the work for planning and budgeting, as well as providing a check against the contractors' pricing. For the BOP work, these estimates will form the first check against the completeness of the contractor's budget; thus if these estimates are wrong, this would greatly complicate development of the 4d estimate and RQE. We are also examining the commercial risks present in the ESMSA contracts to test if there are provisions that are causing poor behavior by the two contractors. We expect to arrive at more definitive conclusions by the next NOC meeting. The project controls team and the estimating vendor (F&G) are performing their own series of self-assessments and quality reviews on the estimating process.

#### 3. Risk Management Program

As a part of our commitments under the 2014 Assurance Plan, we performed a detailed assessment of the Darlington Refurbishment's Risk Management Program in the fourth quarter of 2013. The purpose of this assessment was to review

## Report to Nuclear Oversight Committee – 1Q 2014 Darlington Nuclear Refurbishment Project

the status of the areas identified for improvement in our August 13, 2013 comprehensive Project Assessment Report. From Mid-July through the end of December, BMcD/Modus monitored and assessed the DR Team's actions regarding the Risk Management Program and note progress in line with our initial observations and recommendations. Although the DR Team still has work to do to effectively implement the program, numerous improvements have been initiated that address matters such as:

- Greater emphasis on risk identification clarity and the progressive elimination of "business as usual" items from the Risk Registers;
- Some formal training has been conducted;
- Improvement to the Risk Register Reports;
- Consolidation and clarification of the applicable risk procedures; and
- The Risk Group has taken a more aggressive role in managing the Risk Management Program.

However, the DR Team has not completed implementation of these essential improvements. The DR Team needs to continue to scrub and clean the risk registers in order to make them an effective tool. The risk reporting tool is somewhat cumbersome and is difficult for end users to sort and analyze information; thereby hindering the effective development and management of mitigating actions. The DR Team has commenced some formal training on the Risk Management Program, however, there needs to be more as evidenced by the current state of the Project Risk Registers. While we have seen some evidence that the Planning and Controls Risk Group has taken a more active role with respect to the implementation and management of the Risk Management Program, we would recommend much more attention in this regard. Additionally, we have not seen much improvement with respect to the identification of opportunities or the development of useful metrics. **Attachment B** to this report is a table which shows the trending on the various areas of the Risk Management Program.

### V. Other Project Risks

#### A. Project Team Development

Some of OPG's procedural and process changes in response to the Auditor General's Report have increased the risk of key personnel leaving the project and will make the hiring and retention of experienced resources more difficult for the DR Project. Enterprise Risk Management carries the retention of key personnel as the biggest program risk to the DR Project, and we would agree that it is certainly among the DR Project's biggest challenges.

BMcD/Modus has pulsed the succession and workforce planning as well as the current and projected staffing levels and found that the DR Team's management is properly focused on this risk. However, the team could benefit from more formal procedural guidance. The unlapping of Unit 2 has also relieved some pressure for immediately staffing the Project Team for the next units.

#### B. Program Management Plan Development

BMcD/Modus monitored the 4Q 2013 update of the DR Team's Program Management Plan ("PgMP"), the primary purpose of which is to demonstrate how the project will be planned, executed, monitored, controlled and closed. A well-constructed PgMP provides a descriptive link between the Project Charter and the lower level procedures; thus, it should be an informative guide for team members and stakeholders alike and subsequent revisions should provide a progressive elaboration of the program management team's plans as they continue to develop.

We found the current state of the DR Team's PgMP to be lacking in detail and clarity. The individual work plans within the PgMP were of inconsistent quality and depth, and these plans were not integrated in a comprehensive fashion. Moreover, the PgMP did not eliminate many of the procedures that are no longer needed or applicable for this work. We would recommend that management make completing the PgMP a priority.

Area

Observations

High

Medium

Low

Current Status / Mitigation

Project Controls

**Continued Schedule Development:**  
Schedule approach was unproven;  
integration at appropriate level at risk

- ▶ Project Team is moving toward industry-wide recommended practices for scheduling
- ▶ Substantial work remains to populate detailed level 3 schedule

**Progress Towards RQE:** The plan  
for developing RQE is being  
developed.

- ▶ RQE development remains essentially on schedule, but will be heavily reliant on the quality of the various inputs.
- ▶ The DR Team has assigned a manager for the planning and development of the multiple pieces that must come together for RQE.

**Risk Management Program:** Risk  
registers require scrubbing;  
monitoring tools are cumbersome

- ▶ DR Team is cleaning up the risk register and improving reporting
- ▶ Risk Group is taking a more active role in managing the Risk Program
- ▶ Risk training is being conducted

**Summary Table From Risk Assessment Assurance Report**

Area	Observation No.	Comments	Change from Previous Assessment
Risk Register Reporting Limitations	1	Migration to SharePoint and Excel reporting tool have increased reporting functionality, but there are still limitations.	↑
Lack of Clarity of Risk Titles and Descriptions	2	Significant progress has been made by the DR Team over the last several months on this issue. Current TCD to complete updating of all risks is January 31, 2014.	↑
Numerous Entries in the Risk Registers are not “Risks”, but Business as Usual “Issues”	3	Significant progress has been made by the DR Team over the last several months on this issue. Current TCD to complete updating of all risks is January 31, 2014.	↑
Lack of Appropriate Risk Management Program Staffing & Leadership	4	There will be some significant changes to the Risk Group in January. This issue will have to be monitored once the new team is in place.	↔
Risk Management Program Training	5	There has been a concerted effort to implement formal training by the Risk Group	↑
Missing Identification of “Opportunities”	6	There has been no effort to identify opportunities within the risk register.	↔
Weak Risk Responses	7	The key to a successful Risk Management Program (and overall project success) includes the thoughtful development of effective Risk Responses (e.g. mitigating) actions. Based solely on a review of the Risk Registers, many risk responses appear to be perfunctory and ineffective.	↑
Long Periods Between Risk Register Reviews and Updates	8	Efforts to update all risks have caused more frequent review of risks. OPG should consider having ROC meetings more frequently than once per quarter.	↑
Risk Oversight Committee Effectiveness	9	Three meetings have been held to date and, as the risk program matures, they are progressively improving by focusing less on process and more on substance.	↑
Lack of Trending and Other High-Level Metrics	10	There was no change as of the end of December. However, we have noted some improvement in this area in the last couple of weeks. New metrics are being developed, but not yet rolled out.	↔

# **Report to Nuclear Oversight Committee**

## **2<sup>nd</sup> Quarter 2014**

### **Darlington Nuclear Refurbishment Project**

**Burns & McDonnell  
Modus Strategic Solutions**

**May 13, 2014**

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

### I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company (“BMcD/Modus”) provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors (“NOC”) regarding the status of the Darlington Nuclear Generating Station’s Refurbishment Project (“Project” or “DR Project”) as of April 30, 2014. The DR Project continues to advance toward its major goal of producing a Release Quality Estimate (“RQE”) for final Board of Directors and Shareholder approval by October 15, 2015.

BMcD/Modus has continued to stress the importance for OPG to embrace its role as the integrator of the work and to actively manage the multiple contractors. To this end, the DR Team has made a significant shift in engineering strategy and will now directly manage and supervise the engineering service providers, rather than continuing the previous “hands-off” oversight approach. This is a bold but necessary move and one that is endorsed by BMcD/Modus. If OPG manages this transition well, we would expect a significant increase in engineering efficiency.

Pursuant to the Project’s Assurance Plan approved by the Audit & Finance Committee, BMcD/Modus has prepared independent reports documenting the DR Team’s status as well as further recommendations for improvement. This quarter we have issued Assurance Reports based upon our detailed review of: 1) DR Project Schedule Process and Development; 2) the 2013-2014 Business Plan as it relates to the latest project estimate (the “4c Estimate”) and 3) Scope Status and Process. Upcoming reports will focus on our review of the Campus Plan cost and schedule overruns, 4d Cost Estimate vetting and RQE preparation. These full reports will be available for the NOC’s review. In addition to our regular, everyday contact with the Project Team, we will continue to meet periodically with the Refurbishment Project Executive Team (“RPET”) to discuss our reports to NOC and our Assurance Reports in order to clarify any recommendations and engage in discussion of appropriate actions. We are also coordinating our efforts with Internal Audit so that we meet our assurance commitments in an efficient and effective manner.

Much of our focus in this quarter’s report was on evaluating the performance of the pre-requisite Facilities and Infrastructure projects (“F&I” or “Campus Plan Projects”). The Campus Plan Projects remain a significant risk to the Refurbishment Project, and provides important lessons learned for the DR Project.

The following is a brief summary of the DR Project’s most significant developments over the last quarter:

- **Campus Plan Performance Project Risk:** Many of the Campus Plan Projects are forecasted to complete significantly beyond the approved budgets and schedules. In fact, schedule adherence is so poor that the Campus Plan work poses multiple threats to the start of Refurbishment. Over the last quarter, BMcD/Modus has engaged in a thorough review of several key Campus Plan projects in an attempt to identify trends and understand the causes of these cost and schedule overruns. Our findings show that the predominant cause was OPG’s Projects & Modifications (“P&M”) organization, who is managing this work for the DR Project, incorrectly applied an “oversight” project management approach for its EPC contracting strategy, leading to a series of cascading management failures and contractor performance issues, including misunderstandings of scope, uncontrolled scope creep, poor quality cost estimates, unrealistic and incorrect schedules and an inability to manage known risks, additional costs and delays. For multiple reasons described herein, P&M was completely overwhelmed in trying to manage Campus Plan Projects – in particular, the two largest of these projects, the D2O Storage Facility and Auxiliary Heat Steam Plant (“AHS”) which were the “pilot” projects for this new contracting model.

Simultaneous to our review, the P&M team’s new leadership has taken aggressive action to correct as many of the major issues as possible. In acknowledgement of many of our recommendations and as a result of its own findings, P&M, the performing Extended Services Master Service Agreement (“ESMSA”) contractors and the DR Team are developing more realistic project schedules for each scope of work that will account for need dates, available resources and optimal work flow. Senior management has committed to a full reforecast of the cost of each of the Campus Plan Projects, starting with the two most notable problem projects, the D2O Storage Facility

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

and AHS. P&M's and the DR Team's senior leadership instructed their managers to actively manage the work henceforth through increased collaboration with the contractors. In particular, OPG's engineering team will be taking on a much more active role in directly managing the remaining engineering work. While these measures are much more likely to be successful, the damage to a certain extent cannot be fully mitigated, as the affected Campus Plan Projects will cost more, finish later and pose a much greater threat to Refurbishment than management initially realized; this is in large part due to the unrealistic nature of P&M's initial project budgets and the way in which scope crept into these projects after these initial budgets were approved. We recommend that OPG look at the impact of these Campus Plan Projects on the Definition Phase budget as soon as possible. Moreover, P&M can only hope to recover these Campus Plan Projects if it receives support from OPG's corporate functions, from whom P&M will require fast action and some needed modifications to processes. Our team has been engaged in closely monitoring the recovery plan and will continue to report on P&M's progress. Our observations and recommendations with respect to the Campus Plan performance to date are summarized in this report and will be the subject of an Assurance Report we intend to issue at the conclusion of the 2<sup>nd</sup> Quarter.

- **RQE Preparation:** RQE development remains essentially on schedule, though the development of the 4d Cost Estimate will be a good test of the DR Team's preparation. Senior management has introduced two new controls to the Project to aid in this endeavor: 1) an Options Review Board chaired by the Senior VP of Refurbishment that is vetting the maturing plans for each scope of work, and 2) a Readiness Schedule and related process which will hold the project managers accountable for meeting interim preparation milestones. These are good measures that will provide additional confidence for RQE. In addition, all of the major Project Bundles except for the Steam Generator Project will be going through Gate 3 prior to the fall of 2015, which should provide the DR Team with an opportunity to re-examine these sub-projects' business cases including scope alternatives, status, methods of delivery, cost estimates, schedules and risks. Strengthening the gate process as we have recommended will provide further levels of vetting for the work planning and should streamline the DR Team's approach to the 4d Cost Estimate.
- **Retube & Feeder Replacement Project Risks:** The RFR project remains the DR Project's most notable ongoing risk, with respect to the Execution Phase as it represents the majority of the work on the Critical Path. SNC/Aecon's performance trends during the Definition Phase needs to be taken into account in the vetting of its Class 3 Estimate<sup>1</sup> (an estimate with an expected accuracy range of between -10% on the low side and +30% on the high side after the application of contingency) and OPG's confidence level for the Execution Phase. Through March 31, 2014, the contract is underspent by \$9 M against plan, though this gap is closing. Additionally, SNC/Aecon's cumulative schedule performance index ("SPI") has improved to 0.94. As noted in our last report, SNC/Aecon's original plan to complete tooling delivery by June 2014 will not be met, and aspects of its recovery plan dates are being challenged by further supplier delays. SNC/Aecon has committed to recover these dates and is reassigning work to different suppliers, though the impacts of these delays could be felt in the tool performance guarantee period. OPG's RFR team is closely monitoring these events and holding SNC/Aecon accountable.

With respect to the Class 3 Estimate preparation, SNC/Aecon met its internal goal of March 15, 2014 to produce construction work packages ("CWP's") and has progressed with its other key deliverables, including the detailed Level 4 schedule. However, the compressed time frame during which SNC/Aecon produced all of these estimate components has put the onus on OPG to review, comment and rationalize SNC/Aecon's estimate by June 15, 2014, which will take considerable effort and coordination. Ultimately, SNC/Aecon must provide OPG with comfort that the Class 3 Estimate meets its committed level of accuracy. Equally important is how the Class 3

<sup>1</sup> Estimate accuracy is classified per the Association for the Advancement of Cost Engineering International (AACEi) standards Class 1 through 5. Class 1 is the most accurate.

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

Estimate forms the platform from which the Class 2 Estimate (with an expected accuracy range of -5% to +20%) will be developed for RQE. As discussed below, there are some commercial opportunities OPG must weigh that could impact the cost estimate as well. Given its high importance to the overall project, BMCD/Modus sees OPG arriving at an appropriate comfort level with the Class 3 Estimate as essential to tightening the project's cost estimate, and we would recommend the team take any reasonable time and action needed to reach that level of comfort.

- **Commercial Risks:** The Project Team has taken our recommendation to review commercial incentives and disincentives in the Project's major contracts in light of some changed planning basis and assumptions—including the Shareholder's mandates set forth in the LTEP, the unlapping strategy and the evidence to date of contractor performance. The DR Team took an action to develop a negotiation strategy with SNC/Aecon that will take into account the impact on their work caused by the unlapping Unit 2, prioritization of Unit 2 performance, potential for economies of scale with the Turbine Generator work and other key considerations. Regarding the ESMSA, senior management is instituting a number of changes to managing and executing the EPC model that has proven to be ineffective at driving performance, cost and schedule compliance and reducing OPG's risk. [REDACTED] and OPG theoretically has both the expertise and the essential knowledge needed to more effectively manage this work. Going-forward, it is OPG's intention to take a much stronger role in managing and directing the engineering portion of the work. In doing so, it will be important to for OPG to understand and communicate the impact of the shifting of risk for this added responsibility as well as any impact to warranties provided by the contractors. The success of this new strategy will depend on OPG's ability to attract and retain talent and OPG's ability to drive change down through its organization to implement a new project management philosophy.

Other ongoing challenges to the DR Project include the development of the DR Team for the Execution Phase, further refinement of the Risk Management Program and Fuel Handling work. Attachment "A" provides an update regarding the DR Project's risks.

