

**Board Staff Interrogatory #44**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh A1-3-3. Page 11

In the above reference, OPG has stated that “changes to public policy, especially the Government of Ontario’s Long Term Energy Plan (“LTEP”) could impact OPG’s nuclear production. In particular, a change to the refurbishment schedule for future units at the Darlington generating station...”

- a) What is OPG’s understanding of when the Government of Ontario would make a decision about whether or not there could be a change to the refurbishment schedule and possibly the cancellation of the refurbishment of units subsequent to Unit 2?
- b) What is OPG’s understanding of what factors the Government would consider in making such a decision?
- c) If the Government of Ontario were to cancel the DRP after Unit 2 is complete, what Facilities and Infrastructure assets would no longer be required?

**Response**

- a) At this time, OPG has no expectation that the Government of Ontario would change the refurbishment schedule for the Darlington units or cancel the refurbishment of units subsequent to Unit 2.
- b) The Government has not specified what factors it would consider in assessing the on-going feasibility of the current refurbishment schedule or the planned refurbishment of units subsequent to Unit 2. OPG would expect that any decisions regarding the on-going feasibility of the schedule or the plan would only be made after a rigorous process of evaluation similar to the one which was undertaken on the decision to proceed with the refurbishment of the Darlington (and the Bruce) units. OPG expects the evaluations and decision-making would involve OPG, the Independent Electricity System Operator, the Ministry of Energy, the Ministry of Finance, other relevant Ministries, and the Cabinet.
- c) If the Government of Ontario were to cancel the Darlington Refurbishment Program after Unit 2 is completed, all of the Facility and Infrastructure Project assets are expected to remain useful for the operation of the Darlington Nuclear Station.

**Board Staff Interrogatory #45**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-1 Chart 1

In 2016, OPG began the execution phase of the \$12.8B refurbishment of the Darlington Nuclear Generating Station. OPG has selected a “multi-prime contractor” model for DRP. OPG is the integrator among the prime contractors and is responsible for the entire DRP. OPG Functional Support refers to work including oversight, coordination and integration among the various contractors and ongoing station operations.

- a) Is OPG asking for \$12.8B to be approved by the OEB in this proceeding?
- b) In Chart 1 of Ex. D2-2-1, the functional support cost is presented with respect to the total DRP forecast cost of \$12.8B. The functional support cost is forecast to be 17% of the total. In Figure 1 of the same exhibit, there is a breakdown of the forecast Unit 2 in-service amounts. The functional support cost is forecast to be 25% of the total. Why is the functional support cost as a percentage of total higher for Unit 2?
- c) How do the forecast functional support costs compare with other mega-projects that have employed a multi-prime contractor model? If there is a significant difference, please explain why.

**Response**

- a) No. The specific approvals OPG is requesting with respect to the DRP are set out in Ex. A1-2-2, pp. 4-5 and Ex. D2-2-1, p. 6.
- b) The reasons why the percentage of functional support costs as a percentage of the Unit 2 in-service amount is higher than the average functional support cost percentage for the RQE 4-unit estimate are as follows:
  - Unit 2 is the first unit to be refurbished and returned to service, and the in-service amount for Unit 2 shown in Figure 1 of Ex. D2-2-1 includes the Definition Phase planning costs. As shown in Figure 1 of Ex. D2-2-4, the Definition Phase costs include \$0.4B of OPG Planning and Support Services costs. These costs were incurred for work such as completion of detailed design engineering, developing and executing the contracting strategy, the on-boarding of OPG’s contract

1 partners, and the establishment of the required reporting and controls  
2 infrastructure for implementing the proper project controls (including databases).  
3

- 4 • Unit 2 is the only unit of the four Darlington units which is planned to be executed  
5 without an overlapping unit being refurbished for at least a part of its refurbishment  
6 duration. Based on the current plan, the subsequent units will benefit from  
7 economies of scale by having certain OPG functional support costs shared  
8 amongst two units as they are being executed with an overlap for all or a part of  
9 the duration of the refurbishment outage.

10  
11 c) OPG cannot provide a comparison of functional support costs in the DRP to that of  
12 other megaprojects for the following reasons:  
13

- 14 • OPG is not privy to a sufficiently detailed cost breakdown for other megaprojects.  
15  
16 • OPG employed a multi-prime contractor model from the outset based on lessons  
17 learned from other projects which did not employ this model initially (i.e., projects  
18 that used a general contractor to assume the Owner's role). OPG is not aware of a  
19 comparable megaproject or megaprogram that was structured as a multi-prime  
20 contractor model from the outset.  
21  
22 • DRP is unique in that each unit will be refurbished within an operating station with  
23 two or three other units operating. As a result of this, OPG functional support costs  
24 include certain operations costs, such as work control authorization and radiation  
25 protection services, which would not be relevant in most other megaprojects. A  
26 description of the Operations and Maintenance Function's accountabilities can be  
27 found in Ex. D2-2-9, p. 5.

**Board Staff Interrogatory #46**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-2, Figure 1

Ref: Exh D2-2-2, Attachment 2, Appendix B

The above references provide organizational charts for the Nuclear Refurbishment Organization Structure and DRP

For the key positions, please provide copies of the resumes for the individuals filling these positions, and summarize the individuals' experience with the multi-prime contractor model, nuclear refurbishments and managing outages of units.

**Response**

The following is a list of the key executives in the Nuclear Refurbishment Organizational Structure together with their years of experience:

- Gary Rose, Vice President, Planning and Project Controls, 28 years
- Dietmar Reiner, Senior Vice President, Nuclear Projects, 37 years
- Michael H. Allen, Senior Vice President, Nuclear Refurbishment, 32 years
- Neil A. Mitchell, Vice President, Refurbishment Engineering, 35 years
- Art Rob, Vice President, Nuclear Projects and Modifications, 34 years
- Meg C. Timberg, Vice President, Project Assurance and Contract Management, 32 years

The Curriculum Vitae of the above individuals are attached as Attachment 1.

OPG used the multi-prime contractor model for Pickering Unit 1 Restart and for Pickering Units 2 and 3 Safe Storage projects. Although these projects were not of the same magnitude as the Darlington Refurbishment Program (DRP), OPG staff who were involved in these projects gained valuable experience with the multi-prime contractor model. Neil Mitchell, Michael Allen, and Gary Rose were involved in these projects.

Dietmar Reiner has been involved with the DRP since 2010 as the Senior Vice President, Nuclear Refurbishment, and has been accountable for the DRP and OPG's Nuclear Projects and Modification group since 2014. As SVP, Nuclear Refurbishment, Mr. Reiner has been

1 intimately involved in all of the key strategic decisions made during the Definition Phase and  
2 has been a key driver behind ensuring that lessons learned on other projects were  
3 incorporated into the Planning phase of the DRP. In prior positions, e.g., as Vice President of  
4 OPG's Inspection and Maintenance organization from 2008 to 2010 and Vice President of  
5 Commercial Systems from 1999 to 2008, Mr. Reiner has been accountable for the  
6 implementation of high value projects for OPG.  
7

8 Michael Allen has been directly involved in refurbishment projects since 2010 when he was  
9 seconded to the Pt. Lepreau nuclear station first as Restart Director, then as Project Director.  
10 Mr. Allen gained valuable refurbishment experience during those secondments. In addition,  
11 Mr. Allen has held positions as Deputy Site Vice President at the Darlington Nuclear station  
12 and has held senior position in Work Management, Operations Management, Outage  
13 Management, and Maintenance Management at OPG's Nuclear stations and nuclear stations  
14 in the United States.  
15

16 Meg Timberg is a highly experienced lawyer who has had extensive experience in  
17 developing contracting strategies and negotiating contracts for major projects while with  
18 OPG. Her experience with major projects is summarized below:

- 19 • **Nuclear New Build at Darlington:** Lead OPG lawyer in a team including Ministry of  
20 Energy, Ministry of Finance and Infrastructure Ontario that was exploring the possibility of  
21 building two new nuclear units at Darlington. Participated in developing innovative and  
22 effective strategies for creating competitive tension and obtaining value for money for  
23 OPG.
- 24 • **Darlington Refurbishment Program:** Lead OPG lawyer responsible for co-ordination of  
25 timely and business minded legal input into development of contracting and procurement  
26 strategies for this complex project. Participated in dual track negotiations of a complex  
27 contract with two different joint ventures using a target cost model for the critical path  
28 retube and feeder replacement project. Co-ordinating and managing legal input into all  
29 other significant contracts associated with the DRP.
- 30 • **Joint Ventures at Brighton Beach and Portlands:** Oversight of legal issues and Board  
31 governance, including supervising the resolution of all significant claims.
- 32 • **Resolution of Significant Intellectual Property Issues:** Lead lawyer in negotiations  
33 that resolved outstanding intellectual property issues with AECL in contemplation of sale  
34 of AECL by the Federal Government.
- 35 • **Beck Tunnel and Lower Mattagami Projects:** Responsible for oversight of all legal  
36 issues and commercial negotiations related to these significant projects.
- 37 • **Aecon Projects:** Exposed to all major projects executed by Aecon, with a focus on  
38 projects in Western Canada, while on secondment with Aecon from January 2013 to  
39 November 2014.  
40

41 Neil Mitchell has been with Ontario Hydro and OPG for 35 years and the Director of Restart  
42 Engineering at the Pickering A Restart Project, Senior Manager, Plant Design at the  
43 Pickering B Station and has also been responsible for the Environmental Qualification project  
44 at the Darlington Station, a key initiative in order to satisfy a license condition. For the past 6  
45 years, Mr. Mitchell has been the Vice President of Engineering at the DRP. Mr. Mitchell has

1 been behind many initiatives at the DRP to improve front-end planning, including the  
2 Collaborative Front End Engineering process with OPG's contact partners.  
3

4 Art Rob has 36 years industry experience including many senior positions in OPG's  
5 Hydroelectric plants. Prior to his current position in OPG's Nuclear Projects organization, Mr.  
6 Rob was the Plant Group Manager for OPG's Northwest Hydroelectric Plant Group, where  
7 he was responsible for 11 hydroelectric generating stations with 39 generating units and  
8 associated control dam structures, 4 work centres, an operations centre and 140 staff in NW  
9 Ontario. Mr. Rob also was the Partnership leader for the legal partnership with Lac Seul First  
10 Nation on the first commercial partnership for a joint venture between OPG and Lac Seul  
11 First Nation.  
12

13 Gary Rose has been with the Nuclear Refurbishment group at OPG since 2008, first as  
14 Director of Planning and Controls and then as Vice President of Planning and Projects  
15 Controls for both the DRP and the Nuclear Projects and Modifications organizations. Mr.  
16 Rose has been responsible for putting in place project controls and reporting infrastructure  
17 for the DRP and has led many initiatives to improve the quality of planning during the  
18 Definition Phase. Mr. Rose has also previously held Managerial positions in Corporate  
19 Finance at the Pickering Restart project and in Project Controls with the Projects and  
20 Modification organization and the New Nuclear Build project. Mr. Rose holds memberships in  
21 the Association for the Advancement of Cost Engineering (AACE), the Project Management  
22 Institute (PMI), Construction Industry Institute (CII) – Member of Product Review Board  
23 (PRB), and is a Chartered Professional Accountant.

## **CURRICULUM VITAE OF DIETMAR REINER**

### **SENIOR VICE PRESIDENT, NUCLEAR PROJECTS**

#### RESPONSIBILITIES:

As Senior Vice President, Nuclear Projects, Mr. Reiner's responsibilities include:

- contributing to and supporting the development of Ontario Power Generation's long-term business strategies and objectives
- providing vision and leadership for OPG's nuclear projects portfolio, including the successful implementation of the mid-life refurbishment of the Darlington Nuclear Station
- jointly developing a long-term vision and strategy for the Darlington Nuclear Station post-refurbishment

#### EDUCATION:

University of Waterloo, Bachelor of Applied Science, Honours Electrical Engineering

#### EXPERIENCE:

1999 to Present	Ontario Power Generation
2014 to Present	Senior Vice President, Nuclear Projects
2010 to 2014	Senior Vice President, Nuclear Refurbishment
2008 to 2010	Senior Vice President, Inspection, Maintenance & Commercial Services
2000 to 2008	Chief Information Officer
1999 to 2000	Vice President, Commercial Systems
1998 to 1999	Director, Generation Resource Management
1985 to 1998	Ontario Hydro
1997 to 1998	Manager, Production Planning
1995 to 1997	Section Head, Hydroelectric Business Unit
1985 to 1995	Engineer, Power Systems Operations and Nuclear Operations
1986 to 1986	Elder Engineering Inc. Consulting Engineer
1979 to 1980	Ontario Hydro Nuclear Operator Training Program

#### MEMBERSHIPS:

Professional Engineers Ontario

## **CURRICULUM VITAE OF MICHAEL H. ALLEN**

### **SENIOR VICE PRESIDENT, NUCLEAR REFURBISHMENT**

#### RESPONSIBILITIES:

As Senior Vice President, Nuclear Refurbishment, Mr. Allen is responsible for all aspects of the successful preparation and execution of the Darlington Nuclear Station refurbishment project.

#### EDUCATION:

Northwestern University, Illinois, USA - Bachelor of Physics  
US Navy - Nuclear Engineer Officer  
US Nuclear Regulatory Commission – Senior Reactor Operator License  
Project Management Institute - Project Management Professional Designation  
York University, Master's Certificate in Project Management  
Institute of Nuclear Power Operations, Georgia, USA – Senior Nuclear Plant Management Course  
Ontario Power Generation – CANDU Advanced Operations Course

#### EXPERIENCE:

2003 to Present	Ontario Power Generation Inc.
2014 to Present	Senior Vice President, Nuclear Refurbishment
2012 to 2014	Deputy Site Vice President, Darlington Nuclear Station
2012	Restart Director, Point Lepreau Nuclear Station, OPG secondment to NB Nuclear
2010 to 2012	Project Director, Point Lepreau Nuclear Refurbishment, OPG secondment to AECL
2010	Director, Nuclear Programs
2006-2010	Director, Work Management
2003-2006	Maintenance Manager, Pickering A Nuclear Station
1999 to 2003	American Electric Power Company Inc.
2002 to 2003	Maintenance Manager, D.C. Cook Nuclear Plant
2000 to 2002	Outage Manager, D.C. Cook Nuclear Plant
1999 to 2000	Production Manager, Steam Generator Replacement Project, D.C. Cook Nuclear Plant
1996 to 1999	Florida Power & Light Company
1998 to 1999	Operations Manager, St. Lucie Nuclear Plant
1996 to 1998	Training Manager, St. Lucie Nuclear Plant
1985 to 1996	Dominion - Virginia Power Company
1989 to 1996	Supervisor Operations Training, North Anna Power Station

1985 to 1989	Lead Instructor, North Anna Power Station
1984 to 1985	Jersey Central Power & Light
1984 to 1989	Operations Engineer, Oyster Creek Nuclear Generating Station
1979 to 1984	US Navy
1979 to 1984	Qualified Submarine Officer and Nuclear Engineer Officer

## **CURRICULUM VITAE OF MEG C. TIMBERG**

### **VICE PRESIDENT, PROJECT ASSURANCE AND CONTRACT MANAGEMENT, NUCLEAR PROJECTS**

#### RESPONSIBILITIES:

As Vice President, Project Assurance and Contract Management, Nuclear Projects, Ms. Timberg's responsibilities include:

- commercial management of all major nuclear projects at OPG, including the Darlington Refurbishment Project
- oversight of all nuclear projects including consolidating and co-ordinating the responses to all independent oversight provided by the Province, OPG's Board, OPG's President and all external oversight entities (WANO, INPO, etc.)
- ensuring effective and efficient management of all major contracts, setting commercial strategy, co-ordinating all major negotiations and managing any significant claims.

#### EDUCATION:

Queen's University, Bachelor of Commerce (Honours), 1984  
Osgoode Hall Law School, York University, LLB 1988  
Law Society of Upper Canada, Called to the Bar, 1990

#### EXPERIENCE:

2014 to Present	Ontario Power Generation Inc.
2014 to Present	Vice President Project Assurance and Contract Management, Nuclear Projects
2013 to 2014	AECON Group Inc.
2013 to 2014	Vice President, Contract Integration & Interface Management
2000 to 2012	Ontario Power Generation Inc.
2012	Acting Senior Vice President, Law and General Counsel, Law Division
2006 to 2012	Assistant General Counsel, Law Division
2003 to 2006	Senior Counsel, Law Division
2000 to 2003	Counsel, Law Division
1988 to 2000	Gowling, Strathy & Henderson LLP
1996 to 2000	Partner
1990 to 1996	Associate
1988 to 1989	Articling Student

MEMBERSHIPS:

Law Society of Upper Canada

## **CURRICULUM VITAE OF NEIL A. MITCHELL**

### **VICE PRESIDENT, REFURBISHMENT ENGINEERING**

#### **RESPONSIBILITIES:**

As Vice President, Refurbishment Engineering, Mr. Mitchell is responsible for all aspects of Engineering for the Darlington Refurbishment Project.

#### **EDUCATION:**

University of Toronto, Bachelor of Applied Science in Mechanical Engineering, 1981  
University of Toronto, Master of Engineering, Mechanical, Nuclear Operations, 1988

#### **EXPERIENCE:**

<b><u>1998 to Present</u></b>	Ontario Power Generation
2010 to Present	Vice President Refurbishment Engineering
2008 to 2010	Senior Manager, Darlington NGS-A Environmental Qualification Project
2007 to 2008	Senior Manager, Plant Design, Darlington NGS-A Design Authority
2006 to 2007	Senior Manager, Plant Design, Pickering NGS-B Design Authority
2005 to 2006	Director, Restart Engineering, Pickering NGS-A Return to Service
2004 to 2005	Senior Manager, Plant Design, Pickering NGS-A Design Authority
2002 to 2004	Manager, Design, Pickering NGS-A Return to Service
2001 to 2002	Manager Environmental Qualification Project, Pickering NGS-A Return to Service
1998 to 2001	Manager, Environmental Qualification Program, Nuclear Operations Support Services
<b><u>1981 to 1998</u></b>	Ontario Hydro
1996 to 1998	Project Manager (Acting), Environmental Qualification Project of Pickering Nuclear Division
1990 to 1996	Technical Supervisor, Pickering Nuclear Generating Station, Equipment & Documentation Unit
1989 to 1990	Technical Supervisor, Pickering Nuclear Generating Station, Reactor Safety Unit
1989	Technical Supervisor, Nuclear Studies and Safety Department, Reactor Safety Operation Analysis Support
1988 to 1989	Assistant Technical Supervisor / Technical Supervisor attached to the Pickering Nuclear Generating Station Technical Unit, Conventional Controls
1987 to 1988	Acting Technical Supervisor, Radioactivity Management and Environmental Protection Department

1983 to 1987	Assistant Technical Supervisor, Radioactivity Management and Environmental Protection Department
1981 to 1983	Junior-Engineer-In-Training, Nuclear Generation Division.

MEMBERSHIPS:

Professional Engineers Ontario  
Canadian Nuclear Society  
Society of Automotive Engineers

## **CURRICULUM VITAE OF ART ROB**

### **VICE PRESIDENT, NUCLEAR PROJECTS AND MODIFICATIONS**

#### RESPONSIBILITIES:

As Vice President, Nuclear Projects and Modifications, Mr. Rob's responsibilities include:

- development and execution for all sustaining and improvement projects in the nuclear business for the Darlington, Pickering and Nuclear Waste Management Organization, and
- Safety and Improvement Opportunity and Facility and Improvement Program projects that are pre-requisites for Darlington Refurbishment

#### EDUCATION:

Confederation College, Diploma in Mechanical Engineering Technology (First Class Honours), 1982

Lakehead University, Bachelor of Mechanical Engineering (First Class Honours), 1989

Project Management Institute, Comprehensive Project Management Course, 2001

Lakehead University, Business Leadership Development Diploma, 2004

#### EXPERIENCE:

1989 to Present	Ontario Power Generation Inc., Ontario Hydro
2013 to Present	Vice President, Nuclear Projects and Modifications
2010 to 2013	Plant Group Manager, Northwest Plant Group
2006 to 2010	Project Manager, Lac Seul Generating Station
2000 to 2006	Project Manager, Northwest Plant Group
1998 to 2000	Front Line Manager, Technical & Programming Support
1994 to 1998	Technical Supervisor, Northwestern Ontario
1993 to 1994	Front Line Manager, Thunder Bay Production Centre
1991 to 1993	Maintenance Supervisor, Mechanical and Civil
1985 to 1991	Thermal Station Engineer, Thunder Bay
1982 to 1985	Montreal Engineering Company
1982 to 1985 commissioning	Mechanical Technologist, Thunder Bay and Atikokan Generating Stations

#### MEMBERSHIPS:

Professional Engineers Ontario  
Canadian Dam Safety Association

## **CURRICULUM VITAE OF GARY ROSE**

### **VICE PRESIDENT, PLANNING AND PROJECT CONTROLS, NUCLEAR PROJECTS**

#### **RESPONSIBILITIES:**

As Vice President, Planning and Project Controls, Nuclear Projects, Mr. Rose's responsibilities include:

- Accountability for project controls functions including maintenance of project infrastructure, systems, and methods.
- Leads strategic planning efforts including project planning, business planning, funding and release strategies including RQE, and OPG wide project improvement strategies.
- Responsible for the processes for estimating, scheduling, cost management, forecasting, change control, project and performance reporting.
- Responsible for the preparation of all Executive, Board, Stakeholder, and external reporting.

#### **EDUCATION:**

Ryerson Polytechnic University - Bachelor of Commerce (Accounting)

Chartered Professional Accountants of Canada –Chartered Professional Accountant (CPA/CGA)

McLaughlin Masters Certificate in Project Management at Durham College Atocrates Centre for Project Management

Project Management Institution - Project Management Professional (PMP) Designation

#### **EXPERIENCE:**

1999 to Present	Ontario Power Generation
2008 to Present	Director, Planning and Control – Nuclear Refurbishment
2005 to 2007	Manager, Finance Process and Support – Nuclear Finance and Projects
2004 to 2005	Manager, Finance Process and Support – Pickering A Return to Service
2002 to 2004	Manager, Corporate Accounts Payable – Controllership
1999 to 2002	Manager, Special Projects – Controllership
1988 to 1999	Ontario Hydro
1997 to 1999	Manager, Fixed Assets & Accounts Receivable – Corporate Accounting
1988 to 1997	Various progressive roles – Financial Analyst, Senior Financial Analyst

#### **MEMBERSHIPS:**

Association for the Advancement of Cost Engineering

Project Management Institute

Construction Industry Institute – Member of Product Review Board and Board of Advisors

Chartered Professional Accountant

**Board Staff Interrogatory #47**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-2, page 7

The above reference explains that the Planning and Controls Function supports the DRP through the establishment and application of project controls, including cost management, reporting, and risk management at both the Program and project levels.

- a) Describe how and when OPG will continue to assess risks of the DRP during the execution phase and provide a copy of all written processes and procedures.
- b) What reporting system is set up for this? E.g. what data will be provided to management? What is the frequency of risk updates to management?
- c) What efforts are being made to ensure that all of the materials/equipment/tools are procured, staged, and ready to be released to the project?

**Response**

- a) Risk identification, assessment, mitigation, monitoring and reporting is an on-going process and will continue during the execution phase. OPG uses a database tool in which risks are continually updated by the project managers and their project control leads. For copies of procedures and processes please see Ex. L-4.3-1 Staff-48, Attachments 1, 8, 15, 24, 34, 40, 41, 42, and 43.
- b) There is an on-line web-based reporting system which is used by project staff. User reports can be generated by anyone on the project at any time. Project and functional managers receive risk reports by project bundle or function on a monthly basis (or more frequently if requested). Senior project and functional managers receive a Key Risk Area report on a bi-monthly basis and the Key Risk Dashboard on a monthly basis. There is a bi-monthly Risk Oversight Committee meeting at which key risks and mitigating actions are reviewed and updated.
- c) Equipment, materials and tools are defined, ordered, delivered and staged in accordance with the field execution needs. Based on lessons learned from previous nuclear projects, a dedicated procurement and materials tracking oversight model, under the accountability of an experienced project director, has been put in place. This model determines, based

1 on the execution schedule, when specific purchase orders need to be placed to allow for  
2 timely receipt of project material.

3  
4 The status of material deliveries is monitored, with a specific focus on long-lead items.  
5 Materials are tracked at the work package level. Senior project and functional managers  
6 regularly review reports and intervene as required. Metrics are based on the execution  
7 schedule and corresponding procurement schedules. Material status is one of the  
8 project's Key Indicators and has significant visibility with senior project executives.

**Board Staff Interrogatory #48**

**Issue Number: 4.3**

**Issue:** Are the proposed nuclear capital expenditures and/or financial commitments for the Darlington Refurbishment Program reasonable?

**Interrogatory**

**Reference:**

Ref: Exh D2-2-2

- a) Provide a copy of all processes and procedures (which have not been provided elsewhere in the evidence) that OPG has put in place to manage the DRP. Include the date of adoption and revision(s). Provide all policies and procedures for the DRP including, but not limited to, OPG Governance, OPG's Project Management Standards, Project Oversight Standards.
- b) Provide the written processes and procedures that govern how OPG will evaluate and report on the project schedule.
- c) Provide the written processes and procedures that explain how OPG will integrate contractor schedule updates throughout the execution phase of the DRP.
- d) Describe OPG's Change Management procedure and systems for tracking performance and monitoring contractor change orders including a copy of all applicable written processes and procedures. Identify the OPG Staff with responsibility for administering the change management procedure and explain decision making authority of the OPG project management team members involved in change management.
- e) Describe OPG's plan to coordinate engineering changes during the execution of Unit 2 and through future units. Provide all applicable written processes and procedures.
- f) What systems, processes, and procedures will OPG use to track each contractor's field performance and monitor contractor change orders? Provide a copy of all written processes and procedures.
- g) Provide any written procedure regarding commercial correspondence and contractual notices that OPG will use for the DRP.
- h) Provide the written cost control process, if any, for the DRP.
- i) Who on the OPG project team is responsible for reviewing and vetting claims received from the Project's contractors?

**Response**

- a) Copies of the Darlington Refurbishment Program (DRP) processes and procedures are attached as listed in the chart below:

b) Please see Attachments 14 and 25.

c) Please see Attachments 14 and 25.

d) Please see L-4.3-1 Staff-058 part b, and Attachments 9 and 27.

e) Engineering change control is described in section 1.6.7 of the Conduct of Engineering document (Attachment 2, p. 16), Engineering Change Control document (Attachment 9), and the Guideline For Engineering Oversight (Attachment 13). OPG would follow these requirements in coordinating engineering changes during the execution of Unit 2 refurbishment and through future units. The Engineering Change Control Program ensures all modifications to OPG nuclear plant systems, structures, and components, including software and engineered tooling, are planned, designed, installed, commissioned, placed into service, or removed from service within the Safe Operating Envelope and comply with the regulator's operating licensing conditions. In addition, this program ensures all problems or improvement ideas requiring modifications are reviewed prior to approval. OPG engineering staff identifies and specifies adequate engineering oversight activities using a graded approach based on the engineering risks and utilizing best practices and lessons learned from both internal and external nuclear projects. Please see Attachments 2, 9 and 13 for more information.

f) Please see L-4.3-1 Staff-069 parts a to c, and Attachments 3, 4, 5, 6, and 11.

g) Please see Attachments 5 and 33.

h) Please see Attachments 14 and 25.

i) Please see L-4.3-1 Staff-058 part c, sections 1.2.5 and 2 of the Contract Management Standard (Attachment 4), section 2.2.5 of the Darlington Refurbishment Contract Management Plan (Attachment 7), and section 4.5 of the Nuclear Contract Management Manual (Attachment 17).

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 1.0 INTRODUCTION

Darlington Nuclear Generating Station (DNGS) requires a major refurbishment in order to extend the service life of all four production units. The refurbishment is currently planned to begin in 2016. The four units will be shut down in a partially overlapping sequence with the second unit shutdown commencing after removal of all reactor components in the first shutdown unit (i.e. the end of the removal phase of the first unit).

The Balance of Plant (BoP) portfolio consists of 3 (three) sub-bundles that span the full scope of the project as noted below.

- OPG Common – This sub-bundle covers areas such as OPG staffing, scope defining inspections, contract administration/overheads and materials. In addition, any modification work that is required to be completed under OPG QA will be completed in this sub-bundle.
- Conventional – Primary scope in the conventional sub-bundle includes Electrical Systems, Service Water Systems (stopple plug modification and temporary modifications), Fire Protection Systems, Feed Water Systems, and Valve Rehabilitation work. In addition, cyclic and corrective maintenance scope has been added into three areas: Electrical, Valves and Other (Miscellaneous).
- Nuclear – Primary scope in the nuclear sub-bundle includes Alternate SDC Heat Sink and Emergency Heat Sink modifications, Primary Heat Transport work, Reactor Regulating Systems and the Vault Vapour Recovery System work. Adjuster rods replacement in the Regulating scope of work will be a first time evolution for DNGS.

The BoP project has progressed from the definition phase to Gate 2X (approved July 2015). Gate 3 is planned in November 2015 and January 2016 with the key deliverable to achieve this milestone being the approval of Level 3 schedules and revised cost estimates.

DCAVR/Design complete was achieved by August 15/15 for all projects with two exceptions: Alternate Shutdown Cooling multi-lin relay (on track for Sept 30) and software ECs (EHS, NPC, ASDCH) that require DCAVR approval to proceed. Both exceptions received exemption approval to the Aug 15 milestone.

The project is now transitioning to a Procure/Construct and Readiness to Execute (RTE) focus. Implementation of the Material Tracking File (MTF) and resolution of construction interfaces are two critical areas required to progress the test RTE project: Containment ScopeID 7012 Button-up Modification scheduled to start in the field Feb 1/16. Release quality estimate (RQE) base and contingency funding amounts are now confirmed and will be used as the baseline for cost going forward.

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 2.0 GOVERNANCE STRUCTURE AND INTERFACES

### 2.1 BoP Management Plans

The Balance of Plant Project Management Plan has followed the guidance set within the OPG Governance per Figure 1. The content of this PMP is divided into nine knowledge areas as shown below:

- Section 4.0: Project Integration Management,
- Section 5.0: Project Scope Management,
- Section 6.0: Project Schedule Management,
- Section 7.0: Project Cost Management,
- Section 8.0: Project Quality Management,
- Section 9.0: Project Human Resource Management,
- Section 10.0: Project Communications Management,
- Section 11.0: Project Risk Management, and
- Section 12.0: Project Procurement Management.

Supporting ESMSA Documents for the BoP PMP:

- Extended Services Master Services Agreement
- ESMSA Request for Work, N-INS-00120-10025
- ESMSA COIR, N-COI-00120-10000 Rev 000

Supporting OPG Management Plans for the BoP PMP:

- Nuclear Refurbishment Project Oversight, N-MAN-00120-10001 R003

### 2.2 EPC Management Plans

A crucial input to the management and execution of the BoP Project will be the schedule, scope, cost, risk and planning integration with the ES MSA Contractors. Each EPC contractor will follow their respective process for management including the preparation and issue of management plans as specified in the Contract Terms and Conditions.

The EPC management plans follow the layout documented in the ES Fox Program Management Plan ESFL-PMP-00 and Babcock Wilcox Project Management Plan BW-DVR-V001.

Internal Use Only

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

### 3.0 SAFETY

#### 3.1 Safety Management

Safety is a core value at OPG for Nuclear Refurbishment and is reflected in all safety management plans produced by OPG and contractors. The BoP Project will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), the OPG expectations (N-POL-0001, OPG-POL-0001, and N-GUID-09701-10011), as well as the requirements set out in the EPC contracts terms and conditions.

ES Fox has issued a Site Specific Safety Plan (SSSP) that has been accepted by OPG. The project will ensure that SSSPs are issued for other BoP vendors prior to commencement of any field work. Compliance to the SSSP will be monitored as part of the BoP Project Oversight Plan (POP).

#### 3.2 Construction Management

The Balance of Plant Project will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), the OPG expectations, and the terms and conditions for each EPC Contract under which BoP work will be executed.

Construction oversight will be achieved by the use of matrixed construction staff that will be the primary overseers of trades work in the field. The matrixed construction staff will have extensive field/trades experience and knowledge of OHSA/OPG safety requirements. A dedicated BoP Contract Administration (CA) position has also been approved and interviews will commence late 2015. The dedicated CA, in addition to Project Engineer (PE) staff will support the matrixed construction staff to ensure that all contractual and administrative duties are covered by CA and PE staff thereby ensuring the matrixed construction staff maximize their time in the field. It is also expected that CA and PE staff are in the field verifying progress/quality.

The first matrixed construction resource is expected to commence mid October 2015 and will be a key participant in the RTE project Construction Completion Declaration table top scheduled for late October.

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 4.0 PROJECT INTEGRATION MANAGEMENT

### 4.1 Integrated Governance

The integration of OPG and EPC vendor processes will enable coordination of activities between OPG and EPC organizations. The BoP Project will be managed in accordance with the governance illustrated in Figure 1. Each of the standards referenced in Figure 1 will be applied in providing contractor oversight to ensure contractors are working within OPG governance, within the requirements set out in the contract as well as within their Quality Assurance (QA) program. Specific oversight activities will be documented in the BoP POP (NK38-PLAN-09071-10200) and activities/findings will be maintained in the Oversight Log.

The ES MSA Contract Owner Interface Requirement (COIR) N-COI-00120-10000 documents how the integration is achieved at the working level. OPG will also review the EPC management plans (reference Section 2.2) to ensure they integrate with OPG governance and expectations.

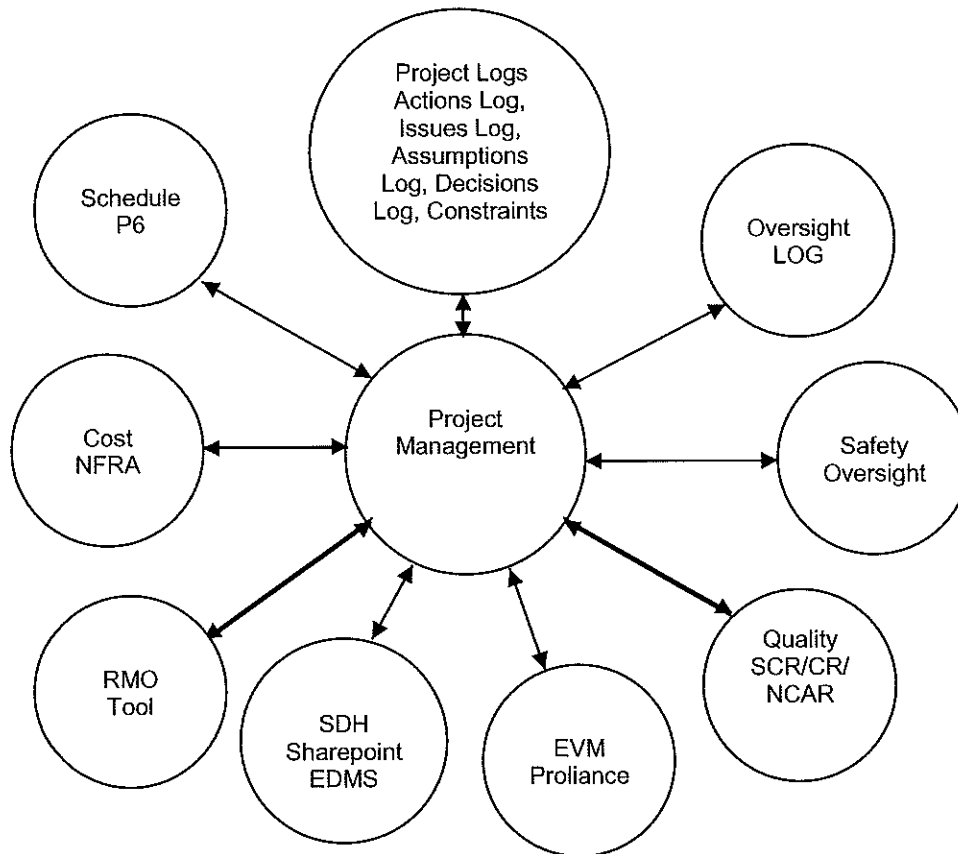

**Figure 1: OPG Management System**

### 4.2 Project Management Toolset

The OPG project management toolset is illustrated below. The toolset will be used to manage OPG internal project activities, facilitate coordination with the EPC vendor activities and document and manage findings resulting from vendor oversight.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>9 of 54</b>

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>
---

**Figure 2: Project Management Toolset**

### 4.3 Project Oversight

The BoP Project vendor oversight will be completed in accordance with NK38-PLAN-09071-10200 and a log of activities will be maintained to document findings and trends in SharePoint. For Pre-Req modifications being managed by Projects and Modifications Organization (P&M) all oversight of the EPC vendors will be done by P&M staff in accordance with their approved POPs. Transition of the applicable refurbishment projects is now complete therefore BoP staff will no longer act as project sponsors for P&M staff.

Refer to POP NK38-PLAN-09071-10200 for further details in this area.

### 4.4 Contract Management

Contract Management of the ES MSA vendors will be in accordance with the Extended Services Master Services Agreement Contract Management Plan N-PLAN-00150-10001. Work will be contracted out in accordance with the Balance of Plant Contract Strategy NK38-REP-09701-10102. The project has received funds in late 2014 to allow the hiring of a full time Contract Management resource for both BoP and Shutdown Layup. This individual was

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>10 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

expected to commence work in Q1 2015 and has been delayed until Q4 2015. The importance of this resource to assist in managing emergent ES MSA contracting issues/strategies has been escalated to Sr Management.

ES MSA core team and overhead resource funding for other BoP vendors has been approved in the RQE. It is expected that a significant portion of the resource funds will be allocated to temporary vendor staff to resolve cross cutting issues as the various Refurb project phases evolve. A typical example would be the assignment of a temporary vendor RTE project management position to expedite resolution of cross cutting construction/materials issues that emerge as part of the test project implementation. Funding will also be required to support Refurb functional initiatives such as East Complex warehouse assessment and subsequent bar coding.

Release of ES MSA contracts will be in accordance with the phases identified below. Release will be via PCA approved by the BoP Project Director. Each release will have agreed cost and schedule criteria of which a subset will be utilized as part of the Vendor scorecard.

Contract Phase	Key Deliverables	Status/Timeline
2A	Level 3 Schedule, Class 3 estimate, RTE pre-req MA22 milestones	Complete
2B	Milestone types documented in Appendix D	Nearing Completion Post gate 3A/B/C to Breaker open
13A	Segment 1 PIMS Milestones Segment 1 CCDs (as applicable) IPG Milestones Segment 2 pre-req PIM Milestones IIP Milestones (as applicable)	Breaker open to end of Segment 1
23B	Segment 2 PIMS Milestones Segment 2 CCDs (as applicable) Mod AFS (as applicable) IPG Milestones Segment 3 pre-req PIM Milestones IIP Milestones (as applicable)	End of Segment 1 to end of Segment 2
33C	Segment 3 PIMS Milestones Segment 3 CCDs (as applicable) Mod AFS (as applicable) System AFS IPG Milestones Segment 4 pre-req PIM Milestones IIP Milestones (as applicable)	End of Segment 2 to end of Segment 3
44D	Segment 4 PIMS Milestones Segment 4 CCDs (as applicable) Mod AFS (as applicable) System AFS IIP Milestones (as applicable) Project Closeout	End of Segment 2 to end of Segment 3

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>11 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

#### 4.5 Engineering Design Management

The OPG Refurbishment project's governance structure for executing Engineering work is described in the Darlington Refurbishment Engineering Program Management Plan NK38-NR-PLAN-09701-10001-0008.

Engineering Design Management in Darlington Refurbishment follows the modification process outlined in N-PROC-MP-0090. All modifications will have Modification Design Requirements (MDR) document issued under OPG Quality Assurance prior to the movement of this work scope into an EPC contract where the design will be completed under the Contractors QA program. In addition, the project will ensure that all staff is familiar with each engineering subcontractor's COIR deviations that have been approved by the Refurb Design Authority.

Each EPC contractor working with the BoP Project will issue design plans for each modification in compliance with the ES MSA COIR. Engineering Earned Value has been implemented in accordance with Refurb procedure N-MAN-00120-10001-SCH-07 and documented/tracked in each vendors P6 schedule.

With DCAVR complete, a review of all the Issues Tracking File (ITF) areas has been completed. Significant issues for any mods will be documented in the Vendor quad charts and applicable RMO actions will be entered into the RMO tool to track to completion.

During the installation planning phase, the vendors engineering group will be focusing on the areas identified below:

- Resolution of any DBOM procurement issues
- Intent/non-intent field initiated changes (FIC)
- Manufacturer non-conformance/technical specification resolution as a result of vendor issued purchase orders to subcontractors
- EC revision as a result of emergent issues (to be minimized and challenged rigorously)
- CWP/ITP review
- Workplan and TPAR submittals

OPG will continue to implement a collaborative approach to ensure engineering issues are effectively resolved with quality and value for money.

#### 4.6 Project Gate Progression Plan

The OPG gated process, described in N-MAN-00120-10001-GRB, is a critical project process and requires integration with the EPC contractor's processes as various contractor inputs will be required for each gate.

Gate 2X was approved July 2016 approving funds to finalize Level 3 schedules, update estimates and progress assessing in order to complete deliverables required for Gate 3. Two projects were granted funding beyond the Gate 3 TCDs below based on the higher level of schedule and cost details namely: ESW L15 (ES Fox ) and SHIM (OPG in-house).

Gate 3 has been broken into three sub-Gates (Gates 3A/B/C) as identified on the following page.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>12 of 54</b>

<b>Title:</b> <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>
--

Gate	Project	Milestone	Comment
3A	Containment Adjusters Flux Detectors PHT + Aux Components Fire Protection	Dec 10/17	Contingency funding will also be requested for any subsequent gate projects to ensure PIMS milestone compliance as applicable.
3B	Alt SDC Heat Sink Emerg Heat Sink LPSW TMODs ESW L15 Fission Chambers	Jan 29/16	Same as above
3C	Other (cyclic scope) SW Stopple Electrical Valves	Feb 28/16	Same as above.
3Execution	Full release of Unit 2	Nov 30/16	Full execution release of unit 2 funding

The next Gate for all Gate 3 A projects is Nov 30/16. The next Gate for Gate 3B & 3C projects will be sequenced at the same time frame subject to RPET availability. At the next Gates, full release funding to execute Unit 2 to closeout will be requested.

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 5.0 PROJECT SCOPE MANAGEMENT

The OPG Refurbishment project's governance structure for scope management is described in the Refurbishment Program Planning and Controls Program Management Plan NK38-NR-PLAN-09701-10001-0002.

BoP was assigned Execution Owner duties for a number of DSRs being project managed by the Projects and Modifications (P&M) organization. Execution VP approval was obtained to move the ownership duties to P&M. That action, including ownership changes in the DSR database, is now complete and P&M report status of those projects as part of the Campus Plan and Facilities projects. DRAS challenges, the Blue Ribbon scope review, and transfer of BoP SIO related DSRs to Projects and Modifications (P&M) has resulted in over 100 BoP DSRs being removed from the project since January 2013. Currently there are 87 DSRs at Approved status in BoP scope per Appendix A

At this time, the only areas where scope may be subject to change are:

- Inspection findings from DNRU2 inspections (Calandria duct for example) and D1641/D1831 planned outage inspections (NIR cable inspections for example). Major areas include components, structures and reactor components.
- Fire Protection emergent repair scope as a result of scheduled inspections & testing. Scope includes:
  - Inspection of selected fire stops to confirm Sikaflex has not been installed
  - Equipment fuel & lube oil tanks including selected berm and penetrations
  - Selected fire system isolating valve testing (4)
- DSR TS0360-7 DCC Consequential changes. DRAS then PSRB approval is required to transfer this scope to AISC. Note - this work does not commence until ~ 50% through Unit 3 Refurb.

Contingency funds have been allocated for all of the above areas

Regulatory (IIP) scope will be managed to ensure float is maintained and the regulatory commitment risk remains low. Appendix C identifies all BoP IIP scope. Reference NK38-REP-03680-10185 Rev 2 for specific actions and completion dates. ARs have been assigned for each BoP IIP item. Note - a breakdown of all IIPs due by the end of 2019 is documented in the Gate 3A package under Appendix D.

## 5.1 OPG Scope Management

### 5.1.1 Scope Definition

This PMP revision covers the work to be performed from Gate 2X to Gate 3. For past work programs refer to the previous rev of the PMP. The next expected update will occur immediately prior or after Gate 3 pending subject to the extent of revisions required due to changing data from Level 3 schedules, estimates or risks.

Title:  
**BALANCE OF PLANT PROJECT MANAGEMENT PLAN**

Table 2a below lists the applicable EPC Contract scopes of work for each BoP project excluding modifications that will be completed in-house (Adjuster Shim Operation, SCID 7026).  
Note – some of the projects have been broken into E, PC contracts as noted.

Table 2a: Project and Scope ID Breakdown			
Project (Vendor)	Scope Document and Detail	Scope ID	Status
PHT and Auxiliaries – Rehabilitation (ES Fox)	Refurb PHT Pump Motors – field work scope	7001	PHT motor scope transferred to P&M Assessing complete
	Inspect and overhaul PHT Pumps	7002	
	Contingency – PHT Pump Refurb	7003	
	Replace PHT switches and cabling	7005	
Emergency Heat Sink Mod (ES Fox)	EHS – ESW to PHT tie (Mod)	7004	Design complete, detailed assessing I/P
Flux Detector Replacement (ES Fox)	Replace RRS Vertical In-Core Flux Detectors	7020	Assessing late - recovery plan I/P
	Replace SDS 1 Vertical In-core Flux Detectors	7021	
	Replace SDS 2 Horizontal In-Core Flux Detectors	7022	
Adjusters (ES Fox)	Replace Adjusters (Mod)	7023	Design complete, rehab assessing late, modification assessing I/P
Fission Chambers (ES Fox)	Fission Chambers Modification (Mod)	7027	Design complete, detailed assessing I/P
Electrical Systems (E Unit 2 – Areva (nearing completion)) (EPC – TBD)	MCC Maintenance	7040	Front end planning PO issued to AREVA, detailed assessing & Level 3 schedule I/P
	BU 1-8 Maintenance		
	Replace various components	7041	
	Replace 500kV Bushings		
	Replace Motor Starters feeding the vault coolers (U2 only)	7042	
	Contingency – Refurb MOT transformer	7043

### 5.1.2 Work Breakdown Structure

The BoP Project Work Breakdown Structure has been prepared in accordance with N-MAN-00120-10001-SCH-05 and can be found in the P6 schedule.

### 5.1.3 Scope Control

DSR based scope changes require prior PSRB approval prior to implementation.

Scope clarifications within DSR scope will be processed via Project Change Authorization (PCA) forms for ES MSA contracts and contracts amendments/notification to proceed (NTP) or Project Change Directive (PCD) for the B&W contract. Prior DRAS approval will be obtained as applicable.

Options Review Board (ORB) approval will be requested for significant scope changes such as EHS leak detection. All ORB decisions will also be documented via DRAS and submitted to the CCB for either approval or information.

A Change Control Form (CCF) in accordance with N-MAN-00120-10001-PC will also be processed with scope changes to ensure planned value and P6 schedules are updated. The CCF may request release of bundle contingency or program contingency.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>19 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 6.0 PROJECT SCHEDULE MANAGEMENT

Project schedule management is concerned with defining, sequencing, and estimating resources and durations of the project activities which are integrated in the project schedule. It will require schedule development and monitoring to be integrated with OPG project and functional groups, EPC contractors and other contractors [i.e. Owner Support Service (OSS)] schedules.

Each EPC contract will require that the Contractor provide a detailed Level 3 P6 schedule that integrates with the overall OPG P6 schedule.

Vendor Level 3 schedules will be resource loaded for OPG resources in accordance with Resource Loading of Functional Engineering Resources Within Level 3 Project Schedules NK38-CORR-09701-0489190.

OPG and Vendor schedules will be managed within milestones documented in the following governance:

- N-PROC-MA0022 – all work that will be completed via IPG
- NK38-MAN-09701-10005 – all work completed during the Refurbishment outage on the Refurbishment unit
- N-PROC-MA0013 – all work completed during planned outages

In addition, Refurb scheduling expectations (Expectation #2) templates have been forwarded to Vendors for their implementation.

### 6.1 OPG Schedule Management

Balance of Plant project schedule management will be performed in accordance with the Refurbishment Program Planning and Controls Program Management Plan NK38-NR-PLAN-09701-10001-0002. Refurb Expectation #2 also documents scheduling templates that are to be utilized for Refurb.

### 6.2 EPC Contractor Schedule Management

Each EPC contractor will have a process to address project schedule management. The EPC portion of the BoP project Level 2 schedule will directly reflect the vendor Level 2 schedule (i.e. all activities with current status). In addition, all 2016 pre-req tasks have work orders assigned to a specific work week and status will be reviewed against the applicable MA22 milestones.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>20 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 7.0 PROJECT COST MANAGEMENT

Project cost management is concerned with budgeting and controlling overall project costs. The RQE project estimate is 651.3M and is broken down per below:

- Base EPC 336.1M
- OPG Oversight 110.1M
- EPSCA/Training 5M
- Cyclic OM&A 61M
- Contingency 138.9M

All costs will be baselined against RQE values and CCFs will be issued to document any change to the project estimate.

### 7.1 OPG Cost Management

The BoP Project cost management and integration is governed by the following documents:

1. Darlington Refurbishment program document N-MAN-00120-10001-PC, Project Controls
2. Nuclear Refurbishment Cost Management and Project Reporting, N-MAN-00120-10001-CST
3. Refurbishment Planning and Controls Management Plan NK38-NR-PLAN-09701-10067-0002

EPC contractor costs are integrated with internal OPG BoP Project costs/contingency to provide a total estimated cost for the project. Costs associated with efforts of the OPG functional groups are not included at the project level and are managed by the respective functional groups except where dedicated matrix staff have been identified. Note - costs for external contracts to prepare modification design requirements and conceptual design reports are included in the project cost estimates under the OPG Common sub-bundle.

EPC contractor costs are incorporated in the project cost management worksheet and updated monthly based on the OPG Nuclear Financial Reporting and Analytics (NFRA) Cost Reports. Costs are managed for work packages in the Work Breakdown Structure (WBS) which are aligned to the Oncore load sheet provided to each EPC contractor and further align with Proliance. This allows the EPC contractor costs to be captured at the work package level as determined by the project and tracked against the original cost estimate via Proliance PV targets.

Any changes to contract cost will be approved via CCF (if required) followed by PCA or PCD. . In all cases, PV will be updated to reflect the cost changes to ensure EV is accurately tracked.

### 7.2 EPC Contractor Cost Management

BoP baselines and cash flows reflect the EPC Contract values. Estimates requested at the Gates will be updated (if required) via Change Control Forms once the purchase order is issued and the actual values are known.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>21 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

ES Fox issues weekly cost summaries to track accruals and estimate to complete costs. The project is currently working to delineate contract phase costs and is expected to be completed by Dec 2015. Valve predefine and corrective scope cost is currently being analyzed with BWXT to confirm the Level 3 cost estimate and P6 schedule. AREVA is completing the same analysis for the Electrical program work under a time and material contract with BWXT phases based on poor subcontractor cost tracking performance. Dedicated staff are now in place and this initiative has been extended indefinitely.

### 7.3 OPG Change Management

The Change Management is a process to manage changes within projects. It extends from identification to inclusion or cancellation of changes to costs (including budgets, planned values, funding, and forecasts), schedule, and scope.

This Change Management process applies to all Nuclear Refurbishment (NR) funded projects. This process applies to work programs, including contingency, approved by the Gating process, and functional work programs approved by the Program Release.

If a change is needed, a Change Control Form (CCF), N-FORM-11252 shall be initiated. Subsequently will follow reviews and sign off's in accordance with the Refurbishment document identified below

Balance of Plant Change management will be performed in accordance with the Refurbishment Change Management Plan N-MAN-00120-10001.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>22 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 8.0 PROJECT QUALITY MANAGEMENT

The overall quality management process will apply to all work in the BoP project; however, the particular QA requirements will be specified in each EPC Contract according to the nature of the work.

Each ES MSA vendor will have a Quality Assurance Manager assigned to support BoP work as required. As part of Construction oversight, OPG hold points will be inserted in Vendors ITPs as applicable to monitor Vendor quality. In addition, it is expected that observation and coaching reviews will take place as field work progresses to ensure that OPG maintains its due diligence with respect to Vendor quality.

### 8.1 OPG Quality Management

The Quality Management of the BoP Project will be in compliance to:

- N-CHAR-AS-0002 - Nuclear Management System,
- N-PROG-AS-0001 - Managed Systems,
- N-PROG-AS-0007 - Project Management,
- N-STD-AS-0028 - Project Management Standard,
- N-STD-AS-0029 – Contract Management Standard,
- N-STD-AS-0030 – Project Oversight Standard,
- N-STD-AS-0031 – Field Engineering Standard
- N-MAN-09701-10002 – Nuclear Project Oversight Guide,
- N-PROC-MM-0010 – Establishing and Maintaining Ontario Power Generation Nuclear Approved Supplier list.

#### 8.1.1 Quality Assurance

For EPC work, each contractor has Quality Assurance Plans that addresses the interface responsibilities with external organizations. For all EPC quality assurance plans, each will address all applicable codes and standards including CSA Z299, CSA N286-05 and CSA N286.7 standards, as required, identifying what quality programs and procedures will be followed, including the contractor's and their sub-contractor's personnel responsibilities under the various quality programs. OPG will review and accept the contractor's project quality assurance plans.

During the different phases of project work, the project team, jointly with the functional groups will work to ensure that the quality of design, materials, and services provided and the quality of installation and commissioning work performed meet OPG standards, purchase order requirements, and are in compliance to applicable codes and standards.

In the instance of a quality system failure or a breakthrough event occurring for which the contractor is accountable; such adverse conditions will be documented per the contractor's QA Program and per N-PROC-RA-0022. The contractor will be asked to initiate a Corrective Action as per their program for any identified quality issues. When there is a systemic failure of

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>

<b>TIME:</b> <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>
---

their implemented Quality System, a formal Non Conformance and Corrective Action Request process will be initiated by OPG Supply Chain Quality Services as per N-PROC-MM-0010 and N-GUID-01935-10004.

To ensure compliance to OPG requirements, the contractor interface will be controlled by the Contractor Owner Interface Requirement (COIR) document forming part of each agreement.

For internal quality issues the OPG Station Condition Record (SCR) and corrective action process will be followed. Vendors will utilize their own corrective action programs to address their issues however the OPG SCR system will be utilized as documented in NK38-GUID-09701-10022 (draft).

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>24 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 9.0 PROJECT HUMAN RESOURCES MANAGEMENT

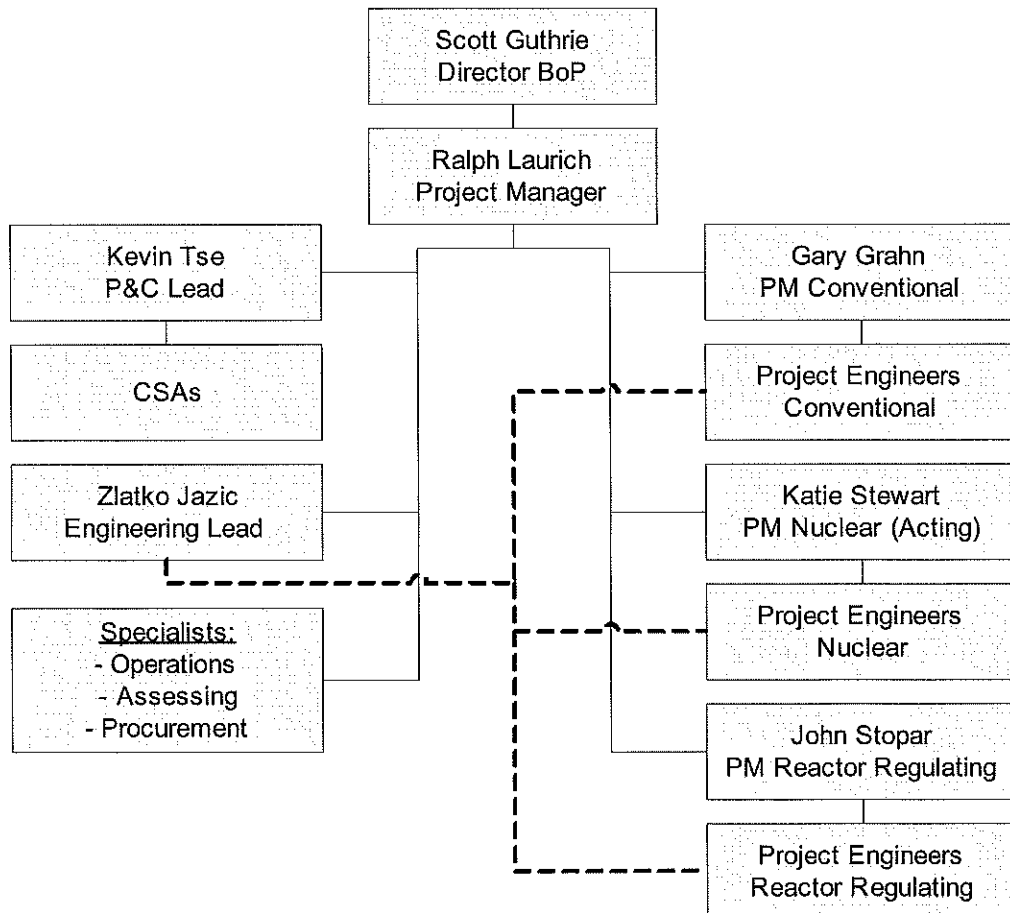

The BoP Project human resources management will be in accordance with Darlington Refurbishment Program Staffing Management Plan NK38-NR-PLAN-09701-10001-0016.

### 9.1 OPG Human Resources Management

#### 9.1.1 Team Resourcing

The BoP Project Organization is shown below. The key roles and their respective accountabilities are described in Appendix B: Project Organization.

Nuclear Refurbishment has elected to employ a Matrix organizational model to execute the Refurbishment Program. It is the BoP Project's plan to staff the project team with OPG and Augmented staff. Managed task resources will be used at a minimum to supplement to ensure cost, schedule, safety and quality issues remain on track. OPG staff will either be embedded in the team or will be matrixed from the NR functional support organizations.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>25 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

**Figure 3: Balance of Plant Project Organization**

## **9.1.2 Team Development**

### **9.1.2.1 Training & Resource Development**

#### Qualifications

Each project member that is matrixed will be assigned the appropriate qualifications by their respective functional manager to ensure compliance with the applicable standards for that group. A review of the current qualification set that are available for project management, contract owner and similar functions is performed by the project.

In order to effectively provide oversight to the EPC contractors, one would ideally have like experience and training similar to that of the EPC contractor. The project will continue to explore internal and external opportunities to develop these skills.

### **9.1.2.2 Training & Resource Development**

The following assessments and methods will be employed and expectations communicated to all project team members:

- Annual Incentive Plan (AIP) Score Card – (Management team only)
- Project Performance Review (PPR),
- Monthly summary data sheets.
- Contract SOWs and Deliverables for contract staff

Vendors will be required to document which programs they train staff under OPG TIMS and their internal programs. A program based milestone will be established for ES Fox to document the applicable programs and ensure alignment with OPG training.

Given the recent challenges that occurred for the valve program during VBO, the Valve Vendor (BWXT) will be required to show how they are utilizing training mock-ups and ensuring sufficient trades skills as part of their valve preparation scope.

## **9.2 EPC Contractor Human Resources Management**

Each EPC contractor will be responsible for the management of their staff. The EPC contractor in the ESMSA for BoP projects will develop resource management plan for all staff and subcontractors in accordance with the ESMSA terms and conditions. A critical document associated with this work is the ES MSA Program Management Plan which will reference a mobilization plan based on allocated or secondary compete awarded work. As of September 2015 the ES Fox has submitted resource plans but they are unacceptable. As a result, a resource planning management representative will be hired into ES Fox on a temporary basis to complete a PMT and overall resource management plan. Deliverables/milestones are being confirmed at the time of this PMP update. In addition, ES Fox will be hiring a temporary RTE Project Manager to facilitate the transition to breaker open and implementing all Construction interfaces effectively from Feb 1/16 to Oct 15/16.

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>27 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## 10.0 PROJECT COMMUNICATIONS MANAGEMENT

Balance of Plant Project communication management will be consistent across each project except if there are differences stipulated in each EPC contract. If major differences exist they will be documented in this plan.

Each SoW issued to the Contractor will have a list of current OPG staff associated with the work. The Contractor will document the names/contact #'s of applicable OPG & Contractor staff in their communication plan and make any updates as required.

## 10.1 OPG Communications Management

### 10.1.1 Information Control

The main stakeholder communication methods are:

- Face to face
- Telephone and Email communications
- Submittals and Requests for Information (RFI)
- Weekly Meetings/Conference calls
- Publications and Reports

Emails: Regularly used to document interface with stakeholders, the project team and with contractors.

Meetings: Conducted face-to-face with available teleconference and videoconference as required. The stakeholder meetings involving the BoP project and its internal stakeholders are listed in Table 4a, and external stakeholders in Table 4b (Conventional Contracts), and Table 4c (Nuclear Contracts).

Records: The Communication Technology and Information distribution tools that will be used by the project include:

- VendM: External environment used for information exchange and management of contractor submittals.
- SharePoint 2007: Internal document storage, exchange environment used for storage of project documents, deliverables, schedules and cost information,
- Project Records will be maintained in SharePoint, Project Emails and VendM.
- Assett Suite 7

### 10.1.2 EPC Job Aid

The combination of a large number of contracting reference documents, contract deliverables, and contracts in BoP, will result in a significant volume of documents. To manage the documentation, BoP developed an electronic binder (E-Binder) system referred to as EPC Job Aids. EPC Job Aids were established for Vendor common documents, which contain on-

### 10.1.3 Stakeholder Inputs

Stakeholder inputs are gathered through the various meetings conducted by and with the project team. Actions, issues and risks are then tracked in the appropriate system as described in the Risk Management Plan.

The major stakeholders for the BoP Project are listed in Table 5.

Table 5: Stakeholder Register			
Identification	Main Expectations	Potential Influence & Phase of Most Influence	Stakeholder Classification
Darlington Nuclear Generating Station (DNGS)	Return of units 1-4 as per Refurbishment Program Charter	Owners of Plant Systems; Execution Phase	Internal
ESMSA Contractors	Coordination with OPG and other EPC Vendors as per ESMSA Agreement	Throughout the entire project	External
Non-ES MSA Contractors	Coordination with OPG and other EPC Vendors as per ESMSA Agreement	Throughout the entire project	External
NR Function Groups: Engineering, Nuclear Safety, Ops, Maintenance, Rad Protection, Reg Affairs	Consultation, input required for review of deliverables	Required to perform oversight activities; Throughout the entire project	Internal
Darlington Engineering, Operations, Work Control and Maintenance Staff	Consultation when implementing modifications on the operating stations	Owners of the Plant Systems; Throughout the entire project	Internal
Darlington and Fuel Handling	Coordination required when executing pre-req outage work and NR work during no-fuel windows	Owners of the FH system, critical impact to installation schedule of the project	Internal

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>35 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

Table 5: Stakeholder Register			
Identification	Main Expectations	Potential Influence & Phase of Most Influence	Stakeholder Classification
Darlington – Mechanical Design Group	Provide input on pressure testing requirements	Owners and operators of station pressure testing equipment. Key stakeholder in developing pressure test strategy	Internal
Government of Ontario	Performance of Program on Time, on Budget, within Scope, and without Safety Incidents	Major influence in making go, no-go decision for Execution Phase	External
Unions	Upholding of Collective Bargaining Agreements	Entire Project	External
Canadian Nuclear Safety Commission	Compliance with Regulations	Throughout the Project	External
Technical Standards and Safety Authority (TSSA)	Compliance with Regulations	Throughout the Project	External
Municipality of Clarington	Compliance with Codes and By-laws	Throughout the Project	External
Ministry of Environment	Compliance with Regulations	Throughout the Project	External
Ministry of Labour	Compliance with Regulations	Throughout the Project	External
Electrical Safety Authority	Compliance with Regulations	Throughout the Project	External

#### 10.1.4 Performance Reporting

Performance reporting will be executed in accordance with the Darlington Refurbishment Planning and Controls Program Management Plan NK38-NR-PLAN-09701-10001-0002. Project cost and schedule performance will be gauged and monitored using the Earned Value

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>36 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

Management technique in accordance with N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management.

A monthly BoP quad will be issued and reviewed at the monthly project status review meeting. The quad will include the following reporting categories:

- Executive summary
- Cost Performance/Variance Explanation
- Schedule Performance/variance Explanation
- Risk Performance/Additional Explanation
- Engineering Earned Value

The recently issued Nuclear Refurbishment Reporting Website will be used going forward to identify all program and project specific metrics.

A bundle specific Refurbishment specific Scorecard is planned to be issued in Q1 2016 documenting ES MSA performance..

## **10.2 EPC Contract Communication Management**

The EPC contractor will issue/maintain individual communication management plans as required by the Contract Terms and Conditions.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>37 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

## **11.0 PROJECT RISK MANAGEMENT**

Risk Management for the BoP Project will require the integration of the BoP Project Risk Management process and the EPC contractor risk management processes.

### **11.1 OPG Risk Management**

OPG Risk Management follows the procedures outlined in these documents:

- NK38-NR-PLAN-09701-10001-0011 Darlington Refurbishment Program Assurance Program Management Plan
- N-MAN-00120-10001-RISK OPG Risk Management Processes

Risks in BoP are managed per the governance of OPG Risk Management. RADAR is a program used to track risks during the entire life cycle of all projects. The BoP Risk Management Plan NK38-PLAN-09701-10196 is specific to the documentation and management of risks in Balance of Plant.

### **11.2 EPC Contractor Risk Management**

EPC contractors will provide risk management plans as required in the Contract Terms and Conditions. The vendor Risk Management Plans are to include requirements for risk identification, tracking and mitigation. Vendors will be required to incorporate risk reporting into the monthly quad charts.

### **11.3 Risk Management Integration**

EPC contractors will manage risks per their internal processes. Interfacing risks identified by EPC contractors will be documented in the RMO tool and mitigating actions assigned accordingly. In general risk communication can take place via the following methods:

- Part of project communication meetings
- Part of weekly quad review meetings
- Vendor Summit/leadership meetings
- BoP Quad risks presented at the Project Status Review Meeting
- Oversight Committee meeting review

Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>
---

## 12.0 PROJECT PROCUREMENT MANAGEMENT

For all OPG procurement activities, the processes as defined in OPG-PROC-0058 Procurement Activities will be followed.

EPC contractor procurement will be in accordance with the applicable Contractor procurement process. Vendors will provide weekly input into the Procurement tracking Tool (PTT) via an excel file (Materials Tracking File) in accordance with N-GUID-09701-10124. EPC contractor procurement will be in accordance with the applicable Contractor procurement process and the OPG accepted Procurement Plan.

### 12.1 OPG Procurement Management

Material provided by OPG to fulfill BoP scope will be procured using existing OPG processes and procedures. The scope of these materials is currently:

- Electrical/Other/Valve – cyclic and preventative maintenance scope
- PHT + Aux - cables
- Containment – EQ cables
- OPG materials available as a result of emergent scope and schedule constraints
- Construction Interface supplied equipment/materials (pending confirmation)

### 12.2 EPC Contractor Procurement Management

Each vendor is required to issue a Procurement Management plan that is accepted by OPG. Project Specific Procurement plans will include the following as a minimum:

- Manufacturer schedule and/or hold points identifying which hold points will be witnessed by the EPC Vendor. These hold points will include selected materials as a result of PNGS ER3.1 findings. To date, 12 CATIDs have been identified for ES Fox that fall into this category. A review of BWXT and AREVA materials is on-going.
- The above hold points will be input in P6 under a standardized code in accordance with Expectation #2.
- Procurement plan checklist as documented in N-GUID-09701-10124

The East Complex warehouse will be used to stage EPC vendor materials prior to movement to approved SATM staging areas inside the protected area. A bar code system will be implemented to manage the movement of materials and a single vendor will be used to transport all materials from the East Complex warehouse to inside the protected area. Vendors are expected to staff the warehouse to care and control their material, including applying the bar code and preparing the materials for transportation into the protected area.

## Appendix B: Project Organization

Project Sponsor: Vice President, Nuclear Refurbishment Execution

### Accountabilities:

- Ensure the program is fully staffed
- Ensure adherence to Nuclear Refurbishment Program
- Administer quarterly Executive Oversight Meetings. Address any concerns escalated in a timely fashion

### Project Director,

The BoP Project Director has the accountability for all aspects of the Project including:

- Environment, Health & Safety
- Scope
- Schedule
- Cost
- Risk
- Quality
- Staffing & Resources
- NR Program Governance adherence
- Reporting & Communications
- Oversight
- Contract Adherence

### Project Manager

Each BoP Project Manager has the overall accountability for the successful delivery of their sub-bundle projects which includes:

- Environment, Health & Safety
- Scope
- Schedule
- Cost
- Risk
- Quality
- Stakeholder Management
- Communications & Reporting

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>50 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

- Vendor oversight

#### Project Controls Lead

The Project Controls Lead is accountable to:

- Ensure project conforms to NR Program Governance, supported by routine quality checks and self assessments
- Liaising between functions and project including centers of excellence
- Cost Management
- Schedule Management
- Risk Management
- Change Management
- Gated Process including budget loads and baselines
- Reporting including Earned Value
- Analysis and Forecasting
- Business Planning
- Project Tools including IT tools, processes and instructions
- EPC contractor integration within OPG system

#### Procurement Lead

The Procurement Lead will be accountable to:

- Be the single point of contact with the EPC contractor for all procurement related matters
- Hold the Contractor accountable to complete procurement activities in accordance with the correct QA requirements, procedures and programs
- Coordinate OPG conducted audits and attend as required
- Arrange for OPG participation in and oversee contractor audits of sub-contractors as required
- Ensure oversight of EPC contractors sub-contractors procurement process
- Ensure materials and services are procured per schedule
- Ensure and coordinate resolution of any Non-Conformances

#### Engineering Lead

The Engineering Lead will be responsible for:

- Ensuring that the ECC process required is defined, understood, reflected in the schedule and implemented per process
- Provide resources and context to perform adequate document reviews within the contractual time frame allotted

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>51 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

- Ensuring resources and context to perform adequate oversight of EPC contractors to ensure project objectives for cost, scope, schedule, and quality are met
- Attend COMS reviews and ensure OPEX is embedded in the Engineering deliverables
  - Ensure scope is defined, understood and managed per the applicable scope management governance
  - Ensure all risks associated with Modifications are identified in RADAR per appropriate governance; mitigating actions are prepared tracked monthly and updated as required
  - Identify, coordinate and solicit all stakeholder inputs to engineering deliverables reviews

#### Project Submittals

Accountabilities regarding project submissions for OPG staff are outlined below. The main responsible groups are Nuclear Refurbishment Records and Document Management group (NR RDM), Document SPOC and document reviewers.

#### NR RDM

- Accountability for support on project submissions to the project team resides with the NR Records & Document Management (RDM) group

#### RDM

- Handles day-to-day transactional responsibilities, including being the medium between the project team and EPC contractors for transaction of submissions related to SDH. RDM also support the initiation, tracking and closure of SharePoint workflows related to document reviews.

#### Document SPOC

- The document SPOC can be the Project Leads or other person delegated responsibility for coordinating documents reviews. The Project Lead is accountable to ensure the document is reviewed by the appropriate stakeholders and for ensuring the review is completed within the specified time.

#### Reviewers

- Reviewers of project submissions, as designated by the Project Lead via review workflows, are responsible for their review of a project submission per the indicated timeline on the workflow.

Title:  
**BALANCE OF PLANT PROJECT MANAGEMENT PLAN**

**Appendix C:**

**IIP Scope/DSR List**

<b>IIP Item #</b>	<b>IIP Activity Description</b>	<b>DSR</b>
IIP-CC 028	Overhaul X-32110-NV3/4/9/10/23/24/28 with new seat and disk material. Replace X-32210-NV112 in all units.	TS1450-1
IIP-CC 029	Replace the following isolating valves 1/2/3/4-63253-V52/53 and 1/2/3/4-32110-V5, V6, V21, V22, V25, V26 and 1/2/3/4-32110-MV1, MV7, MV8, MV11, MV12, MV31, MV32	TS1070-3
IIP-CC 050	Inspect 5 representative MOVs on Unit 2	TS0110-2
IIP-CC 050	Disassemble and inspect removed valves to determine path forward for remaining units Provide an inspection and rehab strategy prior to and after inspections are complete in Unit 2	TS0110-2
IIP-CC 050	Inspect 4 representative valves in U1, U3 & U4	TS0110-2
IIP-CC 050	Inspect MOV intergate drain lines	TS0110-2
IIP-CC 050	Replace bellows sealed valves 33410-MV28 MV97 in Unit 2	TS0110-2
IIP-CC 051	Complete an engineering assessment of manual valves to determine if repacking is required. Repack the SDC manual valves as required.	TS0110-8
IIP-CC 037	Replace the cables associated with PHT trip pressure switches and perform any corrective maintenance for switch modules and pressure switches in all units.	TS0090-7
IIP-CC 039	Inspect 2-32110-P3 and fix gasket leaks. Repair gasket leaks on 1-32110-P2. Inspect one Unit 3 pump and repair/replace if required.	TS0090-12
IIP-OI 001	Upgrade the station fire alarm system to allow transfer of the fire alarm to the secondary control areas where applicable alarms will be displayed.	IP1270-1
IIP-OI 001	Add fault isolation modules where missing from stairwells.	IP1270-1
IIP-OI 002	Complete an analysis to determine where modifications to the Fire suppression system are required and make any required modifications.	IP1220-2
IIP-OI 003	Complete an additional analysis to determine if seismic restraints are required for fire extinguishers located in the areas specified by the clause. Install any required seismic restraints for fire extinguishers.	IP1220-6

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10166</b>	Usage Classification: <b>Internal Use Only</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>53 of 54</b>
Title: <b>BALANCE OF PLANT PROJECT MANAGEMENT PLAN</b>		

IIP-OI 004	Complete an evaluation of the existing SG combustible fuel oil tanks secondary containment dykes to confirm that the dyke's permeability is not deteriorating. Correct any deficiencies.	IP1220-14
	Additionally, inspect the Standby Generator and Emergency Power Generator combustible fuel oil tanks secondary containment penetration locations to confirm their integrity is not deteriorating. Correct any deficiencies.	IP1220-14
IIP-OI 019	Replace door S-213A to the laundry room shaft in room S-213 with a listed and labelled fire door having a rating of not less than 45 minutes.	IP1220-2
IIP-OI 022	Provide emergency lighting in the Fuel handling Transfer Chamber S120	IP1220-4
IIP-OI 023	Protect the Fire and Smoke Detection system cabling located above the instrument air compressors in R-108.	IP1220-18
IIP-OI 024	Perform a review of penetration seals larger than a single cable, a single tube, or 13mm mm wide construction joint seal, in required fire separations to confirm that listed fire stopping materials are used. Replace unlisted materials if they have been used.	IP1220-3
IIP-OI 025	Install fire dampers in ducts penetrating Service Shafts S-289 and S-290 on the 107.5m and 110.9m elevations in the CSA, in the normally occupied areas.	IP1220-2
IIP-OI 027	Install fire dampers at the duct penetrations of vertical service shafts S-289 and S-290 between the Central Services Area 107.5m and 110.9m elevations in normally occupied areas and seal any penetrations	IP1220-2
	Enclose the top of the two laundry shafts in rooms SM-215 and SM-208 by construction that would provide a 1 h fire separation	IP1220-2
IIP-OI 029	Complete an assessment of the Emergency Power Generators and Lube Oil tanks conditions to confirm the tanks suitability for the extended life of the station. Correct any deficiencies.	IP1220-14
IIP-OI 030	Complete the following actions related to Valves Controlling Water Supplies: 1 - test all private service main control valves to confirm operability	IP1220-14

# Nuclear Program

## TITLE

## CONDUCT OF ENGINEERING

## AUTHORIZATION

OWNER: S. Lawrence  
Manager, Engineering Mechanics

APPROVAL FOR ISSUE: R.J. MacEacheron  
Director, Nuclear Regulatory Affairs

AUTHORIZATION AUTHORITY: M. Elliott  
Senior Vice President, Nuclear Engineering and  
Chief Nuclear Engineer

COMPLIANCE DATE: Immediate (See Exceptions)

## PURPOSE

This program provides a framework, which includes programs, standards, procedures and instructions, for performing engineering in a consistent manner across Ontario Power Generation Nuclear, (hereafter referred to as Nuclear). The program establishes the following practices for engineering:

- Ensures each plant and nuclear waste management facility configuration is maintained in accordance with the design and licensing bases, and operated within its Safe Operating Envelope (SOE). In the case of nuclear waste management facilities, the applicable term is Safety and Design Envelope in place of SOE which is used throughout this document.
- Ensures essential plant and nuclear waste management facility equipment performs safely and reliably.
- Complies with relevant legal, statutory, and regulatory requirements.
- Encourages continuous improvement in the conduct of engineering targeted at achieving safe, reliable, and competitive operation of nuclear power generating stations and nuclear waste

© Ontario Power Generation Inc., 2012. This document has been produced and distributed for Ontario Power Generation Inc. purposes only. No part of this document may be reproduced, published, converted, or stored in any data retrieval system, or transmitted in any form by any means (electronic, mechanical, photocopying, recording, or otherwise) without the prior written permission of Ontario Power Generation Inc.

### CONDUCT OF ENGINEERING

management facilities.

Note: The words “facility” and “plant” are used interchangeably in this document.

### SCOPE

This program is applicable to organizations performing engineering activities within Nuclear. This includes contractors and design agencies performing engineering activities on behalf of Nuclear unless these organizations are performing these activities in accordance with a Quality Program approved by Ontario Power Generation (OPG).

This program does **not** apply to facilities, systems, equipment, and buildings, governed by N-PROG-MA-0024, Conduct of Nuclear East Facilities Maintenance and Engineering, under the authority of Projects and Modifications.

### EXCEPTIONS

The compliance date for Nuclear Waste Engineering Division and Nuclear Waste Design Engineering Department is December 31, 2012.

## CONDUCT OF ENGINEERING

### 1.0 DIRECTION

#### 1.1 Overview

N-PROG-MP-0007, and interfacing Engineering programs, standards, and procedures are consistent with the expectations established in:

- N-CHAR-AS-0002, Nuclear Management System
- N-POL-0001, Nuclear Safety Policy
- Codes and standards of record, including those of the Canadian Standards Association (CSA) [B-1] [B-2]
- Applicable regulatory and statutory requirements, including those of the Canadian Nuclear Safety Commission (CNSC)
- Guidelines of the Institute of Nuclear Power Operations (INPO) and the World Association of Nuclear Operators (WANO). [B-3]

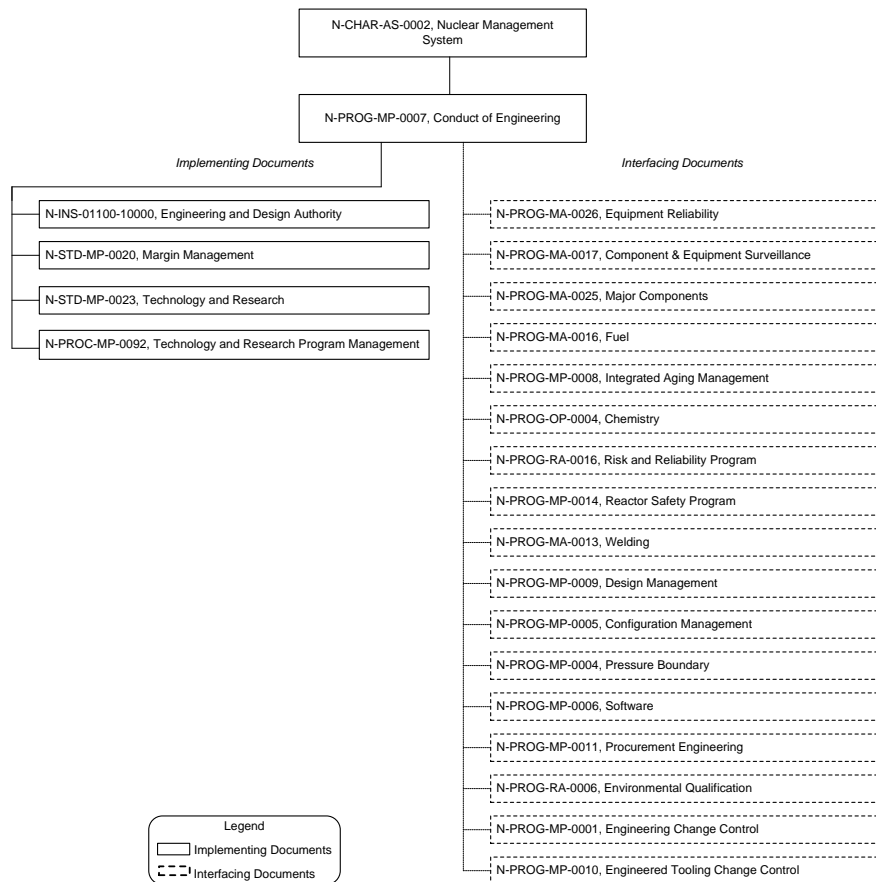

Figure 1, Conduct of Engineering Program Governance and Interfacing Documentation, provides a diagram of the Conduct of Engineering governance framework. It shows the implementing and interfacing documents.

Title:
CONDUCT OF ENGINEERING

### 1.2 Engineering Program Requirements

- 1.2.1 Every Nuclear staff member, engaged in engineering activities, shall accept the unique and grave responsibility inherent in using nuclear technology, including great respect for the reactor core, its stored energy, decay heat, radioactive by-products, and spent nuclear fuel.
- 1.2.2 Engineering personnel at all levels of the organization shall consider nuclear safety as the overriding priority over schedule, cost, and production. Decisions and actions are based on this priority. Engineering Vice Presidents, Directors, and Managers follow-up to verify nuclear safety concerns receive appropriate attention.
- 1.2.3 Each member of the Engineering organization is expected to take responsibility for, and be committed to, protecting the operating, design and safety margins, and defence-in-depth. The work environment, attitudes and behaviours of engineering personnel, and programs, standards, and procedures shall foster this safety culture.
- 1.2.4 Engineering personnel practice the use of engineering human performance event free tools to implement barriers to minimize the occurrence of errors. These tools include, but are not limited to the following:

- Validation of Assumptions
- Questioning Attitude
- Pre-job briefing and Post-Job debriefing
- Peer *Review* and *Verification*
- Precision in Communication and *Signature*

Details of when and how to use these tools, are described in N-GUID-01900-10000, Human Performance Event Free Tools for Knowledge Work.

- 1.2.5 Whenever questions are raised, confusion exists, or change is required, Engineering staff should seek resolution and not proceed until resolution is achieved in accordance with approved change control processes.
- 1.2.6 Part of executing Nuclear business with integrity includes being duly diligent in checking that information which is signed for is correct and holding those that prepared, *reviewed*, *verified* or *approved* the work, to the highest standard in that area. Engineering *signatures* indicate that the product meets this quality standard. All signatories of a document are held accountable for the work they performed. The following standards are applicable to the preparation, verifications and approval *signatures* of design outputs.
- (a) Design outputs shall be prepared and signed by individuals fully *qualified* to execute the task. Personnel not fully qualified may be identified as a contributor as evidence of experience.

**Note:** A contributor may provide their signature as a co-signer or note in the document (e.g. list of contributors) to indicate their contribution.

## Nuclear Program

Internal Use Only		
Document Number:	Revision:	
N-PROG-MP-0007	R012	
Usage Classification:	Sheet Number:	Page:
Information	N/A	8 of 26

Title:

### CONDUCT OF ENGINEERING

- (b) Design outputs shall be independently verified by *qualified* individuals. Individuals assigned to perform verification shall not verify their own work, or work they have directly supervised.
  - (c) Approvers should be the line managers of the preparers.
  - (d) Approvers may also perform verification subject to (b) above.
- 1.2.7 Identification and discussion of safety concerns are encouraged, rewarded, and aggressively pursued to resolution. Where warranted, early communication of potential concerns to senior management is also expected and encouraged.
- 1.2.8 Engineering actions arising from internal OPG departments or organizations external to OPG are documented, assessed, and tracked.
- 1.2.9 Adverse conditions are identified and corrective action plans are developed in accordance with N-PROC-RA-0022, Processing Station Condition Records.
- 1.2.10 Engineering staff should act in accordance with the following INPO principles of Technical Conscience taken from INPO 10-005 [B-3]:
- (a) **Engineers Identify, Communicate, and Advocate Resolution of Technical Concerns.** Engineers identify trends and emerging technical issues, communicate concerns, advise management of potential consequences, and advocate their solution of conditions that affect design requirements or operating, design, or safety margins.
  - (b) **Engineers Adhere to Sound Engineering Principles.** Engineers ensure products are of high quality when they “sign off” on the product as complete. Engineers develop technical products, recommendations, and decisions using appropriate facts, engineering practices, codes, standards, operating experience, and *review* and *verification* processes. The probabilities and consequences of negative outcomes are thoroughly evaluated, documented, and communicated.
  - (c) **Engineers Challenge Conditions and Decisions When Needed.** Engineers professionally challenge the technical bases of decisions that might compromise nuclear safety or design requirements. In decisions, engineers advocate actions to preserve and recover operating and design margins to support reliable operation. Advocacy positions are formulated based on the best available technical facts, codes, standards, and analytical techniques. For decisions that affect reliability, engineers ensure that technical considerations are given appropriate priority and that decision-makers thoroughly understand the probability and potential consequences of problems.
- 1.3 **Engineering Management and Leadership**
- 1.3.1 Engineering Vice Presidents, Directors, and Managers shall, by leadership, commitment, and example, comply with and implement standards of performance established by Engineering programs, standards, and procedures.
- 1.3.2 Engineering Vice Presidents, Directors, and Managers should practice effective communication with their staff, hold planned and periodic staff meetings, and communicate

Title:

## CONDUCT OF ENGINEERING

priorities to affected personnel. This includes clear and frequent communication to staff not to proceed in the face of uncertainty.

- 1.3.3 Engineering Directors and Managers should routinely monitor, observe, and assess engineering work activities and conditions to maintain and reinforce high standards of performance. Assessments include:
  - Effectiveness of Engineering programs, standards, and procedures
  - Human performance
  - Work management practices and resource requirement
  - Staff training and qualification requirements
  - System status and configuration control
  - Modification initiatives
  - Adherence to safety and radiological protection procedures
  - Overall equipment performance and material condition
  - Quality of services and products provided by consultants, contractors, and vendors
  - Effectiveness of execution of engineering accountabilities for maintaining the SOE and the Design Basis of the station.
- 1.3.4 Engineering work should be identified, prioritized, planned, dispositioned, performed, and documented.
- 1.3.5 Engineering personnel should use relevant Operating Experience (OPEX) while planning and performing their work in accordance with N-PROG-RA-0003, Corrective Action.
- 1.3.6 Self-assessment measures, oversight techniques, and engineering-related performance indicators should be used to compare actual engineering performance to established standards of excellence, management expectations, and promptly address negative trends and areas needing improvement in accordance with N-PROC-RA-0097, Self-Assessment and Benchmarking.
- 1.3.7 Engineering Directors at each facility should establish an Engineering Review Board. The focus of this group is unit and station risk. Details are provided in N-GUID-01900-10001, Engineering Decision Making and includes consideration of the following:
  - Significant Station Condition Records (SCRs)
  - Technical Operability Evaluations (TOEs)
  - Discovery Issue Resolution Processes (DIRPs)
  - Operational Decision Making (ODM) actions
  - Engineering Decision Making (EDM) actions.

### CONDUCT OF ENGINEERING

Also considered are the impacts of these items on facility SOE, margins, *Design Basis*, Licensing Basis and aggregate risk.

- 1.3.8 Engineering Vice Presidents, Directors, and Managers should support justified improvements in system design margins by modification, replacement, test, inspection, or by modification of technical procedures.
- 1.3.9 Engineering leaders should act in accordance with the following INPO principles of Technical Conscience taken from INPO 10-005 [B-3]:
- (a) **All leaders Respect and Reinforce the Importance of Technical Considerations in Decision-Making.** Corporate and facility leaders understand, respect, promote, and reinforce the importance of technical considerations to ensure decisions reflect the need to operate and maintain the facility in accordance with design requirements and ensure preservation of operating, design, and safety margins. Leaders understand the need to apply conservative technical considerations in matters that affect nuclear safety and ensure the appropriate balance between technical considerations and business needs in matters that affect reliability. In all cases, leaders accept the responsibility to create a safe, positive environment for the identification and resolution of technical issues as part of the decision making process.
  - (b) **Engineering Leaders Accept and Exercise Technical Authority.** Engineering leaders recognize and accept their responsibility to address technical issues. They exercise a deep sense of personal obligation to uphold the design requirements and ensure appropriate operating, design, and safety margins are maintained.
- 1.4 **Implementing Documents**
- 1.4.1 **N-INS-01100-10000, Engineering and Design Authority**
- N-INS-01100-10000, Engineering and Design Authority, provides guidance on how to exercise and delegate Engineering Authority and Design Authority accountabilities. It also provides an explanation of Engineering *advice* and guidance on how to document Engineering *direction*.
- 1.4.2 **N-STD-MP-0020, Margin Management**
- N-STD-MP-0020, Margin Management, outlines expectations for the management of operating and design margins to support safe and reliable operation.
- N-INS-03600-10001, Margin Management Implementation, provides instruction and guidance for the implementation of N-STD-MP-0020.
- 1.4.3 **N-STD-MP-0023, Technology and Research**
- N-STD-MP-0023, Technology and Research, establishes the processes for effective management of Research and Development programs for Nuclear in support of safe, reliable and competitive performance of Nuclear Facilities. This standard establishes the scope, requirements and processes that govern consistent inputs, activities and outputs of all stakeholders to form an integrated managed system.

### Title: CONDUCT OF ENGINEERING

#### 1.4.4 N-PROC-MP-0092, Technology and Research Program Management

N-PROC-MP-0092, Technology and Research Program Management, describes the life cycle and associated stakeholder activities for the development and implementation of Research and Development programs for Nuclear, starting from issue identification through program development, execution, application, close-out, and evaluation.

#### 1.5 Engineering Programs that Protect the Asset (Interfacing Documents)

##### 1.5.1 Preamble

- 1.5.1.1 This section outlines the Engineering programs that have been implemented in order to help protect the station assets.
- 1.5.1.2 Reliability is achieved by putting in place business processes that:
- Determine the condition of SSCs
  - Predict expected failure
  - React to the results in a timely manner.
- 1.5.1.3 Surveillance programs have been implemented to provide effective system performance monitoring, component and program health reporting, equipment performance trend reporting, and effective troubleshooting.
- 1.5.1.4 These processes are applied to equipment important to nuclear safety and power generation to ensure systems and equipment perform consistent with their design requirements. These programs establish requirements for predictive and preventative maintenance, inspection, test, surveillance, and monitoring necessary to ensure systems and equipment perform in accordance with their *design basis* and at levels optimum to meet needs of the business.
- 1.5.1.5 Tracking and trending of system and equipment performance, maintenance history, internal and external shared OPEX, and lessons learned from root cause analysis of critical equipment failures are used to determine any changes to design, maintenance, or operating practices necessary to achieve target reliability.

##### 1.5.2 N-PROG-MA-0026, Equipment Reliability

N-PROG-MA-0026, Equipment Reliability ensures the ongoing high levels of reliable performance of components and equipment important to nuclear safety, production, and environmental protection through the implementation of the following program elements:

- Identification of critical components
- Specifying and continuously improving maintenance strategies
- Executing predictive and preventative Maintenance
- Monitoring system and component condition and implementing plans to restore and maintain system and component health

## Nuclear Program

Internal Use Only		
Document Number:	Revision:	
N-PROG-MP-0007	R012	
Usage Classification:	Sheet Number:	Page:
Information	N/A	12 of 26

Title:

## CONDUCT OF ENGINEERING

- Initiating prompt and effective corrective action for equipment failures
- Identifying and predicting aging and obsolescence issues.

### 1.5.3 N-PROG-MA-0017, Component and Equipment Surveillance

N-PROG-MA-0017, Component and Equipment Surveillance, provides requirements for establishing component programs that manage component health. Major components such as steam generators, fuel channels, and reactor components (including feeders) are not included in this program. Requirements include:

- Inspection.
- Maintenance.
- Certification.
- Testing.
- Defining interfaces with other engineering programs that can affect component health.

### 1.5.4 N-PROG-MA-0025, Major Components

N-PROG-MA-0025, Major Components, establishes a formal and systematic process in Nuclear for managing information related to four major component areas: Feeders, Steam Generators, Fuel Channels, and Reactor Components and Structures. This program provides a framework for integrating and *reviewing* existing governance and reporting of the component performance, condition, and compliance with *design basis* documents. This hierarchy of documents, procedures, and other governance ensures the four major components perform safely and reliably over the life of the stations maintaining the design and licensing basis and the operational safety requirements while optimizing production and cost-effectiveness.

### 1.5.5 N-PROG-MA-0016, Fuel

N-PROG-MA-0016, Fuel, establishes requirements to integrate and *review* nuclear fuel related data in order to ensure fuel performs safely and reliably over the life of the stations, consistent with design and licensing bases, while optimizing station reliability, production, and cost effectiveness.

Fuel related data includes any information which may impact fuel throughout its life-cycle including (but not limited to) manufacturing, inspection, research, station operating conditions, and fuel channel interactions. Also included is fuel channel data which may impact safety analysis, or the safety report. This program does not include responsibilities for fuel channel life-cycle management and fitness for service which are covered by N-PROG-MA-0025, Major Components.

### 1.5.6 N-PROG-MP-0008, Integrated Aging Management

N-PROG-MP-0008, Integrated Aging Management, provides the following:

- (a) Timely detection and mitigation of significant aging effects in SSC important to safety, reliability, and economics.
- (b) A sound technical basis for the achievement of design life and possible life extension.

Title:

### CONDUCT OF ENGINEERING

- (c) An interface with the business planning program to optimize major refurbishment and modifications consistent with Nuclear business plans.

#### 1.5.7 N-PROG-OP-0004, Chemistry

N-PROG-OP-0004, Chemistry, specifies processes, overall requirements, and staff accountabilities to ensure effective control of chemistry, including the provision of analytical services.

#### 1.5.8 N-PROG-RA-0016, Risk and Reliability Program

N-PROG-RA-0016, Risk and Reliability Program, provides organizational accountabilities, interfaces, and key program elements to ensure that risk from nuclear accidents are identified, monitored and controlled across Nuclear and that the Risk and Reliability Program is consistent with OPG Nuclear Safety Policy and best practice in the industry. The Program consists of Safety Goals, station-specific Probabilistic Risk Assessments (PRAs), associated risk models, unavailability models of systems important to safety and software applications, and Nuclear governing documents.

#### 1.5.9 N-PROG-MP-0014, Reactor Safety Program

N-PROG-MP-0014, Reactor Safety Program, defines the following:

- (a) Organizational responsibilities and key program elements for the management of issues related to Nuclear Safety Analysis, in particular Generic Action Items, and major components of safe operation such as:
- SOE
  - Safety Analysis Basis (Safety Report and Analysis of Record)
  - Severe Accident Management.
- (b) Standard and consistent methodologies for performing safety analysis and defining the SOE are developed and managed.
- (c) Requirements for implementation of the results of safety analysis and specification of SOE by the station Reactor Safety Engineering Departments.
- (d) When the ability of a SSC to carry out its safety-related function is questioned, a TOE is performed in accordance with N-PROC-MP-0045, Technical Operability Evaluation.
- (e) When the Safety Analysis of a Nuclear station is suspected to be less than adequate, a DIRP is performed in accordance with N-PROC-RA-0094, Discovery Issue Resolution Process.

#### 1.5.10 N-PROG-MA-0013, Welding

N-PROG-MA-0013, Welding, establishes standardized welding practices to safely and efficiently make sound welds that meet structural integrity, code and licensing requirements. This program also covers welding on components not governed by codes and standards.

### Title: CONDUCT OF ENGINEERING

## 1.6 Engineering Programs that Control Design (Interfacing Documents)

This section outlines the Engineering programs that have been implemented to control station design.

Design changes are controlled to ensure the configuration is maintained in conformance with design and licensing bases. This maintains margins and ensures operation within the safe operating envelope.

### 1.6.1 N-PROG-MP-0009, Design Management

N-PROG-MP-0009, Design Management, provides the following:

- (a) Framework for the establishment, maintenance, and compliance with the *design basis* for Nuclear stations, including fidelity with the licensing basis.
- (b) Design Management provides assurance that the risk to Nuclear stations is minimized, for design and procedure changes, by preserving the *design basis*.
- (c) This program provides assurance that design and procedure changes are prepared, *reviewed, approved*, documented, and implemented in accordance with *approved* procedures, applicable regulatory requirements, standards, and industry practices.

### 1.6.2 N-PROG-MP-0005, Configuration Management

Configuration Management is an integral part of the change control processes, encompassing selected SSCs, computer software, electronic information, and documents important for safe and reliable operation.

- (a) Changes to configuration shall be controlled to maintain conformance between the *design basis*, license basis, SOE, and associated analyzed conditions.
- (b) N-PROG-MP-0005, Configuration Management, provides the framework to ensure:
  - (1) Physical configuration matches configuration documentation (documents or electronic data).
  - (2) Configuration control scope, responsibilities, authorities, and interfaces among all pertinent organizations in Nuclear are clearly defined.
  - (3) Changes are effectively managed by:
    - (i) Confirming proposed changes to any SSC, or element of configuration information conform to design and licensing bases, by specifically ensuring changes requiring regulatory *review, approval* and concurrence are identified, and if necessary, additional licensing *reviews* and safety evaluations are completed.
    - (ii) Ensuring proposed changes requiring a change to design and licensing bases receive appropriate *verification* and *approvals* before a change is made.

## Nuclear Program

Internal Use Only		
Document Number:	N-PROG-MP-0007	
Revision:	R012	
Usage Classification:	Information	Sheet Number: N/A
		Page: 15 of 26

Title:

### CONDUCT OF ENGINEERING

- (iii) Ensuring proposed changes made to any physical configuration or element of configuration information be *reviewed* for impact so related configuration information is maintained consistent with the change.
- (iv) Managing changes from one configuration baseline to another to ensure configuration information is accurate, consistent, up-to-date, and readily accessible to Nuclear users of the information.
- (v) Ensuring change processes resulting in a change from one configuration baseline to a subsequent configuration baseline, work in accordance and consistency with each other for design, procurement, construction, installation, commissioning, operating and maintenance aspects of the station, including testing activities.
- (vi) Maintaining the documented configuration equivalent to the physical configuration through N-PROG-AS-0006, Records and Document Control.

#### 1.6.3 N-PROG-MP-0004, Pressure Boundary

N-PROG-MP-0004, Pressure Boundary, provides a managed process for performing repairs, replacements, and modifications on pressure retaining systems and components, including installation of new self-contained systems, at Nuclear facilities as follows:

- (a) Ensures compliance with applicable CSA Standards and American Society of Mechanical Engineers (ASME) Codes, Nuclear Station Power Reactor Operating Licenses (PROL) and Waste Facility Operating License (WFOL).
- (b) Allows nuclear facilities to plan, perform, and verify pressure boundary fieldwork as *authorized* by N-MAN-01913.11-10000, Pressure Boundary Program Manual.

#### 1.6.4 N-PROG-MP-0006, Software

N-PROG-MP-0006, Software, identifies the processes and overall requirements for development, maintenance, modification, procurement, qualification, and retirement of both real-time computing and analytical software. Quality Assurance (QA) for scientific, engineering and analysis software is performed in accordance with CSA N286.7 **[B-3]**.

#### 1.6.5 N-PROG-MP-0011, Procurement Engineering

N-PROG-MP-0011, Procurement Engineering, establishes requirements for a managed process of creating procurement specifications for materials, systems, components and services. "Services" refers to repair or refurbishment services performed on an item in the material catalogue. The Procurement Engineering function is to specify clear and adequate procurement requirements. Procurement Engineering activities will interface with other programs within the procurement chain in order to ensure purchased items perform their intended end-use design function(s).

## Nuclear Program

		Page: 16 of 26

Title:

## CONDUCT OF ENGINEERING

### 1.6.6 N-PROG-RA-0006, Environmental Qualification

N-PROG-RA-0006, Environmental Qualification, provides auditable assurance that essential safety related equipment, required to mitigate the consequences of a *design basis* accident, can perform its intended function when exposed to harsh environmental conditions resulting from that accident. Environmental Qualification includes programmatic controls necessary to maintain the qualified status of the equipment over the life of the facilities and ensures compliance with applicable CSA N290.13-05 and Update 1, and nuclear generating station power reactor operating license.

### 1.6.7 N-PROG-MP-0001, Engineering Change Control

N-PROG-MP-0001, Engineering Change Control, establishes procedural and management controls to ensure modifications to SSCs and engineered tools are controlled to be:

- (a) Within the SOE, *design basis* and licensing conditions, and to receive the appropriate *reviews* and *approvals*.
- (b) Designed in accordance with relevant codes and standards.
- (c) Designed to meet Nuclear objectives for safe, reliable, and cost effective energy production.
- (d) Performed with a graded approach to design and changes, where the rigor is consistent with the modification's effect on nuclear, environmental, and conventional safety, equipment and production risk, and safeguards and security.
- (e) Performed with sufficient analysis to be safe for foreseeable modes of operation.

**Note:** This includes modifications made outside the controlled plant boundary (CPB) and under N-PROG-MA-0024. It ensures that possible impacts on SSC's located within the CPB are addressed.

- (f) Performed such that sufficient operating and design margins are maintained.
- (g) Adequately *reviewed* by stakeholders and *approved* by Design Authority.
- (h) Installed in accordance with *approved* design and installation requirements.
- (i) Commissioned and tested in accordance with acceptance criteria as specified in commissioning specifications.
- (j) Made available for long-term operation and maintenance in full compliance with Nuclear standards and requirements.

## Nuclear Program

Document Number:	Revision:	
N-PROG-MP-0007	R012	
Usage Classification:	Sheet Number:	Page:
Information	N/A	17 of 26

Title:
CONDUCT OF ENGINEERING

### 1.7 Engineering Programs that Provide Services (Interfacing Documents)

#### 1.7.1 N-PROG-MP-0010, Engineered Tooling Change Control

N-PROG-MP-0010, Engineered Tooling Change Control, provides *direction* for the design, and modification, of engineered tools by the stations and by Inspection and Maintenance Services (IMS) to provide safe and reliable equipment as follows:

- (a) Defines a systematic approach and changes to tool design.
- (b) Ensures tool designs and subsequent changes are *reviewed* by competent individuals and *approved* by the appropriate authority.
- (c) Ensures tools are designed, built, tested, and proven to stated requirements.

### 1.8 Engineering Program Ownership

#### 1.8.1 Program Owner Accountabilities

Program Owner accountabilities for Engineering programs are specified in N-PROG-AS-0001, Managed Systems. These include the following:

- (a) Seek involvement and input of key stakeholders.
- (b) Ensure compliance with internal and external requirements.
- (c) Lead business and strategic planning in program area.
- (d) Provide program oversight through monitoring and reporting on program.
- (e) Manage and communicate program requirements.

#### 1.8.2 Conduct of Engineering Working Group

Where deemed necessary, the Conduct of Engineering working group and other working groups are established in accordance with N-STD-AS-0026, Peer Teams and Working Groups.

### 1.9 Performance Indicators and Review

#### 1.9.1 Performance Reporting

- (a) N-PROC-RA-0023, Fleetview Program Health and Performance Reporting, documents a fleet-wide functional *review* and reporting process performed to monitor and routinely report on overall program effectiveness. The reports document the health of each program and contribute to meeting the requirements of CSA N286-05.
- (b) The reports include the following key areas:
  - Program oversight and leadership
  - Program execution performance indicators
  - Status of program initiatives

### Title: CONDUCT OF ENGINEERING

- (c) The frequency is determined by the Chief Nuclear Engineer (CNO). The results are presented to the Nuclear Executive Committee by the Program SPOC or Owner in conjunction with the peer team or working group.

#### 1.9.2 Engineering Self Assessments

- (a) Engineering self-assessment activities are planned and carried out in accordance with N-PROC-RA-0097. The objective of self-assessments is to achieve continuous improvement. Current performance is compared to management expectations, industry standards of excellence, and regulatory requirements to identify areas needing improvement. Self assessments should help identify low level issues or trends for early resolution before more significant problems occur.
- (b) A divisional self-assessment should be performed for each program every four years. Stations should perform a focused self-assessment on program implementation with schedules set with stations Working Group input.
- (c) Station Engineering should conduct an annual self assessment to confirm:
  - (1) Effectiveness of the Station Engineering Director's accountability to act as the facilities overall Engineering authority, to interpret the *design basis*, to specify SOE limits, to perform aggregate assessments of risk, and to manage degradation of design margin.
  - (2) Effectiveness of continuing training on Engineering ethics and responsibility.
  - (3) Effectiveness of implementation of Engineering *direction* and recommendations.
- (d) Nuclear management should perform a self assessment to assess the use of the title "engineer" by staff at least once every five years.

#### 1.10 Personnel and Training Qualifications

- 1.10.1 N-PROG-TR-0005, Training, describes the Training Program for regular staff, contractors, temporary personnel and other staff assigned work. The Training Program provides the structure, processes, and tools for defining developing, implementing, documenting, assessing, and improving the training.
- 1.10.2 N-PROG-TR-0005 ensures nuclear staff have the appropriate knowledge, skill, and attitudes for safe and efficient operation.
- 1.10.3 Engineering managers ensure availability of staff with required core skills through effective succession planning done in accordance with N-PROC-HR-0026, Succession Management.
- 1.10.4 Engineering managers establish qualification requirements required for work in their duty areas, link staff to the Training Information Management System, Version II (TIMS II), qualification requirements required for work in their duty areas, and maintain qualifications of Design Engineers, Registered Professional Engineers, and Draftspersons.
- 1.10.5 Staff shall use the title "engineer" or "professional engineer" (P. Eng.) only if they are licensed by Professional Engineers Ontario (PEO) in compliance with the Professional Engineers Act.

### Title: CONDUCT OF ENGINEERING

- 1.10.6 Engineering managers ensure that work is assigned to *qualified* individuals or that *qualified* individuals are assigned to work with and oversee *unqualified* contributors used during the preparation of the work. The *qualified* individuals are required to sign and take joint responsibility for the quality and accuracy of the final product. The *unqualified* contributors may co-sign or note their contribution to the final product.
- 1.10.7 Engineering managers ensure that the qualification requirements provided are specific and that they identify the need for continuing training.

## 2.0 ROLES AND ACCOUNTABILITIES

### 2.1 Chief Nuclear Engineer

- 2.1.1 Ensures Conduct of Engineering program and supporting processes are implemented and maintained across all engineering business units.
- 2.1.2 As designated Nuclear Design Authority prescribes:
- Overall requirements for the Conduct of Engineering program.
  - Scope, development, and implementation of Engineering programs.
  - Manner in which design activities are performed.
- 2.1.3 Requests audits of and monitors Nuclear Engineering activities.
- 2.1.4 Prescribes requirements and scope of station inspection and surveillance programs.
- 2.1.5 Prescribes specific actions to correct performance deficiencies.
- 2.1.6 Delegates, within specified limits and controls, station specific Engineering and Design Authority responsibilities. Delegation of Design Authority responsibilities is documented in N-INS-01100-10000.
- 2.1.7 For external organizations, providing design engineering services, ensures:
- (a) External organizations adhere to Nuclear procedures or *approved* procedures that meet the requirements of Nuclear procedures.
  - (b) Design activities are monitored and assessed.

**Note:** Any provider of outside design engineering services is considered a Design Agency, **not** a Design Authority.

### 2.2 Manager, Engineering Mechanics

- 2.2.1 Assumes Program Owner roles and accountabilities for the Conduct of Engineering program, Engineering Change Control Program, Design Management Program, Configuration Management Program and Pressure Boundary Program in accordance with N-PROG-AS-0001.

## Nuclear Program

## CONDUCT OF ENGINEERING

### 2.3 Director, Engineering Services

- 2.3.1 Ensures engineering activities are performed in accordance with written and approved policies, programs, standards, and procedures that reflect the expectations of the CNO, Chief Nuclear Engineer (CNE), and all applicable rules, regulations, codes, standards, and requirements of the station operating licences.
- 2.3.2 Executes Performance Engineering, Aging Management, Design, and Project Execution roles for all plant computers, OH180 Programmable Logic Controllers (PLCs), and station perimeter security systems.
- 2.3.3 Manages the overall Equipment Reliability (ER) program, and ensuring that adequate monitoring of the ER program is occurring at the nuclear facilities so that equipment performance remains aligned with the business goals of the OPG organization.

### 2.4 Director, Nuclear Safety

- 2.4.1 Ensures engineering activities are performed in accordance with written and approved policies, programs, standards, and procedures that reflect the expectations of the CNO, CNE, and all applicable rules, regulations, codes, standards, and requirements of the station operating licences.
- 2.4.2 Accountable for the oversight of technical support and specialized services to the stations in the area of Nuclear Safety Analysis.
- 2.4.3 Provide Nuclear Safety programmatic support to Darlington Refurbishment.

### 2.5 Vice President, Engineering Strategy

- 2.5.1 Ensures engineering activities are performed in accordance with written and approved policies, programs, standards, and procedures that reflect the expectations of the CNO, CNE, and all applicable rules, regulations, codes, standards, and requirements of the station operating licences.
- 2.5.2 Perform duties as primary Nuclear Engineering liason with the IAEA and other industry groups.
- 2.5.3 Manage Engineering Projects including Probabilistic Risk Assessment (PRA), Fukushima Response and 37M Modified Fuel for Darlington.
- 2.5.4 Provide assistance to CNE in the development and implementation of strategic initiatives in Nuclear Engineering.

### 2.6 Director, Design Engineering

- 2.6.1 Ensures assigned engineering programs and activities are performed in accordance with approved policy, programs, standards and procedures that reflect the expectations of the CNE and all applicable rules, regulations, codes, standards, and requirements of the station operating licenses.

## Nuclear Program

Title:

## CONDUCT OF ENGINEERING

- 2.6.2 Provides oversight of the Conduct of Engineering Program, Engineering Change Control Program, Design Management Program, Configuration Management Program and Pressure Boundary Program.
- 2.6.3 Assumes Program Owner roles and accountabilities for the Procurement Engineering, in accordance with N-PROG-AS-0001.
- 2.7 Vice President, Science and Technology Development**
  - 2.7.1 Ensures engineering activities are performed in accordance with written and approved policies, programs, standards, and procedures that reflect the expectations of the CNO, CNE, and all applicable rules, regulations, codes, standards, and requirements of the station operating licences.
  - 2.7.2 Maintains and regularly updates life cycle management plans for Feeders, Reactor Components, Pressure Tubes, and Steam Generators.
  - 2.7.3 Provides leadership on the content and direction of the Nuclear Research and Development program, and other technology development initiatives.
- 2.8 Director, Station Engineering**
  - 2.8.1 Ensures station engineering activities are performed in accordance with written and approved policies, programs, standards, and procedures that reflect the expectations of the CNO, CNE, and all applicable rules, regulations, codes, standards, and requirements of the station operating licences.
- 2.9 Director, Nuclear Waste Management**
  - 2.9.1 Ensures nuclear waste engineering activities are performed in accordance with written and approved policies, programs, standards, and procedures that reflect the expectations of the CNO, CNE, and all applicable rules, regulations, codes, standards, and requirements of the station operating licences.
- 2.10 Senior Manager, Plant Design**
  - 2.10.1 If required, ensures CNE is informed within 72 hours of actions taken where departure from applicable provisions or requirements are urgent in nature, in order to better assure Nuclear Safety or unit reliability.

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

**Advice** means words offered as an opinion or recommendation about future actions, or knowledge input into other's deliberations. *Advice* is informal, does not necessarily require *verification* or formal record, even though it would be a good practice to document the *advice* at an immediate opportunity to prevent misinterpretation or taking the *advice* out of context. *Advice* is literally an opinion that can be used to support decisions which may require more formal assessment and *verification*.

## Nuclear Program

Internal Use Only		
Document Number:	Revision:	
N-PROG-MP-0007	R012	
Usage Classification:	Sheet Number:	Page:
Information	N/A	22 of 26

Title:

### CONDUCT OF ENGINEERING

**Approval** ensures that the engineering product is prepared, *reviewed*, and verified by competent persons and that appropriate processes and/or procedures including codes and standards were applied as required.

**Note:** *Approval* of engineering design documentation may require a P. Eng. *signature* and seal. Such an *approval* means taking professional design responsibility for the engineering document. P. Eng. *Signature* requirements are specified in N-LIST-01300-10000, Bounded Document Set.

**Authorize** means to permit or allow the use of the engineering product by others.

**Design Basis** is the set of information that identifies the specific functions to be performed by a system, structure, or component and specific values or ranges of values chosen for controlling parameters as reference bounds for design. This includes the Safety Report and Safety Analysis.

**Direction** shows the way or provides instruction. *Direction* is formal, always in writing, and requires *verification* by an independent *qualified* person. *Direction* can be prescribed, such as in a work plan or a QA record, on letterhead or in a less formal manner such as Plan of the Day (POD) update through an e-mail provided the message identifies the persons who verified and approved the *direction*. *Direction* unless approved or *authorized* by the appropriate authority on the actual document, should always be prefixed by a phrase “This *direction* does not signify *approval* for execution which requires the *approval* from appropriate design and/or operating authority”.

**Review** is the act of providing expert input and/or feedback to a specific area of an engineering product to determine whether its content generally conforms to the design requirements.

The technical expert providing the *review* has to ensure feedback is provided to the preparer on the quality of the engineering product, and is accountable for reasonable duty of care in doing the *review* and providing the feedback. The extent of rigor applied varies depending on the context and is normally specified in the related process. The person performing the *verification* should sign as a reviewer if *review* is the only *verification* activity that occurs.

**Qualified** means being linked to and having completed the required TIMS II qualifications for the required task and being deemed competent, and experienced to perform the task independently by the manager or supervisor assigning the task.

**Signature** is a pen or electronic name or mark applied to a document or record uniquely identifying the individual having applied the name or mark.

**Verification** is the act of an individual *qualified* in the subject matter, *reviewing*, inspecting, testing, checking, or otherwise determining and documenting through evaluation of objective evidence whether the product conforms to specified requirements, including examining for the correctness of the engineering product being verified.

*Verification* activities shall be planned. Specific procedures or a *verification* plan may mandate specific *verification* activities; otherwise, select the set of *verification* activities to ensure *verification* scope and extent of rigour applied is appropriate for the context, use,

W-PROG-WM-0001, Nuclear Waste Management Program

## 5.0 REVISION SUMMARY

This is an Intent revision.

- **COMPLIANCE DATE:** Compliance date for nuclear waste engineering functions deferred until 2012-DEC-31 to accommodate transition from NWMD governance (DCR 118099).
- **PURPOSE:** Updated text to include nuclear waste management facilities (DCR 118099).
- **FIGURE 1:** Removed box labelled “N-PROG-MA-0018, Non-Destructive Examination” (DCR 116161).
- Removed box labelled “N-INS-03600-10001, Margin management Implementation” per discussion with Gov Docs.
- Added box labelled “N-STD-MP-0023, Technology and Research” (DCR 116831).
- Added box labelled “N-PROC-MP-0092, Technology and Research Program Management” (DCR 116831).
- Removed box labelled “N-PROC-MP-0012, Technology and Research” (DCR 116831).
- Removed box labelled “N-PROG-MP-0013, Field Engineering”.
- SECTION 1.2.6: Added wording specifying standard requirements for preparers, verifiers, and approvers.
- **SECTION 1.3.6:** Updated title of N-PROC-RA-0097.
- **SECTION 1.4.3:** Added section regarding N-STD-MP-0023, Technology and Research (DCR 116831).
- **SECTION 1.4.4:** Added section regarding N-PROC-MP-0092, Technology and Research Program Management (DCR 116831).
- **SECTION 1.5.7:** Removed this section regarding Non-Destructive Examination (DCR 116161).
- **SECTION 1.5.9:** Removed this section regarding N-PROC-MP-0012, Technology and Research (DCR 116831).
- **SECTION 1.6.3:** Added reference to Waste Facility Operating License.
- **SECTION 1.6.4:** Replaced the word “technical” with “analytical” (DCR 113845).