## II. Summary of Campus Plan Root Cause

### A. Overview

The Campus Plan Projects consist of 26 separate scopes of "pre-requisite" work that are needed to support the DR Project or the station's operations during construction. These projects are being managed by OPG's P&M organization. Prior to this Campus Plan work, P&M executed capital projects for the stations, with annual budgets of approximately \$300M. With the advent of the DGNS Refurbishment Project, senior management sought to use P&M to develop and oversee all of the Campus Plan Projects, allowing the DR Team to focus on planning for the DR Execution Phase. The inclusion of the Campus Plan Projects caused P&M's portfolio to increase by four to five times, and the scale and technical complexity of this work was unprecedented for this organization. At the same time, OPG was under pressure to decrease its staff in line with the Shareholder's requests. As with many utilities in the US, OPG who had once had a very large construction unit that built the current stations and Bruce, and as recently as Pickering A Unit 1 RTS Project in the mid-2000's had considerable in-house construction, planning, procurement and engineering resources, was shrinking even further and the capability for managing and directing large capital projects was sacrificed.

From 2010 until July 2013, P&M was led by its former VP [REDACTED]. [REDACTED] ultimately succeeded [REDACTED] in January 2014. P&M's governance, including most of its business and management processes, were separately developed and maintained from those used by the Refurbishment Project. Also, P&M negotiated and utilized the Extended Service Master Services Agreement ("ESMSA") contract and the two "ESMSA Contractor" consortiums led by Black & McDonald and ES Fox. The ESMSA contract is actually a mix of multiple standard form agreements that could be used in combination depending on the circumstances – e.g. there are separate forms for engineering, procurement and construction that could be combined into an "EPC" contract. The business deals with the ESMSA Contractors were

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

the result of a competitive process which resulted in the contractors agreeing to some unique provisions that are used for all contracted work with these vendors. As an example, when used as an EPC, the contractors who lead these consortia are required to bid engineering work on a fixed-price basis with no profit for themselves. The construction work is all cost reimbursable target price, and the performance incentives include up to a 50% reduction of profit, though this and some other disincentives built into the contract have proven thus far to be much less effective in practice than concept at driving the contractors' behavior and performance.

The impetus for having P&M execute the Campus Plan work was that through the Definition Phase of Refurbishment, the DR Team was not assembled as an execution organization, but a planning one. P&M was an existing service resource with some experience in managing the ESMSA contractors. P&M's work on the Campus Plan Projects is funded by Refurbishment and it must report its progress to Refurbishment, though these business units are otherwise autonomous. Until recently, other than these approvals and the fact that both organizations use the ESMSA Contractors, there was very little else in common between Refurbishment and P&M, including the project management procedures utilized for their respective projects. P&M's project management procedures were not developed to manage multi-year projects of the size and scope of some of the Campus Plan Projects. Over the last several months, P&M has begun to manage the Campus Plan projects in accordance with the project management procedures developed for the DR Project in an attempt to implement industry-standard risk, cost and schedule controls. Additionally, the new VP has implemented a series of organizational and strategic initiatives with the goal of improving performance.

As of April 2, 2014, the Campus Plan Projects are estimated to cost in aggregate approximately \$660M (an increase of \$111.5 Million over the Board of Directors approved 2014 Business Case release for this work) and the work varies widely in size and complexity. The performance of the work is largely split between the two ESMSA contractors, Black & McDonald and ES Fox. Deadlines for completion of these Projects vary based on the project's and stations' needs; AHS is scheduled to be complete prior to the DNGS Vacuum Building Outage ("VBO") in mid-April 2015, while all the remaining work is scheduled to be completed one year later, in April 2016, to allow enough time for commissioning prior to the October 2016 Refurbishment Project's breaker open milestone. Many of these Campus Plan Projects involve the construction of commercial buildings that are made more complex because of their location on or adjacent to the nuclear island, which impacts their associated design requirements for such things as nuclear safety, security, and seismic requirements. Additionally, these are brownfield projects on a site where soil quality issues and underground interferences are the norm and coordination with the operation of DNGS must be managed.

Over the last quarter, BMCD/Modus has engaged in a number of activities related to the Campus Plan Projects. In this regard, we have:

- Reviewed the reasons for significant cost variances in five of the largest Campus Plan and Prerequisite Projects: D20 Storage Facility; Auxiliary Heat System Building ("AHS"); Water & Sewer; RFR Island Annex Building ("RFRISA"); and Retube Waste Processing Building ("RWPB"). Our goal was to determine the root cause of the Campus Plan Projects' variances so that past mistakes will not be repeated. We chose to examine the RWPB, which is being built by SNC/Aecon and managed by the DR Team, for a real-time direct comparison with the ESMSA-managed projects.
- Reviewed the Campus Plan Projects' schedules prepared by the vendors to identify any major gaps. This review led our team to make a series of recommendations to the P&M and DR Teams, and our subsequent monitoring of progress of the vendors' ongoing redevelopment of their detailed schedules for each of the major projects.
- Examined the risk management process within the P&M organization, including its ability to properly identify, avoid, mitigate and monetize risk.
- Reviewed the design and scoping process and identified the causes for the extreme inaccuracy of the vendors' engineering cost and schedule estimates.

Confidential – Do Not Disseminate

Page 4 of 23

May 13, 2014

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- Reviewed the management structure and capabilities of the P&M team that started this work down the current path. We have also spent time with P&M's new VP and members of P&M's restructured leadership team to convey our findings and recommendations and gauge the effectiveness of P&M's current initiatives to improve performance and mitigate these earlier management failures.

As noted, these Campus Plan Projects have been plagued by myriad problems that have resulted in significant schedule and cost variances. Our findings show that the predominant cause of these overruns was P&M's original strategy to use a project "oversight" management model for the EPC contracting strategy utilized by OPG that was inappropriate in application and lead to a series of cascading management failures and contractor performance issues. The oversight management model employed a disengaged, "hands-off" approach by the P&M organization which caused the fledgling P&M organization to: (1) wrongly assume that the contractors understood the scope on the basis of performance specifications that outlined scope initial requirements; (2) utilize inexperienced project managers; (3) allow Operations & Maintenance and other OPG stakeholders to initiate scope changes to these projects long after the conceptual design period ended; (4) to accept the poor schedules and cost estimates by the contractors without appropriate vetting and challenge, and which were not updated to incorporate the impact of scope changes on a timely basis; and (5) to inaccurately or untimely report the projects' progress, risks and cost and schedule overruns to the DR Team and senior management.

### B. OPG Contractor Management and Contractor Performance

#### 1. Summary

Based on the information we have reviewed, it is apparent that P&M put excessive faith in the ESMSA Contractors' ability to perform this work and an over-reliance on the perceived ability of the EPC contracting model to shift project risk to the contractor and alleviate the need for active project management. As a result, OPG chose to provide oversight of the contractor's work at arms-length. In a recent self-assessment related to the D2O Storage Project's delays, the P&M Project team ("P&M Team") noted that at the onset of the Project, P&M believed "the EPC Process" would mitigate known risks via "project efficiency gains due to the expertise and autonomy of the contractor."<sup>2</sup> This exemplified OPG management's initial hands-off approach to project management that P&M piloted under which the contractor was given autonomy to develop its own scope requirements without process monitoring. As noted in P&M's self-assessment, this model resulted in "unclear expectations, re-work, frustration."<sup>3</sup> P&M's error was misunderstanding the essential nature of the ESMSA contracts, which are not fixed-price EPC contracts that shift all risk and responsibility for performance to the contractors (nor were they ever meant to be). The majority of the Campus Plan Project's execution cost is being performed on a cost-reimbursable target price, where contractors have only a portion of their fee at risk in the event that the target price is exceeded. In our experience, the nature of this work (refurbishment and construction of new facilities on an operating nuclear site) and the fact that the contract is cost reimbursable, require the owner to engage in active management of the contractors and coordinate interfaces. This means providing very specific instructions to lock down scope at the project's conceptual design phase and holding the contractors accountable on a daily basis to meet expected cost and schedule.

- Moreover, it is apparent that the P&M Team did not have the necessary experience, training or internal management direction to properly manage this work. Attachment B is a matrix that provides a summary of our observations regarding the five major ongoing F&I Projects. This matrix shows, among other things, that in the management of the work, P&M:
- Routinely accepted poor quality schedules and cost estimates without adequate vetting;

<sup>2</sup> SCR Number D-2013-19100, January 22, 2014.

<sup>3</sup> Id.

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- Mischaracterized the nature of these estimates by assuming anything provided by a contractor was at a very high level of maturity (Class 3/2) when such estimates were based on conceptual (at best) engineering, meaning these estimates could not have been better than Class 5 (-50% to +100%) in nature;
- Failed to establish accountability standards for the contractors;
- Failed to identify or mitigate known risks;
- Did not effectively react to problems when they materialized and accurately and timely report the extent of cost overruns, schedule delays and scope increases to senior management;
- The P&M Team did not seek to lock down the scope at start of this work and allowed the “customer” – Operations and Maintenance – to make significant changes to the design that were not properly understood, quantified or captured in subsequent reports to senior management; and
- The ESMSA contractors contributed to the problem by not transparently reporting or timely identifying how these projects were evolving and failing to provide any reliable metrics—cost, schedule or otherwise – that informed OPG of these brewing problems.

### 2. Indicative Projects - D2O Storage and Auxiliary Heat

In our analysis, BMcD/Modus examined five separate projects in detail, and each exhibited some or all of the management issues to some extent. Attachment C is a brief summary of each of these projects’ cost overruns.

The management failures we observed were most evident and acute with the D2O Storage and AHS projects. These projects were the “pilot” EPC projects for the ESMSA contractors—

[REDACTED]

[REDACTED] In both cases, P&M sought the Board’s full funding approval at a point when very little design was done, only to have to later seek additional funds from the Board once design had matured.

#### a. The Flawed Bidding/Estimating Process

P&M’s management failures can be seen throughout the planning and execution phase of the project. Notable from OPG’s initial negotiation and acceptance of bids for this work is P&M’s mischaracterization of the vendors’ estimates in the approved Business Case Summaries (“BCS”). In August 2011, OPG produced a BCS for D2O Storage that estimated its cost at \$210.6M, [REDACTED]. At the project’s next gate in June 2012, the estimated cost had dropped from \$210M to \$108M. However, BMcD/Modus could not find any attempt by P&M to rationalize or otherwise explain how the cost estimate for this building was cut virtually in half from one approval gate to the next. Moreover, the estimate for design and construction was \$52.2M, which P&M characterized as a “Class 2 Estimate” despite the fact that at the time of the estimate, Black & McDonald had little experience with this type of construction and had performed no engineering or scope definition. Thus, this estimate was more likely a Class 5 Estimate. In retrospect, it is likely that the initial \$210M estimate was more accurate; however, it is certainly clear that the approved \$108M estimate should not have had any greater accuracy attributed to it, since it was not based on a significantly greater level of project maturity. Likewise, the AHS BCS was termed a “Class 3” Estimate, though it was similarly immature.

This estimate classification drove P&M to vastly underestimate the amount of contingency associated with each package. There is no evidence that P&M engaged in the type of vetting of the estimates that we would expect on projects of these size and importance. From interviews with the current P&M staff and the contractors, it appears that these initial BCS estimates were poorly characterized as part of a deliberate management strategy directed by the former VP of P&M. P&M’s managers told us that the contractors were challenged to reduce their bid prices and remove all contingencies for unknowns, despite the extreme immaturity of project definition underlying their respective bids. As

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

an example, for the D20 Storage project, Black & McDonald was told to remove from its contract price any contingency for unforeseen soil conditions, even though there was a high likelihood that there would be contaminated soil issues. Moreover, P&M clearly overvalued price as a consideration in the contractor selection process, especially in light of the fact that the work was going to be performed on a cost-reimbursable basis and the bid prices were not binding.

P&M gave only token consideration to determining which contractor had a better approach for executing the work. P&M chose the “low bidder” even though the other contractor’s qualifications and project approach were viewed more favorably. Thus, P&M created the conditions for a perfect storm of cost and schedule overruns. Because the work is largely based on a cost-reimbursable target price with no caps on size, P&M’s artificial beating down the contractors’ prices in the bid phase was a Pyrrhic victory: P&M’s actions did not reduce cost and only served to deprive senior management of realistic cost projections for this work. The budgets for these and other F&I projects were nothing more than paper barriers that were easily surmounted as the design work continued to generate more complex (and expensive) work.

### b. Lack of an Integrated Schedule

Until April 2014, the P&M project teams for D20 and AHS were working without a reliable, integrated Level 3 Schedule. Many on the project and throughout the OPG organization were given a false impression that the Campus Plan Projects, and D20 in particular, had a year of float, and so on-going delays had no impact on the Project. The delays to D20 Storage’s schedule were not forecasted by the project team and were simply reported after the fact. By this point, the schedule had already slipped so that engineering was on its way to an 18-month projected overrun of an original 11-month schedule. However, without a resource-loaded, level 3 schedule, it was impossible to assess the status of the project, let alone calculate with any accuracy any remaining float.

One of the strategic initiatives was implemented by the new P&M VP was to improve the projects’ schedules. This endeavor allowed the project team to see that D20 Storage was actually projected to be completed on April 26, 2016, more than a year after the original April 15, 2015 deadline. Furthermore, once known risks are factored in, it is likely that the D20 project can only achieve this revised date if some of the schedule durations are accelerated—at an additional cost. Even then, these efforts will not improve completion of the schedule by much, but will increase the probability that the April 2016 date can be met. However, none of this would be known if efforts had not been made to improve the schedule.

### c. Risk Management

Based on our observations, it appears that all P&M’s identification of risks is a “check-the-box” activity due the fact that having a list of risks is a prerequisite to obtaining a funding release. P&M does not actively manage its on-going risks as a part of an effective risk management program. As an example, the risk sections of the D20 and AHS BCSs consist of lists of potential risks and some evaluation of their nature, but it is not apparent that these risks in any way influenced the calculation of these projects’ contingency, nor are there any regular reviews or updates of these risks until required to do so in order to pass a gate and obtain a funding release. Once a project obtains full funding for execution, very little, if any, attention is paid to day-to-day risk management, including the ongoing identification of new risks and opportunities as well as the formalized implementation of risk mitigation strategies. Additionally, there is no structured or defined risk program management oversight (such as the NR Risk Oversight Committee).

A recent self-assessment performed by the NR Management Systems Oversight group (SA RF13-000855 dated January 20, 2014) identified perceptions (opinions) of several P&M managers that included the following: “[D]evelopment and use of a Risk Register is seen as purely administrative and not adding value to the Project Managers.” This suggests a lack of understanding of the value of a risk management program or lack of acceptance, which can be addressed by effective training and indoctrination. However, risk management training is virtually non-existent in the P&M organization in distinct contrast to several years ago when quarterly workshops were regularly conducted.

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

### d. The Gate Process and Failure to Report Cost and Schedule Increases to Senior Management

BMcD/Modus next explored the relative effectiveness of the gate process for this work, and found that while the process in concept is a good one, it suffers from problems in execution. The BCS documents for D2O Storage and AHS were inconsistent in presentation of key information on cost, risk and scope. As these projects progressed, P&M's management failed to provide visibility to OPG management of the extent or nature of project cost increases. Most notably, P&M failed to update its project reports during the design phase to reflect cost increases due to scope changes in the projects.

AHS provides a critical example. On November 12, 2012, P&M presented its Gate 3A package for approval and full funding release (except for a small portion of costs to be approved in 2014). The P&M Team's gate presentation characterized the AHS cost estimate as a Class 3 estimate in the amount of \$45.6 M. P&M included [REDACTED] of contingency in the \$45.6M estimate, of which [REDACTED] was identified as having a 100% chance of occurrence. P&M expressed an "85% confidence level" in this cost estimate and assessed there were [REDACTED] days of schedule contingency in the estimate—despite the fact that the full scope of the project was not known at that time because detailed engineering had not started. The option of building a new AHS was preferred over seven alternatives, based primarily on the projected cost. At the time of this gate, the project had spent \$1.46M.

Between this gate and January 2014, ES Fox engaged in the design of the AHS, scope changes caused the cost to increase from the initial \$45.6M estimate to \$79.9M. This cost increase is largely attributable to two causes: (1) remediation of contaminated soil that as of the time of bid was known by both OPG and the contractor to be of poor quality; and, (2) prescriptive design requirements that served to make a stock steam boiler design follow nuclear Engineering Change Control ("ECC") processes, which caused an increase in the size, complexity and nature of the work. Moreover, these design requirements and the overall length of the design phase, coupled with the soil issues, has frittered away virtually every day of float.

The fact this project had so substantially changed from the original BCS was not accurately or timely reported to management. The failure of the gate process was that the Gate Review Board members did not provide adequate oversight in ensuring that the AHS project team had a reliable estimate, schedule, and well-defined scope prior to approving the gate and recommending a funding release. As of January 2014, P&M had already expended nearly \$20M, or more than half the approved budget excluding contingency, even though the design was not complete and no construction had begun. However, during this entire time, P&M's estimate at completion ("EAC") in all of the DR Project's and Campus Plan reports **never varied** from the approved BCS amount. Moreover, the DR Project's Program Status Report for March 2014 showed the AHS at 49% spent with a CPI of 1.10 and an SPI of 1.0, clearly not an accurate representation of the Project's status. Part of this failure was based upon some of the P&M project managers' mistaken belief that the reported EAC amounts should not be changed until additional funds had been approved for the projects. This lack of accurate reporting has deprived senior management and the Board the option of revisiting the original BCS analysis in order to determine if building a new AHS facility continues to be the preferred option—and if not, change course. This is particularly true in light of the fact that as of November 2012, three of the competing options to building AHS were priced at less than \$50 M.

D2O Storage provides a very similar example at a much higher overall cost. The cost variance progression from D2O Storage began with an original approved BCS of \$110M, based upon estimated contractor costs of approximately \$77.8 Million. The ES Fox team and design solution were both preferred but Black & McDonald was chosen entirely because its price was \$30M less even before P&M further drove Black & McDonald's estimate down.

D2O Storage's engineering effort was originally scheduled for 11 months, and was supposed to be completed by July 2013. However, even today, engineering is not complete and is projecting to extend to a total duration of 29 months. The P&M team provided sporadic updates to the design milestones as they continued to be missed but failed to convey the potential consequence. In August 2013, P&M reported that CNO Milestone 73472M0015, "D2O Modifications –

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

Detailed Design Complete” was expected to miss its planned completion date of August 21, 2013 **by four months** though stated, “there is no impact to the critical path.”<sup>4</sup> As of this same meeting, an action was recorded to “confirm the timing for integration” of the D2O Storage schedule into the master C&C Schedule, the follow-up to which indicated that the schedule would not be available for integration because “it falls short of our requirements for several parameters.”

In September 2013, P&M reported in the Program Status Report that:

Due to the change in design for the connection of the new tanks to the existing, significant additional design work is required. This change of design was required to address water hammer issues with the initial plans which could not be resolved without a significant change in design. A new underground tunnel connecting the two buildings will now be utilized to connect the two buildings.<sup>5</sup>

However, this “significant” design change was not highlighted as a major risk item in P&M’s reporting, and P&M maintained the same EAC for D2O Storage despite having this information in hand. P&M also maintained that there was no impact to the critical path, even though P&M again admitted that the vendor had yet to produce a detailed schedule, which begs the question how could one arrive at such a conclusion regarding float without a reliable schedule.

P&M first reported a variance to the D2O Storage budget in October 2013, which coincided with months of mitigating adverse soil conditions and failing to meet the schedule for tie-ins for the TRF outage. Black & McDonald presented a high-level cost estimate that showed approximately \$49M of increases in foundation work and engineering in October 2013, though this estimate was characterized as a work in progress. This estimate was increased by \$5M in December 2013. P&M finally updated the D2O Storage EAC in the January 2014 DR Program Status Report from \$95M to \$122.7M, though simultaneously, P&M issued a report to the Nuclear Executive Committee (“NEC”) showing a forecasted EAC of \$152M. Thus, P&M’s first reporting to senior management and other OPG stakeholders of any impact of the design changes that had been brewing for nearly two years was inconsistent at best.

In January 2014, Bill Robinson required Black & McDonald to update its costs. Black & McDonald committed to an estimate of \$94M (compared to its original contract of \$67M), which with OPG’s costs was ranged by P&M at a total of \$150-170M, including OPG contingency and financing costs. After coming on board, P&M’s new VP required Black & McDonald to prepare a bottoms-up, high confidence schedule and budget based on the high level of engineering completion. Black & McDonald’s output has trickled in. [REDACTED]

[REDACTED] Black & McDonald has broken down the cost increases into several categories, including: additional scope (\$85.4M), changed assumptions (\$14M), soil remediation (\$17.3 M), delays to the schedule resulting in acceleration (\$9.8 M) and inclusion of items that were either missed or misestimated in the original estimate (\$31 M). Black & McDonald characterized this estimate as a Class 4 even though: (1) the design is 80% complete; and (2) Black & McDonald had just provided a Level 3 schedule for the remaining work which they claimed was comprehensive. Based on these two data points alone, Black & McDonald should be able to produce at least a Class 2 estimate at this time. [REDACTED]

Moreover, throughout 2011-13, P&M did not require Black & McDonald to timely update costs and provide visibility to the cost of these design changes as they were occurring; thus, as with AHS, P&M’s management allowed the contractors

<sup>4</sup> DN Refurbishment Program Status Report Meeting, August 21, 2013

<sup>5</sup> DN Refurbishment Program Status Report Meeting, September 18, 2013

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

to run up the tab and incorporate a flood of OPG stakeholder generated late design changes without adequate checks and balances or understanding of the magnitude of these changes.

As a direct consequence of P&M's failure to report these cost and schedule variances, senior management was deprived of the ability to:

- Stop the design changes that led to these increases;
- Stop the project entirely and resort to one of the other evaluated options;
- Identify and characterize the cost increases that are not related to Refurbishment and subject these changes to the same value-enhancing criteria as the remainder of the DR Project's work; and
- Mitigate the impact of the schedule delays and overruns.

Thus, the consequences to OPG are two projects that may cause external stakeholders to question OPG's management prudence.

[REDACTED]

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

### 3. Current Schedule Status

P&M's effort to recover these projects began with finally getting the vendors to develop resource loaded, integrated Level 3 schedules, with focus on developing template schedules for D2O Storage and AHS. These schedules are portraying the following significant challenges:

- The AHS project is currently projecting about 3 months behind schedule which will delay the VBO outage. The schedule is currently being impacted by late design, with some twenty outstanding design changes that ES Fox needs to process. This late design could impact the schedule to September 2014 and beyond and frustrate both procurement and construction, which have essentially no float. Based on our review of this schedule, attempts to accelerate the work to recover this time could be ineffective. Instead, BMcD/Modus recommends P&M, in concert with the Station, look to: (1) eliminate these multiple design changes; and (2) rationalize and potentially reduce the time needed to commission the AHS. If these upfront and follow-on tasks can be reduced in duration, the project will regain some much needed time for construction.
- D2O Storage is more complicated. The combination of underground utilities and poor soil conditions, design changes, engineering delays and contractor performance has pushed D2O Storage to a projected completion of April 15, 2016, which has no float to OPG's need date. In analyzing the current status of the work, we have determined that: (1) while engineering has driven significant delays to date, accelerating its final completion will not result in improvement to the overall completion date; (2) the current March 2015 completion date for concrete and foundation work, including drilling and setting caissons, needs to be improved by as much as possible and ideally to complete prior to the onset of winter conditions in 2014; (3) the current duration for building on top of the completed foundations, including structural steel erection, building enclosure and mechanical piping, is a scant 5 ½ months and needs to be substantially improved. Based on this status, we recommend OPG examine: (1) value engineer the foundations and structural design, with the goal to eliminate as much of the building's complexity as possible – the office space and associated concrete structure may be over-designed based on non-Refurbishment requirements added during the attenuated design phase; (2) value engineer the building's piping design, which similarly increased due to ASIC and Station needs; (3) accelerate the caisson drilling so that rebar and foundation work can recover essential lost time.

OPG should also examine other options in light of the overruns on these projects, as less permanent solutions that were narrowly rejected in the upfront BCS may now prove to be more economical solutions. At a minimum, we recommend OPG examine and parse the costs associated with non-Refurbishment scope that was added by OPG's other stakeholders and consider capitalizing those costs separately from Refurbishment for purposes of future rate recovery. In any event, whichever course OPG chooses with these buildings, it is imperative that it act quickly and definitively.

### 4. Corrective Actions by P&M Team

OPG senior management has taken definitive action to turn around the Campus Plan work, including bringing in new leadership for P&M and fostering greater integration between the P&M Campus Plan and DR Project work. The visibility of the issues P&M has encountered will help the BOP, Islanding and Services projects work more effectively with the ESMSA contractors.

P&M's and the DR Team's senior leadership are fostering a more collaborative and cooperative effort between OPG and the contractors, known as the "Collaborative Approach." Essential parts of this Collaborative Approach include:

- For the remaining Campus Plan Projects and BOP work, the OPG teams and the vendors working "shoulder-to-shoulder" to develop project scope basis and corresponding cost estimates. The ESMSA vendors have agreed to perform the work on an open-book, split cost basis. Relieving the ESMSA of the secondary compete bidding

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

process through direct assignment of the work should expedite the process, though the funding for this phase of the collaboration has been slow to arrive.

- OPG's Refurbishment Engineering and Design Authority directly managing and supervising the engineering work to reduce scope creep, unnecessary management and supervision costs and delays due to churn. This will include co-locating OPG engineering resources at the vendor's shops to answer questions and involve themselves in the development of the detailed design work and institute regular Steering Committee meetings with project leadership to remove performance barriers.
- Continuing integration of all of the Campus Plan pre-requisite work into a single integrated schedule so that the ESMSA's can properly plan and resource load the work and OPG can manage the contractors' work load and performance.
- Complete the work allocation to each of the ESMSA vendors so that they can properly plan their work. The DR Team has attempted to allocate the work evenly, though it may become necessary to shift work based on performance and resource availability. This becomes a more complex issue with the BOP work scope also needing attention in the coming months.
- Provide additional and focused project management support from OPG to clear barriers to engineering and execution work.
- Engage in constructive high-level dialogue with the ESMSA's senior management on a regular basis. P&M has established weekly meetings with each contractor that senior management attends to deal with any barriers and discuss status of the key projects. OPG has also established a monthly ESMSA Summit that allows for OPG to air and discuss issues with senior management of both contractors together. These meetings have had an immediate and measureable impact on both OPG's and the ESMSA's performance.

These changes will not fully recover the work in progress – in particular D2O Storage and AHS – but should provide some needed relief and better approaches for the remaining Campus Plan Projects.

For P&M, the recent changes in its senior leadership as well as the increased integration with the DR Team are taking root and providing visible benefits. P&M's VP is working through the multiple issues caused by the "hands-off" project management approach. The P&M staff has begun to accept the changes and is becoming motivated to correct its past problems, though the need for continual guidance and mentoring is evident. P&M will need corporate support to execute a full turn-around as discussed below. The DR Team's engineering organization is poised to take on active management of the ESMSA's engineering shops, which is diametrically opposite to how these projects were initially conceived. P&M's problems are now visible, as is the recovery the new team is trying to make, and the DR Team must recognize that P&M needs its support or the Refurbishment of Unit 2 is very much at risk.

### 5. Lessons Learned and Recommendations

Based on our root cause findings, BMCD/Modus's recommendations to OPG are somewhat different for P&M, which is in full recovery mode, versus Refurbishment, which has time (though not much) to incorporate lessons learned from the Campus Plan Projects into its program. For P&M, our recommendations focus on speeding the pace of the recovery, while for the DR Team, these Campus Plan Projects need to be a vivid reminder of what can happen if and when contractors are not actively managed. Ultimately, there are two major questions for the DR Project as a whole: (1) Can P&M succeed in completing the Campus Plan Projects on-time and within reasonable (though much higher than originally considered) cost parameters; and (2) whether the same issues we found related to the mismanagement of the Campus Plan Projects are a threat to the DR Project's BOP work and if so, to take strong and decisive action for eliminating the threat.

Regarding the Campus Plan Projects, we believe these can be turned around to support the VBO and breaker open, though at a higher cost that will require greater management focus than ever anticipated. Moreover, to facilitate this recovery, OPG will likely have to make some accommodations to its normal course of business:

Confidential – Do Not Disseminate

- **Hiring practices will require increased flexibility** – P&M's ranks are filled with inexperienced personnel who need guidance. OPG needs to recognize that the P&M organization urgently needs qualified people to fill significant management positions in project management, project controls and field supervision that are open at this time. Moreover, because P&M is a business unit with an expected expiration date, it makes for a difficult sell to OPG employees. In our experience, business units such as P&M would not be subjected to the same rules as the company-at-large for the hiring of temporary or transitory employees. Moreover, companies usually provide incentives for employees to work in transitional project environments because it forms a valuable learning experience. Such moves are needed and, in our view, completely justifiable in light of industry best practices. It is likely that Refurbishment will need similar changes to allow the development of its Execution Phase team.
- **Operations & Maintenance's and other OPG stakeholders' ability to change project scope must be contained** – As noted, the processes in place for the Campus Plan Projects allowed Operations & Maintenance and various other OPG stakeholders to make scope and resultant design changes that caused significant increases to the Campus Plan Projects after the conclusion of the conceptual design phase. These changes have crept into cost estimates over time. The appropriate time to add scope to projects is the conceptual design phase, subject to the approval of the authorized stakeholders, not after the project has been approved and passed through multiple gates including approval at the Board of Directors level. The process needs change to eliminate the consideration of major post-award design changes that increase project costs or extend project schedules.
- **Scope of work for Campus Plan and DR Projects needs frequent re-examination** - As a general principle, management prudence requires that scope and objectives be periodically examined in light of current circumstances. Where OPG has information that shows projects trending above approved budgets and beyond schedule milestones, it is prudent to examine both the cause of the overruns and any reasonable alternatives that can be justified based on a renewed net present value calculation. Thus, we recommend that OPG senior management take a second look at the scope and question its value, including re-examining (as necessary) alternative ways to accomplish the originally intended scope of work.

Similarly, where the root cause of the overruns appears to be the insertion of nuclear processes where such are not typically applicable or necessary (i.e. for commercial buildings), OPG senior management should take action to rescale and change the scope of such projects. This may require OPG's senior management to the CNSC to allow changes to its regulatory commitments if such commitments are so costly as to make them unreasonable.

Finally, as noted, if there are reasonable and prudent costs for non-Refurbishment related enhancements that are being spent by Refurbishment, OPG should consider capitalizing such costs separately from the DR Project. As an example, many of the value enhancing changes to D2O Storage were apparently made to handle and process water for non-Refurbishment purposes. These costs may ultimately have been prudently incurred but are likely in the wrong cost bucket for purposes of cost recovery.