## Nuclear Program

Title:

### CONDUCT OF ENGINEERING

- **SECTION 1.6.8:** Removed this section regarding N-PROG-MP-0013, Field Engineering.
- **SECTION 1.8.2:** Text revised to replace Conduct of Engineering Peer Team with Working Group (DCR 117690).
- **SECTION 1.10.3:** Updated title of N-PROC-HR-0026
- **SECTION 1.10.4:** Specified manager's responsibilities for staff qualification.
- **SECTION 1.10.6:** Managers accountability for assigning work to qualified staff clarified.
- **SECTION 2.0:** Removed roles and accountabilities associated with Engineering and Design Authority. These roles and accountabilities are provided in N-INS-01100-10000 (DCR 116917).
- Updated roles and accountabilities to include Manager, Engineering Mechanics for ownership of Conduct of Engineering program. .
- Revised roles and accountabilities in accordance with Business Transformation (DCR 117689)
- **SECTION 3.1:** The definition of "*DIRECTION*" has been updated (DCR 115757). Added definition of Qualified.
- **SECTION 3.2:** Added CNO and WFOL to list of acronyms.
- **SECTION 4.2.1:** Removed N-PROG-MA-0018, Non-Destructive Examination (DCR 116161).
- Updated title of N-PROC-HR-0026 and N-PROC-RA-0097.
- Added N-PROC-MP-0092, Technology and Research Program Management. (DCR 116831).
- Removed N-PROG-MP-0012, Technology and Research (DCR 116831).
- Added N-STD-MP-0023, Technology and Research (DCR 116831).
- **SECTION 4.2.2:** Added W-PROG-WM-0001, Nuclear Waste Management Program.

COMPLIANCE DATE: Immediate

### PURPOSE

This instruction is intended for use by the Nuclear organization in administering contracts in the Oncore Contractor Management system. The users of this instruction include contractors, Nuclear Finance, Contract Owners (COs), Contract Administrators (CAs), and Cost & Schedule Analysts (CSAs) for the purposes of administering contracts within the Oncore system. Compliance to this instruction is mandatory for administering contracts for select vendors who are setup to use the Oncore Contractor Management System.

### EXCEPTIONS

None

Title:

### CONTRACT ADMINISTRATION IN ONCORE

## 1.0 DIRECTION

### 1.1 Introduction

This instruction documents the processes to administer contracts using the Oncore Contractor Resource Management System. The instruction provides direction on all activities that need to be performed from contract initiation through contract closeout as it relates to Contract Administration in the Oncore system. The instruction clearly identifies the roles and responsibilities of the parties involved in administration of contracts within Oncore.

Oncore helps project and cost control managers keep track of contractor costs such as labour and non-labour expenses such as equipment rentals and provides them with information to assess the performance of the contractor.

Once a contractor is setup in Oncore, all contracts/Purchase Orders (POs) issued to that contractor shall be setup and tracked in Oncore.

The processes identified in this instruction are supported by N-GUID-00150-10000, Contractor Management Guide as well as Oncore desktop user guides and the Oncore User Manual.

#### 1.1.1 Responsibility, Accountability, Consult, Information Chart

Each section of this instruction contains a Responsibility, Accountability, Consult, Information (RACI) chart indicating which role:

- Is responsible and accountable for the process
- May be consulted to support execution of the process
- Needs to be informed of decisions or outcomes of the process.

The following legend applies to these charts:

**Responsible:** Executes the process on behalf of the person accountable.

**Accountable:** Is accountable for the performance and/or completion of the process.

**Consulted:** Provide input in the form of review/advice, as required, to support the process.

**Informed:** Informed of decisions or outcomes of the process.

### 1.2 Contractor Setup

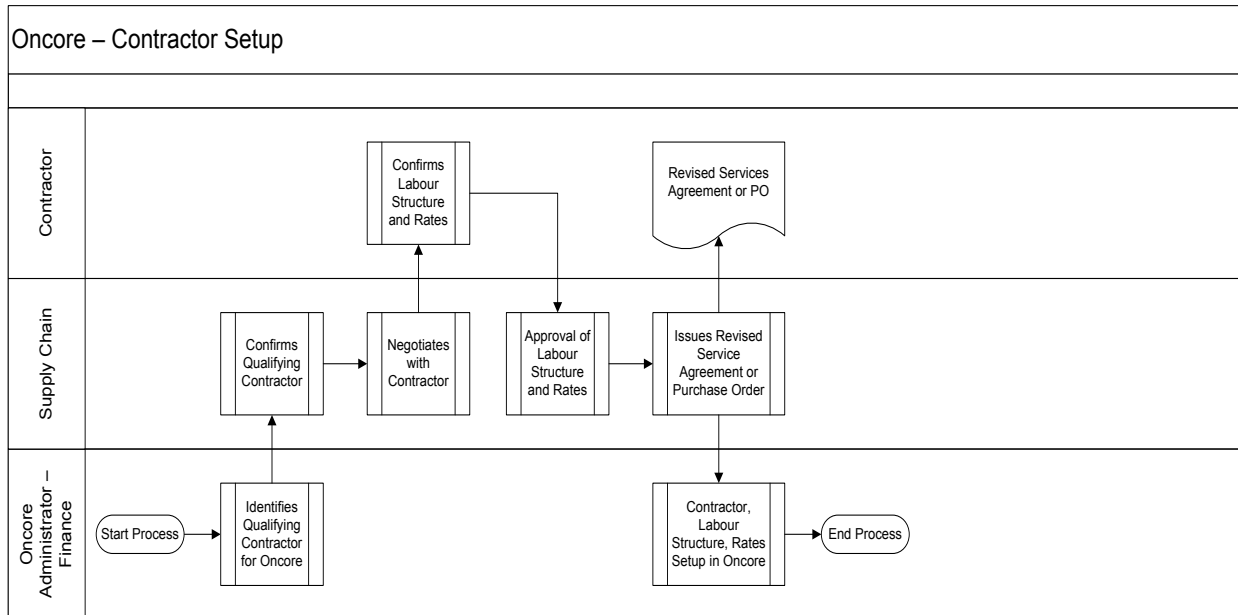

The purpose of this section is to establish the rules and processes to qualify and setup a contractor in Oncore with appropriate labour structures and rates.

Title:

### CONTRACT ADMINISTRATION IN ONCORE

#### 1.2.3 Qualifying a Contractor to be Setup in Oncore

- (a) In order to be setup in Oncore, a contractor shall meet **all** of the following requirements:
- (1) Perform services for Nuclear, have sufficient volume (sum total of all invoices is > \$500k per year) and performing work for Ontario Power Generation (OPG) continually throughout the year to warrant the use of Oncore. Services may include, but are not limited to, Design Agency services and Building Trades Union (BTU) trade services (Managed tasks and/or Augmented Staff Services). Services may be billable as fixed price (milestone or progress based), target price, time and material, or cost plus.
  - (2) Billings are in Canadian dollars.
  - (3) On OPG's approved suppliers list.
  - (4) Billing rates are agreed upon in advance of work performance and are generally applied annually by organization or site through the issuance of a contract or other agreement.
- (b) Once a vendor is identified, the Oncore Administrator – Finance, and Supply Chain, shall ensure the vendor meets the above qualifications prior to negotiating with the contractor to be setup in Oncore.
- (c) Only Supply Chain may negotiate with the contractor on behalf of OPG.
- (d) The Oncore Administrator – Finance shall obtain all required information from Supply Chain and the contractor representative and setup the contractor as an organization in Oncore.
- (e) Once a contractor is setup in Oncore, all work awarded to that contractor after the setup date shall be processed through Oncore.

#### 1.2.4 Contractor Rate Management

- (a) Contracts or agreements, e.g., a MSA or an ESA, are established between OPG and contractors.
- (b) A required component of these contracts is a billing rate schedule for labour and occasionally non-labour expenses such as equipment rentals. These schedules are used to establish the labour structure and rates that the contractor shall use when billing OPG within Oncore. Billing rate schedules normally include:
- A resource level, e.g., Pipefitter Apprentice 3
  - An effective period (start and end date)
  - Shift (days, afternoons, and nights)
  - Time type (straight time, overtime, double-time).

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (c) Rates shall require periodic adjustments due to negotiated union agreements, regulatory burden changes, or annual review of rates as prescribed in the contract. When this occurs, the contractor shall forward an electronic rate table to Supply Chain.
- (d) Supply Chain shall review and negotiate rates/rate changes with the contractor and upon approval, shall update the contract with the new rate tables, and notify the Oncore Administrator – Finance.
- (e) All MSA rates shall be approved by the Manager of Contract Management - Supply Chain prior to loading into Oncore. All IM&CS vendor rates shall be approved by the IM&CS Supply Chain Manager prior to loading in to Oncore.
- (f) When possible, rate changes shall be approved by Supply Chain one month prior to the effective date of new rates so Oncore may be updated in advance to ensure that correct rates are used for contractor payments and to avoid retroactive rate changes.
- (g) Written notification (email or memorandum) of approval from Supply Chain to the Oncore Administrator – Finance shall initiate the rate setup or change process in Oncore.
- (h) The Oncore Administrator – Finance shall update the labour structure and rates in Oncore manually or by using the Oncore bulk data import utility.
- (i) Oncore Section Manager reviews and approves the rate tables.
- (j) The Oncore Administrator – Finance is accountable for setting up the correct rate tables in Oncore based on the approved rate schedules provided by Supply Chain.
- (k) Oncore shall determine the appropriate rate based on data input by the timesheet entry staff (e.g., contractor occupation, shift, time type, project and PO).
- (l) Retroactive rate changes may be required if the effective date of a new rate is in the past. The Oncore Administrator – Finance shall update the rates in Oncore.
- (m) The Oncore Administrator – Finance shall run the retroactive rate process. This process shall reverse transactions on timesheets where the rates have changed and repost with the new rates. Approved timesheets do not need to be re-approved due to rate changes.

### 1.3 Contractor Resource Setup

- (a) All Contractor resources shall first be setup in TEMPUS by TEMPUS staff.
- (b) These resources shall automatically be setup in Oncore on a nightly basis.
- (c) The vendor shall complete the OPG-Nuclear Request for Employee Number for Non-Nuclear Employees form.

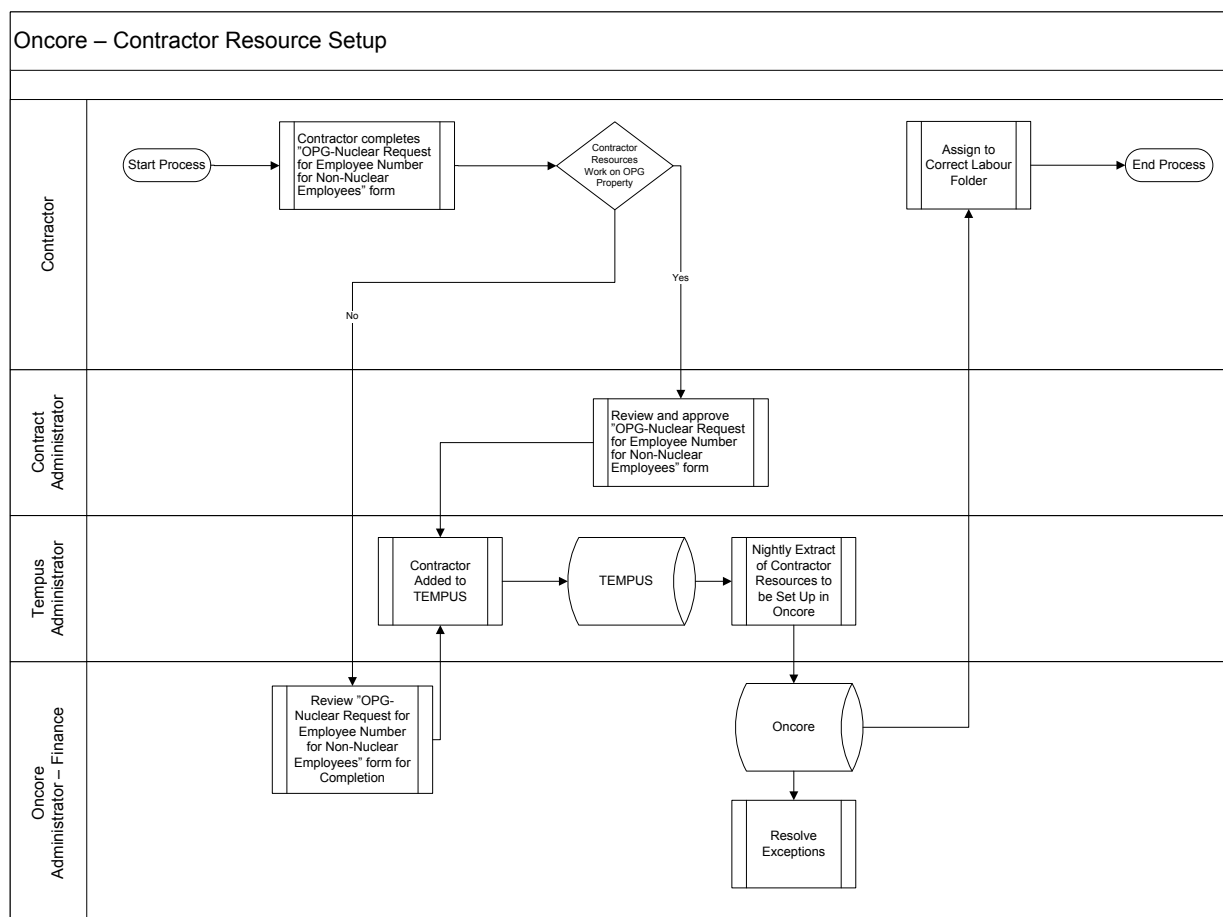

## Nuclear Instruction

Title:	<b>CONTRACT ADMINISTRATION IN ONCORE</b>
--------	--

- (d) If a contractor resource is going to work on OPG property, the vendor shall forward the completed form to the Contract Administrator for approval. The Contractor Administrator shall review and approve the form and send to Tempus for processing.
- (e) If a contractor resource is not going to work on OPG property, the vendor shall forward the completed form to Oncore Administration for review and processing.

Contractor Resources are setup in Oncore in the Unassigned folder, Exceptions resolved	Oncore System (Integration)	Oncore Administrator – Finance	Contractor	CA
Contractors are moved to the appropriate labour folder	Contractor Time Entry Staff	Contractor	Contract Management Office	Contract Management Office

### 1.3.3 Initiating Contractor Resource Setup

- In order to include a contractor resource on a timesheet for billing purposes, the contractor resource shall be setup in Oncore.
- The contractor resource shall first be setup in Tempus and assigned an OPG employee number.
- Prior to the work start date, the contractor shall complete the OPG-Nuclear Request for Employee Number for Non-Nuclear Employees Form for all resources that shall perform the scope of work as documented in the contract.
- If the contractor will be working on OPG property, the completed form shall be sent to the CA for review and approval. The CA confirms that the contractor resource(s) are required to complete the scope of work. Upon approval, the CA shall forward the form to the TEMPUS Administrator for setup in TEMPUS.

Title:

### CONTRACT ADMINISTRATION IN ONCORE

If the contractor will not be working on OPG property, the completed form shall be sent to the Oncore Administrator – Finance for review. After review, the Oncore Administrator – Finance shall forward the form to the TEMPUS Administrator for setup in TEMPUS.

- (e) Contractor resources added in TEMPUS shall automatically be setup in the Contractor's Unassigned labour folder, within Oncore, each night.
- (f) All contractor resources shall be setup in Oncore prior to the commencement of work.

#### 1.3.4 TEMPUS to Oncore Interface

- (a) Contractor resources are added to the Unassigned folder in Oncore by a nightly interface between TEMPUS and Oncore.
- (b) The nightly TEMPUS to Oncore electronic interface shall perform the following activities:
  - (1) Add new contractor resources to the Unassigned folder of a specific contractor organization.
  - (2) Deactivate contractor resources that are no longer active in TEMPUS and move deactivated contractor resources to the Terminated Labour folder.
  - (3) Move contractor resources from one contractor organization to another based on a change in reporting relationship within TEMPUS.
- (c) The Oncore Administrator – Finance shall review daily transaction logs and review and resolve any exceptions.

#### 1.3.5 Contractor Resource Labour Folder Assignment

- (a) Contractor resources are added to the contractor's unassigned folder in Oncore each night.
- (b) The contractor time entry staff moves the contractor resource to the appropriate labour folder, based on the labour hierarchy in Oncore (e.g., Pipefitter – Journeyman: PF-J). This determines the applicable billing rates for the resource.
- (c) The contractor time entry staff may record their employee's contractor employee number. This helps facilitate reporting for the contractor.

#### 1.3.6 Contractor Resource Termination/Deactivation

- (a) When a contractor resource is no longer working at OPG, they shall be terminated in TEMPUS and deactivated in Oncore.
- (b) Upon contract completion and/or contractor resource termination, the CA shall provide the TEMPUS Administrator, via email, a listing of contractor resources to be terminated in TEMPUS which results in deactivation in Oncore seven days after the termination date in Tempus. This seven day allowance provides the Contractor Time Entry Staff

## Nuclear Instruction

time to enter all timesheets and charges into Oncore for those resources after work has been completed.

### 1.4 Job Setup in Oncore

A job in Oncore is a group of work events or activities that the contractor shall charge time, non-labour expenses, or progress payments against. Each Oncore job shall relate to a single PO, PO Release. Work events or activities shall also relate to a PO Line Number.

A job shall be setup in Oncore before a contractor is able to create a timesheet and bill OPG. A job shall not be setup in Oncore until an approved PO has been issued by Procurement in Supply Chain.

#### 1.4.1 Process Overview

**Figure 3 – Job Setup**

<b>CONTRACT ADMINISTRATION IN ONCORE</b>

### 1.4.2 Accountabilities

**Table 3 – Job Setup RACI Chart**

Task	Responsible	Accountable	Consulted	Informed
Request for Services (N-FORM-10029, Services – Request for Purchasing) Issued; the CO identifies the contract scope (direct work) on the “Quotation” tab of the Oncore Job Setup Form and sends it to Supply Chain	CO or delegate	CO	CA	Supply Chain (Purchasing Agent)
Request for Proposal (RFP) Issued; Include the Oncore Job Setup Form that Identifies Scope	Supply Chain (Purchasing Agent)	Supply Chain (Purchasing Agent)	CO CA	Contractor
Oncore Job Setup Form (with Quote) included as part of Bid Response	Contractor	Contractor	CO Supply Chain CA	Supply Chain
Bids Evaluated and Contractor Selected	CO, CA, Supply Chain	CO	Contractor Finance	N/A
PO Issued	Supply Chain (Purchasing Agent)	Supply Chain (Purchasing Agent)	CO, CA	Contractor
Oncore Job Setup Form Completed	CO or delegate	CO	CA, Contractor, Supply Chain	Oncore Administrator – Finance
Job Setup in Oncore	Oncore Administrator – Finance	Oncore Administrator – Finance	CA, CO or delegate, Contractor, Supply Chain	Contractor, CO, CA

For projects, the CO delegate is normally the Project CSA. However, some organizations do not have a CSA and thus the job setup package is prepared by the CO themselves, or by maintenance support for outages, and/or by finance.

It is the CO's accountability to ensure that the job setup package is completed and sent to the Oncore Administrator – Finance prior to the contractor starting work.

### 1.4.3 Purchase Order Requirements

- The Oncore Job Setup package shall reference an approved PO + Release (if applicable) and each work event or activity shall have a PO line number.
- Jobs shall not be setup in Oncore without an approved and valid PO.
- No contractor or consultant may commence work without a valid PO number or the authority of the Vice President, Nuclear Supply Chain or his/her delegate.

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (d) All non-compliance with this requirement shall be tracked and reported to senior management (OPG-PROC-0058, Procurement Activities).

#### 1.4.4 Oncore Job Setup Form

- (a) The CO is accountable for completing the Oncore Job Setup Form in order to have all new jobs setup in Oncore. The CO may delegate the responsibility for completing the Oncore Job Setup Form to others, e.g., the CSA. The Oncore Job Setup Form is available on the Oncore website – see Section 1.12 for Oncore website information.
- (b) The CO shall initiate the Oncore Job Setup Form by completing the OPG Job Information Section and identifying the contract scope (direct work) on the “Quotation” tab.
- (c) In the Quote Detail Section, the CO shall identify how the work shall be tracked, either by PASSPORT WO, by PASSPORT Work Order (WO)-Task, or by Work Activity (if PASSPORT WO-Task not available).
- (d) The information provided on the Oncore Job Setup Form shall be used to setup the job in Oncore in order to manage contractor performance.
- (e) The CO shall send N-FORM-10029 and the electronic version of the Oncore Job Setup Form to Supply Chain.
- (f) The Oncore Job Setup Form shall be issued as part of the RFP.
- (g) The bidding contractor is required to complete the “Quotation” tab within the Oncore Job Setup Form by completing the following:
- Provide an estimate for the scope (i.e., the direct work) that has been identified
  - Select the indirects which are applicable to the job by providing their appropriate estimates.
- (h) Once the contract is awarded, the CO shall review the information on the “Quotation” tab that has been provided by the bidding contractor.
- (i) Once the CO deems the information is acceptable, they shall complete the following:
- PO number
  - Approvers
  - Accounting information
  - Contract Type
  - Holdback, if any
  - Rate table information.
- (j) Upon thorough completion of the Oncore Job Setup Package, the CO shall send it to the Oncore Admin - Finance mailbox (oncore@opg.com) for setup at least ten (10) days prior to the start of work, providing sufficient time for the job to be setup.

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (k) For indirect charges, e.g., supervision and training, the standard indirect list on the Oncore Job Setup form shall be used to ensure consistency in cost measurement between jobs enabling comparability.
- (l) All mandatory fields on the Oncore Job Setup Form shall be completed in order to set the job up in Oncore, including:
  - Contract Type
  - The scope and description of work activities including the PASSPORT description for WO tasks
  - Estimated hours and cost
  - PO number + release + line, project number
  - Accounting information
  - Identification of the CA and CO, and
  - Contractor name
  - Rate table.
- (m) It is highly recommended that the CO assign Alternate Approvers at each approval step when initially setting up the job. This allows for timely approvals when the CA/CO is unavailable.
- (n) Alternately, this can be done immediately prior to a planned absence by emailing the required information to the Oncore Admin – Finance mailbox (oncore@opg.com).
- (o) If there is an unplanned absence, please contact the Oncore Administrator – Finance for assistance.
- (p) The Oncore Administrator – Finance shall review the Oncore Job Setup Form for completeness and return it to the initiator if not complete.
- (q) The Oncore Administrator – Finance shall set the job up in Oncore on a first-come, first-serve basis – this may take up to ten (10) days from the receipt of a completed Oncore Job Setup Form.
- (r) The same turnaround time applies for revisions to existing Oncore jobs.
- (s) The Oncore Job Setup Form is to be used for ORIGINAL setup of a job in Oncore based on a PO being issued with a contractor quote. Additionally, the Oncore Job Setup Form shall be used to document revisions to existing scope and/or to setup NEW scope.
- (t) The CO remains accountable for submitting the revised Oncore Job Setup Form.

### CONTRACT ADMINISTRATION IN ONCORE

#### 1.4.5 Job Setup in Oncore

- (a) The basis for a job setup in Oncore is the completed Oncore Job Setup Form.
- (b) The general hierarchy for setting up jobs in Oncore is as follows:  
Division → Site → Project Number → PO-Release-Line → Work Event or Activity
- (c) Work events or activities, and/or progress milestones are contained within the PO-Release-Line folder within a Project, referred to as a “job”. This provides the ability to link timesheets, which are charged at the work event or activity level to a PO-Release-Line for billing rate application and payment purposes.
- (d) Once the job is setup in Oncore, the Oncore Administrator – Finance shall advise the contractor, CA, CO, and CSA when the work events or activities are available so timesheets may be entered.
- (e) The Oncore Administrator – Finance shall verify that all Step 3 approvers have Stratum III authority level in accordance with the Organizational Authority Register (OAR) prior to assigning them as the Step 3 Approver of a job in Oncore.

#### 1.5 Timesheet Entry

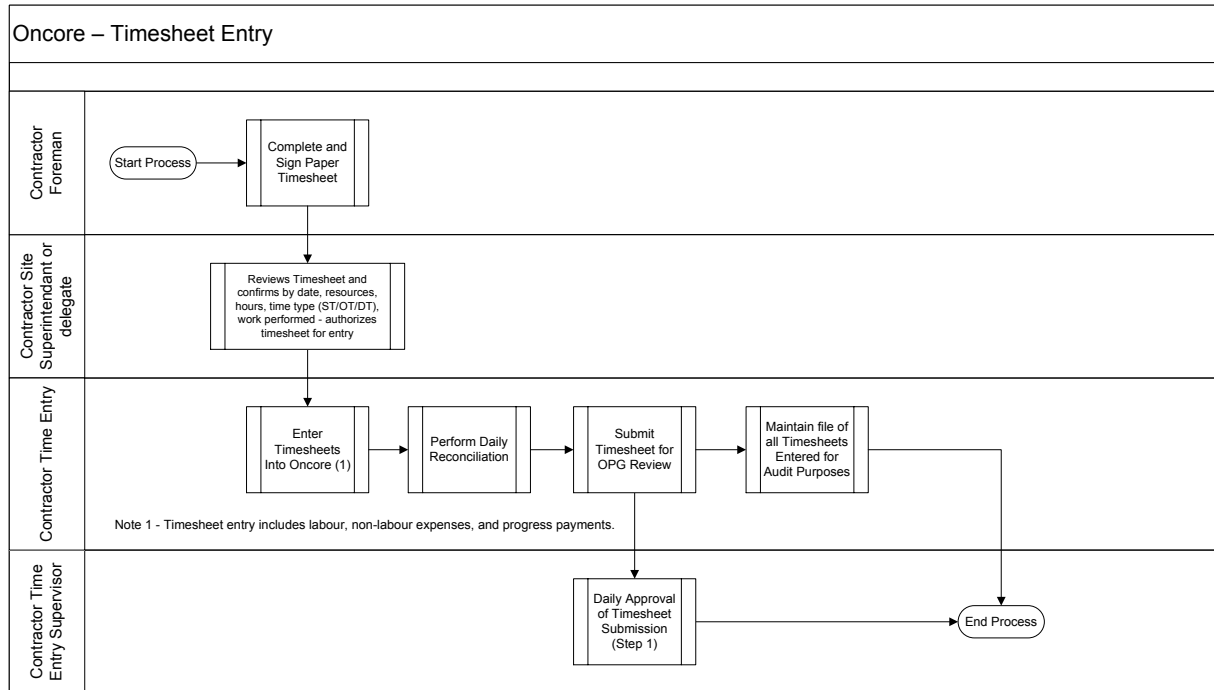

- (a) A timesheet is the document used in Oncore to record labour and non-labour expenditures, or milestone achievements in order to process progress payments.
- (b) Timesheets shall be entered by contractor time entry staff once jobs are setup in Oncore. This process also identifies the requirements for reconciliation of timesheets collected in the field and the entry into Oncore.

Task	Responsible	Accountable	Consulted	Informed
Paper timesheets completed	Contractor Foreman	Contractor	CA	Contractor Site Superintendent or Delegate
Timesheets reviewed by date with respect to resources, hours, time type, and work performed and authorized for entry	Contractor Site Superintendent, or Delegate	Contractor	CA	Contractor Time Entry Staff
Timesheets Entered into Oncore	Contractor Time Entry Staff	Contractor	CA	Contractor Time Entry Staff Supervisor
Timesheets reconciled with Oncore report	Contractor Time Entry Staff	Contractor	Contractor Foreman, Contractor Site Superintendent	Contractor Time Entry Staff Supervisor
Timesheets filed and maintained by Contractor in case of review by OPG and/or Audit	Contractor Time Entry Staff	Contractor	N/A	N/A
Timesheets submitted (Step 1 Approval)	Contractor Time Entry Supervisor	Contractor	Contractor Time Entry Staff	CA

### 1.5.3 Timesheet Entry Process

- (a) Contractor foreman shall complete paper timesheets.
- (b) Contractor Site superintendent or delegate shall review and authorize that the timesheet accurately:
  - Reflects the work that was performed
  - By whom
  - Exceptions incurred, i.e. delays
  - Hours worked
  - Time type (i.e., straight time (ST), overtime (OT), double time (DT), etc.).
- (c) Contractor Site superintendent or delegate forwards authorized paper timesheets to the contractor time entry staff for input.
- (d) Contractor time entry staff:

### CONTRACT ADMINISTRATION IN ONCORE

- Input the time and material timesheets into Oncore on a daily basis.
  - Escalate issues preventing entry (e.g., job not setup in Oncore, WO-Task not setup in Oncore) to the CA for resolution.
  - Additional timesheets are entered into Oncore for non-labour expenses and/or for milestones met/progress payments due.
  - Timesheets for non construction work, i.e., engineering design work, may be entered weekly where daily entry is not reasonable. This shall be approved by the CO in advance.
  - Perform a daily reconciliation of timesheets with time entered into Oncore.
  - Print a report from Oncore and ensure reconciliation in terms of hours charged by project, date, activity (correct WO-Task #), time type (ST, OT, DT) and resource (correct Trade/Class).
  - Standard reports have been developed in Oncore to support this reconciliation; e.g., Daily Timesheet Detail by Contractor.
- (e) Contractor time entry supervisor shall approve the reconciliation prior to submitting the timesheet in Oncore (Step 1 Approval) attesting that all hours entered into Oncore for the period are supported by authorized (contractor foreman and contractor site superintendent or delegate) paper timesheets.
- (f) The authorized paper timesheets and the Oncore report shall be filed for a period of seven (7) years and provided to OPG upon request.
- (g) If a timesheet is not entered within 15 days of when the work was performed, the contractor, prior to entry, shall inform the CA. Rationale for late entry shall be documented in the comments field on the timesheet. This rule also applies to resubmitting rejected timesheets.
- (h) Under normal circumstances, any timesheet entered after 30 days of when the work was performed, shall be rejected.
- (i) Exceptional situations shall be pre-approved by the CA and CO for work being entered 30 or more days late.

#### 1.5.4 Recording Delays

- (a) Delays may be incurred while executing work. A delay is only billable to OPG when not caused or created by an action or inaction of the contractor or its subcontractors.
- (b) If a delay is incurred, the contractor shall take appropriate actions to ensure quick resolution and to minimize unproductive charges.

## Nuclear Instruction

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (c) The CA shall be notified within 30 minutes of a delay occurring in the field, whether billable or non-billable) so they can help facilitate resolution of the delay situation.
- (d) A Station Condition Record (SCR) is to be filed and referenced on any documentation and Oncore timesheets.
- (e) All billable delays in excess of 30 minutes shall be specified by the contractor on the Oncore timesheet by using the appropriate delay billing code.
- (f) The reason for the delay, SCR# and actions taken to minimize the delay shall be recorded in the comments section of the timesheet.
- (g) The duration of delays is captured in Oncore for tracking purposes and may lead to a change in the following:
  - Progress Schedule
  - Contract Schedule
  - Contract Price
- (h) All delays shall be noted on the contractor paper timesheet for auditability of time entered into Oncore.

#### 1.5.5 Recording Rework

- (a) Contractor rework may be required due to quality of performance, failed quality inspection test, changes in engineering requirements or other.
- (b) Rework shall be reviewed and approved by the CA and CO in advance.
- (c) This review shall also determine what portion of the rework, if any, is non-billable to OPG, consistent with the terms and conditions of the Contract Agreement.
- (d) All rework hours and costs, whether billable or not-billable shall be recorded in Oncore using the appropriate rework billing code.
- (e) Non-billable rework shall be coded as such using the Non-Billable time type code.
- (f) The reason for the rework and actions taken to minimize rework costs shall be recorded in the comments section of the timesheet.
- (g) The duration of rework is captured in Oncore for tracking purposes and may lead to a change in:
  - Progress Schedule
  - Contract Schedule
  - Contract Price
- (h) All rework shall also be noted on the contractor paper timesheet for auditability of time entered into Oncore.

### CONTRACT ADMINISTRATION IN ONCORE

#### 1.5.6 Contractor Employee Step-Ups or Step-Downs

- (a) The contractor may be required to temporarily step-up/step-down an employee to a different pay classification. Step-ups shall be approved by the CA prior to occurrence.
- (b) All step-ups/step-downs shall be noted on the contractor paper timesheet for auditability of time entered into Oncore.
- (c) All step-ups/step-downs shall be recorded in Oncore on the electronic timesheet in order to ensure correct billing amounts.
- (d) This is done in Oncore by “dragging & dropping” a different class onto the timesheet.
- (e) It is permitted to have more than one class on the timesheet simultaneously, for example, an employee who is journeyman for part of the day and a foreman for part of the day.
- (f) Notations (see Section 1.5.9) shall be added on the electronic timesheet as to the nature of the step-up and reference the pre-approval by the CA.

#### 1.5.7 Recording Non-Labour Charges Such as EPSCA Allowances

- (a) The following non-labour expenses shall be entered into Oncore once these charges are incurred and supporting documentation is available:
  - Materials
  - Rentals
  - EPSCA allowances
  - Sub-contractor billings.
- (b) Contractor time entry staff shall attach a .PDF copy of all supporting documentation to timesheet for the CA to review. Attachments are available for all approvers to review during the approvals process.
- (c) The comments field on the timesheet for these charges shall be utilized to clearly indicate the nature of the charge.
- (d) All billings shall be consistent with the terms of the contract/PO.
- (e) Where possible, all employee-related charges, i.e., EPSCA allowances, shall be entered against the contractor resource that has incurred the expense.

#### 1.5.8 Rejected Timesheets

- (a) The CA or CO shall reject transactions on Oncore timesheets if they are not acceptable or appropriate based on their review.
- (b) Comments shall be added to the timesheet detailing the reason for the rejection. This allows the contractor time entry staff to follow up accordingly and resolve the issue.

## Nuclear Instruction

Internal Use Only

Usage Classification:	Sheet Number:	Page:
Information	N/A	21 of 41

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (c) Timesheets shall not be rejected merely for a clarification of timesheet entry; dialogue with the contractor shall be the first course of action when clarification on the timesheet entries is required.
- (d) Rejected timesheets are routed back to the contractor time entry staff for revision.
- (e) The contractor time entry staff shall review the rejected timesheet and resolve the issue as quickly as possible to ensure that rejected transactions are processed and resubmitted to OPG on a timely basis.

#### 1.5.9 Adding Comments to a Timesheet

Oncore allows users to add comments to events to let them better track the exact information contained in an event. For example, if the duration of a work activity was increased resulting in a contractor being required to work beyond the normal shift duration or a contractor employee was stepped up, information shall be captured in a comment.

A comment is represented by a red triangle in the upper left corner of the cell. Comments are identified by user name, so that you can tell who entered each comment. Multiple comments are listed in chronological order (from most recent to the least recent).

Comments may be added to a timesheet at any time; however, the use of comments is mandatory for the following situations:

##### (a) Contractor Employee Step-ups

If a contractor employee is stepped up for a period of time, this shall be noted on the timesheet. Information required includes reason for step-up and statement of pre-approval.

##### (b) Timesheet Adjustments

If a timesheet is adjusted after it is submitted and approved, the nature of the adjustment shall be documented on the timesheet. This provides the CAs and COs with an explanation as to why they are required to approve a timesheet a second time.

##### (c) Timesheet Rejections

If a timesheet approver rejects a timesheet, they are required to provide comments on the timesheet detailing the reason why the timesheet has been rejected. This allows the contractor time entry staff to follow up accordingly and resolve the issue.

##### (d) Delay & Rework Codes

The contractor is required to provide comments noting the specific details associated with delay and rework costs recorded on the timesheet.

### Title: CONTRACT ADMINISTRATION IN ONCORE

#### (e) Non-Labour Charges

- (1) The contractor is required to provide comments for all non-labour charges including progress/milestone billings.
- (2) The comments shall clearly indicate the nature of the charge.
- (3) Any third-party invoice numbers (i.e., subcontractor invoice) shall be documented in the reference field on the timesheet.

#### (f) SCR

The use of the SCR process is often required to record certain events. If an SCR has been filed and relates to timesheet entries, it shall be recorded in the reference field on the timesheet.

## 1.6 Timesheet Approvals and Rejections

This section outlines the accountabilities for those involved in the timesheet approval or rejection process within Oncore.

### 1.6.1 Process Overview

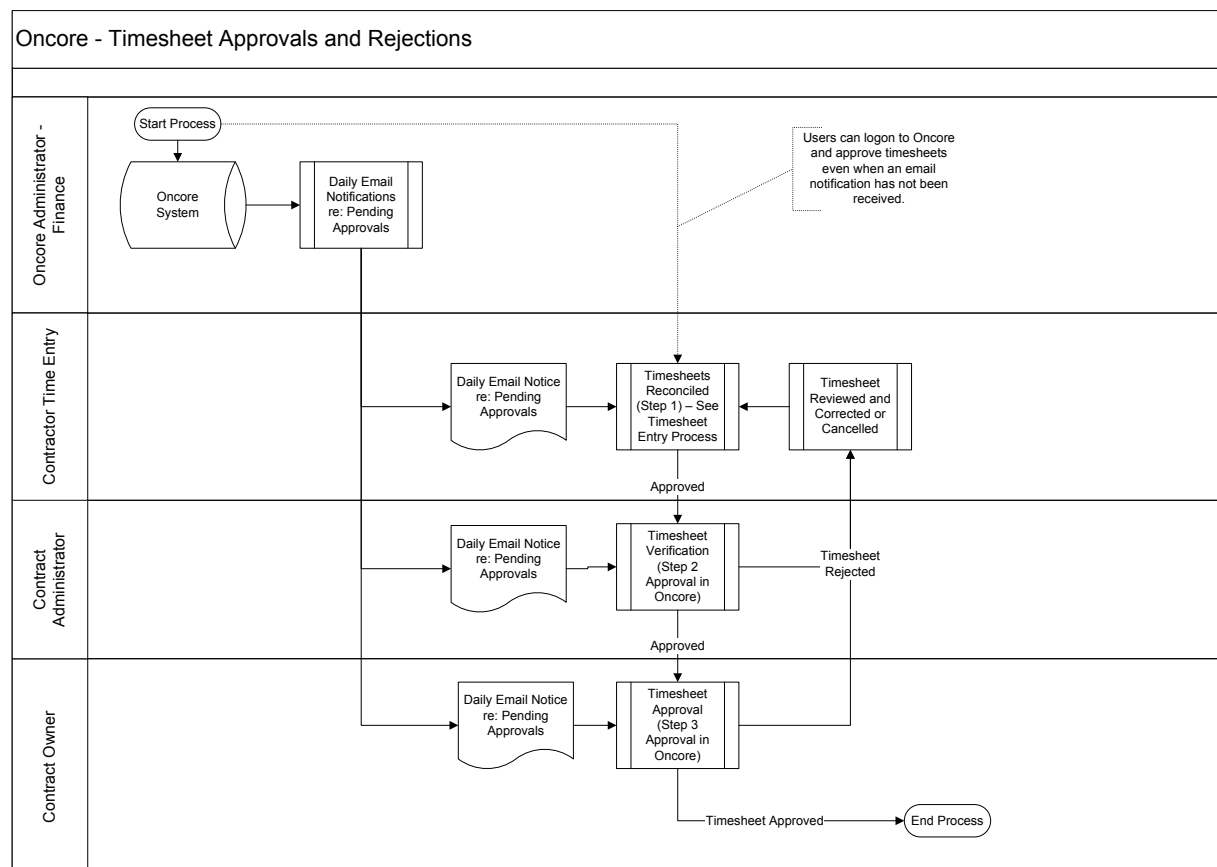

Figure 5 – Timesheet Approvals and Rejections

### 1.6.2 Accountabilities

**Table 5 – Timesheet Approvals & Rejections RACI Chart**

Task	Responsible	Accountable	Consulted	Informed
Daily email notifications issued for timesheets pending review and approval.	Oncore System	Oncore Administrator – Finance	N/A	Contractor, CA, CO
Timesheet Entry Verified and Submitted in Oncore on a daily basis (Step 1 Approval) and Reconciliation Complete	Contractor Time Entry Staff	Contractor Time Entry Supervisor	N/A	CA
Timesheet Entry Verified and Submitted in Oncore on a daily basis (Step 2 Approval)	CA	CA	Contractor	CO
Timesheet Entry Approved and Submitted in Oncore on a daily (preferred) or weekly basis (Thursday's) (Step 3 and Final Approval Step)	CO	CO	CA	Contractor
For pending timesheets, an approval Aging report is issued monthly for management action.	Oncore Administrator – Finance	Oncore Administrator – Finance	N/A	CA, CO, Controllers and Project Management

### 1.6.3 Overview of Timesheet Approval Process

The timesheet approval process includes the verification and approval of time charged within Oncore and confirmation that the time is appropriately recorded in terms of quantity of hours, worker classification (i.e., Pipefitter – Journeyman), time type (i.e., straight time, overtime, double-time), and that charges are to the correct work activity or event. Additionally, all exceptions including delays charged, rework, etc. are reviewed. For new scope, the timesheet approval process shall ensure that charges are added to the new work activities representing the new scope. Approval in Oncore is a confirmation that OPG has received value for money for the work performed, i.e., charges in Oncore are for actual effort in the field consistent with the scope of work identified on the approved PO.

Before given rights to approve timesheets, the CA and CO shall first complete the Oncore Contract Approver Course (Course/PEL # 67847). This can be done by completing the Computer Assisted Learning (CAL) session available through OPG's eLearning Portal or attending a classroom session.

- (a) The Oncore Administrator – Finance shall verify that the approvers (CA and CO) have completed the Oncore Contract Approver training and then shall setup the approvers at the same time the job is setup in Oncore. The CA and CO are identified on the Oncore Job Setup Form. If an approver has not yet completed the training, the Oncore

Title:

### CONTRACT ADMINISTRATION IN ONCORE

Administrator – Finance will send an e-mail to the approver, advising that the Oncore Contract Approver training shall be completed before the approver can be setup as an approver in Oncore.

- (b) Oncore shall issue a daily email notification to contractors, CAs, and COs who have timesheets in Oncore pending their review and approval. The purpose of this email notification is to prompt the required daily approval by CAs and COs.
- (c) Timesheets may be approved prior to the issuance of an email notification by logging onto Oncore and reviewing and approving all pending timesheets.
- (d) The primary approver shall receive email notification daily for outstanding transactions.
- (e) If alternate approvers are assigned, they shall also receive the email.
- (f) The alternate approver only needs to take actions when the primary approver is away and approval has been delegated to the alternate.

#### 1.6.4 Approving Timesheets

Within Oncore, timesheets are to be entered on a daily or weekly basis (see Section 1.5.3). Timely approval is required for timely costing in our cost systems as well as timely contractor payment.

Within Oncore, there are multiple approval steps, as noted below. Once transactions are approved in one approval step, they move onto the next approval step. Once the final approval step is completed, the approved transactions are the basis for updating costs in OPG's general ledger Systems, Applications and Products (SAP), in the Nuclear Finance Reporting and Analytics (NFRA) system, and for creating invoices electronically in PASSPORT and automatically setting to approved status for payment.

OPG uses the following three approval steps to manage the timesheet approval process:

##### **Step 1 Approval – Performed by the Contractor Time Entry Supervisor:**

The contractor time entry supervisor attests that timesheets entered into Oncore are reconciled to supporting timesheets and invoices for non-labour expenses (Step 1 "approval" in Oncore). Please see Section 1.5.3 of this Instruction for further details on this step.

##### **Step 2 Approval – Performed by the CA:**

The CA is accountable for verifying all timesheets entered into Oncore on a daily basis as follows:

- (a) The CA may generate reports (e.g., PO Summary Report, WO Detail – Approval Status) in Oncore to support the approval process. Please see Section 1.7 of this Instruction for further information on reporting.
- (b) It is not the accountability of the CA or CO to validate rates; they are validating and approving work performed in terms of contractor occupation and hours worked.

## Nuclear Instruction

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (c) The CA shall review the Oncore timesheets daily (as submitted) for the following:
- That timesheets being reviewed are current (within 15 days of work date),
  - Where timesheets are not current (> 15 days past work date), there is a clear understanding as to why timesheets are entered late,
  - The hours are charged to the correct work activity or event (including indirect charges such as Supervision, Holder of Record, in accordance with the terms of the contract) and only against current work activities; i.e. Oncore charges reflect actual field activity for the current stage of work or “plan-of-the-day”; there shall not be any demobilization charges when the work has just started,
  - New scope is charged to work activities or events setup for the new scope and that all Contract Change Requests (CCRs) have been processed for the new scope; i.e., charges for new scope are not charged to the original scope work events or activities,
  - Contractor resource names and occupation codes, hours charged, time types, delays incurred, and rework billed, are as expected per the contract and consistent with the spot checks recorded in the log book during contract monitoring and/or attendance records provided by the contractor,
  - That non-labour charges, including EPSCA charges, third-party sub-contractor charges, and others, are supported by documentation provided by the contractor and are billable in accordance with terms and conditions specified in the contract,
  - That progress billings are for milestones that have been achieved, as documented in the contract, and are supported by clear documentation provided by the contractor, and
  - Goods and services have been received in accordance with the contract terms and OPG has received value for money for the work performed; i.e., the timesheets in Oncore are fully representative of activities that have occurred in the field and represent the recorded progress (% complete) on the job and exceptions are minimized to the extent possible.
- (d) The CA shall be satisfied that all the above criteria have been fully met. If in doubt, a call shall be placed to the contractor for additional information and follow-up.
- (e) If additional information is provided, this shall be recorded in the log book and/or the comments field in Oncore.
- (f) Once satisfied, the CA shall approve the timesheets in Oncore and, by pressing “Submit”, is agreeing to the following statement:

“I hereby certify that the (above 8) timesheet review activities have been completed and all the results are acceptable and appropriate and the timesheet is being recommended for approval.”

## Nuclear Instruction

Usage Classification:	Sheet Number:	Page:
Information	N/A	26 of 41

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (g) If any of the above are not acceptable or appropriate, dialogue with the contractor shall occur prior to rejecting the timesheet.
- (h) CA shall reject the Oncore timesheet and include comments describing the reason for the rejection.

#### Step 3 Approval – Performed by the CO:

The CO is accountable for approving timesheets in Oncore on a daily (preferred) or weekly basis. When approvals are done on a weekly basis, they shall be done by end of day Thursday to ensure appropriate costs are sent to OPG's financial systems.

Timesheets shall only be routed to the CO for approval after the CA has performed their review. By receipt of a timesheet for approval, the CA is recommending it for approval.

By approving timesheets in Oncore, the CO is approving them for payment. Approved timesheets are consolidated into an invoice which is automatically uploaded to PASSPORT, automatically approved, and paid monthly.

- (a) The CO may generate reports (e.g., PO Summary Report, WO Detail – Approval Status) in Oncore to support the approval process. Please see Section 1.7 of this Instruction for further information on reporting.
- (b) The CO, in reviewing and approving timesheets in Oncore, is approving payment on behalf of OPG where OPG is contractually obligated to pay after they are satisfied that:
  - The timesheet is for valid labour and non-labour charges for scope completed to date within the contract terms and conditions,
  - Exceptions, delays, rework, and extras are identified, understood, justifications are documented and OPG is only paying where contractually obligated,
  - The quality of goods and services received meets expectations and contract requirements,
  - Cost, scope, or schedule deviations are known, documented, and corrective and/or mitigation actions are in place by the contractor and OPG, and
  - The contractor is managing the work and costs to achieve value for money (e.g., limiting use of overtime when ahead of schedule).
- (c) To perform the above task, the CO shall review the timesheets and, if needed prior to approval, discuss with the CA, field engineering, project staff, or contractor to ensure it is appropriate to pay the contractor's timesheet.
- (d) If approvals are delegated to an individual other than the CO, this delegation shall be consistent with corporate policies and required to be in writing indicating the period of the delegation.

## Nuclear Instruction

Usage Classification:	Sheet Number:	Page:
Information	N/A	27 of 41

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (e) This written delegation shall be maintained by the CO and shall be made available in case of an audit.

#### 1.6.5 Rejecting Transactions

- (a) Dialogue with the contractor shall be the first course of action when clarifications are required on timesheet entries. It is best to avoid rejecting transactions if possible.
- (b) The CA and CO shall reject transactions on Oncore timesheets if they are not acceptable or appropriate based on their review.
- (c) Comments shall be added to the timesheet detailing the reason for the rejection. This allows the contractor time entry staff to follow up accordingly and resolve the issue.
- (d) Rejected transactions shall be routed back to the contractor time entry staff for revision and shall be resolved and resubmitted or cancelled as quickly as possible.

#### 1.6.6 Aging Report for Oncore Transactions Pending Approval

On a weekly basis, the Oncore Administrator – Finance shall issue a detailed aging report to CAs, COs, Finance Controllers and selected senior management for action. The purpose of this report is to show the CA, CO & Controllers what payables are outstanding and which ones need to be dealt with on an urgent basis because they have been overdue for a long period of time. It highlights the following:

- The amounts of outstanding timesheets pending approval – this is what OPG owes to its Vendors.
- Which approval step the timesheet pending approval is currently on. It also includes the name of the Primary Approver associated with that approval step.
- Tab 1 of the Aging Report lists the number of days the timesheets have been pending approval (calculated as: date of Aging Report minus timesheet creation date). Note: it is not the number of days the timesheet has been sitting at a particular approval step. Tab 2 of the Aging Report is broken down into 1 to 7, 8 to 30 and over 30 day increments.

Note: This is not a standard report that users can generate from the Oncore Reporting module.

#### 1.7 Reporting

Contractors, CAs, and COs shall rely on Oncore reports to support reviews of Contract performance. A number of standard reports have been developed in Oncore to meet the needs of Oncore users.

The CA and/or CSA shall generate and review reports on a timely basis to ensure timesheet entries are complete and timely, and delays and non-billable work are entered accurately into Oncore.

### CONTRACT ADMINISTRATION IN ONCORE

These reports shall be printed and reviewed with the CO and appropriate mitigating actions taken to correct any issues highlighted by the reports, i.e., submission of N-FORM 10029 to deal with a contract over-spending situation.

Due to the loading of actual hours into Oncore, the contractor is not required to create or submit similar reports unless identified by the CO and agreed to by both the contractor and CO.

#### 1.8 Processing Changes in Oncore

- (a) The CA is responsible for managing contract changes, during the post-award phase through to closeout and termination.
- (b) The CA shall document the change, obtain approval from the CO and have the change executed through the purchasing agent prior to commencement of work.

**Note:** In emergency situations, the work may be authorized in advance of processing contract changes and/or changes in Oncore.

- (c) When changes are required to the setup of a job in Oncore in order to measure contractor performance and/or to track new scope, the CO delegate shall update the Oncore Job Setup Form and send it to the Oncore Administrator – Finance.

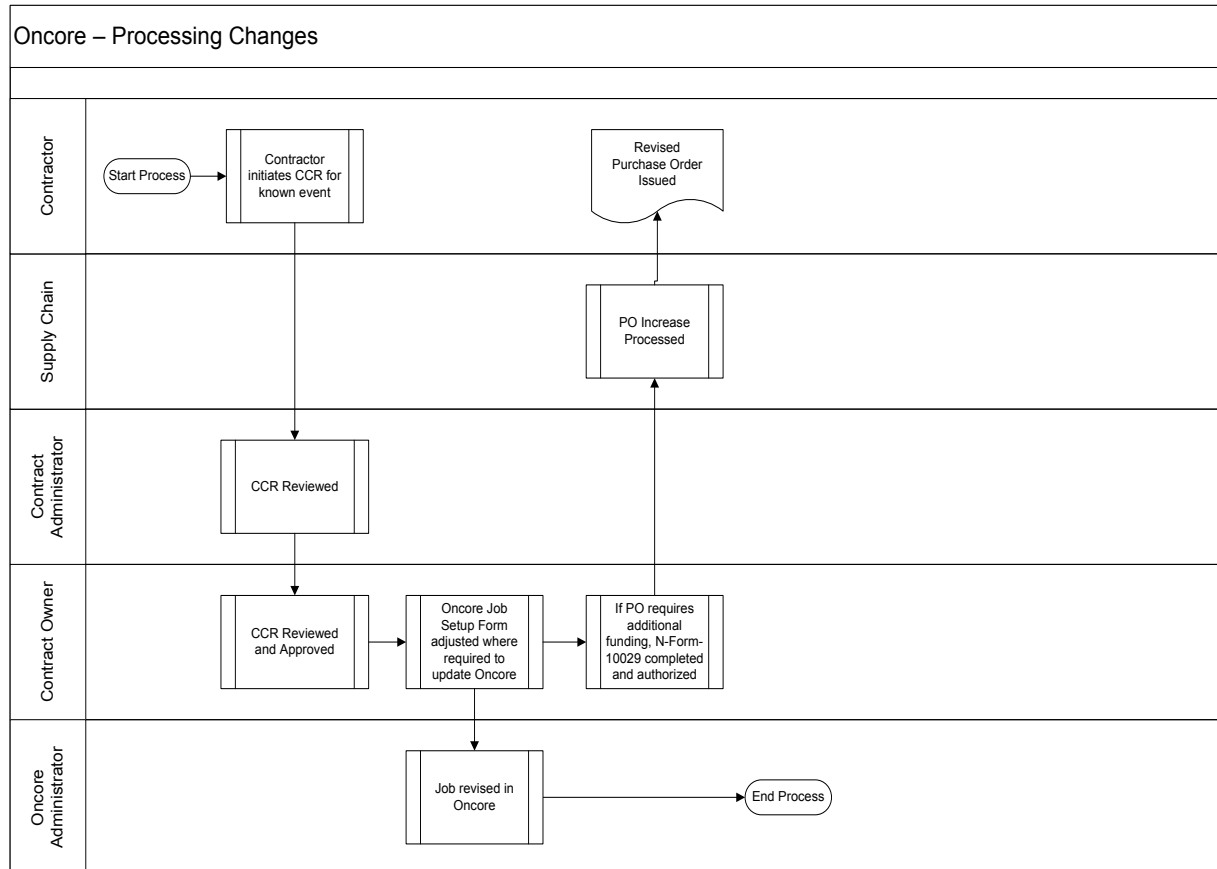

**Note:** Refer to Section 1.4 of this instruction for further information on the Job Setup process. Refer to N-GUID-00150-10000 for additional tools on identifying, managing, and recording contract changes.

### 1.8.2 Accountabilities

**Table 6 – Processing Changes RACI Chart**

Task	Responsible	Accountable	Consulted	Informed
CCR initiated by Contractor due to change event in executing the contract.	Contractor	Contractor	CA	CA
CCRs Reviewed and Approved	CA	CA	Contractor	CO
Oncore Job Setup Form Revised	CO or delegate	CO	CA	Oncore Administrator – Finance
Job Revised in Oncore	Oncore Administrator - Finance	Oncore Administrator - Finance	CA, CO or delegate, Contractor, Supply Chain	Contractor, CO, CA
Request to Purchase N-FORM-10029 submitted if PO increase required. Note Contract Change Notice (CCN) Form used if Contract is Fixed Price.	CO or delegate	CO	CA	Supply Chain (Purchasing Agent)
PO Revised	Supply Chain (Purchasing Agent)	Supply Chain (Purchasing Agent)	CO	Contractor

For projects, the CO delegate is normally the Project CSA. However, some organizations do not have a CSA and thus the job setup package is prepared by the CO themselves, or by maintenance support for outages, and/or by finance.

It is the CO's accountability to ensure that the job setup package is completed and sent to the Oncore Administrator – Finance prior to the contractor starting work.

### 1.8.3 What Constitutes a Change in Oncore

Generally, a CCR is submitted for approval if any of the following has taken place:

- Scope Change – as a result of a new or revised business requirement; a change to an existing contract deliverable; a new deliverable being added; or an existing deliverable is no longer required.
- Cost/Forecast Change – as a result of an increase or significant decrease in estimated contract costs. On the Oncore Job Setup Form, the forecast estimated costs and/or hours is adjusted. A cost increase may be due to more overtime, delays, or rework than planned for in the contract.
- Deferral – as a result of a decision to defer an active contract to a later date. The job would be closed (deactivated) in Oncore.
- Re-activation – as a result of a decision to re-activate a contract that has been deferred. The job would be re-activated in Oncore.

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (e) Cancellation – as a result of a decision to cancel a contract that no longer fits within the business strategy. The job would be closed (deactivated) in Oncore.

#### 1.8.4 Job Change Form and Process

- (a) When a Contract is changed for any of the above reasons, the PO in Passport is revised if additional funding is required.
- (b) Additionally, the Oncore Job Setup Form shall be adjusted and re-issued to the Oncore Administrator – Finance in order to add new scope or revise the existing estimates in Oncore for tracking purposes. All requirements as identified in Section 1.4 of this instruction apply.
- (c) When new scope is added to a job in Oncore, the activity shall be identified as “NEW” on the Oncore Job Setup Form. This shall allow tracking of added scope.
- (d) For changes, the CCR Number shall be recorded in the CCR# column on the Oncore Job Setup Form. This shall provide documentary evidence of the reasons for the changes to Oncore.

#### 1.9 Cost Reporting

The cost reporting system used at OPG is SAP. NFRA is used by Nuclear to provide further details of what is contained in SAP.

Title:	<b>CONTRACT ADMINISTRATION IN ONCORE</b>
--------	--

### 1.9.1 Accountabilities

**Table 7 – Cost Reporting RACI Chart**

Task	Responsible	Accountable	Consulted	Informed
Weekly cost files generated & processed based on approved transactions in Oncore.	Oncore Administrator – Finance	Oncore Administrator - Finance	N/A	N/A
Report of outstanding timesheets not entered into Oncore using the Oncore standard electronic template	Contractor Time Entry Staff or Supervisor	Contractor	N/A	Oncore Administrator – Finance CO CA
Weekly accruals processed for transactions in Oncore that were not approved and/or transactions that were not entered into Oncore at time of weekly cost file being generated.	Oncore Administrator – Finance	Oncore Administrator – Finance Section Head	Contractor	CO CA CSA

### 1.9.2 Weekly Cost Reporting

- On a weekly basis, the Oncore Administrator - Finance posts approved transactions (timesheets, expenses, materials, etc.) to SAP/NFRA so costs are available for timely project reporting. To review Oncore transactions in NFRA, refer to Financial Source System 36. When costs are posted to a project or outage, the offsetting Financial Account Classification (FAC) is accounts payable liability account 41308. When the invoice is paid, the liability account is cleared.
- The Oncore Administrator – Finance shall reconcile the total amount posted each week with the amounts actually posted in SAP/NFRA to confirm completion.
- Finance shall, through weekly cost reviews, identify accounting issues, e.g., invalid project number, and provide details to the Oncore Administrator – Finance to correct.
- Corrections in Oncore shall only be for future cost reporting; Finance shall create journals to adjust costs processed in the past.

### CONTRACT ADMINISTRATION IN ONCORE

#### 1.9.3 Accruals

OPG uses the accrual basis of accounting – this means that income and expenses are recorded in the accounts when the transaction takes place, rather than at the time the cash is received or paid.

- (a) On a weekly basis, the Oncore Administrator – Finance is responsible for accruing the following items:
- (1) Transactions (timesheets) in Oncore that were pending approval when the weekly cost batch was generated, typically Friday mornings by 9 a.m. These timesheets shall include transactions for time and material contracts, expenses, milestone and progress payments.
  - (2) Where the PO is already setup in Oncore, timesheets that have not yet been input in Oncore.
    - (i) Contractors shall provide the Oncore Administrator – Finance with a report of hours and costs incurred life-to-date for timesheets that have not been entered into Oncore.
    - (ii) These amounts shall be accrued for cost reporting purposes.
    - (iii) The Oncore Accrual Report (template) shall be used and data provided on a PO + Release + Line basis (i.e., by Oncore Job).
    - (iv) Due to the importance of recording accurate costs for reporting purposes, it is important for contractors to provide accurate accrual information.
- (b) On a monthly basis, the Oncore Administrator – Finance shall also accrue costs for retroactive trade rate increases that have not yet been approved by Supply Chain and/or processed in Oncore.
- (c) On a quarterly basis, the Oncore Administrator – Finance shall analyze contractor performance with respect to providing accurate accrual information and may recommend improvements to the accrual process, where warranted.

**Note:** The Oncore Administrator – Finance shall not process accruals for rejected transactions or for partial completion of planned milestones or progress payments where a timesheet is not yet entered into Oncore. These accruals shall be processed by the local finance unit. If a timesheet is entered into Oncore and contains milestone or progress payment information, and is not approved, the costs shall be included in the weekly accrual.

#### 1.10 Invoice Payment

Invoices are paid in accordance to the payment terms noted on the approved contract/PO.

Title:	<b>CONTRACT ADMINISTRATION IN ONCORE</b>
--------	--

### 1.10.1 Accountabilities

**Table 8 – Invoice Payment RACI Chart**

Task	Responsible	Accountable	Consulted	Informed
Monthly invoices created & interfaced with PASSPORT for payment.	Oncore Administrator - Finance	Oncore Administrator - Finance	N/A	Contractor
				Supply Chain
				CA
				CSA
Resolve non-payment issues (funding increases).	CSA	CO	CSA	Supply Chain
	CA		CA	

### 1.10.2 Reverse Invoicing

- Oncore utilizes a streamlined invoicing process known as reverse invoicing. This simply means that invoices are created by OPG rather than the contractor. A single, aggregate monthly invoice for each PO-Release-Line is generated through this automated invoicing process. These invoices are created through an Electronic Data Interface (EDI) with PASSPORT and automatically set to approved status.
- These invoices may be viewed in PASSPORT by selecting Invoice Type = "AUTO-EDI".
- When invoices are processed, they clear the offsetting accounts payable liability account 41308 created during the weekly SAP/NFRA costing process (See Section 1.9.2); PASSPORT invoices do not create costs directly to the project or outage.
- The contractor is not required to provide OPG Accounts Payable with an invoice for items processed in the Oncore system.

### 1.10.3 Holdbacks

- If holdbacks are required, e.g., Construction Lien Act, Oncore shall hold back the appropriate amount on each invoice.
- The invoice shall indicate the amount of the holdback.
- Upon contract closure, a Holdback Clearance invoice shall be submitted by the contractor to Accounts Payable for final payment.

### 1.10.4 Invoice Payment Cycle

- OPG's normal payment terms are that payment is made on the 25<sup>th</sup> of the current month for approved invoices dated on the 25<sup>th</sup> of the previous month provided the PO has sufficient funding; i.e., the invoice is not in "Mismatch".

## Nuclear Instruction

Internal Use Only

N-INS-00150-10001	R001	
Usage Classification:	Sheet Number:	Page:
Information	N/A	35 of 41

Title:

### CONTRACT ADMINISTRATION IN ONCORE

- (b) In order to comply with these payment terms, the Oncore Administrator – Finance shall generate invoices at 3:00 p.m. on the 15<sup>th</sup> of each month for payment on the 25<sup>th</sup> of the same month. Included in this invoice shall be approved transactions on timesheets with a date worked on or prior to the 25<sup>th</sup> of the previous month.
- (c) This cycle provides a 20-day grace period to ensure entry and approval of timesheets to maximize eligible payment to the contractor on the 25<sup>th</sup> of each month.
- (d) It is imperative that transactions be approved daily by the CAs and COs so that there are no delays in paying contractors and to avoid increased cost to OPG for late payments.

#### 1.10.5 Invoice Mismatches

- (a) The CO shall be responsible for closely monitoring the status of their contracts/POs and take appropriate actions to increase PO funds, if necessary – this shall be done at least once per month, weekly during outages. This rigorous monitoring shall eliminate invoices in MISMATCH due to PO-exceed conditions.
- (b) If an invoice has an Invoice Status of MISMATCH in PASSPORT, the CO shall resolve this; the most common invoice mismatch is due to insufficient funding in the PO.
- (c) When the CO determines that additional funding is required for their contract/PO, they are responsible for completing the necessary paperwork (N-FORM-10029) to increase the funds in the PO.
- (d) The CSA and CA work in conjunction with the CO and shall be fully engaged in this regard in order to avoid the worst-case scenario, i.e., when OPG is required to stand-down a contractor on a project because OPG is in arrears.
- (e) In Oncore, timesheets may still be processed and approved against a PO that is out of funds because the mismatch is PASSPORT system related and not Oncore system related. They shall automatically clear once sufficient funds have been added to the PO in PASSPORT.

#### 1.11 Purchase Order and Project Closure Process

- (a) The CO shall be responsible for closing the PO / Project in Oncore in order to reduce the risk of further charges to OPG.
- (b) The CO or delegate is required to send an email to Oncore Administration – Finance once all vendor charges to the PO have been entered and approved.
- (c) Oncore Administration – Finance will close the PO in Oncore which prevents the vendor to charge to that PO.
- (d) Each month, Oncore Administration – Finance will review a report of the last posted charges against all open POs. Where an open PO has been inactive for 6 months, the Oncore Administrator - Finance will close the PO.

### CONTRACT ADMINISTRATION IN ONCORE

#### 1.12 Oncore Administration

The Oncore system is normally accessible 24 hours per day, 365 days per year, within OPG and via *Virtual Private Network (VPN)*.

There are two groups involved in supporting the Oncore system:

- (a) Oncore Administration Group – provides administrative support.

Administrative support is available during normal business hours only, via email or phone.

Email: Internal email address: Oncore Admin – Finance

External email address: [oncore@opg.com](mailto:oncore@opg.com)

Phone numbers for the Oncore Administrator – Finance may be found on the Oncore website (see below).

- (b) New Horizons System Solutions – provides technical support and password resets.

Technical support is available during normal business hours only. If a technical issue occurs after business hours, notify the New Horizons System Solutions (NHSS) Help Desk.

Pickering – local extension 4357

Darlington – local extension 4444

700 University and other OPG locations – (416) 592-6400

The Help Desk is staffed from 7:00 am – 6:00 pm Monday to Friday, excluding statutory holidays. At all other times, calls to the Help Desk shall be taken by the NHSS Information Systems Management Centre (ISMC). Calls after business hours shall be addressed next business day.

- (c) Oncore Website

### CONTRACT ADMINISTRATION IN ONCORE

The purpose of this website is to provide users with the information and support resources they need to get the most out of Oncore. The website features online documents such as:

- Forms & Templates
- Governing & Supporting Documents
- Oncore Administration Group - Contact Information
- User Manual from Coreworx – Not OPG specific
- User Training Documentation – OPG specific
- List of Vendors Currently Setup in Oncore

Our website is constantly evolving and new and updated information shall appear on a regular basis. The Oncore website is available 24 hours per day, 365 days per year.

#### 1.12.1 Accountabilities

##### (a) Oncore Administration Group

The Oncore Administration Group is responsible for the strategic planning and management of the Oncore system. This entails:

- Managing and providing operational support
- Ensuring security administration
- Providing extensive staff training and documentation
- Problem resolution is provided for system-related problems
- Incidents experienced by users are appropriately tracked and resolved.
- Review and report on any internal control issues with respect to the Oncore Contract Management Process
- Generate exception reports each month and review with contractors, CAs, COs, and OPG Management. Typical exception reports may include:
  - (1) Time Entry exceptions – e.g., Contractors who worked > 16 hours in a day.
  - (2) Time Entry Cycle Review - Days to enter by contract.
  - (3) Approval Cycle Review - Time to approve timesheets.
  - (4) PO Issuance Check - Identification of time worked prior to issuance of PO.
- Periodically confirm that this Instruction is being adhered to and shall request supporting evidence; i.e., record of daily contractor reconciliation.

Title:

### CONTRACT ADMINISTRATION IN ONCORE

#### (b) New Horizons System Solutions

NHSS is responsible for all technical aspects of Oncore. This entails:

- Applying updates, patches, and configuration changes
- Performing daily backups of Oncore data.

#### 1.12.2 New User Setup

All requests to be setup as a new Oncore user shall be initiated through the Information Technology Service Request (ITSR) system. All users of Oncore shall have an OPG identification number, including contractors.

##### (a) Users shall request one of the following specific roles:

- Report generation only
- Timesheet Inputter (usually the Contractor); includes report generation
- Timesheet Approver – Step 2 (OPG CA); includes report generation
- Timesheet Approver – Step 3 (OPG CO); includes report generation.

##### (b) The Oncore Administrator – Finance shall verify that all Timesheet Approvers (Step 2 and Step 3) have completed Oncore Contract Approver training prior to initial setup in Oncore. The Oncore Administrator – Finance shall send an e-mail to any Approvers who have not yet completed the training, advising that they shall complete the Oncore Contract Approver training before they can be setup with approver rights in Oncore.

##### (c) All requests shall be reviewed by the Oncore Administration group prior to setup. Once setup, a new user shall be notified by email of all the particulars (login name, password, etc.) and provided with training material relevant to their role.

#### 1.12.3 Security Roles

The Oncore Administrator – Finance shall maintain the User Account Groups in Oncore. User Account Groups represent a standard set of permissions that applies to more than one user account. In general, there are four standard roles:

- Administrator (Oncore Administration Group)
- Timesheet Inputter (usually the Contractor)
- Timesheet Approver (OPG CA & CO)
- Reporter.

#### 1.12.4 Deactivation of Users

All requests for deactivating Oncore users shall be submitted by the user's supervisor/manager through the ITSR system on the employee's end/termination date. Once the ITSR is approved, the Oncore Administrator – Finance shall deactivate the Oncore user.

Each month, Oncore Administration – Finance will review a report of user accounts. Where a user account has been inactive for 6 months, the Oncore Administrator – Finance will deactivate the account.

Title:

## CONTRACT ADMINISTRATION IN ONCORE

## 2.0 DEFINITIONS AND ACRONYMS

### 2.1 Definitions

**Actual Cost (AC):** The actual costs of work performed, as recorded in Oncore in terms of hours or dollars.

**Internal Control over Financial Reporting (ICOFR):** is required by the Ontario Securities Commission. For Ontario Power Generation, it means that for financial statement accounts over an annually determined materiality threshold (e.g., \$25 million), the processes that contribute to the development of that amount shall be documented. Any risks to the integrity of the transactions shall be identified and, for each risk, all controls in place to mitigate that risk shall be listed. These controls are then tested to make sure they really would prevent that risk. Once that is done, the Process Owner signs off as final confirmation that they are satisfied with the documentation and confident that the controls are sound.

**Planned Value (PV):** The estimated value of work planned in terms of hours and dollars, also referred to as the budget.

**Scope:** The sum of the products and services to be provided as a project.

**Scope Change:** Any change to the project scope and results to be achieved. A scope change almost always requires an adjustment to the project cost, schedule or both.

**Variance at Completion (VAC):**  $VAC = \text{Budget at Completion} - \text{Estimate at Completion (EAC)}$ ; this shall provide an estimate of how much the project shall be over/under the current budget based on the current Cost Performance Index and calculated EAC. This can be used to determine if additional Purchase Order funding is required.

**Virtual Private Network:** A VPN is a communications network tunneled through another network. Security tokens are used to connect to the Ontario Power Generation network via a VPN.

Title:  
**CONTRACT MANAGEMENT STANDARD**

### 1.0 DIRECTION

This standard provides requirements for the development, management, execution and close out of contracts within OPG-N. The amount of detail and effort applied to contract management shall utilize a graded approach based on contract and project risk and complexity.

Contract management is the process that enables both parties to a contract to meet their obligations in order to deliver the objectives required from the contract. It also involves building a good working relationship between OPG and the supplier. It continues throughout the life of a contract and involves managing proactively to anticipate future needs as well as reacting to situations that arise.

An important element of contract management is the oversight of supplemental personnel (contractors) to ensure they are meeting safety, quality and performance requirements. N-STD-AS-0032, Oversight of Supplemental Personnel provides the oversight principles and requirements to be applied to work packages initiated and/or executed within OPG by supplemental personnel.

The project manager is accountable for the management of contracts which will deliver project objectives.

It is acknowledged that the means by which different executing organizations implement this standard may vary taking into consideration the risk profile and complexity considerations of the particular contract being undertaken.

### 1.1 Key Contract Management Elements

The following elements are important in the contracting process:

(a) Principles to be followed:

- (1) Adhere to safety and regulatory requirements, laws, codes, and standards.
- (2) Obtain value for money in the delivery of goods and services to maximize the value to shareholders by optimizing total lifecycle costs.
- (3) Ensure quality of service so that the right goods and services are received, when and where they are needed, and per the terms and conditions of the contract.
- (4) Be accountable for the results.
- (5) Be fair to suppliers while protecting OPG interests.
- (6) Engage internal and external stakeholders to ensure alignment and use of best practices, contracts, rates, and terms and conditions.

## Nuclear Standard

Document Number:	Revision:	
N-STD-AS-0029	R001	
Usage Classification:	Sheet Number:	Page:
Information	N/A	4 of 10

Title:  
**CONTRACT MANAGEMENT STANDARD**

- (7) Improve efficiencies and leverage resources.
- (8) Strive for continuous improvement in the creation and lifecycle management of a contract.
- (9) Foster trust and improved supplier relationships including:
  - Being open and transparent
  - Proactively communicating with suppliers and stakeholders
  - Striving for mutual success
  - Sharing of risks and rewards
  - Driving opportunities for cost reduction and efficiency improvements
- (b) Monitor and report key OPG and supplier contract performance indicators. Performance indicators should allow for the detection of at risk deliverables and other risks, and support the implementation of any corrective actions needed to address such issues.
- (c) Leverage the existing and potential future relationships and contracts between OPG and the supplier across multiple contracts and/or projects.
- (d) Manage commercial relationships between multiple suppliers in large projects and programs.
- (e) Execute effective contract administration including:
  - Contract maintenance and change control
  - Cost monitoring
  - Work order and payment control
  - Management reporting
- (f) Ensure safe and effective management of contractors, including:
  - (1) Standards, expectations, and accountabilities for performance are clearly identified, thoroughly communicated to, and understood by, contractors, and then reinforced.
  - (2) Contractors understand their roles and responsibilities specific to the tasks they are performing.

## Nuclear Standard

Document Number:	Revision:	
N-STD-AS-0029	R001	
Usage Classification:	Sheet Number:	Page:
Information	N/A	5 of 10

Title:  
**CONTRACT MANAGEMENT STANDARD**

- (3) Contractors understand the safety significance of the work they are performing, including nuclear, conventional, environmental and radiological safety and also the impact to station reliability.
- (4) Contractors exhibit safety and human performance behaviours expected in the nuclear industry.
- (5) The responsibility for the monitoring and oversight of contractors is clearly identified and effectively performed.
- (6) Feedback is provided to contractors promoting continuous improvement in their performance.

## 1.2 Contracting Process

The contracting process typically consists of five stages as illustrated in Figure 1, Contract Management Stages.

**Figure 1: Contract Management Stages**

Detailed process instructions, guides, work aids and good practices for all key elements of contract management in OPG-N are stored in the controlled documents module of Asset Suite and can also be accessed via N-MAN-09701-10003, Nuclear Contract Management Manual which is available on the OPG intranet through “PowerSearch” or as an E-Manual under the Nuclear Projects webpage.

### 1.2.1 Stage I – Contract Planning

The following is to be well understood in order to develop an effective contracting and sourcing strategy:

- (a) The scope of work must be sufficiently detailed to effectively communicate requirements (i.e., specifications, objectives, and deliverables).
- (b) Risk management strategy (e.g., what risks are acceptable and how are they distributed to the contracting parties?).
- (c) Type of contract (i.e., use existing OPG standard contract or master agreement or develop a custom contract for the project).

## Nuclear Standard

Internal Use Only		
Document Number:	Revision:	
N-STD-AS-0029	R001	
Usage Classification:	Sheet Number:	Page:
Information	N/A	6 of 10

Title:  
**CONTRACT MANAGEMENT STANDARD**

- (d) Pricing model (e.g., firm fixed, time and materials, target).
- (e) Management processes (i.e., interface requirements, oversight, end of life, dispute resolution).
- (f) Negotiations strategy for the contract.
- (g) Proposal evaluation criteria and methodology.
- (h) Contractual terms and conditions.
- (i) Project estimate.
- (j) Sourcing (e.g., single supplier versus multiple suppliers, supplier qualifications, current supplier relationship with OPG, and existing contracts).

Contract planning should include consideration of relevant information such as:

- (1) Internal and external stakeholder input.
- (2) Possible contract innovations, strategies and costs gained from Operating Experience (OPEX), market evaluation and other sources.
- (3) Alignment with other OPG business units regarding strategy and lessons learned.

All contracts should have an assigned contract manager. In some instances the project manager may also be the contract manager. Decisions on the separation of these functions should consider relevant factors including:

- Risk or complexity of the contract
- Sufficient commercial experience

The contract manager will be accountable to and support the project manager.

### 1.2.2 Stage II – Procurement

The procurement stage of the contract management life cycle includes sourcing and awarding of contracts for materials and services in accordance with the contracting and sourcing strategy.

### 1.2.3 Stage III – Post Award

Post award activities typically include the following:

- (a) Site meetings, contractor orientation and mark-up meeting.

## Nuclear Standard

Title: <b>CONTRACT MANAGEMENT STANDARD</b>
---

- (b) Execution planning and preparation.
- (c) Contractor mobilization.
- (d) Training of supplier personnel.

### 1.2.4 Stage IV - Contract Execution

Contract management activities during execution include:

- (a) Utilizing the resources in the project team to ensure work (delivery of goods and services) by the suppliers or performed by the contractors is managed and executed in accordance with all applicable quality and regulatory requirements, laws, codes and standards, expectations, roles and responsibilities, accountabilities and in accordance with the terms and conditions of the contract.
- (b) Timely and accurate review and approval of supplier invoices to ensure payments reflect agreed terms and conditions, and completed work.
- (c) Relationship management to keep the relationship between the two parties open and constructive, aiming to resolve or ease tensions and identify problems early in the best interests of both parties.
- (d) Managing, documenting and controlling disputes and/or changes to scope, cost and schedule in accordance with the process defined in the contract and OPG requirements.
- (e) Prompt communication and escalation of issues and risks to reduce potential impacts and set course correction.
- (f) Frequent and effective formal and informal communication with suppliers to ensure objectives and deliverables are understood.
- (g) Regular review of contract status, deliverables, issues and risks as a proactive means of identifying potential issues and implementing correct actions when required.
- (h) Proactive monitoring of supplier and OPG performance to verify adherence to contract terms and conditions to ensure safety, quality, performance and value is maintained to meet OPG and project objectives.

### 1.2.5 Stage V - Contract Close Out

Contract close out typically includes:

- (a) Resolution of outstanding deficiencies and claims related to warranty, insurance, and breach of contract.

## Nuclear Standard

Internal Use Only		
Document Number: N-STD-AS-0029		Revision: R001
Usage Classification: Information	Sheet Number: N/A	Page: 8 of 10

Title:  
**CONTRACT MANAGEMENT STANDARD**

- (b) Confirmation that all obligations of both the supplier and OPG have been successfully completed.
- (c) Verification of receipt of all required documentation, completion of required payments, and release of project securities.
- (d) Identification and documentation of lessons learned as appropriate.
- (e) Final evaluation of the supplier's performance.
- (f) Formal close of contract.

## 2.0 ROLES AND ACCOUNTABILITIES

### Contract Manager

The Contract Manager is accountable for the following:

- Support the Project Manager throughout all of the contract management stages
- Comprehend fully the commercial and contractual terms and conditions of the contract.
- Interpretation and clarification of the contract terms and conditions to ensure all obligations and compliance with the contract are being met.
- Ensuring that adequate resources are assigned for the management of the contract(s)
- Confirming and periodically verifying that the original signed contract and amendments are in place
- Developing, periodically reviewing, and updating the Contract Management Plan (CMP)
- Identifying high risk terms and conditions within the contract and ensuring mitigation programs or measures are in place
- Coordinating the development and implementation of management procedures, systems and processes to facilitate effective management of the contract
- Participating in project review meetings to support the project team on commercial and contractual matters for the assigned contracts
- Ensuring that all contractual conditions regarding safety, environment, quality, scope, legal requirements, cost and schedule are met in a timely manner during execution of the contract.

## Nuclear Standard

Document Number:	Revision:	
N-STD-AS-0029	R001	
Usage Classification:	Sheet Number:	Page:
Information	N/A	9 of 10

Title:  
**CONTRACT MANAGEMENT STANDARD**

- Coordinating resolution of contractual claims and disputes
- Ensuring that appropriate oversight of supplemental personnel is in place to meet safety, quality and performance requirements.
- Maintaining communication with the Supplier to ensure the ongoing relationship between the parties continues
- Supporting closure of the contract

All contracts will have an assigned contract manager. In some instances the project manager may also be the contract manager. Decisions on the separation of these functions should consider relevant factors including:

- Risk or complexity of the contract
- Sufficient commercial experience for the person assigned the accountability

Title: <b>CONTRACTOR MANAGEMENT PROCESS</b>		

### 1.0 PURPOSE

This document identifies the minimum process requirements for monitoring a contractor during the field execution of contracted work at Ontario Power Generation Nuclear (OPGN).

### 2.0 EXCEPTIONS

- Contracts issued for the purchase of manufactured goods delivered to site, or for work being done for OPG in a contractor's workplace.
- Other contracts where the company is only on site for delivery, e.g., items handled through warehousing, courier, and bottled water delivery. The process DOES apply to contracts where the company requires craning and rigging to load and unload the delivery or when the delivery involves physical connections to OPG systems on OPG property; e.g., fuel oil, bulk chemicals, pressurized gases.
- Owner Only contracts
- Contracts excluded with the approval of the Stratum IV Manager or greater.

### 3.0 DIRECTION

To guide Project/Contract Managers responsible for a contractor during execution of work at OPGN facilities, if OPGN's roles and duties are *Owner/Constructor* or *Owner/Employer* as defined by the Ontario Occupational Health and Safety Act (OHSA). Oversight of the Contractor(s) in the field will be incorporated in the Project's Oversight Plan (POP) per N-STD-AS-0030 and N-MAN-09701-10002.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-00120-10008</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R002</b>	Page: <b>4 of 6</b>
Title: <b>CONTRACTOR MANAGEMENT PROCESS</b>		

### 4.0 OVERVIEW OF THE PROCESS

Once a contract has been successfully awarded, the Project Manager/Contract Manager will ensure the following is completed:

- 4.1.1 Assign a qualified supervisor, as per OHSa Section 14 of O. Reg. 213.  
  
Note: Direct supervision of contractor workers is always provided by the contractor, not OPG.
- 4.1.2 Report and document deficiencies, incidents and deviations to the contract.
- 4.1.3 Conduct a Project Kick-Off/Orientation Meeting with the Contractor and other applicable OPGN stakeholders including review of Human Performance and work expectations.
- 4.1.4 Ensure that the Contractor has conducted a Mark-up Meeting to determine jurisdiction for Building Trades Union work.
- 4.1.5 Verify Contractor qualifications and provide OPGN-based training as required. For BTU Training requirements, refer to N-TQD-510-00001.
- 4.1.6 Appoint competent person(s) for oversight of work to ensure safety, quality, performance and value are maintained and to verify adherence to contract terms and conditions.

Activities in support of the above may include but are not limited to the following:

- Stop any work activities that pose an immediate danger.
- Attend Contractor Pre-Job Briefings at a frequency determined by the Project Manager/Contract Manager and in accordance with the Project Oversight Plan.
- Maintain a log to record Contractor activities, discussions and deficiencies

**Note:** Job aids providing guidance for the tasks listed above are available in the Contract Management Toolkit on the Projects and Modifications website.

### 5.0 RECORDS AND REFERENCES

#### 5.1 Records

- 5.1.1 Any controlled documents which may be produced as a result of this document should be managed in accordance with N-PROC-AS-0003, Controlled Document Management.

**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

## 1.0 INTRODUCTION

### 1.1 Scope

This Interface Requirements (COIR) outlines the responsibilities and accountabilities, activities, deliverables and interfaces between OPG and the Contractor while performing activities in support of work at OPG Nuclear.

### 1.2 Purpose

The purpose of the COIR is to facilitate the successful implementation of work at OPG Nuclear by ensuring that Engineering, Procurement, and Construction activities are in conformance with OPG and regulatory requirements.

### 1.3 Safety

Safety is our core value when conducting any business activity in OPG Nuclear. Safety includes Nuclear, Conventional, Environmental, and Radiological safety aspects.

The safety of OPG's personnel, the Contractor's personnel, individuals at or near the Sites, and the public is of paramount concern to OPG. OPG will require that Contractors and their Subcontractors maintain a level of safety equivalent to that of OPG employees while at OPG workplaces.

Our business needs to comply with OPG Requirements and applicable Federal and Provincial regulatory requirements.

#### 1.3.1 Nuclear Safety Culture

OPG and the Contractor's management shall use their respective management systems to understand and promote a nuclear safety culture by

- a) Issuing a statement committing workers to adhere to the management system;
  - b) Defining and implementing practices that contribute to excellence in worker performance;
  - c) Providing the means by which the business supports workers in carrying out their tasks safely and successfully, by taking into account the interactions between individuals, technology, and the organization;
  - d) Monitoring to understand and improve the nuclear safety culture; and
  - e) Promoting the practice of the Nuclear Safety Traits in the development and execution of work.
-

Title:

**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

## 2.0 DESCRIPTION

### 2.1 Process

Work of a commercial or non-complex nature may utilize a simplified or different process. Additionally, specific projects may be executed using only sub-portions of this document (e.g. engineering only projects), or with modified accountabilities particular to a project or Contractor. A list of deviations to this document or a separate stand alone process for such work will be included in a project specific Worksheet.

Contractor steps may not apply to all work and are illustrative to support the OPG/Contractor Interface Requirements.

Sections 3 to 6 of this document details typical deliverables or items related to work where there is an OPG/Contractor interface in the delivery of work. Any section of the Contractor/Owner Interface Requirements (COIR) which is applicable will be identified in the worksheet or scope of work.

### 2.2 Contractor Responsibilities

The Contractor shall have and maintain full working knowledge of OPG's Design and Configuration Management standards and procedures to ensure that design basis and plant configuration management standards are maintained throughout the project life cycle.

The Contractor has responsibility for maintaining accuracy of technical content and compliance with the Contractor's Quality Assurance Program.

#### 2.2.1 Governing Procedures

All modifications shall be carried out in accordance with the OPG Nuclear Engineering Change (EC) N-PROC-MP-0090.

Maintenance activities will have defined interfaces which will be reviewed and approved by OPG.

OPG procedures shall be followed and OPG requirements met for all work unless otherwise approved by OPG.

#### 2.2.2 Professional Engineers of Ontario (PEO)

The Contractor shall comply with the Professional Engineers of Ontario (PEO) guidelines on sealing engineering drawings and documents.

### 2.3 OPG Roles and Accountabilities

OPG shall appoint an overall project single point of contact (OPG Representative) for each specific Purchase Order utilizing this document. The OPG Representative shall prepare a contact list detailing specifically who within OPG will interface and / or accept related deliverables or items as defined in sections 3 to 6 of this document.

OPG roles / accountabilities as defined in sections 3 to 6 of this document are defined as follows:

(1) Review

## Contractor/Owner Interface Agreement

<b>Internal Use Only</b>
Document Number: <b>N-COI-00120-00001</b>
Revision: <b>R000</b>
Page: <b>6 of 61</b>

Title:

**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

Review means that when stated in the Design Plan or in the approved COIR document or in the agreement between OPG and Contractors, a signed copy of the specific Engineering Document will be transmitted to OPG for comments, and an acknowledgment of receipt is to be recorded by the Contractor.

Contractor Project Representative will maintain a Comment / Disposition file for all deliverables in the project file until final acceptance by the Contractor and OPG at which point the Contractor will file a PDF version of the accepted Comment / Disposition Forms in the working files.

An OPG review is to ensure that the deliverable satisfies the project scope & design requirements, procedural compliance and OPG's quality expectations. OPG reserves the right to conduct a further detailed review of the deliverable if OPG feels necessary.

Asking questions and clarifications and providing suggestions and alternative approaches with respect to design issues when required. This is not to be misinterpreted as direction or advice from OPG to the Contractor.

OPG is not accountable for the accuracy of technical content of any document produced by the Contractor, including validation of any assumptions regarding existing condition of the equipment/system interfacing with the new modification. For greater certainty, the Contractor bears the entire risk for design & implementation of the work in accordance with the OPG Specification.

### (2) Accept

Accept means that the document or deliverable is suitable for its intended use, and meets process, format and content requirements as required for its input into OPG's approved information management system.

OPG will indicate acceptance of a document by a suitable stamp on the document signatory page, or by an OPG Coversheet, identifying OPG accepting signatories, which is then attached to the document being accepted, or by an electronic signature in the OPG Asset Suite program. OPG's acceptance of the product does not relieve the Contractor from responsibility for errors or omissions or from any obligations or liability under the contracted OPG Specification.

Asking questions and clarifications and providing suggestions and alternative approaches with respect to design issues when required. This is not to be misinterpreted as direction or advice from OPG to the Contractor.

OPG is not accountable for the accuracy of technical content of any document produced by the Contractor, including validation of any assumptions regarding existing condition of the equipment/system interfacing with the new modification. For greater certainty, the Contractor bears the entire risk for design & implementation of the work in accordance with the OPG Specification.

### (3) Authorize

Revision: <b>R000</b>	Page: <b>7 of 61</b>

Title:

### CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR

For the Contractor deliverables like Design Manuals, and Design Plans , OPG site Design Authority will sign-off for 'Authorized for Use'.

Asking questions and clarifications and providing suggestions and alternative approaches with respect to design issues when required. This is not to be misinterpreted as direction or advice from OPG to the Contractor.

OPG is not accountable for the accuracy of technical content of any document produced by the Contractor, including validation of all assumptions regarding existing condition of the equipment/system interfacing with the new modification. For greater certainty, the Contractor bears the entire risk for design & implementation of the work in accordance with the OPG Specification.

#### (4) Support

As applicable, Support means to lend the Contractor verbal and process guidance by:

- Attending and contributing at meetings.
- Participating in discussions and providing informal undocumented comments.

Asking questions and clarifications and providing suggestions and alternative approaches with respect to design issues when required. This is not to be misinterpreted as direction or advice from OPG to the Contractor.

OPG is not accountable for the accuracy of technical content of any document produced by the Contractor, including validation of any assumptions regarding existing condition of the equipment/system interfacing with the new modification. For greater certainty, the Contractor bears the entire risk for design & implementation of the work in accordance with the OPG Specification.

#### (5) Approve

1. Engineering Approval is conducted by the Contractor under the Contractor's QA program. Approval of engineering design documentation may require a Professional Engineer's (P. Eng) signature and seal. Such approval means taking professional design responsibility for the engineering document.
  2. OPG or Design Authority (DA) approval shall be performed by OPG to signify OPG's acceptance that the product(s) is prepared, reviewed, and verified by competent persons and that appropriate processes/procedures including codes and standards were applied. In addition, the approval shall ensure that the document or deliverable is suitable for its intended use, and meets process, format and content requirements as required for its input into OPG's approved information management system.
  3. Director of Operations & Maintenance (DOM) approval signifies the deliverable has no significant impact on Plant Operations and License obligations (e.g., Safety, Environmental, Production etc.)
-

## 2.4 Deviations from the COIR

Deviations are changes to the roles and responsibilities for the applicable elements of the COIR. Deviations from this COIR will be documented in the approved Deviation List (N-Form-11583). Some of the accountabilities performed by the Contractor require Purchase Service Agreement (PSA) with unions representing OPG staff. Based on PSAs obtained, deviations from the COIR may be required.

## 2.5 Asset Suite Updates

All Asset Suite activities should be completed as the Engineering Change is progressed through the EC process.

Submit documents to OPG's Information Management Services (IMS) with proof of OPG representative acceptance. As appropriate, submissions can be completed via the Supplier Document Hub (SDH) or through one of the following emails

- a) Internal: DNGD:REFURB DM –NUCLEAR or
- b) External: [nrdocmgmt@opg.com](mailto:nrdocmgmt@opg.com)

### Notes:

- 1. Do not include any other IMS mailboxes/contacts in email submissions.
- 2. OPG is replacing the SDH with a new Nuclear Projects custom Electronic Document Management System (EDMS).

**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

### APPENDIX B: Procurement Plan Template

The Procurement Plan shall be prepared and include the Owner or Contractor Specified Materials and Services procurement activities. The Procurement Plan shall be based upon the Contractor's qualified procurement program.

The plan may include, but not limited to, the following elements:

1. Executive Summary
2. Background Information
3. General Description of Product/Services
4. Technical and Regulatory Requirements
5. Historical and Future OPG Usage
6. Vendor/Marketplace Capabilities & Supply Restrictions
7. Existing OPG/Vendor Relationships
8. Bidder Prequalification
9. Competitive Tendering
10. Evaluation/Negotiation & Contract Award
11. Subcontract Management
12. Scheduling
13. Staffing and Succession Plans
14. Source Surveillance
15. Concessions and Exceptions
16. Sourcing Strategy
17. Success Criteria
18. Risks and Mitigations
19. Commercial/Contractual Requirements
20. Contract Administration Considerations
21. Quality Assurance
22. Quality Control
23. Expediting
24. Transportation/logistics,
25. Site Receipt of Goods, Warehousing
26. Claims Resolution
27. Invoice Approval
28. Contract Closeout
29. Post Contract Considerations
30. References

Title:  
**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

### APPENDIX C: Non-Conformance Post-Installation Reporting

The Contractor shall submit a notification on company letterhead endorsed by Senior Quality Management addressing the following as a minimum:

- (a) A clear description of the defect or non-conformance.
- (b) An assessment on the impact of the defect or non-conformance to the product form, fit or function. Also address the potential impact on safety if known.
- (c) Identify OPG CatID numbers(s) that are affected including OPG PO and line item numbers, ship date, quantity, manufacturer product identification / traceability (i.e. serial number, lot number, batch number, manufacturing date, etc.).
- (d) Immediate short term actions to be taken to remedy the situation at OPG (address the availability of replacement item(s) and delivery time lines).
- (e) Long term corrective action plan to address the root cause for the defect or non-conformance, including completion / implementation commitments.

Contractor to submit notification by email to: [scqs.suppliers@opg.com](mailto:scqs.suppliers@opg.com)

Title:  
**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

### APPENDIX D: OPG Approved Supplier List

(a) **Use of OPG's ASL.**

Subject to the other requirements of the Agreement, the Contractor will be able to utilize vendors on OPG's Approved Supplier List (ASL). All vendors which are active on OPG's ASL are maintained up to date and their qualification is current. OPG's ASL is maintained using OPG's QA Program.

OPG will provide to the Contractor a list of vendors qualified on OPG's ASL. The list will contain the following information: the Asset Suite Vendor Code, Vendor name, supplier web page – when available, Quality level (QL1 or QL3), qualification result (SAT or UNSAT), detailed scope of qualification, including scope restrictions, if the vendor has Corrective Actions issued or restrictions and warnings (only Yes or No – no additional details), qualification effective date and expiry date, scope of supply – manufacturer, services, distributor, etc, Pressure Boundary (PB), non PB flag, and quality standard used. The Contractor may use the list for the sole purpose of work to be performed for OPG.

Vendors on OPG's ASL may be used by the Contractor only if the Contractor determines that the information provided is sufficient and meets the requirements of the applicable standards and the Contractor's own quality program. The Contractor is responsible to use the vendors on OPG's ASL only for the specific purpose(s) for which they have been approved on OPG's ASL. The Contractor is solely responsible for taking all necessary actions to ensure that its sub-suppliers have the technical and quality assurance capability for the scope of work they are utilized for, and the ability to provide the required product or service. This includes obtaining assurance that the sub-suppliers have an appropriate and effective quality program implemented in accordance with the Contractor's own quality program and applicable standards requirements.

The use of vendors on OPG's ASL does not preclude or limit in any way the Contractor's responsibility for and obligation to provide OPG with quality parts and services meeting all requirements under the Agreement.

(b) **Use of suppliers not on OPG ASL**

If the Contractor's requirement is not satisfied by vendors on the OPG's ASL, or the scope of qualification for a vendor on OPG's ASL needs to be changed, the Contractor shall inform OPG and obtain OPG's acceptance to use a new supplier when required as identified below:

(i) **OPG acceptance is required for the use of sub-suppliers only when:**

The Contractor acts a procurement organization as per CSA N286-05 for the purchase of items and services:

- For QL1 and QL3 items only when a quality program is specified
- For QL1 and QL3 items, when the specified quality program is for CSA Z299.3 or higher (e.g. CSA Z299.1/.2/.3, NCA 3800 Material Organizations)
- When a primary CSA N286-05 engineering, procurement or construction is subcontracted in its entirety

## Contractor/Owner Interface Agreement

Document Number: <b>N-COI-00120-00001</b>	
Revision: <b>R000</b>	Page <b>60 of 61</b>

Title:  
**CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR**

(ii) **OPG acceptance is not required for sub-suppliers:**

- When the Contractor purchase materials/ components following a CSA Z299 program as part of their manufacturing process (i.e. the Contractor is the manufacturer or the manufacturer of record)
- When there is no quality program specified
- When the specified quality program is CSA Z299.4 or ISO 9001
- Service suppliers (other than those primary N286-05 engineering, procurement, or construction service suppliers identified above in (i))
- Software suppliers

The Contractor shall evaluate, audit as appropriate, and approve the new supplier, according to the Contractor's own quality program. When OPG acceptance to use a supplier is required and obtained, the Contractor shall provide the audit report, checklist, corrective action requests and certificates to OPG. When OPG acceptance is not required, the Contractor shall maintain the audit report and checklists according to their own quality program requirements and provide it to OPG upon request.

(c) **Administrative Instructions for requesting OPGN acceptance to use suppliers not on OPGN ASL**

When EPC suppliers performing Nuclear Power Plan Procurement want to use a supplier not on OPG's ASL, the N286-05 qualified EPC Contractor/Subcontractor shall send requests for acceptance to [scqs.suppliers@opg.com](mailto:scqs.suppliers@opg.com).

The emailed request shall include:

- 1) Purpose of the request: e.g. "This is to request OPG acceptance of our use of a supplier not on OPG's ASL per N-DAI-0010-10000 requirements."
- 2) Attach N-FORM-10170 – ASL action request, (the form shall be appropriately filled out). The form shall include a brief business justification as to why OPG should accept. Note: justification section on the N-FORM-10170 shall address OPG business considerations such as the following:
  - a. Cost considerations, specifically:
    - i. Minimize the addition of new suppliers required to be maintained on OPG's ASL for replacement/maintenance activities going forward.
    - ii. Maintain and continue existin OPGN business leverage with strategic partners on OPG's ASL.
    - iii. Other business benefits/reasons why OPG should accept when it conflicts with OPG's business considerations.
  - b. Quality considerations:

### CONTRACTOR/OWNER INTERFACE REQUIREMENTS FOR NUCLEAR

- i. Preference is to suppliers with a history of acceptable CSA Z299 Quality Assurance program implementation and experience/knowledge of CSA Z299 requirements.
    - c. Sustainable Businesses considerations – Per N286-05 Clause B.2 – Supplier has to have a reliable and maintainable business (provide replacement parts or support warranty issues).
  - 3) Copies of Audit Report & Checklists (if already performed), or identification that an audit will be performed and the report and checklist will be submitted for OPG acceptance at a later date, prior to purchase orders being issued.

Title: <b>DARLINGTON REFURBISHMENT CONTRACT MANAGEMENT PLAN</b>		

## 1.0 PURPOSE

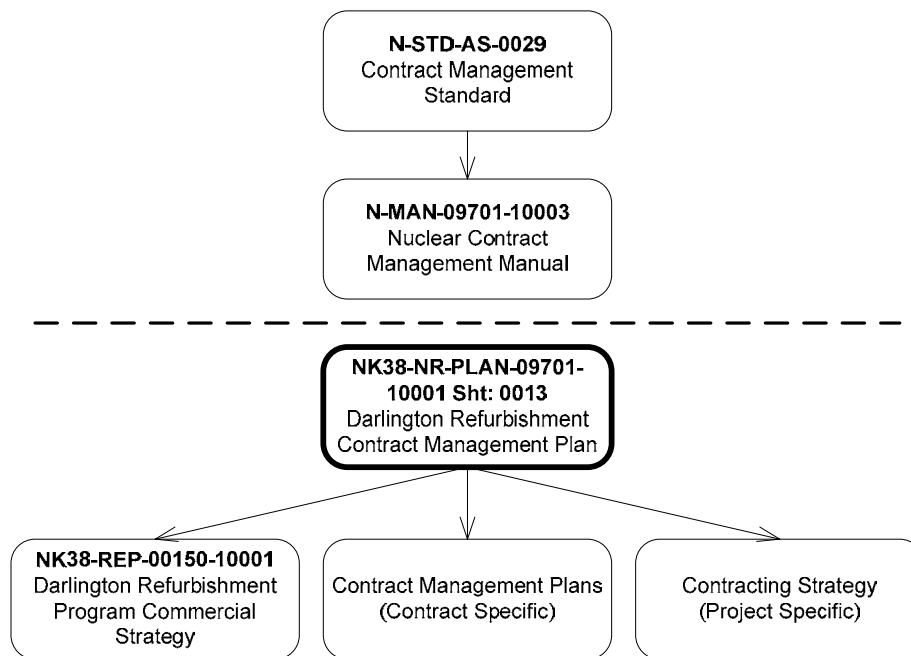

The purpose of this Program Management Plan (PgMP) is to define how the major *Contracts* within Darlington Refurbishment (DR) will be defined, managed, and controlled.

Contract management is the process that enables all parties to a *Contract* to meet their obligations in order to deliver the objectives required from the *Contract*. It involves building a good working relationship between OPG and the Supplier(s), and continues throughout the life of a *Contract*. Active contract management shall ensure OPG and Supplier compliance to contractual obligations through project monitoring, early identification of potential issues and prudent management of issues as they arise. Contract management includes oversight of Suppliers to ensure they are meeting safety, quality and performance requirements.

This PgMP aligns with the requirements laid out in NK38-NR-PLAN-09701-10001 Sht: 0001, Darlington Refurbishment Program Structure.

## 2.0 PROGRAM REQUIREMENTS

This Contract Management PgMP aligns with Nuclear, Corporate, and other business unit governance, governance support and non-governance documentation. Figure 1 shows the framework of documents that impact this PgMP.

**Figure 1: Contract Management Documentation Framework**

Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0013</b>	Revision Number: <b>R001</b>	Page: <b>6 of 16</b>
Title: <b>DARLINGTON REFURBISHMENT CONTRACT MANAGEMENT PLAN</b>		

Activities within the Contract Management organization are broken into two groups – overall program requirements and contract specific requirements.

## 2.1 Overall Program Requirements

The purpose of the Darlington Refurbishment Program Commercial Strategy (NK38-REP-00150-10001) is to set out the overall commercial framework with guiding principles for establishing and maintaining commercial relationships with third parties to support the DR program objectives.

Project Director, Contract Management reviewed the *DR Commercial Strategy*.

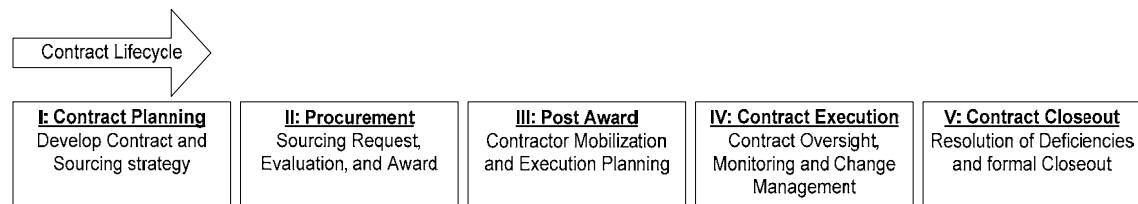

Vice President, Nuclear Projects Oversight approved the *DR Commercial Strategy*.

Senior Vice President, Nuclear Refurbishment approved the *DR Commercial Strategy*.

The *DR Commercial Strategy* should be reviewed and updated annually.

## 2.2 Contract Specific Requirements

The contracting process for a specific *Contract* is implemented in five stages in accordance with N-STD-AS-0029, Contract Management Standard, and as illustrated in Figure 2. Appendix A describes the agreed roles and accountabilities Contract Management and Supply Chain organizations throughout the contract lifecycle.

**Figure 2: Contracting Process Stages**

### 2.2.1 Stage 1: Contract Planning

The contract planning stage of the contract management life cycle includes preparation of the *Contracting Strategy*.

Manager, Strategic Contract Management will prepare a *Contracting Strategy* for each major work package in accordance with the *DR Commercial Strategy*. The *Contracting Strategy* will be prepared taking into consideration input from the Project Manager, Supply Chain and other relevant stakeholders.

Project Manager will recommend the *Contracting Strategy*.

Project Director, Contract Management will concur with the *Contracting Strategy*.

Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0013</b>	Revision Number: <b>R001</b>	Page: <b>7 of 16</b>
Title: <b>DARLINGTON REFURBISHMENT CONTRACT MANAGEMENT PLAN</b>		

Vice President, Nuclear Projects Oversight will approve the *Contracting Strategy*.

Senior Vice President, Nuclear Refurbishment will approve the *Contracting Strategy*.

### 2.2.2 Stage 2: Procurement

The procurement stage of the contract management life cycle includes sourcing and awarding of *Contracts* in accordance with the *Contracting Strategy*.

Manager, Strategic Contract Management and / or *Contract Manager* will provide input and concur with procurement documentation prepared by Supply Chain such as the Expression of Interest and Request for Proposals.

Manager, Strategic Contract Management and / or *Contract Manager* will participate in the Supplier selection process including:

- Establishing evaluation and selection criteria
- Development of negotiation strategy and plans
- Bid evaluations
- *Contract* negotiations
- *Contract* award

### 2.2.3 Stage 3: Post Award

The post award stage of the contract management life cycle covers Supplier mobilization and execution planning.

*Contract Manager* should develop a *Contract Management Plan (CMP)* for each *Contract* supporting a major work package in accordance with N-MAN-09701-10003, Nuclear Contract Management Manual.

Project Manager will concur with the *CMP*.

Project Director, Contract Management will approve the *CMP*.

The *CMP* will be reviewed on a periodic basis as activities under the contract proceed and when *Contract* changes or amendments are executed, but not less than annually.

The *Contract Manager* is be responsible for supporting the Project Manager with interpretation and clarification of *Contract* terms and conditions and ensuring that all obligations under the *Contract* are being met by both parties.

*Contract Manager* should provide input into the project management plans, procurement oversight plan, and should participate in the Supplier kick-off meeting.

### 2.2.4 Stage 4: Contract Execution

The contract execution stage consists of a range of activities that can be grouped into the following three key areas:

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0013</b>	Revision Number: <b>R001</b>	Page: <b>8 of 16</b>
Title: <b>DARLINGTON REFURBISHMENT CONTRACT MANAGEMENT PLAN</b>		

1. Service Delivery Management
2. Relationship Management
3. *Contract* Administration

All three areas must be integrated and managed successfully for OPG to achieve the intended value of the *Contract*. This means optimising the efficiency, effectiveness and economy of the service or relationship described by the *Contract*, balancing costs against risks and actively managing the relationship.

The Project Team will execute the contract management activities as outlined in the *CMP*, with support from the *Contract Manager* as applicable. Activities that the *Contract Manager* will be involved in include:

- Management of *Contract* documentation
- Management of OPG complaints/disputes with Supplier
- Management of Supplier complaints/disputes with OPG
- Provides evidence to Supply Chain and Law in support of formal claims process
- Management of Supplier warranty and/or rework requirements
- Management of *Contract* Project Change Directives (PCDs)
- Assist with drafting and implementation of *Contract* Amendments (as required)
- *Contract* performance monitoring and reporting (e.g., Supplier scorecards)
- Management of insurance requirements
- Review of subcontractor *Contracts*
- Assessment of Supplier Workplace Safety and Insurance Board certificates
- Oversight of Supplier recovery plans as required
- Execution of engineering, procurement, and / or construction terms and conditions
- Commercial contract input on Supplier invoices (as requested)
- Analysis of Supplier financial information
- Supplier correspondence register
- Program and project status reports
- Supplier risk management

*Contract Manager* shall participate in meetings related to the *Contract*, including:

- Project meetings
- Joint steering committee meetings
- Executive committee meetings
- Challenge meetings

*Note: Contract Management will organize and chair the Contract Steering Committee Meetings.*

### 2.2.5 Stage 5: Contract Close Out

The contract close out stage covers ensuring all products and services have been delivered and accepted, fulfillment of contractual requirements, and resolution of deficiencies and claims.

## Plan

Internal Use Only		
Document Number: <b>NK38-NR-PLAN-09701-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>0013</b>	Revision Number: <b>R001</b>	Page: <b>9 of 16</b>
Title: <b>DARLINGTON REFURBISHMENT CONTRACT MANAGEMENT PLAN</b>		

*Contract Manager* will recommend to the Project Manager that the *Contract* is ready for close-out. Prior to recommending *Contract* close out, the *Contract Manager* should:

- Ensure all disputes and / or claims have been resolved
- Confirm that all contractually required documentation has been received from the Supplier
- Confirm that all products and services provided under the *Contract* have been accepted by the Project Team
- Ensure that all outstanding project security documents (i.e. letters of credit) have been returned
- Confirm that all contractually required payments have been processed

*Contract Manager* will participate in any lessons learned sessions that take place prior to or after a *Contract* has been closed.

### 2.3 Performance Indicators

Contract Management organization will execute the major contract audit program.

Contract Management organization will perform an annual self-assessment of its adherence with this PgMP.

Contract Management organization will perform *Contract* compliance reviews as required. The purpose of the reviews will be to assess execution of a *Contract* compared to the CMP and the *Contract* terms and conditions.

Contract Management organization will perform a review of Station Condition Records related to *Contract* issues, compliance, and misinterpretations.

### 3.0 ROLES AND ACCOUNTABILITIES

The Contract Management organization shall ensure that contract management is implemented within the Darlington Refurbishment program as set out in N-STD-AS-0029, Contract Management Standard, and N-MAN-09701-10003.

Project Director, Contract Management, will ensure that a *Contract Manager* is assigned to support each major work package for the duration of a *Contract*.

Project Director, Contract Management is the document owner and is responsible for the definition and implementation of this document.

## 4.0 DEFINITIONS AND ACRONYMS

### 4.1 Definitions

**Commercial Principles:** As defined in N-MAN-09701-10003, the commercial principles for contract management are Accountability, Value for Money, Fairness and Transparency, and Risk Transfer/Sharing.

**Contracting Strategy:** An internal, OPG confidential document that takes into consideration factors such as the nature and scope of the work, the Supplier marketplace, potential longer term or broader commercial arrangements and results in a recommendation of the procurement approach, contract structure, pricing mechanism and the style and type of management to be adopted for the subsequent *Contract*. The depth of analysis and documentation required for each *Contracting Strategy* is based on a graded, risk-based approach, supported by adequate inputs and analysis taking into consideration the *Commercial Principles*.

**Contract:** An agreement between two or more parties based on an agreed allocation of rights, obligations, responsibilities, and risks. *Contracts* are based on the concept of 'offer and acceptance' which may be enforced by a court.

**Contract Management Plan (CMP):** An internal, OPG confidential document which outlines OPG's approach to managing key contractual terms and risks for a specific *Contract*. It identifies systems and processes to ensure that the Supplier complies with the terms and conditions during the performance of the *Contract*. The *CMP* is developed utilizing a risk-based approach. The *CMP* is a living document that will continue to be updated throughout the life of the *Contract*.

**Contract Manager:** A member of the Contract Management organization that it engaged exclusively with the management of the *Contract* (in support of the Project Manager) and involved in the planning and implementation of the *Contract*. Responsibilities of the Contract Manager are documented in N-MAN-09701-10003.

**Darlington Refurbishment Commercial Strategy (NK38-REP-00150-10001):** An internal, OPG document that sets out the overall commercial framework with guiding principles for establishing and maintaining commercial relationships with third parties to support the DR program objectives from schedule, quality, and cost perspectives.

## Appendix A: Roles and Accountabilities for Contract Management, Project Management and Supply Chain

The following roles and accountabilities were agreed between the VP Nuclear Projects Oversight and the VP Supply Services OPG Projects on August 6, 2015.

**Principles:** Contract Management and Supply Chain organizations will work together, sharing project, supplier, and contract related information and providing assistance to each other as required.

Stage of Work		Contract Management (CM) <sup>1</sup> & Project Management (PM)	Supply Chain (SC)
Preparation/Planning	1	PM identifies need (services and materials) and CM develops Contracting Strategy. If need is for materials only, SC to support.	Provide input to Contracting Strategy
	2		Determine mitigating strategies for long lead and at risk materials
	3	PM prepares Scope of Work. CM reviews Scope of Work (and assists with developing Scope of Work for MSAs)	Review and provide input to Scope of Work
	4	Review and provide input to the Procurement Strategy	Develop Procurement Strategy
	5		Review vendor procurement plans. Perform oversight of EPC contractor procurement activities.
	6	Provide input to procurement documents	Prepare and issue procurement documents
	7	Provide input to proposal evaluation criteria	Document criteria and weightings for proposal evaluation
	8	Participate in SC led bid evaluation. Escalate if cannot agree on vendor selection.	Evaluate Bids with CM and PM Escalate if cannot agree on vendor selection.
	9	Chair Contract Steering Committee Meetings	Provide input to Steering Committee presentations and

<sup>1</sup> CM is involved in all strategic contracts or contracts that exceed \$40 MM. Otherwise the CM accountabilities are managed by the PM

**DARLINGTON REFURBISHMENT CONTRACT MANAGEMENT PLAN**

Stage of Work		Contract Management (CM) <sup>1</sup> & Project Management (PM)	Supply Chain (SC)
		into a contract amendment on at least an annual basis.  CM to identify and track all PCD's in a consistent manner for all major contracts	SC to be copied on, or have access to, all PCD tracking information.
	21	Assists Supply Chain with the drafting and implementation of contract amendments as required.	SC drafts amendments, revises purchase orders, and seeks approvals.
Claims and Contract Close-Out	22	PM/CM informs SC of potential warranty claims associated with the work.	SC determines if warranty applies. Enforces warranty and other terms and conditions.
	23	Manage vendor complaints/ disputes related to scope, schedule and cost, or anything that is not significant in nature.  Inform SC of significant complaints /disputes at an early stage. <sup>2</sup>	Manage all formal vendor claims. Ensure PM/CM aligned with settlement terms and conditions.
	24	Work with PM to provide evidence to support formal claims.	Manage and negotiate disputes that have escalated to formal claims.
	25	PM to identify when work is complete and when milestones have been met. PM/CM to notify Supply Chain of completion of contract deliverables and of final payment.	Close-out purchase orders.
	26	Implement a major contract audit program. Inform SC of audits and audits results. Work collaboratively with SC to resolve findings.	Support enforcement of resolution of audit results. Assess impact against other contracts for precedents, etc.
	27	Support OEB reporting	

Notes:

This allocation of responsibility currently applies to the DNR program and does not apply to

<sup>2</sup> It is anticipated that approximately 90% of disputes can be resolved between PM/CM and Supplier before a formal claims process is initiated. SC and Legal will manage formal claims disposition.

Title:  
**DEFUELLING PROJECT MANAGEMENT PLAN**

## 1.0 INTRODUCTION

Darlington Nuclear Generating Station (DNGS) requires a major refurbishment in order to extend the service life of all four production units. The refurbishment is currently planned to begin in 2016. The first unit will be shutdown and restarted with no overlap while the remaining units will have a partially overlapping sequence with the third unit shutdown commencing after removal of all reactor components in the second shutdown unit. The first major step in the Refurbishment Program is to remove the irradiated fuel from the reactor core (i.e. 480 channels everyone containing 13 fuel bundles for a total of 6240 irradiated fuel bundles) in order to allow the downstream activities, including RFR, to be executed.

## 1.1 Project Scope

The main scope of the Project is to design, manufacture and test Defuelling tools with support from an External Contractor as well as defuel the entire reactor core using OPG resources. The Defuelling activity will be repeated for all four units at DNGS, is on the Critical path, and needs to be completed in the shortest practical timeframe.

The following Defuelling tools/software are being required:

- Universal Carriers (UC)
- Flow Restrictive Outlet Bundles (FROB)
- Dummy Fuel Bundles (DFB)
- Fuel Push Tool (FPT)
- New Fuel Transfer Mechanism (NFTM) modification
- Software changes (SW)
- Grappling Equipment

## 1.2 Technical background

A number of defuelling options were considered for the units in NK38-REP-35000-10004 "Darlington NGS Defuelling Study" [1] and the option selected is flow defuelling using 2 Fuelling Machines (FMs) with 2 channels being defuelled simultaneously where possible.

Flow Defuel uses the flow of the Primary Heat Transfer (PHT) system to push the fuel into the downstream fuelling machine. FROBS will be inserted into the empty channels to mimic the flow resistance of a fuel string and maintain overall core hydraulic conditions constant. There will be some channels close to the periphery where PHT flow alone is not able to defuel a channel so dummy fuel bundles will be used to displace the irradiated fuel into a fuelling machine.

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

### 1.3 Project Management approach

The Defuelling project is divided into three phases:

- The Definition Phase includes tasks required to complete detail design, supply of prototype components and testing of these components. The definition Phase will be completed in August 2015 with DCAVR (Design Completion Assurance Verification) process.
- The Execution Phase includes tasks required to commission the components at the DNGS as well as defuel entire reactor core on Unit 2 and will be repeated three times for the rest of the reactor units. It will start in July 2015 after the DCAVR process is completed and will end in 2021 after Unit 4 is defueled.
- The Project Closeout Phase will be done at the end of the Execution Phase for Unit 4 in 2021.