- **Supply Chain and Finance need to streamline controls to accommodate changes** – The potential for the Campus Plan and BOP projects to rationalize the scope, develop more realistic cost estimates and schedules and model risk depends on the success of the collaborative process. Initiating this process will require some changes in the Supply Chain and Finance processes to allow for timely award of the work and prompt payment to the ESMSA contractors during the concept development phase. The benefit of this collaboration should be seen as projects reach their subsequent gates, they should be in much better shape with better defined and controlled scope, more accurate cost estimates and more achievable schedule goals. The ESMSA vendors will need appropriate funding to meet these goals. Finance has already moved forward with some measures that will enhance the cash flowing of the contractors' work. Additionally, the Supply Chain procedures with respect to change orders or contract amendments are cumbersome, time consuming, and reduce the project teams' accountability for managing costs. We would expect the project team to have the ability to negotiate and approve change orders directly with the contractor with appropriate controls.

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- **Risk Management needs immediate attention** – Risk management was not taken seriously in the P&M organization, thus many of the problems that have emerged were hidden below the surface. P&M needs a different approach which the DR risk management team is helping to facilitate: (1) the P&M team needs to monetize risks for future gates on a deterministic basis; (2) risks need to be managed on a day-to-day basis as a part of project management; (3) a better understanding of the ESMSA Contractors' risk management programs is needed; (4) formalized risk training is needed within the P&M organization. Most importantly, there needs to be a culture shift towards recognizing risk management as an important aspect of maintaining cost and schedule. This culture shift can only be driven from the top of the organization. Refurbishment has made many strides in improving the risk management program and their improvements should form OPEX for P&M.
- **Security and site access changes are urgently required** – The current time needed to in-process workers and management personnel alike is frustrating the OPG project teams and the ESMSA contractors. The reported average time it takes for clearance is upward of 6 weeks, and the contractors' cost per employee for the screening process is estimated at \$8,000 to \$10,000 per person. Moreover, there are security issues preventing or complicating the contractors' use of essential project-based systems - the P6 Schedule and the Electronic Document Management System (EDMS) are notable examples. BMCD/Modus certainly sees the need for maintaining the company's security, though in our experience with other nuclear utilities there are readymade solutions for these issues that OPG has been slow to adopt. These issues will cause continued risk to the DR Project if not fixed.
- **Contractor performance** – OPG needs to reconsider the scope of the work given to the ESMSA vendors on the Campus Plan and Refurbishment Projects in light of their current performance. OPG should examine the possibility of assigning Refurbishment BOP scope to other contractors performing on the DR Project where this makes economic and strategic sense.
- **Project estimating needs significant improvement** – As discussed throughout this report, BMCD/Modus has significant concerns that need to be addressed with the performance of project estimating by both the contractors and P&M's team. BMCD/Modus recommends that P&M should make changes, and Refurbishment should examine and potentially refine its processes for the following:
  - Check estimates be developed in the same format as estimates provided by vendors – the templates should be developed by OPG and provided to vendors prior to bid, and any submitted bid not utilizing the approved template is noncompliant;
  - All estimates need to be fully vetted and understood, regardless of whether the quoted price is more or less than the expected cost. Drivers of variances (both positive and negative) between bid and check estimates need to be investigated and understood by the Project Teams;
  - Contractors need to be trained in the method of estimating that OPG finds acceptable. The current process SNC/Aecon is using for developing its estimate includes upfront vetting by OPG of the contractor's specific processes and ongoing, real-time review of estimating product in a collaborative manner. These are principles that can be easily applied to the rest of the DR Project's work;
  - Estimates and project metrics/reports must incorporate accurate past, current and forecast cost information. The team needs to receive appropriately detailed contractor cost reports which, coupled with a resource loaded schedule, will enable them to properly status and forecast contractor performance;
  - P&M needs to standardize an EAC process so that all project teams follow the same basic procedures on a consistent basis. A seminar or workshop should be considered so that project team members are taught the fundamentals for preparing a reliable EAC; and

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- OPG needs to examine staffing and resources. Currently, there is only one dedicated cost estimator for all of P&M's work. The DR Team has already taken action to increase staffing levels and add experienced personnel, and P&M needs to do the same.
- **Project Reporting must be accurate, timely and convey information critical to senior management for decision-making** – As noted, the reports P&M provided to senior management on the Campus Plan projects were inaccurate and not updated in a timely manner to enable prudent decision-making. Our examination of P&M's reporting shows a general desire to produce large volumes of surface-level reports that are completely inadequate for managing the work, all the while P&M ignored such critical metrics as an accurate Estimate at Completion (EAC) and detailed schedule of work. Any tendency to "turn everything green" when such is not the case must be resisted - prudent management of complex projects requires full transparency and visibility of anything that is not going well so it can be addressed and fixed. P&M and the DR Team need to increase the focus on accurate, concise reporting with an emphasis on forecasting.
- **P&M needs to break down the silos**—All of the Campus Plan Projects are being performed by two contractors. However all of the Campus Plan work has been managed as 26 separate projects. All of the project management functions—i.e. schedule, cost and risk need to be managed through an integrated approach so that resources and management focus can be applied appropriately. We recommend that P&M look at its organizational structure to optimize the ability of its project managers to have more direct accountability. This may require more and different resources.
- **Campus Plan Projects will require a full rebaseline of cost and schedule** – Irrespective of when these projects' next gates occur, each of the Campus Plan Projects and, likely, each of the P&M non-Refurbishment projects at DNGS and Pickering, will require a full, bottoms-up rebaseline of costs and schedules. With the examples cited herein, BMCD/Modus cannot ascribe any confidence to any project estimate that was developed by P&M's former regime. Bill Robinson has made this commitment and appropriate focus will need to be applied. P&M needs to perform this reforecast on an urgent basis.

With respect to the Refurbishment portion of the DR Project, BMCD/Modus's monitoring of the BOP work to date shows that OPG has spent considerable time and effort in a robust scope definition process that addresses most of the external OPG stakeholder-driven scope issues in a manner that is consistent with the DR Project's charter. The DR Team has embedded in the organization a Director of Maintenance and a team to work our operational concerns and has an independent Design Authority. Moreover, as stated, the DR Team had already acted to safeguard against some of the problems seen in the early Campus Plan Project, notably; (1) the DR Project's institution more thorough scope definition to contractors via the MDPs the engineering team developed was a direct consequence of the OPEX from D2O Storage from over a year ago; (2) it is also apparent to us that while the DR Team had started down the same management path as P&M, it was able to put on the brakes and change course at a much earlier stage. Nonetheless, in light of our review of the Campus Plan Projects, we recommend that the DR Team perform a detailed self-assessment that considers the ways in which the Campus Plan Projects management failures might apply to Refurbishment.

### III. RQE Preparation

With this report, BMCD/Modus will begin a dedicated section for assessing the status of the DR Team's activities that specifically lead to the development of the RQE budget and associated schedule for the October 15, 2015 deadline. With respect to RQE planning, the DR Team has started its specific planning efforts, though soon there needs to be a greater focus on the specific deliverables, the timing of their preparation and a thorough understanding of how the many components will be compiled into a comprehensive estimate. Project Controls has named a manager for this effort and an activity schedule is being developed for incorporation into the Project's plan.

The most imminent upcoming RQE-related tasks relate to the development of the 4d Release Cost Estimate for the 2015 Business Plan ("4d Cost Estimate") that will be prepared for the Board's approval at the November 2014 meeting. The 4d Cost Estimate effort should also provide a template for many of the activities needed for RQE. In this section, we will

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

also report on the maturity of the DR Project's development of the project's integrated schedule, which is an important component to providing a reliable RQE.

### A. 4d Cost Estimate

In our Initial Project Assessment, we recommended that OPG consider the 4d Cost Estimate as a "dry run" for RQE. This recommendation has been embraced by senior management. As part of our 4<sup>th</sup> Quarter 2013 Report, BMcD/Modus provided the DR Team with specific recommendations on the development of its cost estimates and lessons learned from last year's 4c Cost Estimate, which we refresh here with some additional observations:

- **Organization of the 4d Cost Estimate:** The DR Team is getting organized for the 4d Cost Estimate effort, which will be considerable. Project Controls has begun with the predecessor work the projects will need to develop their various estimates and is in the process of developing a schedule for these activities. Based on last year's approach to the 4c Cost Estimate, we see more activity occurring at a similar stage though we are still concerned that the development of 4d Cost Estimate will run into summer, during which time very little can be finalized due to the critical individuals taking vacation.
- **Projectizing Costs:** The DR Team is moving toward "projectizing" the functional costs, i.e. attempting to bucket as much of the cost of the functional work as a distinct part of the sub-projects' cost. This is an appropriate methodology and should provide a more accurate cost picture, though the DR Team needs to develop some clear guidelines for how this will be accomplished. Also, since this will mean functional cost centers from the 4c Cost Estimate will be distributed differently, the DR Team should provide traceability between the two phases of the estimate.
- **Bottoms-up Approach:** Given the increase in project maturity since the 4c Cost Estimate, a bottoms-up approach to many elements of the 4d Cost Estimate is appropriate. To the extent that projects have recently passed through a gate, the associated gate documentation should reflect this approach. However, a gate review should not be viewed by the DR Team as an opportunity to reset the clock and the budget on projects that are in trouble. The DR Team should review its processes for rebaselining at gates so that projects that are projecting to over-spend or run late are not given proverbial "get out of jail free" passes.
- **Re-examine Scope and Commitments:** As the Definition Phase has unfolded, it has become apparent that the cost estimates for many scopes of work have greatly exceeded the 4c Cost Estimate. In particular, F&I projects have changed in scope, execution strategy and cost, and many of the BOP projects are showing similar signs, such that the increases in cost would likely run at or above any alternative. The recently initiated Options Review Board (discussed below) has the potential to be a good control to catch projects with wide variances at an earlier stage. As noted above, BMcD/Modus believes that the periodic reexamination of principles on a project as an essential ingredient to prudent management. Thus, we recommend that OPG re-analyze any scope item with a wide cost variance over its 4c Cost Estimate budget allowance by re-reviewing the requirements and any alternatives, including canceling the scope entirely, on the basis of the least-cost alternative at this time. Had this methodology been followed with the F&I Projects, it is now apparent that OPG would have considered different alternatives for a number of projects. OPG should also review such alternatives when a regulatory commitment is at the root of a significant cost increase, as once the extent of the cost increases are fully known, it is possible the regulator would entertain alternatives as well.
- **Increase Efficacy of Project Estimating:** As discussed in the Campus Plan section of our report, BMcD/Modus is concerned that OPG's ability to develop check estimates is challenged by resources and work volume. To the extent that OPG's check estimates are intended to be a control mechanism, these estimates need to be executed with the same information and level of rigor that the contractors/project teams are developing. From our observations to date, the current method used for check estimates at Class 4/5 level: (1) includes the use of too many factors and factored values for check estimates at the Class 3/2 level; (2) suffer from a general lack of transparency of the root sources of information; (3) utilize non-standardized estimating templates despite OPG's investment in the US Cost estimating platform. As the DR Project moves to the next phase of maturity, so

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

should the estimating work. We have also observed that the check estimates have gaps and errors that should not occur if the estimates had been performed by qualified, experienced individuals. Moreover, it is becoming evident that estimating is becoming a choke point to the point of causing notable delays in the procurement schedule, and its importance will only increase as time goes on. Thus, we have recommended that OPG examine its vendor's (Faithful & Gould) resources, experience level and ability to support the increase in both the volume and efficacy of the estimates it is preparing. In addition, we recommend OPG utilize the collaborative estimating/vetting approach that it has initiated with the ESMSA vendors and with SNC/Aecon for each of the DR Project's other scopes of work. The DR Team is already acting on these recommendations.

Considering the increased focus on the DR Project from its external stakeholders, it is very likely the development of 4d Cost Estimate will receive significant scrutiny. Therefore, the DR Team needs to organize its efforts, develop appropriate expectations for the deliverables and intensify its efforts as soon as possible.

### B. Schedule

A high-confidence RQE depends on a reliable integrated schedule. In our past reports, BMcD/Modus has identified several concerns and observations with respect to the development of the DR Project Schedule and the Project Schedule Management Program. Over the last few months, the DR Team has made significant strides in addressing many of the issues we have raised. While much work remains to be done, the DR Team has moved forward with a significant number of initiatives calculated to improve both the DR Schedule and the Schedule Management Program, including:

- The DR Team now sees itself as a project management team and is putting programs in place to properly manage its contractors;
- The DR Team has abandoned earlier questionable scheduling methods in favor of developing a fully integrated Level 3 resource loaded schedule that automatically rolls-up to form a Level 2 depiction of the work;
- P&M is becoming the "beta" group for testing the basic standards for managing the Level 3 with the Campus Plan Projects;
- OPG has developed standards for required resource loading of the Level 3 schedules by OPG and the contractors; and
- Detailed schedules for sub-projects that are not let are represented by placeholder activities to be replaced once a contractor is in place.

While these changes are positive, we have made additional observations that should be addressed by OPG in order to improve the reliability of the integrated project schedule, including:

- Development of an improved set of metrics for monitoring the schedule is imperative. As part of the effort to improve the Level 3 integrated scheduling process, a set of metrics needs to be established to categorically monitor improvements made by the Project Teams and their respective contractors.
- Currently, the DR Team is making manual adjustments the cash flows in Proliance, rather than having it be an automated function tying the cost estimates to the P6 dates for cash flow analysis. Ultimately, work hours in cost estimates and schedules must balance and the Work Breakdown Structure ("WBS") should be the binding mechanism. The DR Team is planning on automating this process though it will remain prone to error until that time.
- OPG needs to speed contractors' access to the scheduling network. The OPG and the contractors need to all work from the same network (preferably OPG's or an third party network) in order to operate in a common environment. However, OPG is not granting the contractors network access in a timely manner. Improvements in time and better standards for control of the databases need to be established.

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

### IV. Major Projects – Summary of Key Risks

#### A. Retube & Feeder Replacement

##### 1. Work Status – Tooling, Definition and Mock-up

Through March 31, 2014, the RFR contract is underspent by \$9 M against plan, though this gap is closing. Additionally, SNC/Aecon's SPI during this time period has improved to 0.94. Although SNC/Aecon remains behind schedule in the Definition and Tooling phases of its work, the mock-up reached substantial completion in March and is ready to receive, test and integrate tooling.

The tooling recovery plan that was initiated at the end of 2013, however, is currently challenged to achieve its August 2014 target. Tooling engineering is now critical path and the tooling design complete milestone for June 15, 2014 will likely be missed while the follow-on milestones for prototypes complete and qualification complete are in jeopardy as well. Continued problems with SNC/Aecon vendors and sub-vendors are driving many of these delays. In particular, the RT platforms being fabricated by Rolls Royce have continued to slip and are now projected to complete 2-4 weeks later than the recovery plan completion dates of June 30 and July 15, 2014. Meanwhile, SNC/Aecon's supplier ATS is suffering from late delivery of parts from its sub-vendors, delaying assembly on its shop floor. SNC/Aecon has made repeated projections for delivery of these tools that have been further impacted by late deliveries, quality issues, and process missteps. SNC/Aecon has resorted to additional mitigation plans and is making reasonable attempts to recover the time lost. The OPG team continues to monitor SNC/Aecon's progress and is holding them accountable to meet the deadlines. The impact of SNC/Aecon's slippages will be felt in the development of the Class 2 estimate. To mitigate this potential delay, OPG's project team is requiring SNC/Aecon develop a clear plan for monitoring tool testing and productivity in the mock-up to ensure this process moves smoothly and that all the required information is captured and incorporated into the estimate.

In addition, the JV is trending over-budget for the target price portion of its Definition Phase work, which includes engineering, schedule and estimate development, and construction management planning. The fact the JV is projecting to complete this phase of the work 15-25% above its target needs to be considered in establishing the confidence level of the JVs Class 3/2 estimates for the Execution Phase. However, OPG's team plans to dispute any charges advanced by SNC/Aecon for the Definition Phase that were caused by SNC/Aecon's own actions.

Finally, the Definition phase shows signs of slow progress with an SPI at 0.91 as of the February 2014 SNC/Aecon Progress Report. Engineering and procurement dates are slipping, showing similarities with the tooling effort described above. These activities will require close monitoring as the Definition phase moves toward the Class 2 estimate over the next year.

##### 2. Class 3 Estimate and Level 4 Schedule

In our 1Q 2014 report, BMCD/Modus expressed serious concerns with the ability of SNC/Aecon to provide Construction Work Packages (CWPs) and variance reports by March 15, 2014 to support the Class 3 estimate. As of February 10, 2014, SNC/Aecon was only 32% complete in preparing its "Stage 1" CWPs and variance reports. Over the next month, SNC/Aecon significantly increased its production in order to meet this date and, in the process, compressed delivery, creating a large bow-wave of work for OPG to review.

Since our 1Q 2014 report, OPG's estimating group has struggled to keep up with SNC/Aecon's pace and its review and analysis of the variance reports, estimates, and mini-reports that will ultimately comprise the Class 3 estimate is proceeding slowly. BMCD/Modus's concern is that the sheer volume of reports provided by SNC/Aecon, essentially all at once, will result in errors or that OPG will be challenged to make sense of the data. Ultimately, SNC/Aecon should be tasked with providing an explanation of how the products satisfy the requirements of a Class 3 estimate. Per the Class 3 Estimate Plan, SNC/Aecon's commitment for this Class 3 Estimate should include:

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- Completed CWPs formulated for DNGS;
- Variance reports showing differences between the OPEX driven Class 4 estimate and the current estimate;
- A Level 4 execution schedule;
- Detailed reports characterizing how SNC/Aecon prepared the estimate; and
- A well-defined risk register.

All of these SNC/Aecon products will require time for OPG to review and in this case it is our opinion that it is better to provide an extension of time than rush the review of such important material in order to meet a previously set deadline.

Concurrent with the development of the Class 3 estimate, SNC/Aecon is developing its Level 4 execution schedule. The first draft of this schedule was delivered on April 15, 2014 and ongoing review sessions are being held to refine it. First impressions of the schedule were that SNC/Aecon had not brought the best possible schedule for Unit 2 forward. It appeared that SNC/Aecon presented a comfortable, achievable schedule rather than an aggressive benchmark. This created a longer schedule than what would be considered a “target” schedule. In addition, several examples of incorrect logic and misalignment with OPG’s level 1 schedule were identified. OPG is continuing to review and recommend changes prior to the delivery of the Schedule mini-report for the Class 3 estimate on April 30, 2014.

Looking forward from Class 3, it is important for OPG and SNC/Aecon to align around the plan and start preparing for the Class 2 estimate. As we have noted in prior reports, after SNC/Aecon completed the Class 4 estimate, there was a long period with no activity that only served to compress the preparation time for the Class 3 estimate, and that compression is at the root of the current need to rush through its approvals. As the Class 3 report is being developed, the team should endeavor to complete the Class 2 estimate plan so that any opportunities or progression points are identified early. In addition, the tool testing and productivity plan should be incorporated with the Class 2 estimate plan so that results are properly incorporated into the schedule and estimate. SNC/Aecon and OPG need to maintain focus on the finished product and what it means to be Class 2 RQE ready.

### 3. RWPB Building

The RWPB is being performed under many of the same conditions as the Campus Plan Projects as a pre-requisite to Refurbishment but by SNC/Aecon, the contractor performing the RFR retube work, rather than the ESMSA contractors. RWPB is facing very some familiar issues to those described above for D2O and AHS. The start of work is currently being impacted by the soil that was excavated from D2O Storage. There is a possibility the soil is contaminated, which has resulted in additional testing. In addition, the building has or will encounter plant operation coordination, and seismic issues have delayed foundation design and pushed out engineering. As of this report, engineering design complete is showing 43 days of negative float and installation/commissioning is showing an October 24, 2016 completion date. Although this schedule is immature and based on very preliminary engineering, the original plan was completion in June 2016 allowing three months before breaker open. It is vital for SNC/Aecon to utilize the lessons that are being learned from the F&I work in order to keep this building within a reasonable cost and schedule envelope. In addition, if there are cost increases, the Options Review Board should test the decisions being made with regard to building design in light of the fact that it is a temporary building that will be housing heavily contaminated materials. Further, the building should avoid any element of gold plating or permanent design.

### 4. RFR Commercial Risks

We recommended in our last report that the DR Team review some major provisions of the RFR contract in order to ensure that it will drive the proper behavior from SNC/Aecon in order to achieve success on the first unit and that OPG will be able to establish that it adequately and prudently considered the principles set forth in the government’s Long Term Energy Plan (“LTEP”)—primarily success on the first unit and ensuring appropriate risk shifting. This included revisiting: (1) the performance incentives for unit-over-unit improvement as an incentive to the contractor to meet an aggressive schedule for the first unit; (2) whether the cost and schedule incentives/disincentives would drive the right contractor behavior; (3) the treatment and monetization of identified risks; and (4) whether to negotiate a guaranteed maximum price (“GMAX”) once engineering is complete. In addition, OPG and SNC/Aecon will need to incorporate the

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

maturing Turbine Generator work into the estimate where economies of scale in project management and other areas are identified. To date, DR senior management has acknowledged that this is an important exercise that must be done with some sense of urgency. However, this sentiment has not been communicated to those individuals tasked with performing the review, who appear not to understand its purpose and are reluctant to even consider the need to modify any portion of the contract.

### B. Balance of Plant and Other Projects

The BOP work should be the direct beneficiary of any lessons learned from the Campus Plan/F&I work. The majority of the BOP work will be performed by the ESMSA contractors based on direct assignment of the work packages. This methodology should readily lend itself to a cooperative, interactive process between OPG and the vendors that should, in theory, eliminate many of the issues we have observed with the F&I work.

With the awards of the containment isolation and Turbine Generator performance work to SNC/Aecon, OPG should consider the benefits of SNC/Aecon treating its overall scope of work as one contract. There are certain economies of scale that can be achieved – plus benefits associated with workforce assignment flexibility and dose management. The DR Team would also benefit from consolidating all of the work in the vault into a single subproject to better manage the critical path and subcritical path interferences.

## V. Functional Groups Update

### A. Engineering

#### 1. Revised Plan for ESMSA Engineering

Amongst other conclusions, the BMcD/Modus Initial Project Assessment (August 13, 2013) recommended improvements to engineering metrics and a close look at the turn-around times for the review, comment and approval cycles. The need for “active management” of the engineering work along with a greater focus on front-end planning was introduced in the BMcD/Modus 4Q 2013 report and expanded upon in our 1Q 2014 report. We continue to stress the importance for OPG to shift their role and perspective from the culture of ‘observation at a distance’ to a much more proactive engagement and active management of the engineering service providers. We also continue to stress the importance of thorough front-end planning.

Since our last report the DR Team’s Senior Leadership has recognized a number of deficiencies with the ESMSA design process, including:

- The quality of planning and scheduling is insufficient. There are no integrated resource loaded schedules. Schedule adherence is very poor - the execution of most of the ESMSA project engineering (e.g. D2O Storage Building, Shield Tank Overpressure Protection, Auxiliary Heating Steam, and Containment Filtered Venting System) is consistently behind plan.
- Cost estimates for the detailed engineering phase are significantly higher than anticipated, particularly given OPG’s development of detailed Modification Design Packages (MDP’s) that were intended to provide the vendors with specific and prescriptive requirements.
- The actual costs to date are significantly above the original budgets (planned value) for all ESMSA projects. A significant portion of these increases are driven by engineering.
- ESMSA quality programs are not aligned with OPG’s quality program. The result is multiple review and comment cycles which add significant cost and time.
- OPG’s intent to shift risk to the ESMSA partnerships was misplaced. The risk associated with the execution of nuclear engineering work is limited by the application of detailed regulatory and OPG standards and procedures. The execution of nuclear engineering work needs to be under the direct control of the OPG Design Authority.

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- Single-point responsibility for coordination of the engineering, procurement and construction elements of these projects through these ESMSA partnerships has not been realized, leading to inefficiency, confusion and rework. Moreover, significant OPG intervention has been required to achieve the results obtained to date.

The results of these deficiencies have become clearly apparent: an inability to predict engineering performance, significant churn, poor cost performance and frustration at all levels of the collective organization. These deficiencies have driven Senior Leadership to make changes to the remaining engineering effort for the ESMSA work. These changes include:

- Shifting to a culture of ‘active management’ of the engineering work;
- Utilizing a collaborative front-end planning methodology for the remaining work;
- OPG taking a leadership role in developing and monitoring the engineering schedules;
- For work in progress, OPG will increase monitoring and provide ready answers through embedded staff within the engineering vendor organizations; and
- For work that has not started, OPG will provide management and direction of the engineering work.

This is a bold but necessary move and one that is endorsed by BMCD/Modus. We will continue to monitor the progress made under this revised plan and provide additional recommendations for streamlining the design process as necessary.

### 2. Scope Definition

Overall, as mentioned in the BMCD/Modus Assurance Report on Scope, we believe that the DR Team has taken a balanced approach to the development of the DR Project scope. The initial scope identification effort incorporated scope beyond that of refurbishment and life extension, potentially increasing the budget and project complexity. However, to balance this out, the DR Team has continuously monitored and repeatedly tested the included scope through scope reviews and de-scoping exercises. Additionally, the team has monitored scope definition through the gate review process and Health of Scope (HOS) metrics. Through this extended process we believe that the DR Team has struck an important balance between overly limiting scope (and risking scope growth during execution) and being overly-inclusive (and risking excessive project budgets).

The resultant Darlington Scope Requests (DSR's) drive engineering. Through April 24, 2014, Engineering had completed 142 MDP's. While this met OPG's goal, the number of MDP's continues to rise and is now at 161 (as compared to 139 in our last report) with 19 known packages remaining. This is particularly important considering the new path OPG has chosen to take for ESMSA engineering.

However, whereas scope definition may be sound, the development of solutions is not. As the revised plan for ESMSA engineering takes root, the DR Team also needs to examine the assumptions and engineered solutions. The DR Team's Senior Leadership initiated a new control, a monthly Options Review Board ("ORB"), the intent of which is to re-review the approaches the project teams are taking and see if the means and methods in the plan are appropriate, cost effective and still required. At the first ORB, the BOP, Shutdown/Lay-up and Services projects identified initial plans for six different scopes that needed to be reconsidered. These different subprojects suffered from many of the same problems evident with the Campus Plan Projects discussed above, thought these problems are being exposed, escalated and resolved. The ORB found:

- OPG's design requirements can cause confusion, misalignment and very expensive solutions that defy common sense. As an example, based on the guidance from the original MDP, the dehumidification of the turbine deck would have cost upwards of ten times more than OPG has spent in the past performing the same work on laid-up fossil units.

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

- The performance specifications in some packages provided the vendors with limited guidance, and in such cases, vendors will usually take the most conservative route.
- OPG often relied on the vendors to suggest more creative solutions to their issues when OPG's team knew the best course to take all along. This was evident with the polar crane package inside the plant. OPG left it to the vendors to discern what was needed. The vendors decided to replace all of the cranes, even though OPG's team determined only refurbishment, not replacement, was required. OPG often relied on the vendors to suggest a more creative solution to their issues when OPG's team knew the best course to take all along. This was evident with the crane package for the polar cranes inside the plant. OPG left it to the vendors to discern what was needed, from which the vendors decided to replace all of the cranes, even though the needed scope determined by OPG's team was refurbishment, not replacement.

This initial ORB was a success and will be followed by further, similar reviews of planned solutions. From this and the lessons learned from the F&I work, BMCD/Modus recommends that OPG consider the aforementioned controls on scope, including: (1) reviewing the necessity of performing the work; (2) revisiting prior options; (3) refreshing the view of net present value; (4) questioning whether scopes of work that are driven by regulatory requirements and have experienced significant cost overruns are still cost effective.

In addition, the DR Team is instituting a Unit Scope Review Board that will examine each subproject's readiness at key intervals in the manner employed by the station for outage preparedness. This team will be led by the DR Team's senior management and will test whether a given project has key deliverables in place at required quality levels as it advances toward execution. We believe these tests are part of prudent management and necessary to meet the intent of the Minister of Energy's Long Term Energy Plan ("LTEP").

### B. Project Controls

The DR Project's reports (namely the Program Management Report) needs attention. This report is difficult to read, contains multiple format changes, and has, in the case of the Campus Plan Projects, erroneous and outdated information that is included without verification. The Campus Plan Projects' reporting discussed above provides a vivid example of how reports that lack accuracy and transparency mislead and deprive senior management the opportunity to make key decisions. The DR Team's Project Controls team is bringing needed QA/QC reviews and personnel to test and monitor this and other key reports' information. The tendency by the DR Team is to provide too much data in these reports so that important information is often obscured and lost in the "noise." Furthermore, metrics and reporting are supposed to provide an accurate snapshot of the status of a project. The current Project Reports need work to achieve these goals. Project Controls is endeavoring to improve its reporting suite that both informs and allows for management focus. The team is working currently on revised versions of the "quad charts" that provide metrics and description of the projects' current focus areas. The DR Team has also agreed to abandon the quarterly produced "report card" which was ineffective at communicating the Project's status. This metric was a jumble of key performance indicators, dates, milestones, etc. and only serves to confuse rather than provide useful information.

Moreover, the DR Team's methodology for measuring earned value needs to be stress tested. The DR Project's schedule is now matured to include resource loading to allow OPG to test work hour productivity factors from information contained in the P6 schedule. As the schedule further matures, we will be providing additional focus to the coincidental development of earned value and productivity factors.

### C. Supply Chain

Our observations of the P&M organization and the Campus Plan Projects have raised some concerns regarding the interface between Supply Chain and the project management team. In particular, the current procedures require that Supply Chain negotiate all change orders (also called contract amendments) on behalf of OPG. This appears to be a cumbersome process with a number of built-in walls that only cause for multiple review stages of the same information.

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 2Q 2014 Darlington Nuclear Refurbishment Project

This process has the potential to cause delays to both the Campus Plan and DR Projects, but more importantly, it disconnects scope, schedule and cost accountability from the project team. We will be further examining these processes as the project progresses, including an upcoming Assessment of the DR Project's Change Management process.