The initial revision of the Project Management Plan covers the planned effort for the Definition Phase i.e. June 2013 and up to August 2015 (Design Completion Assurance Verification Requirements process – DCAVR). The second revisions will focus on the early portion of the Execution phase i.e. commissioning (June 2015 - April 2016).

The project management approach for the Defuelling project is as follows:

- The EP (Engineering, Procurement) part will be executed by an External Contractor: General Electric Hitachi Nuclear Energy Canada (GEH-C) was chosen as the Defuelling Contractor.
- The C (Construction) part will be executed by OPG with technical support from the Contractor since only authorized OPG staff (Fuel Handling panel and field operators) can operate/maintain the Fuel Handling system.

OPG will be accountable for performing oversight for the EP Contractor and integrating all work packages throughout the project lifecycle.

### 1.4 Project roles and accountabilities

The key roles on the Defuelling project are:

- Project Sponsor: Vice President, Nuclear Refurbishment Execution
- Contract Owner: Defuelling Project Manager and authorized delegates
- Engineering Lead
- Project Controls Lead
- Contract Manager

For other roles see Appendix A "OPG Defuelling Project Organization".

N/A	R001	8 of 40

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

### **1.5 Limits of Authority**

The authority to execute the Defuelling Project resides with project Sponsor – Vice president of Refurbishment Execution. As sponsor he delegates execution authority to the Defuelling Project Manager. This authority includes the following:

- Determine the structure, size and makeup of the organization required for project execution.
- OAR (Organizational Authority Register) authority for Defuelling project costs.

### **1.6 Project organization**

The Defuelling project staffing structure has been organized to facilitate project execution. The organization has been setup to align with the execution model and contract. For more details about the project organization see section 9.0 "Project Human Resource Management".

## **2.0 GOVERNANCE STRUCTURE AND INTERFACES**

### **2.1 Defuelling Management Plan**

Defuelling Management Plan is consistent with NR Program Management Plan NK38-NR-PLAN-09701-10001 sheet 1 "Darlington Refurbishment Program Structure" [2] and the Project Management Body of Knowledge (PMBOK), fourth Edition [R3]. The content of this PMP is divided into nine knowledge areas as shown below:

- Section 4.0 Project Integration Management
- Section 5.0 Project Scope Management
- Section 6.0 Project Time Management
- Section 7.0 Project Cost Management
- Section 8.0 Project Quality Management
- Section 9.0 Project Human Resources Management
- Section 10.0 Project Communications Management
- Section 11.0 Project Risk Management
- Section 12.0 Project Procurement Management

There is a separate section dedicated to Safety as a cornerstone of the Project.

Sheet Number:	Revision Number:	Page:
N/A	R001	9 of 40

Title:	DEFUELLING PROJECT MANAGEMENT PLAN
--------	------------------------------------

### 3.0 SAFETY

Safety is the core value of the Nuclear Refurbishment and Defuelling Project.

#### 3.1 Safety Management

The Defuelling Project will comply with the requirements in the Health and Safety Management Plan NK38-NR-PLAN-09701-10001, sheet 5 [4].

Specifically the Project will discuss safety issues at the weekly Defuelling Project meetings and safety statistics for both OPG and the Contractor (when applicable) on a weekly basis.

A Project specific Safety Management Plan will be issued prior to the Execution phase of this project (August 2015).

Goals and Objectives:

- No Defuelling Project related injury, illness, or damage to property or the environment is acceptable.
- OPG and Contractor (when applicable) will work collaboratively to prevent all such injury, illness and damage.
- OPG and Contractor (when applicable) will accept nothing short of zero incidents as the only justifiable goal for Nuclear Refurbishment work.
- OPG and Contractor (when applicable) will carry out Defuelling activities in a responsible manner that minimizes risk to employees, and the public.

#### 3.2 Environment Management

The Defuelling Project will comply with requirements of Program Environmental Management NK38-NR-PLAN-09701-10001, sheet 4 [5].

#### 3.3 Execution/Implementation Management

The Defuelling Project will comply with requirements of Darlington Refurbishment Construction Program Management Plan NK38-NR-PLAN-09701-10001, sheet 12 [6]. OPG will have different roles during the Definition and Execution project phases as follows:

- Definition phase: Owner role
- Execution phase: Constructor role

Plan

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

## **4.0 PROJECT INTEGRATION MANAGEMENT**

### **4.1 Integrated Governance**

This section refers to the integration of OPG and Contractor's governance is outlined in details as part of the approved Contract/Owner Interface Requirements document (COIR) for Defuelling project (D-DAI-35000-10003) [7] and the associated list of approved deviations as documented in NK38-CORR-35000-0481077 [8].

### **4.2 Project Management**

The technical side the project is supported by the NK38-SOW-35000-10002 "Scope of Work – Reactor Defuelling" [9] and a suite of other technical documents while the commercial side is covered by NK38-REP-09701-10020 "Contracting Strategy for Fuel Handling Defuelling" [R10] as well as the Defuelling Contract.

### **4.3 Project Oversight**

Defuelling project oversight covers all activities required to be performed by OPG in order to properly oversee the Contractor's activities as well as its own activities over the life of the project. All oversight activities will follow "Nuclear Refurbishment Project Oversight" N-MAN-09701-10002 [11] and will be planned and documented on Risk, Management and Oversight Tool (RMO). When oversight activities are performed, the findings will be documented in the Oversight Log which is a separate tab on RMO Database.

#### **4.3.1 Project team oversight**

Defuelling project team oversight plans to use the following guiding principles:

- Trust but verify.
- Use a risk based approach – level of intrusiveness. The more risk the more oversight required.
- Alarm before fail.
- Focus on identifying and correcting organizational weaknesses in the EP Contractor's management system rather than focusing on individual performance.
- Use Pareto principle to focus oversight on the right 20% of the products and services to uncover 80% of the problems.
- Escalate issues quickly when problem persist.

#### **4.3.2 Functional team oversight**

The Nuclear Refurbishment (NR) program will provide an important formal aspect of project oversight over the Defuelling Project team that will be executed through the NR Functional Support groups. This formal functional team oversight will be delivered via the self assessment process that will ensure that performance of work meets the requirements and

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

opportunities to improve the functional management systems per N-PROC-RA-0097 "Self-Assessment and Benchmarking" [12] are taken.

#### 4.4 Engineering Design Management

The Defuelling Project Engineering Plan has been developed by the Contractor to describe how work will be organized and where applicable processes and procedures will be located for these activities. This plan is based on the requirements from the Defuelling COIR [7] and may be revised periodically to align with the Contract schedule.

The breakdown of individual work packages was determined by the Contractor in consultation with OPG and is captured in the Contractor's Engineering Plan and Schedule. Planning for activities within the individual work packages will be conducted as specified below:

##### 4.4.1.1 Engineering Modifications

The Contractor developed Detailed Design Plans for each individual work package to address the associated engineering activities beginning with conceptual engineering and finishing with the release of the construction packages. Those work packages following OPG's ECC process N-PROC-MP-0090 "Modification Process" [13] will require the Design Authority to authorize the Contractor's detailed design plans via a separate coversheet during the "Modification Planning" and "Closeout" phases.

##### 4.4.2 Scoping

During the scoping phase of the project, OPG developed and approved a set of Modification Design Requirements (MDR) and Component Design Requirements under 3 separate Master ECs. The following documents will form the bounding Design Basis Requirements and thus, as a set, shall be considered a set of Modification Design Requirements for the project:

Master EC #	Title	Documents
<b>118844</b>	0-35000-MASTR: Darlington Reactor Defuelling Introduction Of Flow Restricting Outlet Bundles And Dummy Bundles	NK38-MDR-35000-10001 TD 38-35667-022-002 TD 38-35667-022-003 TD 38-35667-022-004 NK38-REP-35000-10008
<b>119682</b>	0-35211-MASTR: Introduction Of Universal Carriers In Lieu Of Existing Fuel And Defuel Carriers In Support Of Darlington Reactor Defuelling	NK38-MDR-35211-10001 TD 38-35211-022-102
<b>119684</b>	0-35260-MASTR: FM Flow Injection Modification	NK38-MDR-35260-10001

N/A	R001	12 of 40

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

#### 4.4.3 Requirements Traceability Matrix

A Requirements Traceability Matrix (RTM) will be prepared and updated by the Contractor through the design process for modifications and tooling as per NK38-GUID-01900-10001 "Darlington Refurbishment Design Completion Assurance" [14]. The RTM will ensure the design satisfies the critical design requirements which will be submitted as part of the Design Completion Assurance Package (DCAVR). The RTM will identify:

- Basis of the requirement(s) (e.g. MDR Equivalent Design Requirements)
- Specify requirement(s) (e.g. Derived Requirements)
- Method used to prove the requirement (e.g. Calculations & Analysis)
- Evidence of meeting the requirements (e.g. Design EC Package)

#### 4.5 Project Gate Progression

A gate progression strategy for Defuelling Project must take into account the needs and timing associated with the Project Contract Agreement as well as the progression of the project N-MAN-00120-10001 Sheet: GRB "Nuclear Projects – Gated Process [15]. Additionally, it is important to forecast the required finances as accurately as possible. In order to minimize the risk of inaccurate financial planning, the Defuelling project will follow the phased approach to the gate review process that employs 5 principle gated reviews and is based on the maturity of scope development and OPG/Contractor integration.

The following is a high level summary of the phased approach that will be structured through the Contractor versus the gated project phases. It will also highlight the work to be completed in each contractual phase and what gates would apply to those phases. Each Gate will include accurate financial forecasts until the next gate. Overall project estimates will be refined further at each gate review.

Defuelling Project Gate			
P6 Activity	Gate	Information	Date

**Table 2 - Defuelling Project Gates**

#### 4.5.1 Approval Process

Approval of this gate progression strategy is obtained through the Gate Review Board as identified in N-MAN-00120-10001 Sheet: GRB "Nuclear Projects – Gated Process and NK38-NR-PLAN-09701-10001 sheet 0010 "Darlington Refurbishment Management System Oversight Program Management Plan" [16].

### 5.0 PROJECT SCOPE MANAGEMENT

Project Scope Management ensures that the Defuelling project includes all the work required, and only the work required, to complete the project successfully. It is primarily concerned with defining and controlling what is or is not included in the project. Defuelling project scope is represented by the DSR item below:

DSR	Description	Status
SI0200-1	Perform Flow defuelling of Darlington reactors using Flow Defuelling method.	Approved

**Table 3 - Defuelling DSR**

#### 5.1 OPG Scope Management

##### 5.1.1 Scope Definition

The scope of work for the Defuelling project is defined in the Scope of Work document, 'NK38-SOW-35000-10002' [9] and is managed in accordance with program document NK38-NR-PLAN-09701-10001 sheet 02 "Darlington Refurbishment Planning And Controls Program Management Plan" [17].

Scope definition for Defuelling project was conducted by the project organization. A set of three Master EC packages were developed which includes 3 MDRs and 4 Component Design requirements.

##### 5.1.1.1 Scope Requirements Basis

Defuelling project consists of a combination of two-bundle flow-defuelling of the high flow channels followed by push defuelling of the remaining channels. For more details see NK38-PLAN-35000-10003, Refurbishment Defuelling Reliability Readiness Development [34].

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

#### **5.1.1.2 Requirements Management Plan**

Requirements will be managed in accordance with NK38-INS-09701-10001, Darlington Nuclear Refurbishment Program - Scope Control [18].

#### **5.1.1.3 Accepted Deliverables**

Contract deliverables will be accepted based on technical requirements from the Defuelling COIR [7] and applicable sections of the Contract.

#### **5.1.2 Work Breakdown Structure**

The purpose of the Work Breakdown Structure (WBS) is to identify the deliverables with top-down approach that serve as the basis for project scope verification during Project planning phase. The WBS is the foundation of the overall schedule for all phases through to closeout. The control accounts setup at WBS level includes work packages for cost estimation, collecting, and monitoring costs using Proliance Earned Value Management System (EVMS). Defuelling project WBS has been developed in accordance with Darlington Nuclear Refurbishment Program Project Work Breakdown Structure documented in NK38-NR-PLAN-09701-10001 sheet 02 "Darlington Refurbishment Planning And Controls Program Management Plan" [17].

##### **5.1.2.1 WBS Elements**

The purpose of the Work Breakdown Structure (WBS) is to identify the deliverables with a top-down approach that serve as the basis for project scope verification during Project planning phase. The WBS is the foundation of the overall schedule for all phases through to closeout. The control accounts setup at WBS level includes work packages for cost estimation, collecting, and monitoring costs using Proliance Earned Value Management System (EVMS). The Defuelling project WBS has been developed in accordance with Darlington Nuclear Refurbishment Program Project Work Breakdown Structure and documented in NK38-NR-PLAN-09701-10001, Sht: 02 – Darlington Refurbishment Planning and Controls Program Management Plan [17] Using the WBS, performance and cost will be tracked for each of the work packages throughout the project evolution.

<b>N/A</b>	<b>R001</b>

Title:	<b>DEFUELLING PROJECT MANAGEMENT PLAN</b>
--------	---

### 5.1.3 Scope Control

The scope of work for the Defuelling Project will be as defined by the contract between OPG and Contractor. No changes to this scope of work will be accepted by either OPG or the Contractor, unless defined Change Directive process is followed. Any written or verbal instructions to the contrary will not take effect, and will not be accepted by either party.

### 5.1.4 Scope Management Integration

Scope Management Integration shall be performed throughout the project duration, identifying areas of best practice that the Project Team should comply with. Change Control will monitor and control the deviations from the approved design requirements during the life of the project. Change control will become active after work is assigned to Engineering and a design re-baseline has been approved. Potential scope changes shall follow NK38-NR-PLAN-09701-10001, Sht: 02 – Darlington Refurbishment Planning and Controls Program Management Plan [17] No work will be performed on a potential change unless authorized by OPG via the Change Directive Process. In any case, to mitigate schedule risk, OPG may direct Contractor to proceed with the change directive in advance of the formal amendment to the contract. In such cases, the Project Manager (PM) will present the request with the commercial and technical risk to the Senior Management team and request authorization to proceed.

### 5.1.5 Optional scope

There is optional scope outlined in NK38-SOW-35000-10002 – Scope of Work Reactor Defueling [9] that may be added later in 2015 to the external contract.

## 6.0 PROJECT TIME MANAGEMENT

The OPG Refurbishment Defuelling projects governance will be structured for Project Time Management once the Engineering mobilization starts during post contract award phase. This process will include the processes required to manage timely completion of the project. The Time Management plan for Defuelling project will be managed and will be followed in accordance with NK38-NR-PLAN-09701-10001, Sht: 02 – Darlington Refurbishment Planning and Controls Program Management Plan [17]

### 6.1 OPG Time Management

The Defuelling project has developed Level 1 and 2 schedules for the entire duration. The activities have been defined, sequenced and the activity resources and durations were estimated. OPG will track monitor and control Contractor schedule via Level 2 schedule (in work package level). See table below for a summary of key milestones:

Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

## 6.2 Contractor Time Management

The Contractor have developed a Level 2/3 schedule that meets project requirements and establish activities to meet project deliverables as defined by WBS. The following guidelines were used when creating the Post contract Contractor's project schedule:

- Level 2/3
- Show integration with OPG's responsibilities and activities
- Show all required deliverables and all required stages of deliverables
- Show all critical path activities and any activities having 10 days float.
- Logic link all tasks and milestones/submittals associated with the Defuelling Project.
- Minimize use of lags and constraints
- Show all required approvals, including OPG approvals.

## 7.0 PROJECT COST MANAGEMENT

The Defuelling project is governed by NK38-NR-PLAN-09701-10001, Sht: 02 – Darlington Refurbishment Planning and Controls Program Management Plan [17]. Project funding is allocated from the Program via the Gated process and the Gate Review Board in accordance with N-MAN-00120-10001, sheet GRB [15].

Funding required in the current release period is categorized and tracked as follows in Nuclear Refurbishment Project Cost Management system (Proliance):

- *Original Budget* is the approved funding established by the release or Gated Process. Original budgets cannot be altered for the period in which they apply.
- *Control Budget* consists of Original budget plus the sum of all approved Directed Changes (i.e. baseline changes).
- *Approved Funding* consists of Control Budget plus all approved funding requests not impacting the baseline.
- *Projected Budget* represents the accountable manager's forecast of cost at completion of the current release and includes all pending (i.e. unapproved) funding change requests plus the impact of undocumented funding impacts based on managerial judgement.

At this time the Defuelling Project has a Class 3 estimate and a Cost Breakdown Structure (CBS), as part of the Project Gate submission documentation.

**DEFUELLING PROJECT MANAGEMENT PLAN**

## 8.0 PROJECT QUALITY MANAGEMENT

### 8.1 OPG Quality Management

The Quality Management of the project will be in compliance to:

- N-CHAR-AS-0002 – Nuclear Management System [19],
- N-PROG-AS-0001 – Managed Systems [20],
- N-PROG-AS-0007 – Project Management [21],

Along with the following Standards and Guideline documents:

- N-STD-AS-0028 – Project Management Standard [22]
- N-STD-AS-0029 – Contract Management Standard 23]
- N-STD-AS-0030 – Project Oversight Standard [24]

### 8.2 **NK38-NR-PLAN-09701-10001 sheet 10, Darlington Refurbishment Management System Oversight Program Management Plan Operating Experience**

Operating Experience (OPEX) from other stations has been reviewed; in the nuclear industry there have been several reactor Defuelling to date: Pickering A, Point Lepreau and Wolsung are from the Candu 6 design type NPP's and Bruce A is from the Candu 9 design type NPP's, a similar design to Darlington.

From technical point of view the OPEX from Candu 6 stations although relevant in many areas, is not really helpful in certain key design aspects due to large differences between the Defuelling methods: Candu 6 and Pickering A use a "mechanical push" type method by using "ram extensions" inserted by the upstream Fuelling Machine (FM) to push fuel bundles in the downstream FM.

The Bruce A Defuelling process used flow to carry away the fuel bundles, in the downstream FM similar to Darlington method. The OPEX from Bruce proved that the current Flow Defuelling method is viable however the Bruce A reactor feeder design uses equal flow configuration for all reactor channels. The Darlington core design uses flow restrictors in the core outer channels which decreases the flow and makes Flow Defuelling more difficult to be executed.

From Project management point of view both Candu 6 and Candu 9 project OPEX is helpful in sense that for both reactor refurbishments, the Defuelling project was the first major step and it was on the critical path so it received similar attention from the main stakeholders.

Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

### 8.3 Quality Assurance

The Defuelling project and its EP Contractor are required to meet the following requirements:

- Applicable elements for engineering, procurement and construction services of CSA N286-05, Managed System Requirements for NPP as amended, restated or replaced.
- CSA Quality Standards Z 299.2 series of standards or such equivalent quality standard agreed to by OPG that may replace said standard.
- Applicable elements for Design Software (use, modification or development) of CSA N286.7, Quality Assurance of Analytical, Scientific and Design Computer Programs for Nuclear plants.
- Electric Power Research Institute (EPRI) guidelines with respect to the prevention and detection of Counterfeit, Fraudulent and Suspect Items (CFSI).
- Ensuring Subcontractor evaluation and selection is performed in compliance with the requirements of the applicable elements of CSA N286-05 and CSA Z 299 series of quality standards or such equivalent standard agreed by OPG.

OPG has reviewed and accepted the Contractor's Project Quality Assurance Plan.

The Contractor's QA program will be audited at intervals as required, but as a minimum every three years to ensure that the Contractor continues to implement the Quality Program as required by OPG.

During the different phases of Project work, the Project team jointly with the Functional team (i.e. the NR Engineering organization supporting the Defuelling project) will work to ensure the quality of design, quality of materials and services provided are meeting OPG standards, Purchase Order requirements, and compliance to codes and standards as applicable. The oversight activities will be based on the documented oversight plans with the oversight being based on risk, criticality and OPEX.

Assessments, witnessing activities, document reviews etc. will be performed as required ensuring that necessary quality standards are maintained. In the instance of a Quality system failure or a breakthrough event occurring for which the Contractor is accountable; such adverse conditions will be documented per the Contractor's QA Program and per N-PROC-RA-0022 "Processing Station Condition Records" [25]. The Contractor will be asked to initiate a Corrective Action as per their program for any identified quality issues. When there is a systemic failure of their implemented Quality System, a formal Non-Conformance and Corrective Action Request process will be initiated by OPG Supply Chain Quality Services as per N-PROC-MM-0010 "Establishing and Maintaining Ontario Power Generation Approved Suppliers List" [26] and N-GUID-01935-10004 "Desktop Guide for Supplier Non Conformance Correction Requests (NCAR)" [27].

Plan

Document Number: <b>NK38-PLAN-09701-10134</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>20 of 40</b>
Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

To ensure compliance to OPG requirements, the Contractor interface will be controlled by the Contractor Owner Interface Requirement (COIR) document forming part of the agreement and deviations, additions, exceptions, revisions thereto will be accepted by both OPG and the Contractor.

#### **8.4 Quality Control**

The combination of OPG's Program, Defuelling Project and EP Contractor's Plans will be used to ensure quality on the project. As the great majority of the work is executed under the Contractor's Quality Assurance program, OPG will perform oversight and witness key aspects of the work program. For example, witness points will be added to Manufacturing Inspection & Test Plans for Defuelling hardware components.

### **9.0 PROJECT HUMAN RESOURCES MANAGEMENT**

#### **9.1 OPG Human Resource Management**

##### **9.1.1 Team Resourcing**

OPG has retained the role of Project Manager and will be accountable for performing oversight for EP Contractor and integrating all work packages throughout the project lifecycle. The EP Contractor will be accountable to deliver the contracted work as per the individual EP Agreement. The OPG Defuelling Project Organization is shown in Appendix A with key roles and their respective accountabilities described in Appendix A "Project Organization".

Nuclear Refurbishment has elected to employ a Matrix organizational model to execute the Refurbishment Program. It is Defuelling project's plan to staff the project team with OPG staff, and supplemented by Managed task activities to meet the project schedule and needs. OPG staff will either be embedded in the team or will perform functions matrixed from the NR functional support organizations. Where NR functional support staff is currently unable to fulfill a specific need, due to unavailability or missing skill sets, the project will work with the accountable Functional Manager (responsible to acquire the required resources) to either utilize Managed task contracts to maximize outside experience or attempt to find staff within other OPG business units.

### **10.0 PROJECT COMMUNICATION MANAGEMENT**

Refurbishment Program Communications Management Plan is NK38-NR-PLAN-09701-10001sht 14 [35].

#### **10.1 Contractor Communication Management**

External Contractor (EP part of the project): communication is managed in accordance with the Contract and will be related to the engineering, manufacturing, and commissioning activities for the Defuelling tools.

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10134</b>	Usage Classification: <b>N/A</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>21 of 40</b>
Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

Key principles in effective communications are to:

- Adhere to OPG ECC process to communicate with modification stakeholders.
- Engage all relevant stakeholders at the right time.
- Be clear and concise and maintain 3 way communication strategy.
- Maintain integrity in the content of written and verbal communications.

All proprietary information and confidentiality requirements required by OPG will be closely adhered to.

## 10.2 Darlington Station Communication Management

OPG Darlington station (C part of the project): communication is managed in accordance with OPG governance and will be related to the training activities for the FH operators as well as Defuelling execution activities.

## 10.3 Information Control

The main stakeholder communication methods are:

- Telephone and Email communications,
- Submittals and Requests for Information (RFI),
- Meetings, and
- Publications and Reports.

Emails: Regularly used to document interface with stakeholders, the project team and with the Contractor. A Defuelling Project Mailbox may be set up in order to streamline the electronic communication hub. If such Project email is set up, it will be accessible by all members of the OPG Defuelling Team to capture emails deemed important for all project members to be aware of..

Meetings: Conducted face-to-face with available teleconference and/or videoconference as required. The stakeholder meetings involving the Defuelling project and its stakeholders are listed in the Table 5.

Publications and Reports: Defuelling Project publications and reports are described in the applicable sections of this PMP. Publications of Defuelling Project information are also communicated to internal stakeholders via OPG newsletters (e.g. The Pulse) and Intranet websites (e.g. Fuel Handling Project intranet website).

Submittals and RFI's: Submittals and RFIs are important communication methods. Submittals will be defined as per the Contract Agreement. The internal process for handling submittals and RFIs is described in Nuclear Projects Records and Document

Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

Records: Communication Technology and Information distribution tools that will be used by the project include:

- Supplier Document Hub (SDH): External environment used for exchange, management of Submittals, Request for Information (RFI) as per the Defuelling Contract Agreement.
- SharePoint 2007: Internal document storage, exchange environment used for storage of project documents, deliverables, schedules, cost information, as well as confidential & commercially sensitive information relevant to the Defuelling contract.
- NR Refurbishment Documents Management (RDM) are owners of both the SDH, SharePoint, and are responsible for process definition and support, technical support for SDH as it relates to Submittals, RFIs as outlined in the Defuelling Contract Agreement. A generic email is available to contract NR Refurbishment Documents Manage group through (DNGD: Refurb Doc Mgmt)
- Project Records will be maintained in SharePoint and Project Emails. As applicable, project records will be indexed and stored in Asset Suite.

#### 10.4 Stakeholder Inputs

Stakeholder inputs are gathered through the various meetings conducted by and with the Defuelling project staff. Actions, issues and risks are then tracked in the appropriate system as described in the Risk Management Plan portion of this PMP.

The major stakeholders for the Defuelling Project are listed in Table 6 'Defuelling Stakeholder Register'. When situation arise that specific stakeholder input is required but not available, additional resources will be obtained either internally or externally to ensure that any stakeholder input gaps are managed.

An example would be when a specific expertise is required to review an engineering package and an external contractor is utilized for expert review.

Defuelling Stakeholder Register			
Identification	Main Expectations	Potential Influence & Phase of Most Influence	Stakeholder Classification
Darlington Nuclear Generating Station (DNGS)	Return of units 1-4 as per Refurbishment Program Charter	Owners of Plant Systems; Execution Phase	Internal
Contractor	Coordination with OPG as per Defuelling Contract Agreement	Throughout the Entire Project	External
Unions	Upholding of Collective Bargaining Agreements	Execution Phase	External

---------------------------------------	--------------------------------	----------------------------------	----------

**Table 6 - Defuelling Stakeholder Register**

#### 10.4.1 Performance Reporting

Project reporting will be done in accordance with the NR Program as per the Defuelling Project Controls Plan.

### 11.0 PROJECT RISK MANAGEMENT

Risk Management for the Defuelling Project takes authority from the Nuclear Project Risk Management Process N-MAN-00120-10001-RISK [28] and N-MAN-00120-10001-RISK-04, Nuclear Refurbishment Risk Management [29]. In addition, the Defuelling Project will provide oversight on the responsibilities that the EP Contractor is obligated to perform.

The Defuelling Project risks are identified, assessed and maintained in the RMO database and an OPG person from the Project is the assigned SPOC for maintaining and updating the Project risks in RADAR Database.

#### 11.1 Risk Identification and Analysis

All known risks that could impact the Defuelling project will be tracked in the RMO. Information gathering for input to the Defuelling risk register will be taken from issues arising from Defuelling Team meetings, OPEX, Contractor risk register.

The significance of each risk is the product of its impact and probability. These factors are assessed by the Defuelling project team, the appropriate stakeholders for each risk and when needed with help from expert advice according to criteria identified in the Table 6 below.

After assessing the risk factors a number from 1 to 5 is awarded to every factor, then risk is calculated by multiplying the Probability factor with the highest of Financial and Schedule impact factors. Then the number obtained is characterized based on Table 7

Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10134</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R001</b>	<b>25 of 40</b>
Title:		
<b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

“Heat Map” below.

Nuclear Projects Risk Assessments Scale						
Risk Attribute	Definition	1 (Minimal)	2 (Minor)	3 (Notable)	4 (Substantial)	5 (Major)
Probability	The probability that a risk will occur	<20%	20%-40%	40%-60%	60%-80%	>80%
Schedule Impact	The impact that a risk would have on the project critical path	No Delay	< 1 Week	1-2 Weeks	2-6 Weeks	>6 weeks
Financial Impact						
Re-turbishment	Program (Functions)	<\$50M	\$50M-\$100M	\$100M-\$200M	\$200M-\$400M	>\$400M
	Projects (Bundles)	<\$1M	\$1M-\$10M	\$10M-\$50M	\$50M-\$200M	>\$200M
AISC Projects	<\$1M	<\$50K	\$50K-\$100K	\$100K-\$300K	\$300K-\$500K	>\$500K
	\$1M - \$5M	<\$200K	\$200K-\$500K	\$500K-\$1M	\$1M-\$2M	>\$2M
	\$5M - \$10M	<\$400K	\$400K-\$1M	\$1M-\$2M	\$2M-\$4M	>\$4M
	\$10M - \$20M	<\$700K	\$700K-\$2M	\$2M-\$4M	\$4M-\$8M	>\$8M
	>\$20M	<\$2M	\$2M-\$5M	\$5M-\$10M	\$10M-\$20M	>\$20M

Table 7 Project Execution Risk Assessment Criteria/Scale

First the risk Probability is assessed and a number from 1 to 5 is awarded, then similar the Financial and Schedule impact numbers are awarded. Risk is calculated by multiplying the Probability factor with the highest of Financial OR Schedule impact factors. Then the number obtained is characterized based on Table 7 “Heat Map” below:

Risk = Probability x Impact

From the Table above, it can be observed that the FH Powertrack project contains three risk categories:

- Low Risk: scores between 1 – 3
- Medium Risk: scores between 4 – 12
- High Risk: scores between 15-25

Appendix C summarizes the risks from Defuelling project: there are 13 Medium category risks.

Plan

Internal Use Only		
Document Number:	Usage Classification:	
NK38-PLAN-09701-10134	N/A	
Sheet Number:	Revision Number:	Page:
N/A	R001	26 of 40

Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>
---

#### 11.1.1 Project Assumptions and Decisions

Significant assumptions and decisions will follow the process for assumption Identification, ownership, analysis and recording as outlined in N-MAN-00120-10001-RISK-07 "Nuclear Refurbishment Assumptions and Decisions Management" [30]. Current significant Project assumptions are documented in Appendix D: Project Assumptions and Decisions.

#### 11.2 Risk Response Planning

Defuelling Project is implementing the following operational mitigation plan for project risks:

1. All risks will be mitigated, accepted or monitored.
2. All risks that are not being monitored will have mitigation actions.

#### 11.3 Risk Monitoring and closure

Risks are reviewed often for reassessing and updating. Risk closure will follow NK38-MAN-00120-1001, sheet: Risk-03"Task Instruction –Closing Risks" [31] and it is performed by the Project Manager or his empowered delegate. Closure notes (e.g. Closed due to risk overlap / duplication with Risk ID ###) are mandatory. Risk trending, variance analysis and performance metrics are performed at the program level.

#### 11.4 Project Issues

Project issues are recorded in the RMO database. An owner is assigned to each issue. The issues are being reviewed weekly in the project meeting. Each owner will use their judgement as to when to identify the issue as a risk and follow the risk process for monitoring and control. As an example, if there is an organizational issue that can be resolved by simply meeting, the issue will be documented until the meeting has occurred and rectified the issue. If the meeting is held and alignment is still not met, it may then be considered as a risk if there is downstream negative impact to the project outcome.

#### 12.0 PROJECT PROCUREMENT MANAGEMENT

The Procurement Management Plan will define how procurement will be managed by both OPG and the Contractor for the Defuelling Project. The Procurement Management Plan is to be referenced for all specifics on procurement management for all phases and aspects of the project.

The Procurement Management Plan applies to procurement activities performed by the Contractor for the scope of work. This includes the procurement of all OPG specific materials, components, goods and services required to complete the scope of work defined during the Defuelling Project. Refurbishment Supply Chain (RSC) department (part of OPG Nuclear Refurbishment) will support the project team with all

Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

procurement related activities in relation to overall cost, schedule and quality of the project. It is the intent of the Darlington refurbishment program to have the EPC Contractors to procure as much of the refurbishment materials as possible under their own qualified QA program with RSC providing oversight on EPC Contractor procurement activities.

## 12.1 OPG Procurement Management

For all procurement activities, the process is defined in OPG-PROC-0058 Procurement Activities [32]. The procurement terms and conditions will be defined in the Defuelling Agreement and Contractor/Owner Interface Requirements (COIR) which will be issued after contract award. Project specific governance may be created on as required basis.

The following table lists the current project materials milestones for each unit to be refurbished at DNGS.

Unit	Breaker open date	Components for Defuelling project	Material required on site
1 <sup>st</sup> Unit (Unit 2); Unit 0	15-Oct-2016	FROBs	01-Apr-2016

**Table 6 - Defuelling Project Materials Milestones**

## 12.2 Long lead materials

Based on NK38-PLAN-31100-10002 "Fuel Handling at risk & long lead materials procurement plan" [33] there are no known materials that have the potential to become LLM's.

If at risk or LLM's for the Defuelling project are identified in the future, the procurement of such materials will be done by EPC Contractor. In situations where the EP contract award is delayed, OPG may choose to purchase the LLM's and free issue to EP Contractor once contract is awarded.

---

## Appendix B: Project Organization

Project Sponsor: Vice President, Nuclear Refurbishment Execution

### Accountabilities:

- Ensure Defuelling Project is fully staffed,
- Ensure adherence to Nuclear Refurbishment Program,
- Administer monthly Steering Committee meetings. Address any concerns escalated in a timely fashion, and
- Administer quarterly Executive Oversight Meetings. Address any concerns escalated in a timely fashion.

Project Manager, Defuelling

### Accountabilities:

- Environment, Health & Safety,
- Scope,
- Schedule,
- Cost,
- Risk,
- Quality,
- Staffing & Resources,
- NR Program Governance adherence,
- Reporting & Communications,
- Oversight, and
- Contract Adherence.

Engineering Lead

### Accountabilities:

- The Engineering lead is responsible to meet the overall project engineering objectives. He/she will ensure that matrix engineers are deployed to perform oversight, document reviews and other engineering tasks as required supporting the project.
- The Engineering lead will be matrixed to the Defuelling project, will take day to day direction from the Project Manager and will be responsible for:
  - Ensuring that the ECC process required is defined, understood, reflected in the schedule and implemented per process.
  - Provide resources and context to perform adequate document review within the contractual time frame allotted
  - Provide resources and context to perform required deliverables per process
  - Ensuring resources and context to perform adequate oversight of the Contractor to ensure project objectives for cost, scope, schedule, and quality are met.

## Plan

Title: <b>DEFUELLING PROJECT MANAGEMENT PLAN</b>		

- Attend COMS reviews and ensure OPEX is embedded in the Engineering deliverables
- Ensure scope is defined, understood and managed per the applicable scope management governance
- Ensure all risks associated with Modifications are identified in RADAR per appropriate governance; mitigating actions are prepared per Defuelling PMP, tracked monthly and updated as required.
- Identify, coordinate and solicit all stakeholders' inputs to engineering deliverables reviews.

### Project Controls Lead

#### Accountabilities:

- Ensure project conforms to NR Program Governance, supported by routine quality checks and self assessments.
- Liaising between functions and project including centers of excellence,
- Gated Process including budget loads and baselines,
- Reporting including Earned Value,
- Analysis and Forecasting,
- Business Planning,
- Project Tools including IT tools, processes and instructions, and
- EP Contractor integration within OPG system.

**DEFUELLING PROJECT MANAGEMENT PLAN**

### Appendix C: Project Risks

ID	Title	Description	Current Score
13471	SDS PIDS hardware commodity contract failed to be renewed or renewal terms unfavourable	The project plans to purchase the PIDS hardware under a current commodity contract which expires October 2015. If the commodity contract fails to be renewed or the renewal terms are vastly different, the cost for the PIDS hardware could be significantly higher.	2
13467	Different SDS setpoints for a pre-equilibrium reactor core may be required	Nuclear Safety had originally identified a requirement for two sets of trip setpoints - one set for a pre-equilibrium reactor core and a different set for a post-equilibrium reactor core. Recently, NS assessed that this was unlikely to be required and the requirement was removed from the Project scope. The Project is now carrying the uncertainty in this regard as a risk.	5
13464	SDS equipment failed during installation	There is a risk that the hardware components are damaged or fail during the installation and commissioning phase.	8
13463	SDS interface compatibility issues discovered during installation	The project plans to thoroughly test the system under simulated conditions. Nevertheless, some field conditions cannot be simulated (for example, driving actual field solenoid valves). Therefore, there is a risk that interface compatibility issues are discovered during installation.	8
13399	Vault Cooler exceptions to Cat ID tech specs	Any significant exceptions to cat ID tech specs and drawings would result in cost impact to the project	4
13397	Vault Cooler equipments quality issues	Quality issues with Vault Cooler Fan Motors and/or Coils result in rework due to ball screws OPEX, this could impact project execution cost and schedule.	1
13396	Vault Cooler agreement to utilize revised strategy for future installation	Agreement to utilize revised strategy for future Vault Cooler installation due to decision on re-wind/Refurbish Fan Motors, this could cause Schedule delay and cost reduction.	1
13394	Vault Cooler Scope Change	Change in project scope (such as to utilize a split coil design), would need to be processed as a project scope change, which would also require a project change directive. This could impact on both cost and schedule.	6

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

ID	Title	Description	Current Score
12423	Vendor Claims	There is risk of the vendor making claims for additional cost and schedule, as a result of OPG not meeting its obligations ( for instance: Contractor's Access to Site for)	1
12422	Risk of Vendor Default/Business Continuity	Risk of Vendor default or otherwise becoming unable to maintain business and contractual obligations.	1
12329	SDS Computer Project inconsistent revisions of SDS hardware components	This risk concerns the possibility of inconsistency in the revisions of SDS2 hardware components. As computer technology changes rapidly, the risk is that the project may be unable to obtain production hardware components and spares of the same revisions as used in the hardware qualification activities of the project.	4
12328	SDS Computer Project grounding problem	Grounding has been an issue in past computer system installations, there is a risk that grounding issues may arise with the installation of the new equipment. This risk concerns signal grounding problems that would not be detected during bench testing and could arise at site due to site wiring issues.	8
12327	SDS Computer Project failure to meet hardware design requirements	The project is undertaking substantial testing and qualification (including age conditioning qualification) activities. The risk is that findings during these activities may necessitate a redesign and/or result in significant delays.	8

Plan

Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10134</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R001</b>	<b>38 of 40</b>

Title:

**DEFUELLING PROJECT MANAGEMENT PLAN**

ID	Title	Description	Current Score
12324	SDS Computer Project difficulty in securing hardware system integrator	The risk is that the specialty hardware vendor selected for unexpectedly becomes nonviable or chooses not to take on the hardware system integration responsibility.	8
12323	SDS Computer Project late hardware deliveries impacting installation	As the work involves custom designed specialty hardware this risk concerns the inability of the equipment vendor to deliver the custom hardware due to competing priorities or fabrication issues in time for the installation window.	8
12258	Installation Delays Due to Unidentified Structural Members in Front of Vault Cooler Coils	Removal or relocation of structural members due the lack of documentation in drawings, may necessitate a modification, significantly impacting the cost and schedule of the project.	8
12255	Procurement Delay Due to Component Obsolescence	Inability to procure like-for-like replacements of fan motors (due to an obsolescence of parts) may necessitate the requirement of a modification, significantly impacting the cost & schedule of the project.	8
12254	Installation Delays due to Assessment Issues	Due to lack of documentation for field configuration of VC motors/fans, installation work may be delayed.	6
12253	Installation Delays due to Lack of Integration/Priority with RFR Activities	Other projects being executed by the JV may have an overriding priority over the vault cooler replacement project due to their size and/or complexity of scope. This may result in the JV reducing focus on the execution of the scope, thereby shifting the execution windows and impacting the schedule and cost of the project.	10
11982	Delay in Contracting process impacting project schedule	This risk concerns the timely issuance of contracts. As the project heavily depends on purchased services and equipment, the risk is that contract delays will seriously impact the project schedule. The risk is particularly significant because of the specialized nature of safety critical computing and the limited availability of suppliers in this area.	12

**DEFUELLING PROJECT MANAGEMENT PLAN**

### Appendix D: Project Assumptions and Decisions

ID	Title	Description	Risks
684	Powertrack Execution can be supported by sufficient Station resources	Additional site infrastructure (breathing air system) will be completed in time to allow the execution of Powertrack refurbishment to begin on time.	
683	Powertrack Estimate accuracy	Estimate/proposal from vendor is within accuracy range for Gate 3/RQE requirements.	
682	Powertrack dose management	Dose can be managed to minimize impact on contractor resources.	13383
681	Powertrack ES MSA staffing agreement	On ES MSA staffing agreement, contractor standby time has not been included in the Powertrack estimate as project contingency (should be carried at program level).	13381
680	Powertrack Installation Methodology	Installation methodology ?Operating units zones can recover following installation windows, with 2 operating trolleys ?Planned fuelling recovery windows allow operating unit recovery	13376
679	Powertrack Execution Schedule	Execution Schedule can be integrated into IPG Schedule, and includes return to service process following each installation window.	
678	Powertrack Modification	There is no modification scope for Powertrack project.	13372
651	Reactor Area Bridge & Carriage Material Procurement, Material Pricing	The assumption is that Reactor Area Bridge & Carriage refurbishment material costs will not escalate significantly from Gate 3 until procurement phase.	
650	Reactor Area Bridge & Carriage Material Procurement, Cat ID Validation and Availability	The assumption is that the material required for Reactor Area Bridge & Carriage Refurbishment will be available and can be procured as required for the Refurbishment outage.	
648	Powertrack Long Lead Material Procurement	The assumption is that Long Lead Material (LLM) is defined as any material with 24 months delivery lead time. On this basis, Powertrack Refurbishment has no LLM.	
596	Powertrack Implementation Costs	The assumption is that the Powertrack implementation costs, based on vendor proposal, are accurate.	
595	Powertrack Integration into IPG Schedule	The assumption is that the Powertrack installation can be integrated into the IPG schedule	11980

--	-------------------------------------	-------------------------------------	-------------------------------------

### PURPOSE AND SCOPE

- The Engineering Change Control (ECC) Program ensures all *modifications* to Ontario Power Generation Nuclear (OPGN) systems, structures, and components (SSCs), including software and *engineered tooling*, are planned, designed, installed, commissioned, placed into service, or removed from service within the *Safe Operating Envelope (SOE)* or *Safety and Design Envelope (SDE)*, *design basis*, and licensing conditions. This program complies with Canadian Standards Association (CSA) N286 **[B-1]** and CSA N285 **[B-2]** code editions as referenced in the facility operating licenses.
- This program ensures all problems or betterment ideas requiring a *modification* are reviewed prior to approval to ensure they improve or maintain operability, maintainability, radiological and conventional safety, regulatory or license compliance, and production at an acceptable cost to

### ENGINEERING CHANGE CONTROL

OPGN.

- (c) This program ensures approved *modifications* are:
- (1) Assessed to clearly identify the problem statement to be solved.
  - (2) Analyzed to determine the requirements and the risk level associated with the *modification*.
  - (3) Evaluated, based on the risk level, to determine the scope of work activities, stakeholders, resources, documentation updates required to reflect the *modification* and materials required to complete the *modification*.
  - (4) Designed in accordance with relevant codes and standards.
  - (5) Analyzed to be safe for all foreseeable modes of operation.
  - (6) Adequately reviewed by stakeholders and approved by the *Design Authority (DA)*.
  - (7) Installed in accordance with the approved design and installation requirements.
  - (8) Commissioned and tested in accordance with acceptance criteria as specified in commissioning specifications.
  - (9) Made available for long term operation and maintenance in full compliance with Nuclear standards.
  - (10) Closed out ensuring configuration is maintained.
- (d) This Program applies to Nuclear and contract staff participating in initiation, design, installation, and commissioning of *physical changes* and controlled document changes associated with SSCs, software, and *engineered tooling*. This includes contractors and design agencies performing engineering activities on behalf of OPGN unless these organizations are performing these activities in accordance with a Quality Program approved by OPGN.
- (e) This program does not apply to facilities, systems, equipment, and buildings, governed by OPG-PROG-0032, Facilities and Projects Management System, under authority of the Vice President, Real Estate and Services.
- (f) SSCs which have been *abandoned* as a result of a previous *modification* are exempt from the application of this process. The process for subsequent removal or harvesting of *abandoned* equipment items are governed by work management and facility specific procedures.

ENGINEERING CHANGE CONTROL

### 1.0 DIRECTION

- (a) The ECC program ensures *modifications* fulfill at least one of the following objectives:
- (1) Improve safety.
  - (2) Meet a regulatory commitment.
  - (3) Correct a design flaw.
  - (4) Replace obsolete equipment.
  - (5) Address a betterment idea.
  - (6) Have a considerable economic or performance benefit.
- (b) The program and supporting procedures ensure proper reviews and approvals are achieved before *modifications* are implemented.
- (c) Affected stakeholders shall review changes for the following:
- Scope and process impact.
  - Nuclear safety, employee safety, and equipment safety.
  - Constructability, operability, and maintainability.
  - Human Factors (HF), and ergonomics
  - Environmental impact (in accordance with OPG-POL-0021, Environmental Policy (Board of Directors Policy) and N-PROG-OP-0006, Environmental Management).
  - Security and potential property damage.
  - Computer software impact.
  - Environmental Qualification (EQ) in accordance with N-PROG-RA-0006, Environmental Qualification.
  - Seismic Qualification, in accordance with N-PROG-MP-0009, Design Management.
  - *Engineered tooling.*
- (d) N-PROG-AS-0007, Project Management, deals with resourcing, scheduling, and ensuring *modifications* add value consistent with Nuclear financial objectives.

## ENGINEERING CHANGE CONTROL

### 1.1 Overview

- 1.1.1 A nuclear system shall be controlled at all times to ensure operation in a state that is analyzed to be safe and operated conservatively within the *design basis*, which is defined conservatively within the licensing limits. ECC should strive to protect operating, design and safety margins (refer to Figure 1, Relationship of Licensing Basis, Design Basis, and Operating Configuration).

Interfacing Program	Area of Control
N-PROG-OP-0001, Nuclear Operations	Operating Configuration
N-PROG-RA-0002, Conduct of Regulatory Affairs	<i>Licensing Basis</i>
N-PROG-MP-0005, Configuration Management	All
N-PROG-MP-0009, Design Management	<i>Design Basis</i>
N-PROG-MP-0014, Reactor Safety Program	<i>Design Basis</i>

**Figure 1: Relationship of Licensing Basis, Design Basis, and Operating Configuration**

- 1.1.2 Performance Engineering reviews and concurs with changes to Operating and Maintenance procedures, which affect *safety-related* portions of the system, to ensure the *SOE* or *SDE* is maintained. Performance Engineering concurs with these procedures only if:
- (a) All modes of operation have been analyzed as being safe.
  - (b) Any new failure mode has been previously considered in the design or accident analysis.
  - (c) There is no increase in the likelihood of a *design basis* event.

Revision:	R014	
Usage Classification:	Information	Sheet Number: N/A
		Page: 6 of 32

### Title: ENGINEERING CHANGE CONTROL

- (d) There is no reduction of safety margins beyond those described in the Safety Report and supporting documents.
  - (e) Sufficient operating and design margins are maintained
- 1.1.3 *Modifications* and revised licensing limits may drive changes to the *design basis* and Operating configuration.
- 1.1.4 The *modification* process provides:
- A systematic risk based approach to identifying a design issue.
  - Developing and approving the scope of the *modification*.
  - Preparing *preliminary designs*.
  - Preparing detailed designs and approving them for installation.
  - Preparing installation and commissioning documentation.
  - Executing installation and commissioning activities.
  - Turnover of systems to operations.
  - Close out of the *modifications*.
- 1.1.5 *Design changes* are controlled and uniquely tracked in ASSET SUITE to provide traceability of the *modification* to changes in the design documentation, to work packages in the field, to procurement of materials, and other documentation as necessary.
- 1.1.6 The *modification* process ensures that:
- (a) Configuration is controlled and maintained by updating design, operating, maintenance, and training documentation impacted by *design changes*.
  - (b) *Design changes* comply with applicable licenses, codes, standards, and regulations.
  - (c) Progression of *design changes* is tracked and monitored.
  - (d) Scheduling of work and purchasing of materials are considered. In particular availability of components and materials, component and material options and suitability of suppliers are considered and long lead items are identified.
- 1.1.7 Requirements are documented and archived on scoping documents and checklists provided by the ECC Program and identified by unique tracking numbers.
- 1.1.8 OPGN's Pressure Boundary (PB) processes are described in N-PROG-MP-0004, Pressure Boundary. **[B-2]**
- 1.1.9 The *modification* process allows personnel to apply effort consistent with Nuclear and employee safety significance and economic impact. The controlling documents are shown in Figure 2, Engineering Change Control Documents. Figure 3, Engineering Change Request and Modification Procedure Paths, shows the available change paths.

### Title: ENGINEERING CHANGE CONTROL

## 1.2 Engineering Change Request Process

- 1.2.1 Anyone may submit a problem or betterment idea. The Corporate policy is to encourage proposed solutions that may improve safety, operation, maintainability, or cost.
- 1.2.2 The electronic *Engineering Change Request (ECR)* process described in N-PROC-MP-0090, Modification Process, describes the process steps necessary to initiate, assign, review, and disposition *ECRs* into one of the following types of changes:
- Soft solution (not a change to the *Design Basis*) (see Section 1.3)
  - Controlled Document Change (Document-only change that does not change the *design basis*, and therefore is not a *modification*) (see Section 1.4)
  - *Facilities Commercial Modification (FMOD)* (see Section 1.5)
  - *Item Equivalency Evaluation (IEE)* (see Section 1.6)
  - *Non-Identical Component Replacement (NICR)* (see Section 1.9.4)
  - *Modification* (includes *temporary modifications*, *engineered tooling* designs) (see Section 1.9)
    - (a) A reviewer knowledgeable in the field impacted by the *ECR* should be assigned to review the requests' requirements for clarity and recommend the appropriate change type.
    - (b) *ECRs* are routed for disposition based on their change type and in accordance with the procedure applicable to the change type.
    - (c) *ECRs* requiring *permanent modifications* (excluding *NICRs*) should be presented to a screening committee for review and approval.
    - (d) *NICRs* and *temporary modifications* are reviewed and approved by the line organizations accountable for maintaining the *design basis* of the impacted SSCs.
    - (e) Where it is unclear which process should be followed, the applicable *DA* should determine what process should be used to administer a change, such as whether use of a *temporary modification*, or some other controlled process such as temporary change request or technical procedure (in accordance with N-PROG-OP-0001) as appropriate.

## 1.3 Soft Solution

A soft solution is any solution that does not require a *physical change* to an SSC or a change to the *design basis*. *ECR* screening is designed to consider soft solutions first to minimize changes and ensure lower cost solutions are explored. Examples of soft solutions are provided in Appendix A, Engineering Change Control Examples. *ECRs* dispositioned as soft solutions are closed to the applicable process governing the implementation of the soft solution.

## Nuclear Program

OPG Proprietary		
Document Number:	N-PROG-MP-0001	Revision:
Usage Classification:	Information	Page:
	N/A	10 of 32

### Title: ENGINEERING CHANGE CONTROL

**Note:** Any soft solution considered to require a significant change should be controlled in accordance with N-STD-AS-0024, Change Management.

#### 1.4 Controlled Document Change Process

1.4.1 Controlled document changes are reviewed to ensure that the change does not impact the *design basis* or require a change to an SSC to maintain alignment between the documented and physical configuration. This review is required for engineering documents, normally those documents described in N-LIST-01300-10000, Bounded Document Set under N-PROG-MP-0005, Configuration Management. Examples of Bounded Document Set documents include:

- *Design requirements.*
- Design verification documents.
- *Design outputs.*
- Safety Report and its supporting documents.
- Other supporting documents identified in the Reactor Operating License.

1.4.2 Changes to engineering documentation that do **not** reflect a change to the *design basis* or a *physical change* to SSCs are **not modifications** (that is, if the *design basis* does **not** change, the change is **not** considered to be a *document-only modification*). Such changes include but are not limited to:

- Correction of errors.
- Addition or revision of information for clarity.
- Addition of new information or documents.
- Propagation of information already included on one or more *design basis* documents to another *design basis* document (for example, a previously-documented *modification* accidentally missed updating a document).

1.4.3 Document-only changes that do not affect the *design basis* are processed in accordance with the governing processes applicable to the document type, and, as applicable, N-PROC-AS-0003, Controlled Document Management.

**Note:** Document changes should be processed using the N-PROC-MP-0090 if a change is required to an engineering document due to an as-found *modification* to an SSC or if a *modification* is required to an SSC to maintain alignment of the paper and physical configuration. Following N-PROC-MP-0090 ensures that the documented and installed configurations meet all requirements even if the result of this process may only require that documentation be updated.

1.4.4 Document changes in support of the *modification* process are listed on the *Affected Document List* of the specific ASSET SUITE Engineering Change (EC) and processed in accordance with the procedure governing the specific document type.

### Title: ENGINEERING CHANGE CONTROL

#### 1.5 Facilities Commercial Modification Process

- 1.5.1 OPG-PROG-0032 gives authority to the *Facilities Commercial Modification (FMOD)* process which applies to SSCs under the management of Projects and Modifications. Such facilities are identified in N-LIST-00700-10000, Pickering and Darlington Property Management Facilities Responsibility Matrix.
- 1.5.2 Where Facilities SSCs have an interface to nuclear systems, any *modification* to the interface or nuclear SSCs are governed by N-PROC-MP-0090.
- 1.5.3 Where there is no clear separation of the systems governed by the *FMOD* process and the *modification* process, the *DA* has the accountability to specify which process should be followed.

#### 1.6 Item Equivalency Process

- 1.6.1 Procurement engineering activities, under N-PROG-MP-0009, invoke the *IEE* process, to make replacements at the structure, component, or parts level, when the item being replaced is no longer available.
  - 1.6.2 Engineering should perform an engineering evaluation, in accordance with N-INS-08173-10048, Item Equivalency Evaluation, to determine if a prospective replacement meets all of the original *design requirements*. Appendix A may be referenced for examples.
  - 1.6.3 An equivalent item shall meet the form, fit, and function of the item to be replaced.
    - (a) **Form** - Physical characteristics (including material composition), design ratings, *safety-related* classifications, code applicability, and Quality Assurance (QA) requirements.
    - (b) **Fit** - Mounting, attachment, mass, and the space which the item occupies or is required to support operation.
    - (c) **Function** - Performance characteristics, range of operation, and how these parameters match up against the *design requirements* of the original item for its intended use.
  - 1.6.4 The *IEE* process ensures that product procurement descriptions should be prepared consistent with component design specifications.
  - 1.6.5 The content of component design specifications shall only be modified in accordance with N-PROC-MP-0090, ensuring all system design and nuclear safety requirements are met.
- #### 1.7 Engineered Tooling
- 1.7.1 *Engineered tooling* produced by OPGN or external contractors is governed by this program.
  - 1.7.2 OPGN designed *engineered tooling* follows N-PROC-MP-0090 to govern tool creation and *modification*.

## Nuclear Program

Usage Classification:	Sheet Number:	Page:
Information	N/A	12 of 32

Title:

## ENGINEERING CHANGE CONTROL

- 1.7.3 *Engineered tooling* shall meet nuclear standards for design of:
- Material Handling and Lifting Tools.
  - Hoisting and Rigging devices.
  - PB Tools. **[B-2]**
  - Software, including Software Engineering Tools (changes should be in accordance with N-PROG-MP-0006, Software).
  - Inspection and Maintenance Tools.
- 1.7.4 Where engineered tools require either temporary or *permanent modification* to SSCs, the *modification* process under N-PROC-MP-0090 shall be used to manage the change to the SSC. If use of the tooling creates the risk of leaving foreign material behind in major equipment assets, special attention should be applied during design and in the field to prevent damage.
- 1.7.5 If an external contractors *engineered tooling* is custom designed, manufactured and maintained by the contractor, N-PROC-MP-0105, Quality Design Plan shall be used to control the use of the tool at OPGN.
- 1.7.6 The *DA* with accountability for the interfacing SSC shall be notified of any new or redesigned engineered tools, including those controlled by contractors, prior to their use at the facility.
- 1.7.7 *DA* authorization for use of such tools shall be obtained if the tooling has any potential impact on PB, Nuclear Safety or Foreign Material Exclusion (FME).
- 1.8 Legacy Engineering Change Control Processes**
- 1.8.1 In the past, Engineering Change Control processes other than N-PROC-MP-0090 were in use by various OPGN organizations.
- 1.8.2 All of these processes are obsolete and all *modifications* in OPGN should be performed in accordance with N-PROC-MP-0090 (see Section 1.9).
- 1.8.3 Any OPGN *modification* initiated under a process other than N-PROC-MP-0090 should only progress after transition to the N-PROC-MP-0090 risk-based *modification* process.
- Note:** N-GUID-00700-10000, Guide to Modification Process provides the mechanism and guidelines for transitioning legacy type *modifications* to risk based *modifications*.

ENGINEERING CHANGE CONTROL

### 1.9 Risk Based Modification Process

- (a) SSCs impacting the *design basis* are modified following a risk based process outlined in N-PROC-MP-0090. This procedure describes activities required to identify the scope of the work, develop the discrete work assignments required to complete the design, and assigns the organizational responsibilities for preparing the design and design documentation. Types of change processes described in this procedure are:

- *Permanent modifications* (refer to Section 1.9.1).
- *Temporary modifications* (refer to Section 1.9.2).
- *Generic modifications (GMODs)* (refer to Section 1.9.3).
- *NICR* (an extended item equivalency) (refer to Section 1.9.4).

**Note:** *Permanent modifications* follow the standard process, which is altered or expanded upon for *temporary modifications*, *GMODs*, and *NICRs* as indicated in their Sections.

- (b) For *modifications* associated with Darlington Refurbishment, users should **also** refer to NK38-NR-PLAN-09701-10001 Sheet 0003, Darlington Refurbishment Return To Service Program Management Plan, which provides references to guides and instructions that add to or enhance the standard engineering change control process governance. No document referenced by NK38-NR-PLAN-09701-10001 Sheet 0003 should contravene or supersede any engineering change control process governance requirements (as found in N-PROC-MP-0090 and its referenced governance), but may add additional requirements, details, enhancements, or specification of options. Any conflicts between documents referenced by NK38-NR-PLAN-09701-10001 Sheet 0003 and the engineering change control process governance shall be resolved in favour of the engineering change control process governance.
- (c) *Document-only modifications* are included in the process, in order to control scope (including evaluation of whether a *physical change* may be required). *Document-only modifications* will not require some aspects of the process, for example, installation and commissioning planning, installation, and commissioning.

#### 1.9.1 Permanent Modifications

##### 1.9.1.1 General

The process uses a graded level of rigour based on a thorough risk assessment, adjusting the number and type of approvals, verification and review, post *modification* commissioning, and pre-operation training to suit the *modification*.

- (a) Risk is defined in terms of, at minimum:

- Employee safety risk.
- Environmental risk.
- Nuclear safety risk.
- Equipment risk.
- Production risk.
- Safeguards and security risk.

Usage Classification:	Information	Sheet Number: N/A Page: 14 of 32

Title:

### ENGINEERING CHANGE CONTROL

- (b) *Modification* Team Leader (MTL) is assigned responsibility for managing the *modification* from scoping through to closeout. Overall accountability for ensuring the work is completed and resources are made available through to the closeout of the *modification* rests with the MTL.
- (c) Design Team Leader (DTL) is assigned to oversee the development of the engineering design and works with the MTL to determine the resources and stakeholders required to complete the design and sequencing and scheduling of work.
- (d) Field Team Leader (FTL) is assigned to oversee the installation and commissioning of the *modification*.
- (e) Stakeholders such as System Engineering, Design Engineering, Operations, Maintenance, Training, and others are identified to participate throughout the *modification* process to ensure all aspects of the *modification* are addressed in the design and implementation process.
- (f) Where Design Agencies perform any roles in the *modification* process, their responsibilities, and OPGN's responsibilities, should be defined in accordance with design agency control processes defined in N-PROG-MP-0009.
- (g) Projects are controlled in accordance with N-PROG-AS-0007. Project Management is the process of planning, organizing, and managing resources to bring about the successful completion of specific project goals and objectives.

#### 1.9.1.2 Scope Definition

- (a) During the scoping phase:
  - (1) The problem statement providing the requirements for the *modification* should be developed.
  - (2) SSCs should be walked down to determine the current configuration of the system to be modified.
  - (3) Operating experience should be reviewed to mitigate potential errors, in accordance with N-PROG-RA-0003, Corrective Action.
  - (4) Design alternatives shall be assessed and criteria for selection of the recommended alternative determined, taking into consideration:
    - *Design requirements.*
    - Results of *conceptual studies* (including conceptual safety analysis if required).
    - Experience with previous similar designs.
    - Cost and schedule risks.
    - Risk of using new or unproven designs.

Title:

### ENGINEERING CHANGE CONTROL

- (5) Regulatory, licensing, and permit requirements shall be established and plans should be prepared to address the purchase of equipment and staff assignment for design. **[B-1] [B-2]**
  - (6) Stakeholders should be determined to ensure input from all impacted disciplines is considered.
  - (7) The risk of the *modification* shall be evaluated to determine the appropriate level of design rigor to be applied to the *modification*. Risk is evaluated on various criteria, including nuclear safety (reference N-PROG-MP-0014, Reactor Safety Program).
  - (8) A turnover plan shall be established based on the type of *modification* and risk, and additional management oversight requirements should be determined.
- (b) MTL should initiate and oversee the scope definition, risk evaluation, and preliminary engineering phase of the *modification*.
- (c) The scope, requirements, and structure of a *modification* package should be described.
- (1) This contract between management and the MTL should not be changed without management approval.
  - (2) The description should be finalized at completion of scope definition.
- (d) Stakeholder review should ensure that *modifications* are evaluated for important issues such as:
- Welding, in accordance with N-PROG-MA-0013, Welding.
  - Fire Protection, in accordance with N-PROG-RA-0012, Fire Protection.
  - Seismic Qualification, in accordance with N-PROG-MP-0009.
  - Harsh Environment EQ impact and accident analysis assumptions.
  - Training Impacts, in accordance with N-PROG-TR-0005, Training.
  - Pre-Start Health and Safety Reviews, completed in accordance with N-INS-08121.3-10000, Implementation of Pre-Start Health and Safety Reviews (PSR).
  - Selection and qualification of computer design tools in accordance with N-PROG-MP-0006.
  - Design and qualification of Real-Time Process Control software in accordance with N-PROG-MP-0006.

OPG Proprietary		
Document Number:	N-PROG-MP-0001	Revision: R014
Usage Classification:	Information	Sheet Number: N/A Page: 16 of 32

Title:

### ENGINEERING CHANGE CONTROL

- Identification and categorization of Critical Equipment in accordance with N-PROG-MA-0026, Equipment Reliability.
  - *Modification*, use, creation or impact on existing *engineered tooling*.
  - Initial *Constructability, Operability, Maintainability, and Safety (COMS)* review in accordance with N-PROC-MP-0083, Constructability, Operability, Maintainability, and Safety (COMS).
  - Impact on corporate or station Beyond *Design Basis* Accident (BDBA) response.
- (e) *Modification design requirements* should be prepared, documenting the requirements of the new SSCs or *engineered tooling* as well as those systems impacted by a *modification*, using the inputs from the stakeholder reviews.
- (f) DA and Director, Operations and Maintenance shall grant approval.
- (g) Additional Reactor Safety and regulatory approvals may be required.

#### 1.9.1.3 Modification Planning

If required, Design Plans, *Design Requirements*, and COMS screening should be completed during the *modification* planning phase.

#### 1.9.1.4 Detailed Design

DTL should oversee the detailed design phase and MTL should ensure that detailed design work and deliverables fall within project scope. During design preparation, use diverse information sources, such as design information, probabilistic safety assessment, operating experience, vendor information, analytical techniques and engineering principles, to understand technical issues and provide the best possible input for making operational decisions.

- (a) An ASSET SUITE *Design Engineering Change (Design EC)* details all design deliverables in ASSET SUITE and is the mechanism used to issue the detailed design for installation. *Design ECs* may be created for each engineering discipline required for the *modification*, and for each affected operating unit. *Modifications* that require changes to the *design basis* of computer software may also have specific *Design ECs* describing the software changes, and design should be in accordance with N-PROG-MP-0006.
- (b) Project ECs provide a mechanism to track and complete project, engineering, operations, training and other details common to the *modification*. These Project ECs are completed at the end of a *modification* after all *Design ECs* have been installed and turned over to operations in accordance with Section 1.9.1.8.
- (c) Affected Documents Lists included on *Design ECs* or Project ECs identify Engineering, Operations, Maintenance, and Training controlled documents to be updated if affected by the *modification*. The minimum set of documents to be considered is listed in N-LIST-01300-10000.

## Nuclear Program

Usage Classification:	Information	Sheet Number: N/A Page: 17 of 32

Title:  
**ENGINEERING CHANGE CONTROL**

- (d) *Engineering change papers* should be:
- (1) Created for *physical changes* to configuration in accordance with N-PROC-MP-0090.
  - (2) Posted electronically in ASSET SUITE for tracking of proposed changes.
  - (3) Used to identify and approve *design changes*, and for installation and commissioning purposes.
  - (4) Retained as *modification* records and should not be incorporated into or issued as controlled documents or records prior to the installed *Design EC* being turned over to operations in accordance with Section 1.9.1.8.
  - (5) An accurate representation of the actual configuration, in addition to the installed configuration represented by the current revision of approved engineering controlled documents, at turn over to operations.
  - (6) Issued or incorporated into the engineering controlled documents or records against which they are posted within six months of turn over to operations.
- (e) Requirements for *COMS* should be rigorously addressed and factored into the detailed design deliverables at this time.
- (f) *Modifications* where full commissioning is not practical should invoke an enhanced *COMS* process, requiring enhanced oversight and a documented assessment of the critical failure modes and characteristics of the design as a basis for *modification* completion assurance, to address the risk.
- (g) HF processes should ensure performance of operators and maintainers is systematically considered in any EC. Questions during scoping should identify whether HF issues are present, and if so, direct the design team to consult with HF stakeholders and N-INS-06700-10000, Preparation of Human Factors Worksheet, to identify the nature of the HF work required and the need for involvement of HF Specialist assistance.
- (h) *Design EC* Affected Equipment List should be used to identify equipment changes. Master Equipment List updates, material specification, spare parts requirements, and procurement activities should be initiated during this phase.
- (i) Designer's Section Manager should:
- (1) Approve the *Design EC* including application of all applicable code and technical requirements.
  - (2) Ensure clear and adequate procurement, technical, and QA requirements are defined, such as the need for Inspection and Test Plans and regulatory witness hold points.
- (j) If required, the *DA* and Director, Operations and Maintenance should grant approval prior to installation.

### 1.9.1.5 Installation and Commissioning Planning

For *modifications* associated with Darlington Refurbishment, refer to Paragraph 1.9 (b) as well as to the following text. For all other *modifications* refer to the following text.

FTL should oversee the installation and commissioning planning phase, with MTL responsible for overall scope.

- (a) Prior to the beginning of Installation and Commissioning, FTL should oversee the specification of an overall Commissioning Plan and development of Installation Instructions and Commissioning Instructions.
  - (1) Installation and Commissioning activities should be planned and scheduled in accordance with the applicable work management programs (e.g., N-PROG-MA-0019, Production Work Management, and N-PROG-MA-0015, Work Protection, or W-PROG-WM-0001, Nuclear Waste Management Program).
  - (2) Installation instructions for project-funded *modifications* should be prepared as described in N-STD-AS-0031, Field Engineering Standard.
  - (3) Installation instructions for base-funded *modifications* should be prepared in accordance with N-PROG-MA-0019.
  - (4) The overall commissioning plan should be documented in the Detailed Commissioning Specifications prepared for large projects using N-INS-00960-10000, Detailed Commissioning Specifications and Commissioning Reports.
  - (5) For small projects, detailed commissioning plans and specifications may be prepared in accordance with N-INS-00960-10000 or the commissioning requirements may be documented in the *Design EC* in ASSET SUITE.
  - (6) Detailed Commissioning Specifications should prescribe the sequence of tests to be executed and include the test objective, required performance values, test prerequisites, and acceptance criteria, for each Commissioning Requirement.
  - (7) Detailed Commissioning Specifications shall be reviewed by design engineering for conformance with the design intent, and may be reviewed by appropriate performance engineers.
- (b) Commissioning Instructions should be prepared in accordance with N-PROG-MA-0019.
- (c) MTL should ensure that installation and commissioning work and deliverables fall within the project scope.
- (d) Contract provisions and interfaces should be administered in accordance with N-PROG-MM-0001, Materials Management, N-PROG-AS-0007, and N-PROG-MP-0007, Conduct of Engineering.

### ENGINEERING CHANGE CONTROL

- (e) MTL should ensure that the *DA* authorizes the use of configuration controlled *engineered tooling* for new or re-designed tooling where the following conditions exist:
  - (1) Tooling impacts on or becomes part of the PB system.
  - (2) Tooling has an impact on Nuclear Safety.
  - (3) Tooling may be intrusive to systems or may have FME impact.
- (f) MTL ensures disclosure to the *DA* of all *modifications* to an engineered tool, since last use, before use on SSC(s).

#### 1.9.1.6 Installation

For *modifications* associated with Darlington Refurbishment, refer to Paragraph 1.9 (b) as well as to the following text. For all other *modifications* refer to the following text.

FTL should oversee the installation phase, with MTL responsible for overall scope.

- (a) Installation shall be executed in accordance with specifications meeting the requirements of CSA N286.
- (b) Installation activities, including associated prerequisite, inspection, testing, and verification details, are governed by installation work plans created in accordance with N-STD-AS-0031 and N-PROG-MA-0004, Conduct of Maintenance.
  - (1) *Field initiated changes (FICs)* should be permitted provided they fall within the scope of the approved design.
  - (2) *FICs* which do not impact the scope of the design are considered non-intent and are managed as a non-intent revision to the *Design ECs*.
  - (3) If the design scope changes, intent revisions to one or more *Design ECs* are required and the scope description document is revised if impacted.
- (c) Any installation work affecting PB shall be performed in accordance with N-PROG-MP-0004, including any concessions requiring regulatory approval. The FTL shall ensure PB QA requirements specified by design are met, such as Inspection and Test Plan execution and regulatory witness hold points. **[B-1]**

#### 1.9.1.7 Commissioning

For *modifications* associated with Darlington Refurbishment, refer to Paragraph 1.9 (b) as well as to the following text. For all other *modifications* refer to the following text.

FTL should oversee the commissioning phase, with MTL responsible for overall scope.

- (a) Commissioning shall be executed in accordance with specifications meeting the requirements of CSA N286.
- (b) Commissioning plans and Commissioning Reports should be developed in accordance with N-INS-00960-10000.

Title:
ENGINEERING CHANGE CONTROL

- (c) Prior to beginning commissioning, FTL shall ensure the following installation activities have been completed for the system being turned over for commissioning:
  - (1) Outstanding items from installation are tracked as installation open items and changes to the design have been documented as field changes.
  - (2) Revisions to the design and the impact of these changes evaluated and incorporated into the Commissioning Specification.
- (d) During the commissioning phase, critical design parameters should be tested under all appropriate operating modes and conditions.
  - (1) Results should be reviewed for acceptability.
  - (2) Multi-discipline engineering reviews of the commissioning results may be required depending on the complexity of the project.
  - (3) Final commissioning results shall be accepted by design engineering to ensure the results conform to the requirements of the design, and may also be accepted by appropriate performance engineers.

### 1.9.1.8 Available For Service or Operations Acceptance

For *modifications* associated with Darlington Refurbishment, refer to Paragraph 1.9 (b) as well as to the following text. For all other *modifications* refer to the following text.

- (a) Prior to Available For Service (AFS) or Operations Acceptance declaration of *modifications* being turned over to operations, all design, purchasing, construction, installation, and commissioning activities shall have been assessed for completeness.
  - (1) Critical characteristics of each of these activities should have been identified and demonstrated to be satisfied.
  - (2) Outstanding or incomplete items should not compromise the safe operation, maintenance, or intended use of the *modification*.
- (b) Boundaries between SSCs being turned over shall be clearly identified in the field and on documentation.
- (c) MTL should be responsible for preparing and arranging for formal AFS turnover meetings.
  - (1) Representation from operations, maintenance, and performance engineering should each review and concur with the AFS package.
  - (2) DA and Manager of Operations, or delegates should approve the AFS package.
- (d) System status should be updated in accordance with N-PROG-OP-0001.

## Nuclear Program

N-PROC-MP-0001	R014	
Usage Classification:	Sheet Number:	Page:
Information	N/A	21 of 32

Title:  
**ENGINEERING CHANGE CONTROL**

- (e) Walk-downs shall be completed as necessary to ensure that systems being turned over are complete as documented in the AFS or Operations Acceptance documentation.
  - (1) Incomplete items and exceptions shall be documented and actions assigned to complete.
  - (2) Systems with incomplete items or exceptions may be fully or partially turned over provided these items do not compromise the safe operation or purpose of the turned over portions of the *modification*.
  - (3) Remaining work for partially turned over systems should be completed in accordance with the *modification* process.
- (f) Operations representative shall formally accept all *modifications* in an AFS or Operations Acceptance package prior to placement into service, except for *NICRs*, where acceptance is captured in the work management processes.
- (g) For *modifications* where full commissioning is not practicable, an enhanced AFS process, requiring confirmation that *modification* critical attributes have been documented and verified by qualified staff, shall be invoked to control the risk.

### 1.9.1.9 Closeout

- (a) MTL should oversee closeout activities in accordance with N-PROC-MP-0090 such as EC and work plan closeout, and update of controlled documents within 6 months of AFS/Operations Acceptance or *NICR* installation.
- (b) Records should be produced and stored as described in N-PROC-MP-0090. Management of Nuclear records and managed in accordance with N-PROC-AS-0006, Records and Document Control.

### 1.9.2 Temporary Modifications

- 1.9.2.1 The *temporary modification* route in N-PROC-MP-0090 shall include removal of the *modification*.
- 1.9.2.2 *Temporary modifications* should be minor in scope, of short duration, few in number, and used only when there is an urgent need to maintain system or component operability or availability, or when needed to support implementation of permanent changes.
- 1.9.2.3 *Temporary modifications* do not require presentation to the Screening Committee.
- 1.9.2.4 The following restrictions apply to *Temporary Modifications*:
  - (a) Installation shall be for only a limited and pre-established period of time, or during a specific system operating condition.

**Note:** Institute of Nuclear Power Operations (INPO) best practice is to remove *temporary modifications* within 6 months of installation or at the next outage if an outage is required for removal.

## Nuclear Program

OPG Proprietary		
Document Number:	N-PROG-MP-0001	Revision: R014
Usage Classification:	Information	Sheet Number: N/A Page: 22 of 32

### Title: ENGINEERING CHANGE CONTROL

- (b) *Temporary modifications* to PB SSCs shall be removed within one year, or one outage cycle where removal is not possible during system operation **unless**:
    - (1) This is a recurring *temporary modification* which has had previous classification approval, overpressure protection report update, and registration update in accordance with N-PROG-MP-0009 (e.g., this PB *modification* is a previously registered alternate configuration).
    - (2) This is a non-recurring *temporary modification* and classification approval, overpressure protection report update, and registration update are completed **or** have been reconciled as not needing registration, in accordance with N-PROG-MP-0009.
  - (c) *Temporary modifications* to non-PB SSCs shall be restored to their original configuration, or the *temporary modification* shall have been processed as a *permanent modification*, as soon as practicable, but no later than the end of the next planned maintenance outage following installation **unless**:
    - (1) The unit is laid up; if so, prior to re-start the *temporary modification* should be removed or made permanent.
    - (2) Written approval of the Chief Nuclear Engineer has been obtained to extend *temporary modifications*.
  - (d) SSCs impacted by a *temporary modification* shall be restored to their original configuration at the end of the established period or system operating condition.
- 1.9.2.5 Shift Manager may initiate installation of an emergency *temporary modification* in accordance with N-PROG-OP-0001. The emergency *temporary modification* is replaced with a fully approved *modification* in accordance with N-PROC-MP-0090, or the system is returned to its approved original design configuration in a time frame consistent with application of steps in the *modification* process.
- 1.9.2.6 *Temporary modifications* that are installed to maintain operability, availability, and reliability prior to resolution of legacy *modification* changes for the affected SSCs shall require DA approval prior to installation.
- 1.9.2.7 Operators should be aware of *temporary modifications* in the system configuration at all times in accordance with N-PROG-OP-0001.
- 1.9.2.8 Engineering, through the *modification* process, shall ensure that *temporary modifications* conform to the design and *licensing basis* and safety and reliability requirements.
- 1.9.2.9 Recurring temporary changes should be implemented using Facility operations and maintenance procedures having received review and approval by Engineering rather than through the repeated use of the *temporary modification* process. Engineering review and approval of these procedures shall ensure consistency and compliance with design and *licensing basis*.

### Title: ENGINEERING CHANGE CONTROL

#### 1.9.3 Generic Modifications

If the same *modification* may be repeated under similar risk conditions, a *GMOD* may be initiated. A *GMOD* may be a *permanent modification* or a *temporary modification*, and is initiated following the same processes, but may be re-used when required for future installation at other locations.

#### 1.9.4 Non-Identical Component Replacement

*NICR* is a process which is effectively an extended Item Equivalency Process used for component substitutions where the original equipment is no longer available and the *IEE* process has failed to find a replacement. The *NICR* route in the *modification* process may be used for replacement of equipment and components which fail the *IEE* process as long as the replacement items meet strict criteria ensuring that there is no impact on the *design basis*. The *NICR* process does not apply to the design of new systems or redesign of existing systems.

- 1.9.4.1 The *NICR* process is considered to be a low risk component substitution that does not require presentation to the Screening Committee. For *NICRs*, a streamlined version of the full *modification* process eliminates the need for completion of scope definition, risk analysis, and preliminary engineering.
- 1.9.4.2 Specific criteria shall be met to ensure that a *NICR* change does not impact the *design basis* of the system including seismic or EQ. If all *NICR* criteria cannot be met the full risk based *modification* process shall be followed.

#### 1.10 Constructability, Operability, Maintainability, and Safety

*COMS* ensures, during all life-cycle phases of a *modification*, that the following issues are adequately identified and incorporated into the *design requirements* of nuclear design projects.

##### Constructability

- Operability
- Ergonomics
- Maintainability
- Conventional Safety
- Radiological Safety

The purpose of N-PROC-MP-0083 is to guide an ECC *modification* team on how to demonstrate due diligence in determining *COMS* issues by:

- (a) Identifying, and assessing user-centred issues impacting *COMS*.
- (b) Analyzing risks these issues present to human safety, and dispositioning and documenting issues.

### Title: ENGINEERING CHANGE CONTROL

## 1.11 Performance Indicators and Review

### 1.11.1 Performance Indicators

The performance indicators in Figure 4, ECC Performance Indicators, provide a set of “Mandatory” and “Suggested” metrics available to monitor the health of the engineering *modification* process.

- “Mandatory” metrics that shall be collected are S99 report data required quarterly by the Canadian Nuclear Safety Commission (CNSC).
- Other “Suggested” metrics may be prepared periodically at each facility to measure quantity, quality, schedule adherence, and cost performance.
- Self Assessments should be used to assess program metrics and overall program quality.

Priority	Performance Indicators
Mandatory (required quarterly by the CNSC)	<ul style="list-style-type: none"> <li># incomplete permanent equipment changes (S99)</li> <li># temporary MODs outstanding (S99)</li> <li># temporary MODs &gt; 6 months old (S99)</li> </ul>
Suggested (non-mandatory)	<ul style="list-style-type: none"> <li># documents with outstanding changes, including Document Change Requests (DCRs)</li> <li># approved modification ECRs outstanding</li> <li># NICR material substitution requests</li> <li># Design change requests</li> <li># ECs designed but not installed</li> <li># ECs installed</li> <li># ECs open &gt; 6 months past turnover</li> <li># temporary MODs &gt; 12 months old</li> <li># temporary MODs &gt; 18 months old</li> <li>Other</li> </ul>

**Figure 4: ECC Performance Indicators**

### 1.11.2 Audits

The following Performance Monitoring and Review processes support this program:

- Line management self-assessment.
- Internal and External reviews, assessments, and audits (e.g., Nuclear Oversight, WANO).
- Management review of performance indicators, results of monitoring, and review of processes, and development of corrective action plans when actual performance is below expectations.

### Title: ENGINEERING CHANGE CONTROL

#### 1.12 Personnel and Training Qualifications

All staff involved in ECC require a general knowledge of ECC concepts, principles, and process. Personnel performing ECC roles should be trained on the working level activities in accordance with N-PROG-TR-0005, Training, and the qualification guide applicable to their role.

## 2.0 ROLES AND ACCOUNTABILITIES

### 2.1 Chief Nuclear Engineer

Approves *temporary modification* extensions.

### 2.2 Manager, Engineering Mechanics

Assumes Program Owner roles and accountabilities for this program, in accordance with N-PROG-AS-0001, Managed Systems.

### 2.3 Design Authority

2.3.1 Accountable for specifying which process change control process should be followed.

2.3.2 Approves scope of all permanent and temporary changes.

2.3.3 Approves AFS Declarations.

### 2.4 Director, Operations and Maintenance

2.4.1 Approves scope and installation of all permanent and temporary changes.

2.4.2 This role is associated with a Stratum V or higher individual or delegate responsible for directing the operations and maintenance of the facility such as defined in the applicable role documents, N-MAN-08131-10000 sheets CNSC-003, S5-0092, S5-0094, and S5-0111. This role may be delegated in accordance with facility practices, and may have differing job titles.

### 2.5 Manager, Operations Production

2.5.1 Approves Available for Service Declarations and Operations Acceptance Declarations.

2.5.2 This role is associated with a Stratum IV or higher individual responsible for the operation of the applicable facility and associated support systems to meet the facilities business objectives for delivery of energy and/or services. This role may be delegated in accordance with facility practices, and may have differing job titles.

Practical Loss Control Leadership (International Loss Control Institute [ILCI]), 1996

### 5.0 REVISION SUMMARY

This is an **intent** revision.

- Purpose and Scope (a) - Deleted reference to N-LIST-08130-10023 and deleted code version number and replaced with reference to facility licenses (DCR 128981).
- Purpose and Scope (e) – Replaced N-PROG-MA-0024 with OPG-PROG-0032 (DCR 129494).
- Figure 2 - Added implementing instruction N-INS-08173-10048 and deleted interfacing program N-PROG-MP-0011.
- Figure 3 - Replaced reference to N-PROG-MP-0011 with N-PROG-MP-0009. Replaced N-PROG-MA-0024 with OPG-PROG-0032 (DCR 129494).
- 1.5.1 - Replaced N-PROG-MA-0024 with OPG-PROG-0032 (DCR 129494).
- 1.6.1 - Replaced reference to N-PROG-MP-0011 with N-PROG-MP-0009.
- 1.6.2 - Added reference to implementing instruction N-INS-08173-10048. Changed “Procurement Engineering” to “Engineering” (DCR 128115).
- 1.9.1.1(e) - Changed reference to stakeholder “Procurement Engineering” to “Design Engineering” (DCR 128115).
- 1.9.1.6(a) - Replace reference to specific code version and Annex C with “CSA N286” (DCR 128981).
- 1.9.1.7(a) - Deleted reference to specific code version and Annex D with “CSA N286” (DCR 128981).
- 2.6, 2.7, 2.8 - Deleted accountabilities which are not specific to this program. These accountabilities are addressed in interfacing processes.
- 4.1 - Deleted version numbers from bases references (DCR 128981).
- 4.2.1 - Deleted reference to N-PROG-MP-0011. Added N-INS-08173-10048. Replaced N-PROG-MA-0024 with OPG-PROG-0032 (DCR 129494)
- 4.2.2 - Deleted N-LIST-08130-10023 (DCR 128981).

Title:
ENGINEERING CHANGE CONTROL

### Appendix A: Engineering Change Control Examples

#### A.1.0 SOFT SOLUTIONS

Examples of soft solutions are as follows:

- (a) Improvements to procedures, training.
- (b) Improvements in work and task planning.
- (c) Improvements to operating and maintenance practices.

#### A.2.0 ENGINEERING CONTROLLED DOCUMENT CHANGES

##### A.2.1 Examples of non-technical changes are as follows:

- (a) Making a document consistent with other like documents.
- (b) Clarifying illegible documents, correcting typographical errors.

##### A.2.2 Examples of technical changes are as follows:

- (a) Evaluating a new hazard that does not result in a hardware change.
- (b) Revising analysis in the safety report that does not result in a hardware change.
- (c) Updating operating procedures where *design requirements* information is changed or correcting a discrepancy between actual physical configuration and documentation.
- (d) Providing clarifying detail to an engineering document that is consistent with the original intent.

#### A.3.0 ITEM EQUIVALENCIES

Examples of item equivalencies are:

- (a) Replacing a valve with one manufactured by a different company with slightly better flow characteristics, but that is otherwise the same in terms of performance parameters.
- (b) Replacing one lubricant with another that is functionally equivalent.
- (c) Changing instrument manufacturers where changes to the instrument's function do not affect the intended design function(s).

#### A.4.0 TEMPORARY MODIFICATIONS

Examples of changes that may be temporary are as follows:

- (a) Electrical jumpers.
- (b) Pulled circuit boards.

## Nuclear Program

Document Number:	Revision:	
N-PROG-MP-0001	R014	
Usage Classification:	Sheet Number:	Page:
Information	N/A	32 of 32

Title:

## ENGINEERING CHANGE CONTROL

### Appendix A (Continued)

- (c) Mechanical bypasses.
- (d) Temporary set-point changes outside of system design range as specified in *design basis* documents.
- (e) Disabled relief or safety valves.
- (f) Installed or removed filters or strainers.
- (g) Plugged or covered floor drains.
- (h) Installed or removed pipe supports.

#### A.5.0 NON-IDENTICAL COMPONENT REPLACEMENT (NICR)

Examples of *NICRs* are:

- (a) Valves or circuit breakers that differ in fit but perform to the same design intent as the current component.

#### A.6.0 PERMANENT MODIFICATIONS

##### A.6.1 Examples of *modifications* that alter the *design basis* (*design requirements* or *design assurance documents*) are:

- (a) A change to a setpoint that is outside of the system design range as specified in *design basis* documents.
- (b) Adding a drain or vent test connection for a new function.
- (c) Auxiliary feedwater systems bypass installation.

##### A.6.2 Examples of *modifications* that do not alter the *design basis* (*design requirements* or *design assurance documents*) are:

- (a) Replacing flange fittings with compression type fittings on a pump unit. Analysis is necessary to assure that the new configuration does not invalidate existing calculations or qualifications associated with the pump.
- (b) Replacing a skid-mounted heating, ventilation, or air-conditioning (HVAC) compressor unit with one from a different vendor. A mounting analysis is necessary to assure that the new compressor, with a different weight, does not invalidate existing calculations or qualifications associated with the skid package. All other functional parameters are the same or better than the original.
- (c) A setpoint change, which changes operating range, but is not outside of the system design range as specified in *design basis* documents.

Title:
<b>FIELD ENGINEERING STANDARD</b>

### 1.0 DIRECTION

This standard provides the criteria, expected behaviours and output requirements for quality services provided by persons performing field engineering activities for projects executed under the Ontario Power Generation – Nuclear (OPG-N) management system.

For clarity this standard is not applicable to work performed under third party Quality Assurance Plans or management systems. The requirements for Field Engineering quality surveillance and oversight of third party quality assurance providers are covered in N-STD-AS-0030 Project Oversight Standard.

### 1.1 Key Field Engineering Elements

#### 1.1.1 Training, Qualification and Experience

- (a) Personnel who execute activities under this standard are required to have skills and qualifications commensurate with their work assignment.
- (b) Operating Experience should be adequately shared among persons performing field engineering activities during work planning and construction/installation execution.

#### 1.1.2 Interfaces and Coordination

Persons performing field engineering activities shall interface and coordinate with the site project manager, contractors and any other applicable organizations to ensure work is planned and executed to meet all stated project requirements including quality while maintaining design, safety and performance objectives.

The site project manager shall ensure that persons performing field engineering activities understand the project requirements and expectations.

#### 1.1.3 Work Planning

Persons performing field engineering activities shall plan the quality service activities to ensure the following objectives are met for the project being executed:

- (a) All activities are planned, verified and controlled based on design requirements, and in particular those related to *Quality Assurance* and *Quality Control* activities.
- (b) Work is assessed and the associated inspection and testing activities are planned, reviewed, approved and released based on the approved scope of work for the project.

#### 1.1.4 Field Engineering Work Execution

Persons performing field engineering activities shall perform technical support and quality service activities to ensure the following objectives:

## Nuclear Standard

Internal Use Only		
Document Number:	Revision:	
N-STD-AS-0031	R001	
Usage Classification:	Sheet Number:	Page:
Information	N/A	3 of 6

Title:
<b>FIELD ENGINEERING STANDARD</b>

- (a) Inspection, examination and test activities are performed and documented in accordance with approved plans, and design and commissioning requirements.
- (b) Measuring and test equipment required during execution is calibrated and controlled.
- (c) Changes are controlled and the results communicated and documented.
- (d) Non-conformances are identified, dispositioned and documented.
- (e) All records management requirements are satisfied, especially those relating to *Quality Assurance* and *Quality Control* records.

### 1.1.5 Non-conformance and Corrective Action

When conditions are encountered resulting in non-conformance with design, commissioning or procedural requirements, field engineering personnel shall ensure:

- (a) *Non-conformances* are dispositioned prior to execution and safe stated, as needed.
- (b) *Non-conformances* are documented / reported.
- (c) Corrective action is implemented to correct the adverse condition as needed and measures or controls are instituted where appropriate, to prevent the recurrence or reduce the risk of recurrence of a similar adverse condition.
- (d) Communicate non-conformance and corrective action results and lessons learned to the appropriate stakeholders.

### 1.1.6 Change Control

Persons performing field engineering activities shall ensure that changes to the following are controlled and documented where applicable to field engineering work:

- approved designs;
- specific procedures or instructions for construction;
- field execution Work Plans; and
- *Quality Assurance* or *Quality Control* documents

## 2.0 ROLES AND ACCOUNTABILITIES

### Field Engineering Manager

Work with a Matrix or Functional Organizational structure within departments and division, and provide daily work direction to a matrix team as required.

## Nuclear Standard

Title:

### FIELD ENGINEERING STANDARD

Accountable for the execution of field related oversight of all projects executed by the Projects and Modifications business unit throughout the project life cycle in accordance with applicable laws, codes and oversight standards and guides, specifically during (but not limited to):

- Project Initiation and Definition – support conceptual design development and front end planning,
- Engineering – support Preliminary and Detail Engineering,
- Procurement – support development of Technical Specifications, Request for Proposal (RFP), Request for Quote (RFQ), Material Handling,
- Execution – review and oversight of: CWP's, installation and test processes, workplace health and safety, non conformances, construction/installation quality.

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

**Non-conformance** is a deficiency in characteristic, documentation or procedure which renders the quality of an item or service unacceptable, indeterminate or not according to specified requirements.

**Quality Assurance** is a planned and systematic pattern of means and actions that is designed to provide confidence that items or services meet specified requirements and perform satisfactorily in service.

**Quality Control** is a set of processes in place to ensure that specified requirements are met through inspections, examinations or verifications.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-00120-10009</b>	Usage Classification: <b>Information</b>	
Sheet Number:	Revision Number: <b>R000</b>	Page: <b>3 of 6</b>
Title: <b>Guide for the Contractor / Owner Interface Requirements (COIR)</b>		

### 1.0 PURPOSE

The Contractor / Owner Interface Requirements (COIR) outlines, at a high level, the responsibilities, accountabilities, activities, deliverables, and processes between OPG and the Contractor in the execution of contracted work.

The COIR supports the Engineering, Procurement and Construction (EPC) work at OPG Nuclear where OPG is the Owner/Constructor.

The COIR is an interface document which forms part of a contract. Depending on the work, some portions of the COIR may or may not apply. The contract should clearly identify which items of the COIR apply and which do not.

It may also be necessary that accountabilities of an interface item needs to be changed from either OPG to the Contractor or from the Contractor to OPG. The contract should clearly identify these changes with the use of the Deviations Form attached to this Guide.

### 2.0 EXCEPTIONS

- Owner Only contracts

### 3.0 DIRECTION

Accountability for the management of contracts to deliver project objectives is clearly stated in N-STD-AS-0028, Contract Management Standard. Project Manager is accountable for the deliverables by the contractor during execution of work at OPGN facilities, and shall apply the appropriate level of oversight as per N-STD-AS-0030, Project Oversight Standard. The COIR provides, at a high level, how the contract deliverables will be managed between OPG and the Contractor.

#### 3.1 Overview of the COIR Interface matrix

The COIR has the following sections: Project Management, Engineering, Procurement, and Construction. Sub sections of each are as follows.

1. Project Management Interface Matrix
  - a. General processes, i.e., SCR, Controlled Documents, etc.
2. Engineering Interface Matrix
  - a. Reports, i.e., Pre-Start Health & Safety, Conceptual Design, etc.
  - b. Regulatory Approvals, i.e., System Classification List (SCL), TSSA Registration, etc.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-00120-10009</b>	Usage Classification: <b>Information</b>	
Sheet Number:	Revision Number: <b>R000</b>	Page: <b>4 of 6</b>
Title: <b>Guide for the Contractor / Owner Interface Requirements (COIR)</b>		

- c. Engineering Change (EC) Activities, i.e., Master EC, Design EC, Electrical EC, Instrumentation & Control EC, Mechanical EC, Project EC.
  - d. Installation Related Activities, i.e., work plans, etc.
  - e. Commissioning Related Activities, i.e., Specifications, work plans, etc.
  - f. Available for Service (AFS) Related Activities, i.e., walk downs, Operations acceptance, etc.
  - g. Close Out Related Activities, i.e., incorporation of Bills of Material, Design Manuals, etc.
3. Procurement Interface Matrix
- a. Procurement Planning
  - b. Engineering Deliverables, i.e., updating CAT ID(s), Master Equipment Lists, etc.
  - c. Identification requirements to support changes to the Asset Suite (PassPort).
  - d. Purchasing Activities, i.e., source surveillance, factory acceptance testing (FAT), management of non-conformances, etc.
  - e. Receiving and Inspection, i.e., security screening, warehousing, spare parts list, etc.
  - f. Documentation Control and Records Management i.e., history dockets.
  - g. Contract Completion OPEX
4. Construction Interface Matrix
- a. Pre-requisite Work, i.e., prepare Inspection & Test Plans (ITP), Schedule, Work Order Assessing, etc.
  - b. Safety, i.e., Safety Program, Permit Execution, Radiation Protection, etc.
  - c. Construction Turnover, Field Changes, Currently Built (as built), Completion Assurance, etc.

### 3.2 Interface and Liaison Requirements

- 1. OPG will ensure that there is an OPG representative responsible for each item in the COIR. It is important to have this identified and documented so that the

## Guideline

	<b>R000</b>	<b>5 of 6</b>

Title:

### **Guide for the Contractor / Owner Interface Requirements (COIR)**

Contractor will know who to work with when engaged in execution of work. The Project Management Plan (PMP), Organization Map may be used to document the contact list, identification of signing authorities, and other interface liaisons.

2. The Project Manager should be satisfied that the OPG representative has the knowledge and experience to perform the OPG activities described in the COIR. The Project Manager should seek involvement of OPG organizations such as, Engineering, Supply Chain, Operations, Maintenance, etc. to support interface activities.

### **3.3 Deviation to the COIR**

A deviation to the COIR is defined as a change to the accountabilities in the approved COIR. It may be beneficial that OPG may provide a deliverable to the Contractor when the COIR states that this is the Contractor's accountability or the Contractor may be in a better position to provide a deliverable to OPG when the COIR states it is OPG's accountability. Any deviation to the accountabilities must be noted and approved using the COIR List of Deviations Form (N-FORM-11583). Approval for the deviation must be obtained from functional organizations within OPG that are accountable for that deliverable and the Project Manager.

### **3.4 COIR Deliverables not Required**

Based on the work to be executed, items in the COIR may not be required. The Scope of Work document, or in the case of the Extended Services Master Service Agreement (ES MSA), the Worksheet, must explicitly state the COIR items which are required or COIR items which are not required (however it is easy to state). This will bring clarity to the Contractors who will consider these changes when providing responses to OPG's bid requests.

## **4.0 RECORDS AND REFERENCES**

### **4.1 Records**

- 4.1.1 Any controlled documents which may be produced as a result of this document should be managed in accordance with N-PROC-AS-0003, Controlled Document Management.
- 4.1.2 Any records which may be produced as a result of this document should be managed in accordance with N-PROC-AS-0042, Records and Document Management and N-MAN-00120-10001-RDM, Nuclear Projects Records and Document Management.
- 4.1.3 The following records may be generated by use of this document and shall be registered in appropriate document management system in accordance with the following table.

Title: <b>GUIDELINE FOR CONSTRUCTION OVERSIGHT</b>		

### 1.0 VISION

The functional groups providing construction oversight for nuclear projects are aligned with all project stakeholders including the contractor. In performing oversight, the oversight staff shall work to complete the project safely, meet the quality requirements including minimizing rework, while always being sensitive to achieving cost and schedule plans. Oversight staff should act as “*Enablers*” supporting the executing groups.

### 2.0 GENERAL GUIDING PRINCIPLES:

1. Safety is our core value. We embrace the traits of a healthy nuclear safety culture.
2. Our ability to influence a positive outcome and thereby achieve all the project objectives is greatest before the execution work starts. Accordingly, adequate oversight is provided prior to field implementation thereby ensuring “readiness” which is critical to achieving successful field implementation.
3. Trust but verify. Building trust and relationships between execution groups is essential to meet project objectives. Verifications are seen by the contractor as process checks and are embraced.
4. Oversight and Project Staff work together as a team. There is no “they” or “them” only “we” and “us”.
5. Oversight will be performed in accordance with N-STD-AS-0030, Project Oversight Standard and according to the guidelines within N-MAN-09701-10002, Nuclear Projects Oversight Guide, and for P&M projects N-INS-09701-10007.
5. The level of oversight applied will be risk based and specific to each project as detailed in the Project Oversight Plan (POP).

### 3.0 PURPOSE

This guide takes authority from N-STD-AS-0030, Project Oversight Standard and demonstrates OPG due diligence by construction oversight during project execution.

### 4.0 DIRECTION

#### 4.1 General

4.1.1 It is expected that the POP will include construction oversight to confirm:

- Work is adequately planned and executed event free in accordance with the appropriate procedures. Quality requirements are satisfied.
- Industry accepted workmanship standards are maintained
- Contractor supervisory staff are adequate and effective
- Contractor “readiness” to execute work is per the plan

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-09701-10120</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>5 of 12</b>
Title: <b>GUIDELINE FOR CONSTRUCTION OVERSIGHT</b>		

- Use of Event Free Tools and safe work practices are exhibited when work is performed.
- Nuclear safety is maintained in both planning and execution of work
- Work is planned and executed in accordance with safety management systems and procedures stipulated in the contract/PO, and the requirements of the Province of Ontario OH&S Act & Regulations.
- Radiation work is planned and executed to achieve ALARA dose rate.
- Housekeeping is maintained and SATM requirements are achieved.
- Workers are adequately trained and qualified to perform the work
- Work protection program requirements are satisfied
- CWP, ITP (job documentation) requirements are followed
- Procedural compliance is maintained
- Crew sizes and work progression is monitored to validate invoicing on reimbursable costs. Contractor maximizes "wrench time".

4.1.2 Contractually, OPG employees performing construction oversight have access to the contractor's facilities, documents, records and work site. The PM will be familiar with the contractual language and any restrictions or protocols and will provide guidance and direction to the OS team on how to engage the contractor when planning and performing oversight activities.

### 4.2 Construction Oversight Planning

Construction Oversight should be planned as part of the POP that is prepared and approved by the PM in accordance with N-MAN-09701-10002, and for P&M projects N-INS-09701-10007. The PM will hold a kick-off meeting and seek input from the functional groups in preparing the POP. The POP is a living document that will be revised as required based on oversight results, risk and project status. This is best accomplished through scheduled recurring meetings chaired by the PM to review findings, discuss strategy and actions going forward with the OS team.

During the kick-off meeting the PM should discuss reporting and communication requirements for the OS team. Unless otherwise stipulated in the communication plan, all OS results should be forwarded to the PM.

### 4.3 Construction Oversight Execution

4.3.1 Construction oversight should be performed in accordance with the activities and frequency specified in the POP. Those performing the construction oversight are members of the project oversight team under the direction of the PM. Beyond the responsibility to execute the construction oversight activities, the oversight team members are also responsible to participate in regular oversight update meetings as may be requested by the PM.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-09701-10120</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>6 of 12</b>
Title: <b>GUIDELINE FOR CONSTRUCTION OVERSIGHT</b>		

- 4.3.2 When performing OS activities an Oversight Report shall be initiated. For all P&M work this will be done using N-FORM-09701-00001.
- 4.3.3 One construction oversight element may include multiple Oversight Reports subject to complexity and progress of work.
- 4.3.4 Oversight findings that require follow up actions should be documented in the project oversight or action log.
- 4.3.5 As there may be multiple persons performing construction OS on any given project, it is recommended that a C-SPOC be assigned (by the functional manager) to represent the various members of the construction oversight team.
- 4.3.6 In preparation for recurring OS team meetings, the C-SPOC should review all of the construction OS results and recommend changes to the POP if warranted. At these meetings, the PM should be informed that the POP may require revision to the construction oversight activities.

### 4.4 Report Adverse Conditions / Non-conformance

- 4.4.1 Adverse conditions shall be documented and reported to the Project Manager in a timely manner, and in a SCR in accordance with N-PROC-RA-0022, Processing Station Condition Records.
- 4.4.2 When oversight identifies issues nonconforming to the contractor's quality program they shall be recorded using the SCR process (for trending and OPEX purposes). It is the Contractor's responsibility to disposition the non-conformance through his own QA program and/or problem identification and corrective action program.
- 4.4.3 For significant adverse conditions, the SCR should include an action to Supply Chain to investigate and issue a Non-conformance Corrective Action Request (NCAR) if required.
- 4.4.4 The SCR number should be recorded in the associated Oversight Report.

### 4.5 Stop Work

- 4.5.1 Anyone has right to stop a work activity when this work activity is likely to endanger personnel or have a high potential for harm (including nuclear, radiological, environmental and conventional safety). The condition of stopped work activity and associated concern shall be reported to his or her supervisor and Project Manager immediately.
- Note:** Stop work is in effect until the Project Manager authorizes the work to continue.
- 4.5.2 The Project Manager may direct work to be stopped when it is identified as nonconforming, i.e., nonconforming to design, deviating from approved plan, inadequate workmanship, not complying with procedures, material issues, etc.
- Note:** Stop work is in effect until the Project Manager authorizes the work to continue.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-09701-10120</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R000</b>	Page: <b>7 of 12</b>
Title: <b>GUIDELINE FOR CONSTRUCTION OVERSIGHT</b>		

**Note:** All instances of stop work initiated by oversight personnel shall be documented on an SCR as well as an Oversight Report.

### 4.6 Competency

The PM is accountable to ensure that persons performing construction oversight are competent. The PM should consult with functional managers to confirm adequacy of oversight resources.

### 4.7 Oversight Records

For all P&M projects Oversight Reports will be filed in accordance with N-INS-09701-10007.

	M&TE is identified to indicate calibration status.
	Calibration record for each M&TE complete
	M&TE handled and stored to prevent abuse, misuse, damage
	<b>Welding Surveillance Activity</b>
	Control of welding equipment
	Electrodes properly controlled
	Applicable approved welding procedure available at workface
	Welder / Brazers qualified
	Filler metal certified
	Comply with welding procedure, e.g., base material, fit up, pre/ post heat temperature, purge/backing, root pass/tack weld, welding parameters, inter-pass temperature, weld size/profile, reinforcement, surface finish, etc.
	Post weld heat treatment
	<b>NDE Surveillance Activity</b>
	Verify qualification of NDE subcontractor
	Review scope of required NDE
	NDE personnel certification and certification level
	NDE/ inspection procedures qualified
	Confirm NDE equipment calibration
	Observe adherence of NDE/inspection procedures
	Document NDE results
	Deficiency identified and dispositioned
	Review sample of RT/MT/PT report
<b>Pressure Boundary</b>	Valid vendor Pressure Boundary Certificate of Authorization
	Work is within the vendor Certificate of Authorization scope
	Control segregation and identification of PB items and traceability of documentation

### GUIDELINE FOR CONSTRUCTION OVERSIGHT

Oversight Area	Oversight Activity
	Control of PB welding consumables before and after issue for use
	Material identification (e.g., heat number) transferred when subdividing
	Monitor interface between vendor and local TSSA inspectors
	Control and justification of pneumatic pressure tests in lieu of hydrostatic pressure tests as specified in design
	Correct fasteners used as per design
<b>Work reporting</b>	Adequacy of work report for progress, quality, quantity, safety and other details of the work
<b>Change Control</b>	Intent changes processed
	Non-Intent changes processed
	Changes incorporated in Design EC revision
<b>CONTRACT ADMINISTRATION</b>	
	Tracking and monitoring subcontracts used by main contractor
	Contractor has conducted a Mark-up meeting
	Verification of Contractor qualifications and arrange for required OPGN-based training
	Attend Contractor Pre-Job Briefings at a frequency to be determined by the Project Manager
	Maintain a log (N-FORM-11487) to record Contractor activities, discussions and deficiencies.
	Complete N-FORM-11479, Contract Inspection Checklist (frequency to be determined by the Project Manager)
	Completion of N-FORM-11482, Safety Certification of Contractor's Equipment for all contractor/sub-contractor equipment.
	Review of applicable Safety Plan(s), JSA's, Critical Material Handling Plan, applicable Lift Plans
	Adequacy of Safety/ Briefing cards / rollouts / stand downs
	Review Work Plans
	Monitor material handling, storage, identification, and house keeping
	Monitor tooling and rental equipment
	Monitor the field conditions prior to demobilizing
<b>SAFETY</b>	
	Refer to items in NK38-LIST-09701-10001, Project Oversight Plan – Health & Safety
Safety for owner only project	<ul style="list-style-type: none"> <li>Project specific site safety plan</li> <li>Project site delineation and control plan (construction island)</li> <li>Emergency Response interface plans (OPG not responsible for first aid)</li> <li>Incident notification process (defined in contract and MOU)</li> <li>Hot work and fire response plan (part of project specific site safety plan)</li> <li>Tie-in plans and controls (both parties identify the OPG energies inside the construction island / control of hazardous energy process) (OPG executes the tie-in as constructor.)</li> <li>Environmental plans and controls by vendor</li> </ul>
Nuclear Safety	Adherence to N-POL-0001, Nuclear Safety Policy

Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### 1.0 INTRODUCTION

- 1.1 This guideline has been prepared to assist Ontario Power Generation Nuclear (OPGN) Engineering staff in selection and application of engineering oversight activities required to support the OPGN Project Manager in the preparation of the Project Oversight Plan and to provide recommended practices during the preparation, execution and documentation of engineering oversight activities.
- 1.2 The purpose of this guideline is to communicate best practices and lessons learned from both internal and external nuclear projects to assist OPGN Engineering staff in identifying and specifying adequate engineering oversight activities using a graded approach based on the engineering risks.

### 2.0 ENGINEERING OVERSIGHT

#### 2.1 Objective

- (a) The goal of engineering oversight is to ensure that engineering deliverables produced by Contractors meet the design quality and procedural requirements and that the modification, when installed in accordance with the detailed design package, will perform its intended function without adverse impact on the plant's design basis or deterioration of the plant's design margin.
- (b) For Contractors involved in modifications, OPGN should provide the Modification Design Requirements, Modification Outline and Conceptual Design Report (where applicable) to the Contractor during the contracting phase. These documents together with the Contractor/Owner Interface Requirements (COIR) document (N-COI-00120-00001), Scope of Work (SOW), Interface Requirements (IR) (Appendix A) or Engineering Specification, should clearly define Technical, Procedural, and Quality requirements which the Contractor must satisfy.

#### 2.2 Principles of Engineering Oversight

- (a) Engineering oversight is performed throughout the lifecycle of the engineering activities.
- (b) Engineering oversight is applied using a graded approach such that higher level risk activities have more frequent and intrusive oversight. The degree of oversight selected should be commensurate with the risk, complexity of the project and the Contractor's past performance.
- (c) Engineering oversight is intended to ensure ongoing conformance of the engineering products or deliverables to the quality requirements and to allow early detection of potential issues so that corrective measures can be taken.

## Guideline

Title:

## GUIDELINE FOR ENGINEERING OVERSIGHT

### 2.3 Oversight Activities

- (a) Engineering oversight activities can be categorized as follows:
  - (1) In-Process Engineering Hold Points
    - (i) Elements in OPGN's Modification Process, N-PROC-MP-0090, that have special restrictions requiring OPGN Engineering in-line approval or authorization prior to proceeding further in the modification process. OPGN Design Authority (DA) authorization of the Design Plan is one such example.
    - (ii) Additional In-Process Engineering Hold Points may be specified by the appropriate Engineering/DA and included in the Project Oversight Plan. These additional hold points should be included as approved deviations in the Generic COIR or similar applicable contractual documents such as SOW, Engineering Specification or IR.
  - (2) Routine Engineering Oversight
    - (i) The ongoing interactions and scheduled periodic informal reviews of engineering products by OPGN engineering staff to seek evidence that the design quality requirements are being met and those assumptions (technical judgments) are identified and validated.
  - (3) Strategic Engineering Oversight
    - (i) Are those activities to be included in the Project Oversight Plan that require more intrusive oversight based on the higher risk to OPGN or critical evolution in the engineering process. Strategic Engineering Oversight may include formal design reviews, process oversight reviews, formal independent technical reviews and design challenge meetings (Appendix B).
    - (ii) Formal technical reviews should use the Comments and Disposition Process (Appendix E) to document and track OPGN's comments to resolution. Process or procedural compliance type oversight activities are referred to as Surveillance activities and should be planned and documented in accordance with Appendix C.
- (b) All Oversight activities to be conducted should be documented, managed and tracked to completion by the Project Manager in accordance with the Project Oversight Plan. In-Process Engineering Hold Points that require OPGN "Approval" or "Authorization" shall be included in the Design Plan where applicable.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>7 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

## 2.4 In-Process Engineering Hold Points

2.4.1 In-Process Engineering Hold Points occur at various stages of the design process and are intended to ensure the Contractor is progressing the product in accordance with OPGN's expectations and contractual requirements. In-Process Engineering Hold Points related to Technical Reviews or Design Challenges will be selected by the OPGN engineering lead based on the risk, the complexity of the project and the capabilities of the Contractor. In-Process Engineering Hold Points may include the following:

- (a) Engineering Mobilization Hold Point
- (b) Design Plan Hold Point
- (c) Constructability, Operability, Maintainability and Safety (COMS) Hold Point
- (d) Independent Technical Review/Design Challenge Hold Point
- (e) Design Completion Assurance (DCA) Hold Point
- (f) Engineering Change (EC) Release Hold Point
- (g) Construction Completion Declaration (CCD) Hold Point
- (h) Available for Service (AFS) Hold Point
- (i) Key event in engineering product development

## 2.5 Engineering Mobilization Hold Point

The Engineering Mobilization Hold Point occurs prior to any substantive engineering work being done by the Contractor. The intent of the hold point is to ensure alignment between the OPGN Design/Engineering Authority and Contractor regarding the technical expectations for the engineering work. The Engineering Mobilization meeting may include the following: Modification Design Requirements, Requirements Traceability Matrix, Design Plan, Oversight Plan, EC Release Plan, COIR, Staff Qualification Plan, Engineering Schedule, Analysis Codes/Software to be used, Operating Experience (OPEX), Station Condition Records (SCRs), Corrective Action Requests (CARs), Lessons Learned, Contractor Previous Performance, Special Processes, Controls and Documentation.

## 2.6 Design Plan Hold Point

The Design Plan shall be authorized by the appropriate OPGN DA prior to the Contractor proceeding with the detailed design activities.

## 2.7 COMS Meeting Hold Point

As required by N-PROC-MP-0090 and N-PROC-MP-0083, COMS meetings shall be held during the design process and include the mandatory quorum of OPGN stakeholders.

## 2.8 Independent Technical Review/Design Challenge Hold Point

2.8.1 If required by the Modification Process, N-PROC-MP-0090, and/or Modification Outline, N-FORM-10958, Independent Technical Reviews should be conducted in accordance with N-PROC-MP-0047, Design Verification. Technical Reviews are

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>8 of 41</b>

Title:

### **GUIDELINE FOR ENGINEERING OVERSIGHT**

mandated based on the risk associated, design complexity and the criticality of the deliverable.

- 2.8.2 OPGN may opt to take ownership for arranging Independent Technical Reviews without Contractor involvement or may request the Contractor to arrange the review. In either case, OPGN will participate on the technical review team to observe and ensure oversight.
- 2.8.3 For certain projects a Design Challenge Meeting may be requested by OPGN. The Challenge Meeting Quorum may consist of OPGN Stakeholders and Contractor personnel. The meeting should cover the following areas:
- (a) Design inputs
  - (b) Design assumptions
  - (c) Validation of above inputs, technical judgements and assumptions (or validations that are outstanding)
  - (d) Adequacy and completeness of design requirements
  - (e) Additional oversight, walkdowns, or consultations undertaken to ensure adequacy of design
  - (f) Evidence of Operability and Maintainability input to design
  - (g) Technical Reviews such as Human Factors Engineering (HFE), Fire, etc.
- 2.8.4 The Contractor will present how design has addressed the above areas, and will be questioned by the OPGN Challenge Team regarding suitability to proceed to the next phase.

## **2.9 Design Completion Assurance**

- 2.9.1 DCA may be used on complex projects. Completion Assurance is one process by which the Contractor provides documented evidence to OPGN that the design and analysis work has been completed in accordance with the requirements of the OPGN's modification process N-PROC-MP-0090.
- 2.9.2 DCA occurs after detailed design has been approved by the Contractor and prior to OPGN acceptance and should be planned and documented in the Design Plan. The documented evidence to be submitted by the Contractor should include the DCA Certification letter, as a minimum.

## Guideline

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-GUID-01920-10000</b>	<b>Information</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R004</b>	<b>9 of 41</b>

Title:

### **GUIDELINE FOR ENGINEERING OVERSIGHT**

2.9.3 The Design Completion Assurance Certification Letter is to be prepared and signed by the Contractor's Design Manager and directed to the applicable OPGN DA/Engineering Manager. This certificate is a signed statement to confirm the following:

- (a) The detailed design as documented meets design and regulatory requirements
- (b) Design has been subjected to appropriate verification processes
- (c) Design methods, analyses, input data, activities and conditions were appropriately selected and applied
- (d) System and equipment interfaces are fully identified and are compatible
- (e) Input from other available technical sources and experienced personnel has been considered
- (f) Design documentation contains clear and complete information
- (g) All design output documents have been prepared, reviewed, approved, issued, and filed in accordance with OPGN governance.
- (h) Issues Tracking File, provided by the Contractor to identify technical issues and open items (including unverified assumptions) in the design along with an action plan for their resolution, is current.

## **2.10 EC Release Hold Point**

2.10.1 Acceptance of an engineering deliverable is the final step in the engineering oversight process. Previous oversight activities have demonstrated and should give confidence that evidence exists that the deliverable will meet the design/engineering quality requirements, is suitable for its intended use and meets process, format and content requirements.

2.10.2 The acceptance is the final check of the product. The following are some examples of documented evidence a contractor would provide to OPGN for acceptance.

- (a) Complete design EC/engineered product with preparer, verifier and approver signatures.
- (b) Issue Tracking File with issues either closed or open items dispositioned properly.
- (c) COMS issues resolution and their incorporation into the design.
- (d) Formal Technical Review report, if applicable.
- (e) Walkdown report.

## Guideline

Document Number:	Usage Classification:	
<b>N-GUID-01920-10000</b>	<b>Information</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R004</b>	<b>10 of 41</b>

Title:

### **GUIDELINE FOR ENGINEERING OVERSIGHT**

- (f) OPEX search / report.
- (g) Updated design plan to record completed activities.

## **2.11 Document Acceptance**

OPGN will indicate acceptance of a document by a suitable stamp on the document signatory or cover page, or by an OPGN Coversheet, identifying OPGN accepting signatories, which is then attached to the document being accepted, or by an electronic signature in the OPGN Asset Suite program. The acceptance process should use the Comment and Disposition (C&D) Process identified in Appendix E, F, G and H.