### VI. Other Project Risks

#### A. Project Team Development

As previously noted, Enterprise Risk Management carries the retention of key personnel as the biggest program risk to the DR Project, and we would agree that it is certainly among the DR Project's biggest challenges. The most urgent challenge in this regard is to ensure that the Project has sufficient skilled resources to manage and monitor all of the work that must precede Refurbishment, including supporting the F&I, ASIC and VBO work, while maintaining the pace of the Refurbishment's key developmental activities. In our view, the best way to address this challenge is to continue to ramp up the front end planning effort so that all the work that must be performed is known and identified by schedule window and priority. Once the total needs of the organization are better defined, OPG can address resource needs in a more comprehensive manner. BMcD/Modus also sees monitoring resources in the schedule via fully resource loaded, level 3 schedules and tracking work hours productivity factor indices as essential ingredients in understanding the resource needs for each work group, trade specialty and the like. Senior Leadership of Refurbishment and P&M have coordinated a monthly ESMSA Summit at which resource needs will be discussed in greater detail going forward.

As the DR Team focuses more on developing its team for the Execution Phase, OPG will need to obtain individuals with different skills and experience than it may have currently in-house. OPG's current hiring, banding, salary constraints and onerous, time-consuming onboarding procedures serve as a barrier to finding the necessary experienced and qualified personnel. BMcD/Modus recommends that the DR Team closely look at the optimal Execution Phase organization design so that it can properly cost-out the Execution Team in the 4d Cost Estimate and prepare to deal with the barriers to securing suitably experienced management and staff.

#### B. Program Management Plan Development

In our last report, BMcD/Modus identified some shortcomings with DR Team's Program Management Plan ("PgMP"). The DR Project's Senior Leadership has moved forward with our recommendations to progress the PgMP. Senior Leadership also led the first of what will likely be a series of meetings with key Project Team members to foster alignment of the functional groups into a "projectized" team in which the individual sub-projects will capture the majority of the cost and coordinate the activities in a more focused manner. This initiative exposed for Senior Leadership that it must go farther to communicate roles and responsibilities within this matrix organizational model.

As we noted in our last report, the PgMP is the key unifying document set for project execution; in our experience, it would be tantamount to the project bible that a new employee would use to understand his or her roles and responsibilities. In addition, with the 4d Cost Estimate beckoning, the project teams will need to know the breadth of their matrixed organization and related cost centers to properly allocate the different elements of the estimate. The Project's need for a solid PgMP is further heightened by Senior Leadership's attempts to evolve the organization for the Execution Phase.

In summary, BMcD/Modus recommends that the DR Team simplify the approach it is taking to develop the PgMP so that it is unifying document and increase collaboration across the team. We believe the current efforts of the Engineering team to provide its portion of the plan could establish a model for the other functions and projects to follow.

Area	Observations	High	Medium	Low	Current Status / Mitigation

Project Matrix  
 Campus Plan  
 Observations/Findings

REF.	OBSERVATIONS	PROJECTS				
		Water & Sewer	D20 Storage	Aux Htg Sys	RFR Annex	* RFR Waste Storage
1	Lack of scope definition.	√	√	√	√	
2	Insufficient effort and time in creating engineering requirements.	√	√	√	√	
3	Initial Project was deferred and then reactivated over a period of years ( > 5yrs).	√	√	√		
4	3rd Party Estimates - Mixed results w/F+G being significantly over or under vendor quote.	√	√	√		
5	Change in contracting strategy with Vendor from a E-PC to EPC.	√	√	√		
6	Basis of Estimates do not conform to AACE Recommended Practices.	√	√	√	√	√
7	Project Team has failed to characterize the changes/progression to the estimates from gate to gate.	√	√	√	√	
8	Mischaracterized Estimate Classification - OPG is accepting vendor quote as a "Class 2" or "Class 3 estimate when such quote does not meet the threshold for a Class 2 or 3.	√	√	√	√	√
9	Contingency calculated at ~21% - not clear how contingency and risk assessment are linked, if at all.	√	√	√	√	
10	Risk shifting - Project Team does not fully understand the nature of target price work.	√	√	√	√	√
11	The process of bid evaluation scoring and metrics used varies among Project Teams.	√	√	√	√	√
12	The process of comparing bids and 3rd party estimates varies among Project Teams.	√	√	√	√	
13	Significant differences between Vendor Quotations (from 50% to > 100%).	√	√	√	√	
14	Vendor quotes and 3rd Party Estimates (Faithful + Gould) are not aligned for ease of comparison to facilitate a comprehensive review of differences.	√	√	√	√	
15	The contractor selection process compelled the contract to be awarded to the lowest bidder over other qualifying considerations.	√	√	√	√	
16	Risks materialized greater than expected during execution, i.e. underground utilities.	√	√	√	√	
17	Senior Management is reluctant to increase contingency on the front end despite selecting the lowest bidder.		√	√		
18	Project Manager is young and appears inexperienced to manage size of project.		√	√	√	
19	Project Team has difficulty in obtaining reliable cost and schedule data from contractor resulting in OPG's inability to effectively forecast costs to complete.	√	√	√	√	√
20	Contractor performance issues have increased costs	√		√	√	
21	OPG performance issue has increased costs, or has the potential to increase costs					√
22	Scope growth beyond what was anticipated for the project.		√	√	√	
*	<i>Project is in its early stages.</i>					

**Attachment C – Summary of Cost Variances to Date for Campus Plan Projects  
 BMcD/Modus 2Q 2014 Report to NOC  
 May 13, 2014**

In accordance with recommended industry practices, construction project costs should be periodically evaluated and updated in order to develop reliable estimate at completion (“EAC”) forecasts. Planning for cost forecasting establishes the timing of forecasts, how forecasts are communicated or reported, methodologies and systems/tools to be used, and specific roles and responsibilities for forecasting. EACs should be prepared and issued on an established schedule that is appropriate for the pace of work on the project.

The development cycle of an EAC typically follows a set process with standard guidelines for the project team to follow. For instance, one step would be to review and rigorously vet contractor cost reports to understand the development of costs versus current budget, planned and actual productivity. Based on our review of five (5) Campus Plan Projects, it does not appear that Facilities and Infrastructure (“F&I”) used a set process or guidelines to govern EAC development. When we interviewed the project teams, we discovered that each team was following its own EAC process, indicating that there was neither visibility to cost increases nor internal cost control.

To understand the impact to the project costs and EAC process, we compared the current EAC to the last approved BCS to identify the magnitude of cost increases. The following chart illustrates the cost increases on the projects<sup>1</sup>:

**Overall Cost Variances between the Latest BCS and the Current EAC on F&I Projects**

Project	Board-Approved Costs	Current EAC	Variance	% Increase
D2O Storage & Drum Handling	\$ 110,015	\$ 314,383	\$ 204,368	186%
Auxiliary Heating System	\$ 45,607	\$ 85,102	\$ 39,495	87%
RFR Island Support Annex	\$ 32,504	\$ 40,738	\$ 8,234	25%
Water and Sewer	\$ 45,703	\$ 57,712	\$ 12,009	26%

We then analyzed the project documents to identify the categories of costs behind the increases identified on each of the projects as described below. We also interviewed the project teams to understand their EAC process.

**D2O Storage & Drum Handling**

Our analysis of the RFR Island Support Annex estimates yielded the following summary highlights:

- On this project, nearly every cost category of work has increased considerably ranging up to +537% above approved gate funds, with the exception of Phase I engineering design and award long lead procurement which was contracted on a fixed price basis.
- Engineering work is 82% complete overall versus a planned completion of 100%; 48 of 84 ECs have been issued in Passport. Engineering is forecasting that all ECs will be completed by early November 2014.

<sup>1</sup> The chart contains only 4 projects because Retube Waste Storage is not included; this project has not progressed beyond the definition phase.

### Summary of D20 Cost Variances between the Latest BCS and the Current EAC

Cost Category	BCS/Gate 3b	Current EAC (4/22/14)	Variance	% Increase
TOTAL	\$ 110,015	\$ 314,384	\$ 204,369	186%

### Summary of D20 Storage Building Cost Variances

Cost Element	Variance (\$K)	% Increase
Underestimate of Effort	\$ 30,978	19%
Design Scope Growth	\$ 46,466	29%
Underestimate PM Plant Materials	\$ 33,654	21%
Client Requested Changes	\$ 5,273	3%
Schedule Extension & Acceleration	\$ 9,852	6%
Environmental Requirements	\$ 17,439	11%
Pipe Chase	\$ 4,326	3%
EPSCA	\$ 1,569	1%
Building Relocation	\$ 9,726	6%
<b>Total</b>	<b>\$ 159,283</b>	<b>100%</b>

A brief explanation of the significant changes, as reported by B&M in its updated cost estimate, is provided below:

- *Underestimate of Effort* – This cost element represents the underestimated effort required to execute the project based on the original scope of work. The staffing levels required to manage the work, generate CWP/ ITPs and integrate the project plans into the OPG work management system were much greater than the original budgets allowed.
- *Design Scope Growth* – Represents the increased construction cost of the project from the original concept. The design engineering was a fixed price. Bidding took place on preliminary design requirements and a conceptual design report with many assumptions that were later invalidated. The absence of the MDR at the time of bidding meant that it was impractical to estimate the project beyond an AACE Class 5 quality level.
- *Underestimate of Permanent Plant Materials*
  - 367% increase in the quantity of process and service piping from 3,000M of piping to >14,000M.
  - 340% increase in the quantity of valves from 250 valves to ~1,100 valves.
  - 40 % increase to the electrical load list including additional equipment such as a UPS and Diesel generator that were not previously in the design requirements.
- *Environmental Requirements* – The project was awarded on the basis that the soil and ground water were free of contamination, an assumption that proved incorrect. Soil testing revealed the presence of tritium above acceptable levels, requiring special soil storage and operational requirements to manage the water runoff.
- *Building Relocation* – The original design concept had a new building with a “shared wall” in contact with the existing west wall of the TRF Building. However, the new foundations for the D20 interfered with the existing foundations necessitating a seven (7) meter relocation of the building to mitigate the conflict. This meant that the building now required four (4) architecturally completed sides rather than the original 3-sided finishes. More significantly, the scant pile (caisson) foundation shoring system became significantly more complex.
- *Schedule Acceleration and Extension required for:*
  - Premium time expended to recover lost time on the critical path and meet outage requirements.
  - Premium time planned critical work and make-up days for inclement weather

#### **Auxiliary Heating System**

Our analysis of the Auxiliary Heating System estimates yielded the following summary highlights:

- The current EAC was provided by the contractor just after the 4c estimate effort was complete. The contractor’s EAC was provided in a high-level letter and spreadsheet form, which the project team did not dive into or vet.
- On this project, nearly every category of cost has increased significantly. The overall project, including interest and contingency is projecting an overrun of 87%.
- As of the March 2014 Program Status Report, the project is reporting 60% complete (\$24M earned on a BAC of \$40M).

### Summary of Aux Heating Cost Variances between the Latest BCS and the Current EAC

Cost Category	BCS/Gate 3	Current EAC	Variance	% Increase
<b>TOTAL</b>	\$ 45,607	\$ 85,103	\$ 39,496	87%

The primary cost driver behind the \$9.5M increase in engineering costs include \$5M of additional Phase III engineering \$3M for items that were simply underestimated. For example, HSL underestimated the cost of working in accordance with OPG's review processes; OPG's design review and approval processes are more time consuming than HSL anticipated. The team explained that OPGs EC process is very time consuming as compared with a commercial process. In addition, lack of detail and definition of scope at the beginning impacted the quality of the estimates and bids, including F+G's estimates.

#### RFR Island Support Annex

Our analysis of the RFR Island Support Annex estimates yielded the following summary highlights:

- For the current EAC, the team relied on high level cost data provided by the contractor which the team did not vet. This information was used at Gate 3B in February 2014.
- The RFR Annex Project is currently projecting a project cost of \$40M, or \$8M over its 4c estimate of \$32M at the last project gate, for an overall increase of 25%.
- As of March 2014, the project is reporting 20% complete (\$7M earned of a BAC of \$33M).
- The EPC portion accounts for 91% of the overrun, with engineering comprising half of the overrun, procurement and construction 40%, and OPG costs, contingency and interest making up the balance of the overrun. See the table below for additional details.

## Summary of RFR Island Support Annex Variances between the Latest BCS and the Current EAC

Cost Category	4C Estimate	Current EAC	Variance	% Increase
Project Costs	\$ 23,265	\$ 31,280	\$ 8,015	34%
Interest	\$ 1,973	\$ 1,966	\$ (7)	0%
Contingency	\$ 7,266	\$ 7,492	\$ 226	3%
<b>Total Project Cost</b>	<b>\$ 32,504</b>	<b>\$ 40,738</b>	<b>\$ 8,234</b>	<b>25%</b>

The following table briefly explains and summarizes the cost increases by \$ and % of the RFR Annex Project is shown as follows:

Cost Category	Variance	% Increase
<b>Engineering</b>		

<b>Total Project Cost Increase</b>	<b>\$ 8,234</b>	<b>25%</b>
------------------------------------	-----------------	------------

This project team has done a better job of trying to allocate the cost increases between scope increases and contractor underestimates as shown above.

- The main driver of cost overruns on the current EAC is contractor cost, specifically engineering. The primary issue is that the engineer, HSL, is unfamiliar with OPG's internal processes for design review and approval. The project team feels that Engineering is approximately 80% complete though there are no metrics to confirm; 16 of 22 design packages are complete.
- Communication direction between OPG and HSL has been an issue driving up the engineering costs; OPG's and HSL's processes are not aligned. HSL bid the job assuming that it would be a typical "commercial" level job, i.e. would not require extensive owner review and signoff. Instead, OPG's review and approval process has required much more level of effort from HSL than originally bid.
- In other instances, HSL has over anticipated OPG expectations and burned hours performing unnecessary engineering that could have been mitigated by better communications (e.g. the replacing and redesigning pole supporting security camera. OPG expected to simply mount the camera on an existing pole while HSL anticipating camera vibration issues engineered a new pole replacement).
- The ESMSA contract process has caused more engineering cost by shifting more risk and liability to the engineer. The work is subject to more stringent codes and is performed by different trades which HSL did not anticipate. That also drives up the engineering cost. The work is subject to more stringent codes and is performed by different trades which HSL did not anticipate. As a result, cost overruns for engineering alone equate to an additional \$100 per square foot in building costs.

#### Water and Sewer

As of December 2013 the project was reporting 81% complete (\$36.9M earned on a BAC of \$45.7M). The Water and Sewer Project is currently projecting a cost increase of \$8.3M on a budget of \$54.0M or an increase of \$18% as shown below:

Cost Category	BCS/Gate 3	Current EAC	Variance	% Increase
OPG Project Management	\$ 3,237	\$ 3,764	\$ 527	16%
OPG Engineering	\$ 705	\$ 688	\$ (17)	-2%
OPG Other	\$ 983	\$ 2,298	\$ 1,315	134%

<b>Total</b>	\$ 45,703	\$ 57,712	\$ 12,009	26%
--------------	-----------	-----------	-----------	-----

- The major driver of this cost increase is in the cost of the construction contracts, due to contractor underestimating the value of change requests, additional change requests not identified or anticipated and increased contractor indirect costs due to schedule delays.

- On a pure percentage basis, the major driver is the OPG other costs which have proved to be higher due to underestimate of the level of effort needed from OPG's Operations Manager, Operations, Project Oversight and Field Support and Drawing Office.
- The EAC for this BCS was based on actual invoiced additional changes as well as internal OPG estimates of the cost of anticipated contract changes.
- Another increase in overall cost of these projects has been due to the nature of the underground work – unforeseen conditions, soil conditions, and undocumented actual conditions.
- Compared to the other projects, water and sewer is well underway. Phase I is 100% complete; phase II is 100% complete on engineering and 75% construction; phase III is scheduled to complete by November 2014 and construction is scheduled to complete by June 2015. However, the work is demolition of the old water treatment plant and is less complicated than the other earlier scopes.