## **2.12 Construction Completion Declaration**

- (a) The CCD package may be required to ensure that all field work, modification or maintenance-related, has been satisfactorily completed prior to the commencement of commissioning. Systems and equipment will not be energized and commissioning activities for the modification will not proceed prior to the CCD. This is documented in the design plan and would typically be required for large modifications involving major construction and commissioning activities.
- (b) The Contractor will prepare a CCD package and will include required reference documentation such as work packages, configuration management report, field changes, non-conformance reports, marked-up drawings, SCRs, Inspection and Test Plans (ITPs) and any other documentation required by the OPGN Project Manager.

## **2.13 Available for Service**

Once commissioning activities are complete and accepted by Engineering via the Commissioning Report, the formal Available for Service (AFS) process is followed as per N-PROC-MP-0090, Modification Process. The AFS Meeting will be executed with stakeholders from OPGN including Operations, Maintenance, the OPGN Project Manager and the Contractor's Team Lead in charge of the modification.

## **2.14 Routine Engineering Oversight**

- 2.14.1 Routine design meetings should be held between the Contractor and OPGN Engineering on a regular basis. The purpose of the design meetings is to informally discuss the engineering work being performed by the Contractor and provide OPGN support and/or answer design related questions as required.
- 2.14.2 As per the Project Oversight Plan, meetings are to be organized by the OPGN Project Manager and the frequency mutually agreed by the OPGN Design Team Lead (DTL) and the Contractor.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>11 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

2.14.3 The intent of the meetings is to review the engineering work with a focus on the following:

- (a) Review the progress of the design and identify and issues that need to be mutually addressed.
- (b) Communicate and reinforce OPGN expectations with respect to quality and procedural requirements.
- (c) Identify emergent risks or OPEX issues that should be considered.

## 2.15 Strategic Engineering Oversight

2.15.1 Strategic Engineering Oversight is the process of requesting, planning, conducting and documenting an engineering review of specific engineering products and processes based on a determination that these products or processes are critical to the successful completion of the engineering activities being performed by the Contractor.

2.15.2 For Modifications, the level and frequency of Strategic Engineering Oversight should be consistent with the risk ranking in the Modification Outline, the critical design requirements in the Modification Design Requirements, OPEX related to the modification and the previous experience with the specific Contractor.

2.15.3 Strategic Engineering Oversight activities should include Technical Processes (e.g., Engineering Verification Procedure), Technical Products (e.g., Engineering Calculations), and Quality Processes (e.g., Staff Qualification Records).

2.15.4 Strategic Engineering Oversight may be performed at any time during the lifecycle of the project or production of the engineering deliverable. It is recommended that process or procedural (Surveillance type) oversight activities be performed early in the contract execution to ensure OPGN approved processes are being followed. Technical type oversight activities may be repeated multiple times at various stages during the development of critical engineering deliverables.

2.15.5 Consideration should be given to using a person independent of the in-process reviews for the Strategic Oversight of process activities. This independence will permit the in-process reviews to focus on the technical quality of the product.

2.15.6 These activities must be communicated to the Project Manager for incorporation into the Project Oversight Plan.

## 2.16 Preparing for Strategic Oversight

2.16.1 The following should be considered when preparing for Strategic Oversight.

- (a) Review the purpose and objective of the oversight activity and any reference documentation such as (reports, records, governing documents, etc.).

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>12 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

- (b) Prepare a detailed checklist with the method, acceptance criteria and performance aspects of the activity and reference the exact source documents including revision numbers to be surveyed. Refer to Appendix D for tips in preparing oversight checklist.
- (c) Prepare a list of Stakeholders and make arrangements with the Project Manager and Contractor to perform the oversight activity.
- (d) Send the Oversight Execution plan to the Project Manager at least 2 weeks prior to the scheduled date. Refer to Appendix C for a Sample Oversight Template
- (e) Review the project schedule to ensure activities are scheduled.

### 2.17 Performing Strategic Oversight

2.17.1 The following should be considered when conducting oversight:

- (a) A Pre-Job Brief should be conducted to present the oversight plan, introduce the oversight team, confirm Contractor roles and responsibilities, establish channels of communication, review Contractor site safety and identify any particular areas of concern.
- (b) Using the oversight checklist, observe activities, review documentation, inspect hardware, etc., to ensure compliance with the specified technical and administrative requirements and to validate whether the performance objectives were attained as per the scope of the plan. Important information required to make valid conclusions from the quality oversight should be gathered in the checklist.

**Note:** The oversight checklist should not restrict the team from making observations that are not specifically included in the checklists.

- (c) Findings shall be supported (typically five occurrences of objective evidence or be dependent on the severity of the finding).
- (d) Document objective evidence (in enough quality and quantity) for conditions adverse to quality or observations in sufficient detail to ensure that the record clearly reflects who was contacted, what was observed, when it was observed or reviewed, and what results were obtained.
- (e) Document adverse conditions requiring immediate attention identified during the oversight. As well, identify areas of strength in which the Contractor adequately meets requirements.
  - (1) The results of each oversight check will include an evaluation of the degree of conformance of the activity or item to its applicable quality requirements and objectives.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>13 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

- (2) The adequacy of the work practice, the “In-Process” quality control activities observed and the effectiveness of the results. (When required, additional observations should be made or initiate follow-up oversights).
- (3) The need to schedule follow-up reviews/oversight for evaluation of weak areas.
- (f) If during oversight a potential issue outside the current scope of the planned oversight is identified, the issue should be evaluated with project manager and stakeholders to determine whether the issue should be added to the scope of the current oversight and/or advise and receive concurrence from the project manager accountable for oversight to initiate follow up action and/or add the scope to the next planned oversight. Findings to be recorded in the OPGN SCR database.
- (g) Conduct a Post-Job Debrief with the Contractor and obtain agreement on the oversight conclusions along with the corrective actions to be initiated by the Contractor. The discussions would also include any action required to be taken up by OPGN organizations. All findings in the report shall be documented in the Contractor’s Corrective Action Program (CAP) and the OPGN SCR database.

## 2.18 Reporting Strategic Oversight

2.18.1 Oversight staff should consider the following in regards to reporting results:

- (a) Prepare an oversight report summarizing the activities performed, dates, oversight team, Contractor staff, a summary of observations/findings, corrective action plan (CAP) for deficiencies identified and a SCR if applicable. Refer to Appendix C for a Sample Oversight Report Template.
- (b) The OPGN staff member responsible for Oversight should discuss the oversight report with the Project Manager and Engineering Manager (Information may be confidential and distribution restricted) and incorporate results into performance measuring with information sensitivity.
- (c) Identify the corrective actions to be initiated by OPGN. These should be managed through the SCR, CAP and Action Tracking Assignment processes, as applicable. Contractor Corrective Actions from the oversight should be issued to the Contractor involving Supply Chain Quality Services as per N-PROC-MM-0010, Establishing and Maintaining Ontario Power Generation Nuclear Approved Suppliers List.

### Appendix A: Interface Requirements

#### A.1.0 DELIVERABLES AND ACTIVITIES INTERFACE REQUIREMENTS

- (a) The methods that the Contractor will use to interface with OPGN staff and OPGN processes should be documented. This documentation is a listing of the responsibilities and accountabilities associated with the deliverables, not just a list of deliverables. For Project work this is typically covered by the COIR, and managed by Projects "Project Leader". What follows is a generic description for when no formal Project Leader is assigned. The minimum information required to document the OPGN Contractor interface, no matter the format, is:
  - (1) A list of deliverables and activities to be completed.
  - (2) Contractor's accountabilities and responsibilities including use of OPGN processes or portions thereof.
  - (3) OPGN's accountabilities and responsibilities.
- (b) The OPG Representative should document the Deliverables and Activities Interface (DAI) requirements in an IR document.
  - (1) The IR may be a standalone document or incorporated into other documentation (e.g., SOW or Engineering Specification) or the project may use N-TMP-10185, Deliverables and Activities Interface, template to develop the IR.
  - (2) N-TMP-10185 is a pre-populated template which provides a draft outline of an IR that may be used to document the DAI requirements. The draft IR created by this template should be:
    - (i) Modified as necessary to meet the needs of the project.
    - (ii) Used when the required information cannot reasonably and concisely be incorporated into other documentation.
    - (iii) Read as a guide to help ensure that all required aspects of the specific work are appropriately documented when the IR are documented in a SOW, Engineering Specification or other document.
- (c) Pre-developed or generic IRs may be attached, referenced or otherwise incorporated into a new IR or an addendum or deviations list may be attached to a pre-developed or generic IR, as long as the set of documents comprising the new IR continues to meet the requirements of this standard.

**Note:** The IR is distinct from the Project Execution Plan (PEP). The PEP is a project management tool prepared for the entire project and may include Contractor work and interfaces as a sub-set of the project scope.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>17 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (d) An IR defines Contractor involvement in project deliverables and activities, identifying which portions are handled by OPGN and which by the Contractor.
- (e) Typical contents of an IR include the following (the template is a guide that may be modified as necessary to meet the needs of the project):
  - (1) Deliverables and activities, or portions thereof, to be provided by the Contractor, including a list of specific documents to be delivered.
  - (2) OPGN and Contractor Accountabilities for the completion of each deliverable and activity (Refer to Section A.4 for Design Input Documentation specific guidelines).
  - (3) OPGN processes and management procedures or portions thereof, to be adhered to by the contractor. This should include mapping of roles and responsibilities in the procedures to Contractor Staff.
- (f) Contractor qualification requirements. Refer to Section A.2 for additional guidelines.
- (g) Training requirements for the Contractor. Refer to Section A.3 for additional guidelines.
- (h) Liaison requirements between the Contractor and OPGN. Refer to Section A.5 for additional guidelines.
- (i) Formats and standards to be applied by the Contractor to related deliverables include the following:
  - (1) Usage of specific forms, templates, checklists, cover sheets, travelers, approval letters, drawings and other controlled document formats.
  - (2) Provisions for electronic copies of documents at the completion of the project (e.g., Computer Assisted Drafting, Computer Aided Design, or stress analysis files). If these are required, OPGN should specify the required software for compatibility.
  - (3) Application of OPGN standards by the Contractor, such as shown in N-LIST-01300-10006, List of Active Engineering Standards and Generic Engineering Specifications. Standards associated with equipment numbering, drafting, and design disciplines, i.e., mechanical, electrical, instrumentation and control, and civil design should be included as required.
- (j) Documentation verification requirements. Refer to Section A.6 for additional guidelines.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>18 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (k) Review criteria and acceptance requirements to be applied to Contractor deliverables by OPGN, including the following:
- (1) Identifying specific areas of deliverables and activities to be reviewed and review criteria. Reviews ensure that:
    - Standards, procedures, codes and regulations are complied with. IR related requirements and contract terms are met.
    - Interfaces to Systems, Structures or Components (SSC's) or engineered tooling outside scope of Contractor work are addressed.
  - (2) Identifying review hold points (e.g., design completion stage, deliverable completion stage, or other criteria). Refer to N-PROC-MP-0078, Specification, Review, Acceptance, and Use of Vendor Technical Documents, and any OPGN-specific instructions where issued, for additional information pertaining to review and acceptance of technical documents from Contractors.
- (l) Methods to control distribution and use of Contractor documents.
- (m) Provisions for monitoring, including audits and surveys of activities, to verify Contractor compliance with the Quality Assurance QA program specified in IR. Refer to Section A.7 for additional guidelines.
- (n) Schedules for Contractor deliverables.
- Note:** If incentives are written in the contract, ensure incentives appropriately recognize proper worker behaviours rather than being based on speed of work. Personnel safety, quality of work performed, and the required rework on tasks performed by Contractor personnel may be considered for incentives.
- (o) Schedules for Interface meetings with the Contractor. The OPG Project Representative should define a schedule for interface meetings with the Contractor for the purpose of status reporting and resolving technical and administrative project issues.
- (p) The process for handling project scope changes, and design changes by both the Contractor and OPGN. Refer to N-PROC-AS-0028 Project and Portfolio Management and applicable Modification Process, N-PROC-MP-0090.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>19 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (q) Requirements for continued Contractor support to OPGN following issue of the project deliverables. Contractor involvement and support as required during design, procurement, installation, commissioning and closeout phases of the project, including the following:
  - (1) Processing of scope changes as well as design intent and non-intent design changes if applicable.
  - (2) Post-construction walkdowns and involvement in turnover or AFS meetings.
  - (3) Finalization of documentation, particularly incorporating Engineering Change Papers via revision to Engineering Drawings and other documents, including signoff by the Contractor.
- (r) Regulatory and legal interfaces the Contractor should handle, such as interfacing with Technical Standards and Safety Authority and municipal authorities for building permits and plumbing permits.
 

**Note:** OPGN should provide the interface with the Canadian Nuclear Safety Commission (CNSC).
- (s) Ownership of deliverables at end of contract and any restrictions on document use by third parties due to intellectual property or copyright concerns.
 

**Note:** Ownership information is normally contained in the commercial conditions. Ownership information is included in this list to allow collection of the information with the other Engineering, Procurement or Construction related information.
- (t) Indication of OPGN and Contractor input and accountability for producing post project management lessons learned and assessments and reports.
- (u) Departments that contract work out frequently may consider developing model IRs for use in future projects (e.g., N-DAI-01920-10001, Generic Design Agency Interface). Previously approved IRs may be used as input to the development of a new IR, as an attachment to a SOW, Engineering Specification, or other project document to be approved in accordance with Section A.8 of this standard.
- (v) IR may be part of, or in addition to, a SOW or Engineering Specification. If the SOW or Engineering Specification is used in place of an IR, the minimum information required to replace the IR is the list of deliverables and activities to be supplied by the Contractor and the Contractor's and OPGN accountabilities with respect to these tasks.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>20 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (w) IR should form part of the contract document for retention of Contractor services and act as input to Request for Proposals (RFP) processed in accordance with N-STD-AS-0029, Contract Management Standard or N-STD-AS-0030, Project Oversight Standard and Request for Quotations (RFQ) processed in accordance with N-PROC-MM-0016, Nuclear Procurement Activities.

#### A.2.0 CONTRACTOR QUALIFICATION REQUIREMENTS

- (a) Supply Chain is accountable to ensure the Contractor is evaluated in accordance with N-PROC-MM-0010, Establishing and Maintaining Ontario Power Generation Nuclear Approved Suppliers List, and to ensure only qualified agencies are listed in the Qualified Bidders List.
- (b) The contractor should have an OPGN approved QA program meeting the QA program requirements specified by OPGN or follow OPGN's QA program. The Contractor has the responsibility for maintaining accuracy of technical content and compliance with the Contractor's QA program.
- (c) The Contractor should have and maintain a working knowledge of OPGN's configuration management standards and procedures to ensure that design basis and plant configuration management standards are maintained throughout the project life cycle.
- (d) Contractor staff qualification shall be ensured either by full compliance with OPGN training and qualification requirements or via OPGN accepted qualification under the Contractor QA program. The following may be considered for inclusion in the IR:
  - (1) OPGN may request the Contractor provide proof of staff qualification to OPGN.
  - (2) OPGN may require the Contractor to provide resumes of staff involved in project activities. This may include requesting a list of Contractor staff, their qualifications, and engineering work they perform, which the Contractor submits for approval before commencing work.
  - (3) The Contractor may be required to identify changes in Contractor staff or their responsibilities and submit to OPGN for approval.
- (e) Contractor engineers approving or supervising engineering work shall be licensed as prescribed by the Professional Engineers Act of Ontario and comply with the Professional Engineers of Ontario (PEO) guidelines on sealing engineering drawings and documents.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>21 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (f) The following list of additional considerations may also be factored into determining suitability of Contractors for specific projects:
- (1) Familiarity with OPGN modification processes and design management processes.
  - (2) Familiarity with OPGN SSCs or engineered tooling undergoing modification.
  - (3) Familiarity with statutes, regulations, standards, and codes applicable to the design of nuclear and non-nuclear SSCs and engineered tooling, normally associated with nuclear generating facilities.
  - (4) Familiarity with OPGN standards, such as equipment numbering.
  - (5) Familiarity with OPGN project management processes.
  - (6) Familiarity with OPGN procurement processes.
  - (7) Familiarity with OPGN field engineering and work protection processes.
  - (8) Required staff certifications.
  - (9) Familiarity with and qualification in Asset Suite for projects where the Contractor is provided Asset Suite access.
  - (10) Track record and results of Vendor Scorecard from involvement in previous projects (see N-STD-AS-0029).

**Note:** Ideally, a close, interdependent relationship between the Contractor and OPGN personnel is established that generates a spirit of cooperation. The relationship between OPGN and the supplier is typically not built on any single job but is developed and cultivated over years of service. The goal is to have the vendor organization be as familiar with OPGN processes and expectations as OPGN workers. If the relationship is not well established, OPGN may take compensatory measures to ensure effective communications of standards and expectations and provide the necessary technical and logistical details to support the contract work.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>22 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

#### A.3.0 CONTRACTOR TRAINING REQUIREMENTS

- (a) The OPG Project Representatives should identify training requirements for Contractor staff, when required. The following criteria should be considered:
  - (1) Specific training and mentoring of Contractor staff by OPGN may be required to provide or augment expertise.
  - (2) If Contractor personnel are required to perform unescorted walk-downs, monitoring, or surveillance activities inside controlled zones, qualification is required in accordance with N-PROC-RA-0010, Facility Access and Working Rights (Radiological).
  - (3) OPGN General Employee Training requirements should be reviewed for applicability to Contractor staff working on site.
  - (4) Contractor Supervisors overseeing the work of Contractor workers on site should be fully aware of OPGN standards for the conduct of work and hold workers accountable to those standards.

#### A.4.0 DESIGN INPUT DOCUMENTATION

- (a) If the project includes engineering design activities, the OPG Project Representative or engineering SPOC(s), in consultation with supporting OPGN design organizations, may conduct a review of design input documentation resources that may be needed by the Contractor, both for reference and revision (e.g., drawings, design manuals, and other documents).
- (b) Input and assistance for this review may be provided by DEs expert on SSCs and engineered tooling being modified and interfacing SSCs. To the extent possible, the review should determine the following during the preparation of the IR:
  - (1) Location of documentation and format available for use by the Contractor.
  - (2) Current status of documentation. Status may include determining applicable revision level and if there is concurrent work being done on the drawings or documents.
  - (3) Identification of accountability, OPGN or Contractor, for dispositioning outstanding documentation changes (e.g., changes indicated prior to the subject modification which have not yet been implemented in the field, or have not been issued as revisions to the documents).

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>

Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (4) Whether documentation contains any OPGN proprietary information. The appropriate Section Manager should approve the release of any proprietary information required by the Contractor.

#### A.5.0 CONTRACTOR LIAISON WITH OPGN

- (a) Project liaison organizational roles between the Contractor and OPGN should be identified in the IR. Use a project liaison setup best suited to the project. The following provides guidelines:
  - (1) The Contractor may appoint liaison roles to interface with OPGN processes. For many projects, typical liaison role identification may include:
    - (i) Identification of the Contractor Project Representative and Contractor discipline specific staff providing liaison with OPGN.
    - (ii) Identification of signing authorities.
    - (iii) Identification of specific interdepartmental interfaces and processes required (e.g., Contractor design staff with OPGN Drawing Office, Contractor procurement specialist with OPGN Supply Chain).
    - (iv) Process requirements for resolution of issues at detail level. This may include rules and limitations for direct contact between Contractor staff and their counterpart at OPGN (e.g., via telephone or e-mail).
  - (2) For projects of large size and complexity, the Contractor may provide staff member(s), to act as representatives between the Contractor and OPGN.
  - (3) A Contractor Project Representative having overall accountability for project execution interface with OPGN. Accountabilities include, but are not limited to, the following:
    - (i) Execution Representative role for transmittal of project documents between Contractor and OPGN.
    - (ii) Distributing Contractor deliverables to OPGN for review and acceptance.
    - (iii) Reviewing performance, progress, schedules, changes, interface issues, and status of OPGN comments on Contractor deliverables.
    - (iv) Attending and maintaining minutes of meetings with OPGN.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>24 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (v) Meeting project schedules.
- (vi) Coordinating Contractor staff training with OPGN.
- (vii) Arranging for presence at site of Contractor staff.

**Note:** The OPGN counterpart for this role is typically the OPG Project Representative. Formal project related communication between the Contractor and OPGN may be established at this level.

- (4) For projects including engineering design activities the Contractor may assign a Contractor Engineering Lead having overall accountability for design execution. Accountabilities include, but are not limited to, the following:
  - (i) Coordinating detailed design activities by Contractor.
  - (ii) Producing specified design deliverables.
  - (iii) Liaising with OPGN engineering.
  - (iv) Attending meetings with OPGN.
  - (v) Ensuring technical staff interfaces are set up between the Contractor and OPGN at appropriate levels to provide efficient consultation links between OPGN design staff and the Contractor for resolving detailed technical issues.

**Note:** The OPGN counterpart for this role is typically an OPGN DTL.

- (5) OPGN representatives should not direct the efforts of the Contractor. The OPGN representative's accountabilities should be limited to providing oversight of the Contractor's activities to ensure:
  - OPGN QA program elements as specified in the IR are followed.
  - Design requirements are met.
  - Product schedules are met.
  - Operability, maintainability and constructability are achieved in vendor design.
- (6) Correspondence pertaining to changes in scope or to the contract in general, formal letters, progress reports, and documentation deliverables should be routed between Contractor and OPGN through the respective Contractor Project Representative, and OPG Project Representative.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>25 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

**Note:** Changes to the contract require processing in accordance with applicable OPGN contractor management processes, N-STD-AS-0029 or N-STD-AS-0030.

- (7) The Contractor Engineering Lead and OPGN engineering SPOC(s) are responsible for identifying and bringing to the attention of their respective Contractor Project Representative and OPG Project Representatives any proposed changes to Engineering SOW prior to any work on the change being performed. The OPG Project Representative is responsible for dispositioning any proposed changes.

#### A.6.0 DOCUMENTATION REQUIREMENTS

- (a) Documentation prepared by Contractors should be:
  - (1) Listed in IR, together with OPGN and Contractor accountability.
  - (2) Numbered in accordance with OPGN standards and procedures applicable to the type of document.
- (b) The Contractor should be accountable for verification and approval of the documents that it prepares as follows:
  - (1) Verification and approval requirements are normally contained in the Contractor's QA program. If not, those requirements should be documented in the IR.
  - (2) A Professional Engineer's seal shall be applied by the Contractor to engineering documentation to comply with the PEO "Use of the Professional Engineer's Seal" guideline on sealing Engineering Drawings and documents (that is, to all final documents that are within the practice of professional engineering).

**Note:** For Engineering Drawings in particular, the above means preparation, verification, approval and sealing of the associated Engineering Change Papers. This may be extended to incorporation of Engineering Change Papers into final drawings when the Contractor is accountable to produce finalized Engineering Drawings for issue.

- (c) Review and acceptance by OPGN of technical documentation prepared by the Contractor should be in accordance with N-STD-MP-0009, Contractor\Owner Engineering Interface and Oversight and N-PROC-MP-0078, Specification Review Acceptance and Use of Vendor Technical Documents.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>26 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

- (d) OPGN acceptance constitutes a declaration that the quality and content of the document meets OPGN expectations based on the specifications provided in the contract.
- (e) Acceptance should not be confused with approval that resides with the Contractor. Acceptance does not relieve the Contractor from responsibility for errors or omissions or from any obligation or liability under the contract.

#### A.7.0 AUDITS/SURVEILLANCE

- (a) Provisions for monitoring Contractor activities such as audits or surveys are at the discretion of the applicable group in OPGN. Refer to N-STD-AS-0029, N-STD-AS-0030, N-PROG-MM-0001 and N-PROC-MM-0010 for their performance.
- (b) If monitoring activities are planned, provision should be made in the IR and subsequent contract for the following:
  - (1) Schedules and associated project hold points.
  - (2) Access by OPGN and the regulator (CNSC) to the Contractor for monitoring purposes.
- (c) Audits and surveys are an effective means to determine Contractor compliance with contractual requirements. They are performed at Contractor premises. Areas assessed for compliance may include the following:
  - (1) Configuration management.
  - (2) Tools and facilities.
  - (3) Conformance to approved standards and procedures, as agreed to in IR.
  - (4) Detailed documentation (e.g., verification records, training and qualification records, testing logs, etc.).
- (d) Each audit or survey should have a precisely defined plan and goals. All audit or survey results should be presented to the Contractor. Action items should be confirmed with the Contractor with respect to timely response and closure.

## Guideline

Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix A (Continued)

#### A.8.0 INTERFACE REQUIREMENT APPROVALS AND REVISION CONTROL

- (a) Documents that include the contents of an IR or serve the purpose of an IR, such as SOW, or Engineering Specifications, should meet the approval requirements specified below.
  - (1) The IR should be reviewed and concurred to by the accountable OPGN Stratum IV Managers, or higher, for each SOW included within the IR (e.g., Design Engineering, Installation/Commissioning Support [engineering Modification Team Lead role], Construction [construction and quality surveillance role], Procurement Engineering, Supply Chain).
  - (2) The accountable Stratum IV Manager, or higher, approves the IR document.

**Note:** Additional project specific approvals such as Project Sponsor, Executive Sponsor, or other approvals may be required based on project scope or other management direction.

- (b) Revisions to an IR should be reviewed, concurred to, and re-approved by the same organizations and stratum levels (or higher) as the original document.
- (c) Documents detailing deviations or amendments to the IR should be reviewed and approved by organizations impacted by the deviation or amendment and at the same stratum levels as required for the applicable original document.

### Appendix B: Suggested Strategic Oversight Activities

#### B.1.0 REVIEW OF CONTRACTOR ENGINEERING STAFF QUALIFICATION PROCESS/RECORDS

##### B.1.0.1 Scope/Timing:

Review the engineering staff qualification records for compliance with the Contractor process for engineering staff qualification in accordance with their N286-05 OPG audited QA Program. Strategic Oversight should be performed immediately following initial Engineering Procure Construct (EPC) contract award and should be repeated periodically.

#### B.2.0 MAJOR EQUIPMENT SPECIFICATION REVIEW

##### B.2.0.2 Definition:

Equipment specification has been signed by Contractor as required by Interface Agreement (i.e., Prepared, Verified, and Approved), and ready for OPGN signature (if required by the Interface Agreement).

##### B.2.0.3 OPGN Oversight Activity:

- (a) As agreed upon in the Interface Agreement or Contractor Design Plan.
- (b) Engineered product of high consequence.

#### B.3.0 INITIAL DETAILED DESIGN REVIEW: PROCESS DESIGN COMPLETE AND CONFIRMATION THAT DESIGN REQUIREMENTS HAVE AND WILL BE SATISFIED.

##### B.3.0.4 Definition:

- (a) Flow Diagram, PID, Control Logic Diagram and/or Single Line Diagram finalized.
- (b) Contractor provides a draft summary of the proposed modification.

##### B.3.0.5 OPGN Oversight Activity:

- (a) Review draft design description.
- (b) Review Flow Diagrams, PID, Control Logic Diagrams and/or Single Line Diagrams.

#### **B.4.0 MIDPOINT DETAILED DESIGN REVIEW: MAJOR EQUIPMENT LAYOUT / PIPING / CABLE RUNS FINALIZED**

##### B.4.0.6 Definition and Deliverables:

- (a) Major Equipment layout, Piping and/or Cable Runs finalized.
- (b) Contractor conducts a Field Walkdown.
- (c) ADL finalized.
- (d) AEL finalized.
- (e) Disposition of outstanding issues from Mod Outline provided.

##### B.4.0.7 OPGN Oversight Activity:

- (a) Review proposed layouts.
- (b) Review ADL and AEL for completeness.
- (c) Review of proposed Mod Outline issue dispositions.

### Appendix D: Guidelines to Prepare Oversight Checklist

#### D.1.0 TIPS TO BE CONSIDERED FOR QUALITY OVERSIGHT

D.1.0.1 Preparation of oversight checklist is considered the most important part of oversight preparation. Obtain comments and assistance, as appropriate, during the preparation of the checklist, from the respective subject matter experts. Given key points to:

- (a) Verify identified from the review of documents in preparation of the oversight. These documents could include applicable governing documents, procedure for the product activity being covered by the oversight.
- (b) Be verified based on the performance history, problems identified earlier etc.
- (c) Be verified based on the critical process activities involved in the specific engineering product, and their acceptance criteria.
- (d) Verify as evidence of quality planning, as applicable to the specific engineering process /product.
- (e) Verify as evidence of In-Process quality control.
- (f) Verify as evidence of corrective actions and preventive actions and their effectiveness.
- (g) Verify as evidence of having complied with the applicable code requirements.
- (h) Any other points identified during the preparation for Quality oversight.

**Note:** When verifying evidence of each element for compliance, make sure that observations include five samples or based on severity as applicable.

## Appendix E: Comments and Disposition Process

### E.1.0 INTRODUCTION

E.1.0.1 This Guide provides clarification around the review and acceptance of Contractor deliverables.

- (a) Although the Contractor assumes full legal liability for its work, OPGN as the Nuclear Plant Licensee is required to ensure all design work is compliant with Quality Assurance Standard CSA N286.
- (b) This Quality Assurance (QA) function, in part, is performed by the DA who will reject non-compliant design work. In support of this, OPGN staff must exercise due diligence to ensure that the delivered quality is adequate. OPGN exercises this due diligence by auditing vendor QA processes and by technical oversight of each job.

The level of oversight depends on the safety or financial significance of the job, the nature of the work (new, novel, standard, complexity), and the capability of the Contractor, and their experience with the specific work.

- (c) Technical oversight can be accomplished in a number of ways, including scheduling a formal technical review, performing an “in-process” inspection at the Contractor’s office, and review of the final deliverable. In-process inspection is particularly effective because it requires a relatively small amount of effort and identifies problems early.
- (d) It is critical to remember that in-process inspection should identify the problem that makes the product non-compliant and leave the solution of the problem to the Contractor.

### E.2.0 APPLICATION OF THE COMMENT AND DISPOSITION PROCESS

#### E.2.1 Oversight

The level of oversight to apply should be discussed with the Section Manager at the beginning of the work, and will consider the items mentioned in Section E1.0.

#### E.2.2 Usage

Use of the C&D process, including documents it should be used for, the number of review cycles, etc., should be documented in the COIR.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>34 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix E (Continued)

#### E.2.2.1 Times of Use:

- (a) To document any Technical Review by a Contract organization performed in accordance with N-PROC-MP-0047, "Design Verification", **unless** a Design Verification Report (DVR) will be used instead in accordance with the Design Plan.

**Note:** The C&D process or a DVR should be used for every Contracted Technical Review even if only to document that no issues were found. A C&D form may be used as the minutes of meeting and therefore as an input to a DVR (for example if one DVR documents many Technical Reviews).

- (b) To document any requests for clarification, comments, or rejection of a document submitted to OPGN for acceptance.

**Note:** A document accepted by OPGN with no comments needs no C&D form.

- (c) To document any requests for clarification, comments, or rejection of a final document submitted for OPGN signature (e.g., for verification or approval).

**Note:** A document signed by OPGN with no comments needs no C&D form.

#### E.2.2.2 Suggested Times of Use:

- (a) To document teleconferences or other discussions or communications that are not face-to-face.

#### E.2.2.3 Optional Times of Use:

- (a) At any time desired by the contracted organization.
- (b) At any time other than the above as documented in the COIR at the discretion of the OPGN Design Section Manager.

### E.2.3 Comments

- (a) The C&D process is a key element in ensuring OPGN has obtained a product that conforms to all its requirements, from the Contractor. Comments should be made at the earliest review opportunity so that rework and project delays are minimized. Comments should be consolidated before being forwarded to the vendor.

## Guideline

<b>Internal Use Only</b>		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>35 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix E (Continued)

- (b) When N-FORM-11109 has been used to document the comments, the comments should be categorized as:
  - (1) TN - Technical, fix NOW, means the process should not continue until the issue has been dealt with (akin to a hold or rejection)
  - (2) TL - Technical, fix LATER, means the process may continue, but the issue should be dealt with at the next revision (akin to ACCEPT AS NOTED).
  - (3) Clarification request means the process may continue but additional information is needed. Clarifications generally have to be answered but may have no other action.
  - (4) Editorial comment or suggestion means a non-technical comment, which may be disposition by the Design Agency in the manner of their choosing.
- (c) Any suggestions that are outside the scope of the contract but that the Contractor interprets as a required change can become grounds for a cost extra. The Contractor should not be requested to evaluate the impact of suggestions and preferences for which the project knows it will not approve cost extras.
- (d) OPGN should exercise care in the manner it provides comments. When OPGN directs a Contractor to take specific action that contractually falls within the responsibility of the Contractor, the legal liability for the consequences are transferred from the Contractor to OPG. For this reason it is important to differentiate between a non-mandatory suggestion, and a mandatory direction.
- (e) OPGN may, of course, make suggestions to the Contractor. However, if it does so, it must be made clear to the Contractor that the suggestions are not mandatory and the Contractor retains full responsibility to meet the specifications and any negative consequences of the implementation.

#### E.2.4 Format

- (a) It is recommended that comments be documented electronically using N-FORM-11109, Comment and Disposition Sheet, to facilitate Record keeping and Consolidation.

**Note:** OPGN personnel are not required to use the C&D form when performing review of the documents prepared internally.

- (b) C&D format is at the discretion of the DTL and Design Section Manager on a case by case basis (i.e., mark-up of document being reviewed, hand written vs. electronic etc.), depending on the type of document being reviewed, the number of comments etc.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>36 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix E (Continued)

**Note:** A spreadsheet may be used in place of N-FORM-11109, as long as at least as much information is available in the spreadsheet. Format is not important, only the content is.

- (c) For example, a hand mark up of the document may be more practical and efficient than transferring the comments onto N-FORM-11109.
- (d) In this instance, consideration should be given to numbering and identifying the individual comments, while still using the electronic form to capture the Categorization (Section E.2.6) and Signatures.

#### E.2.5 Consolidation

- (a) The OPGN DTL should collect and consolidate the Comments from OPGN reviewers.
- (b) The OPGN DTL should review the comments (in conjunction with MTL and/or Design Section Manager as required) to:
  - (1) Eliminate duplication;
  - (2) Remove illegitimate comments; and
  - (3) Ensure proper categorization of each comment.

#### E.2.6 Incorporation and Disposition of Comments by Contractor

- (a) OPGN DTL should present consolidated comments to Contractor for disposition. Rating of deliverables should be done in accordance with Appendix F.
- (b) If available, an electronic copy of N-FORM-11109 should be forwarded to the Contractor.
- (c) The Contractor shall disposition each comment and forward to OPGN for review and acceptance.
- (d) Upon satisfactory disposition of the Comments, both parties should sign the bottom of the completed N-FORM-11109 (Contractor is the Author and OPGN is the Reviewer).

#### E.2.7 Retention of Comment and Dispositions

- (a) OPGN DTL should keep the signed N-FORM-11109 with the Project File.
- (b) A PDF copy of the completed form should be stored within the "Working Files" in the Asset Suite EC folder, with a copy forwarded to the Design Department Manager for information.

## Guideline

Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix E (Continued)

- (c) For frequently asked questions on the C&D Process, and examples, refer to Appendix E, Section E.2.8 and E.2.9

## E.2.8 Examples

### E.2.8.1 Noncompliance Type Comment

An example of a noncompliance type comment could be “The specification called for pumps to be sized for worst case design conditions. You have sized the pumps for normal operating conditions. Please revise your pump sizing to comply with the specification”. In this case, the Contractor must resize the pumps for the correct conditions that establish the pump size. Notice that the Contractor still retains the responsibility for a satisfactory solution because OPGs reviewer did not direct them to use a specific pump size.

### E.2.8.2 Clarification Type Comment

An example of a clarification type comment could be “It is not clear how your design has incorporated the requirement for the control system to resume operation after a short interruption of Class II power. Please explain how this is accomplished”. In this case, the Contractor simply needs to explain what they have done to satisfy the OPGN reviewer that work is compliant with the specification. If, however, the design cannot meet that requirement, the Contractor will identify there is a problem that needs resolution.

### E.2.8.3 Non-Mandatory Suggestion

- (a) An example of a non-mandatory suggestion type comment could be, “The specification requires you to control the pressure of the heating steam. Would it not be easier and cheaper for you to meet the specification using a pressure regulating valve for this service rather than a control valve?” In this case, the Contractor needs to explain to the OPGN reviewer why the pressure regulating valve will not work properly in that application. For example, the margin for the relief valve setting may be too small for a regulating valve to operate properly. However, if a regulating valve will work, the Contractor can choose to modify the design to provide a simpler and more cost effective option. In this case, however, the Contractor still retains the responsibility for a satisfactory solution as OPGs reviewer did not order them to change their design.
- (b) Work that is clearly in non-compliance with the specifications must be dispositioned to OPGs satisfaction. The required changes will usually not incur additional costs. On occasion, the change will be impractical to correct after the work has progressed beyond a certain stage and a concession to the specification may need to be processed formally by the Contractor. Whether the concession is approved by OPGN will depend on the impact on the success of the overall project.

## Guideline

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>38 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

### Appendix E (Continued)

A further example to differentiate between a legitimate comment and an illegitimate direct order follows.

#### E.2.8.4 Legitimate Comment

The Contractor has specified a relief valve installation with the standard, very short inlet pipe, but in a location where it is difficult to provide regular maintenance and calibration. A legitimate OPGN comment would be “The specification required you to locate the new relief valve at a location for ease of periodic maintenance and calibration. The chosen location is inconsistent with that requirement. Please relocate the relief valve to meet that requirement”. In this situation, the Contractor would have to find a more suitable location, and then, if the pipe is any significant length, calculate the inlet line pressure drop, to satisfy the maximum allowable values in the ASME Boiler and Pressure Vessels Code. If the pressure drop was too large, the Contractor would have to come up with a solution. The Contractor retains the design responsibility for a complete solution for both maintainability and ASME code compliance.

#### E.2.8.5 Illegitimate Comment

Now suppose the OPGN reviewer stated “The relief valve is not in a convenient location for maintenance. Move the relief valve 5 feet west and 5 feet north of its present position”. This is a direct order and it can be interpreted by the Contractor to mean, move it blindly to the new location. This is especially true if the OPGN reviewer is a mechanical engineer who would be expected to know what he or she is doing. Since the OPGN reviewer did not ask for the inlet pressure drop calculation to be performed, the Contractor may simply move the valve and assume the OPGN engineer knew that the resulting inlet pressure drop was acceptable. The resulting pressure drop may in fact exceed the ASME Boiler and Pressure Vessels Code requirement for maximum pressure drop on the inlet line. When the valve chatters and fails under test, the Contractor may say they were ordered to move it and their original design location would have permitted the valve to work correctly, resulting in a contract dispute. It will take a considerable amount of time to resolve the dispute, as at this stage, there will be significant cost involved in fixing the problem.

### E.2.9 Frequently Asked Questions

#### (1) Should SCR's be raised for Technical Errors?

Yes, this should be discussed with your Section Manager. In addition, the Design Agency should also be notified and requested that they generate an internal “Non-conformance Report” as required by the Design Agency internal QA program. Significant trends should be identified through OPG Supply Chain via the Non-conformance and Corrective Action Request (CAR) process so that a formal reply to the identified deficiencies is obtained from the Contractor. Refer to N-PROC-MM-0021, Supply Inspection.

**Guideline**

Internal Use Only

Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>39 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

**Appendix E (Continued)**

- (2) **Should the C & D process be used on Draft Documents submitted to OPG for review?**

Refer to Section E.2.2. This is at the discretion of the Section Manager, but should be discussed and agreed upon at the beginning of the work, as this could impact the schedule and also the Contractor Quality Program may not allow the release of "draft" documents.

- (3) **Does OPGN need to consolidate / type up hand written comments from the reviewers?**

Refer to Section E.2.5.

- (4) **What if the Contractor has its own Comment & Disposition process?**

Refer to Section E.2.0. This should be discussed and agreed upon at the beginning of the work as to how Comments & Dispositions will be handled.

- (5) **What if there are too many comments / document is unacceptable?**

This should be discussed with the Section Manager prior to rejecting the document. The reason for rejection should be documented in the Comment & Disposition form, and a SCR should be considered if appropriate.

- (6) **Is a C&D form required if the document is acceptable and OPG has no comments?**

No, refer to Section E.2.0.

- (7) **What if the Comments are not being dispositioned to the satisfaction of the Reviewer?**

This issue should be brought to the attention of the Section Manager to be resolved with the Contractor.

Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

**Appendix F: Contractor Deliverable Rating Criteria**

**F.1.0 UNACCEPTABLE**

- (a) Cannot be implemented without product revision.
- (b) Does not meet all Design Requirements / SOW Requirements.
- (c) Does not meet procedural requirements.
- (d) Significant documentation and reviews missing.
- (e) Missing major requirements.
- (f) Wrong conclusions and / or assumptions.
- (g) Document contains significant errors and is difficult to understand.
- (h) Implementation could result in non-conformance with nuclear safety, industrial safety, environmental compliance, or other regulatory areas.
- (i) Implementation of the product could result in significant loss of productivity or generation.

**F.2.0 NEEDS IMPROVEMENT**

- (a) Can be implemented, but should be revised to achieve best results.
- (b) Minor procedural compliance issues (improper forms, unchecked boxes, etc.).
- (c) May require rework to correct deficiencies.
- (d) Documentation is imprecise, contains editorial errors, and/or superfluous information.
- (e) Additional work may be required in the field if implemented as is.
- (f) Solution is workable but may not be most cost effective.
- (g) Assumptions not clear.

**Guideline**

Internal Use Only		
Document Number: <b>N-GUID-01920-10000</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R004</b>	Page: <b>41 of 41</b>
Title: <b>GUIDELINE FOR ENGINEERING OVERSIGHT</b>		

**Appendix F (Continued)**

**F.3.0 MEETS**

- (a) Meets procedural requirements.
- (b) Requires no product revision to implement.
- (c) May contain some superfluous information.
- (d) May contain a few editorial errors (number dependant on size and complexity of product).
- (e) Documentation is understandable and at a level of detail adequate to support review and implementation by trained personnel.
- (f) Root cause identified and documented (reason for document development is clear).
- (g) Cost effective solution or resolution approach implemented.
- (h) All affected external organizations are evaluated and reviews completed.
- (i) Operational Experience and lessons learned considered and documented.
- (j) All testing and other requirements identified.
- (k) All documents requiring update are identified.

**F.4.0 EXCEEDS CRITERIA (SAME AS MEETS CRITERIA, EXCEPT):**

- (a) Documentation is to a level of detail and clarity that staff with reasonable levels of training and experience can review and implement.
- (b) Documentation with the correct level of detail, not too much or too little.
- (c) May contain innovative solution or resolution which provides reduced burden and life cycle cost beyond required.
- (d) Implements best practices from multiple sources.
- (e) May be an example for others to follow.

## Nuclear Procedure

### TITLE

**INTEGRATED ON-LINE WORK SCHEDULE**

### AUTHORIZATION

SINGLE POINT OF CONTACT: E. Conde  
Sr. Advisor, Work Control

AUTHORIZATION AUTHORITY: V. Smyth  
Senior Manager, CFAM Work Control

COMPLIANCE DATE: Immediate

### PURPOSE

This procedure defines the process for scheduling, coordinating and tracking work activities to effectively direct company resources for the purpose of:

- Managing plant risk.
- Optimizing health of assets and health of process.
- Optimizing plant systems and components.
- Meeting licensing and regulatory commitments.

This document Supports programs CAN/CSA-N286-05, Management System Requirements for Nuclear Power Plants and N-PROG-MA-0019, Production Work Management.

### RELEVANCE TO NUCLEAR SAFETY POLICY

This procedure is most closely aligned with the requirement in Ontario Power Generation's Nuclear Safety Policy which states that "Sound and rigorous processes are implemented and enhancements proposed to ensure all work activities are planned and controlled to maintain plant configuration and condition within the design basis."

### EXCEPTIONS

Nuclear Security and Nuclear East Facilities are exempt from compliance with this procedure.  
Revision 19 should be used during the transition to the compliance date

© Ontario Power Generation Inc., 2014. This document has been produced and distributed for Ontario Power Generation Inc. purposes only. No part of this document may be reproduced, published, converted, or stored in any data retrieval system, or transmitted in any form by any means (electronic, mechanical, photocopying, recording, or otherwise) without the prior written permission of Ontario Power Generation Inc.

### Title: INTEGRATED ON-LINE WORK SCHEDULE

## 1.0 DIRECTION

This procedure provides the requirements for activities associated with scoping, planning and executing of any on-line work.

The *On-line Scheduling Process* is one part of the Work Management integrated process for the operation and support of our Nuclear Power Plants. It provides an organized, well coordinated station collaboration by which fully planned work, system and component tests, Corrective Maintenance (CM), Deficient Maintenance (DM), Preventive maintenance (PM), Other Maintenance (OM) and *Projects* are systematically identified, scoped, scheduled, executed, monitored and reported.

This procedure defines a sequence of accountabilities and milestones (T weeks) by which multiple departments are required to perform. These milestones build upon each other to identify, select, plan, schedule and execute work in a manner that helps ensure high levels of safe and reliable plant operation. Successful scoping, planning and scheduling of station online work require the support, participation and commitment of managers in all departments and Stratum levels. This commitment involves active, visible participation in all steps of the process. Site management should provide the necessary oversight and support for completion of the process milestones described in this document.

Each "T-week" in the process has an outline of what is to be achieved. Operational, production, personal and outage risks versus on-line risks, as well as the application of conservative operational decision-making and Job Safety Analysis are all considered.

The on-line work-week schedule is a timeline which begins just before week T-53 and ends at the post-execution critique week T+1. The process allows the scope of work to be selected, finalized, prepared, maintenance resources committed, detailed logic built, material holds removed, reviews completed, permits prepared and walk downs completed prior to execution. In the week following execution (T+1), a review is performed to analyze the countdown process and identify problems that were identified during the execution week so that they may be avoided in the future.

Work should be scoped in given work weeks assigned to specific primary equipment groups (PEG). A graded approach to scheduling shall be used. This improves both accountability and ownership of the schedule and provides management with the appropriate emphasis on the different systems, structures and components to properly maintain the facility.

The on-line work-week schedule shall include work performed to maximize the reliability of the station's equipment.

Reference the following appendices for further information:

- Appendix A, Meeting and Team Purpose and Criteria
- Appendix B, Milestone Activities.
- Appendix C, Examples of Cycle plan type work
- Appendix D, Scheduling process Milestones
- Appendix E, Ontario Power Generation Cause codes

### Title: INTEGRATED ON-LINE WORK SCHEDULE

## 1.1 Cycle Plan

Major on-line work due for field execution in one year or more shall be identified as *Cycle Plan* to ensure sufficient time to get work properly planned, including availability of long lead-time materials.

### 1.1.1 Cycle plan Scope Criteria

1.1.1.1 The following work should be selected for Cycle Plan Scope and flagged as such in Asset Suite 7 (WO attribute Importance 52 week look ahead, also known as 52w):

- Work that imposes significant operating restrictions on one or more units.
- Work requiring significant electrical coordination.
- Maintenance programs for critical equipment.
- Work that historically has required significant effort to schedule due to the prerequisites or unit conditions required.
- High profile work that should be completed to meet a management action or regulatory commitment.
- Work orders (WOs) with type CC, CN, DC, DN which are not already in approved scope for execution in less than a year.

1.1.1.2 All work meeting the criteria of the *Cycle Plan* shall be identified, submitted, coded in AS7 and reviewed during the quarter preceding the cycle plan scope identification which is at T-52. Then it should follow the milestones described in Appendix B.

### 1.1.2 Sources for Cycle Plan Work

- System Health (SH) Program (Plant Reliability List – (PRL))
- Preventive Maintenance (PM) Program
- Safety Related System Tests (SRSTs)
- Technical Operability Evaluation (TOE) Actions
- Regulatory Commitments
- Management Commitments
- Operator Burdens and Operator Work Around's (OWAs)
- *Projects* and Modifications.

1.1.2.1 Outage support work with potential to impact on the On-line *Cycle Plan* shall also be identified as such.

1.1.2.2 *Project* work meeting the criteria of *cycle plan* shall be identified as such.

## 1.2 Resource planning

Analysis of the Supply and Demand for Maintenance Resources should be performed on a regular basis and should support the Annual Business Planning process. The aim is to

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	Revision: R021
Usage Classification:	Information	Sheet Number: N/A Page: 6 of 51

### Title: INTEGRATED ON-LINE WORK SCHEDULE

ensure that all on-line and outage production work demands, including *project* and *Cycle Plan* work can be supported by available resources prior to approval of the *Cycle Plan*.

#### 1.3 Management oversight

Successful achievement of on-line scheduling goals requires the support, participation and commitment of all departments and stratum levels. This commitment involves active, visible participation in activities (communications, meetings) which ensure work readiness. Specific accountabilities are defined in Section 2.0.

#### 1.4 Online scheduling goals

The ultimate goal of the online scheduling process is to provide a resource-balanced, stable schedule of ready work for execution crews. Success is measured by meeting the completion, survival and stability targets.

#### 1.5 Online scheduling milestones

On-line scheduling milestones are based on industry best practices and Nuclear needs. Successful work execution can only be achieved by adherence to all the milestones in the order and at the time prescribed in the process.

1.5.1 Completion of scheduling milestones shall be monitored regularly by various indicators in the online process metrics suite (OPM) and will ultimately lead to healthy plant condition.

1.5.2 Deviations from milestones should be reported with an Station Condition Record (SCR).

##### 1.5.3 Major Milestones and deliverables

An overview of the on-line work scheduling process is found in Appendices B and D, Work Week Scheduling Process Overview and Online Milestones. Several deliverables are identified leading up to work execution.

Major phases of the online scheduling are:

- Cycle plan scope identification
- Cycle plan scope preparation
- Cycle plan scope freeze
- All online scope commitment
- All online scope freeze
- Walkdowns
- Schedule freeze
- Execution

Detailed milestones, defined in Section 1.7 support the completion of the major phases of online scheduling.

##### 1.5.4 On-line process metrics (OPM)

Milestone status is tracked and documented by the indicators in the OPM suite of metrics.

## Nuclear Procedure

Title:
<b>INTEGRATED ON-LINE WORK SCHEDULE</b>

The OPM metrics provide a consistent, standardized reporting basis for on-line work preparation, scheduling and completion. They are designed to focus site and corporate management attention on specific deliverables and their respective progress to completion.

### 1.6 Project and Minor modifications work

*Projects* meeting the criteria of *Cycle plan* work should follow the cycle plan (52w) milestones identified in sections 1.7.1 to 1.7.9.

#### 1.6.1 EPC Project identification

The following rules apply to *Projects* awarded to external suppliers as EPC contracts (Engineering Procurement Construction).

##### 1.6.1.1 The project organization or Project manager should ensure the following:

- (a) The *Project* [and any associated temporary modification]- is identified via a work order in NIMS at least one year ahead of the targeted execution date.
- (b) EPC Projects may be scoped in quarterly increments i.e. the scope is entered in NIMS once per calendar quarter.

##### 1.6.1.2 By the end of T-21 (T-21 of the first in project which involves station interface)

The EPC project leader should submit to work control an outline of the project including the following:

- (a) A Schedule or work plan showing critical path, all interface points with station equipment. and any temporary modifications needed to execute the project.
- (b) A "job owner" or project leader shall be identified for such EPC work orders. The job owner shall attend all "T" meetings to provide updates on project tasks status.
- (c) Committed resource profile including non-station resources to be used for project execution.
- (d) A report on parts needed for task execution with status of purchase orders: parts procured by entities other than OPG supply chain should have a committed delivery date to support targeted execution.

**Note:** Any parts procured by OPG should follow the milestones identified in this document.

##### 1.6.1.3 By the end of T-19

The EPC project leader should submit all draft work plans to Operations, Maintenance and/or Field Engineering for review.

##### 1.6.1.4 By the end of T-16

The EPC project leader or "job owner" should ensure the following:

- (a) All work plans are reviewed and approved by Operations and Maintenance.

## Nuclear Procedure

Internal Use Only		
Document Number:	Revision:	
N-PROC-MA-0022	R021	
Usage Classification:	Sheet Number:	Page:
Information	N/A	8 of 51

Title:  
**INTEGRATED ON-LINE WORK SCHEDULE**

- (b) All tasks requiring OPG detail of assessing are identified and fully planned according to N-PROC-MA-0002, Work Planning.

### 1.6.1.5 By the end of T-13

The EPC project leader or “job owner” should ensure:

- (a) all tasks requiring operator assessing are planned per 1.7.12.  
(b) All tasks requiring walkdown are identified.

### 1.6.1.6 By the end of T-10

The EPC project leader or “job owner” should inform OPG work control of any change to the planned execution dates or the planned duration of tasks, or confirm current dates and duration.

## 1.6.2 Minor modifications work

- 1.6.2.1 Minor modification work which are not cycle plan linked to business objectives shall be identified in the scheduling process as follows:

- 1.6.2.2 Minor modifications or shorter term projects should follow the scheduling milestones (non 52w) to ensure integration of their work with the online schedule. Key milestones for modifications are:

### 1.6.2.3 By the end of Week T-19

- Modifications manager or team leader should make draft work plans available to Operations, Maintenance and Field Engineering.
- Non-Station resources needed for the work should be identified.

### 1.6.2.4 By the end of Week T-16

Modifications manager/team leader should ensure all work planning (assessing) is complete and work plans are approved.

**Note:** Long lead items should be identified to Supply Chain as early as possible when the design is approved to ensure delivery by the end of T-6.

## 1.7 Online Scheduling process milestones

### 1.7.1 By the end of Week T-53

Objective:

- Call for cycle plan scope complete

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	Revision:
Usage Classification:	Information	Page:
	N/A	9 of 51

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- a) Work control manager should ensure an action request to identify non-PM cycle plan work is issued once per quarter to all organizations likely to have input to scope meeting the cycle plan criteria (Projects and mods, Engineering, Operations, Outage).
- b) Organizations receiving a scope request should provide a response by initiating or identifying any supporting work requests no later than T-53.
  - (1) All work needs meeting the criteria of the *cycle plan* including *projects* should be identified to work control.
  - (2) Organizations provide committed preliminary resource profile.
  - (3) Commit (non-station) Project resources.

#### 1.7.2 By the end of T-52

##### Objectives:

- All cycle plan type work is in scope.
- Identify estimates of resources available (incl. for *project* & minor mods work).
- Scope all currently unscheduled CC, CN, DC, DN WOs to proper PEG with 52 weeks lead time; add 52w attribute.
- Enter the online/outage split in the Resource Balancing Tool (RBT).

#### a) Work control manager should ensure the following activities are performed:

- (1) All cycle plan type work is approved in scope for a given work week in NIMS (Nuclear Inage Management System) with the 52w attribute (importance 52 week look-ahead in Asset Suite).
- (2) All currently unscheduled CC, CN, DC, DN WOs are approved to proper PEG with 52 weeks lead time; and coded with the 52w attribute.
- (3) The split of resources to support Online or Outage work should be pre-determined consistently with the business plan, and estimates entered into the *Resource Balancing Tool* (RBT).
- (4) Any meetings or reviews required to support cycle plan work are held as appropriate

#### b) All organizations which own resources (Maintenance, Projects & Mods, Operations etc.) should identify all resources available in the *RBT* estimates field.

#### 1.7.3 By the end of T-48

##### Objectives:

- Complete planning for cycle plan work.

## Nuclear Procedure

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- Address any outstanding Preventive Maintenance Living Program (PMLP) feedback for cycle plan PMs.
- a) Maintenance and Operations Managers, with support from Project and Contract Managers should ensure that the following activities are performed:
- (1) Complete 100 percent of the planning and work package preparation for 52w WOs in approved *Scope* in accordance with N-PROC-MA-0002.
  - (2) For fully planned tasks, set the task status to ready or apply a valid hold code for tasks requiring resolution from support organizations.
  - (3) Forward Action Alert Awareness (AAA) messages to alert group codes responsible for the hold resolutions in accordance with N-PROC-MA-0002, Work Planning.
  - (4) Identify Permit requirements.
  - (5) Prepare and submit PC1-Ns (application for work protection) and N-FORM-10185, PC1-N Application for Work Protection to Operations including external and contractor permit requirements.
  - (6) Any required Material requests (MRs) should be fully approved.
  - (7) Address any outstanding PMLP feedback for 52w PM type WOs. Outstanding PMLP is defined as follows:
    - PMLPW\_INTFC\_v\_FEEDBACK\_CORR: (Status: New, Assigned)
    - PMLPW\_INTFC\_v\_FEEDBACK\_GEN: (New, Assigned)
    - PMLPW\_INTFC\_v\_FEEDBACK\_TRADE\_PM: (Status: New, Assigned)
    - PMLPW\_INTFC\_v\_CHNG\_RQST\_TBL: (Status: New, Assigned, Approved)
- b) Project Manager should identify the tasks which may be scheduled over a number of weeks (*windows* or *Long duration tasks*). Non-station resources shall be supplied for *project* tasks scheduled over a *window*.

#### 1.7.4 By the end of T-47

##### Objectives:

- Initiate purchase requests for cycle plan work orders.

Supply Chain manager should ensure purchase requests are initiated as needed for all cycle plan WO tasks.

#### 1.7.5 By the end of T-42

##### Objectives:

## Nuclear Procedure

Internal Use Only

Usage Classification:	Information	Sheet Number: N/A Page: 11 of 51

Title:

### INTEGRATED ON-LINE WORK SCHEDULE

- Resolve all Engineering holds for 52w tasks
- Resolve BMU (Bill of material update) holds for 52w work orders
- Ensure all parts holds have purchase orders (POs)

a) Alert group code owners should perform the following activities:

- Resolve all engineering holds assigned to their groups for 52w tasks.
- Resolve BMU holds for 52w work orders
- Inform Work Week Leader or Work Control Team Leader (WWL/WCTL) and other affected groups of unresolved holds.

b) WWL/WCTL or delegate should remove from the schedule, *WOs* or tasks where engineering holds are not resolved.

c) Supply Chain manager should ensure all parts holds (PH) on cycle plan work have a PO.

1.7.6 By the end of T-40

Objectives:

- All 52w WO tasks set to ready except tasks with PH and holds for pressure boundary and Inspection and Test plan (MPA, MPB, MPD, ITP)
- All PH on 52w tasks have a committed T-21 delivery date

a) WWL/WCTL should remove from scope, *cycle plan* WOs or tasks with unresolved holds except tasks with committed parts holds, pressure boundary or inspection & test plan holds.

b) Supply Chain manager should ensure all parts holds on tasks in cycle plan scope have a committed delivery date for T-21.

**Note:** Cycle plan scope is considered frozen at this point; re-scheduling of any 52w WO beyond this point requires approval from the work control manager or delegate.

1.7.7 By the end of week T-24

Objective:

- Prepare detailed design packages for minor modifications work
- Identify long lead items and resources needed for minor modifications work
- Conduct PM review meeting.

a) Modifications Manager should ensure detailed design is approved and *long lead items* are identified to Supply Chain and Procurement Engineering for minor modifications package.

b) Modifications or Project Manager should identify resources required for the work and the material requirements.

## Nuclear Procedure

Revision:	R021	
Usage Classification:	Information	Page:
Sheet Number:	N/A	12 of 51

### Title: INTEGRATED ON-LINE WORK SCHEDULE

**Note:** Long lead items should be identified to Supply Chain as early as possible when the design is approved to ensure delivery by the end of T-5.

- c) Maintenance manager should ensure a PM review meeting is conducted in accordance with the guidelines in Appendix A.

#### 1.7.8 By the end of week T-21

##### Objective:

- All parts holds are removed from cycle plan work orders; or WOs rescheduled
  - Outlines of EPC projects are submitted
  - Organizations provide committed resource profile including non-station resources to be used for minor modifications work.
- a) Supply chain manager should ensure all parts holds committed for cycle plan WOs are cleared.
  - b) WWL/WCTL should ensure any cycle plan WOs with unresolved holds except pressure boundary or ITP holds are removed from scope
  - c) Maintenance Manager should provide committed maintenance resources for on-line schedule.
  - d) Operations Manager should provide committed operator resources for On-line schedule.
  - e) EPC project leaders should submit to work control an outline of the project as described in 1.6.1.1.
  - f) Projects and Modifications Managers should identify resources to execute *Project* and minor modifications work.
  - g) All committed resources shall be identified in the *Resource Balancing Tool* (RBT) estimated resources fields.

#### 1.7.9 By the end of T-20

##### Objectives:

- Scope identification
  - Provide preliminary scope with priority weighting scores (1 week prior to T-19 meeting)
  - Resource balance scope within 20% (maximum 120% of disciplines MC, MM, MS)
  - Review preliminary scope list in preparation for T-19 meeting
- a) The following departments shall provide input to the Work Control organization on scoping needs, which are consistent with the business plan:
    - (1) Operations Manager identifies operations significant issues for On-line schedule.

Title:

### INTEGRATED ON-LINE WORK SCHEDULE

- (2) Engineering Managers identify system health improvements and support preparation of the work.
- (3) Outage Managers identify prerequisite work and resources to execute the work.
- (4) Project and Modification Managers identify *Project* work.

b) Work Control Manager should ensure the following activities are performed:

- (1) Scope all on-line scheduled work utilizing Nuclear Inage Management System (NIMS)
- (2) Prepare and issue a consolidated preliminary *scope list* for all work needs identified and seek assistance from the requestors when required. The scope list should be available one week prior to the scope commitment meeting held in T-19
- (3) Priority weighting scores, as determined with the scoping priority matrix in effect at site, for all jobs scoped are made available for scope reviewers.
- (4) Integrate *Cycle Plan* work in the scope of the relevant work week.
- (5) Resource balance all on-line scope for the disciplines of mechanical, control and civil maintenance to a maximum of 120% of estimated resources.

c) Department Managers requesting work should review the preliminary scoping list in preparation for the scope commitment meeting held in T-19 and feedback any concern to the WWL/WCTL.

1.7.10 By the end of T-19

Objectives:

- Draft work plans for minor mods and EPC projects available.
- Hold T-19 scope commitment meeting
- Provide Supply intelligence recommendations on items in scope

a) Project or modifications Manager should ensure the following activities are performed:

- (1) Work plans are submitted to Operations, Maintenance and Field Engineering.
- (2) Work Plans and Asset Suite 7 (formerly known as PassPort) identify any station support tasks required.
- (3) Project/Modifications staff and Work Control staff discuss minor modifications tasks which will be scheduled over a number of weeks (*window*) and ensure they are planned as such. Agreement should be reached on the duration and timing of installation *windows*.
- (4) Non-station resources to be used for tasks scheduled over a *window* are supplied.

### Title: **INTEGRATED ON-LINE WORK SCHEDULE**

- a) Work control manager should ensure a Scope Commitment meeting is conducted in accordance with the guidelines in Appendix A.
- b) WWL/WCTL or delegate should perform the following activities:
  - (1) Add or remove work from the preliminary *Scope List* as required.
  - (2) Identify work requiring planning to the affected Planning organizations.
- c) Supply Chain manager or delegate should provide recommendations on items in scope based on the probability of parts delivery for the targeted date.

#### 1.7.11 By the end of Week T-16

##### Objectives:

- Review *EPC and* minor mods work plans, resolve concerns.
  - Complete Maintenance and field engineering planning; all tasks are set to ready or contain a valid hold code.
  - Prepare PC1-Ns and submit to Operations.
  - Identify any conflicts or operational issues in the scope list.
  - Identify Eng holds & PE which cannot be cleared by T-13 & T-12 respectively
  - Identify parts holds for non 52w tasks that cannot be resolved by end of T-6.
  - Hold a Scope Rationalization meeting.
- a) Modifications manager/team leader should ensure work plans are reviewed and concurred by Operations, Maintenance and Field Engineering.
  - b) Maintenance, Projects and Project & Modifications Managers should ensure that the following activities are performed when planning needs are identified:
    - (1) Complete 100 percent of the planning and work package preparation identified on the *Scope List* in accordance with N-PROC-MA-0002.
    - (2) For fully planned tasks, set the task status to ready or apply a valid hold code for tasks requiring resolution from support organizations.
    - (3) Forward AAA messages to alert group codes responsible for the hold resolutions in accordance with N-PROC-MA-0002.
    - (4) Fully approve any required Material requests (MRs).
    - (5) Identify Permit requirements.
    - (6) Prepare and submit PC1-Ns and N-FORM-10185, PC1-N Application for Work Protection to Operations including external and contractor permit requirements.
  - c) Project or Modifications Manager or team leader should identify the tasks which may be scheduled over a number of weeks (*windows or Long duration tasks*) and ensure they are

planned to the first T-16 milestone for that window. Non-station resources shall be supplied for *project* tasks scheduled over a *window*.

d) Operations Manager or qualified delegate, should perform the following activities:

- (1) Review preliminary *Scope List*.
- (2) Perform initial operations review as follows:
  - (i) Confirm the plant can be configured safely to perform the desired work.
  - (ii) Verify Operations personnel are properly resourced taking into account all operations station activities.
  - (iii) Identify pre-maintenance, post-maintenance and operational testing requirements and associated resources to support the work.
  - (iv) Inform WWL/WCTL of any concerns.

e) Alert Group Code Owners responsible for hold resolutions should perform the following activities:

- (1) Review holds and disposition where required.
- (2) Identify engineering (non-procurement) holds that cannot be resolved by end of T-13 in preparation for the Scope Freeze review held by the end of T-8.
  - (i) Determine Target Completion Date (TCD) and obtain reason for the delay prior to the meeting, and enter the information into the Holds toolkit or via the Engineering Work Management System (EWMS).
  - (ii) Tasks with non-parts holds not expected to be resolved by end of T-13 should be removed from the scope list .
- (3) Identify procurement holds that cannot be resolved by the end of T-12 in preparation for the Scope Freeze review to be held by the end of T-8.
  - (i) Determine TCD and obtain reason for the delay prior to the meeting, and enter the information into the Holds tool kit .
  - (ii) Tasks with Engineering parts holds not expected to be resolved by end of T-12 should be removed from the scope list.
- (4) Identify parts holds that cannot be cleared by end of week T-6 in preparation for the Scope Freeze review held by the end of T-8.
  - (i) Determine TCD and obtain reason for the delay prior to the meeting, and enter the information into the Holds toolkit.
  - (ii) Tasks with part holds not expected to be resolved by end of T-6 should be removed from the scope list.

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- f) Work Control Manager should ensure a Scope Rationalization meeting is held as described in Appendix A.

**Note:** The scope survival metric takes effect at this point.

#### 1.7.12 By End of Week T-13

##### Objectives:

- Resolve Engineering non parts holds.
- Complete Operations Assessing
- Create all permit tasks
- Identify all permit support tasks, Maintenance to assess

- a) Alert group code owners responsible for hold resolution should perform the following activities:

- (1) Resolve all engineering non-parts holds due by end of T-13.
- (2) Inform WWL/WCTL and other affected groups of unresolved non parts holds.

- b) Operations managers, with support from maintenance managers should ensure the following is done:

- (1) All tasks to prepare and check permitry are created for scheduling 4 weeks prior to the projected execution week.
- (2) All PC1's are reviewed and a permit scope is established for the targeted execution work week.
- (3) All permitry support tasks (e.g. scaffolding, running hoses, rubber areas etc. required for permitry) are identified, created and assessed in a WO.
- (4) Identify to work control jobs where permit tasks cannot be scheduled at least 48 hours prior to the start of the actual maintenance activity.

#### 1.7.13 By End of Week T-12

##### Objectives:

- Resolve procurement engineering holds.
- Resolve BMU holds
- Tasks not set to ready or which do not have a valid hold code are pulled from scope.

- a) Alert Group Code Owners should perform the following activities:

- (1) Resolve all engineering parts (procurement) holds including but not limited to Procurement Engineering (PE) holds, Parts gone Obsolete (PGO) holds, Holds for Master Equipment List (MEL) Updates (MDA)/MDU).
- (2) Update hold status in appropriate toolkits.

## Nuclear Procedure

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- (3) Inform the WWL/WCTL or any affected group of any unresolved procurement hold.
- (4) Resolve all BMU holds.

b) WWL/WCTL or delegate should perform the following activities:

- (1) Remove from the scope, WOs or tasks where procurement engineering holds cannot be resolved.
- (2) Schedule all “prepare and check permit” tasks 4 weeks prior to execution work week
- (3) Prepare a revised *Scope list*. Tasks not assessed (not set to ready status), tasks that do not contain a valid hold code and all parts holds not committed to be cleared by T-6 should be removed from the list.

**Note:** Any items not ready (without a valid hold code) kept at risk past this milestone shall have a committed resolution date prior to T-10 and an owner assigned by work control or the task will be cut by end T-11.

#### 1.7.14 By End of Week T-10

Objective:

- Refine schedule logic
- Issue materials at risk report
- Finalize committed resources in the RBT to support T-8 scope freeze

a) Work Control Manager should ensure:

- (1) Refining, tracking, and modifying of the the schedule from T-10 through to T-9 to provide an executable plan for the T-8 scope freeze reviews.
- (2) Schedule logic is built.
- (3) “Apply Permit” tasks are scheduled at least 48 hours prior to the start of the actual maintenance activity, unless otherwise specified by Operations.
- (4) Confirm any operating or functional test (as-found test) required for PM Work orders with an OTR (Operability Test Required) flag are scheduled prior to the actual preventive maintenance.”
- (5) any WOs or tasks not ready with non valid holds are removed from scope

b) Supply Chain should provide a “Material At Risk” report for required and contingency parts for the targeted execution work week.

c) Resource owners should ensure resource levels in the RBT are accurate and assigned at crew level to support the Scope Freeze meeting process.

### Title: INTEGRATED ON-LINE WORK SCHEDULE

#### 1.7.15 By End of Week T-9

##### Objective:

- Review Material at Risk report in preparation for scope freeze.
  - Issue a “logic driven” *scope* for review 1 week prior to scope freeze meeting.
- a) Work Control Manager should ensure a logic driven, resource balanced schedule is issued one week ahead of the scope freeze meeting held by the end of T-8. Specifically, WWL/WCTL or delegate should perform the following activities:
- (1) Prepare a revised *Scope list*. Tasks not set to ready status, tasks that do not contain a valid hold code and all parts holds not committed to be staged by T-5 should be removed from the list.
  - (2) Review the material at risk report with work group coordinators and Supply Chain to determine work which may remain in scope with at risk material. Tasks where material delivery are deemed an unacceptable risk should be removed from scope.”
  - (3) Notify the site Inspection and Maintenance Services (IMS) contract Manager for any removal or addition of IMS work.
  - (4) Notify the Hydro One Single Point of Contact (SPOC) in Work Control prior to the removal of any switchyard or main power output work.
  - (5) If change in scope affects the switchyard, obtain approval from the Independent Electricity System Operator (IESO) prior to the change.
  - (6) Balance worker estimated resources to align with final scope.
  - (7) Issue the scope list.
- b) Work Control Hydro One SPOC should perform the following activities:
- (1) Monitor Hydro One switchyard or main power output work preparations for execution of switchyard and main power output work.
  - (2) Ensure plant will be aligned to allow work to proceed.
  - (3) Ensure necessary Work Protection is prepared and applied to allow work to proceed as scheduled.
- c) Department Managers should prepare for the Scope Freeze Meeting held by the end of T-8, by ensuring all their milestones deliverables are met.

#### 1.7.16 By End of Week T-8

##### Objectives:

- Conduct Scope Freeze Meeting.

## Nuclear Procedure

### INTEGRATED ON-LINE WORK SCHEDULE

- Begin preparation of permits.
  - On- line Scope Addition Form in effect beyond this point.
  - Resource levels are considered frozen beyond this point.
  - Scope Stability Measure in effect beyond this point.
- a) Work Control Manager should ensure a scope freeze meeting is held in accordance with Appendix A.
- b) Scope freeze meeting attendees should perform the following activities:
- (1) Review the *Scope List* prior to the meeting and be prepared to discuss the following:
    - Any remaining holds (except PH or MPA/MPB/MPD).
    - Tasks not set to ready status.
    - Hydro One switchyard or main power output work.
    - IMS work.
    - *Project* work.
    - *Cycle Plan* work.
    - Resource comparison (estimated supply vs. demands) reports for all major disciplines.
  - (2) Recommend disposition and reschedule of work as appropriate considering the following:
    - Next available PEG system *window*.
    - Sequencing.
    - Station priority.
    - System health.
    - Regulatory commitments.
    - PM Late dates.
    - Manpower issues.
    - Material deliveries that cannot support pre-staging by Friday of T-5.
    - Committed TCDs for hold removals.
    - Impact on *Cycle Plan*.
  - (3) Reach agreement on a revised *Scope List*.
- c) Operations Manager should ensure preparation of permits is initiated with the goal of completing all requirements by end of T-4 noting that PC1-N requirements were submitted by end of T-16 and finalized in T-13.

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- d) Department Managers should follow the rules of the Scope Addition Process as described in Section 1.8 when requesting addition of new *WOs* (*WOs* not tasks).

**Note:** Estimated resource levels are considered frozen beyond this point.

- e) Should changes to resources be required inside the T-8 window, resource owners should:

- (1) Notify Work Control and the site RBT administrator of the new levels.
- (2) Initiate an SCR to document and trend the deviation.
- (3) Take corrective actions when required.

#### 1.7.17 By End of Week T-6

##### Objectives:

- Issue frozen scope list for review
- Clear all parts holds

- a) Work Control manager should ensure the frozen, resource balanced schedule is issued for preliminary review.
- b) Supply chain manager should ensure parts holds are cleared and should initiate the part staging process.

#### 1.7.18 By End of Week T-5

##### Objective:

- Stage all parts
- Remove tasks with unresolved parts holds from the schedule.

- a) Supply Chain Manager should perform the following activities:

- (1) Ensure all parts are pre-staged by Friday of T-5.
- (2) Ensure WWL/WCTL is informed of any materials concerns.
- (3) For *project* tasks scheduled over a number of weeks (*window*), parts must be pre-staged by Friday of T-5 of the first week of that *window*.

- b) WWL/WCTL or delegate should remove tasks with unresolved parts holds from the schedule and resource balance as required.

#### 1.7.19 By End of Week T-4

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- All permits prepared, checked and ready for review
- Perform preliminary operability review
- Perform preliminary reactor safety review
- Remove all pressure boundary holds

a) Operations Manager should ensure the following activities are performed:

- (1) Ensure all permits are prepared, checked and ready for review by Friday of T-4.
- (2) Ensure preliminary operational and reactor safety considerations are addressed.
- (3) Identify to Work Control any activities where permitry should be applied inside the 48 hour rule (Sections 1.7.12.b.4 and 1.7.14.a.3).

b) Reactor Safety Manager should perform the following activities:

- (1) Ensure a preliminary reactor safety review is performed by Friday of T-4.
- (2) Inform WWL/WCTL of reactor safety concerns and if maintenance testing tasks need to be added to the schedule.

c) Design Engineering Manager should ensure all holds for Pressure Boundary nuclear item release (MPA, MPB, MPD) are cleared.

#### 1.7.20 By End of Week T-3

Objective:

Perform First Line Manager (FLM) walk down.

- a) Work Control Manager should ensure a resourced and executable schedule is available T-3 through to T-0.
- b) Execution FLM, First Line Manager Assistant (FLMA) or qualified delegate in appropriate departments, and Project Leader for Project work should conduct work package walk down by Wednesday of T-3 at the latest. Refer to N-PROC-MA-0006, Work Performance for full details.
- c) Supply Chain, Work Control, Maintenance and Operations Managers should ensure all issues identified during the walk down are addressed prior to the T-2 schedule freeze meeting.

#### 1.7.21 By End of Week T-2

Objectives:

- Disposition walk down feedback prior to Schedule Freeze meeting
- Conduct Schedule Freeze meeting
- Finalize and issue Schedule.

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	
Revision:	R021	
Usage Classification:	Information	Sheet Number: N/A
Page:	22 of 51	

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- a) Maintenance Manager, Engineering Managers, Operations Manager and other department Managers, as required, should ensure the following activities are performed:
    - (1) Review the disposition comments entered in the walk down tool kit.
    - (2) Initiate resolution prior to the Schedule Freeze meeting as follows:
      - (i) If resolution cannot be resolved prior to the meeting, obtain a commitment date as to when the issue can be resolved.
      - (ii) Prepare for discussion at the meeting.
      - (iii) Update status in Walk down tool kit.
  - b) Work Control Manager should ensure a Schedule Freeze meeting is held to review FLM walk down comments and finalize any required changes to the schedule as a result of the walk down or of changing plant conditions. Refer to Appendix A for details.
  - c) Meeting attendees should perform the following activities during the Schedule Freeze meeting:
    - (1) Review resolution feedback from support organizations.
    - (2) Justify keeping tasks on the schedule if the discrepancy can be resolved (with a firm commitment date) by T-1.
    - (3) Remove the task(s) from the schedule prior to issuing it if the discrepancy cannot be resolved by T-1 after a TCD for resolution has been entered into the Holds tool kit. Comments should be added in the Walk down tool kit.
    - (4) Review estimated resource variance reports and obtain agreement on a revised schedule.
- Note:** At this point all work groups and resource owners are committed to executing the work on the frozen schedule.
- d) WWL/WCTL or delegate should perform the following activities:
    - (1) Remove from the schedule any task(s) as agreed at the Schedule Freeze meeting.
    - (2) Resource balance the schedule as required.

#### 1.7.22 By End of Week T-1

##### Objectives:

- Disposition *Carry-in Work*.
- Complete reactor safety reviews.
- Complete operability reviews.
- Post final schedule.

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	Revision: R021
Usage Classification:	Information	Sheet Number: N/A Page: 23 of 51

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- Issue Level “D” job jar work list.

a) WWL/WCTL or delegate should perform the following activities:

- (1) Review the current execution work activities and identify any work that cannot be executed as scheduled.
- (2) Determine if unexecuted work can be added to the following week’s schedule considering the following:
  - (i) Determine if the schedule is under resourced or if overtime is approved.
  - (ii) If (i) applies, review the addition of work activities with the next week’s Execution FLM or Work Group Coordinator and obtain concurrence.
  - (iii) If concurrence is received, add *Carry-in-Work* from current execution week to the schedule.
- (3) Revise the schedule and resource balance as appropriate.
- (4) Issue a job jar of level “D” work for each crew.

b) Manager, Reactor Safety should ensure the following activities are performed:

- (1) Reactor safety reviews of the final schedule are completed.
- (2) Reactor safety concerns are communicated to the WWL/WCTL and direction is provided as required.

c) Manager, Operations should ensure the following activities are performed:

- (1) Operational and reactor safety issues are addressed.
- (2) Operational and reactor safety issues are communicated to the WWL/WCTL and direction is provided as required including any activities where permitry should be applied inside the 48 hour rule (Section 1.7.14 [a] [3 &4]).

#### 1.7.23 By End of Week T-0

##### Objectives:

- Execute work
- Re-enter *Long duration Tasks* into following week schedule
- Conduct daily status meetings, provide Carry-over updates as required.

a) Execution organizations should perform work activities in accordance with N-PROC-MA-0006.

b) Execution organizations should update the status of all work (including percent complete of *long duration tasks*) in T-0 throughout the week and make recommendations for carry-over to future weeks.

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	
Revision:	R021	
Usage Classification:	Information	Sheet Number: N/A
		Page: 24 of 51

### Title: INTEGRATED ON-LINE WORK SCHEDULE

c) Manager, Work Control should ensure:

- (1) Addition of *Long durations Tasks (window)* which are not yet complete to the scope of the upcoming work week.
- (2) Scoping of work which is not expected to be completed in execution week and is expected to be carried over to the following work week, into the next week's schedule.
- (3) Daily status meetings are held during execution week; carry over should be discussed during the meetings. Refer to Appendix A for details.
- (4) Re-level the updated T-1 schedule [execution schedule for the following week] if the new scope represents more than 10% of available crew resources.

#### 1.7.24 By End of Week T+1

Objective:

Critique meeting.

Manager, Work Control should ensure that a critique meeting is held to perform the following activities: (Refer to Appendix A for meeting purpose and criteria)

- a) Review work performance against the frozen schedule.
- b) Review online process metrics (OPM) to identify improvements required.
- c) Identify gaps.
- d) Document and inform appropriate organizations of action items to ensure lessons are learned for future work weeks.
- e) Ensure SCRs are initiated in accordance with N-PROC-RA-0022, Processing Station Condition Records to identify failures to meet milestones and document corrective action for future improvements.
- f) Review scheduling process leading to that work week to identify any gaps or non-compliance.

## 1.8 Scope Addition Process

The primary objective of the Scope Addition Process is to control addition of work into the scope after it has been frozen by the end of T-8. The intent is to minimize any risk of creating potentially adverse conditions due to scheduling conflict or diverting of resources. The following considerations would benefit the Scope addition process:

1.8.1 When requesting addition of new *WOs* (*WOs* not tasks), Department Managers shall follow the rules of Scope Addition:

- a) Complete N-FORM-10312, On-line Scope Addition Request.

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	
Revision:	R021	
Usage Classification:	Information	Sheet Number: N/A
		Page: 25 of 51

### Title: **INTEGRATED ON-LINE WORK SCHEDULE**

b) Obtain signature approvals as follows:

- Work Control Manager for concurrence to proceed.
- Reactor Safety concurrence, if required.
- Support groups review and commitment inaccordance with section 3 of N-FORM-10312.
- T-8 to T-0, approval by WWL/WCTL and SPOC.
- T-6 to T-0, Sponsoring Manager and Work Control Manager.
- T-2 to T-0, Sponsoring Director and Director of Operations and Maintenance (DOM). When the DOM is the Sponsor, the Director of Work Management should approve.

c) Submit approved N-FORM-10312 to the WWL/WCTL for input to the schedule.

1.8.2 Department requesting addition Work Control manager should ensure the following activities are performed when addition of work has been approved:

- a) Ensure Assessor resources are available to support the addition of work to the schedule.
- b) Initiate preparation of work package.
- c) Ensure Manager Operations is notified of changes for review of operational impact as a result of emergent work, and permits can be prepared in time, as required.
- d) Ensure any required material is available.

1.8.3 WWL/WCTL or delegate should perform the following activities upon receiving approved form N-FORM-10312:

- a) Review approved form.
- b) Refine and modify the Scope List as appropriate.
- c) Resource balance if adding this scope brings crew demand above 110%.
- d) File completed N-FORM-10312 in the facility Work Control department, in accordance with local filing instructions, for the purpose of future effectiveness reviews, post job reviews and internal self-assessments. Maintain a minimum of 12 months retention.

1.8.4 When a block of resources becomes available, the WWL/WCTL may add new scope without the use of N-FORM-10312 providing communication with affected organizations has been performed to verify the following:

- Resource availability
- Parts availability

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	
Revision:	R021	
Usage Classification:	Information	Sheet Number: N/A
		Page: 26 of 51

### Title: **INTEGRATED ON-LINE WORK SCHEDULE**

- Assessment (planning) is complete
- Walk down is complete
- Permits are prepared, checked and ready
- Work is ready with no holds
- Work will not cause scheduling or reactor safety conflicts with already approved scope.

1.8.5 The Work Control Manager may authorize keeping work on the schedule past any of the milestone gates in the *On-line Scheduling Process* provided the relevant work group commits to resolving the issue by an agreed upon date. An SCR shall be filed to document these limited cases.

## 1.9 Scope variation Review/Trend code input- T-7 through T-1

1.9.1 The WWL/WCTL or delegate shall ensure that:

- An approved cause code is identified in the approved database for all transactions (tasks added or removed T-7 through T-1) from approved scope. The cause code selected should reflect the “root” cause i.e., the condition that if corrected would prevent recurrence. Typically asking “why” 3 times should identify that cause. Approved cause codes are listed in Appendix E, Ontario Power Generation Cause Codes and are reflected in the scoping database.
- A review of the cause codes for the work week is done at the T+1 critique meeting for lessons learned.

1.9.2 The Work Control Manager shall ensure appropriate analysis of the top three cause-code trends once every quarter. An SCR shall be initiated to capture the trend analysis and corrective actions.

1.9.3 The Work Control Manager may exempt a top cause code from analysis if:

- it is a repeat occurrence from the previous quarter and
- it is deemed that action plans have not had adequate time to achieve desired results.

## 1.10 Break Plan Work

Priority Code 1 or 2 work that needs to be added to the schedule after T-3 walk downs is considered *Break Plan Work*.

1.10.1 If *Break Plan Work* is within the *Fix-It-Now (FIN)* Team capabilities, work should be managed in accordance with N-INS-08400-10000, Fix-It-Now Process to protect the schedule. Contact *FIN* Team Leader for direction.

1.10.2 If *Break Plan Work* is outside the *FIN* Team capabilities, new work may be added to the schedule without N-FORM-10312 at the discretion of the Work Control Manager provided the following criteria are met:

- Resources are made available.
- Walk down is complete.

## Nuclear Procedure

Internal Use Only		
Document Number:	Revision:	
N-PROC-MA-0022	R021	
Usage Classification:	Sheet Number:	Page:
Information	N/A	27 of 51

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- Assessment (planning) is complete.
- Work is ready with no holds.
- Parts are pre-staged.
- Work will not cause scheduling conflicts with already approved scope, including reactor safety concerns.

#### 1.11 Resource Balancing Tool (RBT)

- 1.11.1 The RBT is the tool used for identifying resources available to support operation and maintenance of the plants.
- 1.11.2 The split of resources to support Online or Outage work should be pre-determined on a yearly basis as part of the business plan, and estimates entered into the RBT.
- 1.11.3 Changes in the relative needs of these groups may arise due to unforeseen circumstances (e.g. forced outage). Review and adjustment of the resource supply-demand should take place via regular meetings of the Maintenance, Outage and Work Control Managers.

#### 1.12 Graded Approach to Scheduling

- a) This approach has four levels of work scheduling: Levels A, B, C and D. Each level has specific criteria associated to it.
- b) All tasks on the execution schedule should be clearly graded A, B or C by schedule freeze.
- c) Level "D" tasks should be identified in a list separate from the execution schedule.
- d) All tasks on a WOs that are scheduled within a work week should have the same grade assigned.

##### 1.12.1 Level A Tasks

- Level A grading is used when the highest level of schedule control and schedule adherence is required. This type of scheduled tasks should be reserved for work activities which impact on safe operation of the facility, due to Licensing Conditions or limits in the Operating Policies and Principles (OP&Ps).

Level A Tasks should be completed within one hour of their scheduled time. This type of task typically requires a ROMS (Resource Outage Management System) slip input or could have an economic or public image impact and should be monitored at least once per day.

##### 1.12.2 Level B Tasks

- a) Level B scheduled activities are the second highest level of schedule grading. This type of schedule activity should be logic-driven and risk-significant only to the point that it should be completed in one 12-hour shift so as not to impact other planned work on subsequent shifts or days.

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	
Revision:	R021	
Usage Classification:	Information	Sheet Number: N/A
		Page: 28 of 51

Title:  
**INTEGRATED ON-LINE WORK SCHEDULE**

- b) Tasks requiring multi-discipline involvement and coordination or specific shift/day finish should be coded Level B as a minimum.
- c) Level B tasks should be completed within one 12-hour shift of their scheduled time and should be monitored daily.

### 1.12.3 Level C Tasks

- a) Level C scheduled activities are the lowest level of schedule grading. Level C activities should pose no risk of impairment on systems and are expected to be completed any time within the work week.
- b) Any type "C" tasks should be evaluated to be acceptable to be worked in combination with any other planned task for the entire week.
- c) This type of schedule should be reserved for work that is routine and typically does not require the details of a logic-driven schedule.
- d) Level C scheduled tasks may be shown on the schedule on the day or shift they are targeted to be completed but may move within the work week at the discretion of the execution organization.

### 1.12.4 Level D tasks or "Job Jar"

Level D work is normally managed at the FLM and technician level. This work should not be included in the weekly resource-loaded schedule. This work is typically classified as support work, or non-plant impact work and does not require support from other organizations. Level D work may be completed any time on any day of any week. The minimum amount of ready work in the job jar for each crew should be agreed upon with work group delegates.

## 2.0 ROLES AND ACCOUNTABILITIES

### 2.1 All department managers

Commit to and meet milestones identified in the online-scheduling process.

### 2.2 Alert Group Code Department Managers

Ensure holds assigned to their group are cleared by the established "T" milestones.

### 2.3 Managers, Engineering

2.3.1 In collaboration with Operations, identify plant reliability work for the Cycle Plan.

2.3.2 Ensure input to Scope identification and prioritization is provided.

2.3.3 Ensure minor modifications work is identified and follows the milestones of the online scheduling process and of the Cycle Plan if appropriate.

2.3.4 Ensure all engineering holds are cleared in accordance with the process milestone timelines

Title:  
**INTEGRATED ON-LINE WORK SCHEDULE**

### 2.4 Manager, Maintenance

- 2.4.1 Ensures work is fully planned and assessed in accordance with N-PROC-MA-0002.
- 2.4.2 Provides accurate resource availability and supply projections to support the work via the *Resource Balancing Tool*.
- 2.4.3 Notifies Work Control Manager of any changes in resource levels past T-19.
- 2.4.4 Ensures walk downs are performed and comments are fed back and resolved.
- 2.4.5 Ensures assigned work is executed as planned.
- 2.4.6 Ensures active participation at all meetings.
- 2.4.7 Ensures review of *Project* work packages.
- 2.4.8 Develops strategy to resolve resource gaps.
- 2.4.9 Recommends bundling of approved work to maximize maintenance efficiency.
- 2.4.10 Identifies opportunities for horizontal planning to the materials Supply Chain representative at the Cycle Plan review meetings.
- 2.4.11 Resolves BMU, task planner (PLH) and work package planner (WPP) holds.

### 2.5 Manager, Operations

- 2.5.1 In collaboration with Engineering, identifies Plant Reliability List (PRL), System Health (SH) and Operations priority work for the scope.
- 2.5.2 Provides input to prioritization of work.
- 2.5.3 Provides operational safety review of scheduled work.
- 2.5.4 Ensures operability considerations are identified and communicated by the established "T" milestones.
- 2.5.5 Ensures plant alignment is adequate for maintenance to occur taking into account reactor safety and operational considerations.
- 2.5.6 Provides accurate resource availability and supply projections to support the work via the *Resource Balancing Tool*.
- 2.5.7 Supports assessment and schedule development activities.
- 2.5.8 Ensures preparation of Permits and walk downs to the established "T" milestones.
- 2.5.9 Completes operability review of the committed scope (T-16) and any proposed or required changes to the frozen Cycle Plan execution schedule or scope.

## Nuclear Procedure

Internal Use Only		
Document Number:	Revision:	
N-PROC-MA-0022	R021	
Usage Classification:	Sheet Number:	Page:
Information	N/A	30 of 51

Title:

### INTEGRATED ON-LINE WORK SCHEDULE

- 2.5.10 Provide estimate for Operations resources to support Cycle Plan work.
- 2.5.11 Commit to and meet process milestones (detailed assessment, reviews, permit preparation or walkdowns).

## 2.6 Managers, Projects and Modifications

- 2.6.1 Ensure *Project* work and minor modifications are identified and follow the milestones of the online scheduling process and *Cycle Plan*.
- 2.6.2 Ensure funding is available for projects.
- 2.6.3 Provide fully assessed work packages to work control.

## 2.7 Manager, Reactor Safety

Ensures review of the schedule and ensures reactor safety related considerations are identified and communicated by the established "T" milestones..

## 2.8 Manager, Supply Chain

- 2.8.1 Ensures all material related holds are cleared by identified milestones.
- 2.8.2 Ensures parts required are staged by identified milestone.
- 2.8.3 Leads the Holds resolution team in accordance to the criteria in appendix A.8.

## 2.9 Manager, Work Control (SFAM)

- 2.9.1 Oversees and continuously improves the work management process with focus on reducing backlogs and improving plant conditions, by ensuring a high quality schedule is provided to the execution groups.
- 2.9.2 Co-ordinates the overall process.
- 2.9.3 Ensures all scheduling process meetings are held in accordance to the guidelines in appendix-A.
- 2.9.4 Ensures Work Orders (WOs) are identified in Asset Suite 7 (formerly known as PassPort) using the appropriate attributes e.g. "52W" WO attribute
- 2.9.5 Ensures all WOs are approved for a given work week in the Nuclear Inage Management System (NIMS).
- 2.9.6 Identifies any known resource gaps to Maintenance and /Operations.
- 2.9.7 Delivers a balanced schedule of ready-work.
- 2.9.8 In collaboration with Outage Manager, allocates resources to support on-line, outage execution, and outage pre/post-requisite work.

## Nuclear Procedure

Title:

### INTEGRATED ON-LINE WORK SCHEDULE

2.9.9 Ensures owners are identified, as required, as soon as practical, for work programs or individual WOs to provide appropriate oversight during work planning and execution.

## 2.10 CFAM, Work control

2.10.1 Ensures OPM metrics are available on a weekly basis.

2.10.2 Ensures governance is accurate.

2.10.3 Leads a peer team of work control managers.

2.10.4 Identifies gaps and leads their resolution through the peer team.

## 2.11 Director, Operations and Maintenance

Approves N-FORM-10312, On-Line Scope Addition Request.

## 2.12 Director, Work Management

2.12.1 Approves N-FORM-10312 when the DOM is the requesting Manager.

2.12.2 Ensures coordination between Outage and Work Control to identify unit outages.

2.12.3 Ensures issues pertaining to the resource split between online and outage are resolved.

## 2.13 All Directors

Sponsor initiation of N-FORM-10312 for their own line.

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

**Break Plan Work** - Priority Code 1 or 2 work that is added to the schedule after T-3 walk downs.

**Carry-in Work** - Scheduled work that could not be executed during a frozen work week and is carried over into following work weeks.

**Cycle Plan** - A 1 or 2-year rolling process used to identify, scope, plan, and schedule major on-line work that supports and provides input to the station business plan. The process is built on the principles of repeatability and achieving maximum system/equipment availability while optimizing the use of maintenance resources.

**Fix-It-Now** –(FIN)- Special cross functional working team assembled as a self-sufficient work group capable of independently performing work with minimal support from any other organization. The primary responsibility of the Fix-It-Now team is to address emergent, high and minor work activities such that the scheduled and planned work activities are protected and the normal shop resources are not distracted from their assigned tasks.

## Nuclear Procedure

Internal Use Only		
Document Number:	N-PROC-MA-0022	Revision: R021
Usage Classification:	Information	Sheet Number: N/A Page: 32 of 51

Title:  
**INTEGRATED ON-LINE WORK SCHEDULE**

**Long duration Task** - Task where the work spans more than one work week.

**Long lead item** – Material for which the catalogue identification (cat id) has a vendor order lead time (VOLT) greater than 90 days

**On-line Scheduling Process** - A developed schedule established from considerations such as preventative maintenance predefineds, reduction of plant risks, required surveillance activities, seasonal plants risks and maintenance history. The Scheduling Process is used as a guideline to establish preferred work windows for specific systems and may include emergent or minor work. The large majority of emergent and most minor work is covered by the Fix-It-Now team.

**OTR**- Operability test required. A flag or attribute placed on a predefined work order when an as found test is needed prior to performing a time based PM. Specific rules for the OTR are detailed in N-PROC-MA-0026.

**Project** - A Project is defined as a temporary endeavor valued at greater than \$200,000 (per unit) over and above base Operation, Maintenance, and Administration (OM&A) that is undertaken to create a unique product or service. Execution duration is limited, with defined start and finish dates.

**Resource Balancing Tool- RBT** - A tool used to optimize plant resources by comparing estimated and actual resource supply against estimated on-line and outage resource demands over time.

**Scope List** - Work activities that may be scheduled to be performed during a target week.

**Window** - A block of consecutive weeks selected for the installation phase of certain project tasks.

**Work Order- WO** - A work document which specifies the affected equipment and contains work instructions used to authorize, perform, control and document activities. Activities can include corrective, preventative or modifications work.

## 5.0 REVISION SUMMARY

**This is an Intent revision. Revision bars have not been used.**

- Added section 1.6.1 on EPC projects
- Updated section 1.7 and appendices A & B to reflect the rules for EPC projects
- Updated abbreviations and acronyms 3.2
- Corrected minor errors or “typos” throughout document
- Clarified wording in sections 1.7.12 and 1.7.13
- Added N-PROC-MA-0020, Predefined Process in section 4.2.1 per DCR 124149

Title:  
**INTEGRATED ON-LINE WORK SCHEDULE**

### Appendix A: Meeting and Team Purpose and Criteria

#### A.1.0 PM REVIEW MEETING

A.1.1 The PM Review meeting is held by the end of T-24, sponsored by the Maintenance manager or delegate. This meeting provides a platform for PM screening and review prior to scheduling the PM within its pre-determined work week. Representation from the following groups is required:

- Maintenance
- Engineering
- Operations
- Work Control.

A.1.2 The PM review includes the following elements:

- a) Update PM scope or technical basis to reflect new or revised requirements.
- b) Revise PM scope and/or frequency based on component performance.
- c) Appropriately credit PMs for past work completed via other work orders
- d) Early identification of planning or materials issues.
- e) Early identification of pending holds associated with procedures.
- f) Recommendations on coordination of PM tasks with other scheduled work may be made.

#### A.2.0 SCOPE COMMITMENT MEETING

A.2.1 The Scope Commitment or Scoping meeting is held in week T-19, sponsored by the Work Control Manager or delegate. The purpose of the meeting is to ensure the proper work orders (WOs) are scoped to meet station needs and to obtain agreement on Preliminary scope. Representation from the following organizations is required:

- Engineering
- Operations
- Projects and Modifications
- Work Control
- Maintenance
- Any other organization with input to the Scope e.g. EPC project leader or "job owner"

**INTEGRATED ON-LINE WORK SCHEDULE**

### Appendix A (Continued)

- A.2.2 Work is brought into scope based on input from key groups such as Engineering and Operations considering the following:
- PEG cycles
  - System health (SH) and Major Projects
  - Plant safety and reliability needs
  - *Cycle Plan*.
- A.2.3 Work Control should send out the proposed scope for the target work week one week prior to meeting, including priority scores of WOs.
- A.2.4 Representatives of EPC Projects should provide the following information:
- an outline of the project including identification of all project tasks which involve station interface (resources and/or equipment)
  - Intelligence that any parts procured independently will be available and staged for targeted execution i.e. part is ordered (PO #) with a suitable delivery date.
- A.2.5 Prior to meeting, participants should review the scope list priority weighting score and be prepared to raise any exceptions to priority of weighting at the T-19 meeting.
- A.2.6 Expected Meeting Outcome
- Ensure scoped WOs redundant equipment will be available (i.e. identify operability, testing, permits issues, etc).
  - Ensure work week execution resources are balanced at approximately 110% as outcome of the T-19 meeting.
  - Identify any known holds that cannot be resolved by subsequent milestone.
  - Identify any known holds that need resolution expedited.
- A.2.7 Multi-departmental representation ensures that vulnerabilities and priorities are evaluated broadly and that necessary work is scoped.
- A.2.8 A revised Preliminary *Scope List* is agreed to at the conclusion of the meeting and submitted for review.
- A.3.0 SCOPE RATIONALIZATION MEETING**
- A.3.1 The Scope Rationalization meeting is held in week T-16 by the Work Control Manager or delegate and sponsored by the Engineering manager. The purpose of the meeting is to

discuss additional input needed (holds), rationalize the scope against available resources, known plant or unit configurations and ensure alignment with the PEGs.

A.3.2 Representation from the following organizations is required:

- Engineering
- Operations
- Outage
- Projects and Modifications
- Supply Chain

### Title: INTEGRATED ON-LINE WORK SCHEDULE

- EPC project leader or “job owner” with work in scope **Appendix A (Continued)**

- Work Control
- Maintenance
- Any **other organization** required to support the work in scope.

#### A.4.0 SCOPE FREEZE MEETING

**A.4.1** The Scope Freeze Meeting held by the end of T-8 by the Work Control Manager or delegate and is overseen by the Operations manager. Representation from the following organizations is required:

- Engineering
- Fuel Handling
- Maintenance
- Operations (Oversight organization)
- Outage
- Projects and Modifications
- EPC project leader or “job owner”
- Supply Chain
- Work Control
- Any other organization who may have requested work.

**A.4.2** The purpose of the review is to reach concurrence on the scope of work in the work week taking into account the following factors:

- Plant safety
- Worker safety
- Schedule logic
- Minimizing commercial risk
- Minimizing out-of-service time
- Optimizing plant resources.
- Ensuring any operability tests required for Equipment or Predefined identification Requirement (PMID-RQs) with the OTR flag are scheduled appropriately

**A.4.3** All support requirements and overall coordination of work activities are reviewed and discussed at the meeting.

**A.4.4** Review participants are expected to be familiar with specific job aspects and discuss job sequencing and required resources.

<p>Title:</p> <p><b>INTEGRATED ON-LINE WORK SCHEDULE</b></p>
--

### Appendix A (Continued)

A.4.6 A review of all gaps is performed and a final *Scope List* is agreed to and issued.

## A.5.0 SCHEDULE FREEZE MEETING

A.5.1 The Schedule Freeze meeting is held by the end of week T-2 by the Work Control Manager or delegate and is overseen by the Maintenance manager. The schedule freeze meeting is held, following completion of the FLM walk downs, and resolution of the issues identified during the walkdown. Representation from the following organizations is required:

- Maintenance (Oversight organization)
- Operations
- Fuel Handling
- Projects and Modifications
- EPC project leader or "job owner"
- Supply Chain
- Work Control
- Any other organization with work on the schedule.

A.5.2 The purpose of the meeting is to finalize any changes that need to be made to the schedule as a result of the walk down.

A.5.3 Participation at this meeting is crucial since after T-2 all execution work groups and resource owners are committed to executing the work on the frozen schedule. After T-2 Maintenance is accountable for execution of the schedule.

## A.6.0 DAILY STATUS MEETINGS.

A.6.1 The purpose of the meeting is to report progress on execution of tasks on the frozen schedule, to report issues which require expediting and to ensure coordination between work groups.

A.6.2 Participation from the following is required:

- Work control manager or delegate (WWL/WCTL- execution)
- Maintenance coordinators (Mechanical, Control, Civil)
- Operations
- Outage if required.

A.6.3 Review of progress on schedule grade C task execution should be done to ensure completion by end of week.

A.6.4 Recommendations for work carry-over should be made by execution work groups. A decision on work to be carried over should be made (rejected or accepted) by WWL/WCTL.

**INTEGRATED ON-LINE WORK SCHEDULE**

### Appendix A (Continued)

#### A.7.0 T+1 CRITIQUE MEETING

A.7.1 The T+1 meeting is held following completion of the work week and is sponsored by the Work Control Manager. Senior management representation from the following organizations is required:

- Maintenance
- Operations
- Projects and Modifications
- Supply Chain
- Work Control
- Any other organization that impacted the schedule.

A.7.2 The purpose of the meeting is to identify process deficiencies, enhancements, transaction cause codes and good work practices.

A.7.3 Individuals of the work groups are encouraged to attend to feedback comments so that corrective actions are implemented the next time the work is planned and scheduled.

A.7.4 Unexecuted tasks and missed milestones are reviewed.

#### A.8.0 HOLDS RESOLUTION TEAM

A.8.1 A Hold Resolution Team should be convened to support hold resolution and scope rationalization.

A.8.2 The Supply chain Manager shall lead the Holds Resolution Team lead. Participation to the team and quorum requirements will be determined in accordance to team charter and site directives.

A.8.3 The purpose of the team is to ensure resolution of identified holds in a timely manner to support future milestones of the *On-line work scheduling process*. Regular meetings of the team will provide a forum to actively seek other groups' cooperation, improve working relationships and meet performance objectives.

A.8.4 The goal of the team is to reschedule – only once - work which cannot meet the *On-line Scheduling Process* milestones. This requires a firm commitment for resource issues from the various stakeholders and re-scheduling of the work into a work week where this commitment is sustained.

## Integrated On-Line Work Schedule

### Appendix B: On line Milestone Activities

By the end of Week	MILESTONES	DEPARTMENTS A = accountable I = input C = concur R = review							
		ENGINEERING	MAINTENANCE	SUPPLY CHAIN	OPERATIONS	OUTAGE	PROJECTS & MODIFICATIONS	WORK CONTROL	ALL
Q-5 to T-53	(a) Call for cycle plan scope [once a quarter WC requests various departments to identify cycle plan type work (non-PM)]							A	
	(b) Provide input to <i>cycle plan</i> scope	A			A	A	A		
	(c) All EPC <i>project</i> work is identified						A		
SCOPING AND PLANNING	T-52	(a) Ensure all cycle plan type work is in scope (major equipment work, major <i>Project</i> *work and/or long lead items)						A	
		(b) Identify estimates of resources available (incl. for <i>project</i> & minor mods work)	A	A		A	A		
		(c) Scope all currently unscheduled CC, CN, DC, DN WOs to proper PEG with 52 weeks lead time; add 52w attribute						A	
		(d) Enter the online/outage split in the RBT						A	
	T-48	(a) Complete planning (assessing) for 52w WOs in approved scope: all tasks are set to ready or contain a valid hold code; MRs are approved; BMU holds are cleared		A			I Field eng		
		(b) For 52w PM type WOs also address any outstanding (PMLP) feedback **		A					
	INDICATOR - % of planning complete for 52 w WOs & tasks								
	T-47	Initiate purchase requests for <i>Cycle Plan</i> WOs (52w WO attribute)			A				
	INDICATOR – Purchase request outstanding metric – cycle plan.								
	T-42	(a) Resolve all Engineering holds for 52w tasks	A						
		(b) Ensure all parts holds have purchase orders			A				
	INDICATOR – Hold code outstanding metric – cycle plan.								
	T-40	(a) All 52w WO tasks set to ready except tasks with PH and MPB/MPD/ITP		A					
		(b) All PH on 52w tasks have a committed T-21 delivery date			A				
		<b>Note:</b> <i>Cycle plan</i> scope freeze in effect: no 52w work orders rescheduled beyond this point without approval from work control manager							
	T-26	(a) Prepare detailed design packages for <i>minor mods</i> work.	A						
		(b) Identify long lead items and resources needed for minor mods work*	A						
	T-24	Conduct PM review meeting	R	A		R			
	T-21	(a) All holds removed on 52w WOs (except MPB/MPD, ITP) or WOs re-scheduled		A				A	
		(b) Organizations provide committed preliminary resource profile including non-station resources to be used for minor mods work		A		A	A		
		(c) All EPC <i>project</i> outlines are submitted including critical path and resource profile					A

## Appendix B (Continued)

INDICATOR – Online readiness metric – cycle plan.									
By the end of Week	MILESTONES	DEPARTMENTS A = accountable I = input C = concur R = review							
		ENGINEERING	MAINTENANCE	SUPPLY CHAIN	OPERATIONS	OUTAGE	PROJECTS & MODIFICATIONS	WORK CONTROL	ALL
T-20	(a) Provide preliminary scope with priority weighting scores (1 week prior to T-19 meeting)	I			I	I		A	
	(b) Resource balance scope within 20% (maximum 120% of disciplines MC, MM, MS)							A	
	(c) Review preliminary scope list in preparation for T-19 meeting								R
T-19	(a) Draft work plans for minor mods and EPC available.	A					A		
	(b) Hold T-19 scope commitment meeting							A	I
	(c) Provide Supply intelligence recommendations on items in scope			A					
	(d) For holds already in scope, identify Eng & PE holds which cannot be cleared by T-13 & T-12 respectively and provide a committed date for others	A							
	(e) Provide updated list post-meeting							A	
T-16	(a) Review EPC <i>project</i> and minor mods work plans, resolve concerns.		R		R		A		
	(b) Complete Mtce and field eng. planning. All tasks are set to ready or contain a valid hold code. (moved from T-13)		A				A		
	(c) Prepare PC1-Ns and submit to Operations.		A				I		
	(d) Identify any conflicts or operational issues in the scope list-				A				
	(e) Identify Eng holds & PE which cannot be cleared by T-13 & T-12 respectively	A							
	(f) Identify parts holds for non 52w tasks that cannot be resolved by end of T-5.			A					
	(g) Hold a Scope Rationalization meeting- <i>Engineering sponsored</i>	A						A	I
INDICATORS - % of planning complete (WOs and tasks), Scope Survival T-15.									
T-13	(a) Resolve Engineering non parts Holds.	A							
	(b) Complete Ops Assessing & Ops review of plan;				A				
	(c) Create all permit tasks.				A				
	(d) Identify & create all permit support tasks; Maintenance to assess		A		A				
T-12	(a) Resolve procurement engineering holds.	A							
	(b) Resolve Bill of material updates holds (BMU)		A						
	(c) Tasks not set to ready or tasks that do not contain a valid hold code or tasks with parts holds not committed to be staged by T-5 are pulled from scope.							A	R
	<b>Note:</b> Items kept at risk past milestone shall have a committed date prior to T-10 and an owner or work cut by end T-11							A	C

By By the end of Week	MILESTONES	DEPARTMENTS A = accountable I = input C = concur R = review							
		ENGINEERING	MAINTENANCE	SUPPLY CHAIN	OPERATIONS	OUTAGE	PROJECTS & MODIFICATIONS	WORK CONTROL	ALL
T-10	(a) Refine Schedule logic.							A	
	(b) Issue "materials at risk" report [contingency parts]			A					
	(c) Finalize committed resources to support T-8 Scope Freeze.		A		A		A	R	
T-9	(a) Review Material At Risk report in preparation for T-8 scope freeze		R	R				A	
	(b) Issue a "logic driven" scope for review 1 week prior to T-8 meeting							A	R
T-8	(a) Conduct Scope Freeze meeting. (Ops accountable)	I	I	I	A		I	A	I
	(b) Begin preparation of permits.				A				
	(c) N-FORM-10312 needed for addition of new WOs beyond this point.							A	A
	(d) Resource levels are frozen beyond this point.		A					R	R
	(e) Scope Stability Measure in effect beyond this point.								A
INDICATOR – Scope Stability T-7 to T0									
T-6	(a) Issue frozen scope list for Operability Review			R	R			A	
	(b) Clear parts holds			A					
T-5	(a) Stage parts			A					
	(b) Remove WOs with unresolved parts holds from scope list							A	
T-4	(a) All permits prepared, checked and ready for review.				A				
	(b) Perform operations review.				A				
	(c) Perform preliminary reactor safety review.	A							
	(d) Remove all pressure boundary holds	A							
INDICATOR - # of WOs pulled from schedule due to unresolved parts holds									
T-3	Perform FLM walk down.		A		A		A		
INDICATOR - # of WOs pulled from schedule due to walk down findings									
T-2	(a) Disposition walk down feedback prior to Schedule Freeze meeting.	I	I	I	I	I	I		R
	(b) Conduct Schedule Freeze meeting. Review walk down feedback and finalize changes.		A					A	R
	(c) Finalize and issue Schedule.							A	
	<b>Note:</b> at this point all work groups and resource owners are committed to executing the work on the schedule								
T-1	(a) Disposition Carry-in Work	A						A	
	(b) Complete reactor safety reviews								
	(c) Complete operability reviews				A				
	(d) Post final schedule.							A	
	(e) Issue Level "D" job jar.		R					A

### Appendix C (Continued)

#### Pickering

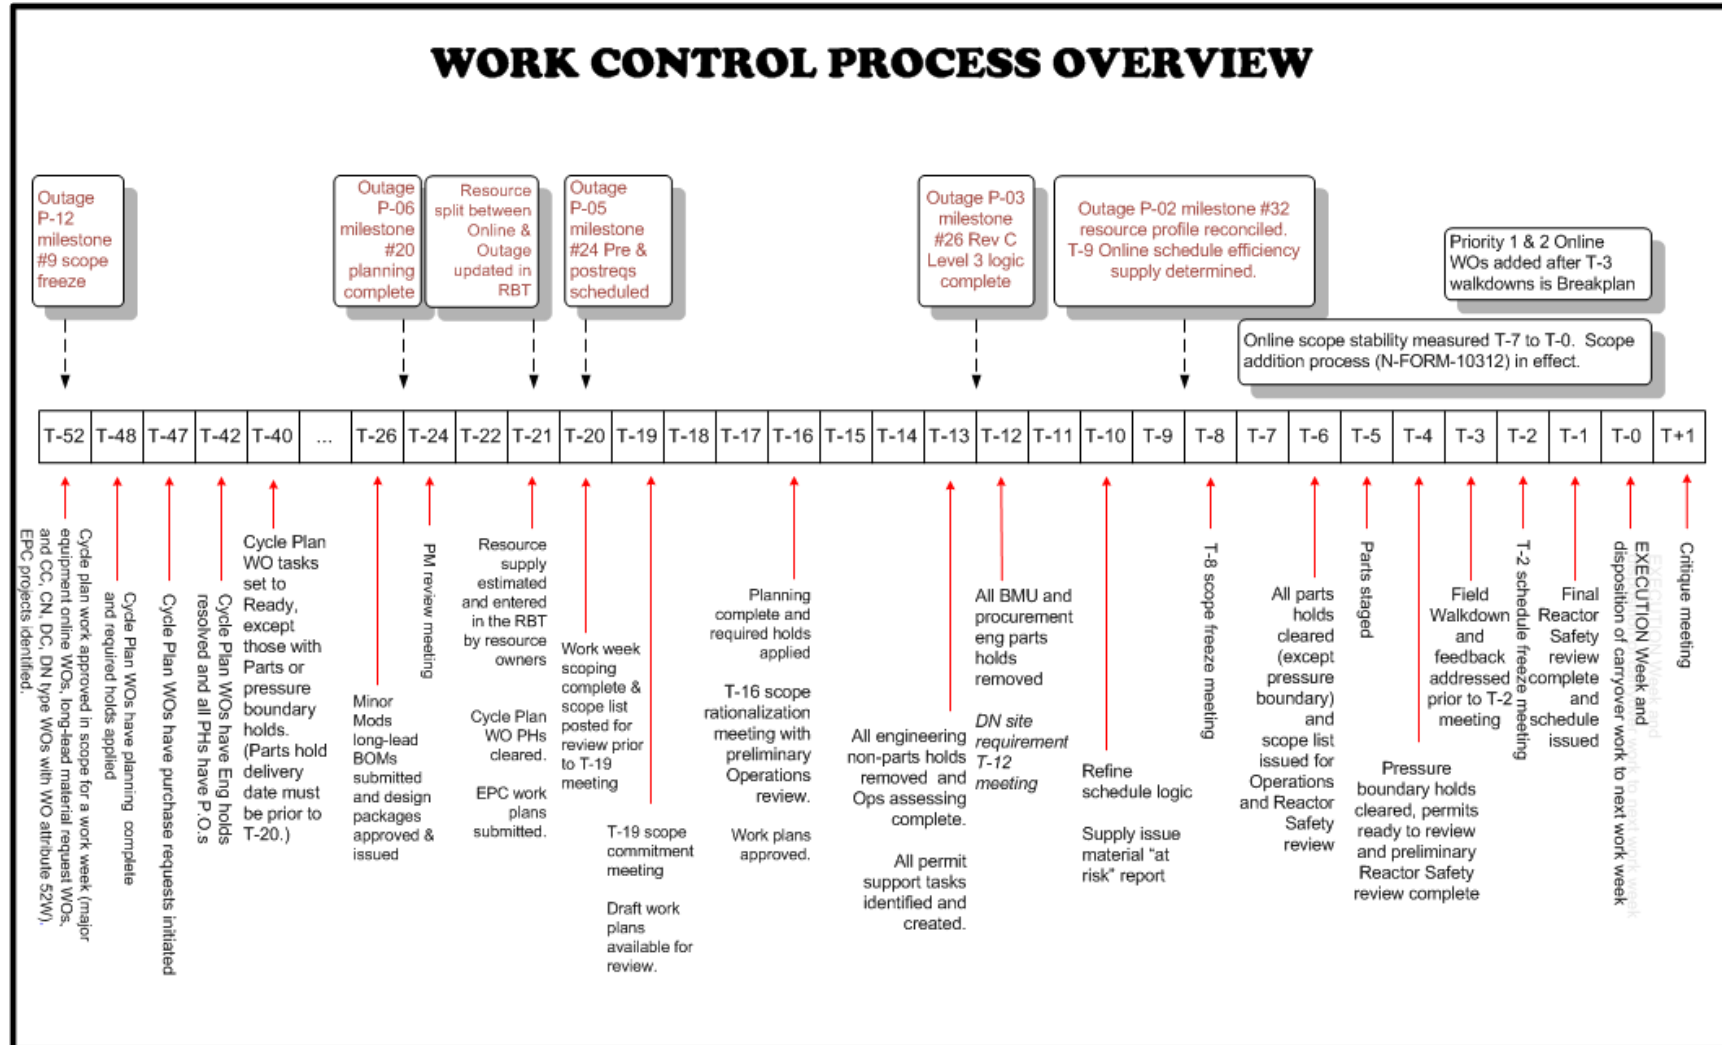

Type of Work	Specific Items or Examples
Major Equipment: Maintenance Programs/ <i>Projects</i> /Overhauls/Modifications	Rotating Equipment/Major Pump overhaul programs Valves (Motorized, Control, Relief) Heating steam header outages Reheat and heater bank outages, Water Treatment Plant Heating, Ventilation, Air Conditioning (HVAC), D2O Driers, Chillers Upgrade programs Containment (Airlocks, dampers, long duration box-ups) Screenhouse Equipment. (screen overhauls, pumps, strainers, valves) Heat Exchangers Cleaning, inspections. Condensers/Debris filters (waterbox outages, tube cleaning system, debris filter upgrades) Major Cranes and Hoists Air Compressors and Driers Heavy Water (D2O) Upgraders and Sultzter outages Ion Exchange clean up system Tank Cleaning Active Liquid Waste System work
Electrical Work	Battery Replacements MCC, Bus, transformer outages Breaker maintenance or testing that results in operating restrictions. Site Electrical System (SES)/In station transfer bus (ISTB) maintenance.
Switchyard work	SST Outages Maintenance where a single failure or error would result in loss of a unit or transfer bus.
No Fuel Windows	Major fuel handling equipment maintenance windows, (Ram replacements, Pump and equipment overhauls, fuel bay maintenance, cranes, inspections)
Station drills/Housekeeping days	
SG, EPG Outages	Major, Minor & Mini outages.,( upgrades, modifications, battery replacements)
Unit Outages	Planned Outages, major evolutions impacting on on-line units
On-line work/programs requiring completion to support outages	Outage prereq's, maintenance on airlocks, D2O driers, etc...
Quiet mode related work	Safety System upgrades/ <i>projects</i> .
SRSTs	Requiring multi workgroups or extended operating restrictions.
Seasonal Programs	Winterization, Summerization (heat trace upgrades, major HVAC, Chlorination)
CC, CN, DC, DN	Selected corrective or deficient work orders not already in approved scope

### INTEGRATED ON-LINE WORK SCHEDULE

## Appendix E: Ontario Power Generation Cause Codes

Revision 3- Apr 2012

Issue	Code	Cause
Automated	1	PassPort status changed to Complete or Cancelled, prior to T-0
	10	PassPort status changed to CXCL/REQ (cancellation request) -- new since Nov 2011
	NEW	New PassPort WO-task created after process milestone; auto-approved via WO approval
	Other	Task status reset (3); auto-carryover (4); data cleanup (6); upload to Excel (7)
Assessing	A A	Maintenance Planning assessment incomplete or Hold added after required milestone (includes outstanding PMLP updates on other occurrence WOs)
	A B	Maintenance Assessment Package Quality, incorrect identification of requirements or tasks
	A C	Operations assessment incomplete not meeting the process milestone
	A D	Operations assessment package quality, identified permit not adequate, incorrect identification of requirements or task missing
	A E	Fuel Handling Assessment incomplete or not adequate
	A F	Field Engineering or Other support groups assessment incomplete or not adequate
Configuration	C A	Plant configuration changed from expected, eg, redundancy u/a, dose rates, weather
	C B	Planned outage extended or Forced Outage
	C C	Configuration should have been known
	C D	Fuelling Machine out of service causing changes to scope/schedule
	C E	Fuelling was NOT as per the schedule (Use CD when recovering from fuelling machine having been out of service)
Discovery	D A	Condition could not have been known, eg, passing isolation
	D B	Testing failed
Eng	E A	Inside T-16 process, new PMID-RQ or frequency change / PM optimization
	E B	Engineering did not meet commitments
	E C	Declined deferral request OR new late date management, prior to T-0 execution
Non-issue	N A	Main task assessed as being greater than 40hrs (days crews) or 168hrs (shift crews)
	N B	Permit task added prior to T-10 milestone (ADD REASON ONLY)
	N C	Logic being defined prior to T-8
	N D	First time scoped: long VLT or new Cat ID that did not have previous purchasing information
Parts	P A	Procurement Engineering BOM, MEL, PE/EVAL not resolved as per the milestone
	P B	Material not staged as per process milestone
	P C	Inventory (Buyers) did not meet process milestone (no P.O. or late delivery from vendor)
T-0 Adherence Codes	T A	Permit not applied as scheduled (Use DA if passing isolation)
	T B	Control Mtce did not meet commitments
	T C	Mechanical Mtce did not meet commitments
	T D	Operations did not meet commitments
	T E	Civil Mtce did not meet commitments
	T F	Fuel Handling did not meet commitments
	T G	Projects, QC, Eng or other support groups did not meet commitments
	T H	Work reported complete; PassPort WO-task closeout required

Title:

## INTEGRATED ON-LINE WORK SCHEDULE

### Appendix E (Continued)

Issue	Code		Cause
Work Control	W	A	Schedule quality issue, eg, incorrect logic, wrong time of year, etc
	W	B	Resource balancing prior to T-0: new resources identified or ready work cut from scope
	W	C	Approved Scope Change Form (# to be entered in comments) -- N-FORM-10312
Management	Z	A	Management decision to divert resource to outage or unscheduled work

### Choosing the right cause code -- Ask the "3 whys"

Example:	Why?	Ops didn't apply permit
	Why?	Ops working on breakplan
	Why?	There was a Forced Outage -- <b>cause code CB</b> -- Planned outage extended or Forced Outage
Example:	Why?	Control Maintenance task was not completed as scheduled
	Why?	Mechanical Maintenance did not complete their preceding task
	Why?	Unknown -- <b>cause code TC</b> Mechanical Mtce did not meet commitments (code on Control Mtce task)
Example:	Why?	No material
	Why?	Not identified on Material Request (MR)
	Why?	<b>Cause Code AB</b> -- Mtce Planning Assessment package quality, incorrect identification of requirements or tasks

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 1.0 INTRODUCTION

Darlington Nuclear Generating Station (DN GS) requires a major refurbishment in order to extend the service life of all four production units. The refurbishment is currently planned to begin in 2016. The four units will be shut down in a partially overlapping sequence, with the 2<sup>nd</sup>, 3<sup>rd</sup> and 4<sup>th</sup> units overlapping.

The Islanding Project has been grouped under the Retube and Feeder Replacement (RFR) project bundle. This is because the major scope of work (SOW) in Islanding (Bulkhead) is being executed by RFR JV vendor. The Islanding Project portfolio consists of a series of projects whose collective purpose is to establish a construction island and isolate the refurbishment unit, area, and systems from the operating units. The various projects in the Islanding portfolio are described below:

- Bulkhead and Containment Isolations – Establishes a new containment boundary to isolate the refurbishment reactor vault from operating containment.
- Pre-Requisite Modifications – Modifications to station systems on non-refurbishment units required to be installed in planned outages or Integrated Planning Group (IPG) in order to allow islanding of the first refurbishment unit.
- Nuclear Refurbishment Outage Execution –required to island systems from the operating units that are required to be installed during the refurbishment outage.
- Barriers/Area Islanding – Construction and personnel barriers, marked pathways and signage required to establish the construction island.
- System Islanding – Establishes the jurisdictional boundary on station systems to define the refurbishment island on a system level.

This revision of the Project Management Plan (PMP), Revision 004, addresses the entire Islanding project portfolio in greater updated detail as the project is nearing to breaker open.

OPG has awarded an Engineering, Procurement and Construction contract for the Darlington Refurbishment RFR Project (RFR EPC Agreement) to the SLN-Aecon Joint Venture.

The project is divided into four phases:

1. Definition,
2. Execution,
3. Commissioning, and
4. Closeout.

In order to gain efficiencies for the engineering and construction activities for the refurbishment unit reactor vault work, OPG has also awarded the Bulkhead and Containment Isolations project to the SLN-Aecon Joint Venture. The Bulkhead and Containment Isolations scope was added to the RFR EPC Agreement via a Project Change Directive issued in June of 2012.

Although the Bulkhead and Containment Isolations Project is an Islanding project the funding has been transferred to the RFR project for Gate 3 and beyond as it and the RFR Project is

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>6 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

being executed under the same contract. Consistent with this approach portions of this document are derived from the RFR PMP NK38-PLAN-09701-10074. Any reference to the Bulkhead and Containment Isolations Project in this document applies only to Gates 1 and 2 funding unless otherwise noted. The management of the Bulkhead and Containment Isolation Project is still done by the Islanding team.

All Pre-Requisite modifications have been given to the Projects and Modifications Organization for oversight of either Engineering, Procurement, Construction (EPC) or Procurement, Construction (PC) contracts to be executed with the Extended Services Master Service Agreement (ESMSA) contract. Those modifications using the PC contracts are performing the Engineering portion in-house (OPG).

All of the NR Outage modifications will be executed by the Islanding project using in house resources. The Airlock and Vault Atmosphere (AL/VA) work in the Islanding project has been split into two groups. The Vault Vapour Recovery (VVRS) modification portion of the AL/VA work has been transferred to the Balance of Plant Project and is no longer in the Islanding project scope. The Airlock Islanding work is no longer being performed as a modification, but is still included in the Islanding NR Outage Modification sub-bundle.

The System Islanding bundle will be executed in house with support from the NR functional groups.

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 2.0 GOVERNANCE STRUCTURE AND INTERFACES

### 2.1 Islanding Management Plans

The Islanding Project Management Plan has followed the guidance set within the OPG Governance per Figure 1. The content of this PMP is divided into nine knowledge areas as shown below:

- Section 4.0: Project Integration Management,
- Section 5.0: Project Scope Management,
- Section 6.0: Project Schedule Management,
- Section 7.0: Project Cost Management,
- Section 8.0: Project Quality Management,
- Section 9.0: Project Human Resource Management,
- Section 10.0: Project Communications Management,
- Section 11.0: Project Risk Management, and
- Section 12.0: Project Procurement Management.

Supporting Joint Venture Documents for Islanding PMP:

- RFR PMP – NK38-PLAN-09701-10074
- RFR Engineering Design Plan – NK38-DP-09701-10001
- Bulkhead and Islanding Contract Strategy- NK38-REP-09701-10100
- RFR COIR – NK38-DAI-09701-10008

Supporting ESMSA Documents for Islanding PMP:

- Extended Services Master Services Agreement
- ESMSA Request for Work – N-INS-00120-10025
- ESMSA COIR - N-COI-00120-00001 (Formerly N-DAI-00150-10000 or ESMSA Schedule 6)

Supporting OPG Management Plans for Islanding PMP:

- All sheets associated with N-MAN-00120-10001
- All sheets associated with NK38-NR-PLAN-09701-10001

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 2.2 EPC Management Plans

A crucial input to the management and execution of the Islanding Project will be the schedule, scope, cost, risk and planning integration with the EPC Contractors. Each EPC contractor will follow their respective process for management including the preparation and issue of management plans as specified in the Contract Terms and Conditions.

The EPC management plans for the Bulkhead and Containment Isolations Project are shared with the RFR project and have been developed by the Joint Venture. The plans are listed in Table 1.

Table 1: Joint Venture EPC Management Plans		
Plan	Document Number	Status
Quality Assurance Plan	509407-0000-00000-38QP-0001	Issued
Project Estimating Plan	509407-0000-00000-33IM-0001	Issued

Field Change Notice Instruction	509407-0000-00000-40WI-0002	Issued

Barriers/Area Islanding and Pre-Requisite bundles are to be contracted under the ESMSA. As stated in the ESMSA contract, project specific Subcontractor Management plans may be developed by the ESMSA as required. If project specific management plans are not required, then the overall ESMSA Management Plans will apply. Examples of these are:

Table 2	
Plan	Doc Number
Subcontractor Management Plan	FGP-MSA-001
Work Plan-Preparation and Development	FGP-MSA-002
Field Engineering Change Control	FGP-MSA-003
MSA Site Document Control	FGP-MSA-005
Risk Management Plan	FGP-MSA-006
Completion Assurance	FGP-MSA-007
Work Assessing	FGP-MSA-018
Processing External and Internal Operating Experience (OPEX)	SP-060

For Pre-Requisite projects, the Projects and Modifications organization will manage the interface with the ESMSA Management Plans.

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

### 3.0 SAFETY

#### 3.1 Safety Management

Safety is a core value at OPG for Nuclear Refurbishment and is reflected in all safety management plans produced by OPG and contractors. The Islanding Project will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), the OPG expectations (N-POL-0001, OPG-POL-0001, and N-GUID-09701-10011), as well as the requirements set out in the EPC contracts terms and conditions. In line with the RFR Project, the Bulkhead/Containment Isolation Project safety oversight will comply with the following:

- RFR EPC Agreement – Site Specific Safety Plan (Execution),
- RFR EPC Agreement – Exhibit 2.6 Safety, and
- RFR EPC Agreement – Exhibit 2.13(a) Oral Review Board Process

In line with the Projects and Modifications Organization and other projects using the ES MSA, the Barriers/Area Islanding and Pre-Requisites will perform oversight to ensure compliance with the relevant sections of the ES MSA contract.

#### 3.2 Construction Management

The Islanding Project will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), the OPG expectations, and the terms and conditions for each EPC Contract under which Islanding work will be executed. OPG will have multiple construction roles throughout the various EPC contracts to be awarded under the Islanding project portfolio (see table 2).

Table 2: OPG Nuclear Refurbishment and Contractor OSHA Roles			
NR Construction Phase	Timeline	OPG Islanding NR Role (OHSA)	Contractor Role (OHSA)
1. Pre-refurbishment work including modifications (including unit barriers)	2013-2025 planned outages/IPG	Sponsor Only (P&M lead projects i.e. NPC, D2O, EQ of CB4)  Owner, Constructor and Employer (Islanding lead projects i.e Barriers, Containment Isolations.)	Employer
2. DNGS Protected Area Site Execution	Oct 2016 – Oct 2025	Owner, Constructor and Employer	Employer
3. Pre-refurbishment mock-up training	2014-2016	Owner, Constructor and employer	Employer

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>11 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

### 3.2.1 Construction Roles under OHSA

OPG will be the Constructor for all installation activities in the Islanding Bundle. The Islanding Project will require construction activities to be undertaken prior to each unit refurbishment and during the unit refurbishment outage window. Pre-refurbishment work will include installation of modifications in planned outages and on-line leading up to breaker open. The pre-refurbishment work will also include installation of barriers which will allow the construction zone to be delineated. These barriers will need to be installed prior to Breaker Open of each unit refurbishment. They will not require planned outages to proceed.

For ESMSA executed pre-requisite work being managed by Projects and Mods (P&M), P&M Contract Management Office (CMO) will support field activities. The Refurb CMO will be used to fulfill oversight requirements per N-GUID-09701-10120.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## **4.0 PROJECT INTEGRATION MANAGEMENT**

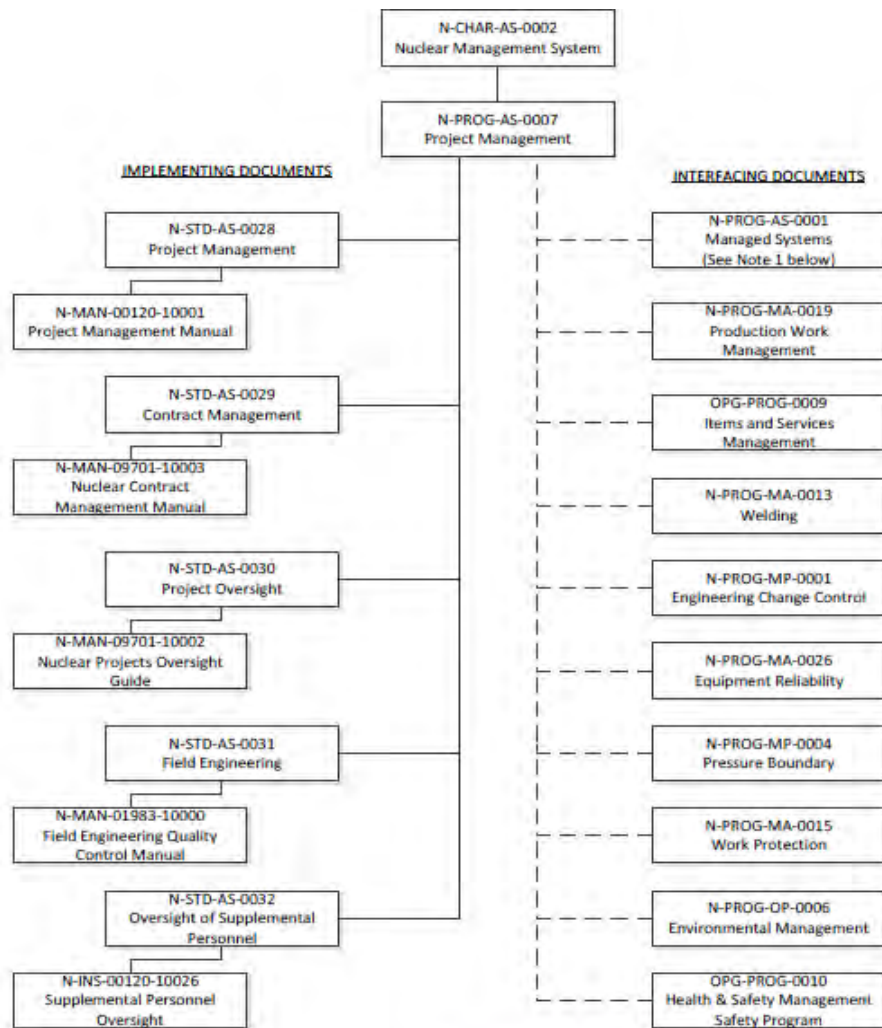

### **4.1 Integrated Governance**

The integration of OPG and EPC vendor processes will enable coordination of activities between OPG and EPC organizations. The Islanding Project will be managed in accordance with the governance illustrated in Figure 1. Each of the standards referenced in Figure 1 will be applied in providing contractor oversight to ensure contractors are working within OPG governance (where appropriate per the EPC model in Nuclear Refurbishment), within the requirements set out in the contract as well as within their Quality Assurance (QA) program.

The respective Contract Owner Interface Requirement (COIR) documents how the integration is achieved at the working level. A COIR document will be issued for each EPC Contract in the Islanding Project. The Bulkhead and Containment Isolations Project is governed by the RFR COIR NK38-DAI-09701-10008. The Pre-Req and Barriers/Islanding Projects will be governed by the ESMSA COIR (N-COI-00120-00001) as stated in the ESMSA Contract between OPG and ESMSA.

OPG will also review the EPC management plans (in Table 1) to ensure they integrate with OPG governance and expectations.

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

**Note 1:**  
N-PROG-AS-0001 has been written to specifically address all of the generic requirements of CSA N286-05, Management system requirements for nuclear power plants and CSA N286-12, Management system requirements for nuclear facilities. As such it includes all of the following programs:

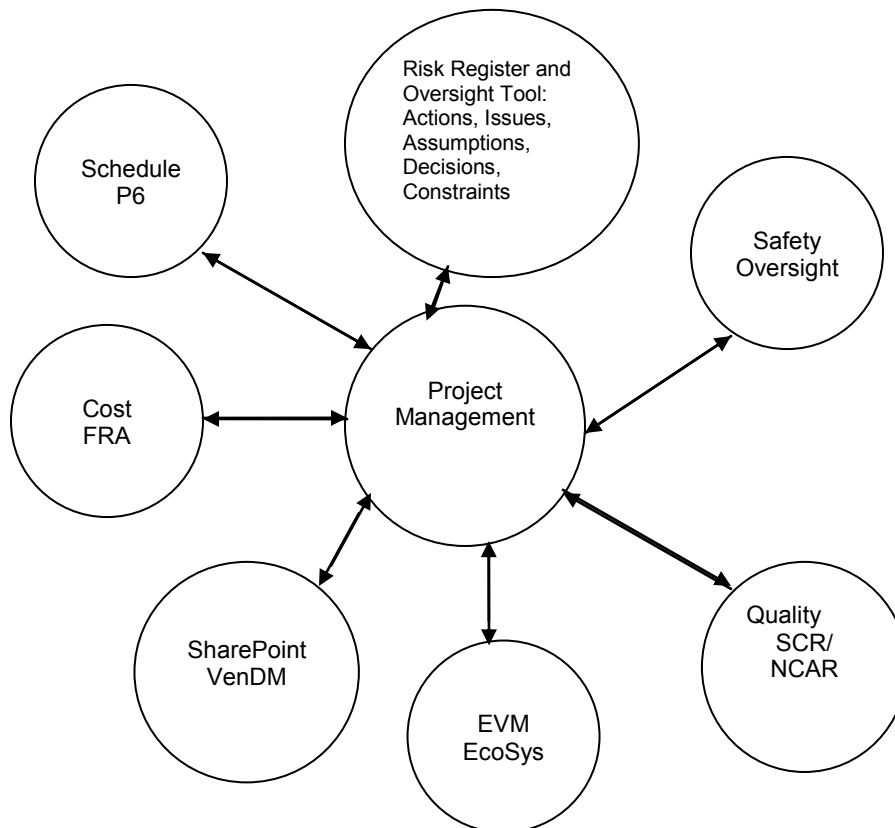

N-PROG-AS-0005	Business Planning
N-STD-AS-0020,	Nuclear Management system Organization
OPG-PROG-0001	Information management
N-PROG-AS-0002	Human Performance
N-PROG-TR-0005	Training
N-PROC-AS-0068	Organizational Change Control
N-STD-AS-0024	Change Management
N-PROG-MP-0006	Software
N-PROG-RA-0010	Independent Assessment
N-PROG-RA-0003	Corrective Action

**Figure 1: OPG Management System (N-PROG-AS-0007)**

<b>N/A</b>	<b>R005</b>	<b>14 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 4.2 Project Management Toolset

The OPG project management toolset is illustrated below. The toolset will be used to manage OPG internal project activities, facilitate coordination with the EPC vendor activities and document and manage findings resulting from vendor oversight.

**Figure 2: Project Management Toolset**

## 4.3 Project Oversight

Project oversight of Islanding Projects will be executed per the items identified in the Islanding RMO Tool Oversight Logs according to the process outlined in N-MAN-09701-10002 Nuclear Refurbishment Project Oversight. Barriers/Area Islanding and Bulkhead and Containment Isolation Projects are currently addressed by this process. For Pre-Req modifications being managed by the Projects and Modifications Organization (P&M) all oversight of the EPC vendors or OPG resources will be done by P&M staff. Islanding Staff will monitor and support P&M staff as project sponsors. In addition, for the Bulkhead and Containment Isolations Project portions of the oversight will be provided by the RFR Oversight Plan. NR Islanding Outage mods and System Islanding work are being performed in house, with any required project management provided by Islanding staff.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>15 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

Formal observations from strategic oversight will be documented in updates to the risk register if appropriate and comments detailed in the Oversight Log for EPC contracts. Discovery of any significant observations will result in additional activities to be undertaken to mitigate impacts and reduce the probability of reoccurrence.

#### 4.4 Contract Management

The Islanding Project will be providing oversight on each EPC Contract in compliance with Contract Management Standard N-STD-AS-0029, to ensure that the terms and conditions of each contract are being followed.

The Islanding Contracting strategy is documented in NK38-REP-09701-10100.

As required, a specific contract management plan for the Islanding Project will be developed as the EPC contracts are awarded.

The Bulkhead and Containment Isolation Project contract management is in accordance with the RFR Contract Management Plan NK38-PLAN-09701-10150.

Contract Management for the definition phase of the RFR Project which includes execution planning and material procurement will involve the management and oversight of the following key items:

- Contractor adherence to the EPC Agreements terms and conditions
- Risk-based audits, e.g. Contractor adherence to their plans and schedule
- Development and completion of Notices / Project Change Directives
- Development and completion of Contract Amendments
- Reconciliation of Contractor invoicing against EPC Agreements, e.g. allowed / disallowed costs
- Management of Interfaces between OPG and all Contractors in RFR Project
- Staff Qualifications

The Pre-Req modifications bundle will document their contract management plans in their Project Management Plans. All Pre-Req modifications initially had NR Design Engineering providing design oversight for EPC modifications. The Negative Pressure Containment Project (TS780-2/TS780-3/TS780-8) EPC contract was terminated mid-engineering and completion of the engineering has been performed by OPG. The Procurement/Construction portion will use the SMSA process and OPG will provide Engineering Support.

The Barriers/Area Islanding contracts will be managed according to Contract Management Standard N-STD-AS-0029, the Darlington Refurbishment Contract Management Plan NK38-NR-PLAN-09701-10001Sht:0013, and the Nuclear Contract Management Manual N-MAN-09701-10003 for those portions of work that apply. A new Procurement/Construction contract will be issued for the Barriers Project.

The Islanding work that is being performed in house may have contracts established for augmented staff support or Owner Support Services tasks as required.

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>16 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 4.5 Engineering Design Management

Engineering Design Management in Darlington Refurbishment follows the modification process outlined in N-PROC-MP-0090. All modifications had Modification Design Requirements (MDR) and SOW prepared in advance of launching EPC Contracts. Modifications completed in house by OPG did not have SOWs prepared.

The Engineering Design Management for the Bulkhead and Containment Isolations Project is described in the RFR Master Design Plan NK38-DP-09701-10001. The RFR contractor will also issue a design plan for each modification that is being completed. Two scopes of work (a subset of the Containment isolation project - TS810-4) will be completed in house using OPG/OSS resources. The first scope will be a documentation only modification (Containment Systems Isolations), and the second (Access Control) will be executed by updating a procedure.

All Pre-Req modifications were initially managed by Projects and Modifications with NR Design Engineering providing design oversight for EPC modifications or performing the design for those modifications being done in house. The Negative Pressure Containment Project (TS780-2/TS780-3/TS780-8) EPC contract was terminated mid-engineering and completion of the engineering performed by OPG. The Procurement/Construction portion will use the ESMSA process using OPG for Engineering Support.

Each EPC contractor working with the Islanding Project will also issue design plans for each modification. The Design Plan for the Barriers Project is NK38-DP-20100-10002, and the Engineering Design Management for Barriers/Area Islanding will be done by OPG resources. The revisions to the original design are being completed by OPG. Procure and Construct (PC) will use OPG for Engineering Support. .

The Construction Island Barriers scope of work (TS0790-1) was originally a temporary modification that was executed by an EPC contract. Due to high construction estimates, revisions were completed with OPG Design. P&C Contract will be awarded to complete the scope of work using OPG Design for Engineering Support. See DRAS 746 and 747 for details.

The Containment Button Up Logic Modification (TS780-1) was originally considered for EPC, however it was determined that the appropriate strategy was to complete the Engineering and Construction using OPG/OSS resources. This was due to there being no procurement required and the specialized construction could only be completed using OPG control maintenance. This decision is documented in DRAS 473 "OPG/OSS to complete TS780-1 Button-Up Modification". The Design Plan for this modification is NK38-DP-63426-10005. This work is grouped under the Nuclear Refurbishment Outage Bundle.

The Booster Pump scope of work (TS800-7) was originally a modification. Engineering analysis during the Preliminary Engineering determined that the scope of work under TS800-7 did not require a modification. This work will be executed via a procedure using the process referenced in N-PROC-AS-0028 "Development, Review and Approval of Technical Procedures". This decision has been documented in DRAS 634 "Non-Modification Solution for TS800-7 Unit Islanding Modifications for Common Systems: Modification to LPSW". This work is grouped under the Nuclear Refurbishment Outage Bundle.

The Airlock/Door Restraint scope of work (TS780-13/TS890-6) was originally a modification to be handled using EPC. It was determined that the modification process did not need to be followed based on N-PROC-MP-0090 exemptions and the EPC contract model was not

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>17 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

required due to the small scope of work. This is documented in DRAS 493 “OPG/OSS to complete TS780-13/TS890-6 Airlocks and Door Restraints as a Non-Modification”. This work will be executed by creating a new procedure using the process outlined in N-PROC-AS-0028 and is grouped under the Nuclear Refurbishment Outage Bundle.

The Spill Skid scope of work (TS780-5) was originally a modification to be executed by an EPC contract, but after the completion of an engineering study it was determined that the spill skid can be procured and staged without doing a modification and the work performed by in house resources. Updated procedures will also be required. See DRAS 336 for details. This work is grouped under the Nuclear Refurbishment Outage Bundle.

The Emergency Coolant Injection (ECI) scope of work (TS780-10) was originally going to be executed as a modification under an EPC contract, but after engineering assessment it was determined that a soft solution was the preferable alternative and that ECI could be islanded by modifying existing operating and maintenance procedures. See DRAS 239 for details. This work is grouped under the Nuclear Refurbishment Outage Bundle.

The System Islanding scope of work is to establish the jurisdictional boundary between the NR unit and the operating station. Any areas or gaps in the systems that precluded the ability of the refurbishment unit to separate from the station have been identified as individual DSRs. The balance of the System Islanding work involves procedure updates for impacts of having a unit in a refurbishment outage, and identifying the operating boundary points between the NR operations organisation and the DNGS station operations organisation.

#### 4.6 Project Gate Progression Plan

The OPG gated process, described in N-MAN-00120-10001-GRB, is a critical project funding release process and requires integration with the EPC contractor's processes as various contractor inputs will be required for each gate. The gate progression strategy for the Islanding Project must take into account the needs and timing associated with the EPC contracts. Additionally, it is important to forecast the required funding as accurately as possible.

Each Gate package will include financial forecasts to the next planned gate. Overall project estimates will be refined further at each gate review. The approved progression plan at Gate 1 can be found in the NR Islanding Project Gate Progression Strategy Plan included in the GRB packages. A timeline of Gate 1 to Gate 4 is available in Appendix A.

Part of the Islanding Gating strategy is to group sub-bundles/project together into one gating package. This is to reduce the number of times the project needs to go through the Gate Review Board (GRB). As a result, when the Islanding bundle progresses to a Gate, the different projects will be at different stages in the project life cycle (e.g. some packages may be at Gate 2 or Gate 3 while progressing through Gate 2). Additionally, the sub-bundles being executed by the P&M organisation will follow an independent timeline which will not align with Islanding bundle gates. To streamline the gate release process, Islanding will request the funding from the GRB, and authorize P&M to spend the funds when they provide the appropriate funding approval request (e.g. a Project Authorization Package). Once authorized, Change Control Forms will be used to align P&M and Islanding cost and schedule.

<b>N/A</b>	<b>R005</b>	<b>18 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 5.0 PROJECT SCOPE MANAGEMENT

The OPG Refurbishment project's governance structure for scope management is described in NK38-INS-09701-10001 "Darlington Nuclear Refurbishment Program – Scope Control". Islanding Project scope management will be executed in accordance with the overall Refurbishment Program scope management plan.

### 5.1 OPG Scope Management

#### 5.1.1 Scope Definition

This PMP will be updated as required to ensure it accurately reflects the work and proposed process for managing the work released. Through the NR scope control process, NK38-INS-09701-10001 "Darlington Nuclear Refurbishment Program – Scope Control", individual Darlington Scope Requests (DSR), composed of core scope, were bundled together to form the approved, scope for the Islanding Project. Appendix B contains a complete list of Islanding DSRs. Progression of these DSRs to completion is as per the process defined in Darlington Nuclear Refurbishment Program – Scope Control. Timelines for progression are as per the Islanding Schedule.

Table 3 below lists the applicable EPC Contract scopes of work for each Islanding project.

Table 3: Scope and Deliverable Breakdown		
Work Breakdown Scope and Deliverable	Scope Document and Detail	Document Number
Bulkhead And Containment Isolations	Darlington Refurbishment – Outage Unit Containment Isolations	NK38-SOW-09701-10005
Pre-req Modifications	DNGS Islanding – Negative Pressure Containment (NPC)	NK38-SOW-34200-0522061
	Scope of Work for DN Islanding Heavy Water Management	NK38-SOW-38000-10006
	Darlington EQ Trip Loop of 1\2\3\4-53140-5\6CB4 Scope of Work	NK38-SOW-53140-10001
Barriers/Area Islanding	Barriers/Area Islanding	NK38-SOW-09701-10045

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>19 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

### 5.1.2 Work Breakdown Structure

The Islanding Project Work Breakdown Structure has been prepared in accordance with N-MAN-00120-10001-SCH-05 and can be found in the P6 schedule. P&M will align the WBS for Islanding Pre-req modifications.

### 5.1.3 Scope Control

The Bulkhead and Containment Isolations scope control is managed per the RFR EPC Agreement scope change process, including the issuance of Project Change Directives (PCDs) as outlined in Article 4 of the RFR EPC Agreement. Project Scope Management by the RFR EPC contractor is governed by their Scope Management Plan 509407-0000-00000-30IM-0003.

Pre-Req and Barriers/Area Islanding projects will have their scope controlled during the execution part of the contract as per the ESMSA scope change process or via the OPG Refurbishment DRAS process for the in-house work.

If there are any major scope changes from scope that was approved through the gate process, a gate refresh may be submitted. Minor scope changes will be handled using Change Control Forms per the Change Control Process outlined in N-MAN-00120-10001-PC.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>20 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 6.0 PROJECT SCHEDULE MANAGEMENT

Project schedule management is the process of defining, sequencing, and estimating resources and durations of the project activities which are integrated in the project schedule. Schedule development and monitoring to be integrated with OPG project and functional groups, EPC contractors and other contractors [e.g. Owner Support Service (OSS)] schedules.

### 6.1 OPG Schedule Management

Islanding project schedule management will be performed in accordance with the Nuclear Projects Schedule Management N-MAN-00120-10001-SCH.

The Projects and Modifications organisation will be preparing and managing their own schedules for the Islanding Pre-req modifications. The Islanding project will use this schedule to manually transfer the information for input into the Islanding level 2 schedule as required. The exception to this is the engineering portion of the NPC modification. Since OPG is performing the engineering, a decision was made to control the engineering portion of the schedule under the Islanding project, up to the level 3 schedule. NPC schedule will be maintained co-operatively with vendor and Islanding CSA. This exemption is only applicable until detailed design is complete. Integration with Station work and other Pre-requisite projects will be coordinated through the refurb Project Control Center (PCC).

### 6.2 EPC Contractor Schedule Management

Each EPC contractor has a process to address project schedule management. The EPC portion of the Islanding project Level 2 schedule will directly reflect the vendor Level 2 schedule (i.e. all activities with current status).

For the Bulkhead and Containment Isolations Project, schedule management and integration is governed by the RFR contractor Schedule Management Plan 509407-0000-0000-30IM-0003 and the following subsidiary documents:

1. Schedule Control – 509407-0000-0000-32WI-0001,
2. Schedule Development – 509407-0000-0000-32WI-0002,
3. Schedule Estimate Development – 509407-0000-0000-32WI-0005.

Barriers/Area Islanding projects schedule will be managed per the ES MSA Contract. The Pre-Req sub-bundles are being managed per the Projects and Modifications organization's processes in accordance with the ES MSA Contract. Activities for the in-house work, such as Button Up and airlock restraints, will be managed in the islanding oversight schedule.

Unit 2 Execution schedules will follow the direction provided by the Refurbishment Scheduling Department. Schedules will be developed in the OPG Primavera environment, and follow the execution schedule framework provided in the 'Vendor Level 3 Execution Schedule Template'.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>21 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 7.0 PROJECT COST MANAGEMENT

Project cost management is the process of budgeting and controlling overall project costs. Cost estimates and cash flow forecasts will need to integrate OPG, EPC contracts and other contracts (.e.g. OSS) costs in order to affect overall cost control for the Islanding Project.

### 7.1 OPG Cost Management

The Islanding Project cost management and integration is governed by the following documents:

1. Darlington Refurbishment program document N-MAN-00120-10001-PC, Project Controls
2. Nuclear Refurbishment Cost Management and Project Reporting, N-MAN-00120-10001-CST
3. Darlington Refurbishment Planning and Controls Program Management Plan NK38-NR-PLAN-09701-10001-0002

EPC contractor costs will be integrated with internal OPG Islanding Project costs to provide a total estimated cost for the project. Costs associated with support required by Refurbishment functional groups are not included in the Islanding execution estimates, and will be managed by the respective functional groups.

For Gate 2 scope, costs for external contracts to prepare modification design requirements and conceptual design reports were included in the projects. Engineering and Functional costs at the project level for projects executed by in-house resources were assigned to the individual projects.

For P&M cost management, WBS elements related to P&M managed scope will be required to reflect funding released to the P&M organisation via a Project Authorization Package or a similar funding request method. Funding released to the Islanding Bundle, but not yet requested by P&M will be held in a cost only WBS element in the OPG section of the WBS. When the funding is requested by P&M, a change control form will be used to move the funding to the appropriate project and WBS element assigned to P&M.

Gate 3 strategy includes identifying all functional support required for work planning and execution. Per RQE Directive #004-R0, Projectization Rule Set, for Islanding in-house mods, functional resource requirements will be identified for execution planning, however no budget will be requested within the Islanding project release to fund the support as these are deemed 'Project Indirects'. See Appendix C for RQE Directive #004-R0. Any resource requirements not available in the Refurb organization will have to be secured from other organizations. Budget will be required as this support will be a direct cost to the project. Any additional funding required for these direct costs will be secured via the Change Control Process (CCP).

Project cost reporting will utilize transactional reporting in the OPG Financial Reporting system (FRA) and the BI reporting tool for tracking release values and EV metrics. EPC contractor costs are incorporated in the project cost via the (FRA) Cost Reports. These costs are represented in Cost Management Systems by work packages based on the Work Breakdown Structure (WBS). Oncore load sheet are provided to each EPC contractor with the WBS

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>22 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

indicated. This allows the EPC contractor costs to be captured at the work package level as determined by the project.

## 7.2 EPC Contractor Cost Management

Islanding baselines and cashflows will reflect the EPC Contract values. Estimates requested at the gates will be updated (if required) via Change Control Forms once the Purchase Order is issued and the actual values are known. Similarly for P&M, estimated purchase order values will be used for gate submissions and when P&M issues the purchase order, a change control form will be used to align the project budgets with the actual purchase order values.

For the Bulkhead and Containment Isolations Project cost management; their integration is governed by the RFR contractor Project Controls Plan 509407-0000-0000-30IM-0001 and the following subsidiary documents:

1. Budget Control – Accounting Plan 509407-0000-0000-35IM-0001,
2. Estimate Control – Project Estimating Plan 509407-0000-0000-33IM-0001, and
3. Cost Control – Cost Management Plan 509407-0000-0000-34IM-0001.

Pre-Req, and Barriers/Area Islanding projects, cost management of the contractor will follow the agreed ES MSA process.

Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>23 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 8.0 PROJECT QUALITY MANAGEMENT

The overall quality management process will apply to all work in the Islanding project; however, the particular QA requirements will be specified in each EPC Contract according to the nature of the work.

### 8.1 OPG Quality Management

The Quality Management of the Islanding Project will be in compliance to:

- N-CHAR-AS-0002 - Nuclear Management System,
- N-PROG-AS-0001 - Managed Systems,
- N-PROG-AS-0007 - Project Management,
- N-STD-AS-0028 - Project Management Standard,
- N-STD-AS-0029 – Contract Management Standard,
- N-STD-AS-0030 – Project Oversight Standard,
- N-STD-AS-0031 – Field Engineering Standard
- N-MAN-09701-10002 – Nuclear Project Oversight Guide,
- N-PROC-MM-0010 – Establishing and Maintaining Ontario Power Generation Nuclear Approved Supplier list.

#### 8.1.1 Quality Assurance

For EPC work, each contractor will be required to prepare a project Quality Assurance Plan, at the contract level, that addresses the interface responsibilities with external organizations. For all EPC quality assurance plans, each will address all applicable codes and standards including CSA Z299, CSA N286-12 and CSA N286.7 standards, as required, identifying what quality programs and procedures will be followed, including the contractor's and their sub-contractor's personnel responsibilities under the various quality programs. OPG will review and accept the contractor's project quality assurance plans.

During the different phases of project work, the project team, jointly with the functional groups will work to ensure that the quality of design, materials, and services provided and the quality of installation and commissioning work performed meet OPG standards, purchase order requirements, and are in compliance to applicable codes and standards.

In the instance of a quality system failure or a breakthrough event occurring for which the contractor is accountable; such adverse conditions will be documented per the contractor's QA Program, and per N-PROC-RA-0022 where appropriate. The contractor will be asked to initiate a Corrective Action as per their program for any identified quality issues. When there is a systemic failure of their implemented Quality System, a formal Non Conformance and Corrective Action Request process will be initiated by OPG Supply Chain Quality Services as per N-PROC-MM-0010.

To ensure compliance to OPG requirements, the contractor interface will be controlled by the Contractor Owner Interface Requirement (COIR) document forming part of each agreement.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>24 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

For internal quality issues the OPG Station Condition Record (SCR) and corrective action process will be followed.

For the Bulkhead and Containment Isolation Project, the RFR EPC Contractor quality will be managed following their Quality Assurance Plan 509407-0000-00000-38QP-0001.

For Pre-Req and Barriers/Area Islanding projects the contractor will follow their own Quality Assurance Program as stated in ESMSA. As listed in the COIR, a Construction Quality Assurance Plan will be provided for each design package prepared by the ESMSA contractor.

Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 9.0 PROJECT HUMAN RESOURCES MANAGEMENT

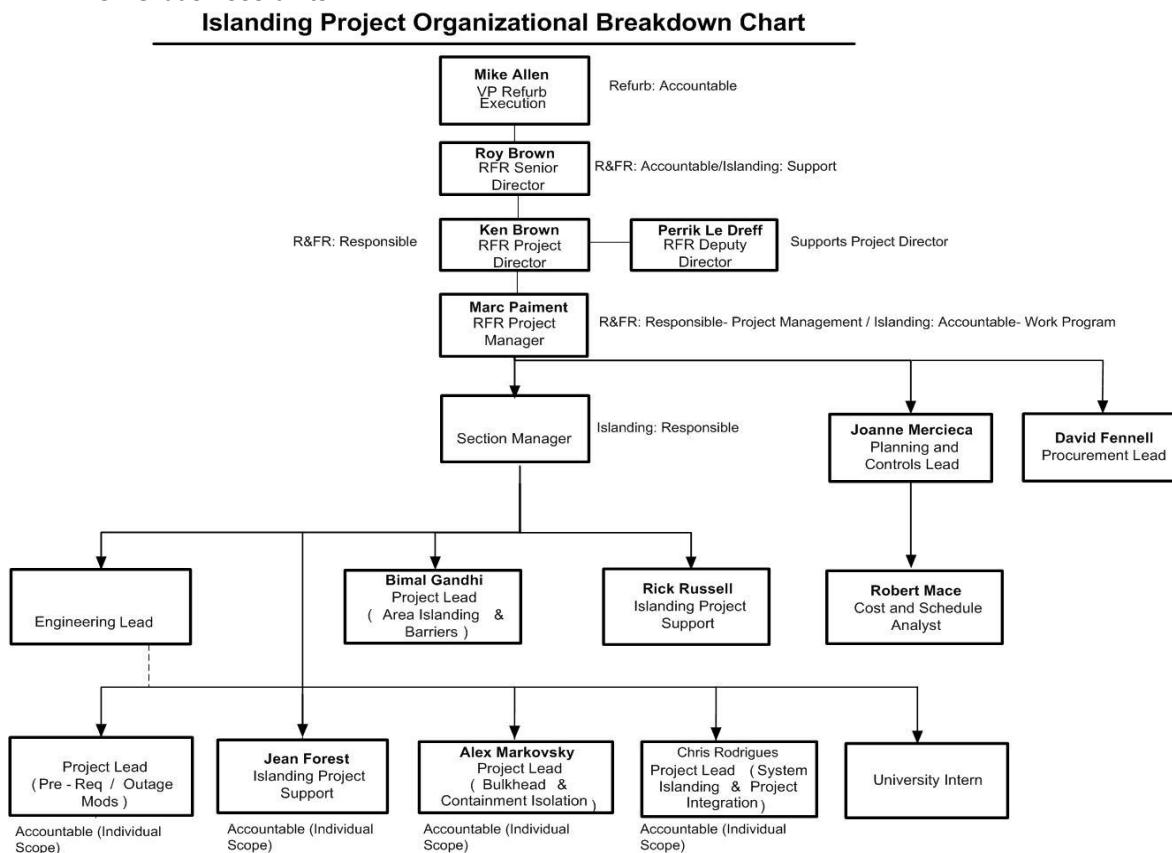

The Islanding Project human resources management will be in accordance with Refurbishment Program Staffing Management Plan NK38-NR-PLAN-09701-10001-0016.

### 9.1 OPG Human Resources Management

#### 9.1.1 Team Resourcing

The Islanding Project Organization is shown in Figure 3. The key roles and their respective accountabilities are described in Appendix D Project Organization.

Nuclear Refurbishment has elected to employ a Matrix organizational model to execute the Refurbishment Program. It is the Islanding Project's plan to staff the project team with OPG staff, and supplemented by Managed Task activities to meet the project schedule and needs. OPG staff will either be embedded in the team or will be matrixed from the NR functional support organizations. Where NR functional support staff are currently unable to fulfill a specific need, due to unavailability or missing skill sets, the project will either utilize managed task or augmented staff contracts to maximize outside experience or attempt to find staff within other OPG business units.

**Figure 3: Islanding Project Organization Team Development**

Internal Use Only

Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>26 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 9.1.2 Training & Resource Development

### Qualifications

Each project member that is matrixed will be assigned the appropriate qualifications by their respective functional manager to ensure compliance with the applicable standards for that group. A review of the current qualification set that are available for project management, contract owner and similar functions is performed by the project. Islanding staff performing the MTL role need to maintain QUAL 32144 Project Fundamentals, and QUAL 39093 NR OPG Modification Team Lead Qualification. Where deemed appropriate by the Islanding PM, Islanding will also maintain QUAL 32905 Contract Administrator.

In order to effectively provide oversight to the EPC contractors, one would ideally have like experience and training similar to that of the EPC contractor. The project will explore internal and external opportunities to develop these skills.

## 9.1.3 Training & Resource Development

The following assessments and methods will be employed and expectations communicated to all project team members:

- Annual Incentive Plan (AIP) Score Card,
- Project Performance Review (PPR),
- Monthly summary data sheets (Monthly Cost Reports and Quad Chart).
- Contract SOWs and Deliverables for contract staff

## 9.2 EPC Contractor Human Resources Management

Each EPC contractor will be responsible for the management of their staff. For the Bulkhead/Containment Isolations Project the RFR contractor resources will be managed in accordance with their Resource Management Plan 509407-0000-00000-30IM-0002.

The EPC contractor in the ES MSA for Pre-Req and Barriers/Area Islanding projects will develop a resource management plan for all staff and subcontractors in accordance with the ESMSA terms and conditions.

Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>27 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 10.0 PROJECT COMMUNICATIONS MANAGEMENT

Islanding Project communication management will be consistent across each project except if there are differences stipulated in each EPC contract. If major differences exist they will be documented in this plan.

### 10.1 OPG Communications Management

#### 10.1.1 Information Control

The main stakeholder communication methods are:

- Telephone and Email communications
- Submittals and Requests for Information (RFI)
- Meetings
- Publications and Reports

Emails: Regularly used to document interface with stakeholders, the project team and with contractors.

Meetings: Conducted face-to-face with available teleconference and videoconference as required. The stakeholder meetings involving the Islanding project and its stakeholders are listed in Table 4. Minutes of meeting and action list will be implemented where appropriate.

Records: The Communication Technology and Information distribution tools that will be used by the project include:

- SharePoint 2007: Internal document storage, exchange environment used for storage of project documents, deliverables, schedules and cost information,
- PDMC: This is the external instance of SharePoint used by SLN-Aecon JV for their documentation management. Some OPG staff have limited access to this site.
- Project Records will be maintained in SharePoint, Project Emails and MacroView
- VenDM: Shared environment used for information exchange and management of contractor submittals.

### 10.1.2 Stakeholder Inputs

Stakeholder inputs are gathered through the various meetings conducted by and with the project team. Actions, issues and risks are then tracked in the appropriate system as described in the Risk Management Plan NK38-PLAN-09701-10117.

The major stakeholders for the Islanding Project are listed in Table 5.

Table 5: Stakeholder Register			
Identification	Main Expectations	Potential Influence & Phase of Most Influence	Stakeholder Classification
Darlington Nuclear Generating Station (DNGS)	Return of units 1-4 as per Refurbishment Program Charter	Owners of Plant Systems; Execution Phase	Internal
SLN-Aecon Joint Venture	Coordination with OPG and other EPC Vendors as per RFR EPC Agreement	Throughout the entire project	External

### 10.1.3 Performance Reporting

Performance reporting will be executed in accordance with the Darlington Refurbishment Planning and Controls Program Management Plan NK38-NR-PLAN-09701-10001-0002. Project cost management and reporting will be gauged and monitored in accordance with N-MAN-00120-10001-PC-13 – Nuclear Refurbishment Cost Management and Reporting.

The following reports are issued to Islanding staff and the Refurb Management Team to support Performance Reporting:

- Weekly cost details from RFA
- Weekly schedule updates
- Weekly Metrics
- Islanding Snapshot (internal project report)
- Monthly EV Reporting from Cost Management Systems
- Tempus
- Quad Chart

## 10.2 EPC Contract Communication Management

It is expected that each EPC contractor will issue individual communication management plans as required by the Contract Terms and Conditions.

For the Bulkhead and Containment Isolations Project communication by the Joint Venture is in accordance with their Communication Management Plan, 509407-0000-00000-30IM-0009.

The RFR EPC Agreement Exhibit 2.9(j) requires reporting for:

- Health, Safety & Environmental Performance;
- Schedule Performance including but not limited to:
  - Engineering Activities;
  - Procurement Activities;
  - Permitting Activities;
  - Construction Activities; and
  - Submittals.
- Cost Performance;
- Quality Performance;
- Risk & Contingency;
- Scope;
- Issues, Assumptions and Decisions; and

Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>34 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 11.0 PROJECT RISK MANAGEMENT

Risk Management for the Islanding Project will require the integration of the Islanding Project Risk Management process and the EPC contractor risk management processes.

### 11.1 OPG Risk Management

OPG Risk Management follows the procedures outlined in these documents:

- NK38-NR-PLAN-09701-10001-0002 Darlington Refurbishment Planning and Controls Program Management Plan
- N-MAN-00120-10001-RISK OPG Risk Management Processes

Risks in Islanding are managed per the governance of OPG Risk Management. The Islanding Risk Management Plan NK38-PLAN-09701-10117 is specific to the documentation and management of risks in Islanding.

### 11.2 EPC Contractor Risk Management

EPC contractors will provide risk management plans as required in the Contract Terms and Conditions. For the Bulkhead and Containment Isolations the RFR EPC vendor manages risk in accordance with their Risk Management Plan 509407-0000-00000-30IM-0005. For the Barriers and Area Islanding project, ESMSA manages risk in accordance with Procedure FGP-MSA-006.

### 11.3 Risk Management Integration

EPC contractors will manage risks per their internal processes. Each EPC contractor may communicate risk to OPG through various methods. If the identified EPC contractor risks will impact the Islanding Project then those risks will also be added to the Islanding project risk register. In general risk communication can take place via the following methods:

- Review risks as part of project communication meetings
- Regularly scheduled risk work shops
- Project reporting

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>35 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

## 12.0 PROJECT PROCUREMENT MANAGEMENT

For all procurement activities, the processes as defined in OPG-PROC-0058 Procurement Activities will be followed. Each EPC contractor will also develop specific procurement management plans for each project as required per the Contract Terms and Conditions.

### 12.1 OPG Procurement Management

Material to be procured by OPG to fulfill Islanding scope (e.g. vault spill contingency materials) will be procured using existing OPG processes and procedures.

### 12.2 EPC Contractor Procurement Management

For the Bulkhead and Containment Isolations Project the RFR EPC contractor manages procurement according to their Materials and Procurement Management Plan, 509407-0000-00000-50IM-0001 and the Materials Control Plan 509407-0000-00000-50IM-0002.

Specific procurement terms and conditions will be defined in each EPC contract. For the Bulkhead and Containment Isolations Project refer to the RFR EPC Agreement (including Exhibit 2.11 – Procurement Work and Contractor/Owner Interface Requirements (COIR) Section 4.0, Procurement Interface Matrix).

Procurement terms and conditions between OPG and the ESMSA contractor are specified in the ESMSA Appendix 1,2,4,6,8. This applies to Islanding Pre-req and Barriers/Area Islanding sub-bundles.

## Appendix C: RQE Directive #004-R0

**RQE Directive #: 004-R0**

**Subject: Projectization Rule Set**

**Status:** Issued for Use

**Purpose:** Define the rule set for “projectization” of budgets at the Work Package Level to satisfy the following program objectives:

1. Enable Refurbishment life cycle cost estimates to be segmented and reported by:
  - Project costs (all costs attributable to project bundles, reportable by bundle – e.g. BoP, RFR, etc.)
  - Functional costs (pure functional program work, management overheads, and support for OM&A field activities)
2. Facilitate appropriate control of project support costs by Refurbishment Project Managers.

**Background:** For the purposes of estimate planning and “projectization”, costs may be categorized as follows:

1. **Project Directs:** Project Directs are costs associated with work packages included in project schedules, where budget is held within the project. All Matrix staff, direct PMT (including labor and Purchase Services) and EPC vendor costs are part of Project Directs.  
All support required from sources internal or external to OPG, that is not being provided via a Refurbishment functional organization, is Project Direct cost. Examples include specialist OPG support such as IMS, or centre-led expertise not provided via a Refurbishment functional organization.  
Project Directs are actively managed by the project teams.
2. **Project Indirects:** Project Indirects are defined as work directly in support of project bundles that is sourced and or funded by a Refurbishment functional organization. Examples of Project Indirects would be Seismic analysis, Human Factors, System Engineering, Operations permitry support of bundle work, MSO field surveillances of project work).
3. **Functional Indirects:** This is purely functional work to support Nuclear Refurbishment program deliverables or work in support of non-bundle work, and is managed by the Functions. Examples include:
  - program support such as process development and documentation, program level oversight and reporting, corrective action plan administration

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>45 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

- non-bundle support such as routine system engineering surveillance, cyclical maintenance support.

For Release 4D, functional budget owners were directed to identify Project Indirects and Functional Indirect work in the estimate templates at the Work Package level. Work Packages could only contain one type of work, thus facilitating separate grouping and reporting of Project Indirects and Functional Indirects. While this methodology allows separation of project and functional costs at the program level, it does not ensure that Project Indirect Costs can be separated by bundle. The planning basis for Release 4D was that Project Indirects would be allocated on a standard % allocation basis by project using bundle life cycle cost as the basis for allocation.

For RQE, the intent is to structure the estimate to allow accurate estimation of life cycle costs at the bundle level for Project Indirect costs.

**Direction:**      **For populating RQE Owner Cost templates:**

1. **Projects:** All life cycle Project Direct OPG Costs are to be estimated within the Excel cost template provided. Project Indirect Costs are not to be captured within project cost templates as these will be included in functional estimates.

It is the accountability of the Project Manager to ensure all project support (Project Direct and Project Indirect Costs) have been identified and the amount and source of funding secured. In cases where funding for support cannot be secured through a Refurbishment functional owner, the Project Manager shall budget for such support as a Project Direct cost, and as necessary flag that cost for further resolution in the template.

2. **Functions:** All Project Indirect and Functional Indirect life cycle costs are to be estimated within the Excel cost template provided. A Work Package may only contain Project Indirect or Functional Indirect costs (not both).

The expectation (unchanged from Release 4D) is that functions will have secured agreement from the Project Managers for the level of Project Indirect support required (i.e. by bundle). The allocation of Project Indirects by bundle will be recorded in a dedicated tab in the cost template provided.

**Management Owner:**

Gary Rose, Director Planning & Controls

**Single Point of contact:**

Andy Elliott, Manager Planning & Controls

**Governance:**

TBD

## Appendix D Project Organization

Project Sponsor: Senior Vice President, Nuclear Refurbishment Execution

Accountabilities:

- Ensure the program is fully staffed
- Ensure adherence to Nuclear Refurbishment Program
- Administer monthly Steering Committee meetings. Address any concerns escalated in a timely fashion
- Administer quarterly Executive Oversight Meetings. Address any concerns escalated in a timely fashion

Senior Project Director, RFR

The RFR Senior Project Director has the accountability for all aspects of the RFR Project as described in the RFR PMP, as well as supporting the RFR Project Manager in executing the accountabilities of the Islanding Project Manager.

Project Director, RFR

The RFR Project Director has the responsibility for all aspects of the RFR Project as described in the RFR PMP, as well as supporting the RFR Project Manager in executing the responsibilities of the Islanding Project Manager including:

- Environment, Health & Safety
- Scope
- Schedule
- Cost
- Risk
- Quality
- Staffing & Resources
- NR Program Governance adherence
- Reporting & Communications
- Oversight
- Contract Adherence

Deputy Project Director, RFR

The RFR Deputy Project Director will support the Project Director in all aspects of the project.

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>47 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

#### Project Manager, RFR

The RFR Project manager has the responsibility for all Project Management aspects of RFR and the accountability for all aspects of the Islanding Project including:

- Environment, Health & Safety
- Scope
- Schedule
- Cost
- Risk
- Quality
- Staffing & Resources
- NR Program Governance adherence
- Reporting & Communications
- Oversight
- Contract Adherence

#### Section Manager, Islanding

The Islanding Section Manager has the responsibility for all aspects of the project including:

- Environment, Health & Safety
- Scope
- Schedule
- Cost
- Risk
- Quality
- Staffing & Resources
- NR Program Governance adherence
- Reporting & Communications
- Oversight
- Contract Adherence

#### Project Leads

Each Islanding sub project is assigned a project lead. Each lead has the overall accountability for the successful delivery of their sub projects which includes:

- Environment, Health & Safety

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>48 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

- Scope
- Schedule
- Cost
- Risk
- Quality
- Stakeholder Management
- Communications & Reporting
- Vendor oversight

#### Planning and Controls Lead

The Project Controls Lead is accountable to:

- Ensure project conforms to NR Program Governance, supported by routine quality checks and self assessments
- Liaising between functions and project including centers of excellence
- Gated Process including budget loads and baselines
- Reporting including Earned Value
- Analysis and Forecasting
- Business Planning
- Project Tools including IT tools, processes and instructions
- EPC contractor integration within OPG system

#### Procurement Lead

The Procurement Lead will be accountable to:

- Be the single point of contact with the EPC contractor for all procurement related matters
- Hold the Contractor accountable to complete procurement activities in accordance with the correct QA requirements, procedures and programs
- Coordinate OPG conducted audits and attend as required
- Arrange for OPG participation in and oversee contractor audits of sub-contractors as required
- Ensure oversight of EPC contractors sub-contractors procurement process
- Ensure materials and services are procured per schedule
- Ensure and coordinate resolution of any Non-Conformances

#### Engineering Lead

The Engineering Lead will be responsible for:

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10159</b>		Usage Classification: <b>Internal Use Only</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R005</b>	Page: <b>49 of 50</b>
Title: <b>ISLANDING PROJECT MANAGEMENT PLAN</b>		

- Ensuring that the ECC process required is defined, understood, reflected in the schedule and implemented per process
- Provide resources and context to perform adequate document reviews within the contractual time frame allotted
- Ensuring resources and context to perform adequate oversight of EPC contractors to ensure project objectives for cost, scope, schedule, and quality are met
- Attend COMS reviews and ensure OPEX is embedded in the Engineering deliverables
- Ensure scope is defined, understood and managed per the applicable scope management governance
- Ensure all risks associated with Modifications are identified in RADAR per appropriate governance; mitigating actions are prepared tracked monthly and updated as required
- Identify, coordinate and solicit all stakeholder inputs to engineering deliverables reviews

#### Project Submittals

Accountabilities regarding project submissions for OPG staff are outlined below. The main responsible groups are Darlington Control Documents Management group, Document SPOC and document reviewers.

#### NR Records and Document Management

- Accountability for support on project submissions to the project team resides with the Darlington Control Documents Management group

#### Records and Document Management

- Handles day-to-day transactional responsibilities, including being the medium between the project team and EPC contractors for transaction of submissions related to VenDM.

#### Document SPOC

- The document SPOC can be the Project Leads or other person delegated responsibility for coordinating documents reviews. The Project Lead is accountable to ensure the document is reviewed by the appropriate stakeholders and for ensuring the review is completed within the specified time.

#### Reviewers

- Reviewers of project submissions, as designated by the Project Lead via review workflows, are responsible for their review of a project submission per the indicated timeline on the workflow.

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>5 of 32</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

### 1.0 DIRECTION

#### 1.1 Objective

The objective of this Manual is to outline the purpose and provide instructions on the management of Milestone definitions for Nuclear Refurbishment, within the Darlington (DN) Refurbishment Program.

The success of the Refurbishment program is highly dependent on timely completion of deliverables and achievement of milestones.

All phases will be controlled by Program Milestones (Tier 1,2,3). Adherence to milestone timelines and definitions is essential to ensure a successful Refurbishment. Each project will also have Milestones (Tier 4 and 5)

#### 1.2 Purpose

This Guide will standardize the framework for developing Darlington Refurbishment Milestone definitions.

The purpose of this Guide is to provide Darlington Nuclear Refurbishment staff and support organizations with knowledge of:

- Milestone Tier Structure
- Milestone Numbering Nomenclature
- Common Milestone Definition Template
- Milestone Completion Progress Monitoring
- Quality Requirements for Milestone Deliverables
- Milestone Closeout and Document Retention Requirements

#### 1.3 Intended Audience

The Darlington Refurbishment Program as documented in the DN Refurbishment Program Integrated Master Schedule NK38-PLAN-00300-10000, including all projects within the program which includes ASIC funded projects scheduled in the Refurbishment Outage.

All Milestones will be identified with a Milestone Tier Structure in accordance with Section 3.1 below.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>6 of 32</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

## 2.0 MILESTONE DEFINITION REQUIREMENTS

### 2.1 Tier 1, 2 & 3 Requirements

All Tier 1, 2 and 3 milestones require an approval milestones definition form.

Tier 1, 2 & 3 are at the NR Program Level and represents Key Program Control Milestones

Each project/ functional schedule, as a minimum, shall have the following program reportable (elevated Tier 3) milestones

- i. Detailed design complete
- ii. Scope Health progress to 20
- iii. Request for proposal
- iv. Contract (s) award
- v. Long Lead Material Identified
- vi. Commissioning Start
- vii. Available for Service
- viii. Any project or functional specific milestone that has important consequences for the Program i.e. EDM for Refueling

### 2.2 Tier 4 & 5 Requirements

Tier 4 and Tier 5 Milestones are at a Project/ Functional Bundle level and requirements will be identified at the project level following the Task Instruction: DNG Refurb— Standard Projects Milestone List, N-MAN-00120-10001-SCH-02. A sample of Standard Milestones Listing completed with associated Milestone Tier coding Structure is shown in Appendix “B”

### 2.3 NR AIP Milestones and Scorecard Requirements

NR AIP Milestone is referring to Nuclear Refurbishment Program AIP level milestones.

A Milestone Definition Template (D-FORM-10762) is required for each identified NR AIP Milestone as outlined in the NR AIP Scorecard list.

NR AIP Milestones should be identified at least as Tier 3 reportable milestones.

### 2.4 CNO Milestones

The CNO Milestones are presented to the Chief Nuclear Officer and they shall be identified as Tier 3 reportable milestones. A Milestone Definition Template (D-FORM-10762) is required for each identified CNO Milestone.

The Approval Process Diagram (4.2) shall be followed.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>7 of 32</b>

Title:

## NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

### 2.5 Milestone Schedules Structure

The Project/ Functional Bundles Milestones Schedules structure (including milestone P6 coding process) will be followed as described in the “DR Program P6 Schedulers User Guide” N-MAN-00120-10002-SCH-08

### 2.6 Readiness to Execute Plan Milestones (RTE)

Readiness to Execute Plan is in support of tracking all processes, tools, and deliverables to ensure readiness for execution phase.

The RTE plan consists of a series of significant milestones leading up to the start of the DNRU2 Outage. These milestones are mainly Tier 4 and Tier 5 with some being Tier 1, 2 or 3. Due to their importance, RTE T4 & 5 milestones will be controlled with slightly more rigor than other T4 & 5 milestones.

RTE Tier 1, 2, 3 milestones follow the same processes as other Tier 1, 2, 3 milestones.

The Approval Process Diagram (4.3 – Approval Process Diagram for RTE Milestones) should be followed for Tier 4 and Tier 5 only.

## 3.0 PROCESS

### 3.1 Milestone Tier Structure

There will be Milestones at the Program level and Gates/Projects Milestones (per Gated Process N-MAN-00120-10001-GRB & N-MAN-00120-10001-SCH-02) at the Project level.

The relationship between Program Milestones and the Gated Process is shown in Appendix A.

Milestone Reporting Tier Structure is required to identify Key Program Control Milestones and to easily identify the level in the Organization that the Milestone is reportable to and the Approval Level required for any deviation to the Milestone

Tier	Reportable To	Definition	Example
1	• EVP Nuclear Refurbishment	• Commitments to the Board or decisions at Board Level	• RQE Release Quality Estimate • Unit Start/Finish Dates
2	• SVP Nuclear Refurbishment	• Critical to the Program ** Normally documented in	• CNSC Approval of ISR

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>8 of 32</b>

Title:

### NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

		Phased Program BCS's per Release Strategy **	
3	• SVP Direct Reports	• Manage the health of the program and keep it on track	• All Projects Scope Freeze/Detailed Eng. Finished
4	• VP Refurbishment Execution (or delegate)	• Project Gates (checkpoints of project preparation progress at which funding is released for next phase) • Pre Install Activities	• G0 Project Scope Approval • G3 Definition Phase • Walkdowns Complete • ALARA Plans Complete
5	• Project Manager	• Within gated process and are specific to project life cycle	• Turbine Generator Project Charter Approved (CHR) • Management Plans Completed • Project Long Lead Materials

## 3.2 Milestone Numbering Nomenclature

### 3.2.1 PIMS Milestones

The Activity ID from the Program Schedule (PIMS) will be assigned as the Major Milestone number.

Same Activity ID will be used to identify the specific record number when filling D-FORM-10762 –Program Milestone Definition, or D-FORM-10763- Program Milestone Recovery Plan.

The Schedule Activity ID coding is as follow:

Activity ID Coding	Code Description
RG	Regulatory Key Dates
RL	Program Release Dates
CP	Campus Plan Dates
RP	Unit 0 Outage Preparation Key Dates
OP	Unit "" Outage Preparation Key Dates
U""	Unit "" Outage Key Dates
CL	Program Close Out Key Dates

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>9 of 32</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

### 3.2.2 Elevated Tier 3 Milestones

The Activity ID from the Project/ Functional Bundles Schedule will be assigned as the Major Milestone number.

The Project/ Functional Bundles Schedules Activity ID coding structure will be followed as described in the “DR Program P6 Schedulers User Guide”. N-MAN-00120-10002-SCH-08.

### 3.2.3 NR AIP Milestones

The Activity ID from the Program/Project will be assigned as the NR AIP Major Milestone number.

### 3.2.4 NR AIP Scorecards

If the NR AIP Scorecard Measure is a combination of more than one schedule Activity IDs, or has an arbitrary background other than the schedule, the AIP scorecard nomenclature will illustrate the AIP measure description.

## 3.3 Milestone Definition Template

The Milestone Definition Template (D-FORM-10762) is required for Tier 1, Tier 2, & Tier 3 Milestones only except for RTE Milestones. Included on the template will be the requirements for the Milestone Completion signoff. Instruction on how to fill in D-FORM-10762 is shown in Appendix E.

## 3.4 Milestone Completion Progress Monitoring

Timely and quality completion of milestones is critical for executing Darlington Refurbishment on schedule.

In order to ensure quality and timely completion of Milestones, the following formal monitoring process is required to manage/control/review/report completion progress of all Tier 1,2 &3 milestones.

All Tier 4 & 5 milestones will be managed by the individual project manager through the normal project management process. The project management process will interface with this process when it impacts a Tier 1,2 or 3 milestone.

### 3.4.1 Milestone Definition Signoff

The Milestone owners will signoff agreement to the definition of the milestone.

The signoff will be included on the Milestone Definition template D-FORM-10762 Part “A”.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>10 of 32</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

### 3.4.2 Milestone Success Plan Presentation

Prior to the Milestone due date the Milestone owner will present, at the monthly program review meeting, their plan specifying how they will satisfy the requirement for a quality and timely completion of the Milestone.

The milestone success plan presentation should be done 3, 6 or 9 months prior to Milestone TCD date. (Refer to D- FORM-10762 Part “A”)

A template for the Success Plan Presentation is shown in Appendix “C”

### 3.4.3 Milestone Recovery and Mitigation Plans Requirements

Recovery or mitigation plans are required whenever the variance from plan is significant enough that completing a milestone within the committed timeframe and with quality, is at risk. The distinction between a recovery plan and mitigation plan is below.

Recovery Plan:	Detailed plan that supports full recovery of the milestone within the committed time frame.
Mitigation Plan:	Detailed plan that identifies how commitments within milestone will be achieved, however outside of the committed time frame. I.e. milestone will be missed.

Milestones identified as Tier 1, 2, or 3 require recovery or mitigation plans documented within D-FORM-10763. Instruction on how to fill in D-FORM-10763 is shown in Appendix F.

Where milestone recovery is not possible, and a mitigation plan has been initiated, a change in the milestone date may be required. Changes to Tier 1, 2, or 3 milestones commitments are required to follow the Change Control process and mitigation plan should be attached.

#### 3.4.3.1 Recovery and mitigation plans shall address the following:

- Original milestone completion date
- Target date by which full recovery will be completed
- Description of why the Milestone became challenged
- Course of action to recover the Milestone including responsible individuals and due for actions

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>11 of 32</b>

Title:

## NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

e. Successor milestones that are affected and the impact.

3.3.4.2 Approval of the milestone recovery and mitigation plans will be consistent with milestone tier structure approval (Section 3.1).

3.4.3.3 A summary of the milestone recovery and mitigation process is shown in Appendix D”.

### 3.4.3 Milestone Change Control Process

In the event that the timely completion of the identified Tier 1, 2 or 3 milestone is in jeopardy a Milestone Recovery Plan should be followed as described under item 3.4.3

In order to cancel a Tier 1, 2 & 3 milestone the Change Control process has to be followed as described in N-MAN-00120-10001-PC-12.

In the event that a Tier 1, 2 or 3 milestone is following the cancelation process, the milestone recovery form N-FORM -10723 shall be attached to the Change Control Form N-FORM-11252 as per N-MAN-00120-10001-PC-12.

Tier 4 & 5 milestones will be managed by the individual project manager through the normal project management process.

### 3.5 Quality Requirements for Milestone Completion and Closeout

Completion of all the Program Milestones (Tier 1 to Tier 3) must be supported by a suitable quality verification process. Depending on the type of Milestone and the deliverables associated with completion, quality verification may be comprised of any one or more of the following:

- (a) Demonstration that preparation, review and approval of supporting deliverables have been controlled by an existing managed system (e.g. OPG/OPGN/DR governance, other Quality Assurance methods or processes adopted by OPGN/DR for conducting its business)
- (b) Demonstration that preparation, review and approval of supporting deliverables have been vetted or validated through other established work processes and practices in OPGN/DR, which may take the form of internal memos, presentations to and agreements from relevant stakeholder, minutes of meetings etc.
- (c) Demonstration that the quality of supporting deliverables has undergone independent, third-party verification.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>SCH-06</b>	Revision Number: <b>R004</b>	Page: <b>12 of 32</b>
Title: <b>NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK</b>		

- (d) Successful outcome from a Challenge Meeting or Challenge Process solely conducted for verifying adequate completion of a milestone against a pre-established set of expectations/success criteria agreed to between the milestone owner and the receiving stakeholder(s).

The requirement for a Challenge Meeting or Challenge Process will be embedded in each specific Milestone Definition.

A Milestone shall not be declared complete until all requirements have been successfully completed or dispositioned. Completion needs to be fully documented and needs to be auditable.

To ensure this, Milestone Closeout needs to be documented; a signed Darlington Refurbishment Signoff for Milestone Completion identifying the deliverables/documents that were completed will be presented at the monthly program review meeting.

Darlington Refurbishment Signoff for Milestone Completion signoff will be included as "Part B" on the Milestone Definition Template D-FORM-10762.

### 3.6 Milestone Completion, Closeout and Document Retention Requirements

A Milestone shall not be declared complete until all requirements have been successfully completed or dispositioned. Completion needs to be fully documented and needs to be auditable.

To ensure this, Milestone Closeout needs to be documented; a signed Darlington Refurbishment Signoff for Milestone Completion identifying the deliverables/documents that were completed will be presented at the monthly program review meeting.

If a Challenge Meeting is identified for a Milestone, this form will be presented at the Challenge Meeting.

Darlington Refurbishment Signoff for Milestone Completion signoff will be included as "Part B" on the Milestone Definition Template D-FORM-10762.

## 4.0 APPROVAL PROCESS

### 4.1 Routing and Authorization

The initiator shall complete all the section of the milestone templates form as required. Major steps on the routing and authorization process are described in the Approval Process Diagrams.

NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

Appendix B: (Continued)

Darlington Refurbishment Standard Milestone Codes												
*	24	Finish	DCO		EC Close-out Completed	Verification that Design EC is closed-out within the 6 months of the AFS. (Design close out of the project.)	5		All support to issue final drawings/documents and close PassPort Design ECs. All action tracking items are set to complete with the exceptions noted in governance.	• Owner: Engineering • Support: Vendor/Project	Y	Closeout
	25	Finish	PCO		Close Out Completed	Milestone to identify the completion of close out activities, or to close out a specific unit. (Financial close out of the project.)	4		Project Close-out activities are complete and Project Closure Report routed for approvals.	• Owner: Project • Support: Vendor/Construction	Y	Closeout
*	26	Finish	MOE		MOE Requirement Met	Milestone for tracking Ministry of the Environment requirements. Include action tracking number in activity description.	5		Action Tracking item is complete and closed.	• Owner: Project • Support: Engineering/Ops/Vendor	N	Definition / Execution
*	27	Finish	MOL		MOL Requirement Met	Milestone for tracking Ministry of Labour requirements (e.g. Notice of Project, Project JHSC). Include action tracking number in activity description.	5		Action Tracking item is complete and closed.	• Owner: Project • Support: NR O&M H&S/Construction/Vendor	N	Definition / Execution
*	28	Finish	PMM		Project or Functional Manager Milestone	User defined Milestone for Project or Functional Team specific tracking. Use this as an interim milestone to track specific progress not already identified in this listing.	5		Project or Functional Team met the intended criteria of PMM specific Milestones.	• Owner: Project	N	Any phase is applicable
*	29	Finish	RGC		CNSC Regulatory Commitment Met	Milestone for tracking Reg C's. Include Action Tracking number in activity description.	4		Documents have been received to confirm completion. Action Tracking item is closed in PassPort.	• Owner: Reg Affairs • Support:ProjectEngineering /Vendor	N	Definition / Execution
*	30	Finish	RGM		CNSC Management Commitment Met	Milestone for tracking Reg M's. Include Action Tracking number in activity description.	4		Documents have been received to confirm completion. Action Tracking item is closed in PassPort.	• Owner: Reg Affairs • Support:ProjectEngineering /Vendor	N	Definition / Execution
	31	Finish	PCM		Plan Complete Milestone	Plan Complete Milestone. This milestone will identify the forecast completion of the entire plan.	4		Project Closure Report has been approved.	• Owner: Project • Support:Vendor	Y	Closeout
*	32	Finish	INC		Inspections Complete	Milestone for tracking when inspection(s) are complete.	5		Inspections complete and signed documents have been issued.	• Owner: Project • Support:Vendor	Y	Any phase is applicable
	33	Finish	IPC		Installation of Pre-requisite work complete	Installation of pre-requisite work, outage tools, equipment and Facilities completed prior to refurb.	5		All Pre-requisite Work, outage tools, equipment and Facilities associated with the project is now complete and signed off.	• Owner: Construction • Support: Vendor/Project	N	Definition
	34	Finish	PCI		Procedure change requirements identified	Procedures requiring update/ changes are identified.	5		TPAR's for Operation and Maintenance producers have been approved and submitted to Document Control for implementation. Responsible group to initiate an AR to track the rollout of the revised procedure.	• Owner: Project • Support:Vendor	N	Definition
	35	Finish	PRI		Procedures Issued	Procedures requiring update/ changes issued.	5		Signed documents have been issued in Passport. The AR for rollout of the revised procedure(s) has been signed off by the responsible manager.	• Owner: Project • Support:Vendor/O&M/Engineering	N	Definition
	36	Finish	PMU		PM (Preventive Maintenance) updated	All PM are now reviewed /updated	5		All Preventive Maintenance Work associated with the project has been identified and required revisions have been incorporated in Passport	• Owner: Engineering • Support: Vendor/Project/O&M/Engineering	N	Definition

NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK

Appendix B: (Continued)

Darlington Refurbishment  
Standard Milestone Codes

	37	Finish	TRI		Training Material Issued	All project specific training materials have been issued by the vendor	5		Vendor to demonstrate that all project specific training materials have been verified by a qualified individual(s) and ready for use in accordance with agreed upon training plan.	• Owner: Project • Support:Vendor/Training	N	Definition
	38	Finish	TRC		Training Completed	All project specific training have been delivered in accordance with the agreed upon training plan	5		Vendor to provide training records for all trained staff and obtain approval to process staff credit in OPG's Training Information Management System	• Owner: Project • Support:Vendor/Training	N	Definition
	39	Finish	RGA		Regulatory Approvals Obtained	Milestone to address commitments that we need to meet, but not for having necessary approvals in place.	4	RG120	Documents have been received to confirm completion.	• Owner: Project • Support:Vendor/Reg Affairs	N	Definition
	40	Finish	RVA	Predecessor to MS-03 **	Revision 'A' schedule support	Vendor leve1 has been submitted for outage REV “A” schedule issuance	4	U2 OP2010 U1 OP1010 U3 OP3010 & U4 OP4010	The duration of execution windows, work calendar and shift structure has been mutually agreed between Project Manager and vendor. Level 1 schedule has been signed off and submitted to the outage team for integration.	• Owner: Project • Support:Vendor	Y	Definition
	41	Finish	RVB	Predecessor to MS-19 **	Revision 'B' schedule support	Vendor level 2 for non-critical path work has been submitted for outage REV “B” schedule issuance. For refurbishment critical path work, vendor must submit level 3 schedule.	4	U2 OP2050 U1 OP1050 U3 OP3040 & U4 OP4050	Major components of execution window for non-critical path work have been identified and signed off by Project Manager and vendor	• Owner: Project • Support:Vendor	Y	Definition
	42	Finish	RVC	Predecessor to MS-28 **	Revision 'C' schedule support	Vendor must submit a fully resource loaded level 3 in support of Refurbishment integrated schedule issuance	4	U2 OP2080 U1 OP1080 U3 OP3080 & U4 OP4080	Full level 3 schedule has been issued. Reporting structures and communication plan with all major stakeholders have been approved.	• Owner: Project • Support:Vendor	Y	Definition
	43	Finish	RVO		Rev 0 schedule issued	Vendor to submit a base line execution schedule	4	U2 OP2110 U1 OP1110 U3 OP3110 & U4 OP4110	Execution schedule has been approved by project manager	• Owner: Project • Support: Vendor	Y	Definition
	44	Finish	LLC		Lessons Learned Compiled	Project team to develop a comprehensive list of lessons learned through SCR's, logs, etc	5		Project Manager to initiate a C3 SCR to capture key lessons learned from the previous outage and get concurrence from the Evaluation Organizations that are in the best position to disposition the generated actions.	• Owner: Project • Support:Vendor/Engineerin g/Construction	Y	Definition
	45	Finish	POA		Phase 1 Assessment Complete	Phase I assessment of Work Orders in Passport is complete.	5		EPC vendor to identify: • 100% of approved work orders • Tasks for support work groups • Regulatory approvals • Where possible, required modifications, pre/post requisite work and revisions to procedures • 80% of Material Requisitions	• Owner: Project • Support:Vendor	Y	Definition
	46	Finish	WDC		Walk Downs Complete	All Project Bundle walkdowns are now complete.	5		All task coded to the vendor/Project have been accepted or rejected in walkdown toolkit prior to start of execution window	• Owner: Construction • Support: Vendor/Project	Y	Definition
	47	Finish	S20		Scope Health Progress to 20	Work is known at the system or project level but not component. Milestone applicable for all packages issued. Individual associated Tier 5 milestones might be identified at lower level in the schedule.	3	OP1000	Definition Phase complete. Solution defined at system or project level. Plan to implement solution is defined. System or project scope is defined.	• Owner: Project • Support:Vendor	Y	Definition
	48	Finish	SOW	For Functional Work	Scope of Work Document Complete	This milestone will identify the Scope of Work document is complete.	5		Scope of Work Document (s) (including Preliminary) complete and issued.	• Owner: Project	N	Definition
	49	Finish	DRC	For Functional Work	Design Requirement Complete	This milestone will identify Design Requirement complete.	5		Design Requirement are complete and signed documents have been issued.	• Owner: Project	N	Definition
*	50	Finish	CBA		Cost Benefit Analysis Complete	This milestone will identify the completion of the Cost Benefit Analysis in order to start the ECR or start the process to cancel the DSR. This is required for Value Enhancing DSR's only.	5		Cost Benefit Analysis complete and issued.	• Owner: Project	N	Definition

Title: NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK		

Appendix B: (Continued)

Darlington Refurbishment  
 Standard Milestone Codes

51	Start	SGS		Segment Start (Program)	Milestone required for start of a segment. The segment is a part of a schedule that has a natural logic which marks the start of a large number of windows /activities. The intend of creating a segment is to minimize the number of activities that are carried over from one phase to another.	3	OP2300S1, OP2200S1, OP2060S1, OP2230S1 ,OP2350S1, OP2330S1, OP2260S1/ OP2060S3OP2300S2,OP2200S2,OP2060S2,OP2	All activities that lead to start a segment should be completed	• Owner: Construction • Support: Vendor/Project	Y	Execution
52	Finish	SGF		Segment Finish (Program)	Milestone required for finish of a segment. The segment is a part of a schedule that has a natural logic which marks the finish of a large number of activities. The intend of creating a segment is to minimize the number of activities that are carried over from one phase to another.	3	OP2300S1, OP2200S1, OP2060S1, OP2230S1 ,OP2350S1, OP2330S1, OP2260S1/ OP2060S3OP2300S2,OP2200S2,OP2060S2,OP230S2A,OP2350S2A,OP	All activities that are part of a segment have to be completed.	• Owner: Construction • Support: Vendor/Project	Y	Execution
53	Start	WNS		Execution Window Start (Program)	Milestone required for start of execution window. This window will allow the schedule to be sorted and viewed by any combinations of these elements.	3		All activities that are scheduled to start in a specific window should be completed	• Owner: Construction • Support: Vendor/Project	Y	Execution
54	Finish	WNF		Execution Window Finish (Program)	Milestone required to finish execution window. This window will allow the schedule to be sorted and viewed by any combinations of these elements.	3		Actvities that are scheduled to finish in a specific window to be completed.	• Owner: Construction • Support: Vendor/Project	Y	Execution
55	Start	SYS		System Released for RTS	Milestone required to start testing for systems or modifications	3		Systems CCD (construction completion declaration )packages completed and accepted.	• Owner: Construction • Support: Vendor/Project	Y	Execution
56	Finish	SYF		System Released for Operation	Milestone required for system to be ready for operations	3		Systems SAFS packages completed and accepted.	• Owner: Construction • Support: Vendor/Project	Y	Closeout
57	Finish	CCD		Construction Completion Declaration	Milestones required for confirmation that construction and installation activities are sufficiently complete and it is safe to proceed with modification commississioning and restart testing on affected SSCs.	3		All documentation required for CCD (field changes, non-conformance reports, marked up drawings, etc) have been completed . The package will be accepted by the Nuclear Refurbishment Project Manager and sent to Return To Service Manager.	• Owner: Construction • Support: Vendor/Project	Y	Execution
58	Finish	GR	Review MS ID if it makes sense. There is currently no ties to PMSSC	Gate Approval (1,2,4,5)	Gate G1 approval for Refurb projects.	4	N/A	Initiation Phase Approval (Refurb).,Definition Phase Approval (Refurb).,Unitized Project Closeout Phase Approval (Refurb).,Final Project Closeout Phase Approval (Refurb).			
59	Finish	FOT		TMOD installed	Milestone to track the Finish of installation or Construction which includes Removal.	5	NA	PassPort Installation Tasks have been set to Finished.	• Owner: Construction • Support: Vendor/Project	Y	Execution
60	Finish	RQE		Rel.5/6/RQE: U2 Outage Release	ROE Milestone represents an OPG Management Decision Gate for the Darlington Nuclear Refurbishment Program (DNRP) within the Release Strategy and signifies the completion of the detailed planning and establishes a program level scope, cost, and schedule baseline for the DNRP (all four units). The output of this phase will also be used to enable Execution Phase funding for Unit 2. The OPG Management Decision Gate will be based on the completion of a number of definition phase planning deliverables, compiled into a Program level "ROE Package". The summary of these deliverables will be documented in a DNRP Business Case Summary (BCS) for the entire Refurbishment program including a release of funds for Unit 2.	1	N/A	The manner in which the ROE milestone will be managed is documented in the ROE Project Management Plan (NK38-NR-PLAN-09701-10004). The ROE deliverables will incorporate a number of products completed during the definition phase of the program.	• Owner: Project • Support: Vendor	Y	Definition

Title:  
**NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK**

Appendix B: (Continued)

Darlington Refurbishment  
 Standard Milestone Codes

61	Finish	HRF		Program Health Review Finished	Program Health Review Finished: - External review of governance related to ROE is completed and action plan to address findings in place. - External review of ROE development progress completed and action plan in place to address findings.	3	N/A	Contracts with 3rd party reviewers awarded. Reports generated and action plans developed.			
62	Finish	RVO		Outage Level 1 Revision 0 Issued (Control Version)	The Revision '0' schedule shall include the following: • A detailed NR outage schedule incorporating the following aspects: • Level I schedule overview identifying the key components of the finalized Critical Path, major projects and programs (PIMS C). • Level II schedule overview identifying the system windows with durations (PGGS G) . • Each level III logic has been completed by the EPG vendor and approved by the NR Project Manager for all NR outage project scope. • A level III logic has been tied and resource levelled for all cyclical outage scope by the NR Planning & Controls Work Management department. • The NR Planning & Controls Work Management department has integrated each EPC vendors' and cyclical outage schedules. • Resources levelling for all NR functional support (i.e. NR Operations, Radiation Protection) is complete. • Each schedule clearly identifies RTS/QCHP window and logic sequencing if required.	3	N/A	• Milestone Success Plan Presentation prior to due date: 0 3 Months 06 Months 09 Months • Identify reference to any process, letters, documents, transmittals in support of milestone completion. The Revision 0 NR outage schedule has been reviewed and approved by the listed supporting managers, including an independent review, The approved schedule incorporates feedback by the Stratum IVN managers, the NR Outage Execution Team and NR Reactor Safety Engineering based on review of the Revision C schedule, fin al schedule integration meetings and the issued Reactor Safety Assessment. Any revisions to the schedule require the plan to be reapproved by all stakeholders. Document this milestone completion by attaching the following Revision 0 schedule components to the milestone sign-off sheet: (a) Revision 0 Level 1 Logic (b) Revision 0 Level 2 Window Logic Overview (c) Revision 0 Level 3 Critical Path logic (d) Schedule development final work down curve at Revision 0.	• Owner: Project • Support: Vendor	Y	Definition
63	Finish	CRR		Cyclical Scope/Cost/Duration Reconciliation Review	The Director, Work Management with supporting managers and functional groups should conduct a Cyclical Scope/CosVDuration Reconciliation Review meeting prior to RQE submission and OMS scope freeze date. The desired outcome of this meeting is to have completed a review of desired cyclical maintenance work in DNRU2 outage and reconciled it against budget, duration and Outage Goals. The review will: - Recommend scope cuts as required to remain within maintenance budget constraints and/or - Provide an estimate of the additional funding required to complete the maintenance work required to achieve the high-level maintenance goals established for the refurbishment outage. Recommendations from the Scope/CosVDuration reconciliation review will be reviewed by the USRB and forwarded to the PSRB as required.	3	N/A	• The Work Control Team Leaders, Supporting Managers, Operations and System Engineering have completed a full review of OMS Approved scope for the outage and concurred. • Recommend scope that should not be or cannot be completed. • Identify and justify work that must be completed that will be in excess of maintenance budget goals. • Identify any work that will be approved for scope that is on the Materials at Risk List with appropriate justification and or mitigation strategy. • Document and issue the minutes of meeting from the Cyclical Scope/Cost/Duration Reconciliation Review meetings. • Submit recommendations from the meeting to USRB for decisions and action • Document this M/S completion by attaching a copy of the final issued minutes from the Scope/Cost/Duration Reconciliation and any approved scope that is on the Materials at Risk List with appropriate justification and or a mitigation strategy.			
64	Finish	MTS		Window Materials Staged and Tools on Site		4	N/A				
65	Finish	DOC		Window Documentation Ready	Supporting documentation includes Work Plans, Operations and Maintenance Procedures and ALARA Plans. All supporting documentation that is required to complete final assessments as per N-PROC-MA-0002 must be issued and approved at this time. This includes all Risk Mitigation Plans and recall strategies that support shut down safety that have been identified by RO-13. Risk Mitigation Plans and recall strategies that support shut down safety identified after RO-13 will be required to be completed by PO-08 (Risk Mitigation Plans Prepared MIS; OP2210). Where reviews are required, draft version of support documents will be available at least one month prior to the MIS due date. Review comments should be fed back to the author with sufficient time to Disposition the comments.	4	N/A	All required Outage Support Documentation has been approved and issued for the purpose of Work Planning to proceed as per N PROC-MA-0002. Document this MIS completion by attaching a copy of the Documents WDC and a list of all documents issued.

Title:

**NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK**

**Appendix D: DNG Refurb – Program & Project Milestones Recovery / Mitigation Process**

**DNG Refurb – Program & Project Milestones Recovery and Mitigation Process**

The following provides summary instructions on the process of documenting and managing the recovery and mitigation plans for program and project milestones that are at risk.

**Program Milestones – Tier 1, 2, or 3**

**Process Description:**

- In the event that the timely and quality completion of a tier 1,2, or 3 milestone is in jeopardy, a milestone recovery or mitigation plan using D-FORM-10763 is required
- In the event that the milestone recovery is not possible, and a mitigation plan has been initiated, a change in the milestone date may be required. Changes to Tier 1, 2, or 3 milestones commitments are required to follow the Change Control process and mitigation plan should be attached.

**Accountability:**

Who	What	When
Milestone Owner	Follow the Program Milestone Recovery and Mitigation Plan Requirements as per N-MAN-00120-10001-SCH 06 using D-FORM-10763 form.	Completion of the Major Milestone in jeopardy
CSA	Support Milestone Owner in Developing Milestone Recovery and Mitigation Plan and associated Change Control Form (if required)	Completion of the Major Milestone is in jeopardy and when the milestone date is not recoverable

**Process**

- Milestone Owner complete Milestone Recovery and Mitigation Plan D-FORM-10763
- Milestone Owner Route D-FORM-10763 to P&C Director and obtain approval
- Milestone Owner file D-FORM-10763 in passport by forwarding PDF to DNG Doc Mgmt
- If milestone is not recoverable, Milestone Owner may be required to complete Change Control Form (CCF) as per N-MAN-00120-10001-PC-12
- Milestone Owner route the signed D-FORM-10763 and approved CCF to P&C Scheduling Department
- P&C updates the PIMS Schedule

**Application**

- All Program Milestones – Tier 1, 2, or 3

Manual

Internal Use Only

Title:

**NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK**

**Appendix D: (Continued)**

*Project Milestones – Tier 4 or 5*

**Process Description:**

- Project milestone changes will be managed by strictly following the NR Change Control Process outlined on N-MAN-00120-10001-PC-12 "Cost & Schedule Change Control" Procedure.
- Project milestone owners may be requested by senior management to document milestone recovery and mitigation plans using D-FORM.

**Accountability:**

Who	What	When
Project Manager	Follow the NR Change Control Process outlined on N-MAN-00120-10001-PC-12	Completion of the Project Milestone is in jeopardy
CSA	Support Project Managers in completing Change Control Form	Completion of the Project Milestone is in jeopardy

**Process**

As per N-MAN-00120-10001-PC-12

- Project Manager completes Change Control Form (N-FORM-11252).
- Route the approved Change Control Form to P&C SPOC.
- Project assigned CSA updates the Project Schedule.

**Application**

- All project Milestones – Tier 4 or 5

**References**

- DN Refurbishment Program Integrated Master Schedule (PIMS) NK38-PLAN-00300-10000.
- Nuclear Refurbishment Cost and Schedule Change Control N-MAN-00120-10001-PC-12.

**NUCLEAR REFURBISHMENT – MILESTONE DEFINITION FRAMEWORK**

**Appendix E: (Continued)**

*\*Please refer to N-MAN-00120-10001-SCH-06, Nuclear Refurbishment – Milestone Definition Framework*

ID	Section	What is this?
1	Record Number	The standard record number begins with NK38-ref-09701-xxxxxx- this cannot change. The xxxxxx portion of the record number shall be the Activity ID assigned in the P6 Schedule.
2	Milestone Number	This shall be the Activity ID assigned in the P6 Schedule
3	Milestone Title	This shall be the Activity Name from the P6 Schedule
4	Milestone Type	Milestone Type shall be identified as either Program or AIP Scorecard
5	Tier Structure	This is the milestone tier, as determined in the Milestone Tier Structure Process (Section 3.1 of the manual): Tier 1 – Reportable to EVP Nuclear Refurbishment Tier 2 – Reportable to SVP Nuclear Refurbishment Tier 3 – Reportable to SVP Direct Report
6	Unit	This is the unit the Milestone Definition Form Relates to. The form defaults to "All". If the form only relates to one unit – please specify
7	Milestone Owner	Please specify the individual and their position
8	Signature	Requires Milestone Owner's signature
9	Date	The date the Milestone Definition Form was signed
10	Milestone TCD	This is the milestone completion date, as established in the P6 Schedule by BL Project Finish
11	Milestone Success Plan Presentation Due Date	This will be the Milestone TCD date minus 3, 6, or 9 months. For example, a milestone with a TCD of November 1, 2013, would have a presentation date of August 1, 2013 if three months were subtracted. See section 3.4.2 of the manual.
12	Milestone Definition	Describe the milestone and include any supporting governance. Identify any supporting departments/directors, if applicable.
13	Milestone Requirements	Identify reference to any process, letters, documents, transmittals in support of milestone completion.
14	Performance Indicator	Identify the performance indicators (metrics, WDC, etc) to indicate progress.
15	Milestone Predecessor (s)	List any milestone predecessors, if applicable. Ensure to use proper P6 Activity IDs from P6.
16	Milestone Successor (s)	List any milestone successors, if applicable. Ensure to use proper P6 Activity IDs from P6.
17	Milestone Completion	Check off one Status: <b>G</b> – Shows that the milestone was completed on time as indicated by the initial TCD; <b>R</b> – Shows that the milestone was completed on time based on a recovery plan; <b>N</b> – Shows that the milestone was removed through the approved CCF process.
18	Milestone Deliverable Met	Indicated how your department met each of the requirements of the Milestone Definition. Provide details, PASSPORT Documents, signed letters, etc. Indicate Challenge Process used.
19	Final Signatures	This form shall be signed by the Owner of the Milestone; Shall be Recommended to Close by the Owner's Director, and Final approved by the Director, Planning and Controls

*Note: This form can also be used for NR AIP Scorecard Definition requirements. For details, please contact P&C Scheduling Departments.*

Title: <b>NUCLEAR CONTRACT MANAGEMENT MANUAL</b>		

### 1.0 PURPOSE

The purpose of this document is to provide guidance for the implementation of the five stages in the contracting process for projects as set out in N-STD-AS-0029, Contract Management Standard, and illustrated in Figure 1. This manual is intended for Project Managers and employees involved in contract management activities.

**Figure 1: Contract Management Stages**

### 2.0 DEFINITION

A contract is an agreement between two or more parties based on an agreed allocation of rights, obligations, responsibilities, and risks. Contracts are based on the concept of offer and acceptance which may be enforced by a court.

Contracts may take a number of forms and OPG expects its contracts to be in the form of written documents that clearly spell out the terms and conditions for each party. The execution of work and work practices should be consistent with the agreed contract terms and conditions.

Contract management is the process that enables parties to a contract to meet their obligations in order to deliver the objectives required from the contract. It involves active monitoring, managing issues proactively as they arise, and anticipating future issues. Contract management incorporates oversight of Supplier personnel to ensure they meet all safety, quality, cost, schedule, and performance requirements. Contract management also involves building a good working relationship between OPG and the Supplier.

Contract management occurs throughout the contract lifecycle. Good contract management:

- Ensures sufficient time for planning
- Ensures achievement of value for money, and continuous improvement
- Supports effective risk management
- Ensures delivery of goods and services in accordance with the contract
- Establishes effective processes and metrics for managing the contract

Title:

### **NUCLEAR CONTRACT MANAGEMENT MANUAL**

- Provides clear and complete documentation to demonstrate due diligence and facilitates resolution of disputes
- Establishes effective communication to ensure no surprises for either party

Failure to implement good contract management could result in negative impacts to OPG including, but not limited to the following:

- Paying for goods and services which do not meet the standards (quality or otherwise) set out in the contract
- Higher costs
- Schedule or delivery delays
- Overcharges by Suppliers and erroneous payments
- Dissatisfaction between the contracting parties
- Safety and regulatory impacts

OPG-POL-0013, Code of Business Conduct Policy, must be adhered to during all stages of contract management.

### **3.0 COMMERCIAL PRINCIPLES**

A set of commercial principles has been laid out for relationships with third parties and will form the basis of the individual contracting strategies. These principles are an integral part of OPG's ability to demonstrate prudence in our contracting activities. They are:

- 1. Accountability:** OPG must comply with applicable provincial and regulatory directives regarding commercial relationships. This can be achieved through the development of effective contracting strategies and clearly defined authority, responsibility, and accountability structures for planning and executing all contracts.
- 2. Value for Money:** OPG must create value by conducting business in a cost effective manner. Value for money is based not only on the minimum purchase price (economy) but also on the maximum efficiency and effectiveness of the purchase, taking into account OPG internal costs and risks, including operational risks (near and long-term). Value for money is achieved by effectively balancing the trade-off between cost, quality, and risk. Value for money is also achieved by packaging work in a manner that facilitates competition between Suppliers.
- 3. Fairness & Transparency:** OPG must operate in an open and transparent manner. Regular communication by OPG with key internal and external stakeholders including government bodies and officials, federal and provincial

Title: <b>NUCLEAR CONTRACT MANAGEMENT MANUAL</b>		

regulators, industry peer groups and community leaders is part of being an open and transparent company.

4. **Risk Transfer/Sharing:** Allocation of risk to the appropriate party best able to manage the risk will minimize the costs and potential issues associated with managing that risk. Decisions regarding risk allocation and risk premiums are an integral part of a contracting strategy and should be based on comprehensive analysis.

## **4.0 CONTRACT STAGES**

### **4.1 Stage I: Contract Planning**

In the contract planning stage the development of a contracting strategy is a key tool designed to analyze the type of work required. The contracting strategy establishes the procurement approach, the type of contract and pricing model, and the style and type of management to be adopted for the subsequent service delivery, relationship management and contract administration. The selection of a contracting and sourcing strategy is supported by adequate inputs and analysis taking into consideration the commercial principles detailed in Section 3.

A comprehensive contracting strategy takes into consideration factors such as the nature and scope of the work, the Supplier marketplace, and potential longer term or broader commercial arrangements and results in a recommendation of the most suitable sourcing approach, contract structure and pricing mechanism. The depth of analysis and documentation required for each contracting strategy should be based on a graded, risk-based approach taking into consideration project value and any political or regulatory considerations.

N-REF-00150-0497673, Contracting Strategy Template, may be used to document accepted contracting strategy for a project.

### **4.2 Stage II: Procurement**

The procurement stage of the contract management life cycle includes the process for sourcing and awarding of contracts for materials and services based on the contracting strategy in accordance with OPG-PROC-0058, Procurement Activities, and OPG-PROC-0060, Requisitioning Items and Services.

Key activities include development of procurement documentation (i.e. expressions of interest, requests for proposals), development of evaluation and selection criteria, development of proposed contract documents, evaluation of proposals, negotiation plans, contract negotiations, and the contract award process. Roles and accountabilities of stakeholders involved in procurement are documented in OPG-PROC-0058 and the partnership agreement established between Supply Chain and Nuclear Projects.

<b>N/A</b>	<b>R001</b>	<b>7 of 12</b>

Title:  
**NUCLEAR CONTRACT MANAGEMENT MANUAL**

For large contracts, it is recommended that the Project Manager and Contract Manager be selected and involved with procurement activities including contract negotiations.

### 4.3 Stage III: Post Award

Post award is the period between the award of the contract and the start of its implementation. A significant factor for success is achieving a smooth transfer of knowledge from the team that was involved in the planning and procurement phases to the team that will be engaged with the management and execution of the contract. There should be discussions between OPG and the Supplier in order to ensure that all parties involved have a common understanding about the goals and the expectations of the project, the performance requirements, and administrative procedures to be implemented to ensure adherence to the terms of the contract. Time and effort must be spent on determining how the obligations of both OPG and the Supplier should be carried out effectively and efficiently. The Contract Management Plan (CMP) documents how OPG will adherence to the contractual obligations.

In large, multi-year contracts, a Contract Manager should be assigned for the duration of the contract. The Contract Manager is engaged exclusively with the management of the contract in support of the Project Manager.

#### 4.3.1 Contract Management Plan

The CMP is an internal OPG document which outlines OPG's approach to managing key contractual terms and risks. It contains information about OPG's risk tolerances, mitigation plans, and the specific individuals in OPG who will manage the aspects of the contract. It identifies systems and processes to ensure that the Supplier complies with the terms and conditions during the performance of the contract.

The CMP should not be distributed beyond key project team members and specifically, not to a Supplier as the information it contains could put OPG at a commercial disadvantage by providing opportunities for a Supplier to exploit potential weaknesses in OPG's contract management controls or provide them with negotiation advantages.

Each contract may have a unique CMP based on the nature of the work and the negotiated terms and conditions. The CMP is developed using a risk-based graded approach appropriate to the type of contract in order to facilitate effective execution of the contract. The CMP should include:

- an assessment of key roles (including succession planning for key roles)
- key contractual milestones and deliverables
- process for development and changes to schedules
- invoicing and payment
- project securities

## Manual

Internal Use Only		
Document Number: <b>N-MAN-09701-10003</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>8 of 12</b>
Title: <b>NUCLEAR CONTRACT MANAGEMENT MANUAL</b>		

- key contractual terms and conditions
- a roll-out plan for communicating key contract terms to stakeholders including the project team
- contract management work plan
- business relationship management including management of communication, issues, claims, disputes, and default
- contract change management
- notice
- contractually related risks and work management plan
- lessons learned
- roles and accountabilities matrix (N-REF-00150-0497675, Contract Management Roles & Accountabilities Matrix, may be used)

The CMP should also contain details on how OPG's contractual obligations to Suppliers are to be managed. The CMP may be a collection of documents containing the relevant information to support effective contract management.

The CMP is usually an attachment to the Project Management Plan (PMP) or may be a separate document. The template, N-REF-00150-0497674, Contract Management Plan Template, may be used. It should be reviewed anytime the project or contract risk profiles change, when contract changes or amendments are executed, and no less than annually.

### 4.3.2 Contract Manager

The Contract Manager will manage the interpretation and clarification of the contract terms and conditions to ensure all obligations and compliance with the contract are being met. Management should consider rotating individuals assigned to this role every three years for multi-year contracts. This is to ensure sufficient succession planning is in place, a questioning attitude is maintained in our business relationships, and ensure OPG can demonstrate arms-length relationships with Suppliers.

The Contract Manager will be responsible for but not limited to the following:

- Fully comprehend the commercial and contractual terms and conditions
- Confirm and periodically verify that the original signed contract and amendments are in place
- Facilitate the development, periodic review, and updates to the CMP

## Manual

Internal Use Only		
Document Number: <b>N-MAN-09701-10003</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>9 of 12</b>
Title: <b>NUCLEAR CONTRACT MANAGEMENT MANUAL</b>		

- Identify high risk terms and conditions within the contract and ensure mitigation programs are in place
- Resolve highly complex contractual/commercial issues that involve high risk through team integration
- Identify business wide and cross-project issues and develop appropriate strategies
- Participate in project review meetings to support the project team on commercial and contractual matters
- Coordinate resolution of insurance claims and contractual disputes
- Coordinate development and implementation of management procedures, systems and processes to facilitate effective management of the contract
- Review applicable OPG procedures and supporting systems from a commercial perspective to improve efficiencies
- Ensure documents exchanged with the Supplier related to the execution of the contract are maintained should contractual issues or disputes arise between OPG and the Supplier
- Maintain communication with the Supplier to ensure the ongoing relationship between the parties continues
- Support closure of the contract

### 4.3.3 Contractor Set-up, Training and Orientation

The Project Manager will identify the relevant stakeholders across OPG and liaise with the key contacts to ensure the requirements for contractor set-up, training, and orientation are understood and managed. Compliance with respective governance ensures OPG is protected in the areas of site access (security clearance, parking, control room access, computer usage, etc.), communication and reporting protocols (e-mails, Tempus, SCR, Safety/Environmental, etc), specific training requirements and accountabilities, establishing the construction island, methods of control of hazardous energies, site walk-downs, etc.

## 4.4 Stage IV: Contract Execution

The contract execution phase of the contract management lifecycle includes a range of activities in the following key areas:

- Service delivery management
- Relationship management
- Contract administration

## Manual

Internal Use Only		
Document Number: <b>N-MAN-09701-10003</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>10 of 12</b>
Title: <b>NUCLEAR CONTRACT MANAGEMENT MANUAL</b>		

All three areas must be integrated, balanced, and managed successfully for OPG to achieve the intended value of the contract. Business risk can never be fully transferred to the Supplier but through successful service delivery management, relationship management, and contract administration these risks can be effectively mitigated.

In this phase, the Contract Manager and project team will execute the contract management activities as outlined in the CMP.

### 4.4.1 Service Delivery Management

OPG must monitor whether the goods or services are being delivered in accordance with the specification as contracted (i.e. price, schedule, quantity and quality) and to the agreed standards.

For most contracts, contractual milestones are aligned with key project activities and deliverables, and have associated payments to the Supplier. This aligns the business interest of the Supplier (receiving payment) with those of OPG (progressing the project). Sufficient written documentation is necessary to support achievement of milestone or services for payment to the Supplier.

### 4.4.2 Relationship Management

Managing the relationship and long-term success requires a proactive approach and commitment to representing OPG's best interests. The key factors vital in making the business relationship successful include:

- Openness and effective ongoing communications
- A joint approach to managing issues
- Mutual trust with verification

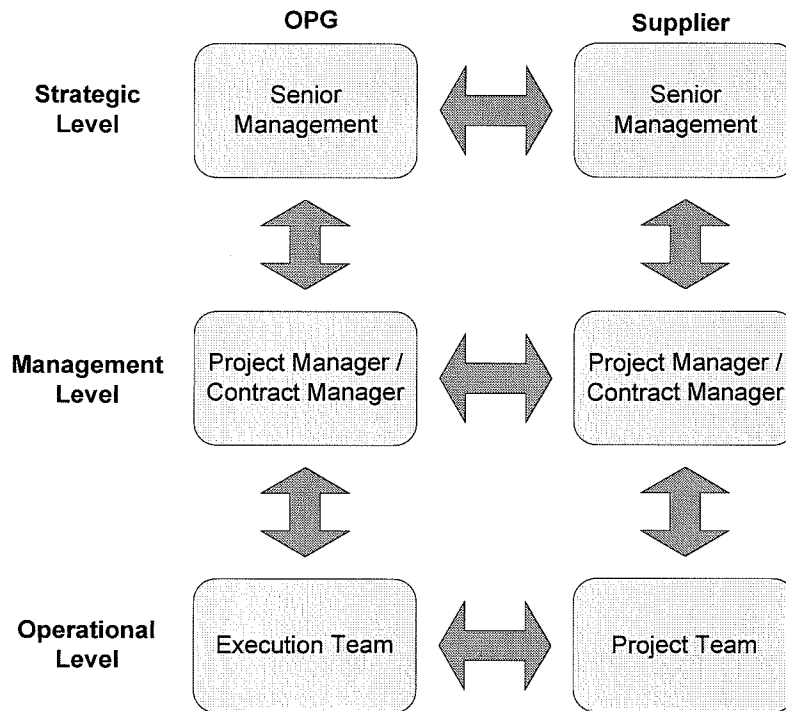

Effective communication is critical in managing a relationship to ensure no surprises. A communication protocol should be documented in the CMP along with the key contacts for both parties. There should be regular meetings to serve as a forum to identify and address specific areas or issues of concern. Depending on the nature and complexity of the contract, a Steering Committee may be formally established or a more informal approach to maintaining the overall business relationship may be taken. An example of a communication protocol is illustrated in Figure 2.

Procedures for handling potential disputes and business issues should also be established and agreed to upfront, with clear reporting and escalation procedures to maintain a business focus for the relationship. The purpose of this is to recognize problems early and get quick and effective resolution.

### 4.4.3 Contract Administration

The key objectives for effective contract administration are:

- Establish clear administrative processes to ensure adherence to contract terms
- Ensure the contract documentation remains current and reflects the business arrangement as the relationship develops and evolves
- Ensure changes are controlled in accordance with contractual terms
- Ensure effective processes are in place for invoicing, cost monitoring, payment procedures, management reporting

### 4.5 Stage V: Contract Closeout

The contract closeout phase includes:

- Ensuring all products and services have been delivered and accepted
- Ensuring all issues, disputes, and / or claims that arose during the execution of the contract have been resolved
- Ensuring warranty and rework issues are addressed

Title: <b>NUCLEAR CONTRACT MANAGEMENT MANUAL</b>		

- Ensuring all lien issues are resolved
- Ensuring Project Securities (Letters of Credit, Parental Indemnities, Bonds, etc) are no longer required and returned
- Ensuring that all required documentation is received (e.g. intellectual property, drawings, specifications, training materials, etc.)
- Ensuring the return of any OPG assets used by the Supplier during execution and confirm assets are in expected condition
- Ensuring that all contractually required payments have been processed
- Recommending to Project Manager that contract has been completed and can be closed

## Nuclear Charter

### TITLE

**NUCLEAR MANAGEMENT SYSTEM**

### AUTHORIZATION

OWNER: Glenn Jager  
Chief Nuclear Officer

APPROVAL FOR ISSUE: Robin Manley  
Director, Nuclear Regulatory Affairs

AUTHORIZATION AUTHORITY: Tom Mitchell  
President and CEO

COMPLIANCE DATE: Immediate

### PURPOSE

This Charter and referenced supporting documents establish the Nuclear Management System for Ontario Power Generation Nuclear (OPGN) which hereafter is referred to as Nuclear. This Charter communicates Chief Nuclear Officer (CNO) expectations regarding implementation of the Nuclear Management System, which fulfills requirements of Canadian Standards Association (CSA) N285 N286-05 and N286-12 standards (the reason for stating both CSA N286-05 and CSA N286-12 is that CSA N286-12 takes over from CSA N286-05 when invoked by facilities relicensing; OPGN is demonstrating it meets the requirements to both Standards regardless of when the licences are updated), International Organization for Standardization (ISO) 14000 series of standards, and American Society of Mechanical Engineers (ASME) NCA 4000. The Nuclear governing document framework is described in this document under Appendix A, Governing Document Framework. This Charter and the supporting documents identified in N-LIST-08130-10023, CSA N286-05 to OPGN Governance Cross Matrix, demonstrate compliance with CSA N286-05.

### SCOPE

This Charter is applicable to all aspects of the Nuclear business as defined within this document and

© Ontario Power Generation Inc., 2015. This document has been produced and distributed for Ontario Power Generation Inc. purposes only. No part of this document may be reproduced, published, converted, or stored in any data retrieval system, or transmitted in any form by any means (electronic, mechanical, photocopying, recording, or otherwise) without the prior written permission of Ontario Power Generation Inc.

Title:

### NUCLEAR MANAGEMENT SYSTEM

includes all equipment, systems, and activities. It provides overall direction regarding administration of Nuclear and establishes requirements to which employees shall comply. The Nuclear Management System Charter takes its authority from the Corporate Safe Operations Policy (OPG-POL-0032) and the Nuclear Safety Policy (N-POL-0001). Nuclear programs that take authority from other Corporate policies are identified within the programs of this Charter and Appendix A. While these other programs do not take authority from this Charter, they are part of the Nuclear Management System and the CNO is accountable for their effectiveness. Activities affecting the safe operation of Nuclear plants satisfy applicable requirements of the CSA N285, N286-05 and N286-12 standards.

This Charter does not apply to maintenance and engineering of Nuclear facilities outside the inner security fence (protected area), unless those facilities directly impact the Nuclear Station within the protected area or involve Decommissioning and Nuclear Waste Management Division (DNWMD). Interfaces between Nuclear and other lines of the business are described herein. This Charter does not apply to activities associated with the Darlington New Nuclear Project.

Title:
NUCLEAR MANAGEMENT SYSTEM

### 1.0 DIRECTION

#### Chief Nuclear Officer's Statement of Policy

As required by the OPG Nuclear Safety Policy, I am accountable to the President and Chief Executive Officer (CEO) and the Board of Directors of Ontario Power Generation (OPG) to establish and implement an overall *Nuclear Management System* that fosters Nuclear safety as the overriding priority.

The Nuclear Safety Policy (N-POL-0001) applies from the initial conception of a Nuclear project, through procurement and design, construction and installation, commissioning, operations and decommissioning. This explicitly includes the two most challenging phases of a Nuclear facility – the initial operation and commissioning phase and the period of operation leading up to the end of service. The Nuclear Safety Policy applies to every person in OPG Nuclear and every person or entity that supplies a product or service to OPG Nuclear. It is through our employees and our *Nuclear Management System* that we assure compliance with the policy by all groups that can have an impact on Nuclear Safety.

I am accountable for the effectiveness of the overall *Nuclear Management System* in ensuring our Nuclear facilities are operated and maintained using sound Nuclear safety and defense-in-depth practices to ensure radiological risks to workers, the public, and environment are as low as reasonably achievable, and in keeping with the Nuclear Safety Policy, and the best practices of the international Nuclear community. I ensure that a foundation of leadership exists and hold my direct reports and other supporting organizations accountable for implementation of and adherence with this *Nuclear Management System*.

I am accountable for the Nuclear vision, mission, cornerstones, values, behaviours and priorities that capture how our goal of safe, reliable, low-cost product delivery is accomplished to ethical and behavioral standards. These principles are developed in conjunction with my management team with input from people across the organization. The messages are communicated and reinforced by me personally, as well as all levels of management in the organization.

**Vision:** People Powering the Future.

**Mission:** To be Ontario's low cost electricity generator of choice.

**Cornerstones:** Safety, Reliability, Value for Money, and *Human Performance*.

**Values:** Safety, Integrity, Excellence, People and Citizenship.

**Behaviours:** Say It, Do It; Think Top and Bottom Line; Simplify It; Integrate and Collaborate; Tell It As It Is.

**Priorities:** Developed annually to focus on major program requirements based on ongoing internal and external business developments, known challenges and improvement opportunities identified through benchmarking.

## Nuclear Charter

Internal Use Only		
Document Number:	Revision:	
N-CHAR-AS-0002	R018	
Usage Classification:	Sheet Number:	Page:
Information	N/A	6 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

Every employee in our organization is responsible and shall be held accountable for complying with expectations in this document and programs referenced in this document, and shall ensure their actions are deliberate and consistent with protecting the health and safety of the public and the environment. All employees shall accept the unique and grave responsibility inherent in using Nuclear technology and shall adhere to radiation safety practices and precautions defined within the Nuclear governance framework. In this regard, this Charter has been written to communicate, to Nuclear generating and support organization employees, and contractors, my expectations for conducting our business.

Where Nuclear generating and support organizations have delegated responsibility for work to contractors, line management shall take all reasonable cost effective steps to ensure that the terms and conditions in the contract are enforced and in particular, that contractors comply with all applicable laws, codes and regulations.

This document, in conjunction with the referenced policies, programs, standards and other controlled documents, establishes the overall *Nuclear Management System* that assures that systems, equipment and activities are of the required quality throughout the life of our Nuclear facilities. Applicable portions of the *Nuclear Management System* shall be in place before undertaking activities covered by this Charter. The *Nuclear Management System* described in this document further assures that Safety-Related Systems, Structures, Components (SSC) and Nuclear fuel are designed, procured, fabricated, installed, operated, and maintained in accordance with applicable regulations, standards, and fuel performance limits, using rigorous processes to ensure all work activities are planned and controlled to maintain plant configuration and condition within the design basis. Changes that could impact on Nuclear safety shall be assessed and implemented in a controlled manner.

*Nuclear Management System* deficiencies or deviations from the requirements of this Charter shall be managed through the Nuclear Corrective Action Program.

Activities may be performed by a support organization or a contractor using their quality program, providing the quality program is approved by the Nuclear organization and appropriate interfaces are established. Support organizations and contractors who do not have a quality program approved by the Nuclear organization shall follow this *Nuclear Management System*.

The Director, Nuclear Regulatory Affairs and Stakeholder Relations is responsible for interpreting the requirements of this Nuclear Charter and its supporting documents.

Chief Nuclear Officer

Usage Classification:	Sheet Number:	Page:
Information	N/A	7 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

### 1.1 Human and Business Performance

The future success of Nuclear lies with our most important asset, our employees. Nuclear must prove itself as a fair and equitable employer of choice. Our organizational pattern, and placement of staff within the pattern, shall meet the needs of the business. Organizational interfaces shall be clearly identified, communicated, and controlled. Employees shall be trained to qualification levels demanded of their role, and shall understand what is expected of them and how they contribute to the success of the business. Effective communication of clearly defined expectations is essential for success. Success is measured by comparing actual results against the defined expectations. Employees shall be given multiple avenues to have their concerns heard in a non-threatening and unbiased fashion and to see them through to resolution; and, when requested, the confidentiality of the employee shall be maintained to the maximum extent possible.

Human and Business Performance establishes overall requirements for sustaining and improving performance. This is accomplished by the following:

- (a) Establishing and implementing a managed system consisting of governing documents communicating essential elements of Nuclear business.
- (b) Reinforcing individual accountability for performance and implementing various self-verification and independent oversight techniques.
- (c) Identifying, documenting, evaluating, and correcting in a timely manner, conditions adverse to quality.
- (d) Using internal and industry Operating Experience (OPEX) to improve human, plant and equipment performance and design, procurement, construction, commissioning, and operating requirements and practices.
- (e) Providing information to the people who need it through the managed systems that establish how necessary information is identified, targeted to required users, maintained current, and communicated effectively.

The Human and Business Performance programs described below are designed to ensure these business objectives are met.

#### 1.1.1 N-PROG-AS-0001, Managed Systems

The Managed Systems Program establishes a business framework that consists of "Plan", "Do", "Check", "Act/Adjust" elements that are common to all Nuclear Management System programs and supporting activities. The elements collectively ensure:

- (a) Management system principles of CSA N286-05, Management System Requirements for Nuclear Power Plants and CSA N286-12, Management System Requirements for Nuclear Facilities, are consistently and effectively applied to all activities defined in N-CHAR-AS-0002, Nuclear Management System.
- (b) Nuclear Management System processes and their supporting technologies are

Usage Classification:	Sheet Number:	Page:
Information	N/A	8 of 32

### Title: NUCLEAR MANAGEMENT SYSTEM

standardized to the greatest extent possible.

- (c) *Nuclear Management System* review is performed by the Fleetview process on programs within the *Nuclear Management System*, as well as Nuclear programs that take authority from corporate policies other than the Charter, for their overall effectiveness and opportunities for improvement. The Program Owners present their programs to the Nuclear Executive Committee comprising the CNO and his direct reports as well as other senior representatives of key OPG organizations such as Nuclear Oversight, Environment, Supply Chain, etc. in accordance with a schedule that ensures all programs are reviewed at least annually. Each program is systematically reviewed using the key areas of program oversight and leadership, program execution performance indicators, and status of initiatives developed to close any gaps in performance or leadership. This review provides an opportunity for interface and challenge by the Nuclear senior leadership team to the Program owner in meeting Nuclear Management System requirements.
- (d) The controls used by the CNO to fulfill the accountability to implement and maintain an effective management system complying with the requirements of CSA N286-05 and CSA N286-12 include:
  - i) A defined organizational structure to own and execute programs in the Nuclear Management System. This includes organizations reporting directly to the CNO as well as Interfacing Organizations which work in partnership with Nuclear to ensure the integrity of the Nuclear Management System is maintained in accordance with the expectations of the CNO. For Interfacing Organizations, Program Authority is retained within the Nuclear organization.
  - ii) Where OPG business units supporting Nuclear develop their own management system, OPG-PROC-0001 (Process Administrative Governance Documents) requires a review for any new program document that supports activities in N-CHAR-AS-0002. Any changes to a Nuclear Management System program as a result of implementing a new business unit management system will be assessed by the designated Nuclear Management System Program Authority against the CSA N286 criteria on behalf of the Nuclear Executive Committee and CNO. This ensures compliance with the generic management system requirements of CSA N286-05 and N286-12. Until such time as other business units develop, obtain approval, and implement separate management systems, the Nuclear Management System will continue to apply to all non-Nuclear Program Owners and staff executing work on behalf of Nuclear.
  - iii) The Fleetview process described in 1.1.1 c).
  - iv) Proactive CNO engagement of Nuclear and all other lines of business that support Nuclear, in the Nuclear Business Planning process (see 1.1.3).

#### 1.1.1.1 Nuclear Organization

N-STD-AS-0020, Nuclear Management System Organization, defines the Nuclear organization and general accountabilities that are applicable to the CSA N286-05 and N286-12 standards. Included are organizations that report to Senior or Executive Vice-Presidents

## Nuclear Charter

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

outside of Nuclear but support the Nuclear line of business. This Standard defines the relationships and interfaces that have been established to ensure effective control of activities that are performed to support the Nuclear line of business. Further details of these supporting organizations and the Nuclear organizations are located in Asset Suite and SAP™.

This standard is owned and implemented by People and Culture under OPG Business Model, OPG-POL-0033.

### 1.1.2 N-PROG-AS-0006, Records and Document Control

This program establishes processes for management of Nuclear records and documents throughout their life cycle, regardless of their media. The program lays out requirements for managed system activities related to records and documents and establishes uniform, efficient processes for management, maintenance, and final disposition of records and documents throughout Nuclear.

All documents which support the implementation of a Nuclear Management System are considered Governance. Creation of all Governance, policies, charters, programs, procedures and processes established through any new Management Systems is controlled through procedures and standards.

Revision control and communication is established through an Approved Information Management System (e.g. Asset Suite).

This program is owned and implemented by the Business and Administrative Services organization, under OPG Business Model, OPG-POL-0033.

### 1.1.3 OPG-PROG-0001, Information Management

This program establishes a set of standards and procedures for the management of OPG's information throughout its life-cycle, regardless of media, including electronic systems such as e-mail, SharePoint, and the Intranet to ensure consistent and appropriate use. It describes requirements for a managed system of activities related to information. The program establishes uniform and efficient processes for management, maintenance, and final disposition of records and documents throughout OPG. It establishes the overall OPG process for governance including electronic filing, approval, distribution, and maintenance of the OPG Governance Framework.

Procedures under this program establish a consistent process across OPG including the establishment of a hierarchy of authority for documents, only one owner for the document, controlled release of the document for revision, controlled review of the document by stakeholders and individuals affected by the change, and the controlled approval and authorization of the document before it is issued as a Governing document.

This program is owned and implemented by the Business and Administrative Services organization, under OPG Business Model, OPG-POL-0033.

### Title: NUCLEAR MANAGEMENT SYSTEM

#### 1.1.4 N-PROG-AS-0005, Business Planning

This program establishes the business planning framework across Nuclear Business Units to ensure compliance with Corporate management strategies and business direction, and to create a structure for undertaking business planning activities. Business planning is a tool that directs the organization's resources to meet strategic goals aligned with the company's objectives and support safe and efficient business plan execution. The business planning program ensures organizational alignment and defines desired results in sufficient detail to support accountability, and ensures constraints, the availability of resources, and business risks are adequately addressed.

#### 1.1.5 N-PROG-AS-0002, Human Performance

The human performance program establishes a systematic framework for human performance management. The program is specifically designed to achieve higher levels of Nuclear and industrial safety, higher unit reliability, and reduced operating costs through event-free operation. The goals of the program are to continually reduce human performance events and errors in pursuit of global recognition as an event-free operator and universal application of event prevention tools.

This program addresses human performance management and improvement by improving human performance through individual behaviours (all employees and contractors), organizational process, and management and leadership behaviours.

A key element of the program is outlined in N-STD-RA-0014, Second Party Verification, which specifies the requirement for verification to confirm a specific task or activity satisfies established requirements in all functional areas of Nuclear (e.g., operations, maintenance, engineering, procurement, construction, commissioning).

#### 1.1.6 N-PROG-RA-0003, Corrective Action

This program establishes the processes to ensure deficiencies, non-conformances, weaknesses with a process, document, service, or conditions that adversely impact, or may adversely impact plant operations, personnel, nuclear safety, the environment or equipment and component reliability, are promptly identified and corrected.

For those deficiencies considered significant, or repetitive in nature, these processes ensure appropriate levels of management are notified, causes identified and actions taken to preclude recurrence, and actions taken to address the identified issues are verified to be complete and effective.

This program also provides the processes to ensure in-house and external OPEX is evaluated, distributed to appropriate personnel, and applied to implement actions that improve plant safety and reliability.

An effective self-assessment and benchmarking process is also implemented by this program to promote continuous improvement. Current performance is compared to management expectations, industry standards of excellence, OPEX, and regulatory requirements to identify areas needing improvement. Self-assessment results are promptly identified, communicated to affected groups or individuals, and resolved.

Information	N/A	11 of 32

### Title: NUCLEAR MANAGEMENT SYSTEM

#### 1.1.7 N-PROG-RA-0010, Independent Assessment

This program provides independent assessment (internal and external) processes to perform a comprehensive and critical evaluation of all activities affecting Nuclear facilities. This program ensures the Nuclear Management System under N-CHAR-AS-0002, is reviewed with sufficient frequency to confirm its continuing effectiveness. The program is comprised of the following processes:

- (a) Internal independent assessments by Nuclear Oversight that provide critical and unbiased oversight function, have organizational freedom and authority to remain independent. Results are identified, reported and communicated to a level of management having sufficient breadth of responsibility to resolve the identified deficiencies.
- (b) External independent assessments that are provided by a Nuclear Safety Review Board (NSRB) and the Nuclear Oversight Committee of the Board of Directors. NSRB provides a broad, systematic, and independent overview of Nuclear safety in our Nuclear facilities by reviewing various safety activities, organizations, programs, procedures, requirements, and results with respect to effectiveness, significance of occurrences, and trends that may affect Nuclear safety and environmental matters. NSRB reports to the CNO, the President and CEO, and reports annually to the Nuclear Oversight Committee. The Nuclear Oversight Committee of the Board of Directors is responsible for performing the duties set out in their Charter to enable the Board to fulfill its oversight responsibilities.

This Program is owned and implemented on behalf of the CNO by the Assurance organization, under OPG Business Model, OPG-POL-0033.

#### 1.1.8 N-PROG-TR-0005, Training

This program describes the Training Program for regular staff, contractors, temporary personnel, and other staff assigned work at Nuclear ("Nuclear staff"). The program provides the structure, processes, and tools for defining, developing, implementing, documenting, assessing, and improving the training required to ensure Nuclear staff have the appropriate knowledge, skill, and qualifications for safe and efficient plant operation. Training governing documents:

- (a) Formalize training standards and processes.
- (b) Provide a process for analysis, design, development, delivery, and evaluation of quality training.
- (c) Identify requirements for qualifying staff to meet performance expectations.
- (d) Identify means by which qualifications are tracked and maintained.

This program is owned and implemented by the People and Culture organization, under OPG Business Model, OPG-POL-0033

**NUCLEAR MANAGEMENT SYSTEM**

### 1.2 Operate Plant

Safety is an integral part of every operational decision. Activities related to the operation of Systems, Structures, and Components (SSC) are accomplished by qualified personnel in accordance with approved procedures that are maintained consistent with facility design and licensing bases. Operating configuration of each facility is controlled to ensure authorized staff retains an understanding of the status of each generating unit and its supporting services.

The Operations programs described below are designed to ensure these business objectives are met.

#### 1.2.1 N-PROG-OP-0001, Nuclear Operations

This program implements a series of standards and procedures to ensure safety of the public, environment, plant personnel, and plant equipment. This program establishes safe, uniform, and efficient operating practices and processes within Nuclear facilities that provide Nuclear professionals the ability to ensure Nuclear facilities are operated in such a manner as to ensure compliance with Power Reactor Operating Licence (PROL), Operating Policies and Principles (OP&P), and other applicable regulations and standards.

The Nuclear Operations format is based on operations-related functional areas as defined in the World Association of Nuclear Operators (WANO) Performance Objectives and Criteria. These functional areas are:

##### Operations Fundamentals

- Monitor Closely
- Control Precisely
- Conservative Bias
- Effective Teamwork
- Understand Sciences, Engineering Principles and Plant Design

##### Conduct of Operations

- Operations Management and Leadership
- Control Room Activities
- Administrative Controls
- Operations Staffing

Communication standards are established to ensure accurate transfer of information, ensuring communications are clear, concise, and complete to reduce operating and human errors. This includes operation and maintenance of the plant during normal, abnormal, and transient conditions, pre- and post-job briefings, operating logs, and main control room turnover.

This program also addresses procedures and standards for self-checking, reactivity management, operability testing, and infrequently performed tests and evolutions. Controls are put in place to ensure technical procedures are written consistent with plant design and licensing bases.

Usage Classification:	Sheet Number:	Page:
Information	N/A	13 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

### 1.2.2 N-PROG-AS-0008, Heavy Water Management

This program establishes overall requirements for effective and efficient heavy water management within Nuclear, through focus on strategic planning, asset management, and logistics and integration.

The program's governing principles requires it to contribute to meeting Operating Policies and Principles limits, emission limits, and other relevant regulatory limits, and to minimize employee and public dose.

## 1.3 Maintain Plant

Maintenance programs are structured to ensure Nuclear facility Systems, Structures, and Components (SSC) are maintained within parameters established in the design basis, and equipment malfunctions or deficiencies are corrected in a timely manner and rarely recur. This includes controlling release of systems and equipment for maintenance, subsequent testing and eventual return to service.

The Maintenance programs described below are designed to ensure these business objectives are met.

### 1.3.1 N-PROG-MA-0004, Conduct of Maintenance

This program implements the processes established to ensure safety of the public, site personnel, protection of the environment, and availability of plant equipment for safe and reliable operation through effective implementation and control of maintenance activities. This program also provides the requirements for managing identification and execution of preventive maintenance and repetitive task work activities using the predefined process in support of operations, maintenance, and testing of Nuclear generating station equipment and facilities.

This program ensures system instrumentation is maintained in a condition to ensure operation within specified limits, and measuring and testing equipment is of proper range, type, condition, and accuracy. To ensure accuracy within limits, adjustment, maintenance, and calibration are performed with equipment having a known relationship to nationally recognized standards. The scope of this program includes the calibration of plant equipment, issue, use, calibration, maintenance, and storage of measuring and testing equipment, and tool identification and issue.

The objectives listed above are primarily achieved by instituting effective maintenance processes, high standards, compliance with procedures, sufficient resources, monitoring and assessing performance, and holding personnel accountable for their performance.

### 1.3.2 N-PROG-MA-0019, Production Work Management

This program ensures maintenance, modification, and testing activities are identified, prioritized, planned, scheduled, and executed in a manner protecting plant operational integrity, while making the most efficient use possible of available resources. Where possible, corrective maintenance and modification activities are performed during windows when

## Nuclear Charter

Usage Classification:	Sheet Number:	Page:
Information	N/A	14 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

affected equipment has been removed from service to perform predefined (repetitive) maintenance work.

This program is highly integrated with Materials Management, Procurement Engineering, Design Management, and Equipment Reliability programs. By defining a common plant priority scheme and management reporting mechanisms, the program ensures necessary resources are focused on problems related to plant condition, thereby minimizing maintenance backlogs.

This program ensures maintenance history is kept in a format allowing for long-term trending as necessary for the Equipment Reliability and Component and Equipment Surveillance programs.

This program also implements requirements of the Conventional Safety and Radiation Protection (RP) programs to ensure a proactive approach to safety is built into task planning.

### 1.3.3 N-PROG-MM-0001, Materials Management

This program ensures equipment, components, materials, and services meet appropriate and applicable design and quality requirements through review and approval of suppliers' quality programs, and audits or in-process surveillance of the suppliers' activities.

Equipment, components, materials, and services are purchased to required specifications and codes. Equipment, components, materials, and tools are controlled through proper identification, receipt, inspection, handling, storage, issuance, and shipping to ensure quality of equipment and components is preserved and that only accepted items are used. An annual inventory certification is performed in accordance with Corporate requirements and usage patterns are analyzed to ensure that spare parts will be available to meet normal operating and outage requirements.

This program is integrated with N-PROG-MP-0011, Procurement Engineering, to ensure materials meet end-use design requirements and N-PROG-MA-0019, Production Work Management, to ensure materials are available when needed.

Nuclear fuel supply processes ensure Nuclear fuel meets appropriate and applicable design and quality requirements. Processes are also in place to ensure the required quantity of Nuclear fuel is purchased from qualified and secure sources. Nuclear fuel materials are controlled through proper identification, handling, storage, issuance, and delivery to stations to ensure quality is preserved and regulatory control requirements are met.

This program is owned and implemented by Supply Chain Division of the Business and Administrative Services organization, under OPG Business Model, OPG-POL-0033.

## 1.4 Engineering

Engineering contributes to safe, reliable, and competitive operation of Nuclear by:

- (a) Ensuring effective plant system performance monitoring and system condition reporting, equipment performance trending, and effective troubleshooting.

## Nuclear Charter

N-CHAR-AS-0002	R018	
Usage Classification:	Sheet Number:	Page:
Information	N/A	15 of 32

### Title: NUCLEAR MANAGEMENT SYSTEM

- (b) Providing corrective action when necessary to restore systems or equipment to optimum performance.
- (c) Maintaining plant configuration consistent with design and licensing basis.
- (d) Supporting operations and maintenance organizations in ensuring plants are operated consistent with the Safe Operating Envelope (SOE), Nuclear Waste Management Safety and Design Envelope, design basis, and licensing basis.
- (e) Performing Integrated Aging Management activities, including Life Cycle Plans and condition assessments, to understand the condition and maintain the health of critical SSC as the plants age.

Engineering programs described below are designed to ensure the engineering business objectives are met. The business objectives fall into two major categories, Protect the Asset and Control the Design. Engineering programs establish overall requirements for the engineering function.

#### 1.4.1 Protect the Asset

Plant reliability is achieved by putting in place business processes that:

- (a) Determine the condition of SSC.
- (b) Predict expected failure.
- (c) React to the results in a timely manner.

Surveillance programs are defined to implement effective system performance monitoring and system condition reporting, equipment performance trend reporting, and effective troubleshooting.

These processes are applied to equipment important to Nuclear safety and power generation to ensure systems and equipment perform consistent with their design requirements. These programs establish requirements for preventative maintenance, inspection, test, surveillance, and monitoring necessary to ensure systems and equipment perform in accordance with their design basis and at levels optimal to meet needs of the business.

Tracking and trending of system and equipment performance, internal and external shared OPEX, and lessons learned from root cause analysis of critical equipment failures are used to determine any changes to design, maintenance or operating practices necessary to achieve target reliability.

##### 1.4.1.1 N-PROG-MP-0007, Conduct of Engineering

This program implements a series of standards, procedures and instructions for performing engineering in a consistent manner across Nuclear. The program establishes the following practices for engineering:

- (a) Ensure plant configuration is maintained in accordance with design and licensing basis, and operated within the SOE and Nuclear Waste Management Safety and Design Envelope.

## Nuclear Charter

Internal Use Only		
Document Number:	Revision:	
N-CHAR-AS-0002	R018	
Usage Classification:	Sheet Number:	Page:
Information	N/A	16 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

- (b) Ensure essential plant equipment performs safely and reliably.
- (c) Comply with all relevant legal, statutory, and regulatory requirements.
- (d) Encourage continuous improvement in the conduct of engineering targeted at achieving safe, reliable, and competitive operation of Nuclear power generating stations.

This program establishes expectations for engineering management and leadership, and expectations on the safety culture required to ensure Nuclear safety is considered an overriding priority.

To ensure plant configuration is controlled to maintain conformance between design basis, licence basis, the SOE, and Nuclear Waste Management Safety and Design Envelope, this program defines requirements for the engineering programs to ensure they work in concert as an integrated change control process.

### 1.4.1.2 N-PROG-MA-0017, Component and Equipment Surveillance

It is essential that component and equipment performance support the safe, reliable, and economic operation at Nuclear facilities. This program fulfils this requirement by identifying defined component programs that evaluate component and equipment health by means of technical evaluations, inspection, maintenance, certification, and testing. Implementation of the program requirements provides a consistent methodology for providing component and equipment surveillance for select components at all Nuclear facilities.

There are component programs in place to ensure assumptions in the Safety Report are met and to ensure reliable component performance as credited in licensing documents. In addition, inspection and test type programs are in place to ensure mandated inspection and test activities driven by licenses and codes and standards are met.

### 1.4.1.3 N-PROG-MA-0025, Major Components

This program establishes a formal and systematic process in Nuclear for managing information related to four major component areas: Feeders, Steam Generators, Fuel Channels, and Reactor Components and Structures. This program provides a framework for integrating and reporting of the component performance, condition, and compliance with design basis documents. This hierarchy of documents, procedures, and other governance ensures the four major components perform safely and reliably, maintaining the design and licensing basis and the operational safety requirements while optimizing production and cost-effectiveness.

### 1.4.1.4 N-PROG-MA-0026, Equipment Reliability

This program defines the requirements for establishing and maintaining optimum levels of reliability for components important to Nuclear safety, production, and environmental protection. Reliable performance of components means very low numbers of component failures, degraded equipment condition is minimized, and redundancy is maintained on key systems. The program provides a framework for the following activities which ensure high levels of reliable performance of critical components:

## Nuclear Charter

Internal Use Only		
Document Number:	Revision:	
N-CHAR-AS-0002	R018	
Usage Classification:	Sheet Number:	Page:
Information	N/A	17 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

- (a) Identification and classification of components according to their criticality to focus activities related to these components according to their assigned criticality.
- (b) Specifying the required maintenance strategies to maintain high levels of reliability, and continuously improving the maintenance strategies based on corrective actions and maintenance feedback.
- (c) System monitoring and performance monitoring to ensure systems important to safety and production will perform their intended functions under design basis conditions and at optimum levels.
- (d) Component monitoring for components outside of established component programs.
- (e) Prompt and effective action when critical equipment fails, and to understand the technical and organizational cause to prevent a recurrence.
- (f) Oversight and direction by management on equipment reliability issues and priorities.
- (g) Management of the technical specifications for preventive maintenance requirements.
- (h) Implementation of predictive maintenance activities to detect early degradation of components.
- (i) Transfer of Equipment Reliability requirements to on-line, outage, and long range plans to ensure key actions are planned and executed.
- (j) Identification and prediction of aging and obsolescence issues on important components and embedding mitigating strategies and actions into the Business Plan.

### 1.4.1.5 N-PROG-MA-0016, Fuel

This program establishes requirements to integrate and review Nuclear fuel-related data in order to ensure fuel performs safely and reliably over the life of the stations, consistent with design and licensing bases, while optimizing reliability, production, and cost effectiveness. Fuel-related data includes any information which may impact fuel throughout its life cycle including (but not limited to) manufacturing, inspections, research, operating conditions, and fuel channel interactions. Also included is fuel channel data which may impact safety analysis, or the safety report; however, this program does **not** include responsibilities for fuel channel life cycle management and fitness for service which are covered by N-PROG-MA-0025, Major Components.

### 1.4.1.6 N-PROG-MP-0008, Integrated Aging Management

This program ensures that the condition of critical Nuclear Power Plant equipment is understood and that required activities are in place to ensure the health of these components and systems while the plant ages. This is accomplished by establishing an integrated set of processes and activities which ensure performance requirements of all critical equipment are met on an ongoing basis.

## Nuclear Charter

Internal Use Only		
Document Number:	Revision:	
N-CHAR-AS-0002	R018	
Usage Classification:	Sheet Number:	Page:
Information	N/A	18 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

The program also requires preparation of life cycle plans and condition assessments for critical plant equipment. These assessments supplement the ongoing engineering surveillance activities in place to monitor and optimize system performance. From these assessments, actions are established to ensure equipment performance requirements are met during station life.

### 1.4.1.7 N-PROG-OP-0004, Chemistry

This program specifies processes, overall requirements, and staff accountabilities to ensure effective control of plant chemistry during operational and lay-up conditions, control of laboratory methods, sampling and analyses, process chemicals, chemistry control performance monitoring, and reporting. These activities are performed in order to ensure critical plant equipment performs safely and reliably over the life of the stations.

### 1.4.1.8 N-PROG-MA-0013, Welding

This program establishes controlled processes and standardized welding practices to safely and efficiently make sound welds meeting structural integrity, code, and licensing requirements in accordance with qualified procedures and using qualified personnel. This program also covers welding on components not governed by codes and standards.

### 1.4.1.9 N-PROG-RA-0016, Risk and Reliability Program

This program provides organizational accountabilities, interfaces, and key program elements to ensure risks from Nuclear accidents are identified, monitored, and controlled across Nuclear. Probabilistic Risk Assessment (PRA) is used as a means to assess and manage the magnitude of radiological risks to the public from accidents due to operation of Nuclear reactors, and applied in a consistent manner across Nuclear. Operational reliability monitoring and reporting ensures risks during operation are monitored and managed.

This program consists of safety goals, station-specific PRAs, associated risk models, unavailability models of systems important to safety and software applications, and Nuclear governing documents.

### 1.4.1.10 N-PROG-MP-0014, Reactor Safety Program

This program defines organizational responsibilities and key program elements for the management of issues related to Nuclear Safety Analysis, in particular generic action items, and the following major components of safe operation:

- Safety Analysis Basis (Safety Report and Analysis of Record)
- SOE
- Beyond Design Basis Accident Management.

This program and implementing procedures and standards govern management of issues related to Nuclear Safety Analysis and their impact on safe operation.

## Nuclear Charter

Usage Classification:	Sheet Number:	Page:
Information	N/A	19 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

### 1.4.2 Control the Design

Design changes shall be controlled to ensure plant configuration is maintained in conformance with design and licensing bases and code requirements, and remains within the SOE, Nuclear Waste Management Safety and Design Envelope and associated analyzed conditions.

#### 1.4.2.1 N-PROG-MP-0001, Engineering Change Control

This program defines a systematic process and methodology for controlling design modifications to plant SSCs, including software and engineered tools, which meets CSA N286-05, N286-12 and N285-08 Standards. The program also ensures that Non-identical Component Replacements (NICRs) and Item Equivalency Evaluations (IEE) comply with applicable codes, standards and regulations. The risk-based Engineering Change Control (ECC) process systematically controls design changes from inception to design package completion ensuring they are planned, designed, installed, commissioned, and placed in service within the SOE, Nuclear Waste Management Safety and Design Envelope, design bases, and plant licensing conditions. For all modifications, the ECC process defines requirements such as:

- (a) Regulatory approval and stakeholder reviews.
- (b) Constructability, Operability, Maintainability and Safety walk-down.
- (c) Design completion.
- (d) Management approvals.

ECC process utilizes a graded risk-based approach that allows for permanent and temporary modifications. The ECC process also defines a process to provide engineering control and approval of field changes if they are required, during installation and commissioning. In addition, the ECC process defines a Non-Identical Component Replacement process ensuring ECC is applied for substitution of components when equivalent items are no longer available. The general overall process for all types of changes is similar, differing only in the degree of rigour and formality. All changes are approved by the Design Authority. N-PROG-MP-0007 describes the role and how responsibilities of the Design Authority are managed.

Document-only changes that do not affect the *design basis* are managed in accordance with N-PROG-AS-0006 and the programs applicable to the engineering document being modified.

#### 1.4.2.2 N-PROG-MP-0009, Design Management

This program provides the framework for establishment of assurance that changes to plant design are controlled in a manner consistent with plant design and licensing basis. This program provides assurance that design bases, design outputs and design process documentation are prepared, reviewed, approved, and implemented in accordance with approved procedures, applicable regulatory requirements, standards, and industry practices. This program also ensures that procurement specifications for materials, systems, components, parts, and services of purchased items will perform their intended end-use design function(s).

A key element of the program specifies the requirement for verification to confirm a specific task or activity satisfies established requirements. Verification applies to all work activities in all functional areas of Nuclear (e.g., operations, maintenance, engineering, procurement,

## Nuclear Charter

Usage Classification:	Sheet Number:	Page:
Information	N/A	20 of 32

Title:

### NUCLEAR MANAGEMENT SYSTEM

construction, commissioning) which requires verification activities to be identified, planned, executed, and documented. The method, extent, and timing of the verification as well as the identity of the verifier shall be recorded and the verifier should be appropriately independent.

#### 1.4.2.3 N-PROG-MP-0006, Software

This program applies to software classified as Real-Time Process Computing, Scientific, Engineering and Safety Analysis Software or Software Engineering Tools. This program identifies processes and overall requirements for classification of software and identifies governing standards for each software classification to define requirements for software development, maintenance, procurement, qualification, and retirement including security of Real-Time Process Computing critical cyber assets.

#### 1.4.2.4 N-PROG-MP-0004, Pressure Boundary

This program provides a managed process to control the quality of Pressure Boundary (PB) activities at Nuclear for performing repairs, replacements, and modifications on pressure-retaining systems and components. It reflects those requirements of the PB Quality Assurance program related to performance of PB fieldwork activities. This is to ensure Nuclear retains the PB Certificates of Authorization (C of A) necessary to perform PB activities and, remains compliant with the Nuclear Station PROL, Waste Facility Operating Licenses (WFOL), and applicable CSA Standards.

N-MAN-01913.11-10000, Pressure Boundary Program Manual, as referenced by this program, describes the system used to control the quality of PB activities at Nuclear facilities and stations. It complies with CSA N285.0, General Requirements for Pressure Retaining Systems and Components in CANDU Nuclear Power Plants, and ASME Section III, NCA-4000, Quality Assurance. PB requirements for all stages of work, from design through installation and test, are implemented through supporting Nuclear governing documents.

The Canadian Nuclear Safety Commission (CNSC) has regulatory jurisdiction over PB requirements, including approval of any deviations from those requirements. OPG maintains a formal agreement with an AIA, acceptable to the CNSC, to provide pressure boundary services of its nuclear facilities in accordance with requirements of CSA N285.0. This includes activities such as certification of QA and QC programs for acceptability, inspections, registrations and other activities as detailed in the agreement.

#### 1.4.2.5 N-PROG-RA-0006, Environmental Qualification

This program provides auditable assurance that essential credited safety-related equipment and components, required to mitigate consequences of a design basis accident, will perform its intended function when exposed to harsh environmental conditions resulting from that accident, and this capability will be maintained over the life of the stations. Implementation of these program requirements shall provide consistent methodology, programmatic controls, and interfaces for establishing and maintaining environmental qualification of equipment and components over the life of the Nuclear plants.

Usage Classification:	Sheet Number:	Page:
Information	N/A	21 of 32

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

### 1.4.2.6 N-PROG-MP-0005, Configuration Management

This program ensures Nuclear facilities are operated, maintained, and modified in accordance with their design and licensing bases. The program objectives:

- (a) Assure the physical plant configuration matches the documented configuration (documents or electronic data).
- (b) Ensure configuration information is accurate, consistent, and readily available.
- (c) Establish clear configuration control scope, responsibilities, authorities, and interfaces among all organizations.
- (d) Manage proposed changes effectively.

## 1.5 Manage Risk

Risk Management programs described below are designed to ensure Nuclear minimizes risk to health and safety of the public, environment, and employees, from events associated with station security, fire, industrial hazards, radiation safety, and pandemic. These programs are designed to understand risk, eliminate unnecessary risk, and ensure protective and control measures are put in place against risks that are part of the Nuclear business. These programs are typically not stand-alone programs. They are integrated with other programs to ensure risk elements identified above are managed as part of day-to-day operation of the business.

In the unlikely event of an emergency, an emergency plan has been established to classify, notify, and respond to such emergencies.

### 1.5.1 Hours of Work

The hours of work for Nuclear employees are controlled, monitored, reported, and assessed for compliance to both legislative requirements and CNSC expectations. N-PROC-HR-0002, Limits of Hours of Work, describes the controls for managing these requirements.

This procedure is owned by the People and Culture organization, under OPG Business Model, OPG-POL-0033.

### 1.5.2 Fitness-for-Duty

Fitness for duty expectations are communicated to all staff through “Human Resources Overview” training and adherence to the Corporate Safety Rules (under Common Safety Rule 1.2) and associated training.

### 1.5.3 N-PROG-RA-0012, Fire Protection

This program establishes provisions to prevent, mitigate, and respond to fires such that fire risk to Nuclear workers, public, environment, Nuclear physical assets, and power generation, is acceptably low and controlled. The PROLs require Nuclear to comply with the requirements of CSA N293-07, Fire Protection for CANDU Nuclear Power Plants, and includes codes and standards such as the National Fire Code of Canada 2005, the fire protection requirements of

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

the National Building Code of Canada 2005, and applicable National Fire Protection Standards.

### 1.5.4 N-PROG-RA-0013, Radiation Protection

This program implements a series of standards and procedures for the conduct of activities within Nuclear sites, and with radioactive materials, intended to achieve and maintain high standards of RP including the following objectives:

- (a) Controlling occupational and public exposure by:
  - (1) Keeping individual doses below regulatory limits.
  - (2) Avoiding unplanned exposures.
  - (3) Keeping individual risk from lifetime radiation exposure to an acceptable level.
  - (4) Keeping collective doses As Low As Reasonably Achievable (ALARA), and taking social and economic factors into account.
- (b) Preventing the uncontrolled release of contamination or radioactive materials from Nuclear sites through the movement of people and materials.
- (c) Demonstrating the achievement of (a) and (b) through monitoring.

This program complies with the CNSC requirement for all licensees to implement an RP program that meets CSA N286-05 and N286-12 requirements for radioactive contamination control and radiation safety.

### 1.5.5 OPG-PROG-0010, Health and Safety Management System Program

The Ontario Power Generation (OPG) Health and Safety Management System program establishes the process requirements that must be implemented and maintained to ensure that health and safety risks to workers are being mitigated. It also outlines the responsibilities of the various levels of the organization to ensure these activities are carried out.

The Health and Safety Management System includes:

- Occupational conditions and factors that could affect the health and safety of workers, in all workplaces or from work-related activities under the control of OPG.
- Non-occupational health-related conditions and factors that could affect the health of OPG workers where it impacts achievement of OPG's business objectives.
- Public safety as it pertains to reporting requirements and operational risk management.
- Contractor safety

Ontario Power Generation (OPG) has established, documented and implemented this health and safety management system consistent with OPG-POL-0033, OPG Business Model. It is aligned with CSA N286-05, Clause 6.27 Workplace Safety and N286-12, Clause 4.2 Safety Culture. Implementation of this management system fulfills commitments in OPG-POL-0001, Employee Health and Safety Policy and ensures that health and safety risks are managed to

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

achieve the desired objectives and identifies continuous improvement opportunities through a “Plan → Do → Check → Review” cycle of management.

This program is owned and implemented by the Corporate Health and Safety organization under the Employee Health and Safety Policy, OPG-POL-0001.

### 1.5.6 N-PROG-MA-0015, Work Protection

This program ensures establishment of standards and procedures necessary for worker safety where work on equipment requires isolation or isolation and de-energization. This program specifies continuous monitoring requirements necessary to ensure work practices used are safe, uniform, and effective. Effective implementation and control of work protection activities primarily are achieved by instituting high standards, providing a professional environment and sufficient resources, monitoring and assessing performance, and holding personnel accountable for their performance.

### 1.5.7 N-PROG-OP-0006, Environmental Management

This program ensures Nuclear activities are conducted such that their adverse impact on the natural environment is prevented or mitigated. All aspects of the program are conducted to ensure Nuclear complies with environmental regulatory and other requirements including ISO 14001 standard (Environmental Management Systems). The long-term objective is to continuously improve environmental performance.

This program is owned and implemented by the Environment organization under the Environmental Policy, OPG-POL-0021.

### 1.5.8 N-PROG-RA-0001, Consolidated Nuclear Emergency Plan

This program implements and maintains Nuclear’s emergency response capability to protect the public, employees, and environment in the event of a nuclear emergency. Appropriate planning measures are established to adequately respond to postulated abnormal situations, including preparation of emergency operating procedures, event classification, notification requirements, event mitigation, personnel protective actions (on-site and off-site), designation of emergency facilities, and public information requirements.

### 1.5.9 N-PROG-RA-0018, Nuclear Pandemic Plan

This program provides direction and instruction to deal with high staff absenteeism and other circumstances that may arise out of a pandemic illness. Primary aim of the Nuclear Pandemic Plan is to outline concepts, structures, roles, and processes required for Nuclear to ensure safety of employees, assets, and the public, and maintain normal plant operations consistent with the current business plan, in the event of a pandemic.

The overriding principle in this plan is that Nuclear plants shall be maintained in a safe state; maintaining the continuity of generating power only if it can be done safely.

**NUCLEAR MANAGEMENT SYSTEM**

### 1.5.10 Nuclear Regulatory Affairs

Nuclear is committed to protecting the safety of the public, our workers, and the environment, to maintaining national security, and to meeting the international obligations to which Canada has agreed. These commitments are in keeping with the requirements of the Nuclear Safety and Control Act, the Regulations made under that Act, and the licences, permits, and certificates issued by the CNSC pursuant to the Act.

#### 1.5.10.1 N-PROG-RA-0002, Conduct of Regulatory Affairs

This program includes broad guidelines for evaluating impact of licence and permit applications and amendments, providing regulatory and legislative interpretations, and monitoring emerging legislative, regulatory, and industry trends. Successful interface with regulatory agencies is critical in meeting Nuclear's overall objective. Communication with regulatory agencies must be open, honest and forthright. The program defines a set of processes to ensure these expectations are met in an effective and efficient manner.

#### 1.5.11 N-PROG-RA-0015, Nuclear Safeguards

This program puts special controls in place to ensure Nuclear complies with Canada's commitment to the Nuclear Non-proliferation Treaty consistent with International Atomic Energy Agency (IAEA) requirements for storage and handling of Nuclear fuel throughout its life cycle. The program includes the following:

- (a) Communication protocol between the IAEA, CNSC, and Nuclear.
- (b) Obligations to meet applicable regulatory requirements and requirements of associated safeguards procedures.
- (c) Reporting to meet applicable regulatory requirements and requirements of safeguards agreements.

#### 1.5.12 N-PROG-RA-0011, Nuclear Security

Physical plant security is provided to minimize risk to the public, employees, environment, and the business, from sabotage, theft, or other criminal acts. This program supports the need to protect Nuclear assets by:

- (a) Establishing an enhanced state of security readiness as a result of potential terrorism and commitments to the CNSC.
- (b) Maximizing the response capability to contain, mitigate, and terminate a security event that has either occurred or is in progress.
- (c) Minimizing the adverse impact on legitimate plant staff or operations.

This program establishes proactive "best-in-business" security processes and conforms to the goals and objectives of the Corporation, and to legislative requirements such as Security Regulations.

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

### 1.6 Provide Services

#### 1.6.1 Inspection and Maintenance Services

Inspection and Maintenance Services (IMS) is a provider of inspection, specialized maintenance, project management, and technical services to Nuclear and non-Nuclear facilities.

##### 1.6.1.1 I-PROG-AS-0001, Conduct of Inspection and Maintenance Services

This program describes the managed system applied by IMS to provide inspection, specialized maintenance, project management, and technical services to Nuclear and non-Nuclear facilities in OPG. The program ensures quality in IMS and enable IMS to provide products and services in a safe, innovative, responsive, and cost effective manner in accordance with regulatory requirements, owner or customer-specified requirements, and industry standards.

The managed system consists of this program document and interfacing OPG and Nuclear governance, the IMS organization structure, IMS Executive and management teams, and IMS infrastructures consisting of equipment, facilities, processes, and procedures.

#### 1.6.2 Commercial Services

##### 1.6.2.1 N-PROG-AS-0009, Isotope Sales

This program outlines basic conditions for the sale of isotope products and services, including managing, controlling, and documenting activities associated with the sale of any Nuclear isotope-related product or service, in compliance with the Nuclear Safety and Control Act, Nuclear policies, federal non-proliferation regulations, and all other relevant regulations.

#### 1.6.3 N-PROG-AS-0007, Project Management

This program identifies project management processes of planning, organizing, and managing resources to ensure the safe, consistent, effective execution and completion of projects across Nuclear. The program also ensures that safety and quality shall be the overriding priority and will not be compromised for cost or schedule. Projects are widely used in Nuclear for engineering and non-engineering purposes.

### 1.7 Manage Waste

DNWMD is responsible for the life cycle management of radioactive waste for OPG-owned facilities and has direct responsibility for transportation, processing, interim storage, and eventual final disposition of radioactive waste.

DNWMD is also responsible for the management system applicable to the decommissioning of Ontario Power Generation (OPG) owned nuclear facilities and management oversight of the radioactive waste repositories for both low and intermediate level waste and the adaptive phase management deep geologic repository for high level waste.

Work performed inside DNWMD licensed facilities is performed in accordance with DNWMD governing procedures as well as Nuclear governance described in this Charter. When

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

DNWMD performs activities within the bounds of other CNSC licensed facilities, DNWMD complies with the licensee's governing procedures.

### 1.7.1 W-PROG-WM-0001, Nuclear Waste Management Program

This program establishes the overall managed system for Nuclear waste management, and decommissioning and incorporates, directly or by reference, the controls necessary to meet the requirements of the CSA N286-05 and N286-12 Standards, ISO 14001:2004, and DNWMD facilities and activities.

This program describes controls for training, work planning and control, regulatory affairs, records and document management, corrective actions, program assessment, and waste acceptance criteria as they pertain to waste management.

### 1.7.2 W-PROG-WM-0002, Radioactive Material Transportation

This program describes controls that ensure safe, compliant, and efficient radioactive material transportation. In addition, it includes verification that the Transportation Emergency Response Plan is appropriately established to provide corporate emergency response for radioactive material transportation incidents.

### 1.7.3 W-PROG-WM-0003, Decommissioning Program

This program describes controls for the decommissioning of OPG owned Nuclear facilities and provides assurance that work will be planned and controlled in accordance with requirements of CSA N286-05, N286-12 and N294-09, Decommissioning of Facilities Containing Nuclear Substances.

## 1.8 Interfaces

Nuclear interface with other OPG line of business is described below.

### 1.8.1 00216-CHAR-0001, Deep Geological Repository Project, Management System

This management system is applicable to Ontario Power Generation's Low and Intermediate Level Waste (L&ILW) Deep Geologic Repository (DGR) Project for the regulatory approval, design, procurement and construction of the project and the turnover to DNWMD L&ILW organization for ongoing operations. It provides assurance that the L&ILW DGR is designed, procured, constructed, commissioned and turned over in accordance with the requirements of CSA Standards N286-05 as it applies to the L&ILW DGR Project. This management system integrates the requirements for other management system standards for health, safety, environment, security, economics and quality and to meet the principle that safety is the paramount consideration guiding all decisions and actions.

## 2.0 DEFINITIONS AND ACRONYMS

### 2.1 Definitions

**Condition Assessment** is a technical or engineering assessment of the current physical condition of a generating facility and its associated structures. It includes a detailed

## Nuclear Charter

Title:  
**NUCLEAR MANAGEMENT SYSTEM**

assessment of all major SSC, and an estimate of the remaining expected service life for the facility and its key components. The condition assessment may also identify future investment requirements for repair, rehabilitation, modification, or replacement to carry the facility and its associated structures to their planned end of life. The rationale for each investment is identified and potential problem areas are highlighted in order that they can be properly monitored.

**Human Performance** is a series of behaviours executed to accomplish specific task objectives or achieve specific results.

**Nuclear Management System** is the principles, the required supporting actions, and the supporting documentation to support safe and reliable nuclear plants, as defined by CSA N286-05 and N286-12. Paragraphs 0.1 and 0.2. of N286-05 state “safe and reliable nuclear power plants require commitment, and adherence to a set of management system principles and, consistent with these principles, the implementation of a planned and systematic pattern of actions that achieves the expected results”. Paragraph 0.2 of N286-12 states “The management system brings together in a planned and integrated manner the process necessary to satisfy the requirements that must be met to achieve business success and sustainability”. The Nuclear Management System is represented by a governance framework supported by this Nuclear Charter and further ensures that Nuclear Safety is the overriding priority at OPG Nuclear.

## 4.0 REVISION SUMMARY

- Included throughout the document that the Nuclear Management System fulfills the requirement of both CSA N286-05 and CSA N286-12.
- Changes have been made throughout to address questions raised by CNSC in their letter of Nov 18 2013 on CNSC Review of the OPG Business Model, N-CORR-00531-06349, and OPG response N-CORR-00531-06485.
- Section 1.0: The role of providing interpretation of the requirements of the Nuclear Charter and its supporting documents is transferred from the Director Nuclear Oversight to the Director, Nuclear Regulatory Affairs and Stakeholder Relations, to enable clear distinction between operational roles and oversight roles.
- Section 1.0: Added OPG Behaviours, to go along with Vision, Mission, Cornerstones and Values.

## Nuclear Charter

Usage Classification:	Sheet Number:	Page:
Information	N/A	30 of 32

Title:

### NUCLEAR MANAGEMENT SYSTEM

- Section 1.0: Clarified the meaning of an “approved” quality system for organizations that support nuclear.
- Section 1.1.1: Per DCR 1259370, the program description has been updated for alignment with N-PROG-AS-0001-R016. In addition, details have been provided to clarify how the CNO exercises control over Nuclear programs and maintains an effective management system compliant with CSA N286.
- Section 1.1.1.1: Identified that the Nuclear Organization standard, N-STD-AS-0020 is owned and implemented by the People and Culture Organization.
- Section 1.1.2: Clarified the role of governance within the Nuclear Management System
- Section 1.1.3: New section is added on OPG-PROG-0001 Information Management as discussed in N-CORR-00531-06485.
- Section 1.1.7: Identified that the Independent Assessment Program , N-PROG-RA-0010 is owned and implemented on behalf of the CNO by the Finance Organization.
- Section 1.1.8: Identified that the Training Program , N-PROG-TR-0005 is owned and implemented by the People and Culture Organization.
- Section 1.2.1: The functional areas for Nuclear Operations have been updated to reflect the latest version of the WANO PO&C's.
- Section 1.3.3: Identified that the Materials Management Program , N-PROG-MM-0001 is owned and implemented by the Supply Chain Division of the Business and Administrative Services Organization.
- Section 1.4.1.10: Per DCR 1289430, the major component description “Severe Accident Management” has been changed to “Beyond Design Basis Accident Management”
- Section 1.4.2.4: Per DCR 1260200 was revised for consistency with Licence Condition 6.2 in the Darlington PROL 13.00/2014.
- Section 1.4.2.6: Per DCR 0129921, the Procurement Engineering Program document has been superseded and thus removed from this Charter. The Procurement Engineering program requirements have been included in the Design Management and Engineering Change Control programs.
- Section 1.5.1: Identified that the procedure on the Limit of Hours of Work, N-PROC-HR-0002, is owned by the People and Culture Organization.
- Section 1.5.4: Per DCR 0129228, the error with respect to indentation was corrected and the program description is now consistent with information in N-PROG-RA-0013.
- Section 1.5.5: The Conventional Safety Program, N-PROG-HR-0004, has been replaced with the Health and Safety Management System Program, OPG-PROG-0010.

Title:

### NUCLEAR MANAGEMENT SYSTEM

- Section 1.7: has been revised to more succinctly describe the responsibility of the Decommissioning and Nuclear Waste Management Division (DNWMD).
- Section 1.8.1: Per DCR 0129494, N-PROG-MA-0024 Conduct of Nuclear East Facilities Maintenance and Engineering, is superseded by OPG-PROG-0032. Also, this program has been removed from N-CHAR-AS-0002 - the approval to remove was granted by the Nuclear Management System Review Board at its Feb. 20, 2014 meeting. The minutes of the meeting is documented in file N-MNTS-08100-T5.
- Section 2.1: Updated the definition of the Nuclear Management System to indicate that it is now also consistent with CSA N286-12, paragraph 02 "The management system brings together in a planned and integrated manner the process necessary to satisfy the requirements that must be met to achieve business success and sustainability".
- Section 2.1: Deleted unnecessary and not fully comprehensive definition of "event".
- Section 3.0: Added CSA N286-12 as a reference. Also, N-PROG-MP-0011 was removed as reference.
- Appendix A:
  - Combined the two Governing Document Framework tables into one.
  - N-PROG-MA-0024 Conduct of Nuclear East Facilities Maintenance and Engineering was removed.
  - N-PROG-MP-0011, Procurement Engineering, was removed.
  - The Conventional Safety Program, N-PROG-HR-0004, has been replaced with the Health and Safety Management System Program, OPG-PROG-0010.

Title: <b>NUCLEAR REFURBISHMENT - GATE REVIEW BOARD - TERMS OF REFERENCE</b>
---

## 1.0 OBJECTIVE

The Darlington Nuclear Refurbishment program will undergo an evolution of detailed planning after scope approval. During the detailed planning phase, the project will flow through the Identification Phase, Initiation phase, and the Definition Phase. The Execution Phase of the program will follow the Definition Phase and will lead to the Close out phase (including Commission/Turnover and Final Project Close out).

The Gated concept is designed to control funding approval through the project phases, and to control steps of phase progression approvals for each individual project.

The Gated Process is intended to provide a standardized, comprehensive review of project scope, schedule, risk, cost and quality in order to enable the Gate Review Board (GRB) to approve the progression of project work through the next project phase(s).

The senior management team (Gate Review Board) mandates 'check-points' at each major project phase in order to ensure the project is on track in its development regarding scope, cost, quality and schedule.

A gate serves as the project budget allocation process upon GRB approval, the budgeted funds (including contingency) required for the approved scope of work and released to the project.

GRB will review the past performance of the previous gate, life cycle project viability (including impact on program viability) and the readiness for the next phase.

For each of the gates in the process, there is a Gate Progression Form that will be required for submission at each Gate Review Board meeting.

Progress through that Gate is approved by the Gate Review Board based on acceptance of the required deliverables, as documented on the Gate Progression Form, and as presented by the Project Manager at the Gate Review Board meeting.

Prior to the submission of the Gate Documents to the GRB a Pre-Gate Readiness Review is performed to ensure the quality meets the governance requirements and ensures consensus that Gate information has been satisfactorily prepared.

A Pre-Gate Readiness Review provides an assessment of the rigor and quality of the Gate Approval Package for cost, estimating, scope, risk and schedule, and ensures adequate definition, strategy, and supporting documentation is available prior to a GRB decision gate.

The Pre-Gate Readiness Review is performed per NK38-PLAN-09701-10227 Terms of Reference that describes the function and role of the Darlington Nuclear Refurbishment Program Pre-Gate Readiness Review/Alignment Meeting.

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10006</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>6 of 8</b>
Title: <b>NUCLEAR REFURBISHMENT - GATE REVIEW BOARD - TERMS OF REFERENCE</b>		

### 1.1 Gate Review Board (GRB)

The primary focus of this document is to describe the function and role of the Darlington Nuclear Refurbishment Program Gate Review Board (hereafter referred to as the 'GRB'). The GRB shall provide review and approval of proposed strategies, options, funding, and schedule of the projects within the refurbishment program in accordance with the Nuclear Projects Gated Process (N-MAN-00120-10001). Approval of progression to the next phase is the outcome of the Gate Review Board Meetings.

The GRB will work within the governance and milestones established by the Program, including all Program level scope management deadlines.

## 2.0 GRB STRUCTURE - MEMBERSHIP AND QUORUM

### 2.1 Gate 0 (GO) Program Scope Review Board (PSRB)

Gate 0 approval will be done in accordance with the existing Program Scope Review Board. Quorum is per the Darlington Refurbishment Program - Program Scope Review Board Terms of Reference - NK38-PLAN-09701-10003.

### 2.2 Gate 1 to Gate 5 (G1 to G5) Gate Review Board (GRB)

The GRB will be comprised of the following team members:

- SVP - Nuclear Projects (Sponsor)
- Director Planning and Control (Chair)
- VP Refurbishment Engineering
- VP Refurbishment Execution
- VP Refurbishment OP's & Maintenance
- VP Nuclear Finance
- VP Nuclear Projects Oversight
- Director Commercial Strategy
- Director Supply Chain
- VP Projects and Modifications (for projects being executed by Projects and Modifications)

Quorum is Chair plus 5 team members.

The Chair will assign a GRB secretary from within the Planning and Control organization.

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10006</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>7 of 8</b>
Title: <b>NUCLEAR REFURBISHMENT - GATE REVIEW BOARD - TERMS OF REFERENCE</b>		

In the event of the unavailability of the individual specified the Board member may delegate the meeting attendance to a knowledgeable and empowered representative. This representative must be a Stratum 4 Level or higher.

In addition to Quorum members, the accountable project sponsor and project manager are to attend the meeting to present.

### 3.0 GRB ROLES, ACCOUNTABILITIES

The GRB consists of voting members, where quorum is required in order to record a decision. The review and recommendation for progression to the next gate shall consider the project contribution in meeting the Program objectives, the technical appropriateness of the proposed alternative options, and the impact on refurbishment cost and schedule.

The gate package will be provided to the RPET members for their review one week in advance of the scheduled gate meeting. In advance of the Gate Meeting, each voting member shall review the material submitted by the Project Manager and, where required, seek clarification in advance of the meeting in order to maximize the effectiveness at the meeting. It is expected that voting members will perform a deeper review of all submittals relevant to their specific role.

Voting members will be expected to review all information relevant to their role, as provided at the Gate.

A contrarian (black hat) will be assigned at each GRB meeting to ensure an independent, challenging view is performed prior to acceptance of project progression to the next phase. This person should not be a voting member.

The GRB voting members will strive to arrive at a consensus for all requests to progress the project to the next phase.

The Director of Planning and Control shall assign a Secretary of the GRB and will ensure that all decisions and actions are recorded and followed up at each Gate Meeting.

Upon approval of gate progression by the GRB release of funds for the next phase will be controlled by the Planning and Controls organization with support from Nuclear Finance.

### 4.0 GRB PROCESS

The Gate Review Board will meet bi-weekly, as required. The GRB Chair will ensure that meetings are on the Refurbishment Master schedule and booked using Outlook.

All meeting material must be issued to the GRB meeting one week in advance; if there is no project requiring GRB approval for the upcoming meeting, it will be cancelled.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10006</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>8 of 8</b>
Title: <b>Nuclear Refurbishment - Gate Review Board - Terms Of Reference</b>		

Meeting materials will include, for the specific project progressing through a gate, the Gate Presentation, the Gate Progression Form, and a link to all supporting material.

The status of all previous GRB actions will be monitored at each GRB meeting.

Deliverables will be prepared and submitted in accordance with approved templates as documented in the Nuclear Projects Gated Process (N-MAN-00120-10001-GRB).

The key outputs from the GRB are:

- Approval of progression to the next phase.
- Gate Progression Form Signoff.
- Documentation of the decisions with the rationale and basis so that these are available for reference purposes, if and when needed.
- Documentation of any actions taken at the gate meeting, and or status of existing actions.
- Documentation of the outcomes of the gate meeting and the next immediate steps.

### 5.0 DURATION

This GRB shall remain in this role until the completion of the Darlington Refurbishment Program.

### 6.0 DOCUMENTATION

A record of all GRB decisions and other gate related documents will be saved under the GRB SharePoint library.

Sheet Number: <b>GRBGRB</b>	Revision Number: <b>R002</b>	Page: <b>4 of 13</b>
Title: <b>NUCLEAR PROJECTS - GATED PROCESS</b>		

### 1.0 DIRECTION

#### 1.1 Overview

In accordance with N-STD-AS-0028, Project Management Standard, all projects executed in Nuclear must progress through the Gated Process. This document describes the Gated Process.

As a project progresses through its development, it will progress through a project life cycle, or phases, including: initiation, development, definition, execution, and closeout.

The transition from one phase to the other is called a Gate. Project Gates are used to assess a projects readiness to proceed to the next phase and will assess and recommend funding.

The Governing bodies who will review project readiness and recommend funding are the Gate Review Board (GRB) for Nuclear Refurbishment and the Asset Investment Screening Committee (AISC) for Nuclear Operations Projects. Decisions to approve, deny or postpone gate approvals for the next project phase are recorded along with any provided direction.

This manual provides guidance on the Nuclear Projects Gated Process and complies with N-STD-AS-0028, Project Management Standard. Projects shall obtain funding in accordance with the approved OPG-STD-0017 Organizational Authority Register (OAR) and OPG-STD-0076 Developing and Documenting Business Cases standards. When a business case is required, it will be submitted at the same time as the Gate package and subsequently routed for further approvals per the OAR.

The intent of the Gated Process is to enable flexible management control and oversight of project development and recommendations of scope approval with attendant releases of funds through the project life cycle. The process ensures that projects meet a consistent expectation of quality and performance.

Gate progression approval is based on:

- Meeting previous phase requirements
- Instilling confidence that the project team will deliver quality, safety, cost, value for money, and schedule performance for the next phase(s).

#### 1.2 Gated Process

OPG Nuclear Projects Gated Process matrix is attached at Appendix B. The matrix is a tool that depicts the five phases of a project's life cycle and identifies required information (Phase Outputs and Gate Submission Documents) that drive the decisions that are made at the end of each phase.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>GRBGRB</b>	Revision Number: <b>R002</b>	Page: <b>5 of 13</b>
Title: <b>NUCLEAR PROJECTS - GATED PROCESS</b>		

After identifying the business need, gap or opportunity, and project alternatives, project sponsors shall also confirm that the proposed benefits are aligned with the OPG-N strategic business objective and obtain the necessary approvals to proceed to the Initiation Phase and Initiation Funding (if required). Initiation Phase Funding is only available to Project Execution Authorities that do not have Base OM&A budget. This phase is the Identification Phase of the business proposal, and ends at Gate 0. The purpose of Gate 0 is to approve progression to the Initiation Phase. The Project Executing Authority may not be involved at this point.

A brief description of each phase is as follows.

### Initiation Phase

The objective of the Initiation Phase is to assess the project alternatives and complete conceptual design or scoping (for non-modification projects) of the preferred alternative along with cost estimate and schedule. The Project Execution Authority develops the Development Phase business case on behalf of the Project Sponsor. This assessment forms the basis for the Gate 1 decision - whether or not to approve progression to develop the project further. There will be cases in which the Project Sponsor would play the role of the Project Execution Authority during the Initiation Phase.

### Development Phase

The objective of the Development Phase is to develop the preferred alternative to a point where there is confidence that all major elements of the scope are accounted for. The Project Execution Authority establishes the project team, which goes forward with developing the Project Management Plan (PMP); refining the schedule, cost estimate, and design; and developing the Definition Phase business case. A contracting strategy is also developed during this phase. At the conclusion of this phase, Gate 2 decision approves progression to define the project.

### Definition Phase

The objective of the Definition Phase is to demonstrate readiness for execution. The definition phase includes the procurement of engineered equipment, completion of detailed engineering, preparations for construction/field work, and, detailed scoping of work (for non-modification projects). During this phase inputs to the performance baseline are refined, engineering designs are completed, and execution contracts are assembled. At the conclusion of this phase, the Gate 3 decision certifies to the Project Execution Authority that commitment to complete the project is warranted.

### Execution Phase

The objective of the Execution Phase is the completion of detailed engineering (if not completed in the definition phase) and procurement, and project construction/ installation, commissioning and the transfer of a completed product to the sponsor, business unit and/or station. The Execution Phase typically consumes most of a project's budget. At the conclusion of this phase, the Gate 4 certifies to the Governing Body that the project is complete.

Title: <b>NUCLEAR PROJECTS - GATED PROCESS</b>		

### Closeout Phase

The Closeout Phase is the last phase in the project life cycle and includes the final actions to complete all activities and formally finish and close out the project. This phase should be completed as quickly as possible after final Available for Service (AFS) in order to minimize project costs. Gate 5 normally does not require a Gate Decision meeting. Typical closeout deliverables include a de-mobilization plan and must be presented for non-standard execution strategies. In accordance with OPG-PROC-0056 Post Implementation Review, the project performance and actual business benefits are evaluated against the baseline plan and summarized in a Post Implementation Review (PIR) Plan.

Appendix A depicts the end-state of the standardized Gated Process.

Decision gates must be shown as milestones on the project schedule. There may be additional decision gates required within a project phase (e.g. G2a, G3a) depending on project risk, funding release and execution strategy, and organization process. This should be documented within the project's gate progression strategy. Sequential unit execution may also require additional gates between phases. Conversely, simpler projects may not be required to use every gate nor have a formal review and approval of every gate at the AISC or GRB.

### **1.3 Graded Approach for Gate Approvals**

The intent of the risk-based, graded approach is to match the level of effort in the Gate progression strategy with the potential impact to safety, quality, cost and schedule.

The need for more or fewer gates, combining gates and deliverables, and bringing deliverables forward or back, is part of defining the gate progression strategy following a graded, risk based approach suitable to the project. The strategy may deviate from the standard five gates illustrated in Appendix B but should be documented and approved by the Governing Body prior to implementation. The Governing Body may direct changes in a project's strategy during the project lifecycle when required.

The logic and method of implementation for the graded approach are defined in business unit level guides, manuals and Terms of Reference for AISC and GRB.

### **1.4 Pre-Gate Readiness Review**

A pre-Gate Readiness review provides an assessment of the rigor and quality of the Gate Approval Package for cost, estimating, scope, risk, schedule, etc. prior to a decision gate. The readiness to submit is documented in the applicable gate progression documentation and signed by the project manager to attest to the completeness of the package. The Terms of Reference for each Pre-Gate Readiness Review is described in NK38-PLAN-09701-10227.

### 2.0 DEFINITIONS AND ACRONYMS

#### 2.1 Definitions

**Sponsor:** organization, department or business unit that identifies a need and initiates the creation of a project.

**Project Executing Authority:** organization, department or business unit that manages the planning, funding, risks and execution of a project.

#### 2.2 Acronyms

AFS	Available for Service
AISC	Asset Investment Steering Committee (Operations)
BCS	Business Case Summary
BOE	Basis of Estimate
CWP	Comprehensive Work Package
DRAS	Decision Record Analysis Summary
DSR	Darlington Scope Request
EA	Environmental Assessment
GRB	Gate Review Board (Nuclear Refurbishment)
ISR	Integrated Safety Report
ITP	Inspection and Test Plan
NR	Nuclear Refurbishment
NWMD	Nuclear Waste Management Division
PDRI	Project Definition Rating Index
PIR	Post Implementation Review
PMP	Project Management Plan
PSA	Purchase Service Agreement
SRB	Scope Review Board
WO	Work Order

Title: <b>NUCLEAR PROJECTS - RECORDS AND DOCUMENT MANAGEMENT</b>		

### 1.0 DIRECTION

This manual provides direction on records and document management pertaining to Nuclear Projects and complies with N-STD-AS-0028, Project Management Standard.

Nuclear Projects records are corporate assets and shall be stored in approved information management repositories such as "Asset Suite".

### 1.1 Overview

This manual provides direction to ensure that records in the custody or control of Nuclear Projects are managed consistently, protected and accessible throughout their life cycle.

Nuclear Projects adheres to all Nuclear and OPG governance in Information Management including records management and document control.

Information Management Services; Records and Document Management (RDM) team provides the centralized (centre-led) control function within the established processes.

Specific document numbering guidance is provided for the Nuclear Refurbishment project.

### 1.2 Registering and Processing Records and Controlled Documents

Document Owner shall adhere to the following records governance.

- OPG-PROC-0019, Records and Document Management
- N-PROC-AS-0003, Controlled Document Management
- N-PROC-AS-0042, Quality Assurance Records.

#### 1.2.1 Document Owner shall complete the following actions when registering *documents* for storage in Asset Suite.

For a controlled document email RDM via "DNGD: Refurb DM" providing the following portions of the document number and requesting the next in sequence #.

For records, obtain the next in sequence # via the automatic sequence generator url below.

## NUCLEAR PROJECTS - RECORDS AND DOCUMENT MANAGEMENT

Example of a document number and retention is shown below

Construction of a Nuclear Projects Document Number	
Property Number	E.g. NK38, N, D, P etc. <u>Nuclear Refurbishment Specific Documents</u> - Use NK38
Document Type	Select a Doc Type (Ref OPG-STD-0032. E.g. PROC, CORR, REP) <u>Nuclear Refurbishment Specific Documents</u> - If a technical procedure revised under N-PROC-AS-0028 then an additional document number element (NR) is required. This will ensure Darlington Operations do not inadvertently use the document on a non layup unit. E.g. NK38- <b>NR</b> -OM-33000-XXXXX E.g. Doc Types OTP, SSRT, OM, ARM, CCP, CLP, CMP, MMP, and CTP
Subject Classification Index (SCI)	Select a SCI - Ref N-GUID-08133-10000.
Sequential (unique) Index #	RDM will provide unique index numbers. XXXXXX for a controlled document XXXXXXXX for a record
Retention	Select a standard retention - Ref N-GUID-08133-10000.
Project ID #	Include Project ID # <u>Nuclear Refurbishing Specific Documents</u> - Use either a) the general NR project ID # 10-73000 or b) the specific project bundle ID #
Security Classification	Select a Security Classification – Ref OPG-STD-0030

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>RDM</b>	Revision Number: <b>R001</b>	Page: <b>6 of 9</b>
Title: <b>NUCLEAR PROJECTS - RECORDS AND DOCUMENT MANAGEMENT</b>		

Nuclear Projects has a well defined project numbering system that provides a common framework for the management of project information. All project controlled documents and records must have a file number applied.

### 1.3 Working Files – OPG Internal SharePoint Team Sites for Collaboration

Interactive team sites have been created in SharePoint for collaboration of working files. A series of document libraries have been set up to provide a central storage and collaboration space for documents and information. The library structure aligns with the standard work breakdown structure for the associated project. Refer to N-MAN-00120-10001-RDM-01, Nuclear Projects SharePoint 2007 for detailed instructions when working in SharePoint team sites.

To enhance search and retrieval, where applicable, all working documents should be named according to the document number along with the revision number; e.g. N-MAN-00120-10001-RDM-R001.doc.

### 1.4 Submissions / Transmittals Between OPG and Suppliers

Post contract, all formal project documents, between OPG and suppliers shall be sent to via either the Supplier document hub or the Electronic Document Management System that is progressively replacing the SDH.

#### 1.4.1 Supplier Document Hub (SDH)

The SDH was created to electronically log, track and workflow the exchange of documents and collaboration between OPG and Suppliers. Refer to MAN-00120-10001-RDM-02, Nuclear Projects Supplier Document Hub.

All documents sent to an external party will be documented using N-FORM-10554, Document Transmittal Record as per OPG-STD-0030, Classification, Protection and Release of Information and transmitted to the supplier using SDH.

#### 1.4.2 Electronic Document Management (EDMS)

The EDMS is a Commercial off the Shelf application developed specifically to manage formal submissions between plant owners and suppliers for major construction projects. EDMS is progressively phasing out the SDH.

### 1.5 Management of Large Size Files

When a document size is too large to send via e-mail (>10 MB) the file can be saved to a Network Shared Folder for internal documents at \\corp.opg.com\opg\nucwebdocs\NuclearProjects.

#### 1.5.1 Transfer of Video Files to Records Management for Filing

This process is to be followed when video files are sent to RDM for filing (e.g. inspection files).

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>RDM</b>	Revision Number: <b>R001</b>	Page: <b>7 of 9</b>
Title: <b>NUCLEAR PROJECTS - RECORDS AND DOCUMENT MANAGEMENT</b>		

- (a) Submitting organization to provide two Digital Video Discs (DVDs) to Records Management for dual storage. Refer to OPG-STD-0057, Electronic Document Management for storage and handling of DVDs
- (b) RDM will index the item in Asset Suite
- (c) One copy of the DVD will be stored in a Secure Storage Room and the second copy will be stored in a QA Vault
- (d) RDM will record the storage locations in Asset Suite.

### 1.5.2 Retrieving Video Inspection Files for Viewing

- (a) Send e-mail to appropriate Records and Document Management mailbox providing the record number of the video to be viewed
- (b) RDM will upload the video to \\corp.opg.com\opg\nucwebdocs\NuclearProjects
- (c) All staff have “read only” access to the shared drive and the ability to view the file and save to a different location
- (d) A link via SharePoint can be created to view the file
- (e) This shared drive is for short term storage of files – one year plus current
- (f) If a DVD of the file is required the individual can burn the DVD from the shared drive and delete the file.

## 1.6 E-mail Management

E-mails that are determined to be Official Records as per OPG-PROC-0093, E-Mail Management, are declared and kept to demonstrate conformance to standards or compliance with laws or to retain knowledge and information of business importance that might otherwise be inaccessible when required.

**Note:** Users **should not** store official *records* in local e-mail folders.

## 2.0 RECORDS

- 2.1 Any controlled documents which may be produced as a result of this document should be managed in accordance with N-PROC-AS-0003, Controlled Document Management.
- 2.2 Any records which may be produced as a result of this document should be managed in accordance with OPG-PROC-0019, Records and Document Management.
- 2.3 The following records may be generated by use of this document and shall be registered in appropriate document management system in accordance with the following table.

<b>SDH</b>	Supplier Document Hub

### 4.0 DEFINITIONS

**Controlled Documents:** A subset of *records* and has a defined revision control process.

**Document** is recorded information that describes, specifies reports, certifies, requires, or provides annotation or results. Documents include paper copies (procedures, manuals, correspondence, etc.), electronic media (such as word processor files and computer databases), and any other sources of information used to design or operate a facility or make sound technical decisions. It includes both current and working documents and historical information. A document becomes a record when it is declared as a record by the creator, receiver, or document owner or is duly approved and authorized.

**Document Owner:** Individual responsible for the integrity (accuracy, completeness, and consistency) of a document, throughout its life cycle. Document owners can be individuals, or groups (such as a department or division in Ontario Power Generation). The accountability for the Document Owner may be delegated.

**Governing Documents:** Are a subset of *records* and comprise the NNP management system and provide assurance that the NNP will be engineered, purchased, constructed, commissioned and turned over in accordance with the requirements of Canadian Standards Association Standard N286-05 "Management system requirements for nuclear power plants" (N286-05). Governance document types include CHAR, PROG, PROC, STD, PLAN, INS and FORMs.

**Record**, also called "official record", is a document that has been declared (in an electronic system) or otherwise authenticated (i.e., signed, stamped, initialled, clearly

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>

identified, or endorsed electronically or otherwise). A record provides evidence of the performance of business activities and/or the achievement of results. Typically, records are kept to demonstrate conformance to standards or compliance with laws, or to retain knowledge and information of business importance when needed. The record is that version of a document designated to be maintained in an Approved Information Management System (for electronic records) or a records centre (for hard copy records). Where possible, the original signed copy of a document shall be designated as the record.

**Quality Assurance Record** is an essential record that provides evidence of licensing, design, construction, operation, maintenance, testing, and modification of nuclear facilities.

Permanent Quality Assurance Record is a *record* which meets one or more of the following criteria and is maintained for the life of an item or the facility such as the following:

- Significant value in demonstrating capability to operate safely.
- Significant value in maintaining, reworking, repairing, replacing, or modifying a structure, system, or component.
- Significant value in determining the cause of an accident or malfunction of an item or an unscheduled occurrence.
- Required to provide baseline data for periodic inspections.
- Significant value during a facility's decommissioning of a system, component, or structure.

Temporary (Non-Permanent) Quality Assurance Record is a record which provides evidence an activity has been performed in accordance with specified requirements, but does not meet the criteria for a permanent Quality Assurance record.

## NUCLEAR REFURBISHMENT – DATA MANAGEMENT PLAN

### 1.0 PURPOSE

#### 1.1 Data Management

Information entered into any database or software is owned by the group entering the information. Once in the database or software included the information it's considered data.

The Nuclear Refurbishment – Data Management Plan *NRDMP* describes how the program will conform to [OPG-STD-0057 OPG Standards for Electronic File Submissions](#) on archiving, dissemination and sharing data including the requirement to “share with stakeholders, within a reasonable time, the primary data, samples, physical collections and other supporting materials created or gathered.”

Once the data is converted to a product such as document, report, drawing, schedule or email, etc., the NR organization will follow OPG-PROC-0019, Records Management and other supporting records management governance and procedures.

#### 1.2 Objectives

This plan will make certain that the data produced during the period of this project will be appropriately managed to ensure its usability, access and preservation over the course of the project until closure.

**Note:** This plan is a living document and will be revised to reflect updated information as required. Areas where known revisions will be required at a future date are noted in the relevant sections.

### 2.0 ROLES AND ACCOUNTABILITIES

There are 3 main groups who accountable for Nuclear Refurbishment data management. All NR Staff and contractors are required to comply with this plan.

#### 2.1 IT Programs

Data storage, architecture and its strategy is managed by the CIO IT Program. This ensures that size of storage; classifications are current and meet the demand of the entire program.

#### 2.2 Project Manager Direction

Project managers and their delegates shall keep informed and ensure management of the software content of the day-to-day data activities. Good practice would be to establish periodic reviews of data within their project teams in line and follow the OPG Electronic, Records and Document Management activities with any products produced.

#### 2.3 Project Management Office (PMO) Role

Ensures strategy, project management governance, process, standards and historical data is archived and/or protected, are followed by performing regular assessments of data in projects and the program. These processes can feedback into the standards definition.

Sheet Number: <b>RDM-20</b>	Revision Number: <b>R000</b>	Page: <b>4 of 13</b>
Title: <b>NUCLEAR REFURBISHMENT – DATA MANAGEMENT PLAN</b>		

### 3.0 EXPECTED PROGRAM DATA

#### 3.1 Methods

Electronic data is expected to be produced throughout the life of the program.  
Sources include:

- Documents
- Reports
- Emails
- Drawings
- Schedules
- Contractual and financial data
- Scope management data
- System and station configuration data
- Environment, health and safety data
- Productivity data (materials and hours)

The data will come in the form of raw system data as well as documents in various formats (Word, Excel, Visio, PDF, etc.). The table in appendix “A” outlines the main applications and databases that will be used by the NR Program:

#### 3.2 Data Retention

All data will be sent to records/archived and retained for the life of the program plus 10 years as per OPG-MAN-08133-0001, 01-03-01, Records Retention.

### 4.0 STAKEHOLDERS

The main stakeholders of this plan are OPG Nuclear personnel. External users are the CNSC, Ministry of Energy and OPG Board of Directors and others from time to time.

### 5.0 ACCESS, SHARING AND REUSE

The primary means of document control is the SharePoint Team sites. Hierarchical taxonomy, Metadata and in some cases WBS structure are in place to easily retrieve working documents. The secondary means is Shared folders.

Vendor data is primarily electronic and interfaces primarily via the OPG Nuclear Electronic Document Management System (EDMS) unless otherwise specified.

The EDMS is a nuclear interface with Passport, maintained by the CIO. In the Passport system data can be accessed by providing descriptive and variable/question-level search; topical browsing; data extraction and re-formatting; and on-line analysis.

## Report

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RDM-20</b>	Revision Number: <b>R000</b>	Page: <b>5 of 13</b>

Title:

### **NUCLEAR REFURBISHMENT – DATA MANAGEMENT PLAN**

NR data will comply with all OPG data governance as per [OPG-STD-0057 OPG Standards for Electronic File Submissions](#). Compliance including good contract management processes and practices is also an expected behaviour. This document is not meant to replace or provide guidance for managing contractual disputes or preparation of evidence in any proceedings.

Terms that guide how NR Program data will be shared and reused are defined below, including when the data will be accessible, how long the data will be available (either during or after the Program), and how access can be gained.

The data will not be encumbered with intellectual property rights (including copyright, database rights, license restrictions, trade secret, patent or trademark) by any party; nor is subject to any additional legal requirements.

Application or Database	Timing of Data Availability/ Currency (phase)	Duration of Availability/ Currency	Accessibility Guidelines (users, privacy, etc.)	Archive Requirements
-------------------------	--	---------------------------------------	--	----------------------

## **6.0 STANDARDS FOR DATA, METADATA, FORMAT CONTENT INFORMATION**

Once a report or document is created, its imperative that the NR organization follows the OPG-PROC-0019, Records and Document Management.

Documentation detailing the sources, coding, and editing of all data, in sufficient detail to enable users to replicate them from original sources; and descriptive metadata for each study including a title, author, abstract, descriptive keywords, and file descriptions.

Electronic Documents will be prepared using applications/software as described in section OPG-STD-0057 OPG Standards for Electronic File Submissions.

Digital copies will be indexed into Asset Suite by OPG for permanent record as required. By exception, OPG may request hard copies be provided. For preservation and long-term access, data collection will be accompanied with proper documentation and associated metadata.

## **7.0 FREQUENCY OF STORED DATA SENT TO RECORDS**

Every department in Refurbishment will save previous months data in the approved format and sent to records within 10 days after the monthly reporting cycle.

## **8.0 CIO SUPPORT**

### **8.1 Security Recover Ability**

OPG server drives are backed up by CIO. This will allow full recovery of data in the event of catastrophic failure. All of these systems will be in place for the 10 year minimum period post-refurbishment.

Title:

### **NUCLEAR REFURBISHMENT – DATA MANAGEMENT PLAN**

#### **8.2 Storage, Backup, Replication and Versioning**

The CIO provides automatic version (revision) control over all deposited materials and no versions of deposited material are destroyed except where such destruction is legally required. All systems providing on-line storage for the Nuclear Refurbishment Program are contained in a virtual and physical secured facility that is continually monitored. System backups are made on a daily basis.

#### **9.0 BUDGET**

The cost of preparing data and documentation will be borne by the program, and is already reflected in the business costs included in the current budget.

NR Infrastructure will support costs for the life cycle of the NR Program. This budget resides within the NR Infrastructure department over the lifetime of the project once complete the burden will be turned over to the CIO as appropriate. This includes any project or capital costs to facilitate the implementation of this plan.

Title:

**NUCLEAR PROJECTS COST ESTIMATING**

## 1.0 DIRECTION

### 1.1 Introduction

1.1.1 Cost estimating is the process used to determine the total cost of labour, materials, equipment, professional fees, and other resources, required for the execution of a project or part of a project. Estimates are also used to evaluate changes, alternatives, and what-if scenarios to assist in decision making. An accurate cost estimate leads to a more precise project schedule and budget which forms the basis for project planning, decisions, value and performance.

1.1.2 This guide complies with N-STD-AS-0028, Project Management Standard.

1.1.3 The estimating process is mainly comprised of:

- Identifying the scope of work, project constraints and assumptions.
- Quantifying the resources required.
- Applying costs to the resources.
- Adjusting or factoring the pricing based on project environment.

1.1.4 The quality of a project estimate is directly proportional to how well the project scope has been defined. Improved scope detail leads to improved estimate accuracy.

1.1.5 An estimate is not complete without considering the project's schedule-related constraints as the time allocated to execute the project will have considerable impact to cost.

1.1.6 Project Manager accountabilities for the estimating process include:

- (a) Provide clear direction on project and estimate deliverables and requirements.
- (b) Provide the required relevant and accurate scope and supporting information to prepare a thorough estimate.
- (c) Review and understand the estimate results to ensure the estimate meets project and Gate requirements, and be able to effectively communicate the results.

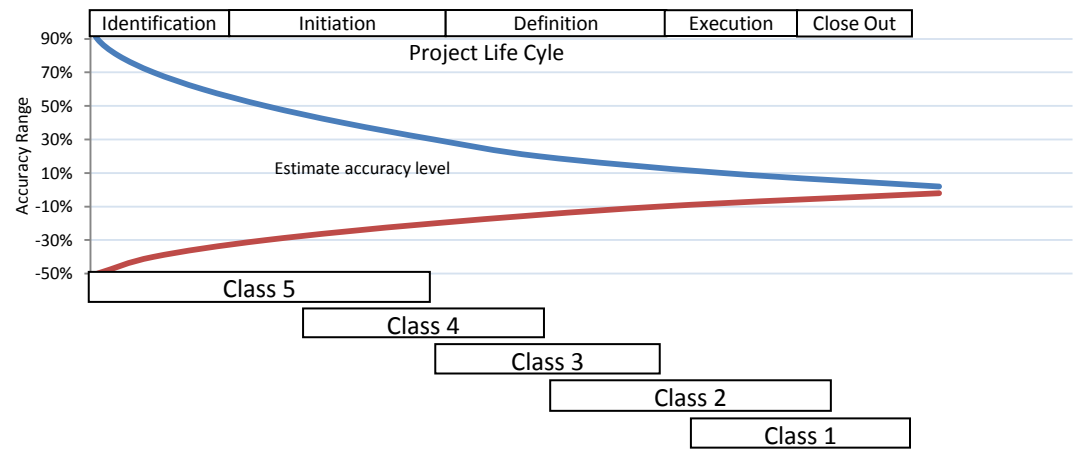

### 1.2 Estimate Classes and the Project Life Cycle

Estimating is a project planning activity that is repeated and refined for each funding release and decision gate of the project to reflect the refined scope and details. The accuracy of the total project cost estimate is expected to improve with each iteration, this is illustrated in Figure 1, Total Project Estimate Accuracy During Typical Project Lifecycle.

**NUCLEAR PROJECTS COST ESTIMATING**

**Table 1 - AACEi Estimating Classification**

Estimate Class	Primary Characteristic	Secondary Characteristic		
	Maturity Level of Project Definition Deliverables Expressed as % of complete definition	End Usage Typical purpose of estimate	EXPECTED ACCURACY Typical variation in low and high ranges [a]	Methodology Typical estimating method
Class 5	0% to 2%	Concept screening	L: -20% to -50% H: +30% to +100%	Ratio from existing units, sales estimates, or published costs. Factored estimate based on appropriate equipment sizes, general features and dimensions <u>Examples Methods</u> Capacity Factored Parametric or Analogous Estimating Method Expert Judgment Analogy
Class 4	1% to 15%	Study or feasibility	L: -15% to -30% H: +20% to +50%	Factored estimate based on equipment sizes, soil and site data, site work, buildings, structures, piping, mechanical and electrical information. Allowances where required for non-quantifiable requirements. <u>Example Methods</u> Equipment Factored Parametric Estimating Method
Class 3	10% to 40%	Budget authorization or control	L: -10% to -20% H: +10% to +30%	Some factoring, some quantity takeoff from preliminary equipment arrangements and architectural drawings and information. Vendor quotes for major equipment. Other owner's costs included. Allowances where required. <u>Example Methods</u> Semi-Detailed Unit costs with Assembly level line items
Class 2	30% to 70%	Control or bid/tender	L: -5% to -15% H: +5% to +20%	Detailed activity-based unit-cost with forced detailed takeoff. <u>Example Methods</u> More definitive, various including, expert opinion, learning curve.
Class 1	50% to 100%	Check estimate or bid / tender	L: -3% to -10% H: +3% to +15%	Detailed activity-based unit-cost with detailed takeoff <u>Example Methods</u> Deterministic, most definitive, including expert opinion; learning curve

Note [a]:The state of process technology, availability of applicable reference cost data, and many other risks affect the range markedly. The +/- value represents typical percentage variation of actual costs from the cost estimate after application of contingency (typically at a 50% level of confidence) for given scope.

Table 1 - AACEi Estimating Classification, lists the AACEi classes of estimates, their intended purpose, the level of definition and the methodology used to prepare them. Refer to Appendix A for further information regarding estimating methods.

## NUCLEAR PROJECTS COST ESTIMATING

Estimate Class requirements for each phase/Gate per manual N-MAN-00120-10001-GRP, Nuclear Projects Gated Process, are listed in Table 2. The estimate for the work pertaining to the next immediate phase is required to be of higher accuracy than the balance of the project as the scope for the next immediate phase should be well defined and planned.

**Table 2, Typical Project Phase / Gate Estimate Requirements**

Project Phase	Business Proposal	Identification Phase	Initiation Phase	Definition Phase	Execution Phase
Gate	G0	G1	G2	G3	G4
<b>Gate Purpose</b>	Initial evaluation - Feasibility of proposed projects;  Identification Phase Funding Concurred	Identify Gap & Screen Business Need;  Initiation Phase Funding Concurred	Evaluate & Develop Alternatives, Select Preferred Alternative;  Definition Phase Funding Concurred	Develop & Define Preferred Alternative and Execution Phase Plans;  Execution Phase Funding Concurred	Implement (Install) & Deliver Preferred Alternative;  Close-out Phase Funding Concurred
<b>Estimate Class for Next Phase(s)</b>	<b>Class 3</b>	<b>Class 3</b>	<b>Class 3</b>	<b>Class 3</b> (w/o Detailed Design Complete)  <b>Class 2</b> (w/ Detailed Design Complete)	<b>Class 2</b>
<b>Estimate Class for Total Project</b>	<b>Class 5</b>	<b>Class 5</b>	<b>Class 4</b>	<b>Class 3</b>	<b>Class 2</b>
<b>Level of Project Definition</b>	Between 0 to 1% of total engineering	Between 1 to 2% of total engineering	Between 1 to 15% of total engineering	Varies from 10% to 100% of total engineering	Project definition 100% done; plus possible Engineering Field Change

1.2.1 Projects should scope and estimate projects against the Work Breakdown Structure (WBS) and/or Code of Accounts in order to allow:

- Monitoring of variance between actual costs and budget (estimate)
- Consistent format for cost reporting across projects.
- Comparison of project performance across a portfolio or program.
- To consolidate cost data for future projects.

## 2.0 BASIS OF ESTIMATE (BOE)

The BOE documents the parameters and scope used in support of developing the estimate and also includes the completed estimate details and breakdown. The BOE is generally started prior to developing the estimate and finalized once the estimate is complete. A Scope of Work (SOW) document may be used to initiate an estimate however a BOE is still required.

**Note:** The BOE may be incorporated as part of the PMP.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST</b>	Revision Number: <b>R002</b>	Page: <b>8 of 21</b>
Title: <b>NUCLEAR PROJECTS COST ESTIMATING</b>		

As listed in detail in Appendix C: Basis of Estimate Template, Key elements of a BOE include:

- Basis of Estimate objective
- Project scope description
- Cost basis
- Assumptions
- Project duration/ milestones
- Exclusions
- Design basis
- Risks & opportunities
- Reference documents
- The completed estimate detail tables and forms

The BOE is approved by the Project Manager and is included or incorporated as part of the PMP.

A formal BOE is typically not required for estimating the cost of:

- Changes
- Alternatives analysis
- What-if scenarios
- Small or simple projects (justification for not creating a BOE must be approved by the applicable project Director and GRB or PMOC).

### 3.0 ESTIMATING PROCESS

There are four major steps in developing a new estimate. They are:

- (1) Estimate Planning
- (2) Estimate Development
- (3) Estimate Review
- (4) Estimate Approval.

These will be implemented to support each applicable decision gate of the gating process.

#### 3.1 Estimate Planning

Estimate Planning is carried out to determine the accountability, estimate class, timeline, and deliverable requirements associated with an estimate. Estimate Planning includes:

- Decide if the estimate is to be completed internally within OPG or externally by a third party estimator. As a general guideline:

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST</b>	Revision Number: <b>R002</b>	Page: <b>9 of 21</b>

Title:

### **NUCLEAR PROJECTS COST ESTIMATING**

- Projects with a total value of less than \$1M would not be expected to use an external estimator except under special circumstances.
- For projects expected to cost between \$1M and \$5M, the use of a third party estimator is at management discretion.
- For projects with a total budgeted cost greater than \$5M, estimating should be delegated to a third party estimator.
- Vendor bid evaluations may include a third party estimate as an independent comparison.

Note: the above recommendation is at the Project Manager's discretion and may be reviewed and challenged at the GRB. All the estimates will be coordinated with OPG project control estimating team.

- Choose who will conduct the estimate for the various scope. Certain sections of scope may be estimated by different people or groups in relation to expertise and responsibility.
- Establish estimate completion and review dates based on scope progress and phase of project (Gate), and with concurrence of the project manager. These dates must be in accordance with the overall project and portfolio/program milestones.
- Determine the level of estimate accuracy in alignment with the phase of the project and Gate requirements. This is based on the available project scope information and engineering progress (see Table 2 guideline).
- Verify the grouping of major scope items via WBS definition and/or code of accounts.
- A unique estimate ID number may be provided by the estimating support team to track and record the estimate and revisions when applicable.

## **3.2 Estimate Developing**

Each project needs to provide to the estimator the required estimating document as listed in Appendix B, Estimate Input Checklist.

Generally, the BOE and SOW content should be frozen before the estimate requirement date to allow sufficient time to complete a thorough estimate and any required reviews prior to approval. Estimator, program or portfolio work load must be taken into consideration.

### **3.2.1 Estimate Preparation**

The estimator should:

- (1) Attain and document scope clarification and ensure there is alignment with the project management team via estimate developmental or clarification meetings.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST</b>	Revision Number: <b>R002</b>	Page: <b>10 of 21</b>

Title:  
**NUCLEAR PROJECTS COST ESTIMATING**

- (2) Prepare or update the estimate and Basis of Estimate (BOE) in parallel while clearly outlining any assumptions, exclusions or exceptions. Confirm and verify the required scope and strategy are fully reflected in the BOE. Recommended BOE template is included in Appendix C.
- (3) Prepare estimate breakdown based on approved project WBS and/or Code of Accounts. following are high level steps for cost estimate preparation:
  - I. Choose applicable estimating techniques (See Appendix A)
  - II. Quantify labour hours, and material/equipment using available document
  - III. Develop the project cost using labour rate, historical data, factors, etc
- (4) Estimates must be structured to distinguish costs by project release and phase, the template for summary table is in Appendix D
- (5) The estimate shall be structured in consideration of data migration to P6 and other project control tools.
- (6) Allowances may be required for areas of project scope which are not yet clearly defined. Allowances must be clearly identified in the BOE. E.g. an allowance for a pump may be required when the type and size of the pump required is not yet known, this should be clearly defined on section 2.3 (Procurement) of BOE. Allowances should not be confused with cost contingency nor used to reduce the effort of creating a properly detailed estimate.
- (7) Estimates may include several key benchmark ratios and factors versus historical (and sometimes estimated) values from similar projects. The key benchmark criteria shall be agreed upon between project estimator and Project Manager and documented in the BOE under applicable section. If there is a large discrepancy between the estimates and similar completed projects, it must be justified and documented in the BOE. Lessons learned on similar types of projects shall also be reviewed and incorporated.
- (8) For projects involving a similar installation strategy for multiple units or stages, the estimate for subsequent units/stages should consider factors to allow benefit of lessons from experience as repeat work moves from the first unit to the last unit.
- (9) Conduct estimate peer internal reviews.
- (10) Prepare the estimate package for formal estimate review.
- (11) Maintain a backup of the estimate calculation details for reviews or audits.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>EST</b>	Revision Number: <b>R002</b>	Page: <b>11 of 21</b>

Title:  
**NUCLEAR PROJECTS COST ESTIMATING**

### 3.2.2 Estimate Package

The estimate package is prepared by the project estimator or responsible vendor and as a minimum should include the following:

- The completed BOE (Appendix C) Cost estimate summary table (Appendix D)
- Detailed breakdown (incl. indirect costs, profit and overhead) by applicable WBS and/or Code of Account, and project release/phase.

**Note:** The BOE represents only overnight cost of project; cash flow, escalation and interest will be added by Scheduling/Finance and applied to the total project budget.

### 3.3 Estimate Review

A scope and quantity check review may be required for larger or more complex projects. The review should include all elements of the BOE and SOW. Estimate reviews are intended to verify technical details of the scope of work and the quantities and processes used in developing the estimate. The goal is achieve agreement and alignment on the total estimate package by all attendees.

The formality of the review should be dependent on the project size and complexity using a graded, risk based approach. More than one review may be required.

The review should include the accountable Project Manager, estimating section manger, applicable team members and stakeholders per the Project Manager's discretion.

If estimates deviate from the normal ranges in historical databases, the Project Manager and/or estimator should provide justification in the BOE or estimate package.

### 3.4 Estimate Approval

The completed estimate is included with the BOE and is approved by the accountable Project Manager.

## 4.0 ESTIMATE REVISIONS AND RECONCILIATION

Estimates shall be revised for each Gate approval package. Depending on the size of scope change or variances between a current bid and previous estimate, project may need to have a "Vendor Estimate Validation" or they may need to seek a new refresh internal/third party estimate. Project Manager needs to make a decision using Estimating Decision Guide flowchart provided in Appendix E.

Note: the recommendation provided in "Estimating Decision Guide" is at the Project Manager's discretion and may be reviewed and challenged at the GRB.

Title:  
**NUCLEAR PROJECTS COST ESTIMATING**

### 4.1 Refresh Estimate

A new BOE and estimate report will be developed by internal/third party estimator following all the steps as explained in section 3.2 and then the new estimate report need to be reviewed and approved as explained in section 3.3 and 3.4.

### 4.2 Vendor Estimate Validation

Project team needs to provide submitted bid proposal and all the correspondent documents between OPG and Vendor to internal/third party estimator, they must also invite third party estimator to all bid review or challenge meetings. Internal/third party estimator will confirm the integrity of the bid by verifying estimating methods, and assessing the assumptions and making sure that the adopted ground rules are consistently applied throughout the submitted estimate/bid. They will issue a "Vendor Estimate Validation report/memo" to document their finding and recommendation.

## 5.0 ESTIMATING TOOLS

Estimating tools or databases may be used for estimating preparation and tracking. Estimating data may be stored in the applicable estimating tool or database. Further information on the estimating tools is available in the applicable estimating guides and task instructions.

Title:  
**NUCLEAR PROJECTS COST ESTIMATING**

**Appendix A - Estimating Methodology**

	<i><b>Parametric Estimating</b></i>	<i><b>Analogous Estimating</b></i>	<b>Detailed Engineering Estimating</b>
<b>General Description</b>	Uses a statistical relationship between historical data and other variables to calculate a cost estimate for a deliverable/project	Uses the actual cost/effort of a previous and similar project/data as the basis for estimating the cost of the current project.	Detailed Engineering estimates is an estimate that is built from a high level of detail based on design quantities.
<b>Example</b>	Variables can include equipment weight, size, number of components to be installed, and number of lines in a computer program.	Replacing a dryer in the reactor building; estimate based on actual cost of a dryer replacement project in the RAB.	Determining the cost of a project from contractor quotes and design bill of materials.
<b>Application</b>	Applicable to a higher level of the WBS (less detailed), provided that statistical data is available. This may be the only method available in the early phases of a project due to limited scope definition.	Applicable when there is insufficient actual cost data to use as a basis for a detailed approach, but a comparable item exists on which to base an estimate.	Applicable when detailed information, concerning labour and material resource requirements, is available. This method may be incorporated with the parametric and analogous method if some aspects of the project do not have sufficient information.
<b>Assumptions</b>	Assumes that the group of variables that affects the cost of a particular component has remained the same.	Assumes that the analogy has been evaluated as a valid comparison.	N/A
<b>Advantage</b>	May be performed relatively quickly. May be performed with limited project definition.	Allows the estimate to be broken down into a lower-level of WBS (more detail) with enhanced credibility.	Provides very detailed estimates on every aspect of the project.
<b>Disadvantage</b>	Subtle changes in relationships between cost and variables are not easily reflected in the estimate.	May be difficult to find a good analogy.	Time consuming to prepare, and requires detailed, well defined information for the project.

**NUCLEAR PROJECTS COST ESTIMATING**

## Appendix D (Continued) – Remarks for Estimate Summary Table Template

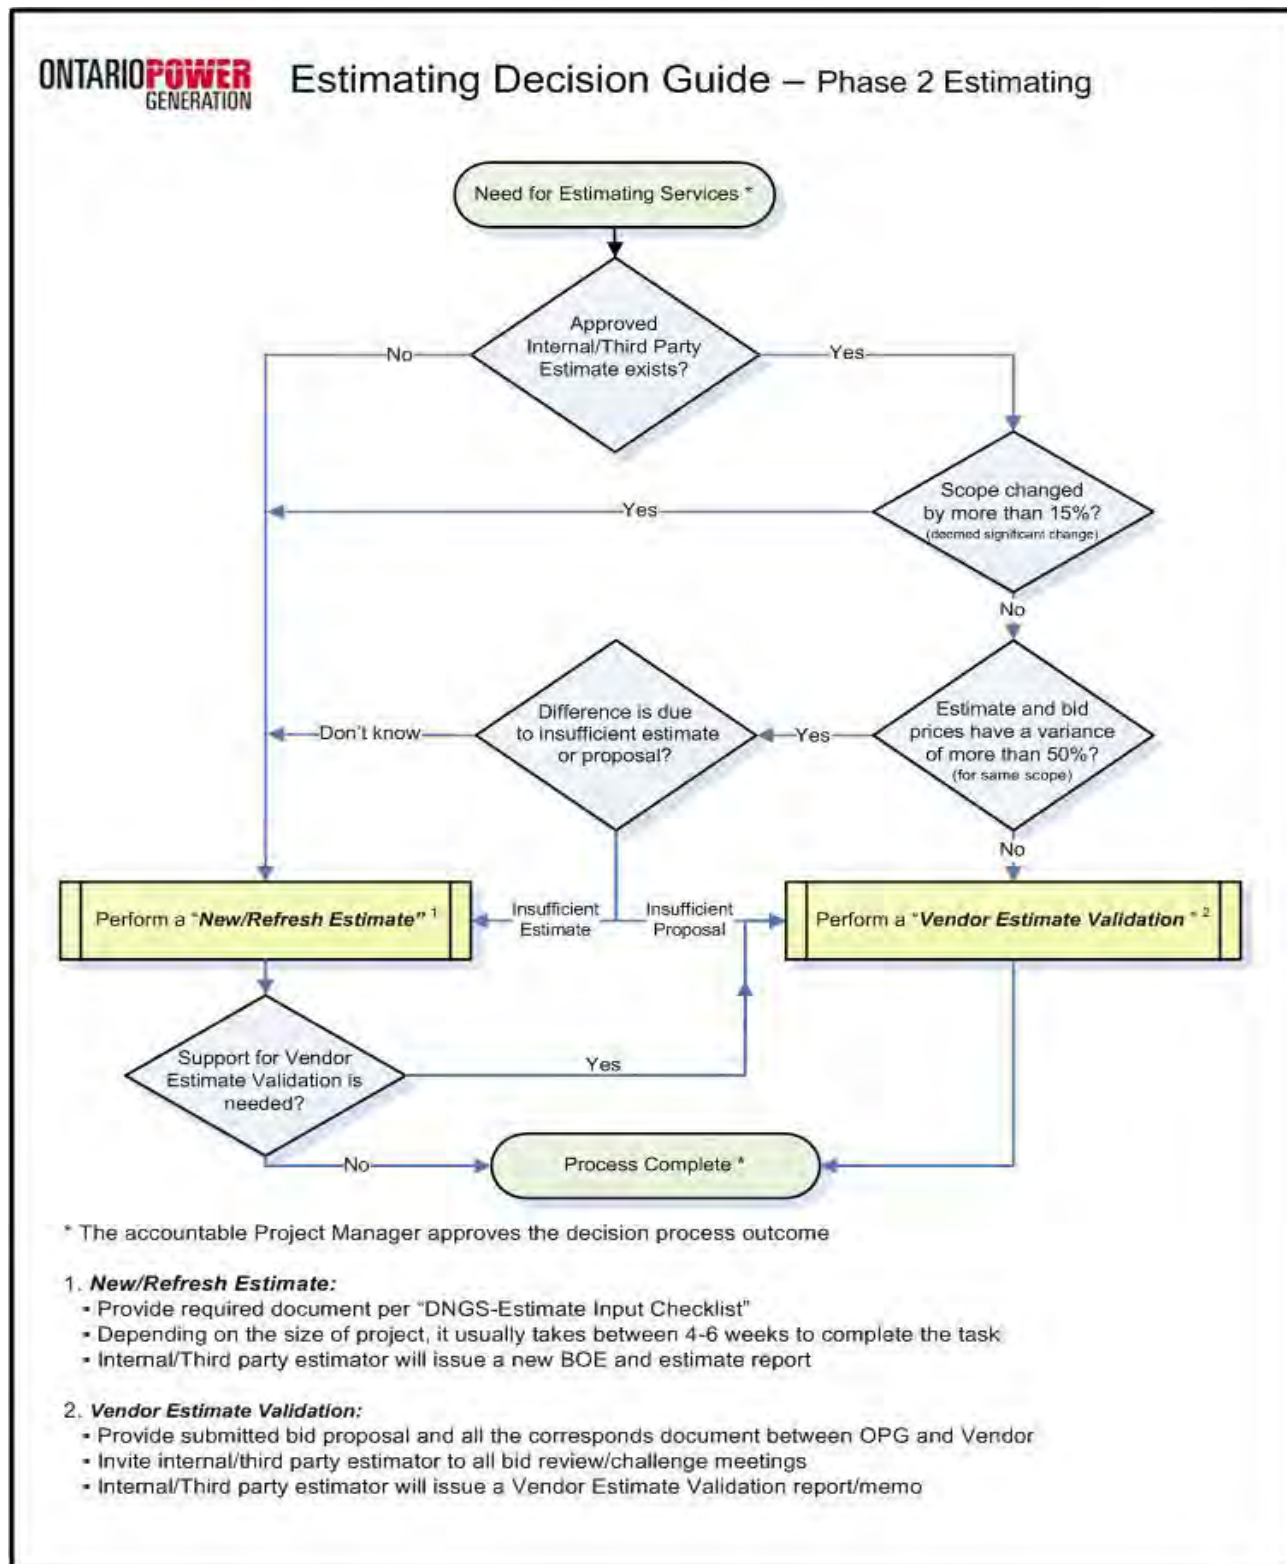

Estimate categories	Remarks
<b>Engineering/Installation cost (All DSR)</b>	
1 Preliminary Engineering (Mod Work Only) (Tier1)	Master EC, Design Plan, MDR, TS, HFE, OPEX Review, Walkdowns/Field Verification, Scoping/Prelim COMS, Software Categorization, Eng Specification for Long Lead Items, Disposition of Comments, etc
2 Preliminary Engineering (Mod Work Only) (Tier 2)	Master EC, Design Plan, MDR, TS, HFE, OPEX Review, Walkdowns/Field Verification, Scoping/Prelim COMS, Software Categorization, Eng Specification for Long Lead Items, Disposition of Comments, etc
3 Detailed Design - Tier 1 Subcon (Mod Work Only)	Tier 1 Engineering Staff Labour Costs for: Discipline EC's, Asset Suit Modifications, ADL, RDL, Change Papers, DBOM's, Design Manual Updates, Engineering Specifications, Tech Data Sheets, Engineering Calculations, Design Review Meetings/Reports, Regulator Support documentation, Engineering Reports (eg Seismic, etc), Create CatID's, TSSA Requirements, Detailed Design COMS, Pre-Start H&S Report, Review Specialist/Vendor Engineering, Disposition of Comments, Update budget for next phase.
4 Sub Contracted Engineering / PE - (Tier 2) (Mod Work Only)	Tier 2 Engineering Staff Labour Costs for all the tasks as mentioned in the above cell; this is Subcontracted Engineering for specialist services or supplemental resources for any of the deliverables in Detailed Design. <b><u>INCLUDES PROCUREMENT EFFORT LABOUR</u></b>
5 Work Planning & Assessing	Installation Work Plan, Commissioning Specifications, Commissioning Work Plan, Field Assessing / Walkdowns, CWP's, ITP's, Completion Forms
6 Equipment (Long Lead and Non Long Lead)	Purchased Cost of Major Equipment and/or Prefabricated assemblies from 3rd Party Vendors <b>EXCLUDES: Procurement Effort (labour), Bulk Materials, Small Tools &amp; Consumables</b>
7 Materials (Long Lead and Non Long Lead)	Purchased Cost of Bulk Materials (incl freight, env charges, etc) to be incorporated into the Work <b>EXCLUDES: Procurement Effort (labour), Equipment (see above), Small Tools &amp; Consumables</b>
8 Mobilization, Work Staging	Any cost related to mobilization.
9 Construction - Direct Performed	Construction Labour for Direct-hired Trades and First Line Supervision executing construction work inside the island (Factored for Work in Station). <b><u>INCLUDES PRE INSTALLATION WORKS.</u></b>
10 Construction Indirects	Indirect Construction Labour for Sr. Supv (GF, Supts), HOR's, MA's, Labourers & other Support Trades, Material Handling, Scaffold Safety Inspection Program, etc. This is based on an agreed factor or estimated separately when the proportion of indirect to direct is significantly higher or lower. <b><i>Note - this resource pool is managed at the Program Level</i></b>
11 Construction by Tier 1 Sub Con	Labour only for Tier 1 Construction Management Subcontractors. Job Expenses and materials should be included in the appropriate categories.
12 Construction by Tier 2 Sub Con	Many trades subcontractors include labour and material in their pricing. Also includes Vendor Specialists - we need to be intentional about having this required as a separate price in the quotation.
13 Eng Sup - Constr/Comm/AFS/Close (Tier 1)	Tier 1 Engineering Staff Labour for: Field Technical Support, Field Initiated Changes, Non-intent Revisions, Commissioning Tech Support, Review/Verify/Approve Commissioning Reports,
14 Eng Sup - Constr/Comm/AFS/Close (Tier 2)	Tier 2 Engineering Staff Labour for: Field Technical Support, Field Initiated Changes, Non-intent Revisions, Commissioning Tech Support, Review/Verify/Approve Commissioning Reports,
15 Commissioning/AFS Support	Construction Labour assigned to support commissioning activities directed by others - OPG or Vendor Reps.
16 Engineering Support - Comm/AFS (Tier 1)	Tier 1 Engineering Staff labour for AFS Walkdown & Reports, Update MEL, As-Built Change Papers, Incorporation of Change Papers into Station Drawings & Design Manuals, Update DBOMs.
17 Engineering Support - Comm/AFS (Tier 2)	Tier 2 Engineering Staff labour for AFS Walkdown & Reports, Update MEL, As-Built Change Papers, Incorporation of Change Papers into Station Drawings & Design Manuals, Update DBOMs.
18 System Restore/Post Maintenance Testing	Support for refilling and re-establishing the system alignment prior to system startup. Post Maintenance Testing for Mod and Non Mod work.
19 Close Out	Engineering Labour assigned to support closeout activities.
20 Demobilization	Any cost related to demobilization.
<b>Shared Cost</b>	
21 Project Management Staff	Project Manager, Project Engineer, Project Coordinators, Project Admin Staff, Scheduler, Project Controls, Cost Control, etc., Project HSE Manager performing Project Initiation, Planning, Risk Management, Monitoring & Control through Closeout. Includes Project Management for Tier 1 Subcontractors only.
22 QA/QC & Completion Staff	QC Supervisors, QA/QC Auditors, Source Surveillance, Completions Supervisor, Completions Walkdowns.
23 Job Expenses	Trailers/Project Offices, Travel, Project Specific Insurance, Temporary Services (e.g. wash trailers), Permits associated with the Work, Services or rentals associated with providing Project offices/trailers and/or other Job Expense items. Project-specific software licenses (e.g. completion systems).
24 Project Specific Training	Training associated with a project specific technology or process to be provided to either Project Trades, Staff and/or OPG Operations and Maintenance
25 Consumables / Tools	Single use consumables specific to the project scope of work (e.g. resin, glycol, pickling solutions, nitrogen, etc).
26 Exceptions	Any exceptional cost not listed above

**NUCLEAR PROJECTS RISK MANAGEMENT**

**Revision Summary**

<b>Revision Number</b>	<b>Date</b>	<b>Comments</b>
R002	2015-03-30	Major Revision to the document to address the integration of the draft P&M Risk Guide RISK-G-01 and to incorporate direction of the new Risk Management and Oversight (RMO) tool. Integration of all NR manuals (RISK-04, RISK-05, RISK-06, RISK-07, RISK-08) regarding OPEX, lessons learned, assumptions and decisions management into a single document.
	2014-06-28	Updated the Risk Management Process to include Key Risk Areas and the related sponsors' responsibilities
	2014-03-24	Integrate N-MAN-00120-10001-Risk 05 (contingency development) to create a consolidated single document. Removed the cost control/change control/reporting sections for contingency. Non-intent updates to provide clarification or context as requested by manual users.
R001	2013-07-07	Minor updates
R000	2012-07-25	First Issue

Title:

## NUCLEAR PROJECTS RISK MANAGEMENT

### 1.0 DIRECTION

Risk management is a systematic approach to identifying, analyzing, and responding to project risks. The goal of risk management is to proactively identify and manage risks in order to deliver projects safely, with quality, on time and on budget. This document provides direction to projects for both day-to-day risk management activity as well as the risk management preparations for authorization packages presented at funding gates/committees.

### 2.0 SCOPE

A graphic depicting the “inputs to” and “outputs of” risk management activity that fall under the scope of this document is outlined below. The sections of this manual are structured in alignment with this diagram.

Figure 1: The Risk Management Process

#### 2.1 Risk Management and Oversight Tool (RMO)

The Risk Management and Oversight (RMO) tool is an application project managers will use to perform risk management activity for projects. The Project Management Office (PMO) is the owner and administrator for this tool and provides training, support, and guidance to the organization. This manual does not include detailed direction for using the RMO tool. For details on how to use the RMO tool, refer to *N-GUID-09701-10123, Risk Management and Oversight Tool*.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>6 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 2.2 PMO Role

The PMO Risk Department will provide guidance to the project managers in the application and interpretation of the requirements outlined in this manual. The support provided exists both in the day-to-day application as well during preparation of funding approval packages (e.g. Gate Review Board). The PMO risk department will perform oversight of the RMO contents on behalf of the Nuclear Projects organization and will prepare reports, metrics, self-assessments, and other such analyses from time to time to monitor the effectiveness and use of the processes outlined in this manual. Annually a consolidated report will be prepared incorporating a strategic review and identification of any corrective actions.

Additional project controls support and deliverables, where applicable, are outlined in the appropriate section of this manual.

### 3.0 RISK MANAGEMENT INPUTS

Risks to project objectives can be identified from a number of sources. If these sources of risk are not considered both in the development of the initial risk profile as well as during ongoing risk management activity the ability for the project manager and senior leadership to make informed decisions about the project may be adversely impacted.

#### 3.1 Operating Experience (OPEX) and External Lessons Learned

OPEX is information ***gained through experience*** that should be retained for future use. Depending on the observation made, OPEX could be a valuable technique, a best practice or a successful outcome you wish to repeat or an undesirable result you wish to avoid. When applicable OPEX is recognized, the project manager is then equipped with the knowledge to incorporate it into their baseline cost and schedule or manage it as a risk.

The Nuclear Projects process complies with *OPG N-PROC-RA-0035, Operating Experience Process*. This base standard has an operational focus. For project risk management, the goal is to look beyond operational events and seek out events that have happened both in nuclear and non-nuclear projects that may present risks to the project that is being undertaken.

OPEX obtained through RA-0035 process is added to the RMO database by the PMO and dispositional by the designated department or project. Anyone with access to the RMO tool can add an OPEX event under the OPEX tab. The PMO can assist the project manager in searching for specific event types and populating the RMO OPEX library with new information that will be helpful to others.

Lessons Learned (LL) are similar to OPEX items, in that they have a foundation in past events. A lesson learned however ***goes beyond an individual event to provide key insights and clearly identify the causal factors that contributed to a positive or negative outcome.*** The RMO tool contains a searchable lessons learned library, with major lessons learned categorized as Programmatic Lesson Learned (PLL). Each PLL

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>7 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

is assigned an owner within Nuclear Projects whose accountability is to ensure that proper actions are developed, assigned, and are monitored to completion.

### 3.1.1 Project Manager Direction

Project managers should be up to date on the content of the OPEX and LL libraries as they conduct their day-to-day risk management activities. Good practice would be to establish periodic reviews of OPEX and LL within their project teams during regular risk reviews.

Prior to any funding gate a detailed review of the RMO OPEX and LL library must be performed and any items that were considered in the preparation of the baseline cost and schedule or resulted in a project risks shall be identified. A summary of the review performed shall accompany the gate or funding approval package in the form of a narrative in *N-FORM-11652, Nuclear Projects Risk Management Input Assessment*.

#### PMO Role

The PMO Risk Department receives external OPEX from the central nuclear OPEX coordinator. The OPEX received has been pre-screened as per *N-GUID-04947.02-10000 External Events Screening Guide* and is determined to be relevant to Nuclear Projects. These items are populated in the RMO tool by the PMO risk department. The PMO risk department will also proactively seek out external and internal project related OPEX events through a variety of sources identified in Appendix A. The PMO risk department provides oversight support and disseminates significant information in real time through email communications. The PMO risk department creates programmatic lessons learned (PLL) based on significant OPEX and presents them to CARB.

### 3.2 Project Definition Rating Index (PDRI)

The Project Definition Rating Index (PDRI) is an industry best practice front end planning tool that helps assess the level of project scope definition and stakeholder alignment during the critical formative stages of the project. The objective of a PDRI is to identify gaps in scope definition early on, prior to committing significant funding to the project. The gaps in understanding or definition identified in the PDRI workshop shall be closed by the project manager prior to proceeding further (i.e. prior to submitting the funding package for approval). At minimum if the gaps cannot be resolved the project manager can use the insights gained in the PDRI session to inform the project risk register.

The requirement for a project to undertake a PDRI workshop is defined by the gating process. The PMO Risk Department can assist the project manager in executing a PDRI workshop by providing resources and facilitation.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>8 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 3.3 Assumptions and Project Bases

Assumptions are factors in the planning process that are considered to be true, real, or certain, without proof or demonstration. Assumptions are ***not completely defined in project documents*** but are required in order to develop the cost and schedule estimates for projects.

Project bases are ***documented descriptions of how an estimate, schedule, or other plan component was developed*** and defines the information used in support of development.

To the extent possible when preparing funding approval packages, the use of assumptions shall be minimized. It is important when preparing the cost and schedule estimates to disposition assumptions so that the project plan being presented has been validated and is supported by project bases. Any residual assumptions that cannot be dispositioned or built into the cost and schedule as a project basis shall be entered into the RMO assumption log and reviewed during preparation of the project risk register. Assumptions are to be populated in the RMO tool, and can be initiated by any Nuclear Projects personnel with access. Project bases that are not documented in other project documents (such as the basis of estimate) shall also be documented in the assumptions log in the RMO tool.

#### 3.3.1 Assumption Revision or Closure

Assumptions can be closed when they are no longer relevant or when they are known to be incorrect or invalid. New or modified assumptions that impact other projects directly, or those that are widely applicable (i.e. "program" level assumptions) shall be broadly communicated by the initiating project manager in order to bring awareness to those affected departments or projects. For example, an assumption pertaining to contracting or resourcing strategies may have a wide ranging impact on projects already in flight therefore strategic, effective communication is imperative.

#### 3.3.2 Project Manager Direction

Prior to submission of funding approval packages, the project managers shall populate the assumptions log in RMO. These assumptions shall be assessed to determine if they introduce risk to the project and require entry to the project's risk register. A summary of the assumptions made shall accompany the gate or funding approval package in the form of a narrative in *N-FORM-11652, Nuclear Projects Risk Management Input Assessment*.

The project managers shall keep up to date on the content of the assumptions log as they conduct their day-to-day risk management activities, and assess risks against assumptions made. Good practice would be to establish periodic reviews of the RMO assumptions log for any new programmatic assumptions made or any assumptions made for projects that may impact the subject project. The project manager shall re-validate their assumptions on a regular basis and at minimum at funding approval gates or when initiating the change control process.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>9 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 3.4 Decisions

***Documented decisions form a part of the project basis.*** Decision records are critical for maintaining an auditable trail for Nuclear Projects and assist in “telling the story” of the projects. In most cases, decisions exist in the form of approved documentation generated by following existing approved processes (the modifications and the engineering change control processes, Engineering or Operational Decision Making, for example). Decisions made under the execution of these processes do not need to be duplicated in the RMO tool.

Project decisions that should be entered into the RMO are those that are not covered by existing processes. These decisions tend to be strategic in nature and arise when there is not a clear path forward but rather a number of possible options to achieve the project’s objectives. Too often, these decisions are made informally without the appropriate authority and are not communicated effectively, resulting in adverse impacts on the projects. These decisions shall be documented in a DRAS (*Decision Record and Analysis Summary*) N-FORM-11390 and entered into the RMO tool once approved. A control document number shall be obtained for the DRAS and the DRAS shall be submitted to records in parallel with being added to the RMO decision log.

This decisions process and associated N-FORM is flexible and may be applied to provide structure to a number of different project departments for a number of different types of decisions. While all decisions documented in a DRAS shall be recorded in the RMO tool, this manual will not provide direction for all the various possible applications.

#### 3.4.1 Project Manager Direction

There is no strict prescription or threshold for entering decisions in the RMO tool. If there is confusion regarding the appropriateness of preparing a DRAS, contact the PMO risk department for support and guidance. As a general rule, the project manager should use judgment and input decisions in the RMO tool if:

- The decision forms a fundamental aspect of the project basis and is not documented elsewhere as part of approved project processes, and/or
- The decision would assist external and internal personnel in understanding the rationale and the considerations made in establishing the project plan, and are not documented elsewhere as part of approved project process.