# **Report to Nuclear Oversight Committee**

## **3<sup>rd</sup> Quarter 2014**

### **Darlington Nuclear Refurbishment Project**

Burns & McDonnell  
Modus Strategic Solutions

August 13, 2014

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

### I. Executive Summary

Burns & McDonnell Canada Ltd. and Modus Strategic Solutions Canada Company (“BMCD/Modus”) provide the following Quarterly Report to the Nuclear Oversight Committee of the OPG Board of Directors (“NOC”) regarding the status of the Darlington Nuclear Generating Station’s Refurbishment Project (“Project” or “DR Project”) as of July 31, 2014.

Pursuant to the Project’s Assurance Plan approved by the Audit & Finance Committee, BMCD/Modus has also prepared independent reports documenting the DR Team’s status as well as further recommendations for improvement. This quarter we have issued the following Assurance Reports: 1) OPG Operating Experience and Lessons Learned Practices and Procedures; and 2) Schedule Management Practices and Procedures. We continue to meet monthly with the Refurbishment Project Executive Team (“RPET”) and weekly with the DR Team’s Management Systems Oversight group to discuss our reports to NOC and our Assurance Reports in order to clarify any recommendations and engage in discussion of appropriate OPG management actions. The DR Team continues to provide its cooperation and transparency to our oversight efforts. We are also coordinating our efforts with Internal Audit so that we meet our assurance commitments in an efficient and effective manner.

Attached to this report are summaries we have provided regarding key aspects of the DR Project’s current status:

- Attachment A is the updated quarterly summary of the Project Risks with annotations regarding the DR Team’s actions with respect to these risks since our May 13, 2014 report;
- Attachment B is a summary of the current status of the recommendations and observations from our Initial Project Assessment of August 13, 2013 (“Initial Assessment”). Here, we summarize the DR Team’s progress in responding to the issues identified in our Initial Assessment so that the NOC can evaluate the velocity of the DR Project’s progress since last year.

The following is a brief summary of the DR Project’s most significant developments over the last quarter.

#### A. Campus Plan Performance Update

The Campus Plan Projects, and in particular the D2O Storage Facility and Auxiliary Heat System Building (“AHS”) remain significant risks to the overall Refurbishment Project. Leadership of Projects & Modifications (“P&M”) has again changed, which adds to the overall risk of these and possibly other Campus Plan Projects not meeting schedule and/ or budget requirements. In our May 13, 2014 NOC report, we highlighted some management practices that increased the risk associated with these projects under P&M’s prior leadership. Management has taken action to address these issues, as discussed in the June 26, 2014 Supplementary Board Meeting, and those initiatives are continuing, as well as changes in the organization’s leadership. What bears monitoring with another leadership change is whether the P&M team reverts to its prior ineffective practices or whether the team has incorporated the difficult lessons from the prior two years. Where beneficial to the projects, the initiatives started under prior leadership to streamline the work’s execution, increase the contractors’ accountability and move P&M to actively manage the work should continue under the new leadership team.

While many of the Campus Plan Projects appear to be on course, select projects are showing evidence of cost growth and schedule degradation. Each of the Campus Plan Projects need to undergo a full reforecast so that the scope, schedule, cost estimate and risks are re-examined, and lessons emanating from the recent D2O Storage estimating effort should be incorporated into these reviews. This work should be completed so the 4d Cost Estimate (the current DR Project estimate that will be included in the 2015-2017 Business Plan Binder) accurately reflects the potential cost and risk associated with the Campus Plan Projects. We describe the most challenging aspects of the Campus Plan Projects below.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

- **D2O Storage Facility**

D2O Storage is currently projected to complete on January 18, 2017, though P&M has established a target date of August 31, 2016 based on an aggressive acceleration plan. Completion of this facility remains a direct threat to the Refurbishment Project's October 2016 breaker open date because this facility is required for storage of the heavy water that must be drained from Unit 2 in order to begin that unit's refurbishment. Importantly, the August 31, 2016 target date assumes acceleration of the work utilizing two 50 hour/week shifts with significant overtime, and that materials needed for installation will seamlessly arrive just-in-time for installation. In short, this is a very compressed schedule with no apparent margin for error.

Black & McDonald's efforts over the last three months to produce a reliable Class 2 Estimate for D2O Storage have resulted in an improved estimate for half of the remaining work, though Black & McDonald did not provide OPG with the opportunity to vet estimates of work by its third tier construction and first tier engineering subcontractors. As a result, the cost estimate for D2O Storage remains uncertain. Moreover, it is unclear whether Black & McDonald and its subcontractors have performed, let alone included in their plans, either value engineering or constructability reviews as requested by P&M. As a result, it is unclear at this time whether the current cost estimate is accurate which also calls into question whether Black & McDonald and its subcontractors have a reliable detailed schedule for the work, as the estimate and schedule go hand-in-hand. It is our understanding that DR Team Management has chosen not to advance the D2O Storage estimate to the Board at this time, which, based on its status, is appropriate. However, the urgency of finalizing the cost estimate, driving to a reasonable scope and schedule and maintaining progress of the ongoing work cannot be understated.

- **Auxiliary Heat Steam**

The AHS project is also on a tight schedule to meet its April 3, 2015 milestone, the start of the station's Vacuum Building Outage ("VBO"). AHS is currently scheduled to be completed on March 26, 2015, four weeks later than planned. The contractor has presented additional costs to OPG that could use most or all of the contingency for the Project; these costs were not anticipated at the time the last AHS estimate was presented and approved by the Board. These changes, as well as additional engineering costs, need to be challenged by P&M's project management team. In addition, the value engineering proposal requested by P&M for streamlining the steam line connection to the plant has thus far not yielded the expected cost savings. The DR Team is looking at potential mitigation plans to shorten the commissioning timelines and other means to meet the needs for heat during the VBO. The team should examine all reasonable mitigation options in light of how tight this schedule is and the likelihood that costs will increase in pursuing an aggressive acceleration of the work.

- **Contractor Performance**

[REDACTED]

### **B. RQE Preparation**

The DR Team is currently developing the basis of the 4d Cost Estimate which will be an important step in the progression to next October's Release Quality Estimate ("RQE"). As we discussed in our Initial Assessment, by this time, the DR

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

Project's maturity will have increased; thus, there is an expectation of commensurate quality of the 4d Cost Estimate, with tighter certainty bands around estimated direct costs of the work. The DR Team accepted our recommendation that the 4d Cost Estimate be a "dress rehearsal" for RQE such that management and the Board can see the progression of the estimate as well as the gaps that need to be addressed in the coming year. In this regard, the DR Team should identify and explain in detail each of the variances from the 4c Cost Estimate so that they can be appropriately assessed. The RFR, Turbine Generator, Steam Generator and Fuel Handling project estimates have matured significantly and should form the basis for understanding the DR Project's core elements. BOP and other services-related work are less mature, meaning that they may require the greatest amount of review and vetting, particularly with respect to risks, estimate accuracy and contingency. We expressed some concern last year regarding the timing of the cost review efforts associated with the 4c Cost Estimate, which occurred largely in the summer vacation season, and we have those same concerns with this year's estimating process. Management remains committed to the \$10B cost of the DR Project and the veracity of its commitment may result in some future difficult choices that are best made with full understanding of all available options.

### **C. Retube & Feeder Replacement Project**

Because of its size and importance to the overall DR Project, execution of RFR remains the DR Project's most notable risk. Fortunately, the ongoing management effort by the DR Team and SNC/Aecon has moved RFR forward, and the issues we previously reported regarding tooling, development of the Class 3 Estimate and meeting the target price for the Definition Phase have been largely mitigated. SNC/Aecon's Class 3 Estimate has been approved by OPG and the tooling fabrication and delivery is on schedule except for the RT Platform. Detailed engineering is currently tracking behind the target schedule, and if not mitigated, SNC/Aecon's estimating effort could be compressed as a result. SNC/Aecon has rolled-out its plan for developing the Class 2 Estimate which will form the basis for the target price negotiation for the Execution Phase. Limited tool testing has commenced in the Mock-Up and preparations for the remainder are well underway with an expected completion of March 30, 2015.

SNC/Aecon's Class 3 Estimate forms a sizeable portion of the overall program budget, and the vetting of that estimate that was concluded in June 2014 should provide the Board with confidence that this segment of the Project's direct costs are well defined within the prescribed limitations of a Class 3 estimate. With the advent of the 4d Cost Estimate, the DR Team should take SNC/Aecon up on its earlier commitment to provide its view of contingency needed for the RFR Project. In addition, the DR Team should consider how it will incorporate potential changes to contract incentives and disincentives into the 4d Cost Estimate because this will represent a large component of the DR Project's overall cost.

### **D. Balance of Plant**

In last year's Initial Assessment, BMCD/Modus identified the risk that the BOP work would be late in starting and maturing due to the sub-competitive bidding process for each individual project that was required at that time. The BOP scope was also under intense review at that time by the Blue Ribbon Panel that vetted the needs for the work that had been defined at the time. One year later, the BOP scope has been reduced but multiple contracts for the work that remains in Refurbishment's scope have been delayed. It appears that BOP has a reasonable path forward with most of the work, though the DR Team remains appropriately concerned regarding the engineering teams under the ESMSA contractors. Currently, approximately 10% of detailed BOP engineering is forecasted to complete after the team's target of May 2015, and where these delays persist, there could be an impact to the quality of those affected portions of the Project's cost estimate at RQE, the development of the detailed schedule and work planning.

### **E. Engineering**

Engineering risks have been front and center in the DR Team's plans and in our reporting of the Project from the outset. Last year, the DR Team's focus was on completion of the scope defining Modification Definition Packages ("MDP's"), and we saw as a risk maintaining enough schedule float to allow for the vendors' transition to the detailed design phase. Many of the anticipated risks have materialized: while the MDP's were completed on time, some confusion regarding the scope OPG desired remained as the vendors continued to interpret OPG's design intent as conservatively as possible. Some corrections were initiated but valuable time was lost in the process that has compressed the detailed

Confidential – Do Not Disseminate

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

design period. With the work moving to detailed design and with increased visibility to the issues that have impacted the engineering process, the DR Team is attending to problems that have surfaced, including: forecasting engineering performance, efficiently managing the work and arriving at final decisions more readily and quickly.

As noted in our 2Q 2014 Report, the DR Team has made a significant shift in engineering strategy and is now directly managing and supervising the engineering service providers. The engineering team is also pursuing how to recover some of the lost time and confirm vendors' commitments to meet target dates. In the Engineering section of this Report we revisit three aspects of the engineering effort, identifying the progress being made and the major concerns that remain for each: ongoing engineering initiatives; scope definition and management; and engineering metrics.

### II. Campus Plan Update

#### A. Overview

P&M's management of the Campus Plan Projects continues to be under review by the DR Team. There are projects that remain a risk to the DR Project's schedule (particularly D2O Storage) and scope definition of smaller Campus projects may continue to reduce management reserve and contingency without additional action. In our 2Q 2014 Report, we focused on many of the concerning management issues that we believe led to the current cost and schedule overruns for these Campus Plan Projects. In our Supplemental Report to the NOC of June 26, 2014, we attempted to characterize the impact of these overruns. While the cost increases were significant on a percentage basis, the current trends in the cost growth should be containable within the Project's remaining management reserve, thus preserving over \$2B of contingency for the overall Project's working cost estimate.

Over this same period, our team has monitored the progress with the D2O Storage estimate and re-examined and updated our assessment of the other Campus Plan Projects, some of which appear to be on course, others which may require course correction. Below we focus on certain of the Campus Plan Projects that appear to present most of the risks at this time. In addition to D2O Storage and Auxiliary Heat System ("AHS"), some Campus Plan Projects that have received partial funding but are not through their full execution releases are showing early signs of potential scope creep and schedule issues that bear watching.

#### B. Ongoing Campus Plan Project Risk

##### 1. Schedule and Cost Development

P&M has continued to develop and update the project schedules for the Campus Plan Projects though many of these schedules still have significant defects. In our 1Q 2014 Report, we recommended that P&M in conjunction with the Refurbishment team, Operations & Maintenance and other needed stakeholders perform a schedule "back pass" for the Campus Plan Projects to confirm that: (1) the projected latest possible completion dates for the various projects fit within the overall program's plan; (2) there are no severe resource constraints; (3) back end activities (commissioning and start-up) are provided adequate time; and 4) a realistic sequence of critical and near critical path activities using the late start and late finish dates has been established. Unfortunately, the quality of the current vendor supplied level 3 detailed schedules precludes the team from developing a meaningful back pass review at this time.

With respect to cost growth, the most notable project remains D2O Storage though there are other Campus Plan Projects that are showing signs of upward budget pressure. We recommended in past reports that P&M reforecast each of the Campus Plan Projects because the past practices in budget formation have proven to be inadequate. P&M intends to hold challenge meetings on each of the Campus Plan Projects in advance of the 4d Cost Estimate that should delve into the underpinnings of each project's cost and schedule. Equally important is whether there is evidence that lessons learned from the Campus Plan Projects have been internalized and resultant management actions are effective at mitigating these impacts and providing control and discipline to these projects' management.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

### (a) D2O Storage

The D2O Storage project's cost estimate and schedule remain very much in flux at this time. Since our 2Q 2014 Report, despite the ongoing efforts of Black & McDonald, Faithful + Gould (the DR Project's estimating team) and the P&M team, the project estimate for D2O Storage has continued to increase, adding approximately 25% in estimated cost since that report. Importantly, the estimate was not deemed by OPG management to be of sufficient quality for presentation to the NOC for the upcoming Board meeting. Approximately half of the D2O Storage estimate has not been vetted by OPG at this time because Black & McDonald had not provided the portions of its estimate related to fixed-price contract work by its third tier construction and first tier engineering subcontractors. Moreover, the status of the value engineering and constructability reviews P&M requested Black & McDonald to perform is uncertain. As such, the issues with the accuracy of the current cost estimate call into question whether Black & McDonald and its subcontractors have a reliable detailed schedule for the work, as the estimate and schedule go hand-in-hand.

The current target date in the DR Project's schedule for D2O Storage Available For Service date is August 31, 2016, which is 110 days late in meeting the DR Project's optimal schedule date of April 15, 2016. This August schedule target assumes an acceleration plan that shaves 4 ½ months off a current projected completion of January 18, 2017 that was derived without acceleration. Black & McDonald's acceleration plan embeds productivity and performance risk, and even if successful the resultant August 31, 2016 date may prove to be a challenge for OPG to support Unit 2's Breaker Open of October 15, 2016.

There is also continued risk in the D2O Storage schedule until final detailed engineering is completed and all of the potential value engineering and design simplification measures are finalized. Black & McDonald's design subcontractor RCM Technologies ("RCMT") reports that its work is over 80% complete, though this estimate is suspect in that there are more than 20% of the design packages outstanding and RCMT projects a design completion date of February 19, 2015. The DR Team has examined the earning rules used and determined that RCMT's calculation of earned value was not aligned with OPG's; this alignment is in process. Any changes to the building could further delay engineering such that it may not be possible to simplify the design and still meet schedule. RCMT has also stated that it is out of funding for engineering under the current release.

The D2O Storage schedule suffers from the same transparency issues from Black & McDonald's subcontractors as the cost estimate. Black & McDonald's subcontractor Ellis Don's schedule for the concrete and civil construction cannot be verified against its cost estimates because its sub-contractors' pricing is based on fixed-prices that Black & McDonald has thus far refused to provide to OPG. Also, procurement activities need to be scheduled and verified with some level of confidence that currently cannot be associated with RCMT's efforts.