In all cases, decisions must be validated with sufficient authority to ensure prudence and facilitate alignment among multiple organizations. Where a decision has a financial impact, the DRAS approver must have the authorization to approve the decision based on OPG-STD-0017, Organizational Authority Register. At minimum, for decisions that impact (or have the potential to impact) other OPG organizations, the Stratum IV manager of that department, or their delegate, shall review and comment. It is the project manager’s accountability to ensure this happens. Any DRAS that results in a change of scope to the project must be submitted to the appropriate project review board/committee for authorization prior to approval. Any employee can initiate a decision in the RMO tool provided it is supported by an approved DRAS.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>10 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

To the extent possible when preparing funding approval packages, the practice of documenting decisions is encouraged. The objective when preparing the cost and schedule estimates is to formally document decisions to support the project basis. A summary of the decisions made and recorded in RMO in the development of the project plan shall accompany the gate or funding approval package in the form of a narrative in *N-FORM-11652, Nuclear Projects Risk Management Input Assessment*. Good practice would be to establish periodic reviews of the RMO decisions log for any new decisions made that may impact the subject project and following up on any impacts if required.

Owners of the decisions recorded in the RMO tool shall review these decisions quarterly and update the project risk register as appropriate. Decisions that impact multiple organizations shall be broadly communicated by the decision owner in order to bring awareness to those affected departments or projects.

## 4.0 RISK MANAGEMENT

Project managers are accountable to apply the risk management (RM) practices identified in this section to their projects. The PMO Risk Department will provide tools, guidance, training, and support to the project managers.

The RM process includes the following fundamental steps:

- (a) **Planning** – defining how to conduct risk management activities for the project or program.
- (b) **Identification** – determining events that may affect the project objectives and documenting their characteristics.
- (c) **Assessment** – analyzing and prioritizing identified risks based on probability and impact (qualitative), and estimating the potential cost and schedule implications of the risks to the approved objectives if they were to occur (quantitative).
- (d) **Treatment** – determination of the most appropriate risk response to reduce threats to project objectives, or exploit opportunities to improve project performance.
- (e) **Monitoring and Control** – implementing risk response plans, monitoring identified risks, identifying new risks, and evaluating risk process effectiveness throughout the project life cycle.

### 4.1.1 Risk Management Planning

A Risk Management Plan (RMP) describes how risk management responsibilities structured and performed. Each project should prepare a standalone RMP or have a section dedicated to risk management within its Project Management Plan (PMP). Where the project is a subset of a larger program, referencing the program RMP or PMP and documenting any specific project deviations or details to the parent plan is acceptable.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>11 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

Included in RMPs are the following sections:

- **Risk Management Methodology** - defines the approach, tools, and data sources that may be used to perform risk management on the project.
- **Roles and Responsibilities** - defines the risk management leads, support personnel, and other team members including their responsibilities and accountabilities to ensure compliance with the risk management process.
- **Monitoring and Control** – definition of when and how often the risk management process will be performed, including the establishment of major risk management activities to be included in the project schedule. Monitoring and update frequencies will reflect the phase of the project life cycle (i.e. the execution phase will require a focused effort to stay on top of risks with more frequent updates).

### 4.1.2 Risk Identification

Risk identification is an iterative process because new risks may evolve or become known as the project progresses. The risk profile presented to support contingency development in a funding approval package is a “point-in-time” snapshot. Failure to perform ongoing risk management activity is negligent from a project management perspective and will result in adverse impacts to the individual project and the overall portfolio.

A number of techniques or forums may be used to identify risks. The project team and functional and external stakeholders should be involved in the process so they can develop and maintain a sense of ownership and responsibility for the risks and associated actions.

Tools and techniques to identify risks include, but are not limited to:

- (a) Facilitated workshops
- (b) Structured Interviews with experienced project team members, stakeholders and SMEs.
- (c) Project Definition Rating Index (PDRI) Workshops
- (d) OPEX and Lessons Learned Review
- (e) Basis of Estimate (BOE) Review; review of assumptions and constraints in the BOE can be used as a source for risk identification.
- (f) Project Schedule Review; review of near critical, critical path and schedule float in schedule assumptions can be used as a source for risk identification.
- (g) Review of a standard risk breakdown structure for potential risks (Refer to Appendix C)

#### 4.1.2.1 Common Pitfalls in Risk Identification

There are five common pitfalls in risk identification that leads to inefficiencies in managing risks:

- (a) Identifying Risk Without Clear Project Objectives

## Manual

Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>12 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

Effective risk identification requires a high quality project plan with clearly defined cost, schedule, quality, and safety objectives. Without this, one cannot effectively identify risk to these objectives and items raised will be based in speculation and not facts. This can lead to initiating actions too early, team confusion, and create a perception that risk management is not an effective use of time or resources.

#### (b) The Presumption of Failure

Too often project and functional managers submit project plans (scope, cost, schedule, resources) for approval that they do not believe are reasonable and achievable. Further, a large risk register may be viewed as a means to indicate to the approval board that the project "is not easy" or has been unsuccessful in the past. This presumption of failure creates too many risks to effectively manage and a lack of clear prioritization for the team. A project risk register is not a repository to capture known shortcomings of an underdeveloped project plan.

#### (c) Identifying Issues as Risks

Issues are events that have 100% probability of occurring, or have occurred already and require resolution. As such, these are not preventable risk events but rather issues that should be addressed. Identifying issues as risks may distract the project managers and prevent them from focusing on the adverse impacts that are truly preventable.

#### (d) Business-as-Usual Risks

Events that will be addressed in the normal course of conducting work are termed Business-as-Usual items. These are items that have a process, plan or organization in place to address them, but the concern is that the execution may be "less than adequate". Examples of poor use of Business-as-Usual risks include:

- "Project Managers may not meet milestones".
- "Oversight plan may not provide complete details to provide guidance for oversight."

In general, in order to be a risk there has to be impact to the objectives of the project plan. Business as usual items may truly present a risk to the project but the cause and the impact must be clearly identified in the risk description in order to be effectively managed.

#### (e) Vague or Misleading Risk Titles and Risk Descriptions

Risk titles that are vague or misleading may result in response plans that do not address the real risk that the project is facing.

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>13 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

#### 4.1.2.2 Risk Titles

Risk titles describe the event and the context of the event.

**“There is a risk of insufficient welders available <event> to support Execution <context>”**

#### 4.1.2.3 Risk Descriptions

Risk descriptions should be comprised of the risk **event**, the **cause** of the event, and the **impact** of the event on project objectives. The absence of any one of these critical items would preclude the item from being added to the risk register due to the inability to define a proper risk treatment.

**“There is a risk of insufficient welders available <event> to support Execution due to competition with other large industrial projects in the province <cause>, resulting in a delay that will impact the critical path by 30 days <impact>”.**

#### 4.1.2.4 Opportunities

An opportunity is an event that, if it is implemented or occurs, increases the likelihood of achieving project objectives. An opportunity must demonstrate a clear benefit to achieving a project objective *in sufficient magnitude to offset the risk presented by changing course*. Opportunities identified in the SharePoint log “Opportunities Inbox” will be reviewed periodically by the PMO risk department and reported in the Risk Oversight Committee meetings for further consideration. In all instances where opportunities are identified as valid, they are to be pursued with focus (i.e. exploited to the extent possible).

### 4.1.3 Risk Assessment

#### 4.1.3.1 Risk Register

A project risk register is a living repository of risks and is the project manager’s tool for identifying, assessing, monitoring, and updating project and program risks. The RMO tool contains the risk registers for all nuclear Projects – it is the working tool and also provides storage and backup of all risks and the associated logs. Risks included in the risk register should include **all project life cycle risks** that can be properly defined, without speculation, bias, or other such features identified in section 4.2.1.

#### 4.1.3.2 Qualitative Scoring of Risks

Qualitative risk scores assist those inside and outside project team in quickly determining the biggest risks to the project. A “heat map” scoring approach is taken based on the probability of occurrence, schedule impact and financial impact of a risk (refer to Figure 2). After the probability, financial impact and schedule impact scores are determined the risk score is calculated by multiplying the probability score with the financial or schedule score, whichever is highest. The heat map scoring is standard for probability and schedule impact, but scaled to four categories for cost assessment criteria based on magnitude of the project and financial impact of the risk. This scaled

Title:

## NUCLEAR PROJECTS RISK MANAGEMENT

approach allows all project managers to qualitatively assess and prioritize risks to their project, with the understanding that a high risk to a \$500K project is not as impactful as high risk to a \$100M refurbishment project that has the same score.

Impact Score	5	5	10	15	20	25
	4	4	8	12	16	20
	3	3	6	9	12	15
	2	2	4	6	8	10
	1	1	2	3	4	5
RED = Major Risks YELLOW=Significant Risks GREEN = Minor Risks		1	2	3	4	5
		Probability Score				

**Figure 2: Generic Heat Map identifying the potential qualitative risk scores for Nuclear Projects**

Refer to Appendix D for the risk assessment criteria/scale and guidelines for how to use the heat map.

### 4.1.3.3 Urgency

Urgency is another qualitative risk measure that assists project managers in prioritization. In the RMO, an urgency score shall be applied for each risk. The measure of urgency for risks in Nuclear Projects is as defined below:

Urgency Score	Approximate Timeline for risk response	Urgency Assessment Criteria
1	> 1yr	Risk treatment activities complete or risk not required to be addressed for the foreseeable future
2	6 months – 1 yr	Risk can be addressed in the long term and risk treatment will still be effective
3	1-6 months	Risk should be addressed in the midterm for risk treatment to be effective
4	Within 1 month	Risk must be addressed immediately for the risk treatment to be effective

### 4.1.3.4 Quantitative Risk Analysis

Quantitative risk analysis is the process of assigning a dollar value to the effect of identified risks on overall project objectives. Quantitative risk analysis is performed on risks that have a significant qualitative residual risk score and require contingency funding. Not all risks qualitatively scored and managed per this process will require contingency (refer to Section 5.1 for guidelines). Wherever possible, the estimating

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

group should be engaged in supporting the determination of the cost impact of a risk to the project plan. If the quantification of risk exceeds the cost benefit argument for the project, the viability of the project should be revalidated.

#### 4.1.4 Risk Treatment

Risk treatment requires effort to develop a plan to minimize the risk and implement response actions where appropriate. All risks in the risk register should have one of the following risk responses:

- **Avoid** – Obtain information to better define the risk source, eliminating the risk entirely. In this case the residual risk score should be reduced compared to the current risk score to reflect the level of confidence in the ability to avoid this risk.
- **Transfer** – Shifting some or all negative impacts of a threat to a third party (e.g. to a contractor via contract terms and conditions). If this response is chosen, the risk owner is still accountable to manage this risk on an ongoing basis. In this case the residual risk score should be less than the current risk score due to the consequence of the risk being transferred to a third party.
- **Mitigate** – Take actions to reduce the probability and/or impact of an adverse risk event to be within acceptable limits. In this case the residual risk score should be less than the current risk score due to mitigation actions being taken.
- **Accept** – Take no action and accept the possibility that the risk could occur. In this case the residual risk should reflect the current risk score, because nothing is being done to reduce the risk. Accepting risk may result in significant cost impacts, as such the risk owner is required to gain the endorsement of the responsible project director prior to selecting this response.
- **Monitor** – Periodically assess the risk through the normal course of project execution until, a) clear mitigating actions are identified, or b) a more appropriate risk response is identified. In this case the residual risk should reflect the current risk score, because nothing is actively being done to reduce the risk.

An informal cost-benefit analysis may be performed to evaluate the appropriateness of the risk response. For example, if the cost to mitigate the risk is greater than accepting the probability and the impact of the risk “as-is”, then the risk response should be “Accept” and not “Mitigate”.

##### 4.1.4.1 Evaluating the Effectiveness of Risk Responses

All risks in the risk register should have three risk scores:

- Pre-Response Risk Score** – the score assuming that the risk will be accepted. This is a one-time assessment at the “point of discovery” of the risk.
- Post-Response Risk Score** – the score of the residual risk assuming the risk response is completed successfully. This score is subjective and based on the confidence level of the risk owner in the effectiveness of their risk response. This post response score is a gauge of how manageable the risk owner believes the risk is.

## Manual

Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>16 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

- (c) **Current Risk Score** – the score reflecting the current status of the risk. This is the primary measure of risk exposure for the purpose of planning and risk metrics/response analysis.

## 4.2 Risk Monitoring and Control

### 4.2.1 Risk Reviews

The risk owner identified in the RMO tool has complete accountability for the content of their risks in the tool and for the implementation regular reviews of these risks. This is true even if they have delegated their authority to update or manage the risk to others. Each risk owner shall perform, at minimum, monthly risk reviews to:

- Ensure risk responses are optimal based on the latest information;
- Ensure mitigation actions are on track and status the actions in the actions log in the RMO tool and initiate new actions were warranted;
- Determine if the assumptions related to the risks are still valid and update in the Assumptions log in the RMO tool, if applicable;
- Determine if the risk characteristics have changed;
- Determine if new risks should be identified;
- Determine if risk has been realized or has expired and can be closed in the RMO Tool (with justification).
- Assess, modify and validate the risk score and any other applicable fields (such as owner, comments, etc.) in the risk register as required.

### 4.2.2 Risk Reporting

Risk reporting is performed in line with monthly or quarterly reporting cycles. The content of risk reports can be taken directly from the RMO Tool using the Business Intelligence (BI) report engine. For senior management and external stakeholder reporting, the PMO risk department may make the the risk wording in the RMO tool more concise to align with the level of detail required in the specific reporting vehicle.

Examples of reporting vehicles for risk include:

- Risk Dashboard
- Key Risk Area Summary Report
- Program Reports
- Quad Charts
- NOC ( Nuclear Oversight Committee) Reports
- Quarterly ERM (Enterprise Risk Management) Reports
- User Reports (“boxed” reports) from BI

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>N/A</b>	
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>17 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 4.2.3 Risk Metrics

In order to assess the effectiveness RM in Nuclear Projects, the PMO risk department will prepare metrics. The Risk Dashboard will contain the primary metrics that will identify trends and allow comparisons of risk across the projects, functions, and Nuclear Projects as a whole. As risk management is a qualitative measure, with no focus on achieving a quantitative “target”, metrics prepared shall be geared towards process compliance only. As the risk management practice in Nuclear Projects evolves and matures, additional metrics may be introduced.

### 4.2.4 Key Risk Areas

Key Risk Areas are used to group risks from different projects which may impact major, overarching Nuclear Projects objectives. Each Key Risk Area is assigned a senior management sponsor who is responsible for providing oversight of the Key Risk Area to ensure that it is effectively being managed as a whole. Key Risk Areas are intended to provide a cross-cutting look at high level risk areas which need increased visibility and attention within Nuclear Projects. It is important to note that not all risks in the RMO Tool need to be categorized under a Key Risk Area.

The Sponsor of a Key Risk Area is required to champion the risk management process to ensure that, as an aggregate, the Key Risk Area is being addressed **efficiently** and **effectively** in order to minimize impact on NR objectives. It is expected that the Key Risk Area Sponsor is:

- **Knowledgeable of** and **able to communicate** the general “health” and status of the Key Risk Area at the R-ROC and in other major communication vehicles, as required.
- **Proactive in initiating change in their Key Risk Area** to improve the efficiency and effectiveness of the NR response.
- **Available to provide the strategy/rationale** for the requested change to the individual risk owners, when required.
- **Rigorous in follow up** to ensure sponsor directives have been implemented.

## 5.0 RISK MANAGEMENT OUPUTS

Effectively managing the outcomes of realized risks is critical to recovering project objectives. Ineffectively managing realized risks can create a snowball effect where distractions result in loss of focus on the remaining risks leading to their eventual impact on the project.

### 5.1 Contingency

Contingency is a tool to manage uncertainty and risk throughout the life of a project. The contingency reserve should be proportional to the project size, duration, complexity, risk exposure and tolerance, prior experience with the work, and

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>18 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

confidence levels set by management. ***Contingency is not a tool to compensate for an underdeveloped project plan.***

Contingency covers the *known unknowns* in a project. Specifically, these are the uncertainties associated with a schedule and cost estimate, as well as the discrete risk events that impact the objectives defined by these fundamental products. Any contingency development exercise requires a high quality, vetted estimate and schedule. Without a high quality project plan, one cannot effectively identify risks or the level of uncertainty. Without a high quality risk register and well understood uncertainty profile, one cannot effectively calculate an appropriate contingency estimate. It is the expectation that the project plan presented for contingency analysis is reasonable and achievable and endorsed by necessary stakeholders during its development.

The PMO risk department will work with the project managers to develop an appropriate project contingency estimate. Contingency should be calculated in advance of submitting the funding approval package to the approving board/committee but after the development of the cost and schedule estimate. Once approved, ongoing contingency adequacy reviews should be performed through the PMO risk department in line with Section 5.1.5.

Management Reserve (MR) is an amount of the project's calculated contingency withheld for management control purposes.

### 5.1.1 Discrete Risks

Risk events have cost, schedule, quality, or safety impacts, all of which can be characterized into potential financial consequences.

The cost score should indicate the direct cost impacts resulting from the realization of the risk exclusive of time dependent costs. Using three point estimates to establish ranges of possible outcomes for risks, the impact of the discrete risks can be modelled in a Monte Carlo simulation to estimate the amount of contingency required to address these specific events.

The schedule score identified on the risk register indicates the impact to a project's critical path, usually expressed in "days" and easily translated to dollars based on burn rates. This approach to schedule contingency (i.e. burn rate x days delay) is high level approach and is less precise than range analysis on a CPM schedule, which is the preferred method. This approach uses a Monte Carlo methodology and assigns three point estimates to critical path project activities considering the risks identified.

### 5.1.2 Cost Estimate Uncertainty

Cost estimate uncertainty is a function of estimate class and is an implicit risk to project objectives. For example, a point estimate built upon conceptual design information is only assumed accurate within a very broad range and may have many potential outcomes. Uncertainty in estimates is expected to decrease over time as the project definition improves and the project matures. Appendix E Table 1 identifies the ranges of uncertainty associated with estimate class definition as defined by AACE.

Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>19 of 35</b>

Title:

### NUCLEAR PROJECTS RISK MANAGEMENT

The determination of the size of the contingency fund must take into the account the estimate accuracy and project phase.

Cost growth areas typically covered by estimating uncertainty contingency are more general than those covered by discrete risks, and include items such as:

- Minor errors in omissions in the estimating process (e.g. precise quantity is only known during execution)
- Variability of productivity (e.g. estimating based on execution in the summer, but actually executed in the winter)
- Variability in wages (e.g. labour agreements expiring during execution)
- Variability in prices (e.g. material prices assumed)

Effort must be made to ensure the factors covered by cost estimating uncertainty are not duplicated in the project risk register. Using three point estimates, the impact of the cost estimate uncertainty can be modelled in a Monte Carlo simulation to estimate the amount of contingency required to address these events.

Estimate uncertainty does not capture variability in scope.

#### 5.1.3 Risk Tolerance and Confidence Levels

Risk tolerance is the degree, amount, or volume of risk that an organization is willing to accept. Nuclear Projects risk tolerance is informed by a number of contributors including the experience and instinct of the project management team, past performance of similar projects, and stochastic methods.

In stochastic risk analysis, it is often expressed in a percentage value called a confidence level. For example, a P50 value on a Monte Carlo contingency estimate means that a project manager can be 50% confident that the contingency allocated is sufficient to address the risks and uncertainties defined for the project.

In managing a portfolio or program of projects, the concept of confidence levels can be useful in managing contingency funds. For example, for a given project's contingency analysis, the following structure could be employed to support the approval authority of contingency funding. This is for illustrative purposes and may be applied differently for different funding streams and risk tolerances within the Nuclear Projects organization.

Contingency \$ at Confidence Level	Up to P50 (Current Phase Risks and Uncertainties)	Up to P50 (Future Phase Risks and Uncertainties)	P50 → P70 (All Risks and Uncertainties)	P70 → P90 (All Risks and Uncertainties)
Treatment Upon Project Approval to Proceed	Released to Project	Allocated to Project but not Released	Allocated to Project but not Released to	Allocated to Management Reserves

<b>Authorization for Release to Project</b>	N/A	VP Nuclear Projects	VP Nuclear Projects	SVP Nuclear Projects

Table 1: Example of how contingency developed for a specific project feeds into portfolio or program management

### 5.1.4 Probabilistic Analysis of Uncertainties

Monte Carlo simulation is a form of probabilistic analysis. It is a method to predict the impact of defined risks and uncertainties using project simulations. Gathering the three point estimates required for the Monte Carlo method can be quick and simple or rigorous, and should be commensurate to the overall magnitude or cost of the project. For example, small projects can use the projects manager's judgment for inputs but large projects should be done with rigor and inputs from knowledgeable personnel. Poor quality inputs to the Monte Carlo (including choosing a misrepresentative probability distribution, or omissions of key risks) will produce misleading results – "garbage in, garbage out".

The PMO risk department will perform the Monte Carlo analysis for risk and uncertainty inputs defined by the project manager. All contingency requests in support of funding approval packages are required to have a supporting Monte Carlo analysis, unless an exception is approved by the Director of the executing Nuclear Projects organization.

The general steps to executing the Monte Carlo contingency analysis are as follows. The PMO risk department can help provide direction and guidance to project teams where required:

- Confirm the basis of analysis. The project scope, schedule, and estimate should be well defined/finalized with minimal anticipated changes.
- Conduct risk screening to determine which risks are warranted to have contingency allocated against them. Not all risks are suitable for contingency allocation. Appendix E Table 2 provides a guideline on how risk screening should be conducted.
- Gather inputs for probabilistic analysis. This involves obtaining three point estimates (Most Likely, Optimistic, and Pessimistic) for residual risk impacts, cost uncertainty, and the logic tied critical path schedule activities.
- Run Monte Carlo simulations using software and analyze the results. Results will be presented as S-Curves or in other tabular forms/reports generated from the Monte Carlo tool.
- Determine the size of contingency required for the determined level of confidence.
- Reassess the inputs if required based on the outcome of the analysis and iterate steps (a) through (e).

## Manual

Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 5.1.5 Monte Carlo Analysis - Limitations

Monte Carlo project predicts the impact of the identified risks and uncertainties by running simulations to identify the possible outcomes of the project. This technique helps in forecasting the likely outcome of a project, thereby helping decision makers and project managers in make informed decisions.

***Monte Carlo contingency analysis is not intelligent. It will not compensate for omissions or errors in the risk registers or estimates that are submitted for analysis. The output of a Monte Carlo considers only those risks and uncertainties the project manager has identified as an input to the process.***

### 5.1.6 Contingency Adequacy Review

The owner of contingent funds should re-evaluate the amount of contingent funds required as the project progresses. Contingency funds defined in funding approval packages are “point-in-time” estimates that reflect the project risk profile in that instance. As the project progresses, risks will be retired and new risks will emerge. It is critical that the contingency estimate is updated to reflect this and maximize the organization’s flexibility in managing these funds.

Contingency reviews should be conducted at the following checkpoints:

- (a) Gate submission, including gate refreshes; BCS submission or superseding BCS submission
- (b) Upon initiation of the project change control process;
- (c) Release planning;
- (d) Risk realization, especially a risk with high demands for funds;
- (e) Unexpected event requiring high demands for funds;
- (f) Significant change in the risk register;
- (g) Significant deviation from the planned usage of contingency
- (h) Alongside regular cost forecasting as defined by the PMO cost control department.

Note that the contingency adequacy review (or contingency assessment during normal forecasting activity) may reveal that there is too much contingency or not enough contingency allocated to the project. The project manager should return contingent funds that are no longer required via change control. If additional funds beyond what has been approved at the gate or release are required, then the function manager or project manager should request additional funds via change control process.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>RISK</b>	<b>R002</b>	<b>22 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

### 5.1.7 Refurbishment Contingency Development

All projects being executed within the Nuclear Projects organization, including refurbishment projects, are required to comply with this manual. However, for Nuclear Refurbishment, a white paper will prepared for each release period detailing how the contingency estimate is assembled. This white paper will be governed by this manual but will contain sufficient detail and additional considerations commensurate to the magnitude of the project.

### 5.2 Internal Lessons Learned

Internal lessons learned (ILL) are valuable because they ***provide real time, directly applicable experiences that other project managers can use when establishing their project plans***. ILL usually take the form of detailed reports prepared upon project completion as defined in the modifications process. While this is valuable the objective of the ILL process is to share lessons both large and small in an effective way with minimal administration. Management and documentation of ILL is conducted electronically in the RMO Lessons Learned library.

ILL entries can be generated by Nuclear Projects staff for the purposes of sharing non-confidential OPEX and Lessons Learned from their department, project, a specific task, pre-post job debriefings, oversight activity, benchmarking trips, meetings, human performance observations or any other source.

#### 5.2.1 Project Manager Direction

All project managers shall proactively document important lessons learned throughout the project life cycle to support improved project performance within the Nuclear Projects organization. Project managers will notify the PMO risk department to ensure lessons are documented and disseminated properly to increase awareness among the Nuclear Projects organization and improve management decision making.

#### PMO Role

The PMO Risk Department actively solicits real-time feedback on ILL throughout the organization, ensures accessibility to all members of the project and ensures standards, quality and completeness is accomplished. PMO Risk Department will provide simple templates for the project management team and prepare communication products (reports, emails, articles) for dissemination to the Nuclear Projects organization and its vendors.

### 5.3 Issues Resulting from Realized Risks

An issue is defined as ***a point or matter in question or in dispute***. For projects, issues that arise usually surface gaps that must be addressed in order to achieve project safety, quality cost, and schedule objectives. Project issues can occur when risks are realized, assumptions made during the development of the project plan are

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>RISK</b>	Revision Number: <b>R002</b>	Page: <b>23 of 35</b>
Title: <b>NUCLEAR PROJECTS RISK MANAGEMENT</b>		

proven to be invalid, or as the result of project authorization to proceed at risk with an underdeveloped plan.

Issues ***are not the normal challenges encountered in the progression of project planning and execution.*** Similar to risks, issues generated from realized risks – as defined in this manual - must demonstrate the potential to impact approved project objectives.

### 5.3.1 Project Manager Direction

Management of issues resulting from realized risks have one of two outcomes:

- A recovery plan is prepared and implemented with the target of achieving the approved plan, or
- The issue cannot be recovered and impacts the ability to execute the approved plan, resulting in a need to modify the plan (i.e. move milestones, increase costs beyond contingency).

When an issue of this type arises a Station Condition Record (SCR) shall be raised to document the issue as an adverse condition. In most cases this SCR will be trended D4 and closed out to recovery actions input to the RMO action log or to the change control process, as appropriate, wherein the issue will be managed to closure. Any actions generated in the RMO action log associated with an issue of this type shall reference the SCR. As defined by the requirements of the SCR process, and depending on the severity of the issue, actions inside the SCR process may be required. In this scenario, the actions do not need to be duplicated in the RMO actions log.

The project manager, depending on the severity and possibility of repeat occurrence, shall work with the PMO risk department to generate an internal lesson learned for distribution by the PMO.

## 5.4 Actions

Project actions not included in an existing managed system (project schedule, business plan, action tracking, etc.) will be documented and managed in the RMO action log. This action log can take the place of Microsoft excel or word files that project managers may be using to track actions.

Nuclear Projects action sources should be diverse and comprehensive and may include, but are not limited to, meeting actions, audit response actions, actions to mitigate risks, actions to validate assumptions, actions arising from assumptions, decisions, issues, oversight, OPEX and lessons learned implementation actions. Actions that are part of the normal course of executing project work such as day to day individual accountabilities and “business as usual” actions should not be included in the log.

## NUCLEAR PROJECTS RISK MANAGEMENT

### 5.4.1 Reporting

User reports can be generated by anyone at any point in time. These online business intelligence (BI) reports may be communicated from time to time in meetings or other forums. PMO risk department will administer these reports and facilitate project team access to them, in real time. Change to reports will occur from time to time as required.

## 6.0 ROLES AND ACCOUNTABILITIES

### 6.1.1 Senior Vice President and Vice Presidents in Nuclear Projects

Champion the risk management process in Nuclear Projects.

### 6.1.2 Project Managers and Directors

Apply this manual to all projects being executed by the Nuclear Projects organization.

### 6.1.3 Project Team

Support project managers and directors through application of this manual.

### 6.1.4 PMO Risk Department

Support project team members in the application of this manual and the RMO tool. Maintain this manual and provide guidance, training, and support to project teams. Support Nuclear Projects executives by providing oversight and reporting of the risk management program in Nuclear Projects.

**Appendix E: AACE Estimate Class and Expected Accuracy Ranges**

Table 1 - AACE Estimate Class and Expected Accuracy Ranges

ESTIMATE CLASS	Primary Characteristic	Secondary Characteristic		
	MATURITY LEVEL OF PROJECT DEFINITION DELIVERABLES Expressed as % of complete definition	END USAGE Typical purpose of estimate	METHODOLOGY Typical estimating method	EXPECTED ACCURACY RANGE Typical variation in low and high ranges <sup>[a]</sup>
Class 5	0% to 2%	Concept screening	Capacity factored, parametric models, judgment, or analogy	L: -20% to -50% H: +30% to +100%
Class 4	1% to 15%	Study or feasibility	Equipment factored or parametric models	L: -15% to -30% H: +20% to +50%
Class 3	10% to 40%	Budget authorization or control	Semi-detailed unit costs with assembly level line items	L: -10% to -20% H: +10% to +30%
Class 2	30% to 75%	Control or bid/tender	Detailed unit cost with forced detailed take-off	L: -5% to -15% H: +5% to +20%
Class 1	65% to 100%	Check estimate or bid/tender	Detailed unit cost with detailed take-off	L: -3% to -10% H: +3% to +15%

Notes: [a] The state of process technology, availability of applicable reference cost data, and many other risks affect the range markedly. The +/- value represents typical percentage variation of actual costs from the cost estimate after application of contingency (typically at a 50% level of confidence) for given scope.

## NUCLEAR PROJECTS RISK MANAGEMENT

### Appendix F: Outputs of the Monte Carlo Method

Several standard outputs are available to provide project managers with insights to cost, and even schedule predictability in their projects. These graphical representations of results allows for robust means of communicating risk, and provides additional data to support decision making and identify the possible outcome of decisions.

Figures F-1 and F-2 are graphs depicting the results of a Monte Carlo simulation defining the probability distribution of cost and schedule outcomes based on input assumptions. This type of information is useful for understanding the expected cost/duration and the range/dispersion of the projected cost and durations.

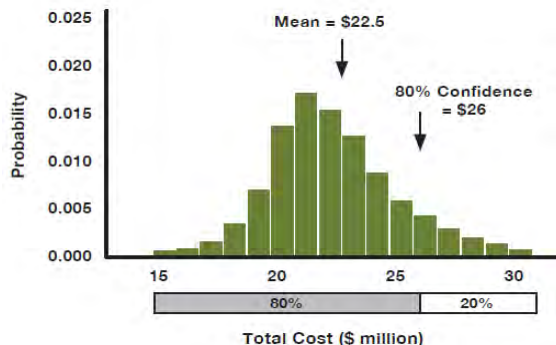

Figure F-1: Sample Probability Mass Function on Project Costs

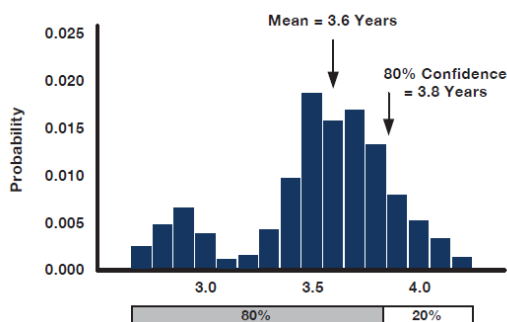

Figure F-2: Sample Probability Mass Function on Schedule Duration

### Confidence in Cost or Schedule

The cumulative probability functions shown in Figure F-3 provide the same information shown in Figure F-1, but in a cumulative manner. The cumulative functions provide a quick reference for the mean (P50) and a confidence level in the estimate or schedule.

### Identification of Risks with the Greatest Impact

Sensitivity analysis is a primary modelling output that can be used in the valuation of the impacts of individual risks. Figure F-4 Sample Sensitivity Analysis on Project Risks provides a sensitivity analysis in the form of a “tornado diagram”. Tornado diagrams depict the influence of individual risks and highlight the greater contributors to the overall risk. Using this information, project managers or function managers can spend more effort on mitigating the risks that has the higher impact on the success of the project/function.

Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

### 1.0 DIRECTION

Establishing an accurate and realistic schedule is a critical planning tool for a project. The schedule is the main planning tool used to understand and communicate the status, interrelationships and dependencies among project activities and deliverables. The schedule is critical to properly strategize, plan and prepare for upcoming project work, resource requirements and corrective actions as required.

This manual outlines scheduling management principles and requirements for Nuclear Projects and is in compliance with N-STD-AS-0028, Project Management Standard. It is applicable to project teams and contractors managing OPG-N project work.

Schedules are to be developed with inputs from all stakeholders and it is an ongoing planning and monitoring process throughout the project lifecycle.

Schedule detail must be developed at an appropriate level to allow the project team to communicate the plan, monitor project progress and cost performance, and use the data to make accurate forecasts, strategize and plan upcoming work.

### 1.1 Overview

Scheduling includes:

- (a) Establishment of schedule Work Breakdown Structure (WBS) and hierarchy level requirements.
- (b) Identification of key activities including their start and finish date, duration and resources.
- (c) Activities that are deliverable based.
- (d) The sequence and logical interrelationship of activities and milestones.
- (e) Identification and optimization of the critical path.
- (f) Regular monitoring and updating to track performance, forecasting, and initiate corrective action for schedule threats.
- (g) Look ahead at planning and strategizing to identify and manage priorities, opportunities, and threats.

### 2.0 THE OVERALL PLANNING AND SCHEDULING PROCESS

The overall planning and scheduling process can be represented in two major stages:

- (a) Project Planning and Schedule Development, resulting in the formation of a Baseline Schedule

**Manual**

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SCH</b>	Revision Number: <b>R001</b>	Page: <b>6 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

- (b) Schedule Management, Monitoring, Analysis, Reporting, and Mitigation, resulting in regular periodic schedule updates and schedule change control management

The planning process uses a top-down approach for schedule development and a bottom-up approach for schedule management.

## **2.1 Multi level scheduling system**

The concept of multi level scheduling comes from the need to have schedules with different levels of detail to suit a specific audience and purpose. Project schedules may be prepared at up to three levels of detail; level 0 contains the lowest level of detail whereas level 3 contains much more detail.

For example, projects where most of the work will be performed by EPC contractors will utilize, at a minimum, detailed level 3 schedules. OPG acting as the owner performs project management and control utilizing level 0 to 2 schedules.

The required level of detail is also directly aligned to the phase of the project. Immediate and current phases should have schedules with greater detail (Level 3 minimum) while the schedule for the future phases will have less detail. As the project moves into subsequent phases and the scope is more defined, the required schedule detail is increased to reflect the improved scope definition. For example, a project entering the Definition phase requires a minimum level 3 for the included engineering work, but the construction and close-out work (future Execution/Close-out phases) might only be detailed at level 1 or 2. This is called Rolling Wave Planning.

## **2.2 Multi Level Scheduling for Nuclear Program**

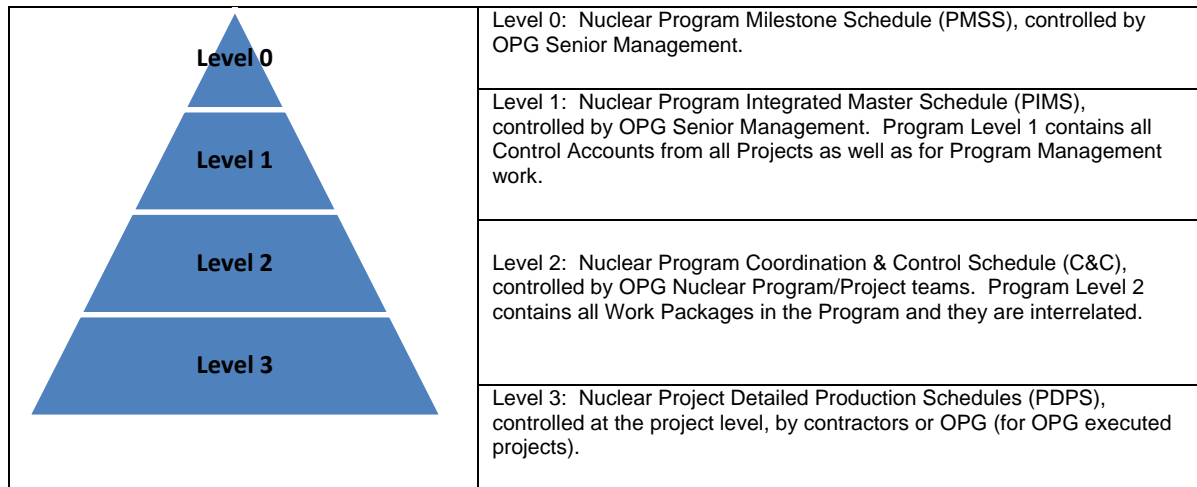

A nuclear program will generally contain multiple interrelated projects and therefore significant coordination and control is needed crossing different project teams. This integration and control is exercised through the Program Integrated Master Schedule, NK38-PLAN-00300-10000, (Program Level 1) and Program Coordination & Control Schedule (Program Level 2), whilst details are addressed by Project Level 3 Schedules that are precisely aligned with Program Level 1 and Program Level 2. Refer to Figure 1.

Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SCH</b>	Revision Number: <b>R001</b>	Page: <b>7 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

**Figure 1 – Nuclear Program Multi Level Scheduling Frame**

### 2.2.1 Level 0 Schedule

Level 0 consists of the **Program/Project Milestones and Key Dates**, e.g., online outage and project contract dates and other major interface dates.

Audiences for this schedule Level include, but are not limited to client, senior executives and general managers. If included with a bid and/or the Contract, demonstrates conformance to contractual and other milestones.

### 2.2.2 Level 1 Schedule

Level 1 schedule is the **Nuclear Program/Project Integrated Master Schedules (PIMS)** that contains all Control Accounts (Level 1 Activities) in the program or project.

Control Account is not a financial term but rather a certain level of WBS element that has a particular work scope, a time window, and a responsible organization.

In nuclear programs and projects, Work Breakdown Structure, Control Accounts and Work Packages are important terms for multi level scheduling and Earned Value Management.

A standard naming nomenclature is applied to all Level 1 activities (Control Accounts).

The level 1 schedule provides a high-level management summary of the project. It will represent all Units, Phases, and Bundles.

The level 1 schedule is a summarization of the C&C (Co-ordination and Control Schedule) at the Control Account level.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>N/A</b>	
Sheet Number: <b>SCH</b>	Revision Number: <b>R001</b>	Page: <b>8 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

The schedule is prepared by OPG as part of the initial planning phase of the project and updated to reflect the progression of planning, i.e. as projects are better defined, the Level 2 Control and Co-ordination Schedule is updated.

Audiences for this type of schedule include, but are not limited to general managers, sponsors, and program or project managers.

### 2.2.3 Coordination and Control Schedule (C&C)

Level 2 Schedules are the ***Nuclear Program/Project Coordination & Control Schedules (C&C)***, controlled by OPG.

The C&C schedules are the major planning and scheduling documents for owner's program/project coordination and control is applied at this level.

At the C&C schedule, each Control Account is broken down to several Work Packages, such as Engineering Packages, Procurement Packages, and Construction Packages.

For a certain Nuclear Program, all C&C schedules are interrelated, and also all C&C activities have logic ties with relevant program Milestones.

The C&C schedule covers the scope of work by Phase, Unit SCI, and Type of work and contains full Critical Path Method (CPM) logic. This is the schedule which will be used, at the Phase and Unit level, to track the overall schedule status of the Program. It will be updated and controlled by OPG and based on the Contractors detailed Level 3 Schedules. The following are some key features of the C&C schedule:

- Contains an adequate number of activities with realistic activity durations to clearly show the sequence and logic in performing all projects, within the Program, at the Phase and Unit level, in a systematic manner. It will include all interfaces between OPG and contractor, and or between contractors.
- Defines the Program critical path and activity total floats
- Schedule variances shall be prepared

Audiences for this type of schedule include, but are not limited to program or project managers.

### 2.2.4 Level 3 Schedule

Level 3 schedules are ***Project Detailed Production Schedules (PDPS)*** in which Work Packages are broken down to detailed activities, mainly prepared by EPC contractors performing the work.

Level 3 schedules shall be precisely aligned with higher level schedules maintained by OPG, the owner. A Level 3 schedule uses the same WBS as that in the owner's Level

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>9 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

1 and 2 schedules, it also contains WBS Summary Activities for every Work Package that follow the same naming nomenclature as that in the owner's WBS.

The Level 3 schedule is also coded to allow summaries of all the C&C Schedules controlled by OPG, the owner.

The level 3 detailed schedules will be prepared by the group executing the work, mainly suppliers and contractors, however, in some case by OPG where OPG is self performing work. The schedule must be prepared in accordance with the Program's Work Breakdown Structure ("WBS") and coding guideline. This schedule contains the lowest level of detail required to manage and execute the work. It is structured in a way to allow summarizing of the activities in order to update the Level 2 C&C Schedule.

- The Level 3 shall include the full scope of each suppliers / contractor showing all interfaces with other contractors / OPG.
- The schedule shall be resource loaded to the lowest level of the defined Resource Breakdown Structure as agreed by OPG.
- The schedule shall define all long lead procurements.
- After being captured as a baseline, the schedule will be regularly updated, providing the basis for status reporting, progress physical percent complete at the activity / Work Package Level, forecasting, and change management.
- All supplier / contractor baseline schedules needs to be approved by OPG to ensure program milestones, WBS and scheduling guidelines and coding are followed.
- Schedule variances and mitigation plans will be analyzed from the Level 3 schedule.
- Daily, Weekly and Monthly look-ahead reports will be generated from Level 3 schedule.
- This method will also be utilized where OPG is self performing the work

Audiences for this type of schedule include, but are not limited to, project managers, superintendents, and general foremen.

### 2.3 Schedule Integration

All Contractors' Level 3 Schedules or OPG Functional detailed schedule are fully aligned, utilizing a common Work Breakdown Structure and coding guideline, and integrated in the overall C& C Schedule.

The C&C Schedule will be the program's basis for measuring schedule progress. Refer to **Appendix A**.

## Manual

Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>10 of 22</b>

Title:

## NUCLEAR PROJECTS SCHEDULE MANAGEMENT

### 3.0 SCHEDULE MANAGEMENT

#### 3.1 Schedule Requirements

Project teams, including contractors, shall follow the relevant OPG Nuclear procedures, manuals, guidelines and plans to develop, update and monitor project schedules as follows:

##### 3.1.1 Scope and WBS

OPG project teams should follow N-MAN-00120-10001-SCH-05, Nuclear Program/Project WBS Manual, to establish a quality WBS that addresses 100% of project work, down to Work Package level.

Particularly, the WBS should be deliverable oriented and based on project SOW documents. The WBS shall reflect contract strategies so that work scope, budgets and responsibilities can be clearly allocated.

Contractors should use the WBS developed by OPG project teams to develop lower level WBS, mainly Work Packages. The lower level, more detailed WBS developed by the contractors shall be concurred by OPG.

##### 3.1.2 Milestones

The definition of **milestones** is different from **deliverables**. Deliverables are expressed by means of WBS components/activities at certain levels, while milestones refer to those most significant events or targets that mark achievement or progress of the program or project.

For example all supplier contract dates and major interfaces shall be defined as milestones in the schedule.

See N-MAN-00120-10001-SCH-06, Nuclear Refurbishment – Program Milestone Definition Framework, for more information.

##### 3.1.3 Activity Planning

Activity planning is a team effort involving all key members of the project team and stakeholders in order to help identify all project deliverables. The project deliverables for the requested release should be developed to schedule level 3 and to level 1 or 2 for any future releases as there is typically less information available regarding the future releases. Project teams must create a schedule sufficiently detailed to allow them to plan, monitor and control their projects effectively.

Activity planning should be completed with input from scoping and estimating processes. It is critical that the activities be deliverable based and not resource based. The activity needs to describe what specific deliverable needs to be accomplished. For example an activity such as “Create design specification” is a deliverable based

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>11 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

specific activity where as “Design support” is a generic resource based activity that provides little useful information on what needs to be done and when.

### 3.1.4 Resource-Loading

Resource availability and task execution duration estimates must be provided from detailed estimates or by those who will be responsible for carrying out the related tasks and activities.

In the contractors’ Detailed Production Schedules (PDPS, Level 3 Schedules), all Work Package Summary Activities are required to be loaded with the following resources.

- **Value Unit for Labour (VUL):** refers to the total Labour Hours. An average hourly rate can be applied to the VUL to obtain the budget.
- **Major Work Quantities**, e.g. number of pressure tubes to be removed or electric boards to be inspected, number of pumps to be installed, cubic meters of concrete to be poured.

For additional detail refer to N-MAN-00120-10001-SCH-07, Nuclear Refurbishment Earned Value Management.

Additionally, OPG resource requirements are to be loaded in OPG Level 3 schedule activities. The C&C schedule is not resource loaded.

### 3.1.5 Activity Sequencing

Connecting the activities and milestones together with ‘sensible’ logic is the foundation of the project schedule. Every activity, except the first and last, should be connected to at least one predecessor (preceding task) and one successor (succeeding task). Ensuring compliance will prevent the schedule from containing open-ended activities and allow proper analysis of the critical path.

Team meetings or workshops involving key team members is an excellent means to develop schedule logic and will ensure better planning results.

Logic planning, or activity sequencing, is an iterative planning process and is further refined during schedule development to optimize project timelines and resources.

When developing schedule logic, interfaces with other processes such as N-PROC-MA-0013, Planned Outage Management, and N-PROC-MA-0022, Integrated On-Line Work Schedule, should be taken into account.

### 3.1.6 Activity Durations

Determining activity durations involves estimating how long it will take to complete the defined work activities. Much of this information may come from estimates, contractor estimates and supporting organizations however, resource availability across the

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>12 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

Nuclear Program/Portfolio must be taken into consideration. Estimating activity durations is generally completed once all activities have been defined and logically tied. This allows the project team to consider all other activities in the schedule and project constraints while determining durations.

### 3.1.7 Schedule Quality

The project schedule should be reviewed for overall quality to ensure it meets process requirements. This includes an adequate level of detail, minimal use of constraints and level of effort activities, use of lags (positive and negative), open-ended activities and identification of the critical path. This should be performed on a regular basis in both the developmental stage and normal updating of the schedule.

Project teams should follow the Schedule Assessment Checklist (see Appendix C) to perform schedule analysis in order to make sure that the schedule is of good quality. Also refer to DR Program P6 Scheduler's User Guide, N-MAN-00120-10001-SCH-08, for additional details.

### 3.1.8 Basis of Scheduling

Contractors should issue a basis of schedule document with the submission of the baseline schedule. The document shall include the following, only if not captured in any other document:

- Summary description of the scope and main deliverables
- List of all Project/Payment milestones and key dates
- WBS / Primavera files structures and integration
- Coding structures for generating the various Schedules layouts
- Calendars used with the various activities
- Productivity rates / Assumptions
- Benchmarking to similar projects for duration assumption
- Progress measurement process for all work packages
- Regular scheduling reports

## 3.2 Schedule Review and Approval

The schedule must be reviewed and approved by the project team members and key stakeholders. The review must consider project and program constraints, milestones, resource requirements, and critical path to determine the acceptability of the schedule. If alterations are required, changes are made to the schedule logic, resource allocations, and/or activity durations and then the schedule is re-calculated. Schedule

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SCH</b>	Revision Number: <b>R001</b>	Page: <b>13 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

reviews must also assess the possibility of conflicts with other projects and operational demands. These iterations continue until an acceptable schedule is developed.

### 3.3 Schedule Baseline

- (a) Once approved, schedules shall be baselined by the project owners as a benchmark for measuring implementation performance.
  - Baselined schedules are archives and shall not be modified. Changes to the baseline occur via a re-baselining process based on cost & schedule analysis and only through authorized change control.
- (b) For Level 3 schedules, schedule variances to baseline shall be explained and justified; corrective action(s) shall be required for any forecasted delay to any defined milestone; mitigation plan shall be prepared by the Contractor and approved by the OPG project manager.
- (c) Once a change application for a Level 3 contractor schedule is received, the OPG project team shall calculate the changes in the Level 2 schedule in order to check potential impacts to milestones and to other projects.

If there are no impacts or the impacts are acceptable, OPG may approve the proposed changes. The Level 2 and Level 1 schedules will all be revised to reflect the change.

### 3.4 Schedule Software

Primavera P6 has been selected as the major scheduling software for Nuclear Projects.

## 4.0 SCHEDULE MONITORING AND UPDATES

Monitoring and updating a project schedule involves revising the project activity status and actual progress (e.g. started, completed, % complete), and forecasting future performance and completion data. The forecasting of completion dates and remaining costs ensures that accurate projections are reported for project metrics and the ongoing management of schedule risks. The project schedule shall be updated and communicated on a regular basis.

Progress is monitored and controlled against the project baseline to illustrate any variance. This allows the project team to visualize what areas of the project require greater priority, potentially leading to changes in strategy or the creation of recovery plans in order to maintain plan commitments or at least minimize impacts.

Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>14 of 22</b>
Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

## **4.1 Schedule Update and Analysis**

### **4.1.1 Level 0, Level 1 and Level 2 Schedules**

OPG Project Teams shall perform the following:

- Closely track the progress status, perform trend analysis and timely updates to the Program/Project Level 0, 1, and 2 schedules, based on updated status information from the Level 3 Schedule.
- Monitor the status of all Program/Project Milestones, Level 1 Activities (Control Accounts) and Level 2 Activities (Work Packages)
- Analyze and communicate scheduling issues.
- Develop recovery plans for Milestones and Work Packages at risk.

### **4.1.2 Project Detailed Production Schedules (Level 3 Schedules)**

- 1) All nuclear project teams should perform the following on Level 3 Schedules:
  - Closely track the implementation progress status, perform trend analysis and timely updates to the project schedules.
  - During updates, monitor project milestones and activities that may impact upper level schedules.
  - For any significant changes that might impact project milestones and/or upper level schedules, carefully analyze, communicate, and take effective actions to mitigate the impacts. Follow the change control process and forms in accordance with N-MAN-00120-10001-PC, Project Controls.
- 2) Contractors shall provide timely updates and submit the revised project schedules per the project requirements.

Projects should maintain records that explain changes in activity durations or logic as they are being made in the project schedule. Activity log notes can be used for this purpose. Apply change management notes or codes to activities that have had baseline changes. Such records and coding can be used to reconstruct changes to project schedules and store the reasons for the alterations.

## **4.2 Schedule Reporting**

- (a) OPG project control and project teams shall review the progress status in all aspects as per Level 0, 1 and 2 schedules, and submit periodic progress reports and specific reports to OPG Senior Management, regarding the nuclear program or project.

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>15 of 22</b>

Title:

**NUCLEAR PROJECTS SCHEDULE MANAGEMENT**

- (b) All OPG project teams shall review the progress status in all aspects as per Level 2 and contractors' Level 3 schedules, and submit periodic progress reports and specific reports to OPG project control.
- (c) All contractors shall submit periodic progress reports along with project schedules updated and further detailed for certain look ahead periods, to OPG project control and project teams.
- (d) Standard reports shall be issued by all Contractors as per OPG requirements.

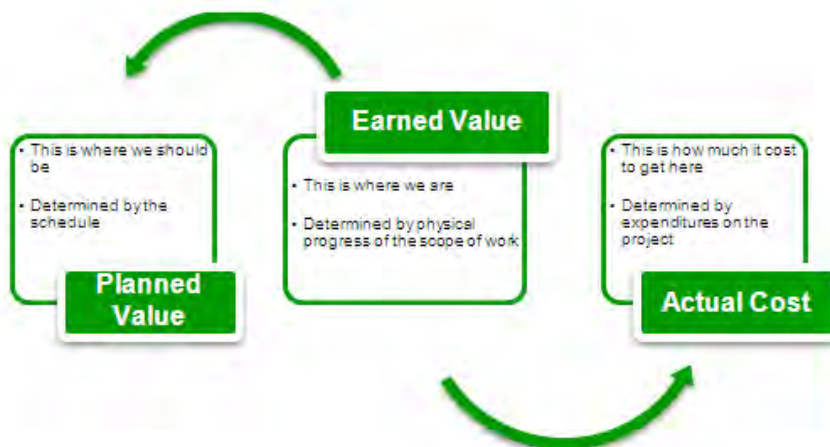

## 5.0 OVERVIEW OF EARNED VALUE PROCESS

Earned Value Analysis (or Earned Value Management) is a commonly used project management technique for gauging the progress and performance of a project. Compared to the conventional analysis of budgeted costs versus actual costs, Earned Value Analysis also considers the amount of progress made as compared to what was planned. As the name implies, value is earned as activities are completed.

EVM involves the assignment of time-based budgeted value to all program/project work; once the work is finished, the relevant value is earned, and this Earned Value is the basis for performance monitoring.

EVM provides necessary incentive mechanisms to project teams and contractors; it also provides effective approaches to assess program/project progress and cost status, and is the basis for a more precise forecast for time and cost control during schedule implementation.

In order to conduct Earned Value Analysis, three components are needed; Planned Value to be earned, Earned Value (physical progress) and Actual Costs. See figure below – Earned Value Process.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>16 of 22</b>

Title:

## NUCLEAR PROJECTS SCHEDULE MANAGEMENT

### 5.1 Purpose

The benefits of Earned Value Management are set out in the following industry recognized publications:

*ANSI/EIA-748-B-2007 Earned Value Management Systems*

EVMS provides a sound basis for problem identification, corrective actions and management re-planning as may be required. It provides for early identification of performance trends and variances from the management plan and allows management decision making while there is adequate time to implement effective corrective actions.

*PMI – A Guide to the Project Management Body of Knowledge*

Earned Value is a commonly used method of performance measurement. It integrates project scope, cost and schedule measures to help the project management team assess and measure project performance and progress

### 5.2 Process

This Earned Value Management process is based on the following principles set out in ANSI/EIA-748B Standard for Earned Value Management Systems.

- Plan all work scope for the program from inception to completion
- Break down the program work scope into finite pieces that can be assigned to a responsible person or organization for control of technical, schedule, and cost objectives
- Integrate program work scope, schedule and cost objectives into a performance measurement baseline plan against which accomplishments may be measured
- Control changes to the baseline
- Use actual costs incurred and recorded in accomplishing the work performed
- Objectively assess accomplishments at the work performance level
- Analyze significant variances from the plan, forecast impacts, and prepare an estimate at completion based on performance to date and work to be performed

Use EVMS in the organization's management processes

### 5.3 Schedule and Cost Integration for EV Calculation

Proliance is the software for Earned Value calculation and analysis for every work package and control account.

## Manual

Title: <b>NUCLEAR PROJECTS SCHEDULE MANAGEMENT</b>		

SPI/CPI shall be calculated at the Work Package level where Actual Cost is collected. Cost reports and earned value can be rolled to various levels according to the WBS/CBS and generated by bundle/unit.

% complete shall be calculated for every work package using L3 schedule and earning rules.

Refer to **Appendix B**.

## 6.0 CHANGE MANAGEMENT

The Contract shall submit with every schedule update a log, which shall contain records of any changes made to the schedule from previous submission:

- Records for all added/deleted activities
- Records for change in activity description/scope/duration
- Records for all changes to logical sequences and relationship between activities
- Any changes to WBS, added/deleted/split scope/work packages need to be formally communicated and approved by OPG before implementation.

## 7.0 DEFINITIONS AND ACRONYMS

### 7.1 Definitions

**Control Account (CA)** – The purposes of the Control Account are:

- Break the program or project down into manageable sub-divisions
- Enable reporting of cost and performance at a level suitable for providing high level indicators to Project and Program management
- Control Accounts shall reflect a consistent breakdown across Bundles and Units / Projects to allow analysis of performance and costs across projects or units for similar work elements
- Control Accounts should also represent the work assigned to one responsible organizational element on one program WBS element.
- A Control Account Manager or Team Leader will be responsible for management of each Control Account.
- A Control Account is a roll-up summary of associated Work Packages

## Manual

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH</b>	<b>R001</b>	<b>18 of 22</b>

Title:

### NUCLEAR PROJECTS SCHEDULE MANAGEMENT

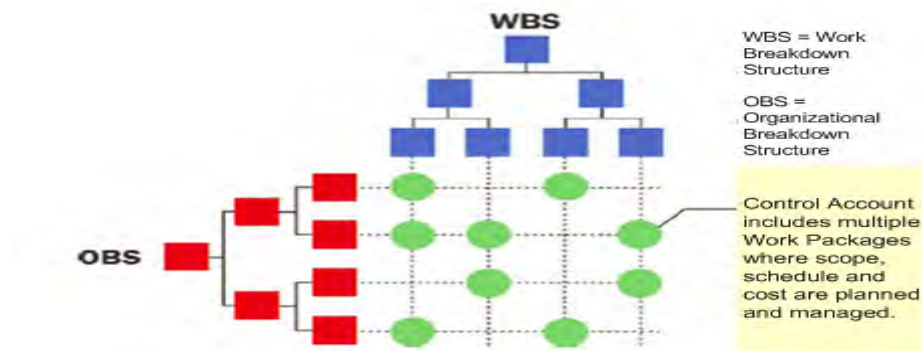

- The Scope, Resources, Cost and Schedule of the Control Account and the associated Work Packages will be defined in a Task Scoping Sheet (TSS) prepared by the Control Account Manager.
- The Resources, Cost and Schedule for each Control Account and Work Package will be derived from the relevant Project Gate or Function Release

**Earned Value** – The value of completed work expressed in terms of the approved budget assigned to that work for a schedule activity or WBS component. Also it is referred to as the Budgeted Cost of Work Performed (BCWP). Here value or cost can be expressed by dollars or labour hours.

**Work Package (WP)** – A Work Package is the WBS element at the lowest level of the WBS and is the level at which the comparison of actual costs to planned budgets and earned value are required. It is also the cost collection point that identifies the cost elements and factors contributing to cost and/or schedule variances.

At this level of the WBS an individual manager is assigned and is responsible for measuring progress, controlling variances, and preparing reports.

Work Packages are single tasks assigned to a performing organization for completion, and should be natural subdivisions of control account effort resulting in a definable end product or event. Each Work Package however, can be made up of a number of activities

Each Work Package will have the following characteristics:

- It represents units of work at the level where work is performed.
- It is clearly distinguishable from all other work packages.
- It is assigned to a single organizational element, or in an integrated product team environment,
- It has scheduled start and completion dates and, as applicable, interim milestones, all of which are representative of physical accomplishment

### 1.0 PURPOSE

This guide defines the processes, including the interface to approved tools and source systems, used to execute Cost Management within the Nuclear Refurbishment Program. This manual takes authority from N-MAN-00120-10001-PC, Project Controls.

Cost Management includes the processes required to enable projects to be completed within approved budgets. The purpose of this manual is to establish the requirements in undertaking those activities.

Cost management is comprised of the following processes:

- (a) Cost Management Planning – The process that establishes the policies, procedures, and documentation for planning, managing, expending, and controlling project costs.
- (b) Cost Estimating – The process of developing an approximation of the monetary resources needed to complete project activities.
- (c) Cost Budgeting – The process of aggregating the estimated costs of individual activities or work packages to establish an authorized cost baseline.
- (d) Funding – The process of providing the financial resources to meet the time-phased cash needs of the project. Funding is an importance part of the cost budgeting process.
- (e) Cost Monitoring and Control – The process of monitoring the status of the project to update the project costs and manage changes to the cost baseline.
- (f) Forecasting – The process of estimating or predicting the project's future based on knowledge and information available at the time of the forecast. Forecasting is an important element of cost monitoring and control.
- (g) Cost Performance Reporting – The physical or electronic representation of cost performance information compiled in project/program documents, intended to generate decisions, actions, and awareness. This information is generated during the cost monitoring and control process.

### 2.0 COST MANAGEMENT PLANNING

Cost Management planning is the process that establishes the policies, procedures, and documentation for planning, managing, expending, and controlling project costs.

Detailed Cost Management planning shall be performed as part of the overall Project Management (PM) planning process.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>Information</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-13</b>	<b>R000</b>	<b>5 of 29</b>

The Cost Management Plan will define how the team will estimate the project cost, prepare and present a project budget, control project costs, as well as document the review and approval requirements for the cost management processes.

Definitions of the terms used in cost management are contained in Section 6.1 of this document.

### 2.1 Organization, Roles and Responsibilities

The organization responsible for cost management activities as well as individual roles and responsibilities are contained in Appendix A.

### 2.2 Cost Management Planning Parameters

Cost Management planning shall establish and document the following as a minimum:

- (a) Control Thresholds – Variances between actual and/or forecast performance and the baseline plan in excess of 5% should be investigated to determine the cause and develop a corrective action plan.
- (b) Control Accounts – Control accounts shall be established for Work Breakdown Structure (WBS) elements at a level consistent with maintaining effective control of the project scope-budget-cost-schedule using Earned Value Management (EVM) techniques. in accordance with N-MAN-00120-10001-PC-09, Earned Value Management.
- (c) Work/Planning Packages and Activities - Each control account shall contain one or more work packages (WP). Each work package may contain a number of activities. Except for functional areas and Cost Only WP, no more than 15% of the total project value shall normally be comprised of Level of Effort (LOE) work packages.
- (d) Reporting Period – Reporting periods shall be monthly and shall be based on the OPG fiscal calendar. During high periods of activity such as during execution, more frequent reporting may be required.
- (e) Earned Value Management (EVM) – As a minimum, EVM shall be performed at the work package level. The EVM measurement techniques to be used for each work package shall be documented and in accordance with N-MAN-00120-10001-PC-09, Earned Value Management.
- (f) Escalation – Adjustments for escalation due to inflation shall be established in consultation with Finance. They shall be tracked and reported in separate Cost Only WPs. Cost Only WPs are not included in EVM.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>6 of 29</b>

- (g) Interest – Adjustments for interest costs shall be established in consultation with Finance. They shall be tracked and reported in separate Cost Only WPs. Cost Only WPs are not included in EVM.

## 2.3 Cost Management Tools

Proliance is the project Cost Management System tool. Proliance is a web-based application, accessible in the office or on site and enabling real-time communication. Using Microsoft's .NET application framework, it integrates with other systems, including NFRA.

The relationship between Proliance and other OPG business systems is shown in Figure 1. The source systems for cost management data are shown in Table 1.

**Table 1. Source Systems for Cost Management Data**

<b>Tools</b>	<b>Data</b>
Proliance	Cost-Only Work Packages, Planned Value, Earned Value, and Forecast
Primavera 6	Work Packages, Schedules, Physical Percent Complete, WBS
NFRA	Actual Costs

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>7 of 29</b>

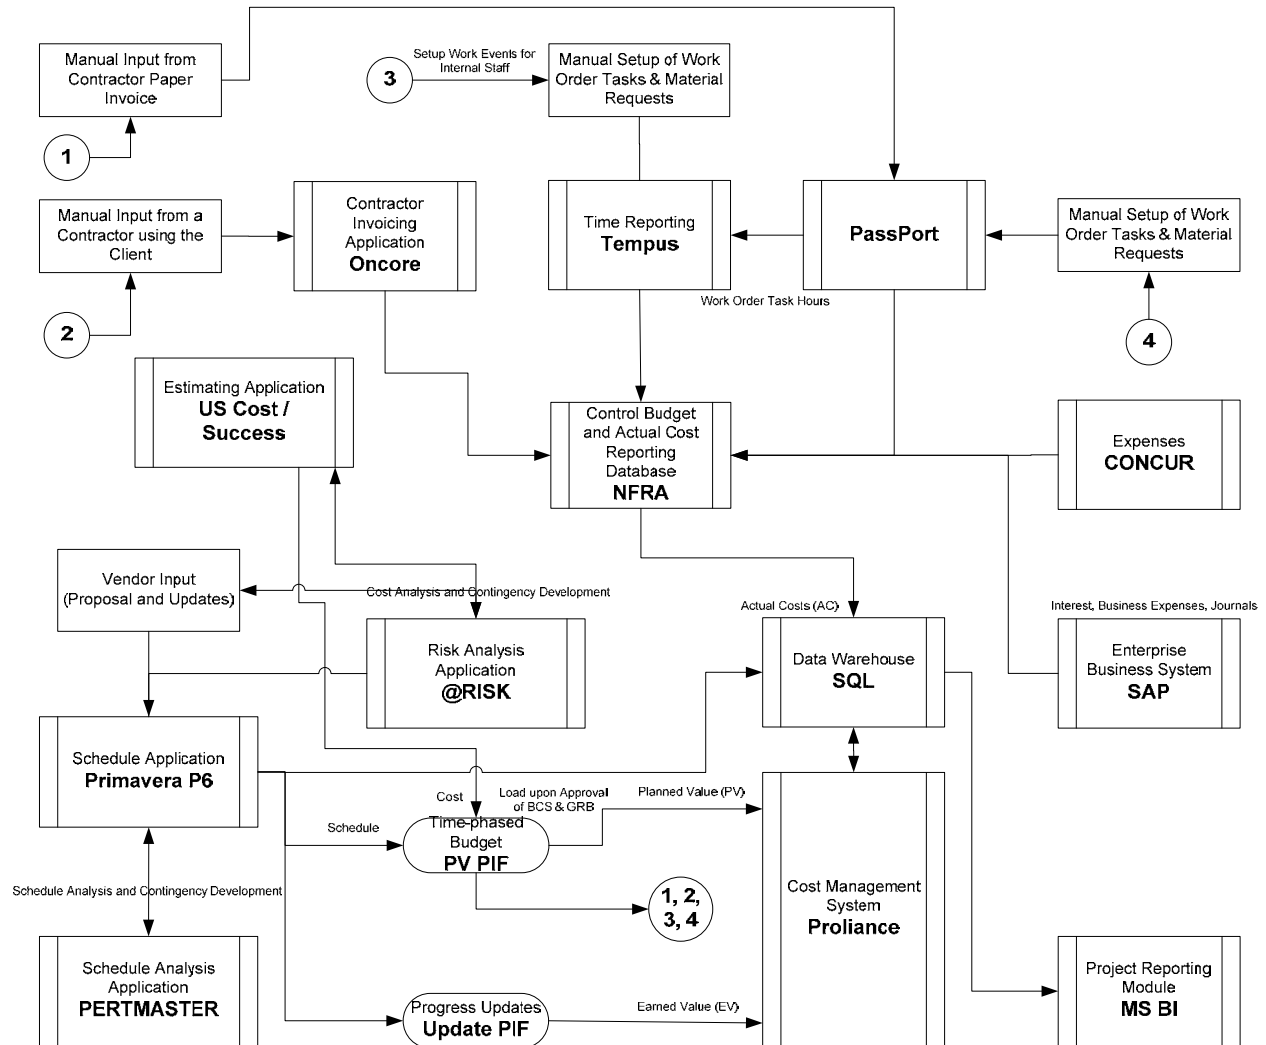

Primavera P6 is the source of all scheduling data. NFRA is the source of all actual costs (including data from Oncore, Tempus, and PassPort). Proliance Import Files (PIF) are custom formatted Excel spreadsheets that are used to import data into Proliance. Scheduling data is exported from Primavera P6 into the PIF.

Microsoft BI has been selected as the Project/Program Reporting tool. It pulls data from Proliance via the data warehouse to generate the Project/Program cost reports.

Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>9 of 29</b>

### 2.4 Cost Management Outputs

Information obtained through Cost Management shall be used for the following purposes:

- (a) Contingency management, in accordance with N-MAN-00120-10001-RISK-05, Risk Management.
- (b) Cost performance reporting, in accordance with Section 5.5, Cost Performance Reporting.
- (c) Schedule performance monitoring in accordance with N-MAN-00120-10001-SCH, Schedule Management.
- (d) Financial reporting, in accordance with FIN-PROC-PA-013.
- (e) Development of cost data for future use in estimating and business planning etc.

### 3.0 COST ESTIMATING

Cost estimating is the process used to determine the total cost of labour, materials, equipment, fees, and other resources, required for the execution of a project or part of a project. Estimates are also used to evaluate changes, alternatives, and what-if scenarios to assist in decision making. An accurate cost estimate leads to a more precise project schedule and budget which forms the basis for project planning decisions, value and performance monitoring and control.

The Basis of Estimate (BOE) documents the parameters and scope used in support of developing the estimate and also includes the complete estimate details and breakdown. The BOE breakdown shall follow the approved WBS to support the funding and budgeting processes.

All estimates shall be performed in accordance with N-MAN-00120-10001-EST, Cost Estimating.

### 4.0 COST BUDGETING

Cost Budgeting is the process of developing time-phased costs of individual activities or work packages to establish an authorized cost baseline.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>10 of 29</b>

### 4.1 Funding

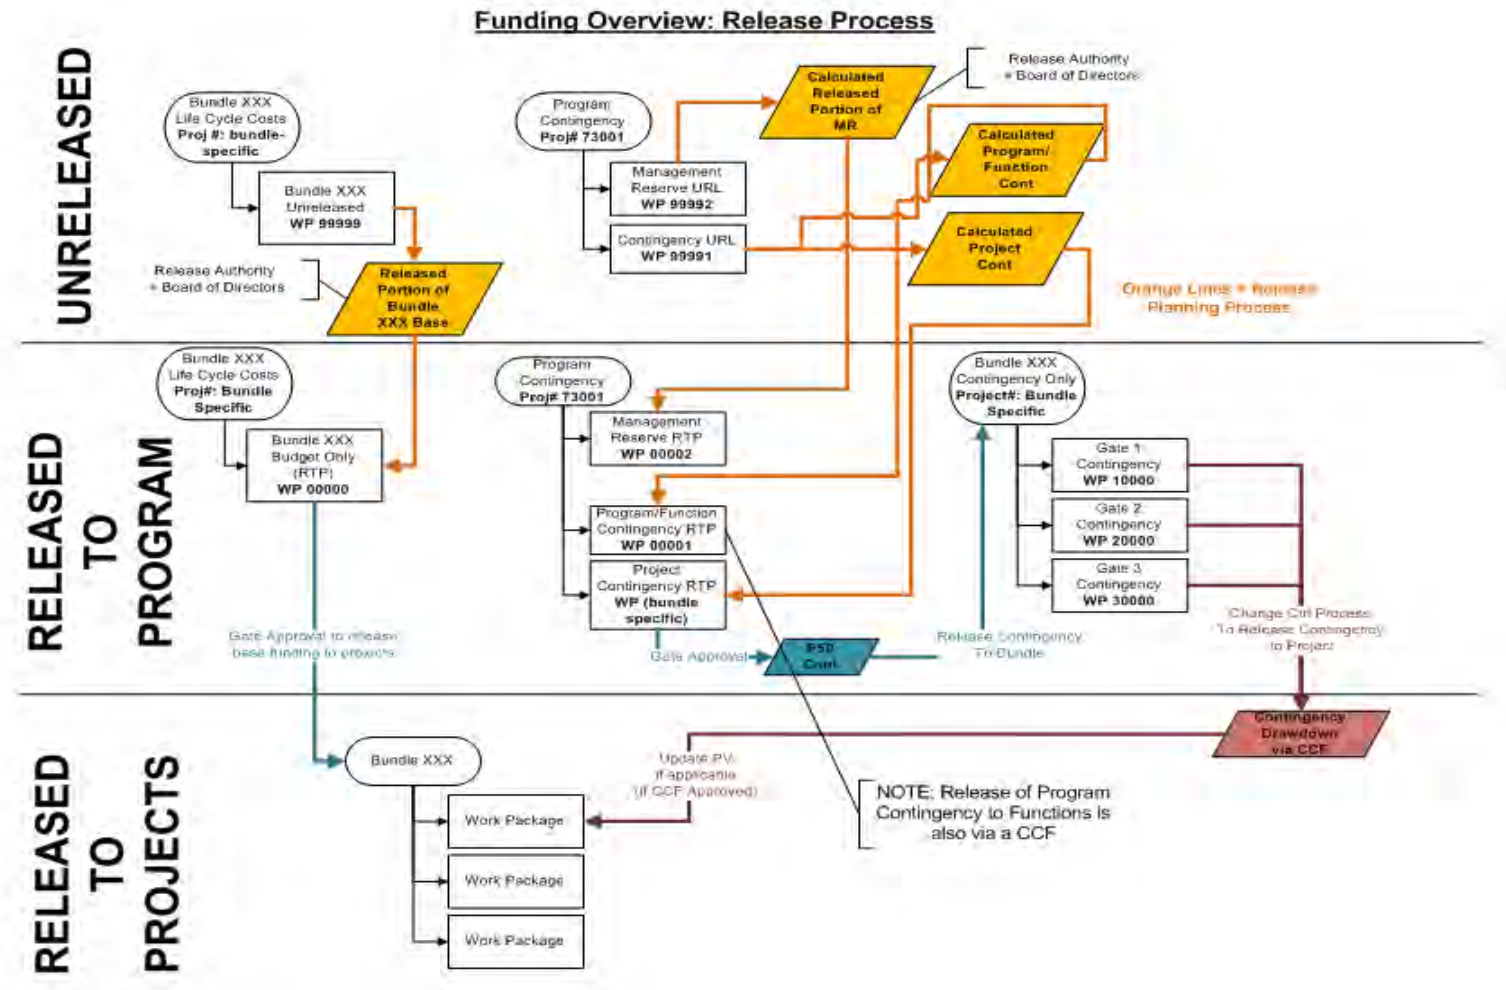

Funding provides the financial resources to finance a need, program, or project. Funding is approved by the OPG Board of Directors (BOD) in the form of Program Funding Releases.

An overview of the Funding Release Process is shown in Figure 2.

Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>11 of 29</b>

Figure 2. Funding Release Process Overview

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>12 of 29</b>

The aggregated cost estimates form the basis of the Program Funding Release submission to the BOD and once approved become the Original Budget (OB). Original Budget funding for the release period will be allocated directly to functional groups upon release approval. Project funding will be allocated from the program via the Gated Process and the Gate Review Board in accordance with N-MAN-00120-10001-GRB. Estimated funding requirements for the program life cycle beyond the current release will be documented as unreleased funds at the Bundle and/or project and functional levels.

Program releases will also establish program level Contingency and Management Reserve funding. Project level Contingency funding may be allocated within the Definition and Execution phases via the Gated Process. Contingency funding at all levels is based on known risks. Management Reserve funding is set based on “unknown-unknowns” that could impact the viability of the program. NR guidance and strategies for managing Contingency and Management Reserve are defined in N-MAN-00120-10001-RISK-05, Nuclear Refurbishment – Contingency Development and Management. Release of Contingency and Management Reserve funding will be controlled via the change control process as described in N-MAN-00120-10001-PC-12.

### 4.2 Control Budget

Once funding is approved at the project and/or functional levels, budget information is loaded into the Proliance cost tool. Budget information is loaded at the Work Package level such that initially:

$$OB = CB = AF = FC$$

Where each of the above is a summary column in Proliance representing:  
OB = Original Budget, which serves as the original baseline and remains unchanged for the life of the project.

CB = Control Budget, representing the current baseline and Planned Value (PV) for the Work Package.

AF = Approved Funding, representing the current approved cost envelope for the Work Package.

FC = Forecast, representing the projected cost of the Work Package, including any pending changes yet to be approved.

## 5.0 COST MONITORING AND CONTROL

Cost Monitoring and Control is the process of gathering, accumulating, analysing, forecasting, reporting and managing the costs on an ongoing basis. Nuclear Refurbishment will utilize Proliance for the effective cost management of all programs and projects.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>13 of 29</b>

### 5.1 Cost Control

Cost Control is the process of measuring progress and monitoring performance against plans; measuring variances from authorized budgets, and allows effective action to be taken to optimize costs.

Nuclear Refurbishment utilizes Earned Value Management (EVM) as the fundamental process for evaluating the overall health of schedule and cost. As such, Proliance, and the associated reports generated from the cost tool, are configured to provide all elements of an Earned Value Management System. These include:

- Planned Value (PV) is (in cost terms) the current Control Budget assigned to the work.
- Earned Value (EV) is the dollar value of work performed in terms of the approved budget assigned to the work.
- Actual Cost (AC) is the dollar amount actual cost incurred as recorded in the OPG financial source system (NFRA).
- Schedule Performance Index (SPI) is the ratio of EV to PV.
- Cost Performance Index (CPI) is the ratio of EV to AC.
- Cost Variance (CV) is the difference between EV and AC.
- Budget Variance (BV) is the difference between PV and AC.
- Schedule Variance (SV) is the difference between EV and PV.

It is incumbent upon the entire team to fully and diligently participate in cost control activities. These activities will be accomplished through the use of formal cost monitoring and reporting procedures. Cost Control is a line-owned function facilitated through the Planning and Controls team. The Cost Control functions described above shall be executed via the following activities:

(a) Measuring progress:

- (1) Measuring physical progress for earned value assessment.
- (2) Updating progress (i.e. percent complete) in the P6 schedules.
- (3) Updating progress in Proliance.
- (4) Ensuring actual costs are collected in the appropriate cost or control accounts.
- (5) Ensuring accruals are captured in the actual costs.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>14 of 29</b>

- (6) Identifying incorrect, inappropriate, or unauthorized charges and implementing corrective actions to rectify.
- (b) Reviewing progress;
  - (1) Gathering all commitments and payments.
  - (2) Monitoring commitments against budgets.
  - (3) Identifying and analyzing variances.
  - (4) Identifying and analyzing trends.
  - (5) Identifying items requiring corrective action (i.e. unfavourable variances and trends).
- (c) Reporting progress: Prepare and distribute status data (e.g. PV, EV, AC, variances, forecasts, and trends) and corrective action plan status as detailed in Section 5.5 of this document.
- (d) Taking corrective action: Initiate any corrective action and recovery plans required to mitigate and resolve identified issues. If warranted, change requests shall be initiated as detailed in Section 5.4 of this document.

## 5.2 Forecasting

Forecasting is the process of estimating or predicting the project's future based on knowledge and information available at the time of the forecast.

Forecasting is performed by analyzing the work performed against the work planned, identifying trends, analysing remaining the work, and determining the impact of performance on the estimated cost and schedule going forward.

Forecasting cost shall take into consideration the committed costs, the actual execution efficiency of the work performed, and the planned efficiency for the remaining work.

The Project Manager is accountable for having the forecast updated as necessary to reflect the latest status and expected performance of the project. Effective forecasting can be achieved when experience and objective judgement are applied together with consideration of risks and the usage of quantitative forecasting techniques, such as Earned Value technique.

All forecasts shall be performed in accordance with N-MAN-00120-10001-PC-14, Nuclear Refurbishment - Forecasting.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>15 of 29</b>

### 5.3 Change Control

Changes to functional and project Performance Measurement Baselines (PMB) will be managed via a formal control process as described in N-MAN-00120-10001-PC-12, Change Management.

### 5.4 Invoice Management

OPG-PROC-0051 specifies and documents the processes, principles and responsibilities for payment of vendor invoices.

FIN-PROC-AP-011 outlines the line responsibilities for invoice approval, defines accountabilities of Account Payment and Supply Chain in support of the line's accountabilities in this process.

FIN-PROC-AP-006 defines the processes, principles, responsibilities, and documents to be utilized in determining approvals required and supporting documents for progress payments. The Procedure establishes the general requirements including governing rules, supporting documentation, and condition to reject or revise a Progress Payment.

FIN-PROC-AP-010 defines the processes, principles, responsibilities, and documents to be utilized in determining approvals required and supporting documents for holdback payments.

### 5.5 Cost Performance Reporting

Cost Performance Reporting is the process of reporting the costs on an ongoing basis. OPG Nuclear Projects will utilize Microsoft Business Intelligence (BI) as the report generation tool for all programs and projects.

This section details the requirements for cost performance reporting. Overall reporting requirements are contained in N-MAN-00120-PC, Project Controls.

#### 5.5.1 Report Planning

The Director, Planning and Control, NR shall establish the cost reporting requirements structured according to WBS.

Cost reporting shall:

- (a) Encompass the entire program and project scope, including activities that are the responsibility of contracting companies.
- (b) Enable the following:

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>16 of 29</b>

- (1) Definition of the process for formally identifying the basis for cost, schedule, and performance reporting.
- (2) Specification of the expectations for documents required to establish cost and progress reporting.
- (3) Documentation of the need for a standard set of reports.

The cognizant PM shall provide the information necessary to establish status of the work (including the WBS), provide explanations of the causes of variance from the baseline plan, and propose changes to address the variance (typically for those > 5%).

### 5.5.2 Report Development

Following approval, Cost Management shall perform the following:

- (a) Establish a cost progress review and reporting process to provide a set of reports with the information necessary for the Project Managers, Project Management Office and contracting companies to understand the status of the work.
- (b) Update reporting of cost to show actual progress and performance achieved against the baseline, inclusive of approved or pending changes.

Definitions of the terms used in this section are contained in Section 6.1 of this document.

As a minimum, the following data shall be summarized and reported at the project and functional area level;

- Project/Functional Area WBS Code And Description
- For the Current Period (CP)
  - PV, EV, AC, CPI, SPI
  - Cost Variance (CV)
  - Budget Variance (BV)
- For Life to Date (LTD)
  - PV, EV, AC, CPI, SPI
  - CV, BV
- At Completion (Gate) and At Completion (Phase)

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>17 of 29</b>

- BAC, EAC, VAC

As a minimum, the following WP data shall be summarized at the project or function level and reported;

- LTD
  - PV, EV, AC, CPI, SPI
  - CV
- At Completion (Gate)
  - Original Budget (OB)
  - Directed Changes (DC)
  - Scope Transfers (ST)
  - Control Budget (CB) which is the BAC
  - Funding Variance (FV)
  - Approved Funding (AF)
  - Estimate At Completion (EAC)

Depending on the audience, the above information may be viewed for the Current Period, At Completion (Gate), At Completion (Release), At Completion (Life Cycle), or Life To Date.

### 5.5.3 Performance Reporting Process

The project team shall seek input from scope budget holders, Finance Department, Supply Chain, and contracting companies, to update the cost report based on observed progress, change approvals, and commitments. This information shall be received in a form that facilitates data entry into the cost management systems.

The project team shall use the information received to update the cost management systems and perform the following:

- (a) Assess the earned value of completed work.
- (b) Validate the actual costs of delivered work and services that have been imported into Proliance from NFRA.
- (c) Update the value of contractor invoices approved for payment, and calculate accrual balance.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>18 of 29</b>

- (d) Identify the value of change orders not yet approved, and any future commitments that are forecast to be required.
- (e) Maintain the current budget through budget transfers and contingency drawdown.
- (f) Identify the variances between current budgets and forecasts.
- (g) Update the risk management system (including contingency drawdown) based on actual activity.
- (h) Update the cash-flow forecast to reflect actual spending to date.
- (i) Track the amount of committed cost, scope, and responsibilities.

### 5.5.4 Outputs from Cost Performance Reporting

Project Reporting shall issue reports monthly and provide NR Project Teams and Project Stakeholders with summarized and detailed information such that project performance and status may be determined and corrective action taken.

During the Project Execution phase, Project Reporting shall issue additional project reports weekly.

Reports shall enable an understanding of (at a minimum) the following:

- (a) Cost and schedule performance against the baseline plan.
- (b) Forecast performance, including EAC.
- (c) Cost and schedule variance explanations (typically for those > 5%).
- (d) Required actions from identified corrective action plans and mitigation strategies.

## 6.0 DEFINITIONS AND ACRONYMS

### 6.1 Definitions

**Accrual** is the value of work completed and eligible for payment but not yet included on an invoice.

**Actual Costs (AC)** is the realized costs incurred for the work performed during a specified time period.

Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>Information</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-13</b>	<b>R000</b>	<b>19 of 29</b>

**Approved Funding (AF)** consists of the Control Budget (CB) plus all approved Funding Variances (FV).

**Budget at Completion (BAC)** is the sum of all budgets established for the work to be performed.

**Budget Variance (BV)** is the difference at a given point in time between the Actual Costs (AC) and Planned Value (PV) (i.e.  $BV = AC - PV$ ).

**Change** is a modification from the approved Performance Measurement Baseline (PMB).

**Committed Costs** is value of work purchased, but not yet paid for.

**Contingency** is an amount added to an estimate to allow for items, conditions, or events for which the state, occurrence, or effect is uncertain and that experience shows will likely result, in aggregate, in additional costs. Some of the items, conditions, or events for which the state, occurrence, and/or effect is uncertain include, but are not limited to, planning and estimating errors and omissions, minor price fluctuations (other than general escalation), design developments, and changes within the scope, risk response, and variations in market and environmental conditions. It is typically estimated using statistical analysis or judgment based on past asset or project experience. Contingency **excludes**:

- (a) Major scope *changes* such as *changes* in end product specification, capacities, building sizes, and location of the asset or project.
- (b) Extraordinary events such as major strikes and natural disasters.
- (c) **Management Reserves.**
- (d) Escalation and currency effects.
- (e) Changes in scope or major social or natural events such as war, strikes, floods or earthquakes.

Contingency is generally included in most estimates, and is expected to be expended, see *Management Reserve*.

**Contingency Drawdown** is the method by which the contingency fund is used.

**Contracting Companies** are organizations external to Nuclear Refurbishment working on a Nuclear Refurbishment project under a contractual arrangement (includes Engineer-Procure-Construct Contracts at an agreed-to level of detail).

**Control Budget (CB)** consists of the OB plus the sum of all approved Directed Changes (DC) and Scope Transfers (ST) (i.e. PMB changes). It is also known as the Budget at Completion (BAC).

Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>20 of 29</b>

**Cost Performance Index (CPI)** is a measure of the cost efficiency of budgeted resources expressed as the ratio of Earned Value (EV) to Actual Cost (AC).

**Cost Variance (CV)** is the difference at a given point in time between the Actual Costs (AC) and Earned Value (EV) (i.e.  $CV = AC - EV$ ). It should be noted that PMI defines this term as  $CV = EV - AC$  and hence the sign would be different.

**Deliverable** is any unique product, result, or capability to perform a service that is required to be produced to complete a process, phase, or project.

**Directed Changes (DC)** constitutes re-baselining, and is generally caused by situations beyond the control of the budget/work program owner that renders the existing baseline obsolete. An approved DC will result in changes to the Control Budget (CB) of the appropriate function or project as well as equal and opposite changes to the appropriate contingency account CB.

**Earned Value (EV)** is the measure of work performed expressed in terms of the budget authorized for that work.

**Estimate at Completion (EAC)** is the expected total cost of completing all work expressed as the sum of the actual costs to date and the estimate to complete. It represents the responsible Project Manager's estimate of the cost at completion of the current release, gate, and the entire Project Lifecycle including all pending (i.e. unapproved) funding change requests plus the impact of undocumented funding impacts based on managerial judgment.

**Estimate to Complete (ETC)** is the expected cost to finish all remaining work.

**Forecast** is the project team's estimate of the most likely outcome for a given element of the project (e.g. cost forecast, schedule forecast etc.).

**Forecast Trends (FT)** are Budget Owner forecast estimates of future **anticipated** changes to Approved Funding levels. Such changes are documented for management forecasting and do not impact budgets. They are reflected in the Estimate at Completion (EAC) column of the cost management system.

**Funding Variance (FV)** is an approved change that does not meet the DC criteria but requires a change in funding requirements. A FV will result in changes to the Approved Funding (AF) of the appropriate function or project as well as equal and opposite changes to the appropriate contingency account AF.

**Management Reserve** is an amount added to an estimate to allow for discretionary management purposes outside the defined scope of the project, as otherwise estimated. Use of management reserve requires a change to the project scope and cost baseline. (Contrast with contingency funds that are used for items within the project's approved scope.)

**Original Budget (OB)** is the approved funding established by the release or Gated Process. Original Budgets cannot be altered for the period in which they apply.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>Information</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-13</b>	<b>R000</b>	<b>21 of 29</b>

**Pending Changes (PC)** consists of all changes proposed changes but not yet approved.

**Performance** is the comparative ratio between the planned rate of progress and the actual rate of progress.

**Performance Measurement Baseline (PMB)** is the approved, integrated scope-schedule-cost plan for the work against which project execution is compared to measure and manage performance. The PMB includes contingency, but excludes management reserve.

**Planned Value (PV)** is the authorized budget assigned to scheduled work.

**Scope Transfer (ST)** is the reallocation of scope, and its associated budget, from one work package to another. The net variance is always zero.

**Schedule Performance Index (SPI)** is a measure of schedule efficiency expressed as the ratio of Earned Value (EV) to Planned Value (PV).

**Trend** is a non-random variance of actual performance from that which was planned. Analysis of performance measurements is required to determine if an observed performance variance is a trend (i.e. predictable), or a random outcome (i.e. unpredictable), and that determination will influence subsequent control actions and forecasts.

**Variance** is the nominal differential between earned, planned, actual, and forecast performance.

**Variance at Completion (VAC)** is the difference between the BAC and EAC.

**Work Breakdown Structure (WBS)** is the hierarchical decomposition of the work to be carried out to accomplish the objectives and create the required deliverables. It is a tool used to define and group a project's discrete work elements (or tasks) in a way that helps organize and define the total work scope of the project.

**Work Package (WP)** is the work defined at the lowest level of the Work Breakdown Structure (WBS) for which cost and duration can be estimated and managed.

## Appendix A: Cost Management Roles and Responsibilities

The following accountability model has been selected and is in use on the Darlington Nuclear Refurbishment project. It details the responsibilities and accountabilities throughout the life cycle of a scope of work, from the Darlington Scope Request (DSR) to the declaration of Ready for Service (RFS).

- (a) The guiding philosophy behind the project revolves around the Project Manager having the ultimate accountability for delivering a successful project. That said, an accountability model showing the Project Manager accountable for each and every element of the project would do little to communicate the width and breadth of effort required to perform the complete scope of work.

The **RAPID** model (as shown in Figure A.1) is used to describe who in the organization has the primary role in making **Recommendations**, establishing **Agreement**, **Performing** the work once decided, providing **Input** to the decision, and being accountable to make that **Decision**.

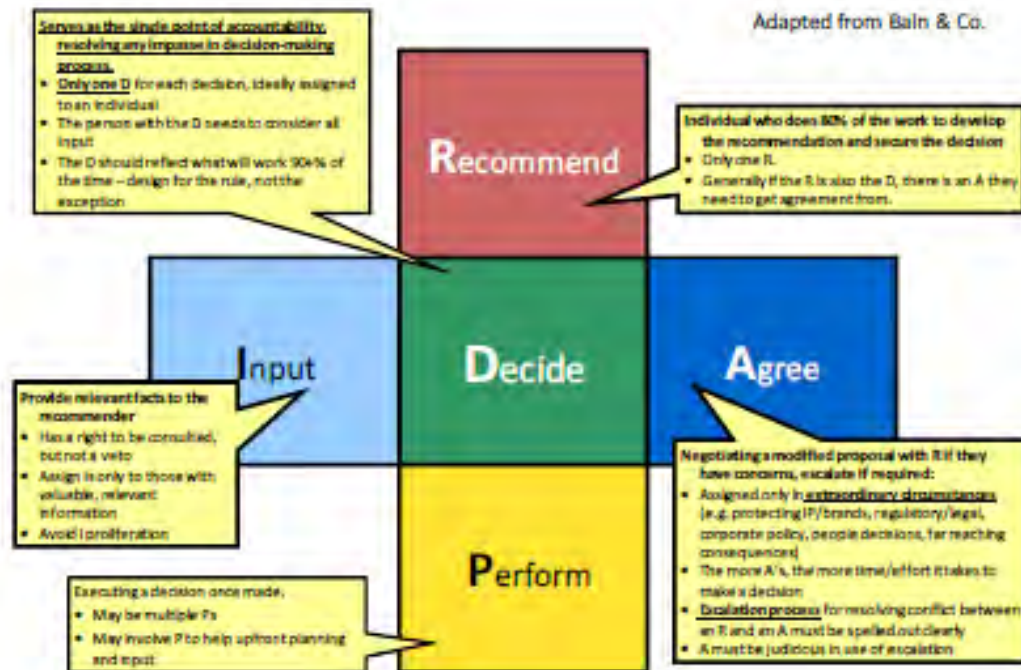

It is important to understand that with this model the Recommender is the role that is primarily responsible for the element of scope and that the primary accountability resides with the role of the Decider.

It is also important to note that this model is centred on each of the elements and their associated responsibilities and accountabilities. The model does not abdicate fundamental accountabilities as defined by the Internal Responsibility System, Chain of Command, Governance, and Delegated Authorities.

Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>	Usage Classification: <b>Information</b>	
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>26 of 29</b>

Figure A.1. RAPID Accountability Model

- Input (I):** Provide relevant facts to the Recommender.
- Recommend (R):** Provide data and analysis based on research and stakeholder management.
- Agree (A):** Negotiate modified proposal with Recommender with ability to veto and escalate.
- Decide (D):** Single point of accountability; bringing decision to closure; implementing decision.
- Perform (P):** Executing the decision promptly and effectively.

## A.1.0 PRIMARY ROLES

### A.1.1 Director, Planning and Controls, NR

Establishes and sets direction for cost management and project reporting activities for NR and support organizations to ensure activities, deliverables, and costs are controlled and appropriate information is reported.

### A.1.2 Manager, Project Control and Reporting, NR

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>PC-13</b>	Revision Number: <b>R000</b>	Page: <b>27 of 29</b>

Manage the operation of the cost management and project reporting systems to provide appropriate outputs.

Establish the processes, guides, and tools necessary to facilitate the successful implementation of the direction herein.

### A.1.3 NR Directors and Managers

Manage approved budgets for projects and functions and ensure costs are appropriately charged to the right budget item.

Provides updates to the cost management and reporting processes as required to meet project reporting cycles.

Review cost reports and take corrective action in accordance with established thresholds.

### A.2.0 COST MANAGEMENT RESPONSIBILITIES

Specific responsibilities for the cost management processes detailed in this document are contained in Table A.1.

**Manual**

Internal Use Only

Title:

# NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

## 1.0 BACKGROUND

*Change* is inevitable in a project. Well managed and controlled projects must manage change. A robust change management process provides guidance on how changes are assessed, implemented and reported on a project. This change manual will be reviewed and updated periodically to reflect the changing environment with respect to project controls tools.

## 2.0 PURPOSE

The primary purpose of Program Change Management is to control cost, schedule and scope changes against approved *baselines*, to manage the proper allocation of contingency funds, to document the nature and cause of changes and to analyse and minimize the impact to cost and schedule.

## 3.0 DIRECTION

### 3.1 Principles

- The *executing organization* will first attempt to mitigate the impacts of change by evaluating alternatives, such as reassigning resources to other available work, to mitigate the impact of change.
- Change is managed at the lowest level of the organization that has the authority to do so.
- Change that has a significant potential impact on project or program scope, cost and schedule is reviewed in detail and the recommended direction is approved at the appropriate level.
- The process balances flexibility and control.
- All changes are documented, tracked and included in relevant reports.
- Detailed evaluation of the impacts of the change takes place when necessary.
- Trends of changes are identified and followed up; the Station Condition Record (SCR) system is utilized when applicable.
- Only after the change is approved by the appropriate authority level, is the work assigned for action by the executing organization.
- Changes are not made solely for the purposes of correcting performance issues that are within the control of the work program owner.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>7 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Projects are re-baselined only when the cumulative effect of multiple Changes or a significant execution strategy Change renders the existing baseline no longer meaningful.

### 3.2 Definition of Change and Change Management

For the purposes of this procedure, a *change* is any deviation from an approved plan or procedure that results in a real or potential impact on program or project cost, schedule or scope.

*Change Management* is the Project Management process (including the supporting tool) that provides a framework to identify and record changes in cost, schedule and or scope against the approved baselines.

See Section 11.0 for a complete list of definitions for this procedure.

### 3.3 Program Baseline and Performance Measurement Baselines

The Change Control Process as defined in this document is performed from project inception through completion. The constraints of cost, schedule and scope must be continuously and rigorously managed either by rejecting or approving changes and subsequently incorporating approved changes into the revised *Program* and *Performance Measurement Baseline*, where applicable.

#### Program Baseline

The aggregate planning efforts during Definition Phase will converge to an overall Program Plan at Release 5, or Release Quality Estimate (RQE). This is the point when the majority of projects have sufficiently defined their execution strategies, cost, schedule and scope that will allow an overall Program Baseline to be set. The Program Baseline will be maintained as a high confidence estimate for all four units and project level changes assessed.

#### Performance Measurement Baseline

The Performance Measurement Baseline for Project and Functions is the cost, schedule and scope approved during the Release Quality Estimate (RQE) and Changes subsequently approved via this Change Management process. The Project Performance Measurement Baseline will be maintained and cost and schedule performance against the baseline monitored.

The use of Baseline in this document refers to the Performance Measurement Baseline.

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

## 4.0 SCOPE

This document takes authority from N-STD-AS-0028 Project Management Standard and guidance from N-MAN-00120-10001-PC, Project Controls.

This Change Management process, illustrated in Appendix A, Change Process Flow, is for NR Funded and Darlington Outage Cyclical Maintenance work, including transfers in and out of the Program, is applicable to the following:

- Changes that occur between Gates to Projects already approved by the gating process and approved by the Gate Review Board (GRB), including scope transfers between Projects, Bundles or sub-Bundles;
- Changes to OPG functional work programs approved by the Functional Business Planning Release;
- Changes to contractual agreements between OPG and external contractors, suppliers or vendors when the change impacts project scope, cost or schedule;
- Changes in contracting or execution strategy;
- Engineering change control process outputs that impact project scope, cost or schedule;
- New/Changed Project Numbers;
- New/Changed Work Packages;
- Changes to *Work Breakdown Structure (WBS)*;
- Changes to project attributes, example Bundle or Sub-Bundle
- Changes to cost, schedule or scope that are approved by other governing documents or bodies, including the Project Decision Meetings, Options Review Boards, Regulatory Affairs or alternative localized decision making committees.
- Changes to scope and scope transfers agreed by both receiving PM and transferring PM.
- New scope, including scope funded by other methods (example AISC) if the work is being executed during the NR Execution Outage.
- Advancing or transferring funds that have not been released by the GRB in circumstances where the work must be performed prior to the next Gate and funding is required to proceed in order to control risk.
- Project and program contingency changes irrespective of value, either drawn or returned back to contingency.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>9 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Administrative updates to the Program Baselines as approved by senior management.

This Change Control process is **not** applicable to:

- Projects that have not yet been presented and approved by the Gate Review Board (GRB), i.e., projects for which there is no approved baseline.
- Changes to correct performance issues that are within the control of the work program owner, unless the change renders the existing baseline no longer meaningful
- Changes to budget amounts in closed accounting periods (changing historic data).

## 5.0 ORGANIZATION, ROLES AND RESPONSIBILITIES

All project team members are empowered and encouraged to identify and initiate the Change Control Process.

The OPG behaviours of “Say it, Do it, Simplify it, Think Top and Bottom Line, Integrate and Collaborate and Tell it as it is” apply to the change management process. Early identification of changes and their impacts and trends allow NR Management to focus attention on performance improvements, and drive the core behaviours.

### 5.1 Change Initiator

The Change Initiator, in conjunction with their manager, is responsible for reporting a change to cost, schedule or scope of their work. Anyone can be a change initiator. The Change Initiator contacts the P&C Lead for the executing organization for assistance with completion of the *Change Control Form* (CCF) N-FORM-11252.

### 5.2 Project Manager

The Project Manager (PM) is responsible for:

- Executing the full scope of project within constraints of working safely, meeting quality requirements, and performing within the approved schedule and budget.
- Reacting to change trends, taking corrective action and identifying and mitigating project risks.
- Limiting, controlling and recommending use or return of contingency.
- Managing contractors to control and mitigate increases to cost and delay to schedule.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>10 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

- Ensuring no commitment (including Project Change Directives (PCD), Project Change Authorizations (PCA), Consent to Proceed (CTP), or any other commercial commitment) is entered into with vendors or contractors, or into the approved baseline, prior to having sufficient budget and/or approval when necessary via a CCF.
- Assessing the impacts of changes to cost, schedule and risk as well as to commercial, union jurisdiction, safety and environment, work and radiation permits, decontamination, material handling and storage, change in resource, quality, other impacts if applicable and impacts to other projects.
- Providing all required data and supporting document for the CCF.
- Attend the Change Control Board to discuss and respond to questions for CCFs pending approval.
- Updating the Project Management Plan as a result of a change if required.

Within the context of the change management process, the PM has the ultimate accountability to ensure changes are fully documented via a CCF and approved by the appropriate authority level as outlined in Section 0 and that the processes documented within this procedure are adhered to.

### 5.3 Project Director

The Project Director is responsible for:

- Reviewing and challenging changes proposed by the PM that are within PM's approval authority.
- Challenging the Project Manager to find offsetting reductions to minimize cost increases.
- Recommending contingency changes to the appropriate contingency owners.

### 5.4 Unit Outage Manager

The Unit Outage Manager is responsible for:

- Ensuring new work orders are reviewed and urgent actions taken to protect the critical path schedule, while ensuring follow up with Project Managers to ensure baselines are maintained.
- Ensuring new work orders are assigned to Project Managers for acceptance of scope.
- Screening new scope through the Daily Work Screening process.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>11 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Referring new scope that is not accepted by the Project Manager during the Screening process to the CCB.
- Concurring that a CCFs requires use of the Fast Track process described in Section 7.4.3

### 5.5 Planning & Controls (P&C)

#### 5.5.1 Director, Planning and Controls, NR

The Director, Planning and Controls is responsible for:

- Establishing and setting the direction for Program Change Management activities for NR.

#### 5.5.2 Manager Project Controls, Cost & Change Management, NR

The Manager Project Controls, Cost & Change Management is responsible for:

- Establishing and managing the processes, guides, and tools necessary to facilitate successful implementation of Program Change Management process.
- Administration of the Program Change Control Board (PCCB) process.
- Reviewing CCF's for compliance with the principles and governance of this manual and providing feedback and coaching on requirements.
- Tracking and following up on requests made or actions assigned by the PCCB.

#### 5.5.3 P&C Leads

The P&C Leads are responsible for:

- Coordinating evaluation and disposition/approval of the change including routing the CCF to the appropriate functional department or subject matter expert to perform an independent evaluation of the impacts of the change.
- Assisting the PM with preparation of change documentation.
- Confirming impacted systems or tools are updated such as P6, the Master Project List (MPL), etc.
- Creating a SCR for adverse trends identified from change pattern analysis if applicable as defined in Section 6.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>12 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 5.5.4 P&C Cost/Schedule Analyst (CSA)

The P&C CSAs are responsible for:

- Supporting the P&C Leads in coordinating evaluation and disposition/approval of changes.
- Reviewing the CCF and supporting documentation to ensure compliance with the criteria set out in this procedure.
- Communicating disposition of the CCF to the stakeholders.
- Updating the cost management system.
- Maintaining the change register.

### 5.5.5 P&C Reporting Department

The P&C Reporting Department is responsible for:

- Providing monthly metrics including trend reports and reporting out of the Change Management process as required.

### 5.5.6 P&C Change Administrator

The Change Administrator is responsible for:

- Administration of the CCB process.
- Reviewing CCF's for compliance with the principles and governance of this manual and providing feedback and coaching on requirements.
- Analyzing CCF trends and presenting analyses to the CCB as required.
- Tracking and following up on requests made or actions assigned by the CCB.
- Following up on SCR actions related to this procedure and/or CCF trends.
- Providing an interface between the committees and boards in this Change Management process.

### 5.5.7 P&C NR Estimating

The P&C NR Estimating department are responsible for:

- Reviewing and/or validate estimating basis of submitted changes including the estimate class and accuracy and completing CCF input in Section 2.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>13 of 41</b>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 5.6 NR Controllership

NR Controllership is responsible for:

- Deciding the correct accounting determinations and project funding sources.
- Reviewing the change register including selected review of individual CCFs (Finance Assurance).

### 5.7 Functional Departments

Functional Department processes are governed by their functional procedures; however when changes in functional work impacts NR project cost, schedule or scope baselines the Change Management process applies. Example:

- To draw contingency when a contract change (an amendment, PCD, PCA or CTP) is required for additional scope, a CCF must be raised and approved prior to updating the vendor contract and commencing work.

Functional Department Managers' budgets released through the business planning release process are governed by this Change Management process if the change meets the criteria detailed under section 6.0. For the purposes of this procedure, Functional Managers hold the same accountabilities as a Project Manager.

### 5.8 Subject Matter Experts

Depending on the nature of a change, a Subject Matter Experts (SME) may be requested to provide written feedback and recommendations on a proposed change. SME's can be anyone with the specialized knowledge or experience to provide additional analysis and recommendations.

SME's provide an independent assessment of the impacts of change for consideration by the approving authority.

### 5.9 New Work Screening Committee

The Director Unit Outage is responsible for the New Work Screening process. Chaired by the Project Control Centre (PCC) Manager, the New Work Screening Committee is comprised of:

#### Required Attendees:

Operations  
Work Management  
Planning & Controls  
Maintenance  
Engineering  
Finance  
CPAAC Member

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>14 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

Optional Attendees:  
Representative from Regulatory Affairs

All proposed scope additions, deletions or changes will be screened by the New Work Screening Committee prior to being released to the Project Manager to execute with the following being considered:

- Confirm if the work order requires an outage to execute, if no outage is required the work will be rejected.
- Determine if the new work is considered to be operations or maintenance work and if Operations or Maintenance agrees to accept the work, the work order can be approved into scope and a CCF will be submitted if required.
- Determine if the work is to be executed by a Project, and if the project owner accepts the work, the work order can be approved into scope and the Project submit a CCF if required.
- Determine if an Action Request from Regulatory Affairs and ensure the screening process is followed with Operations or Maintenance or a Project accepting the work.
- Work Orders removed from scope with greater than 1,000 hours will be reviewed to determine if an action needs to be assigned by the Screening Committee for the Project to initiate a CCF to reduce budget.

If the Screening Committee can't come to an agreement on an owner for the work then the person / group sponsoring the work (typically the SCF initiator) will prepare a CCF and the CCB will assign the work to Project. Once the Project is assigned, the project will finalize the CCF and obtain appropriate approval.

Action items arising from the Screening Committee will be recorded in the Risk Management and Oversight Tool (RMO) using Meeting Source "New Work Screening Committee".

### 5.10 Change Control Board

Chaired by the Vice President, Refurbishment Execution, the Change Control Board (CCB) is a diverse group of individuals who are responsible for making the ultimate decision regarding project changes. The CCB considers the implications of changes that exceed a Project Managers authority, approves Tier 3 Milestone changes and refers significant new or changed scope to the Project Decision Meeting or if deemed necessary obtain concurrence of the Program Scope Review Board (PSRB) or Program Change Control Board (PCCB). See NK38-CORR-09071-0591482 for the Terms of Reference for the CCB.

Note that staffing and resource changes are not within the authority of the CCB. The CCB needs to assess these requests and either reject the change or recommend the change for approval to the PCCB.

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

Action items arising from the CCB will be recorded in the RMO Tool using Meeting Source "Change Control Board".

When the need arises for urgent approval of a CCF, a fast track process to allow CCB members to vote via email has been developed, see Section 7.4 Decision.

## 5.11 Project Decision Meeting (PDM)

When significant new or changed scope requires a decision as to whether or not it should be included in the NR Program or be moved to Darlington Station for processing through their change management process, a Project Decision Meeting (PDM) will be held.

The chair of the PDM is the Vice President, Refurbishment Execution (or delegate) along with senior representatives from Refurbishment Operations & Maintenance and Station Engineering.

Meeting participants will consider the appropriateness and implications of adding new scope. The following considerations should be made when evaluating the proposed scope:

- The scope requires the reactor to be de-fueled/de-watered.
- The scope could significantly exceed normal outage durations.
- The scope could significantly extend normal outage durations.
- The scope has other overriding long term operational impacts to the Station.

If the PDM decides that the proposed change warrants further work by the NR Program, a sponsor will be designated to create a DRAS as appropriate.

## 5.12 Options Review Board (ORB)

In cases where there are multiple potential options to address new scope, and the option set does not provide a clear preferred option, an Options Review Board (ORB) will review each option and decide which will be pursued. The ORB is responsible for making an informed and business-conscious decision. The ORB is administered by NR Execution.

The ORB is chaired by the Vice President, Refurbishment Execution along with senior representatives from Operations and Maintenance, Engineering, Planning and Controls, Execution, Supply Chain, Finance and External Oversight.

The ORB is empowered to make decisions to progress work toward full definition. Cost implications require a CCF and approval via this Change Management Process.

## 5.13 Program Change Control Board

The PCCB, Chaired by the Vice President Planning and Controls is convened to approve significant Program level cost and schedule changes. The PCCB also approves all Program Contingency draws or returns and impacts to Tier 1 and 2

Milestones. See NK38-CORR-09071-0591416 for the Terms of Reference for the PCCB. The PCCB approves OPG staffing and resource changes.

Action items arising from the PCCB will be recorded in the RMO Tool using Meeting Source "Program Change Control Board".

## 6.0 CHANGE MANAGEMENT PROCESS

### 6.1 Change Decision Criteria

The Change *decision criteria* utilize GREEN, YELLOW, RED labels to identify the level of impact the change has on the project baseline, and consequently the level of approval required. The criteria are noted in the diagram below:

**Manual**

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>17 of 41</b>

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

Separate schedule criteria based on durations are not laid out as it is assumed that all schedule changes/delays will be translated to cost based on the *project burn rate* and the cost criteria applied.

### 6.1.1 Green Changes

GREEN changes are addressed within the level of authority of the project/function, an example is a change to contractor field execution work where an agreed alternate arrangement has been developed by the executing organization; a CCF will be entered for a GREEN change and will be tracked for trends. Green changes update the project forecast, but not the baseline. Green changes will be reviewed to ensure that they are accurately labelled as Green. For RFP approvals, Finance will accept an approved GREEN CCF as authorization for PO increases.

Adverse trends will be monitored by the Project Managers to ensure action is taken to correct, and submitted a RED CCF when required.

For small projects where the two percent threshold is not material, the Senior Vice President Execution has the authority to override the percentage and approve the change up to \$100K. Section 1 of the CCF completed with the amount initialled by the Senior Vice President Execution.

### 6.1.2 Yellow Changes

YELLOW changes are addressed within the level of authority of the Project Manager and Director within the envelope of the latest approved project's baseline. YELLOW changes will go through rigorous review and evaluation. YELLOW changes do not change the overall control budget. YELLOW changes can facilitate re-planning of future work within the same project budget (example cash flows). If there is an impact to field work, a scope change or a change in contracting, procurement or executing strategy the CCF is considered RED and must be approved by the CCB. The principles of not changing past and not changing solely for the purposes of correcting performance issues within the control of the project will be strictly enforced.

### 6.1.3 Red Changes

RED changes have a material impact on the Gate approved cost, schedule or scope. These include fundamental changes to Contracting Strategy, Procurement Strategy, Execution Strategy or Design Requirements and require a contingency draw or return. RED changes will go through rigorous review and evaluation. All scope changes, additions or transfer requests are considered to be RED changes that require significant review for impacts. All contingency draws are considered RED changes. The material cost impact threshold is considered:

<b>Projects &amp; Functions, the lower of</b>	\$5M	10%	of the current approved baseline budget
---	------	-----	---

**Manual**

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>18 of 41</b>

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

The material schedule threshold is considered a revision to any of the Tier 1, 2 or 3 milestones as listed below (refer to N-MAN-00120-10001-SHT-06: Nuclear Refurbishment- Milestone Definition Framework):

Milestone	Description	Example
Program Tier 1	Milestones that are commitments to the Board or decisions at Board Level	Release Quality Estimate, and Unit Start/Finish Dates
Program Tier 2	Critical Impact Milestones normally documented in Phased based Program Business Case Summaries per Release Strategy	CNSC Approval of ISR
Program Tier 3	Program Controls, including the NR AIP Milestones and NR AIP Scorecard, Milestones that manage the health of the Program and keep it on track	All Projects Scope Freeze/Detailed Engineering Finished

Program Tier 1 and 2 Milestone schedule delays require approval by the PCCB.  
Program Tier 3 Milestone schedule delays require approval of the CCB.

Schedule impacts that do not impact on Tier 1, 2, or 3 milestones may also be considered to be a Red change if the cost impact of a delay reaches one of the cost thresholds listed above when taking the project burn rate into account.

The Schedule Change Control process is governed by N-MAN-00120-10001: SCH-11, DR Schedule Management Plan for Integrated Level 3 Execution.

Decision Type	Contingency				
	Impacts Forecast	Impacts Baseline or Cash Flow	Program	Project	Management Reserve
<b>GREEN</b>	Y	N	N	N	N
<b>YELLOW</b>	Y	MAYBE	N	N	N
<b>RED</b>	Y	MAYBE	Y	Y	Y

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>19 of 41</b>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 6.2 Change Classification

The Initiator will choose a *Change Classification* from a drop down list. The following is a list of change classifications:

Classification			
1	Scope - OPG	9	Quality & Conformance - OPG
2	Scope - Vendor	10	Quality & Conformance - Vendor
3	Resources/Materials - OPG	11	Safety - OPG
4	Resources/Materials - Vendor	12	Safety - Vendor
5	Process & Communication - OPG	13	External Influence Nuclear Refurbishment
6	Process & Communication - Vendor	14	Refurb Program Strategy & Integration
7	Contract Management - OPG	15	Estimate Change - OPG
8	Contract Management - Vendor	16	Estimate Change - Vendor

Individual changes may not have an immediate significant impact on cost, schedule, or scope but they may be symptomatic of a larger problem that may cause more significant impacts in the future or may affect other projects. For example delay in or unavailability of a field service such as radiation protection, scaffolding or permitry may not cause a significant impact for one particular case if alternate work arrangement is possible; however future similar service issues could have much larger impacts if this trend continues and the systematic issues go unresolved.

Change classifications are assigned to all levels of changes to facilitate reporting on trends. Change classifications also have potential commercial implications related to contractor changes or claims.

### 6.3 Change Type

There are three (3) basic *Change Types*: *Forecast Change*, *Budget Change* and *Schedule Change*. The table below contains details of which categories are updated depending on the type of change:

Change Type				Contingency		
	Impacts Forecast	Impacts Schedule	Impacts Scope	Program	Project	Mgmt. Reserve
Forecast Change	Y	MAYBE	N	N	N	N
Budget Change	MAYBE	MAYBE	MAYBE	MAYBE	MAYBE	MAYBE
Schedule Only Change	N	Y	N	N	N	N

Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>20 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 6.4 Contingency Changes

The development of contingency amounts and time-phased planning and monitoring of contingency forecasts are governed by the Risk Management and Cost Management Sections respectively using N-MAN-00120-10001: RISK, Nuclear Projects Risk Management.

The Program Change Management process provides the structured framework and the mechanism to document, review and approve “draw” or “return” of contingency funds.

To facilitate tracking contingency usage, unused contingency must be returned to program contingency account using a CCF; it cannot be transferred between projects or bundles. The process of returning contingency does not apply to an underrun or savings realized on completed work.

Note that schedule contingency/float shall be reviewed for the impact on critical path, reference procedure N-MAN-00120-10001: SCH, Nuclear Projects Schedule Management.

The contingency management process for the DRP is incorporated in the project controls framework and focuses on early identification of risks and trends, active mitigation, forecasting, and contingency adequacy reviews in order to proactively manage the project estimate at completion.

Whenever possible, drawdown of contingency will be avoided by effectively managing and mitigating risks and trends including the use of favourable variances identified through project cost forecasting. When a risk or trend cannot be fully mitigated a drawdown of contingency will occur.

The following controls will be incorporated into the process for managing the drawdown of contingency:

All project changes, including scope, cost, and schedule, will be documented, reflected in the risk register and reviewed and dispositioned by the CCB.

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R001</b>	<b>21 of 41</b>

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

**6.4.1 Project Contingency**

Source	Approver	Approval Threshold
Estimating Uncertainty – Projects	SVP Refurbishment Execution	100%
Critical Path Schedule to Medium Confidence	SVP Refurbishment Execution	To 50% Consumption
	SVP Nuclear Projects	50% to 100% Consumption
Critical Path Schedule to High Confidence Duration	CNO and CEO	100%
Discrete Project Risks	SVP Nuclear Projects	100%

(1) Includes \$42 Million for Facility and SIO Projects

**6.4.2 Program Contingency**

Source	Approver	Approval Threshold
Estimating Uncertainty – Functions	SVP Nuclear Projects	100%
Discrete Program Risks	CNO and CEO	100%

All program contingency changes, including scope, cost, and schedule, will be documented, reflected in the risk register and reviewed and dispositioned by the CCB and PCCB.

In addition to the above approvals, the following controls will be implemented:

Any discrete risk resulting in an allocation of contingency greater than \$40 Million will require CNO and CEO approval. This aligns with the Organizational Authority Register (OAR) requirement for in-budget project investments.

Notification will be provided to the CNO and CEO on contingency draw downs that impact multiple units.

Any contingency allocation requiring CNO and CEO approval also requires CFO approval.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R001</b>	<b>22 of 41</b>

Title:

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Any low probability high consequence event that is outside the contingency determined for the project (e.g. Force Majeure, significant labour disruption, an international Fukushima Type Event) will be escalated to the DRC for approval. This may result in a revision to the DRP Business Case.

### 6.4.3 Management Reserve

Management Reserve funding approval, if it becomes necessary, will require resubmission of the NR business case to the Board of Directors prior to approval in a CCF.

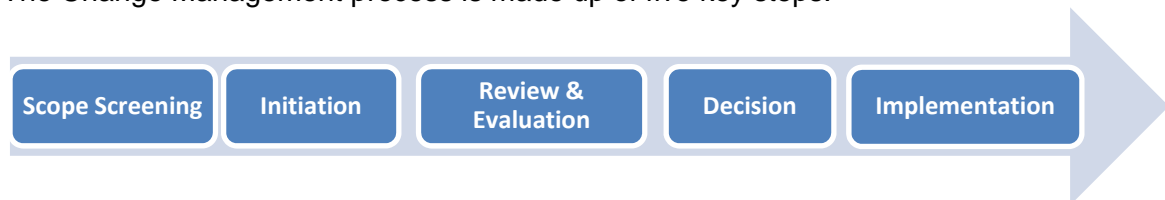

### 6.5 CCF Approval Authority Level

The CCF approval authority level is based on the cumulative change impact of all GREEN, YELLOW AND RED CCFs, not incremental change. When a project is re-baselined, the cumulative approvals of remaining contingency apply to the re-baselined value and not to the original project baseline value. Example:

	Incremental Change	Cumulative Change	Total	Growth	Authority Level
Project Baseline			\$6,000,000		
CCF #1	\$550,000	\$550,000	\$6,550,000	9%	within PM Authority, <10% or \$5M of Project or Functional Baseline
CCF #2	\$400,000	\$950,000	\$7,500,000	15%	not within PM Authority, >10% or \$5M of Project or Functional Baseline

## 7.0 CHANGE MANAGEMENT STEPS:

The Change Management process is made up of five key steps:

See Appendix D, Process Overview.

### 7.1 Screening, Scope Changes/Additions

All proposed scope changes and additions initiated by creation of a new Work Order or work request will be screened daily by the New Work Screening Committee. The process of screening scope is further defined in Appendix B. The Project Manager accepts the scope change and initiates a CCF if required based on the criteria of this procedure for approval at the CCB. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>23 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB. In cases where there are multiple potential options to address new scope, the ORB will review the options and decide which will be pursued.

## 7.2 Initiation

The initiator starts the process with a CCF. Refer to Appendix E for an example of a CCF with instructions for completing the form.

For GREEN changes, the initiator completes Section 1 of the CCF. Section 1 provides the minimum information required to register a change for trending. GREEN changes are reviewed and if agreed to be GREEN go directly to Implementation. The output of Implementation for a GREEN change is trending metrics.

For RED or YELLOW changes, the initiator completes **all** Sections of the CCF, **no blank fields will be accepted**.

All required data on the CCF must be completed and the following supporting documents are required as applicable:

- Business rationale or justification for the requested change.
- Technical supporting documents if applicable.
- Cost Estimates prepared by OPG and/or Contractors in sufficient detail to allow review, including hours, rates, quantities and assumptions. Contractor estimates are reviewed and validated by P&C Estimating Department.
- Identify the change impact on project interest and include in the cost estimate.
- A resource loaded schedule with affected activities and Critical Path impacts listed if applicable.
- Identify impacts to the Work Breakdown Structure (WBS) including to the overall Program WBS if applicable.
- Identify impacts to the Risk Register, including listing any additional risks, closed risks, changes in impacts on probability, schedule and cost and mitigating actions required.
- A listing of the Work Packages affected by the proposed Change in the required in the following format:

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>24 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

Work Package ID	Work Package Title	Original Budget	Approved Changes	Control Budget	Pending Changes	Control Budget + Pending Changes

- Identify impacts to Contingency.
- Identify the impact to the Project Life Cycle Estimate at Completion (EAC), provide a definitive EAC and compare to the Control Budget.
- Any other relevant supporting documents that facilitate review and evaluation of the change.

The CCF is a stand-alone document subject to audit and significant scrutiny, all documentation must be attached.

### 7.3 Review and Evaluation

The CCF is reviewed to ensure that an adequate amount of information and backup to fully support the proposed change is included as listed in Section 7.2 and that all required fields of the CCF are completed and correct. The evaluation of the impacts of change is integral to the success of a Project.

If required, the CCF is routed to the appropriate functional department or subject matter experts to perform an independent evaluation of the impacts of the change. Impacts that must be evaluated are:

- Cost
- Schedule
- Scope
- Basis of Estimate
- Estimate at Completion
- Risk

Project or vendor basis of estimates must be evaluated by the P&C Estimating Department. For estimates less than \$500K, allow two working days for review. For estimates greater than \$500K or of a complex nature, allow five working days. NR Estimating complete the "Estimate Review" section of the CCF.

Other Impacts to consider, but not limited to, are:

- Nuclear Safety
- Conventional Safety
- Environmental
- Union Jurisdiction
- Commercial
- Design

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>25 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

- Work and Radiation Permits
- Decontamination
- Material Handling and Storage
- Work support activities

The key outputs of the Review and Evaluation of a CCF are:

- Independent written feedback regarding the identified impacts.
- Recommend action to the approving authority.

Outputs of evaluation are attached to the CCF as backup documentation.

### 7.4 Decision

The core expectation of this procedure is that change is managed at the lowest level of the organization that has the authority to do so and that change that has a significant potential impact on project or program scope, cost and schedule is reviewed in detail and the recommended direction is approved at the required level. Approval is based on the decision criteria applied in section 6.1.

#### 7.4.1. Change Control Board

The CCB is Chaired by the Senior Vice President, Nuclear Refurbishment (or delegate) and scheduled as/when required. The CCB may also refer a change for additional approval as required. The CCB approved change within their authority. The CCB recommend to the PCCB OPG staffing and resource changes.

#### 7.4.2. Program Change Control Board

The Program Change Control Board (PCCB) Chaired by the Vice President, Planning and Controls is scheduled as/when required. The PCCB convenes to approve significant Program level cost and schedule changes that require additional approval. The PCCB approve OPG staffing and resource changes.

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

#### 7.4.3 CCF Fast Track Process

Due to the nature of construction projects and the need to process urgent changes that impact field work, a Fast Track process exists for urgent CCF's:

Step	Description	Responsible	Notes
1	Prepare CCF and Supporting Documentation	Project Manager	The Fast Track CCB processes will require quality CCF form, with supporting documents.
2	Assess if fast track process is required	Planning & Control Lead	Criteria for Fast Track: - Immediate impact to field work - Is not caused by poor planning
3	Concur that the fast track process is applicable.	Unit Director (Work Control)	Email: Project, Unit Director, Copy Change Administrator
4	If #3 = NO, CCF will be submitted via the regular CCB process and schedule	Planning & Control Lead	Register for next CCB
	If #3 = YES, Review CCF for quality, then prepare for a email-based voting process.	Change Administrator	Voting email to CCB members, copy Project Manager to respond to questions.
5	CCB Vote	Change Control Board	Upon approval, the results will be communicated and the change recorded in cost management system.

It should be noted that the Project Control Centre (PCC) has the authority to approve changes in the field in emergency situations and the change paperwork will be submitted after the fact.

Expectation is that turn-around time for fast track is to be less than 5 business days.

#### 7.5 Implementation

The final decision and disposition of a CCF will be communicated to all stakeholders listed on the CCF. The status of a CCF will be changed to "approved" once all actions are completed.

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R001</b>	<b>27 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

The following systems and tools shall be updated, as applicable and verified updated by the P&C Lead:

ACTION	RESPONSIBLE
Budget cost and cash flow ("PV") baseline Proliance	NR Cost Management Section
Schedule baseline plan in Primavera P6	NR Schedule Management Section
Risk Management and Oversight (RMO) database	NR Risk Management Section
Project Management Plans	Project Managers, or designate
Contracts/Purchase Orders with Suppliers	Supply Chain
Update Change Register	NR Cost Management Section
Update IDB Data Sets	Data Stewards

## 8.0 CHANGE REGISTER

A Change Register will be maintained in the Cost Management system by the P&C Cost Management Section to record the sources of change, track and monitor status and provide inputs for key change related metrics.

The following are maintained in the Change Register:

- (a) Change Identification
- (b) Date Initiated
- (c) Change Type
- (d) Resultant Change Status
- (e) Action By (Submitter, Approver, Rejecter)
- (f) Approve/Reject Comments
- (g) Disposition Date (date approved or rejected)
- (h) Cost
- (i) Total Milestone Variance Days

## Manual

Internal Use Only

Sheet Number: <b>PC-12</b>	Revision Number: <b>R001</b>	Page: <b>28 of 41</b>
Title: <b>NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT</b>		

### 9.0 METRICS AND REPORTING

The data compiled in the Change Register will be used to generate Program and Project metrics. Metrics will be generated on a monthly basis and include statistics such as:

- (1) Number initiated
- (2) Number Approved
- (3) Number Rejected
- (4) Change Classification Trends
- (5) Contingency Drawn Percentage
- (6) Remaining Contingency value
- (7) CCF Cycle Time

A Station Condition Report (SCR) shall be created for adverse trends identified from GREEN change pattern analysis if applicable. The intent of the SCR is to put in place corrective actions that are consistent with the consequences involved.

## NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

### 10.0 DEFINITIONS

A comprehensive listing of P&C Terms, Acronyms and Definitions are provided in N-MAN-00120-10001 PC-16. Acronyms and definitions used in this document are summarized below.

Term/ Acronym	Definition
Baseline	See Performance Measurement Baseline
Change	For the purposes of this procedure, a change is any deviation from an approved plan or procedure that results in a real or potential impact on project or program cost or schedule.
Change Classification	Used to differentiate the reasons for a change to facilitate trending analysis.
Change Control Form (CCF)	Change Control Form N-FORM-11252; used to document changes for trending and approval purposes.
Change Management Process	Change Management is the Project Management process (including the supporting tool) that provides a framework to identify and record changes in cost, schedule and or scope against the approved baselines.
Comprehensive Work Package (CWP)	A CWP is a collection of all necessary information required to complete the field implementation of construction work. It provides a systematic approach to completing the installation while taking into account nuclear, conventional, radiological and environmental safety.
Decision Criteria	RED, YELLOW or GREEN labels applied to differentiate the severity of a change so that the right risk-based change management controls are applied.
Executing Organization	The Project Team, OPG Function or Contractor's organization executing the scope of work.
Forecast	Forecast represents the projected cost of the Work Package, including any pending changes yet to be approved.
Integrated Data Base (IDB)	IDB is Nuclear Refurbishment's data repository where integration and mapping occur. Information is pulled into IDB for the purpose of integration, mapping, data quality analysis, data integrity, and reporting.
Performance Measurement Baseline (PMB)	<p>The Performance Measurement Baseline is the Project scope, cost and schedule approved during the Gated process for Project and Bundle Releases</p> <p>The approved budget and schedule allocated to Work Packages indicate cost and schedule performance which will be measured against Current Budget in the Cost Management System and the Project Baseline Schedule.</p> <p>The Performance Baseline will be established for both Cost and Schedule:</p> <ul style="list-style-type: none"> <li>Project Performance Baseline – Will be established at each Gate.</li> <li>Functional Performance Baseline – Will be established at each Release</li> </ul> <p>The Performance Measurement Baseline will not include:</p> <ul style="list-style-type: none"> <li>Contingency</li> <li>Management Reserve</li> </ul>

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>PC-12</b>	<b>R001</b>	<b>30 of 41</b>

Title:

**NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

Term/ Acronym	Definition
Program Baseline	The aggregate planning efforts during Definition Phase will converge to an overall Program Plan at Release 5, or Release Quality Estimate (RQE). This is the point when the majority of projects have sufficiently defined their execution strategies, cost, schedule and scope that will allow an overall Program Baseline to be set. The Program Baseline will be maintained and actual cost versus budget monitored.
Program Integrated Master Schedule (PIMS)	The Program Integrated Master Schedule is the Level 1 schedule controlled by OPG senior management and contains all control accounts from all projects, OPG functional as well as for program management work.
Program Milestone Schedule (PMSS)	The Program Milestone Schedule is the Level 0 schedule controlled by OPG senior management.
Program Tier 1 Milestone	Program tier 1 milestones are milestones that are commitments to the Board or decisions at Board Level.
Program Tier 2 Milestones	Program tier 2 milestones are milestones that are critical to the Program, normally documented in Phased based Program BCS's per Release Strategy.
Program Tier 3 Milestones	Program tier 3 milestones are milestones that manage the health of the Program and keep it on track
Project burn rate	The cost a project incurs on a daily or weekly basis as a result of overheads, direct expenses (e.g. equipment rental) and labour.
Program Work Breakdown Structure (PWBS)	The Program Work Breakdown Structure is a hierarchical decomposition of the entire scope of work to be executed by the program team to accomplish the program deliverables.
Scope	Within the context of this document scope refers to the data sets that are used to manage projects and the Darlington Refurbishment Program. These include for example, Darlington Scope Requests, Engineering Changes, Work Orders, <i>Comprehensive Work Packages</i> , Construction Completion Declarations (CCDs).
Work Breakdown Structure (WBS)	A hierarchical decomposition of the total scope of work to be carried out by the project team to accomplish the project objectives and create the required deliverables. The main purpose is to breakdown the scope of work into more controllable components and to identify responsible organizations for the completion of all components.

Title:

### **NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT**

## **Appendix B: Scope Change/Addition Screening Process**

For the purposes of this document, "Project Manager" represents the Project Manager, Maintenance or Functional Manager who holds the budget to execute the work.

During Refurbishment execution, all requests for new scope will be handled through Asset Suite through the OMS Work Order Approval Process. A New Work Screening Committee (Screening Committee) will review work requests on a frequency depending on the volume received and categorize the work as to either execute during the Refurbishment outage or deferred as post-breaker close work.

For all types of new work orders not linked to current projects, consideration of the impacts of union jurisdictional issues and the Chestnut Park Accord Addendum (CPAA) work assignments should be made, reference file NK38-CORR-09701-0408278-T10. The CPAA Committee is available to assist with this impact assessment (contact Dan Smith dan.smith@OPG.com).

### **1.1 Emergent Work**

#### Non-Project Emergent Work

Emergent work categorized as Refurbishment by the Screening Committee and accepted by the Project Manager will be added to OMS and dispositioned by the Outage Manager as being an Available for Service requirement. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB.

#### New Work Team - Fix It Now (FIN)

If the emergent work requires immediate action due to station conditions, the Outage Manager (pre-breaker open) or the PCC (post-breaker open) will assign the work to the FIN Team.

The FIN team is a multi discipline team that reports to Director of NR Operations & Maintenance, which will support the Unit Director. The team will act as "first responders" for emergent work on the unit where repairs are required on Operating Systems not in the control of an EPC vendor.

Work Orders for urgent work generated from the FIN process must be accepted by the Project Manager the next business day. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

Work Orders that cannot be completed by FIN process will be prioritized, planned and integrated with appropriate windows in the outage schedule with the acceptance of the Project Manager.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>PC-12</b>	Revision Number: <b>R00</b>	Page: <b>34 of 41</b>

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

#### Project Emergent Work

Individual projects will manage their own project schedule and plan in P6, but these plans will interface with the Outage execution integrated schedule.

Additional work may be added to scope though the Screening Committee, CCB or PDM. The work must be characterized (mandatory or nice-to-have) based on work in progress, schedule and cost. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance.

#### **1.2 Cyclical Outage**

The Cyclical portion of the Refurbishment will be executed by the Refurbishment organization using Asset Suite and will follow the Refurbishment Planned Outage Management milestones and planning process.

#### Cyclical Scoping

Cyclical scoping will require a collaborative effort of Station & NR Engineering, Operations, Maintenance and Work Control. Accountability is maintained by Unit Director (NR Work Control). The Cyclical Scope selection will include the following:

##### Must Do:

- Station License or Regulatory Requirements.
- Testing/inspections required for normal shutdown and start-up of the Unit.
- Mandatory Inspections due during the Outage Period.

##### Need or Want To Do:

- Life Cycle Management inspections or Maintenance as required to facilitate RTS (Return to Service) expectations.
- Preventative Maintenance, Deficient Maintenance (DM) and Corrective Maintenance (CM) Work Orders as requested to achieve RTS expectations. These will be a subset of: PRL (Plant Reliability List) Work to Improve Unit Reliability, Reduce Forced Loss Rate, Station Cycle Plan Support and Operating Backlog Targets Support.
- Cyclical outage scoping strategy will consider scope that can be proven to add value to the station operations in future by improving maintenance method saving costs on outages, optimizing resources or improving operations. Replacement of components which due to scale of work makes economic sense.
- Operator Burden and Operator Work-Around elimination.

## Manual

Title:

### NUCLEAR REFURBISHMENT - PROGRAM CHANGE MANAGEMENT

This work is assigned to the Project Manager by the Screening Committee. The Project Manager confirms the correct project has been assigned and, if required, raises a CCF upon acceptance. If the Project Manager does not accept the scope, a new scope sponsor must raise the CCF for approval at the CCB.

**Note:** The cyclical scoping process cannot be used to circumvent the CCF or DSR/DRAS process.

#### Cyclical Schedule

The Unit Director is accountable for the preparation of cyclical schedules that will include all cyclical outage approved scope (Operations & Maintenance work orders, from breaker open to closed, required to allow operation until the next planned outage, D2221).

The cyclical outage schedule will include Operations I RTS detailed shutdown and return to service activities. Additionally, this schedule shall be reviewed for horizontal and vertical integration with the IL3 (Integrated Level 3) and CCL2 (Coordination and control level 2) schedule. Refer to N-MAN-00120-10001-SCH-11 (Darlington: Schedule Management Plan for Integrated Level 3 Execution) for more details on IL3.

The cyclical outage scoping process is initiated following the last planned outage prior to the start of the unit as per the Work Management Ownership Transfer Plan (NK38-PLAN-09701-10113-WM-01).

### 1.3 Major Scope

Significant new or changed scope will be referred by the CCB to the PDM and if approved, a scope sponsor prepares a DRAS for budget approval by the PSRB. In cases where there are multiple potential options to address new scope, the ORB will review the options and decide which will be pursued.

Major program scope changes referred to the PSRB by the CCB or PDM follow the Darlington Nuclear Program Scope Control, NK38- INS-09701-10001.

### 1.4 New Projects and Station Sponsored Work

During the time period when NR is the scheduling authority, the Station may desire to have work (new scope) performed on the unit. Since there is only one schedule to perform work in the Refurbishment unit, all Station or Projects & Modifications work groups must ensure their tasks are approved and shown on the Refurbishment schedule once approved.

New scope identified at the Screening Committee requires a scope sponsor who prepares a CCF for approval at the CCB. Significant new or changed scope will be referred by the CCB to the PDM and if approved a DRAS for budget approval by the PSRB is required. In cases where there are multiple potential options to address new scope, and that option set does not provide a clear

preferred option, an Options Review Board (ORB) will review each option and decide upon which of the options will be pursued.

#### **1.5 Decision Escalation (Appeal) Process**

In the situation where a scope addition or change has been rejected by the Project Manager, a request can be made to escalate the decision to the CCB and PDM.

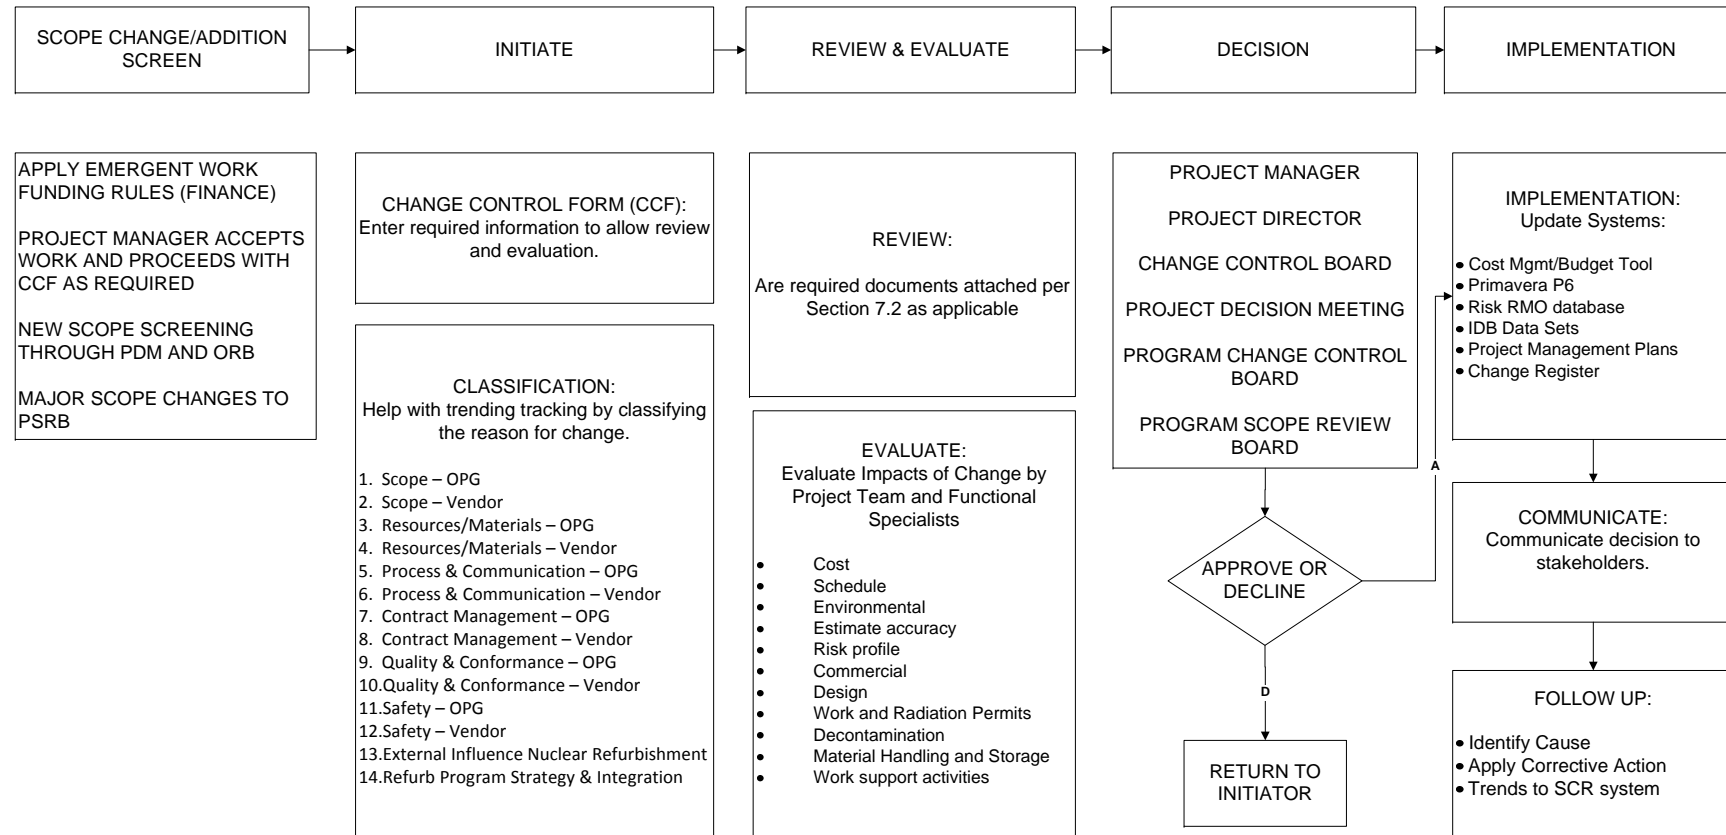

In the situation where a scope addition or change has been rejected by the CCB, a request can be made to escalate the decision to the PSRB. In such cases, a written request by the Sponsor must be made to the Chair of the PSRB with rationale. The PSRB chair will arrange an ad hoc PSRB meeting to consider the request.

Title: <b>DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION</b>		

## 1.0 INTRODUCTION

### 1.1 Purpose

This document describes the Integrated Level 3 Darlington Refurbishment Schedule Management Plan (SM Plan). The purpose of the SM Plan is to provide guidance on how to develop, manage, and control the Integrated Level 3 Execution Schedule throughout the Refurbishment Execution life cycle. This covers the preparation and management of the execution plan from Breaker Open to Breaker Closed, including the integration of readiness activities.

### 1.2 Scope

The SM Plan identifies the process and procedures used to manage the schedule during the course of the Darlington Refurbishment Outage Execution. In addition to defining the schedule development approach, the plan defines who is responsible for tracking and reporting schedule progress, how schedule updates are received and incorporated, how variances and changes will be addressed, and how to baseline the schedule. The plan describes the project's schedule management tool. The plan also addresses the four execution segments, work types and work groups, taking into account Operation Authority, Nuclear Safety, Permit Strategy and Return to Service requirements.

### 1.3 Level 3 Schedule Development Timeline

The development of the Integrated Level 3 Execution Schedule will be iterative process with many inputs provided at different times. List and timeline of major revisions, deliverables and milestones required before the level 3 execution schedule is fully integrated is provided in Appendix F: Timeline of Critical Inputs Required for Development of IL3E Schedule

### 1.4 Guiding Principles

Establishing an accurate and realistic schedule is a critical planning step for a project/outage. The schedule is the main planning tool used to understand and communicate the status, interrelationships and dependencies among project activities and deliverables.

Schedule detail must be developed at an appropriate level to allow the project team to coordinate the work and communicate the plan, monitor project progress and cost performance, and use the data to make accurate forecasts, strategize and plan upcoming work.

The Integrated Level 3 Execution Schedule will:

- Be all inclusive of all work to be done during the execution window (all work groups)
- Be prepared and updated by the individual work groups and monitored by the Master Scheduler
- Be hours based
- Be one network (longest path) in a single P6 database
- Be resource loaded (histograms and work list tool) (user defined - examples; SDS qualified CT, Pipefitter Welder, BM Rigger, BM Welder)
- Be coded to roll up to the Level 2
- Be baselined

## Manual

Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>6 of 36</b>

Title:

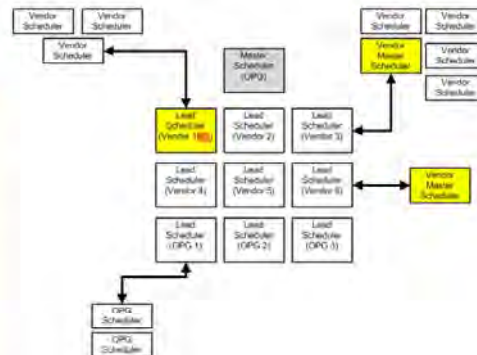

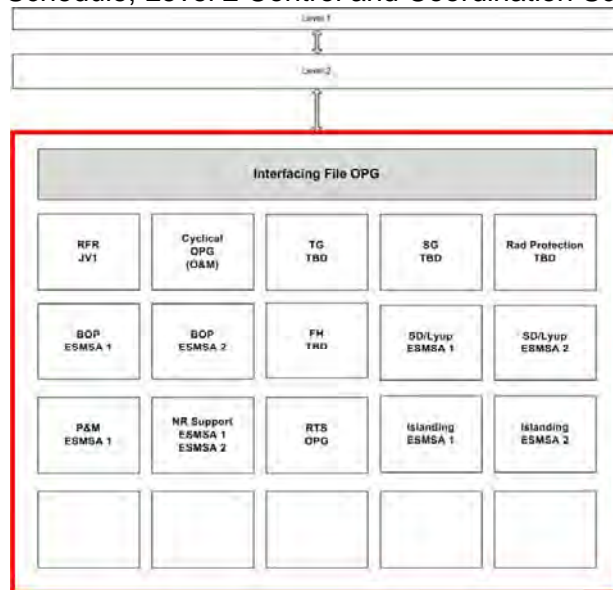

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Have all integration activities (hand-offs) between work groups logically tied through an interface file under control of the Master Scheduler and subject to schedule change rules
- Contain appropriate detail to support Release Quality Estimate (RQE)
- Show support activities for all work groups (See Task Breakdown Table, Section 5.2)

There will be one P6 scheduling database controlled and managed by OPG. All work groups (OPG and vendor work groups) will work in the same P6 instance

- An OPG Assigned Master Scheduler is responsible to control and manage the unified P6 schedule.
- A Lead Scheduler will be assigned by each work group and will follow schedule process direction from the OPG Master Scheduler
- The work group Lead Scheduler has authority to update and revise his work group's schedule within the protocols specified by the Master Scheduler
- The Master Scheduler takes his direction from the Unit Director and Outage Manager

The structure of the schedule will include Milestones, Level 1 Program Integrated Master Schedule, Level 2 Control and Coordination Schedule and Level 3 Execution schedule

**Methodology:** Owner performing the role of General Contractor to integrate multi prime EPC and Owner directed resources for a multi year project.

**Bundle → Sub Bundle → File / Vendor (commercially independent)** working in owners P6 able to calculate Critical Path @L3 and fully integrated via OPG interfacing file.

**ESMSA Lead Scheduler may direct more than one bundle (commercially independent)**

## 2.0 PARTICIPANTS

### 2.1 Roles and Responsibilities

During the definition phase, OPG's role was that of the Design Authority and Project Manager. The Execution phase adds the role of General Contractor, Owners Engineer, and License Holder / Controlling Authority of a power reactor.

During the execution of the Darlington Refurbishment, OPG's role during execution includes the following:

- Shut down, de-fuel and lay-up the unit

**Manual**

<b>SCH-11</b>	<b>R000</b>	<b>7 of 36</b>

Title:

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Maintain control of the island/plant
- Ensure all aspects of safety are adhered to
- Perform Cyclical ,FIN and Contact Partner Support Work/Rehab
- Construction coordination & integration
- Schedule analysis and optimization
- Configuration control/management
- Commission and restart the unit
- Quality Oversight

Schedule-related responsibilities of staff and stakeholders involved in managing and controlling the project schedule are noted as follows:

**Responsibilities:**

- Director Planning and Controls – will approve the project's Schedule Management Plan. Responsible to establish and publish reports and metrics in support of Unit Director and other project stakeholders. Assign the Master Scheduler in order to provide the infrastructure required for the schedule development.
- Unit Director – will approve baseline schedule, and any significant changes through the schedule change control process. The Unit Director is ultimately responsible for the schedule and to complete the project according to the schedule. Accountable for unit scope management process. Accountable for development and implementation of Project Control Center (PCC) command and control processes. Accountable to identify report requirements and interpret/analyze reports and metrics. Accountable to establish and implement readiness review process.
- Outage Manager – Accountable for affirming, documenting and communicating all decisions relating to establishing and executing the critical path. Will be responsible for development of the Schedule. Accountable for identifying risks to the schedule and determining the appropriate risk management strategy. Accountable for work integration. Accountable for unit and segment forecasts. Responsible for managing outage scope. Responsible to implement PCC command & control process. Will review reports and metrics to identify and counteract schedule deviations. Responsible to implement readiness review process.
- Work Control Section Manager and Work Control Team Leaders – will be responsible for developing detailed logic for the execution of assigned outage work windows. Responsible to identify and resolve work integration issues within assigned work scope. Will identify to Project Managers any interfacing logic issues which might impact on a projects cost and/or schedule. Will document system window logic assumptions and assist Outage Manager with decision support information as required to help resolve project interface issues. Will identify risks and establish risk mitigation plans as appropriate.
- Project Manager – will oversee, provide input to the schedule and review schedule status reports provided by the Lead Scheduler. The Project Manager will also evaluate time-risk recommendations from the Lead Scheduler to avoid schedule issues. Accountable for project schedule and cost. Accountable for project readiness.
- Functional Managers – will notify the Unit Director and Lead Scheduler of workload changes that may affect the schedule. The Functional Manager will also review and approve time estimates provided by staff for the schedule.

Title:

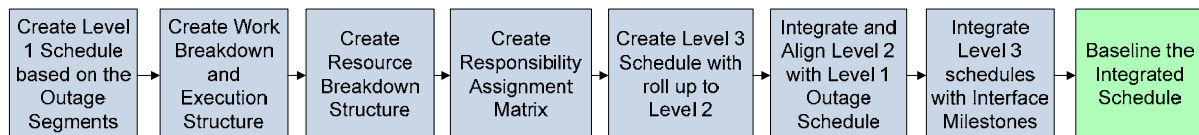

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Work Group (OPG or Contractors) - Accountable for work quality. Responsible for developing detail schedule. Responsible for work cost. Responsible for work readiness. Responsible for work execution. Responsible to status the work. Will provide accurate time estimates for the beginning and completion of work as well as status reports on the achievement of those times. Will manage their internal activities to the timely accomplishment of the schedule, of which status shall be reported regularly notifying the Unit Director of potential or actual schedule variances. Will ensure resources are utilized efficiently and effectively such that down time is minimized and identify opportunities to utilize resources more effectively to the benefit of the project.
  - Master Scheduler – will report functionally to the Unit Director and will be accountable for the development of the unit and segment schedules. Will provide critical path analysis. Will integrate the work for the segment and unit schedule while managing and controlling the L3 interface file. Will publish reports and metrics on the work. Will raise upwards any integration or scheduling conflicts for resolution. Gives direction to Lead Schedulers on schedule logic and integration. Will maintain the scheduling tool and supporting documentation. The Master Scheduler will make recommendations to the Outage Manager to avert schedule variances that may adversely affect the project critical path, budget or expenditures
  - Lead Scheduler (Work Group) – Will develop unit and segment schedules for the work group. Will provide critical path analysis for the work group. Will integrate the work for the segment and unit schedules for the work group. Will status the schedule activities per work group's direction. Will publish reports and metrics for the work group
- Quality Assurance – will periodically audit scheduling practices to validate compliance with this Schedule Management Plan.

### 3.0 SCHEDULE DEVELOPMENT PROCESS

The schedule development process is comprised of multiple development steps. Each step taken generates a schedule subcomponent that can stand alone to inform the project team of that aspect of the final schedule. When integrated, it forms the basis for the approved working version of the final schedule known as the Baselined Schedule. Figure 1 depicts the order and the individual products generated during the schedule development process.

**Figure 1 - Schedule Development Process**

#### 3.1 Create Level 1 Schedule (PIMS-C)

The Level 1 Schedule is a visual representation of anticipated critical activities, milestones, and interfaces across the entire project/outage. Level 1 schedule is the Program Integrated Master Schedule (PIMS) that contains execution windows in the Refurbishment. Each Unit Outage will have its own PIMS. The Unit 2, Level 1 is called PIMS-C. It is developed by OPG during the Definition Phase to provide the project teams and Contractors with the earliest possible view of

<b>SCH-11</b>	<b>R000</b>	<b>9 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

project's most critically timed activities. At this stage, the date for a critical activity may not be known, but the visual representation of the activity among all the activities on the chart will enable the team to conceptualize the relative flow of important events.

The PIMS displays both the project's expected flow of critical activities as well as the vertical integration of related deliverables from other existing or pending contracts. It displays what OPG is responsible for in parallel with the Contractor's responsibilities. It sets a clear expectation early on of critical timing between project deliverables and key events.

See Appendix C: Overview of Unit 2 -Darlington Nuclear Refurbishment Program

PIMS-C will be updated according to the schedules' milestones. With each progressive revision, more knowledge and optimization of the schedule will be incorporated. The nomenclature of the revisions will be Revision 'A' schedule, Revision 'B' schedule, Revision 'C' schedule and Revision 'O'. Revision 'O' will be the final revision before Breaker Open. In support of the Release Quality Estimate, an RQE revision will be issued. This revision will come after Rev B and incorporate the best available input from all stakeholders.

### **3.2 Outage Segments**

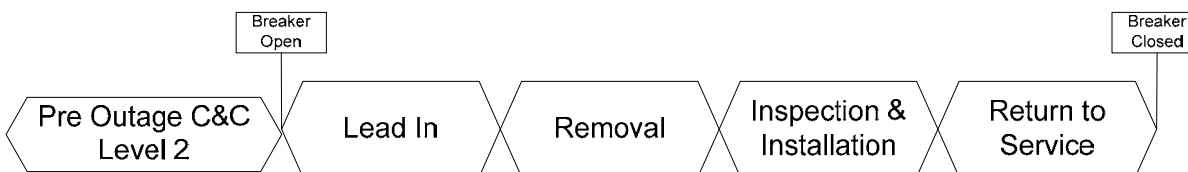

Due to duration of each Refurbishment Outage, there are complexities and data management considerations that are greater than previous outages or projects. In order to manage the volume of data in a logical fashion, Outage segmentations have been established. The segments were developed from the following rule set:

1. Segment needs to be big enough to have its own P6 project
2. Segment needs to be small enough not to threaten P6 capability with respect to the number of activities that can be in a single P6 file
3. Segment needs to be complex enough to warrant its own handling team
4. The end point for a Segment should be a natural logic node which marks the completion of a large number of activities. It may mark a major transition e.g. OPG to vendor, vendor to vendor work program, vendor to OPG. The intent is to minimize the number of activities that are carried from one phase to another in order to limit the number of interfacing milestones to only those required. To the extent possible work will be scheduled within a segment.

The benefits of breaking the Outage into Segments include:

- Maintain schedule integrity while reducing complexity
- Allows Planning & Scheduling Basis change
- Appropriate level of detail
- Strong reporting model
- Reporting frequency
- Establishes Integration Points (work horizon)
- Enables close-out of a P6 node

The segments are Lead in, Removal, Inspection & Installation and Return to Service

## DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

### 3.3 Create Work Breakdown Structure (WBS)

The Darlington Refurbishment uses a deliverable-oriented work breakdown structure (WBS) to best reflect the scope of project (Reference WBS Guide NK38-GUID-09701-10006). The WBS is created by breaking down the project's main deliverable – e.g. Refurbishment of Unit 2 – into its sub components using a hierarchical -tree format and will be developed in parallel with L1 execution windows and aligned with work sequence. The upper levels of the WBS breakdown the deliverables into Control Accounts while the lower levels of the WBS depict the Work Package and activities and tasks.

Example of how the standard WBS has been implemented is in Appendix D

**Figure 3 – General Work Breakdown Structure**

Title:

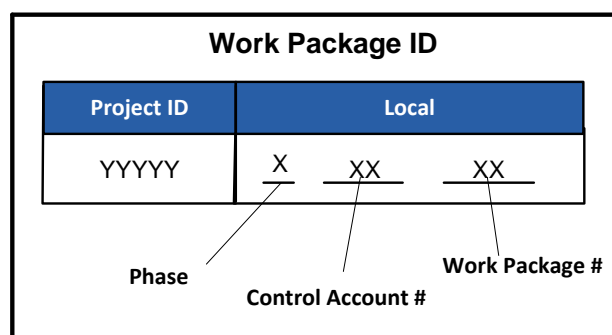

# DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

## 3.3.1 WBS Element Numbering Methodology

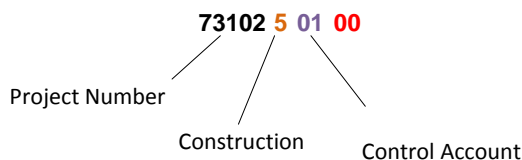

In order to successfully implement the Multi Level Scheduling Model we will utilize the WBS functionality in P6 to allow progress on lower level activities to roll up through the WBS to Work Packages and Control Accounts. To facilitate this structure and to create traceability between the WBS and the schedule and to distinguish between levels, all boxes on the WBS, known as “elements” will be numbered using the methodology shown in Table 1

**Table 1. Element Numbering Methodology**

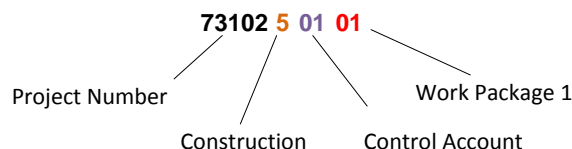

WBS Elements	WBS Path
NR Program	NR
Bundle BOP	NR.BP
Sub-Bundle Nuclear System	NR.BP.NS
EPC Contract 1	NR.BP.NS.01
Unit 2	NR.BP.NS.01.U2
Project 73592	NR.BP.NS.01.U2.73592
Construction	NR.BP.NS.01.U2.73592.5
Control Account 50100	NR.BP.NS.01.U2.73592.5.01
Work Package 50101	NR.BP.NS.01.U2.73592.5.01.01
Level 3 Activities	NR.BP.NS.01.U2.73592.5.01.01....

### Level 1 Schedule: Control Account - Activity ID

### Level 2 Schedule: Work Package - Activity ID

## 3.4 Create Resource Breakdown Structure

The Resource Breakdown Structure will be based on the Crew codes in Asset Suite 7. Crew codes will be used to estimate resources and provide resource demand curves. All level 3 activities will be resource loaded. Labour will be identified in hours. Commodities such as Pressure Tubes or Control Vales can also be included in the RBS. Common critical equipment such as the Turbine Hall Crane will also be included in the RBS in order to identify conflicts in requirements. All tasks identified in the L3 schedule will be estimated to identify resource requirements so that a resource histogram of the work identified in the L3 can be produced. Each contractor will be accountable to produce a resource histogram for Level of Effort work such as work performed in contractor shops and supervision. Total resource histograms will be a sum of the detailed tasks and the LOE estimates.

Full list of resources can be found on SharePoint: [Resource Breakdown Structure](#).

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

## 3.5 Create and Integrate Schedule

The WBS serves as the outline structure for the schedule. The Execution Windows serve as identification of the unit condition which allows work to be scheduled safely and integrated. A coding structure in P6 will include a code for each Execution Window within the Outage Segments and all the Systems that are part of the Refurbishment.

The intersection of the WBS, Systems and the Execution Windows allows the schedule to be sorted and viewed by any combinations of these elements.

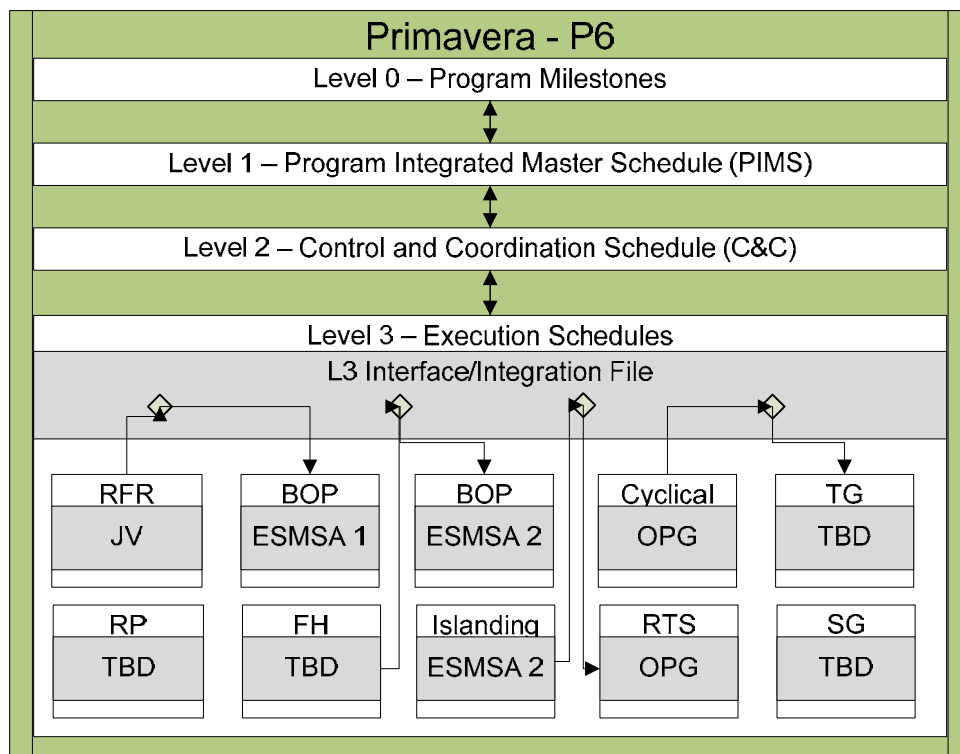

As part of the Multi Level Scheduling Model, NR Refurbishment will have different levels of the schedules that are integrated and aligned with each other using WBS Summaries, Activity Codes and Milestones, as described below:

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>13 of 36</b>

Title:

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

**Level 0 – Program Milestones**

- Program Milestones schedule including Program Release Milestones, Regulatory Milestones, Outage Preparation Milestones, and Outage Execution Milestones
- Level 1 execution schedule will be logically tied with Program Milestones

**Level 1 - Program Integrated Master Schedule (PIMS-C: First Unit Outage)**

- Level 1 execution schedule will be broken up by Outage Segments, Systems and RTS Phases/Nodes, following the standard WBS structure
- Master Scheduler will work with the vendor's Scheduling Leads to create the high level Control Accounts, based on the logic and execution windows defined by the Outage Manager
- Each Control Account will be a WBS Summary activity to allow roll ups from the Level 2 and Level 3 schedules
- Each Unit will have a separate PIMS P6 file
- PIMS will go through multiple revisions as more detail information becomes available. Revision '0' will be the final revision before Breaker Open.

**Level 2 - Control and Coordination Schedule (C&C)**

- Each Work Group/Vendor will develop number of Level 2 execution activities called Work Packages
- Work Package will be used to integrate schedule and cost, and for Earn Value Management
- All level 3 activities will roll up to Work Packages using the standard WBS, to allow progress tracking at a higher level
- Change Control is done at the Work Package level
- Level 2 will be used to manage float

<b>SCH-11</b>	<b>R000</b>	<b>14 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

#### Level 3 – Detailed Execution Schedule

- All activities will be developed and updated in a single P6 instance, controlled and managed by OPG
- Activities will be created using standard WBS and broken into Segments and Systems
- Activities will be hourly based, resource loaded, and less than one week in duration. Longer duration activities will require additional monitoring mechanism (e.g. Work-Down Curve)
- All activities will roll up to Level 2 Work Packages using the WBS structure
- Activities will be generated using 2 methods:
  - o Manual Input by the Scheduling Leads
  - o Automatic upload of Work Orders from AS7 where each activity ID will be a Work Order and Task number.
- Each Level 3 P6 file will be owned and managed by a single Work Group/Vendor
- Standard P6 templates will be utilized to communicate the scheduling requirements for similar work across different Work Groups
- Activity Code dictionaries, resource codes and calendars will be established in OPG P6 instance and used by all the work groups
- All activities will be coded with the window segment and the system (SCI)

#### Level 3 Interface/Integration File

- All the integration activities (hand-offs) between Work Groups/Vendors will be logically tied through Interface Milestones
- The Interface Milestones will be created by the Master Scheduler and each Scheduling Lead will create logic ties between the milestones and their activities
- All the interfaces within the same Work Group will have direct ties between L3 activities
- Milestones will be created using standard WBS and broken into Segments and Systems

#### **3.5.1 Date, Sequence, and Link Activities**

There are four types of dependencies (logical relationships) used to create links between schedule tasks. The Finish to Start dependency is more commonly used for scheduling the Darlington Refurbishment.

- **Finish-to-Start (FS):** The initiation of the successor activity depends upon the completion of the predecessor activity.
- **Finish-to-Finish (FF):** The completion of the successor activity depends upon the completion of the predecessor activity.
- **Start-to-Finish (SF):** The completion of the successor activity depends upon the initiation of the predecessor activity.
- **Start-to-Start (SS):** The initiation of the successor activity depends upon the initiation of the predecessor activity.

Tasks are linked together and sequenced to identify the relationships between deliverables, sub-deliverables, activities, tasks, and subtasks. The following rules should be applied when creating task dependencies:

Tasks are linked together and sequenced to identify the relationships between activities. The following rules should be applied when creating task dependencies:

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>15 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

Tasks are linked together and sequenced to identify the relationships between activities. The following rules should be applied when creating task dependencies:

- All tasks shall have at least one successor and one predecessor so there are no unlinked tasks.
- Start and Finish dates should not be entered when creating new tasks.
- For purposes of modeling the critical path, all dependencies should be linked to a detail task or deliverable and not to a summary task.
- Early dates (the earliest date on which a task can start or finish) are calculated in the forward pass of time analysis.
- Late dates (the latest date on which a task can start or finish) are calculated using backward pass time analysis.
- Constraints will be applied sparingly (only when required) in order to maintain a flexible, realistic schedule.

#### **3.5.2 Risk Estimate Duration**

To identify the time- risk associated with a critical or near critical activity or task, the Darlington Refurbishment and/or contractor staff should apply the Program Evaluation and Review Technique (PERT).

The formula is:  $PERT\ mean = (O + 4ML + P) \text{ divided by } 6$

Where:

O = Optimistic estimate

ML = Most likely estimate

P = Pessimistic estimate

The project team member performing the task will provide variables O, ML, and P to calculate an optimistic, most likely and pessimistic estimate that can be utilized in the Monte Carlo simulation. A schedule for both the most likely and the pessimistic will be maintained and risk mitigation strategies will be documented in the Risk Plan for those tasks on the critical path (Reference Risk Process N-PROC-LE-0017).

#### **3.5.3 Duration Guidelines**

As a general rule, the basis for resource estimation will be in hours. The task duration will also be in hours. Tasks of significant duration should be broken down into shorter duration tasks if possible to permit accurate assessment of work progression or they need to be supplemented with a metric/work down curve to identify status.

Standard resource calendars will be used in P6. All vendors and OPG will use the same suite of calendars.

#### **3.5.4 Validate Schedule**

##### Horizontal Schedule Review

A horizontal schedule review of the sequence of scheduled activities and logic ties is performed to ensure prerequisites or constraints are satisfied, including, but not limited to:

- Shutdown safety (e.g., redundant systems available, appropriate heat sink configurations).

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>16 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Logical constraints (e.g., preparation work complete, isolations).
- Alignment of conventional equipment to support planned electrical evolutions.
- Satisfaction of required plant conditions (e.g., system pressure, temperature, and configuration).
- Confirmation that any operating or functional test (as-found test) required for PM WOs with an operability test required attribute are scheduled prior to the actual PM.

#### Vertical Schedule Review

A vertical slice of activities scheduled to be executed concurrently is reviewed to ensure the following:

- (1) Maintain Shutdown reactor safety (e.g., aggregate work/risk does not impair ability to control power, cool fuel or contain reactivity below an acceptable level).
- (2) Following the publication of Rev C Schedule's we will perform a risk analysis of WOs causing elevated risk.
- (3) Formulate oversight contingency or compensatory actions to mitigate both risk and possible duration extensions.
- (4) System conflicts do not exist that preclude completion of work as planned (e.g., conventional equipment alignments support planned electrical evolutions).
- (5) Sufficient resources are available (e.g., manpower, equipment, location) to complete the schedule as planned. This should include the evaluation of external resource commitments to other outages or projects.

Prior to the Reactor Safety Challenge Meeting an independent schedule review shall be completed to ensure defense in depth has been maintained throughout the outage.

- (1) The review should ensure that shutdown safety is maintained and shutdown risks are minimized.
- (2) The review should be completed by an independent licensed individual that has not been involved in the planning and preparation of the outage (e.g. a Fleet Peer).
- (3) Any outstanding actions from the independent review should be documented and reviewed at the Reactor Safety Challenge meeting.]

#### **3.5.5 Integrate Schedules**

An Integrated Level 3 Schedule is created after contract award and prior to Breaker Open. OPG and the Vendor will each prepare their schedules for integration into a single schedule - the Level 3. The Level 3 is the combined list of deliverables and tasks to be completed by OPG and Vendor, logically tied with defined duration. The combined schedule is based on OPG's Project WBS and the Vendor's scope of work.

The following steps are necessary to create the Integrated Multi-Level Scheduling Structure:

1. OPG will define all the Program Milestones based on the committed dates and create Level 0 Schedule
2. Outage Manager will define high level execution windows and system groupings for execution based on the Program Milestones, that will be represented as Control Accounts in Level 1 Schedule
3. Vendor will build a detail Level 3 schedule based on the Program Milestones and Control Accounts defined by OPG. Level 3 schedule will follow the standard WBS and will have all the mandatory activity codes like System, Equipment, Location, Unit, Work Order, MEC/EC Number etc. (See Scheduling Guide for full list of mandatory codes)
4. Vendor will summarize the Level 3 Schedules into Level 2 activities called Work Packages

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>SCH-11</b>	Revision Number: <b>R000</b>	Page: <b>17 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

5. Master Scheduler will work with the vendors to integrate and align the Level 2 activities within the Control Accounts, refining the structure of Level 1 schedule based on the contractual commitments, constraints, coordination with other work groups and additional information that were not available during the initial planning phase
6. Master Scheduler will work with the vendors to identify and integrate any interfaces between Work Groups using the Level 3 Interface P6 File

The resulting Integrated Level 3 will be reviewed and approved by Unit Director after which it will be baselined.

Appendix E shows how multiple levels of the schedules are integrated together

### **3.6 Baseline Schedule**

Prior to commencing outage work and after OPG's schedule and the Vendor Contractor's schedule are integrated, reviewed, and approved, the schedule will be baselined.

Prior to breaker open, the Integrated Level 3 schedule will be going through multiple revisions as we develop and incorporate additional details. With each revision, we will create a new baseline. The plan is to have 4 major revisions: Revision 'A', 'B', 'C' and Revision 'O'. Revision 'O' will be the final revision before Breaker Open.

In support of the Release Quality Estimate, an RQE revision will be issued. This revision will come after Rev B and incorporate the best available input from all stakeholders.

To baseline the Integrated Level 3 schedule, the Master Scheduler saves the approved version in P6 and stores a copy in the project repository. New baseline dates are uploaded to the BI Reporting Engine, to be reflected on all the standard reports.

After Revision 'O', the baseline will be re-established only upon scope change as approved through the Change Control Process.

# DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

## 4.0 SCHEDULE CONTROL CENTER (SCC)

To facilitate the collaboration between OPG and the Vendors in order to develop an Integrated Level 3 schedule, we are creating a Schedule Control Center (SCC) Room. This room will be located in a close proximity to the Project Controls Center (PCC), and will be equipped with multiple OPG workstations connected to a single P6 instance.

Each vendor will supply a Lead Scheduler who will be co-located with other vendors in the SCC room. Lead Schedulers will take direction from a Master Scheduler on how to develop and integrate their individual Level 3 schedules.

Everyone will be working in one P6 environment, using one set of standard codes, calendars and resource dictionaries. The environment will be supported by IT and a dedicated P6 administrator, who will managed security and code libraries based on the requirements set by the Master Scheduler.

All the Level 3 schedule updates should be coordinated from the SCC room to ensure the integrity of the integrated schedule and based on the PCC requirements.

SCC room will have Break Out areas for problem solving and meetings. There should also be access to flow sheets, area diagrams and SOW documents for reference.

Access to Asset Suit 7 will be available to the Vendors so they can status the work. The BI solution hosted on the OPG network will provide live reports to monitor schedule development and progress.

## DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION

### 5.0 SCHEDULING DEVELOPMENT TOOL

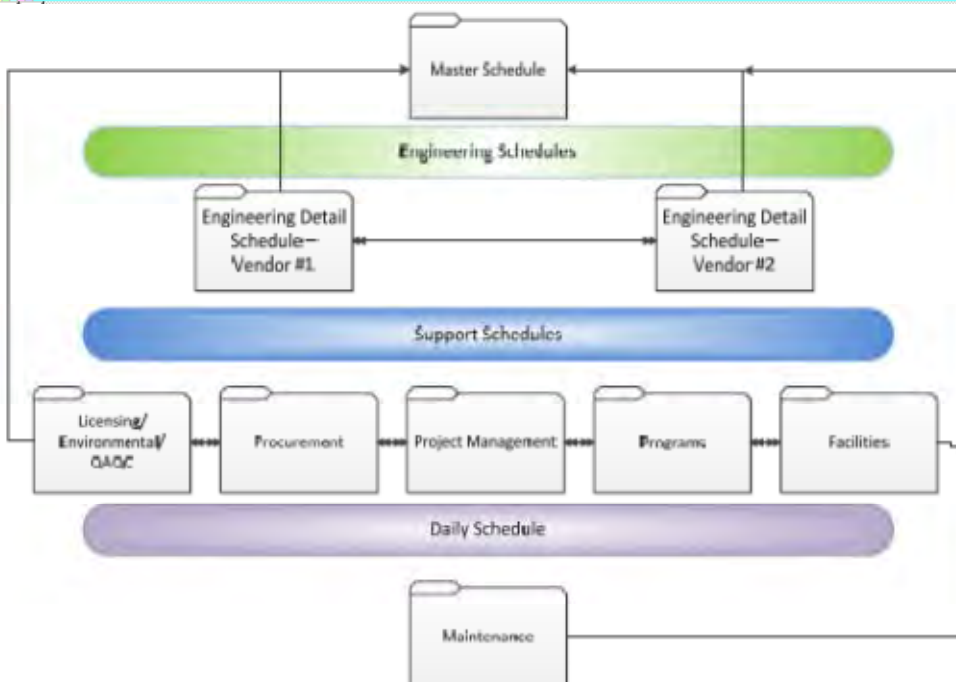

Primavera P6 will be used as the schedule development tool. Activities generated in the schedules will be downloaded from Asset Suit 7 (AS7) or they will be manually created based on the standard P6 templates/fragments.

#### 5.1 Scheduling Development Tool Description

Schedule data is compiled and updated in a scheduling tool to depict the time-sequenced flow of tasks, the actual work progress, and what remains to be completed. P6 is the standard schedule development tool used at OPG. P6 will interface with Work Management Tool (Asset Suit 7), Cost Management Tool (Proliance) and Estimating application (US Cost).

## 5.2 Task Breakdown

The development of a Level 3 Schedule that integrates the schedules of numerous contractors including some OPG work groups requires a degree of standardization. An analysis process has been used to determine what user groups will need to be in the schedule and the results are shown in Task Breakdown Table. OPG and contractors are expected to use this table to establish the tasks that will appear in the Level 3 schedule.

### 5.2.1 How to use Task Breakdown Table

What belongs in the schedule? - The table identifies a number of possible tasks (e.g. submit PC1, Prepare permit) in a subject area (e.g. Work Protection). The next three columns are labeled Always, Sometimes, and Never.

Always means always. For reasons that have to do with plant status control, management of critical and near-critical path, resource assignment etc, we have determined that these tasks must be in the schedule and must be shown at level 3.

Never means never. If, for reasons of its own, a contractor wishes to include these activities in its own P6 schedule they are at liberty to do so, but they must be coded so that they are NOT brought into the OPG layouts of P6 in which tasks are being integrated. OPG is conscious of the need to limit the total tasks brought into the project in order to ensure the manageability of project updates, and hence we will not be including "never" tasks in our schedule.

Sometimes has the following interpretation:

**Manual**

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>21 of 36</b>

Title:

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

A “sometimes” task may be included in the schedule because contractor’s scheduler needs it there for internal coordination purposes or

A “sometimes” tasks may be brought into the schedule at the request of the OPG Master Scheduler or Work Control Team Leader (WCTL) to facilitate broader scale coordination of work. Normally the requirement to add additional tasks will be identified in Task Analysis Meetings (TAMs) as system window logic is being established.

The next three columns in the table are labeled Direct P6, AS7 and Either. These labels describe how activities get into P6. There are two means available for a contractor to populate the P6 schedule with the tasks as defined above. The first is to directly inject the task into P6. The second is to add the task to the Work Order in Asset Suite 7(AS7) through the use of the assessment functions of that program. Most tasks can be placed into the P6 schedule using either method and contractors are encouraged to use whichever is most effective. A small number of exceptions are identified in table below.

## 6.0 SCHEDULE INPUT MONITORING

### 6.1 Compare Schedule Status to Time Status Reports

Level 3 schedules will be resource loaded with hours for OPG and Vendor work. The total hours loaded at Level 3 activities will be rolled up to Level 2 (Work Package). Total hours will be compared to the estimates done at the Work Package level and all the Actual hours will be collected at this level using financial systems called Tempus and Oncore.

BI (Business Intelligence) Reports will be available to compare plan hours versus actual hours. The SPI and CPI will be calculated at the Work Package level and when issues are identified at Level 2, more detail analysis of Level 3 activities will be initiated. Level 2 and 3 activities will also be monitored against a baseline to identify any work that is not progressing as planned or is ahead of schedule so we can take advantage of the early completion or initiate a recovery plan as required.

### 6.2 Monitor Vendor's Schedule

Schedule health and integrity will be monitored on level 3 schedules developed by all the Work Groups. Standard scheduling templates with minimum number of activities and all the mandatory codes for different work types will be provided. BI reports will be developed to monitor the compliance.

ACUMEN FUSE application will be used to analyze schedule quality and look for issues like missing logic, hard constraints, negative float, number of lags or areas where there is insufficient level of detail, before vendors schedules are integrated within the Program Integrated Master Schedule (PIMS)

<b>SCH-11</b>	<b>R000</b>	<b>25 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

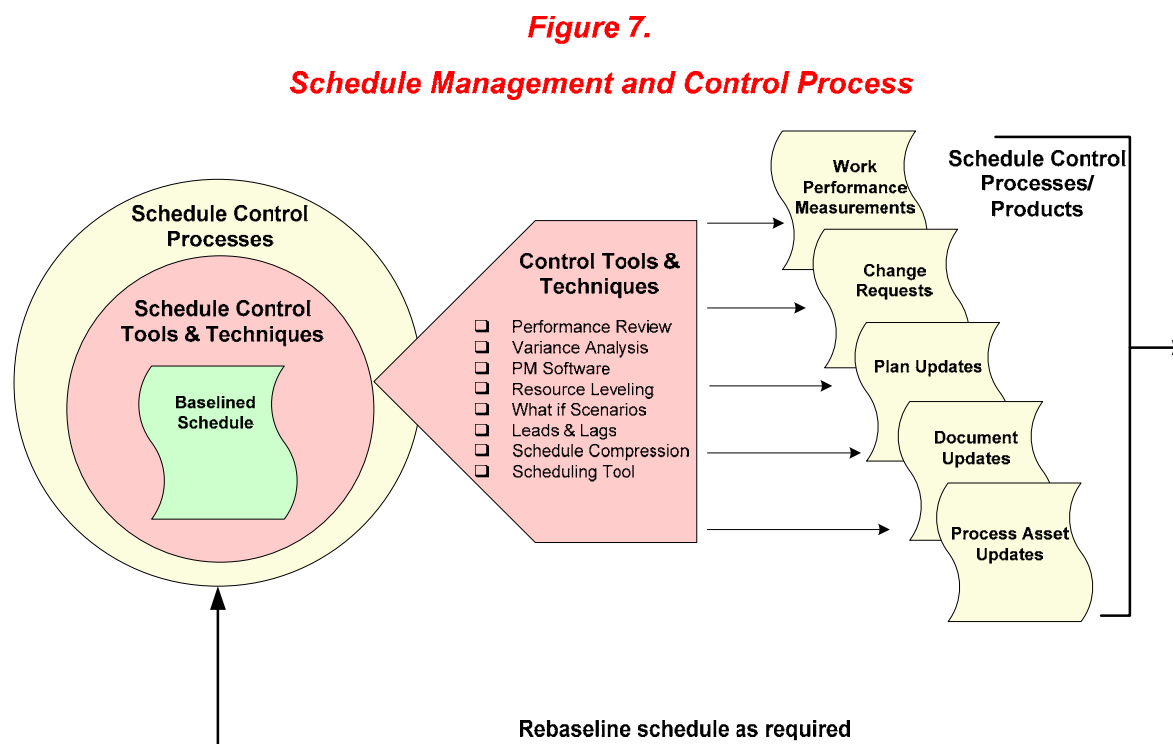

Monitoring vendor's schedules will be ongoing activity and all the issues will be communicated through Master Scheduler to the Lead Schedulers located in the SCC room. It will be Master Scheduler's responsibility to ensure that all the corrective actions have been resolved in a timely manner and that both Outage Manager and Unit Director are aware of the issues.

## 7.0 SCHEDULE MANAGEMENT AND CONTROL

Schedule management and control begins when the Level 3 is first baselined. This initial baseline establishes the project's scope and sets the expectation for how and when the scope will materialize. Any proposed changes to the scope will drive a schedule change management process. At this point, changes happen only if there is a change in requirements.

Schedule control addresses anticipating or correcting schedule variance. To do this, control tools and techniques are used to detect and forecast serious deviations from the baseline.

Figure 7 depicts a high-level representation of the schedule management and control process used by the Darlington Refurbishment.

As actual completion dates are monitored against the baseline, control tools and techniques are applied to anticipate, avoid, and mitigate time loss as well take advantage of extra time due to early completions.

## **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

### **7.1 Schedule Control Techniques**

Schedule control processes serve to minimize schedule changes. Control techniques are designed to reveal the status of the schedule and suggest corrective action to bring the project back on schedule. A number of techniques will be used on Level 3 schedules developed by OPG and contractors. For a list of Schedule Control Techniques that will be used in the Darlington Refurbishment see Appendix B

Schedule Planning Analysis takes place early in the project when the WBS is formulated. The scheduling team will use P6 to run What-if Scenarios to align the project owner's vision of the project with the likely timeframe for completion. What-if Scenarios will again be run when a new completion date must be determined as a result of a requested change to the WBS during the course of the project...

### **7.2 Schedule Control Products**

Schedule Control Products such as Work Performance Measurement Data, Change Requests, Plan Updates, Process Asset Update, and Project Document Updates will result from applying schedule control techniques.

Planning and Controls (P&C) will facilitate the development of these products but it will be the Bundle/Project Team's responsibility to prepare, review or update the product and take the necessary correct actions, e.g. To submit a Change Request or to review the Performance Reports or to update the Schedule Baseline.

### **7.3 Schedule Change Request Process**

Schedule changes may be driven by unanticipated work, new scope or when forecast is so far from the baseline that all the monitoring tools are no longer providing meaningful information. The change control process will be done at the Work Package level. If schedule analysis reveals an unfavorable impact to Work Package End Date or total resource hours projected, then a work Package Change Control process will be initiated.

Change Control process specifies different thresholds when a proposed change is considered an approved variance, a baseline change or full re-baseline of the schedule. Different levels of approves are required, based on the type of change.

Every change request will be reviewed to evaluate impact on Program Milestones, downstream activities, interfaces with other work groups and resource requirements.

The Master Scheduler monitors the Level 3 by reviewing and incorporating updates on a weekly basis. The Schedule Change Management Process is applied when:

- New tasks or deliverables cause baseline milestones or Work Package End Date to slip
- The project scope is changed
- A new constraint impacts the planned delivery date of the final project deliverable
- A directed change has occurred

### **7.4 Update Schedule**

Level 3 schedules will be updated daily or weekly during the execution phase based on the Outage Segment requirement. Asset Suite 7 tasks will be updated automatically with an interfaces process. Activities created manually will be updated by the Lead Schedulers sitting in the SCC room. Daily updates will include actualizing activities and entering percent complete.

## Manual

<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>27 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

The Data Date will be moved as required to support the process of generating integrated T-0 schedule.

Based on the daily status updates in Level 3 schedules, the Master Scheduler will analyze the schedule accuracy, float, extra time and overruns with respect to impact on interfaces across work group or execution windows within segments.

#### **7.5 Establish New Schedule Baseline**

Prior to breaker open, the Integrated Level 3 schedule will be going through multiple revisions as we develop and incorporate additional details. With each revision, we will create a new baseline. Revision '0' will be the final revision before Breaker Open and that will be the baseline for execution.

After Breaker Open, in order to change the baseline, work group will have to follow the Change Control Process. Once the change is approved as baseline change and all the impacts on downstream activities have been analyzed, effected baseline will be restored and updated in P6.

Every time a baseline is updated, a copy of the baseline is retained in P6 before any changes are made.

#### **7.6 Archive Schedule Change Support Materials**

A Change Control Form (CCF) is required for any change request. Supporting documentation and analysis is assembled by the project teams and submitted for review to Planning & Controls group. All the information is stored in SharePoint and recorded in Change Control Log. See the Change Control procedure to get the full list of requirements.

### **8.0 SCHEDULE STATUS REPORTING**

NR Refurbishment will use the BI Reporting solution for all the reporting requirements. The BI reports are located on the OPG network in the SharePoint environment. P6 data, including current schedules and the baseline schedules, will be downloaded every night into the BI data warehouse.

All the reports required in the BI will be defined and developed prior to Breaker Open. Existing reports used during outages will be leveraged and new reports will be created based on Refurbishment requirements and industry standards/practices/templates.

#### **8.1 Monthly Project Reports**

Schedule status reporting is accomplished via four monthly reports:

- Project Master Schedule (Gantt Chart)
- Monthly Project Report (Internal and External)
- Sponsor Monthly Project Report
- Contractor Dashboards
- Bundle Dashboards

#### **8.2 Monthly Metrics and Trend Analysis**

Reports that specifically detail the status of the schedule including completion status of tasks, activities, deliverables, and milestones as compared to the baselined plan include:

- Planned vs. Actual Task Completions

## Manual

Internal Use Only		
Document Number:	Usage Classification:	
<b>N-MAN-00120-10001</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>SCH-11</b>	<b>R000</b>	<b>28 of 36</b>

Title:

### **DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

- Estimate to Complete (ETC)
- Critical Path Analysis

#### **8.3 Weekly Metrics and Trend Analysis**

- Weekly CNO Package
- Schedule Adherence Report
- Schedule Variance by Activity
- New tasks added (or deleted) since last reporting period
- Outage Segment Dashboard
- Project Dashboards

#### **8.4 Daily Reports and Metrics**

- Break Plan
- Plan of the day
- T-0 Plan
- List of tasks that were completed or not completed

#### **8.5 Schedule Oversight Reports**

Reports used to analyze current status and identify potential or actual issues include:

- Project Milestone and Deliverables Reports
- Task Lead Oversight Reports
- Oversight Reports
- Tasks with Negative Float Reports
- Contractual Product Status Reports
- Late or At Risk Task Reports

### **9.0 SCHEDULE CLOSING**

P6 production database will be monitored by P6 administrator who will ensure that the number of active activities do not cause any performance issues. Completed schedules representing early phases of the projects/segments will be archived. Historical data will be available through custom solution.

#### **9.1 Closing Reports**

The Schedule Manager will provide input into the final schedule-related reports generated by the IPOC. These reports include:

- Post Implementation Evaluation Report (PIER)
- Federal Closeout Report

#### **9.2 Archive Schedule Data and Tools**

Archived activities will be in another P6 instance available for review and analysis. Custom P6 Viewer that combines information from two separate P6 instances will be available. Archived schedules will also be available in XER format.

BI Data Warehouse will have all archived and active schedules available for reports and metrics.

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

**Appendix A: Glossary & Acronyms**

ACRONYM/TERM	DESCRIPTION
Archive	An Archive is a secure repository of Configuration Items often stored offsite for additional security. Archiving is a process of storing Configuration Items in a secure manner. The purpose of archiving is to provide recoverability to a past state. Although the process for creating an archive is similar to that of taking a baseline, the method of storage for both is different. Whereas baselines are maintained in easily accessible media for reference during the project lifecycle, archives are stored on secure media.
Baseline (also: Project Schedule Baseline)	Approved project schedule that serves as the basis for measuring and reporting schedule performance.
Change	Change and clarifications to any configured item including operational requirements and contract requirements.
Change Control	The tracking and management of proposed changes to an item's format, content, version and/or configuration. Change control applies to many different project office functions (e.g. requirements management, project management, quality management, contract management, etc.) as well as contractor delivered products.
Sub-Contractor	The external service provider that will develop, or otherwise supply a service to or component of a project deliverable. (See Vendor)
Deliverable	A work product produced by a contractor or consultant in accordance with the terms of their contract. It is measureable, tangible, verifiable outcome, result, or item that must be produced to complete a project or part of a project.
ETC	Estimated Time to Complete
FSR	Feasibility Study Report
Integrated Level 3	A schedule of tasks to be completed by both the Vendor and OPG staff.
IT	Information Technology
Managers	The Department staff that oversee other department staff and are generally responsible for workload management.
Milestone	Identifiable point in a project or set of activities that represents a reporting requirement or completion of a large or important set of activities.
Vendor	The contractor who has primary responsibility for developing or integrating the given system, or the primary contractor performing work on the system.
Project Management Body of Knowledge (PMBOK)	Information Technology project management supported by a discipline and a formal body of knowledge that defines a project from inception to implementation.

Title:

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

ACRONYM/TERM	DESCRIPTION
Project Participant	Individuals that are either dedicated project staff or individuals that provide executive level sponsorship and support.
Project Schedule	Time-sequenced plan to accomplish activities or tasks used to direct and control project execution. Usually shown as a milestone chart, Gantt or other bar chart, or tabular listing of dates.
Project Work Breakdown Structure (Project WBS)	The Project WBS is a hierarchical tree diagram that depicts the first three levels of the work breakdown structure beginning with level 1 that shows the project's main deliverable (the final system) followed by level 2 – the major deliverables that make up the level 1 deliverable, followed by level 3 – sub-deliverables to the major deliverables. "Deliverable" may be a contracted deliverable of major work product.
Request for Proposal (RFP)	The RFP used to solicit proposals from the bidding community based on a set of defined requirements. The requirements may be general in nature allowing the bidders to propose a solution and the specific products to be used. The RFP describes the problem requirements, contractual terms, and required format for the proposal responses. The RFP also includes the specific criteria which will be used to evaluate the received proposals. The project works with DGS to ensure the RFP meets all appropriate state guidelines and regulations.
Resource Breakdown Structure (RBS)	A hierarchical structure of resources by resource category and resource type. The RBS may be organized by functional organizations.
Schedule Management	The process of developing, managing, and controlling the project schedule or integrated master schedule.
Stakeholder	(1) Individuals and/or groups who are involved in or may be affected by project activities. (2) The people who have a vested interest in the outcome of the project.
System Implementation	System implementation includes the activities of the project office and Vendor to deploy the new system into the target environment or production. This includes but is not limited to, the installation of equipment, the installation of software, the rollout of new or modified business processes, and the delivery of supporting documentation. Implementation is complete upon system acceptance by the department's maintaining organizations, and when the system is deemed "In production". Since the project may be developed, implemented, and transitioned in iterations, these processes may be repeated and overlap between iterations.
Work Breakdown Structure (WBS)	A deliverable-oriented hierarchical grouping of project elements that organizes and defines the total scope of the project. Each descending level represents and increasingly detailed definition of the project work.

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

**Appendix B: Schedule Control Techniques**

<b>Technique</b>	<b>Definition</b>
Performance Reviews	Performance reviews measure, compare, and analyze schedule performance such as actual start and finish dates, percent complete, and remaining duration for the work in progress.
Scenario Analysis	Allows decision makers to explore the implications of several alternative future states thus avoiding the danger of single-point forecasts. Conducted in a nonthreatening group setting, participants express beliefs, challenge assumptions, and alter their viewpoints to ultimately arrive at a strategic direction that is flexible and will remain so as actual events unfold.
Forward-Pass Analysis	Calculation of early start dates and early finish dates for uncompleted portions of all network activities. Determined by working forward through the network logic from the project's end date.
Backward-Pass Analysis	Calculation of late finish dates and late start dates for uncompleted portions of all network activities. Determined by working backward through the network logic from the project's begin date.
Bottom-Up Estimating	Cost, work, or resource estimate derived by first estimating the project's individual elemental tasks at the lower levels of the WBS and then aggregating those estimates at successively higher levels of the WBS. For cost estimates, the project manager typically includes indirect costs, general, and administrative expenses, profit, and any reserves when calculating the total project cost. This form of estimating is more accurate than making one large estimate.
Top-down Estimating	Approximating the size (duration and cost) and risk of a project (or phase) by looking at the project as a whole and comparing it to previously performed similar projects. The comparison may be made directly using "analogous estimating," through an algorithm as in "parametric estimating," or from the memory of estimating experts. Upon establishing an overall estimate for the project, sub-divide the estimate down through the levels of the WBS, for example, development will be 50% of the total, testing will be 25% etc; then sub-divide development and testing into their components and so on.
Critical Path Method	Predicts project duration by analyzing the sequence of activities (network path) that has the least amount of scheduling flexibility (i.e. float). Early dates are calculated by a forward pass using a specified start date. Late dates are calculated by a backward pass starting from a specified completion dated (usually forward pass's calculated early finish date for the project.)
Monte Carlo Simulation	A technique in which the project team leader or project team computes and/or quantifies the complete and total project cost and/or project schedule a number of times through the use of input values that have been selected at random through the careful utilization of probability distributions or potential costs and/or potential durations. The purpose of utilization of the Monte Carlo analysis is for the sake of calculating a defined distribution scenario of possible total costs associated with the project as well as a range or possible completion dates of the project.
Resource Histogram	Vertical bar chart used to show resource consumption and availability by time period. Also called, resource loading chart.
Resource Leveling	1) Practicing a form of network analysis in which scheduling decisions (start and finish dates) are driven by resource management issues such as limited

Title:

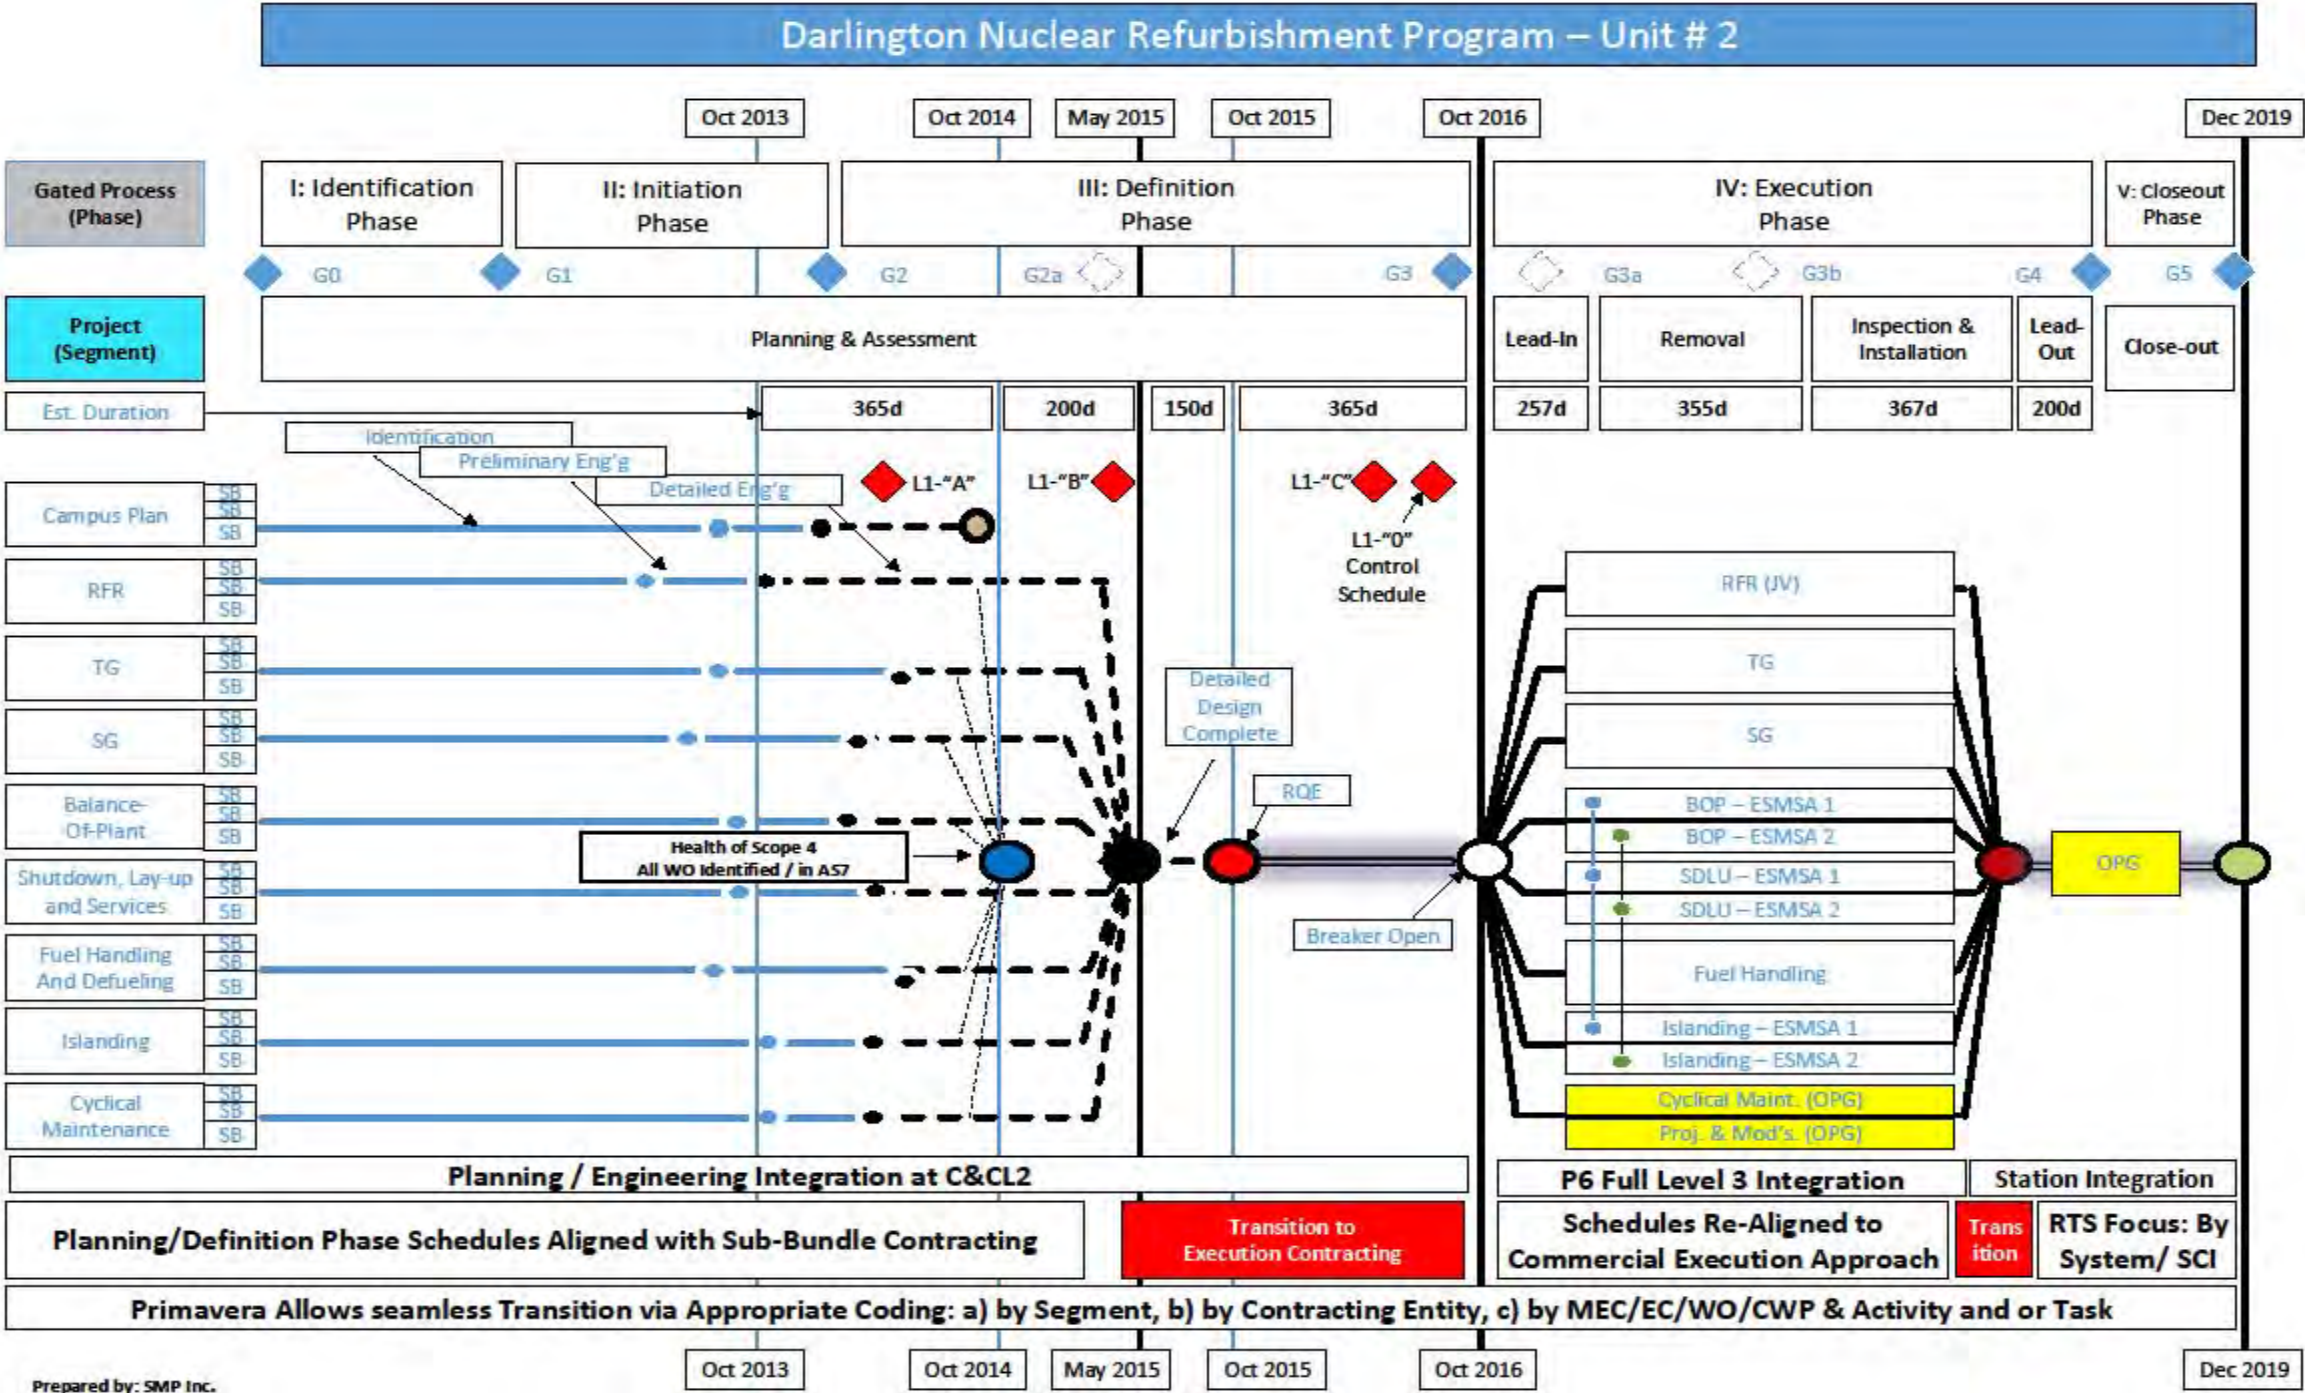

**DARLINGTON REFURBISHMENT: SCHEDULE MANAGEMENT PLAN FOR INTEGRATED LEVEL 3 EXECUTION**

Technique	Definition
	resource availability or changes in resource levels.  2) Evening out the peaks and valleys of resource requirements so that a fixed amount of resources can be used over time.  3) Ensuring that a resource is maximized but not used beyond its limitations.
Variance Analysis	The goal is to determine the causes of a variance (that is to say, the difference between an expected result and an actual result).
Schedule Compression	Shortening of the schedule without reducing the project scope. Often requires an increase in project cost.
Crashing	Taking action to decrease the total project duration by adding resources (human and material) to the project schedule without altering the sequence of activities. The objective is to obtain the maximum duration compression for the least cost.
Fast Tracking	Compressing the project schedule by overlapping activities normally performed in sequence, such as Design and Build/Construction.
Free Float & Total Float (or Slack)	Free float is the amount of time an activity can be delayed without delaying the early start of any immediately succeeding activities. Also called, secondary float. Total float is the amount of time an activity from its early start without delaying the project end date. Derived by subtracting the early start from the late start or the early finish from the late finish and may change as the project progresses and as changes are made to the project plan. Also called slack, float, and path float.
Adjust Leads and Lags	Lead: A modification of a logical relationship that allows an acceleration of the successor activity such as when a task has a finish-to-start dependency with a ten-day lead, the successor activity can start ten days before the predecessor activity has finished. Lag: A modification of a logical relationship that directs a delay in the successor activity such as when a task has a finish-to-start dependency with a ten-day lag, the successor activity cannot start ten days after the predecessor activity has finished. Adjusting leads and lags is used to find ways to bring project activities that are behind into alignment with the plan.

**Title:**           **OPG BUSINESS MODEL**

**Policy Statements:**   The **OPG Business Model** defines how OPG operates its business. It includes the company's mission statement, values and expected behaviours - the elements that are central to OPG's culture.

It sets out how OPG plans its business and sets targets. It identifies the controls that are in place to address the key risks faced by the company. It codifies the company's matrix organization and summarizes the key accountabilities of OPG's operating units and functions.

It also gives direction to the design and scope of the operating unit and function management systems that direct the planning and execution of work within OPG and the achievement of the company's business goals.

**Approval:**    President and CEO

**Date:**        July 21, 2015

Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>3 of 26</b>

Title:  
**OPG BUSINESS MODEL**

### OPG BUSINESS MODEL:

#### Mission:

**To be Ontario's low cost generator.**

We will achieve our mission by reliably and cost-effectively producing electricity from our diversified generating assets, while operating in a safe, transparent and environmentally responsible manner. We will also leverage the skills and experience of OPG staff by pursuing new business opportunities and additional sources of revenue without jeopardizing our core business.

#### Values and Behaviours:

OPG's values are critical to the success of the organization. They guide our behaviour and decision making.

Our key values are ***safety, integrity, excellence and people & citizenship***.

Staff performance is another key to the success of OPG. The company has identified five staff behaviours that will ensure our effectiveness and efficiency.

- **Say It, Do It** - demonstrate personal accountability to deliver results and hold others accountable
- **Simplify It** - create the most straightforward path to execution
- **Think Top and Bottom Line** - look for ways to improve efficiencies, eliminate waste, maximize revenue and make money
- **Integrate and Collaborate** - break down the silos and work together in support of OPG's mission
- **Tell It as It Is** - Demonstrate open and direct communication to everyone with the intention of making things better

These values and expected behaviours are described in the OPG Code of Business Conduct. All OPG employees are expected to understand their obligations under the Code and conduct their day-to-day work in adherence with the Code. The Chief Ethics Officer ensures that the Code is effectively implemented within OPG.

#### Planning the Business:

OPG plans its business through an annual strategic planning process and through an annual business planning process. These two processes are used to set long and short-term business objectives, priorities and targets in the areas of financial performance, operations, business development, project execution, supporting strategic objectives, health and safety and environmental performance.

## Policy

Internal Use Only		
Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>4 of 26</b>

Title:  
**OPG BUSINESS MODEL**

The key inputs into these planning processes are: operational and financial benchmarking data; an environmental scan of strategic developments, including an identification and assessment of new business opportunities and industry dynamics; cost and operating projections; and, generation asset condition and expected investment needs.

The strategic planning process is co-ordinated by the Corporate Office and involves the entire Enterprise Leadership Team (ELT). The process includes the discussion of strategic issues throughout the year and culminates in a strategic retreat with the OPG Board in the early fall. At the retreat, the ELT presents the strategic issues and opportunities facing the company and makes recommendations to the Board. Based on decisions taken at the retreat, a strategic planning context and direction is developed that serves as an underpinning for the OPG Business Plan and related strategic initiatives.

OPG's current strategic objectives are **operational excellence, project excellence and financial sustainability**. As part of its strategic planning process, OPG will use Key Performance Indicators (KPIs) to track its progress in achieving these objectives.

The business planning process is co-ordinated by Finance through the provision of business planning instructions which are issued to the operating units and functions in the spring of the year. Based on these instructions, the operating units and functions prepare three year business plans and longer term, less detailed business projections. The operating unit and function business plans are reviewed by the CEO and CFO, typically in September. Once approved, these business plans are integrated into an overall corporate business plan which is approved by the OPG Board and OPG's Shareholder, normally in December.

The key corporate targets from the approved OPG Business Plan are included in an annual Corporate Balanced Scorecard, which is used to assess the company's overall performance for the coming year.

The approved operating unit and function business plans provide the unit/function's budget and establish their performance objectives/targets for the year. The performance of the operating units and functions is assessed against their approved business plans on an ongoing basis.

Each month, the operating units and functions are required to report on their performance against their approved plan as part of the Key Results process. This process also allows for any needed re-direction by the President and CEO. The Key Results are also presented to the entire OPG senior leadership team to promote alignment on the company's priorities.

Biweekly, the Enterprise Leadership Team (ELT), composed of the President and CEO and certain direct reports, meets to seek input on issues with business-wide impact and to communicate corporate direction.

### Key Business Controls:

OPG has developed an **Integrated Framework** to describe how the company's governance, management systems, risk processes and assurance function interact to guide the operation of OPG. The integrated framework ensures that the company is operated in an effective and

## Policy

Internal Use Only		
Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>5 of 26</b>

Title:  
**OPG BUSINESS MODEL**

efficient manner, and within approved limits and requirements (see Appendix B – Integrated Framework).

OPG's governance begins with Board Policies that authorize the delegation of certain authorities to senior management, address statutory obligations, and give high-level direction to the operation of the company. The Board also approves a Code of Business Conduct that sets out the required standards of conduct for all OPG employees.

OPG maintains an Organization Authority Register (OAR) which sets out the authority delegated to staff for approval of financial transactions.

OPG has adopted a matrix organizational structure with centre-led functions supporting operating units. It has developed **Decision Rights** to indicate where and how key business decisions will be taken under the matrix organization (see Appendix A - Decision Rights).

Each operating unit and function is required to have a **Management System** sufficient to meet its specific accountabilities. The Management System shall be designed to efficiently and effectively achieve the goals and objectives of the particular operating unit and function. It shall reflect the Management System design principles set out below.

OPG has an Enterprise Risk Management Framework for identifying, assessing and managing risks to achieving its operating and strategic objectives and targets. Each operating unit and function leader is required to identify and report through the Business Unit Risk Self Assessment (BURSA) process the key risks and hazards facing their business unit, the mitigation that they have in place, and remediation plans to reduce the impacts should mitigation be ineffective.

Using the results of the BURSA process and an analysis of relevant external events, the Chief Risk Officer, identifies and assesses Enterprise Level Risks which are reviewed on a regular basis with ELT and the OPG Board. The OPG Board also approves a set of Risk Tolerance Metrics which are used to guide business decisions. The operating unit and function leaders are required to manage the risks in their business in accordance with the framework and the Risk Tolerance Metrics.

OPG provides assurance to the Board and Management on the effectiveness of its management systems and the controls over key business and operating risks through **Internal Audits, Nuclear Oversight Audits and Assessments, Management Self-Assessments** and other **Third Party Reviews** (e.g. WANO, INPO, ISO 14001, etc).

The Internal Audit Charter, which guides the work of OPG's Internal Audit function, and the annual internal audit plan are approved by the OPG Board. The annual assurance plan will identify the specific audits and Nuclear Oversight audits and assessments to be conducted in the coming year based on key risk areas, legal and regulatory requirements, and reflect the planned Management Self-Assessments and third party reviews.

**Management Self-Assessment** is a self-checking process designed and maintained by management that is directed to identifying opportunities for improvement in management systems, controls and performance. It can involve benchmarking, peer reviews, and various forms of independent evaluation.

## Policy

Internal Use Only		
Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>6 of 26</b>

Title:  
**OPG BUSINESS MODEL**

Operating units and functions are encouraged to perform management self-assessments to support the achievement of business objectives and facilitate effective risk management, based on the applicable needs of the group, as assessed by the business unit leader.

Operating units and functions are required to respond, as appropriate, to deficiencies and improvement opportunities identified in internal audits, Nuclear Oversight audits and assessments, third-party reviews and their own self-assessments.

### **Organizational Design and Key Accountabilities:**

OPG has adopted a **Centre-led Matrix Organization** design with centre-led **Functions** supporting **Operating Units**.

The centre-led functions are generally accountable for developing and maintaining functional excellence, setting standards, and providing cross-company services.

The **Corporate Office** function is responsible for supporting the CEO and OPG Board in risk management, corporate strategy, developing new business opportunities, and communications and stakeholder relations. Its specific accountabilities include the requirement to:

- Manage the OPG Business Model that all operating units and functions will follow;
- Manage the corporate strategy process and develop the strategic planning context and direction, which includes corporate strategic objectives and priorities, KPIs, supporting initiatives and capital investment guidelines;
- Manage corporate business development activities, including development activities related to new generation opportunities and services, acquisitions and divestitures;
- Manage OPG's risk management framework and provide oversight of enterprise-level risks, credit, market, and commodity exposures, and establish an enterprise wide business continuity program;
- Provide support to the OPG Board and Board Committees through the Board Secretary function, including planning agendas, maintaining the corporate minute book, developing Board and Shareholder instruments required under the OBCA and the Memorandum of Understanding;
- Provide a centre of excellence on corporate governance, including developing and maintaining OPG's governance for joint ventures and wholly owned subsidiaries;
- Manage corporate relations and communications, including relationships with industry stakeholders, local communities, all levels of government, and First Nations and Métis communities. Manage external and employee communications, media, speechwriting, advertising, social media, digital communications, and reputation and issues management.

Title: <b>OPG BUSINESS MODEL</b>
-------------------------------------

The **Finance** function is responsible for determining OPG's financial strategies and providing financial stewardship to help OPG achieve its business and operating objectives. Finance provides strategic support, business partnering support to OPG's business units, and ensures that OPG fulfills its fiduciary responsibilities. Finance's specific accountabilities include the requirement to:

- Provide strategic and business decision support, analysis of opportunities and risks, and effective financial challenge to enable business units to achieve their objectives;
- Manage the business planning and performance reporting processes to proactively identify financial issues, develop robust financial plans and to monitor progress against financial objectives;
- Ensure investment decisions and contracts are supported by sound financial and business analysis;
- Ensure the integrity of OPG's financial reporting and compliance with external reporting obligations, accepted accounting practices, and taxation laws;
- Ensure that adequate controls are in place, commensurate with risk and cost, to manage revenues, costs, cash and expenses and protect assets against loss, theft, destruction, alteration or unauthorized access;
- Provide cost effective treasury services including financing, cash management, and pension and nuclear fund management;
- Provide efficient financial services, including accounts payable and receivable, accounting and transaction processing.

The **Business & Administrative Services** function is responsible for supply chain, IT/CIO, information management and real estate and services. Its specific accountabilities include the requirement to:

- Manage OPG's supply chain to procure goods and services and dispose of surplus material to meet the operating needs of OPG consistent with the OAR, the Code of Business Conduct, approved financial management and control standards, and all applicable legal and regulatory requirements;
- Manage OPG's vendors and vendor relationships including quality management, commercial management and performance management;
- Develop and manage the company's information technology (IT) systems to ensure that they can securely, reliably and cost-effectively meet the company's needs;
- Direct the management of OPG's recorded information over its entire life cycle to ensure that it is complete and accurate and available when required; and, to ensure that it is kept secure and protected against unauthorized use, destruction, modification or loss;

Title:  
**OPG BUSINESS MODEL**

- Acquire, manage, maintain and dispose of real estate to support the company's goals and objectives while meeting the requirements of OPG's policies and procedures and any applicable legal and regulatory requirements.

The **People & Culture** function is responsible for labour relations, health and safety standards, compensation and benefits, training, talent management and succession planning. Its specific accountabilities include the requirement to:

- Manage all labour relations activities to ensure compliance with collective agreements, labour legislation, and to ensure policies for non-represented staff are applied in a manner consistent with the intent of the policies;
- Develop and maintain a health and safety management system that all operating units and functions will follow;
- Develop and manage a compensation and benefits program to achieve the company's business objectives;
- Provide conventional and nuclear training for OPG employees;
- Take steps to attract, develop and retain staff with the talents required to meet the company's needs;
- Co-ordinate succession planning to ensure that critical skills and business knowledge are maintained and to ensure that corporate leadership requirements are met;
- Support the operating units and functions in planning and implementing significant change.

The **Law** function is responsible for providing legal advice and support across the organization to help OPG achieve its business goals and objectives. Its specific accountabilities include the requirement to:

- Provide general counsel services;
- Provide a range of internal legal services;
- Retain, as required, external legal resources.

The **Assurance** function is responsible for providing a systematic disciplined approach to independently assess the effectiveness of OPG's risk management framework, management systems and controls. Its specific accountabilities include the requirement to:

- Develop and execute its internal audit plan;
- Perform nuclear oversight audits and assessments.

**OPG BUSINESS MODEL**

The operating units are accountable for achieving operations and project management excellence, maintaining and expanding their operating assets, and complying with established standards.

The **Nuclear** unit is responsible for the safe, efficient operation of OPG's nuclear plants to achieve the approved business plan targets as well as execution of projects for the OPG Nuclear fleet including the refurbishment of Darlington. Its specific accountabilities include the requirement to:

- Effectively execute operations and maintenance activities at OPG's nuclear stations to achieve the approved business objectives;
- Provide engineering services and support to the nuclear business;
- Provide inspection and maintenance services and decommissioning services for nuclear reactors;
- Provide a range of support services to the nuclear business unit including nuclear regulatory affairs, radiation safety, environmental assessment, and business planning and improvement;
- Manage nuclear waste and used fuel in accordance with all legal and regulatory requirements;
- Effectively develop and manage the low and intermediate deep geologic repository (DGR) project to achieve the company's business objectives;
- Provide oversight of the Nuclear Waste Management Organization (NWMO) as a contractor to OPG in the development of the DGR;
- Implement OPG-wide security strategies, measures and practices to protect employees, contractors and members of the public, and OPG's property and equipment from risks associated with employee wrongdoing, crime, terrorism, sabotage, unauthorized diversion, misuse or other relevant cause of loss or harm;
- Ensure that an effective response can be made, across OPG, to address emergencies affecting the safety or health of employees and contractors, property and equipment, the environment or members of the public.
- Effectively execute the Darlington Refurbishment project to achieve the targets and deliverables set out in the project plan;
- Manage projects and modifications across the nuclear fleet to achieve the timelines and budgets set out in the approved business cases or project plans;
- Manage vendor contracts for the delivery of project related services.

The **Hydro - Thermal Operations** unit is responsible for the safe and reliable operation of the company's hydro and thermal generating stations as well as executing on new generation projects. Its specific accountabilities include the requirement to:

- Effectively execute plant operations and maintenance activities to achieve business unit targets;
- Provide engineering and technical services to support the operation of the hydro-thermal generation fleet;
- Ensure that hydro-thermal projects are executed to achieve the target and business objectives set out in the approved business cases;
- Undertake dam and public safety activities to ensure that the public is protected and that all legal and regulatory requirements are met;
- Provide strategy and business support to the hydro-thermal business unit to ensure that its activities are effectively planned and co-ordinated.

The **Commercial Operations & Environment** unit is responsible for optimizing the market value of OPG's portfolio of assets, developing the corporate generation and revenue plan, commercial contracting, regulatory affairs and the environment. Its specific accountabilities include the requirement to:

- Develop an integrated revenue plan for OPG as part of the annual business planning process, including all market related modeling and analytics, reflecting short and long term generation plans (including fuel requirements), commercial contracting and trading strategies, and short and long term rate strategies;
- Integrate and coordinate the use of OPG's assets into the IESO administered market through all time frames in order to optimize OPG's return, while adhering to all legal, regulatory and station constraints;
- Conduct electricity commodity trading in the Ontario/Interconnected markets to generate revenue including managing and delivering on various service agreements with OPG Energy Trading, Inc. (OPGET);
- Conduct commodity hedging for the generation portfolio;
- Manage positions/trade fuel and emission allowance/reduction credits for the benefit of OPG's assets;
- Negotiate and manage commercial energy contracts such as electricity supply agreements, non nuclear fuel agreements, and legacy interconnected counterparties, environmental attributes, generation, and Bruce Lease agreements;
- Manage the heavy water and isotope sales programs;

Title:  
**OPG BUSINESS MODEL**

- Manage the interface with Hydro One, all economic, reliability, and market regulators and all market operators that OPG deals with, including making all necessary applications and submissions;
- Develop and maintain an environmental management system and manage the interface with government environmental agencies.

### Management System Design Principles:

Each Function will have a management system sufficient to meet its specific accountabilities.

Each Operating Unit will have a management system sufficient to meet its specific accountabilities that will integrate the applicable management system elements developed by the interfacing Function.

Every management system will be based on the principles of Plan - Do - Check - Act and embrace continuous improvement in support of OPG's business and strategic objectives.

Management systems will be designed to:

- Meet the requirements established by OPG's governance, external legal and regulatory requirements and business objectives;
- Reflect OPG Decision Rights (see Appendix A – Decision Rights);
- Support a nimble, scalable organization that drives individual accountability and gets the most out of employee skills and experience;
- Reflect that operating safely is the overriding priority for activities performed at OPG's facilities;
- Foster high levels of performance and reliability and deliver value for money;

Be consistent with OPG's Integrated Framework (see Appendix B – Integrated Framework).

Title:  
**OPG BUSINESS MODEL**

## Appendix B: Integrated Framework

### B.1.0 GOVERNANCE

#### Definition

OPG Governance is defined as Board policies that establish the parameters for management of the company.

Governance in general is driven by legal requirements, regulatory requirements, and/or OPG's strategies and objectives. Our culture and approach to risk and risk management inform how we interpret those requirements and determine the degree to which we establish governance, risk management and management systems, and provide assurance.

#### Accountabilities

The Corporate Office is accountable for establishing and maintaining Board policies.

Operating Units and Functions are accountable for establishing and maintaining implementation of those policies specific to their areas of responsibility.

#### Principles for Governance

##### 1. Integrated governance framework

Governance is part of an integrated OPG framework that includes elements of governance, risk management, management systems and assurance. The framework uses common language and definitions across the company and has clear linkages and interdependencies across all elements. Governance will establish clear policies and requirements and specific requirements for management systems. Management systems will define how those requirements are to be met and business objectives will be achieved; management will hold individuals accountable for following the management systems.

The integrated framework is designed to support the needs of the Board and OPG Leadership by providing clear expectations and guidance that ensure the enterprise is meeting the policies and requirements in an efficient manner and providing assurance that risk is being adequately managed.

##### 2. Necessary, unique and distinctive

Governance should be established judiciously.

Any new governance policies should be unique and distinctive from existing governance and/or regulatory requirements. If existing governance does not adequately address OPG's requirements, the priority should be to revise those policies and requirements over establishing additional governance.

## Policy

Internal Use Only		
Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>20 of 26</b>

Title:  
**OPG BUSINESS MODEL**

### 3. Clear mandate

Board policies must have a direct link to an established board mandate (e.g. strategic planning, risk management, internal controls, succession planning, ethics, etc.), OPG's interpretation of legal and regulatory requirements, legal agreements, or be essential in achieving OPG's strategies and objectives.

### 4. Business rationale

There must be a reasonable business rationale for establishing any new governance, or raising/lowering expectations in existing governance. Requirements established in governance must be cost effective and lead to more profitable and sustainable operations, serve to reasonably ensure legal and regulatory compliance, or mitigate strategic risk to the company.

### 5. Specific accountabilities

Each policy will have a Sponsoring Executive. The sponsoring executive is responsible for developing the business rationale and to ensure the policy is implemented in a reasonable manner. The governing policy will establish clear definitions and accountabilities throughout the organization.

### 6. Documented and Current

All governance policies and requirements shall be documented. Documentation should be kept simple and concise. Board policies will aim to be one page in length. Documentation should include who has accountability for maintaining the governance.

Governance policies and requirements should be reviewed on a periodic basis for relevance and effectiveness, and the frequency of this review should be identified within the governance document. Policies should be reviewed annually. The review will result in a decision to do one of three things. 1. Maintain the governance policy and requirements as is. 2. Modify the governance policy and requirements. 3. Discontinue the governance policy and requirements. The owner of the governance policy and requirements should execute the review process.

## B.2.0 RISK MANAGEMENT

### Definition

Risk Management is forward looking identification, assessment, mitigation and monitoring of risks and is undertaken in an effort to improve the likelihood for positive outcomes. OPG's Enterprise Risk Management Framework defines the principles for identifying, assessing, managing, monitoring, and reporting risks which are integrated into OPG's governance, management systems, and assurance in order to support the achievement of OPG's strategic and business plan objectives. Robust risk assessments and management self assessments are a key principle underlying successful management systems, and are distinct from assurance.

## Policy

Internal Use Only		
Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>21 of 26</b>

Title:  
**OPG BUSINESS MODEL**

### Accountabilities

In collaboration with the OPG Board of Directors and the Enterprise Leadership Team, the Corporate Office is accountable for establishing, maintaining and improving the Enterprise Risk Management Framework including, but not limited to, risk appetite and tolerance. Corporate Office is also accountable for providing independent, middle office oversight and reporting of all OPG market and credit risk exposures.

Risk Management is the responsibility of management and an integral part of OPG's culture and organizational processes, including decision making. Operating Units and Functions are accountable for managing the risks specific to their areas of responsibility.

Although Risk Management and Assurance both assist in the achievement of strategic and business plan objectives, they are separate and distinct activities. Assurance reviews the effectiveness of the risk management framework and activities, as well as the management system in general.

### Principles for Risk Management

#### 1. Integrated governance framework

Risk Management is part of an integrated OPG framework that includes elements of governance, risk management, management systems and assurance. The framework uses common language and definitions across the company and has clear linkages and interdependencies across all elements. Governance will establish clear policies and requirements and specific requirements for management systems. Management systems will define how those requirements are to be met and business objectives will be achieved; management will hold individuals accountable for following the management systems.

The integrated framework is designed to support the needs of the Board and OPG Leadership by providing clear expectations and guidance that ensure the enterprise is meeting the Policies and Requirements in an efficient manner and providing assurance Risk is being adequately managed. Risk Management should assist in making informed choices, prioritizing actions, and distinguishing among alternative courses of action.

#### 2. Alignment with risk appetite and tolerance

Risk Management activities as well as business activities and decisions should be guided by OPG's risk appetite and tolerance. Risk appetite is the amount and type of residual risk that an organization is willing to pursue or retain in pursuit of value or organizational objectives. Risk tolerance defines the acceptable range of negative impacts from residual risks, and can be influenced by legal or regulatory requirements.

## Policy

Internal Use Only		
Document Number: <b>OPG-POL-0033</b>		Revision Number: <b>R004</b>
Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>22 of 26</b>

Title:  
**OPG BUSINESS MODEL**

### 3. Systematic, dynamic and iterative response to change

Risks should be identified, assessed, and managed based on the Enterprise Risk Management framework (processes, criteria, etc.) to ensure consistent, comparable, and reliable results. Risk Management activities should be adaptable, continually sensing and responding to changes. As external and internal events occur, risks should be monitored and changes (i.e. new and emerging risks; increasing or decreasing risk, etc.) should be addressed.

### 4. Frequent communication

There should be constant dialogue with internal and external stakeholders regarding risks, including frequent reporting at various levels of the organization in order to support timely decision making on risk management.

### 5. Specific accountabilities and training

Risk Management accountabilities should be clearly outlined in governance so that each employee is aware of their role in risk management. Supervisors will ensure training and guidance is provided to individuals with risk management accountabilities.

## B.3.0 MANAGEMENT SYSTEMS

### Definition

OPG's management systems define how work gets done in order to meet the requirements established by relevant OPG governance and to achieve business objectives. They are comprised of strategy, structure, processes, procedures, metrics, and people and include all elements of Plan - Do - Check - Act.

### Accountabilities

Operating Units and Functions are accountable for establishing management systems necessary to achieve their accountabilities. The Operating Units and Functions management systems will establish controls that manage the risk within the OPG risk appetite and tolerance, specify how work is accomplished in order to support achievement of the strategic or business objectives, and comply with governance requirements.

Management is accountable for ensuring that all individuals follow the management system.

### Principles for Management Systems

#### 1. Integrated governance framework

Management systems are a part of an integrated OPG framework that includes elements of governance, risk management, management systems, and assurance. The framework uses common language and definitions across the company and has clear linkages and interdependencies across all elements. Governance will establish clear policies and requirements and specific requirements for management systems. Management systems will

## Policy

Title:  
**OPG BUSINESS MODEL**

define how those requirements are to be met and business objectives will be achieved.

The integrated framework is designed to support the needs of the Board and OPG Leadership by providing clear expectations and guidance that ensure the enterprise is meeting the policies and requirements in an efficient manner and providing assurance that risk is being adequately managed.

### 2. Simple and Concise

Management systems should be simple and concise, with clear accountabilities and written in plain language with the user in mind. The management system should focus on the things that are necessary to comply with governance, to effectively run the business, and to achieve business objectives.

The management system will include mandatory requirements when necessary, and otherwise allow flexibility in how requirements are met.

The management system will describe the desired objectives and outcomes. It shall be recognized that outcomes describe not only quantifiable results, but conformance to expected behaviours.

### 3. Incorporate Plan - Do - Check - Act

Management systems should include all elements of Plan - Do - Check - Act (PDCA) and embrace a continuous improvement mindset in support of business and strategic objectives. The PDCA cycle should be the basis for achieving the desired objectives and outcomes and identifying opportunities for improving the approach to achieving the objectives and outcomes.

### 4. Integrated into routine work

All elements should be integrated into routine work and should be consistent with the way the organization functions on a routine basis.

- **Plan**, when appropriate, should be linked and integrated with regular business planning routines, relevant governance, and required risk assessments.
- **Do** should be integrated into accomplishment of routine work.
- **Check** should include self-assessment and management reporting.
- **Act** should correct, reinforce and validate current processes or lead to improvement opportunities.

### 5. Risk-based

The scale and rigour of the management system should be based on the defined level of tolerance of the risk associated with the activity being performed.

Usage Classification: <b>Information</b>	Sheet Number: <b>N/A</b>	Page: <b>24 of 26</b>

Title:  
**OPG BUSINESS MODEL**

### 6. Documented and Current

The management system shall be documented.

Management system performance should be reviewed periodically by the owner of the management system for relevance and effectiveness. The results of the review will be reported to the leaders of the Functions and Operating Units.

### B.4.0 ASSURANCE

#### Assurance Definition

OPG's assurance programs assess governance, management systems and controls to provide reasonable, assurance to the Board and Management that there are governance and management systems in place to plan and control the work of the company and that they are effective in meeting the company's objectives.

Assurance is accomplished through a combination of internal audits, assessments and third party audits that the Chief Audit Executive (CAE) has determined meets the requirements set forth in this policy for audit reliance.

#### Audit Definition

An audit is a process used to independently assess the effectiveness of governance, management systems and controls in achieving OPG business objectives.

Internal audit plans and scope are based on business unit or functions objectives and the assessment of risks to achieving those objectives. Internal audits are those completed by OPG Assurance (i.e. Internal Audit and Nuclear Oversight).

#### Accountabilities

The CAE establishes an Annual Internal Audit Plan for OPG that is approved by the Audit and Finance Committee of the Board of Directors.

The CAE will work with Operating Units and Functions to develop a plan for integration of, or reliance on, third party audits (e.g. external ISO certifications) and on management monitoring and self-assessment processes, based on accepted practice, and integrate those approved third party audits into the audit plan.

The Operating Units or Functions may schedule third party audits. For reliance purposes, the scheduling of third party audits and self-assessment processes must be coordinated with the CAE and the CAE establishes that the third party audit meets the reliance criteria.

Title:  
**OPG BUSINESS MODEL**

## Principles for Assurance

### 1. Integrated governance framework

Assurance is part of an integrated OPG framework that includes elements of governance, risk management, management systems, and assurance. The framework uses common language and definitions across the company and has clear linkages and interdependencies across all elements. Governance will establish clear policies and requirements and specific requirements for management systems. Management systems will define how those requirements are to be met and business objectives will be achieved; management will hold individuals accountable for following the management systems.

The integrated framework is designed to support the needs of the Board and OPG Leadership by providing clear expectations and guidance that ensure the enterprise is meeting the Policies and Requirements in an efficient manner and providing assurance that risk is being adequately managed.

### 2. Objective, impartial, and independent

Audits must be objective, impartial, and independent, and the audit process must be both systematic and documented.

### 3. Emphasis on Higher Risk/Consequences

Internal audits are risk-based and generally concentrate on areas with higher risk exposure.

### 4. Appropriate Audit Integration and Reliance

OPG Assurance will integrate third party audits into the audit plan as appropriate.

OPG Assurance may rely appropriately on third party audits and management self-assessment processes that meet the following criteria: 1) Independence, 2) Technical competence and due professional care, 3) Relevance of audit objectives and scope, 4) Elements of practice, and 5) Communication of results and remediation.

The level of independence of a third party auditor is determined by a number of factors including: 1) The contractual terms, and 2) The relationship to the audited entity. The level of independence of an internal self-assessment process is determined by the nature of the relationship between the assessor and audited entity and process owner.

When the CAE establishes that the reliance criteria are met, OPG Assurance may place appropriate reliance on other assurance activities in developing its assessment of the particular Operating Unit or Function. The audit results, including those that meet reliance criteria, are reported in an integrated manner to Management, the Audit and Finance Committee of the Board and to other committees of the Board of Directors as appropriate.

### 5. Greater Reliance on Management