In our experience, a successful acceleration plan of this magnitude must be well-planned and coordinated, and the schedule for the work needs to be reliable with full buy-in from all needed stakeholders and contractors. There are currently a number of challenges with the D2O Storage project that will bear on the confidence in the schedule, regardless of which completion date becomes the target. As of this writing, P&M's new leadership is considering the next steps for D2O Storage.

### (b) Auxiliary Heat

The current March 26, 2015 Available For Service date for AHS is virtually at the start of the Vacuum Building Outage ("VBO"). As with the D2O Storage above, the contractor (ES Fox) has incorporated acceleration in the form of a two shift schedule for piping and electrical work beginning in August of 2014. This acceleration of the work provides no float or cushion for the VBO, which is a critical milestone. ES Fox recognizes that this schedule is very tight and has little room for failure or delay. ES Fox has raised concerns with the pace of OPG's design approvals and final acceptance of vendor drawings, which could further risk the timeliness of the schedule. OPG has embedded Resident Engineers with the Hatch/Sargent & Lundy ("H/SL") design team to respond to issues through the completion of AHS engineering.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

The P&M team is evaluating ways of mitigating the potential delays to meeting the VBO milestone, including shortening commissioning and start-up. The DR Team has committed to maintaining operation of the existing construction boilers and using temporary boilers to augment the steam capacity of the existing facility if necessary. Given that ES Fox's acceleration plan has significant risk associated with it, developing a "plan B" mitigation for the VBO is advisable.

From a cost perspective, ES Fox was asked to provide an estimate regarding a simplified design of the steam line connection from the AHS to the plant, replacing the original design of an underground concrete tunnel with an overhead pipe rack; however, that request was later changed to have them review a simplified under-the-roadway design. ES Fox claims that this change would have no positive impact on the Project's budget, and that it would need time it no longer has to examine different design alternatives. These changes and the costs and schedule savings associated with them need to be evaluated, though this provides a key lesson that value engineering should be performed as early as possible. In addition, it is also our understanding that ES Fox has presented additional engineering costs, scope and delay costs that P&M needs to disposition. These should be vetted so that the budget risk for this project (that has already received full funding approval) can be assessed. At this time, these changes would absorb the remaining contingency for the project.

### (c) Emergency Power Generator #3

The new Emergency Power Generator #3 ("EPG3") is a Safety Improvement Opportunity ("SIO") project that P&M is managing for Refurbishment. ES Fox was selected as the contractor for the work. The project went through Gate 3A for partial funding in November 2013. The current estimate at completion for EPG3 shows the cost is projected grow by another 25% is growing as it is being prepared for the full-funding release at Gate 3B.

Issues that have resulted in cost increases to other Campus Plan Projects are also impacting EPG3, including soil conditions and scope identification during the design process. These changes are adding cost to what was believed to be one of the more straight-forward Campus Plan Projects. Nonetheless, given the issues on the earlier Campus Plan Projects, these changes were reasonably foreseeable. P&M's most recent reports for the EPG3's Estimate at Completion ("EAC") continued to show the project being on or under the Gate 3A estimate. However, ES Fox has provided contract change requests as part of its regular executive updates that date to the 1Q of 2014 which have not all been dispositioned or included in the EAC. These change requests are for: (1) Work that the sole-sourced sub-vendor from whom ES Fox is procuring the stock emergency power generator has refused to modify the stock unit it is supplying, including seismic qualification and controls for the unit; this work has to be performed by others; (2) Shoring and dewatering due to unexpected soil conditions that have been common to the rest of the Campus Plan Projects in the protected area; and, (3) Increased size of air handling units on seismically qualified foundation pads; among other changes. If approved, these changes in their current form would add approximately 25% to the project cost. However, we understand that of this amount, a significant proportion should not be proposed change orders but monetized risk items that should be carried in lieu of a portion of the project's contingency. All of these proposed changes need to be thoroughly vetted, as some appear to have been estimated at a very high level (Class 5) and may be duplicative of other changes sought on different Campus Plan Projects. It is our understanding that the Engineering team is currently challenging the underlying scope of these requested changes to the extent there are remaining questions.

The EPG3 schedule currently included in the DR Project's schedule network needs attention. The original Available for Service date for EPG3 is September 17, 2015. The completion of detailed engineering is projecting to finish December 9, 2014, which is a push of approximately three months since March 2014. The schedule was just rebaselined and still shows multiple concurrent critical paths and potential logic that could drive the completion to be significantly later if not corrected. In addition, there is overlap of construction work and commissioning that may not be possible. The final engineering completion dates need confirmation so that the potential risk to downstream procurement activities can be properly evaluated.

Based on these trends, this project that was reported to be relatively straightforward has been subjected to increased costs and schedule delays. This project would benefit from a thorough drill-down with the contractor and the project

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

management team and a full reforecast of the cost and schedule before its next gate so that the basis for the changes in scope can be identified and challenged, and the planning and execution sequence can be confirmed. In addition, to the extent the contractor has provided monetized risk items, these need to be properly accounted in the project's request for contingency at the next gate.

### (d) Containment Filter Venting System

The Containment Filter Venting System is another SIO project that addresses a potential need to release steam from containment under extreme conditions where the station would be subjected to a complete loss of power. The scope of the project was initially addressed in an MDR that was released to ES Fox with preliminary assumptions regarding the size of the venting system that ES Fox and H/SL were required to validate.

As the design matured, additional decay heat studies were performed, ultimately resulting in the current design path in which the required filter system is substantially larger than initially assumed. Because the filter system was significantly larger than originally assumed, the size of the supporting structure for this duct system also had to be increased. Cost growth for these changes is under review but believed to be on the order of 18-30% over the early project estimate that is embedded in the current 4c Cost Estimate. This cost growth appears to be justifiable due to the increased scope, though the estimates for this additional cost should be vetted to ensure they are appropriate and properly priced.

The current schedule for CFVS forecasts a completion date of March 25, 2016. This work was originally contemplated to complete on November 17, 2015. The detailed level 3 schedule suffers from many of the same logic issues and poor critical path definition as noted for EPG3. These issues, as well as the potential cost growth, need to be addressed as soon as possible.

## 2. Risk Management Progress

In our 2Q 2014 Report, we identified that P&M was not utilizing the risk management process in an effective manner, and was merely using risk as a "check-the-box" activity as a prerequisite to obtaining funding for the work. The Refurbishment risk management team has been deployed to help P&M restructure its risk program, and risks are being collected and are now visible on the Project's risk register. However, there is some remaining confusion with the P&M team regarding on-going risk management. The DR Team is in the process of consolidating the risk management program under the Refurbishment organization, utilizing the same processes for risk identification and management with strong scrutiny by the DR Risk Oversight Committee. This should clear up any remaining inconsistencies.

## 3. Vendor Performance Issues

As noted, [REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

[REDACTED]

It is also worth noting that three of the four Campus Plan Projects that we have identified above as having concerns are being performed by ES Fox. While there is no evidence that we have seen that questions ES Fox's safety or quality record, and their team has thus far been very responsive to addressing any issues OPG has raised, the scope creep and cost increases evident in EPG3 and CFVS indicate that P&M should be just as vigilant in managing ES Fox's work. Any lessons from Campus Plan Projects should also be understood by the Refurbishment BOP team, who is using ES Fox for multiple scopes of work. P&M and Refurbishment BOP project managers need to vet ES Fox's estimating methodology, including how ES Fox is using factors for productivity, estimating project management team size and engineering costs, among other things.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

### III. RQE Preparation

#### A. 4d Cost Estimate

The DR Team is currently preparing the 4d Cost Estimate, the last of the planned Definition Phase funding releases that will be requested prior to RQE. The DR Team should see the 4d Cost Estimate as a “dress rehearsal” for RQE, as the DR Project will have substantially matured over the intervening year. We recommended that the DR Team get an earlier start on the development of the 4d Cost Estimate so that appropriate vetting of the various component cost estimates can be performed and have a detailed schedule of vetting activities with visibility to the team. Further, in past reports and at the advent of this effort, we provided the DR Team with more granular recommendations for different aspects of the 4d Cost Estimate development.

To date, there are certain portions of the cost estimate that have followed along their expected paths. The DR Team completed the development, vetting and approval of the RFR Class 3 Estimate in the spring of 2014, and while the review period was significantly compressed, we witnessed good cooperation between SNC/Aecon and OPG that facilitated OPG’s approval of the estimate on schedule in June 2014. The resultant estimate (excluding fee, contingency and incentives) increases SNC/Aecon’s Class 4 Estimate by more than 20%, though this increase was anticipated and the 4c Cost Estimate carried sizeable contingency for estimating accuracy. Other elements of the 4d Cost Estimate, including the Turbine Generator, Steam Generator, Defueling and Fuel Handling work are proceeding down similar paths with submitted vendor cost estimates that the DR Team must now characterize. In all, these project bundles account for approximately 70-75% of the DR Project’s expected direct cost, and 50% of the overall Project cost, excluding contingency, interest and inflation.

The challenges between now and the completion of the 4d Cost Estimate appear to reside largely in the following major areas:

- **Project Bundles:** BOP, Shutdown/Layup, Specialized Projects and Support Facilities bundles which currently do not have the same level of maturity as the other bundles;
- **Functional Costs:** DR management directed the DR Team to “projectize” functional costs, in particular engineering and planning, so that costs that can be attributed to a specific bundle are properly expressed. In addition, Operations & Maintenance’s cost estimate needs sufficient justification;
- **Campus Plan Projects:** as discussed; and
- **Contingency and Management Reserve:** the DR Team must monetize the contingency for all of the DR Project’s direct costs, including RFR, which by contract, does not have to be provided by the RFR contractor until next year.

In our recommendations to the DR Team, we have stressed the need for a bottoms-up approach to developing the 4d Cost Estimate, meaning that the DR Team vets and understands the underpinnings and assumptions of each of the cost components within the estimate. The DR Team currently has embedded in its processes project gate reviews and the Options Review Board, which are opportunities for such vetting; though there are major cost components that, as of the issuance of the estimate, will have not been subjected to such a detailed review that will require additional effort in order to be better understood. In our view, a bottoms-up review should root-out uncertainties and misunderstandings that may exist within the DR Team, as it is better to know those now when there is time to manage them, rather than wait until just before RQE. In addition, such a review may highlight a resolution path for decisions on cutting costs that may be needed in order to preserve the DR Project’s overall economics.

The remaining work for 4d Cost Estimate is sizeable and will be very time consuming. Our team will be closely monitoring the DR Team’s activities and has asked for detailed vetting sessions in late September and mid-October so that we may inform the NOC and the DR Team of our view of the 4d Cost Estimate’s overall quality.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

### B. Risks to RQE Development

The DR Team's goal for RQE is to have virtually all of the DR Project's costs within a Class 2 accuracy band (with a range of -15% to +20%). The AACE guidelines on which OPG has based its progression of estimates refers to a Class 2 Estimate as a project's "Control Budget" which is commonly used in the industry to signify that the scope and planning of the work have sufficiently matured so as to be the basis for comparing cost trends until the project's completion. The application of the Class 2 range when combined with OPG's commitment to hold the DR Project's overall cost to \$10B would imply a need for retention of approximately \$2.0B in contingency at RQE.

The 4d Cost Estimate should be a leading indicator of the risks that the DR Team is likely to encounter in development of the RQE. In addition to the 4d Cost Estimate deadline of November 13, 2014, there are other key milestones that must be maintained so that the intended accuracy of RQE is commensurate with a Class 2 designation.

Program Integrated Master Schedule (PIMS) Milestone	Date
Refurbishment Outage Planning Organization Defined	15-October-14
Health of Scope 4 Achieved	
Unit 2 Long Lead Materials Identified	15-November-14
IIP Approved by CNSC	31-December-14
Vacuum Building Outage (Start)	3-April-15
Detailed Engineering Complete	1-May-15 <sup>1</sup>
RFR Class 2 Estimate from SNC/Aecon	15-June-15

At this time, the RQE predecessor milestone with the most associated risk is completion of detailed engineering by May 15, 2015. A project is subject to variability and uncertainty in cost and schedule until its scope is frozen and detailed engineering is completed. As we observed with the Campus Plan Projects, developing a budget from immature scope and engineering definition can result in significant cost overruns. Thus, the DR Team was correct in highlighting the importance of this milestone and there is strong awareness within the team of the consequences of missing this date. The Project bundles that are currently most at risk for missing the detailed engineering milestones are the same that are lagging behind for the 4d Cost Estimate—BOP, Shutdown/Layup and Specialized Projects—and those projects are utilizing the ESMSA contractors who have thus far failed to meet significant engineering milestones. The collaborative approach the DR Team initiated should help increase the efficiency of engineering work although the DR Team needs to perfect its metrics for measuring engineering so that this progress can be accurately tracked. In addition, while not among the above milestones, project planning and assessing needs to be sufficiently advanced to support a fully developed RQE.

### IV. Major Projects – Summary of Key Risks

#### A. Retube & Feeder Replacement

##### 1. Tooling Fabrication

The tooling program achieved completion of a major milestone in July with Tooling Detailed Design Complete. Although the milestone was achieved two weeks late, SNC/Aecon's tooling recovery plan is on track to recover the schedule by September 2014 with a few minor exceptions, including:

- **RT Platforms:** Rolls Royce and its sub-contractor have continued to struggle to maintain committed delivery dates for the RT Platforms. However, a recent commercial agreement between Rolls Royce and its subcontractor to provide additional resources, overtime payments, and equipment should help to stabilize the

<sup>1</sup> This is a "stretch goal" for the DR Team. The actual PIMS milestone is August 10, 2015, though this date is recognized to be too late to support RQE.

## Report to Nuclear Oversight Committee – 3Q 2014 Darlington Nuclear Refurbishment Project

delivery date, which is currently projected to be the third week in September 2014, approximately four weeks behind the recovery schedule. SNC/Aecon has initiated a contingency plan to mitigate these delivery delays, working from fixed scaffolding in the Mock-Up until the moveable RT Platform is delivered.

- **ATS/CANDU Tools:** Several tools being developed by SNC/Aecon's suppliers ATS and CANDU are threatening to miss the Prototype Complete and Qualification Complete milestones, precursors to Tool Performance Guarantee ("TPG") testing in the Mock-Up. However, the DR Team believes that the impact of missing these milestones is minor and can be acceptably mitigated. The Class 3 Estimate currently uses TPG values that were negotiated in the contract that will be replaced for Class 2 by actual measured times from activities tested in the Mock-Up. The testing activities are currently scheduled in series, and if required, many tools could be tested in parallel, therefore reducing the total duration required without consequence to the schedule. This is particularly relevant for the CANDU tools which are much smaller, less complex, and mostly hand tools.

For the larger, complex ATS tools, the DR Team believes it is more important for the tools to be proven through rigorous durability testing than through TPG testing. This is because TPG testing will only test five operation cycles, whereas durability testing will test potentially hundreds of cycles of the machine. In addition, the results of durability testing could be used in the case the TPG tests on the Mock-Up could not be completed. Finally, there is the ability to parallel path some of the TPG tests, as described above.

ATS has committed to complete the durability tests to OPG's satisfaction prior to TPG testing. This will give OPG confidence that the risk to critical path delays during the Execution Phase caused by defective tooling will be reduced. At this time, it appears that the TPG testing can be completed on the Mock-Up per the Schedule.

### 2. Engineering and Procurement Status
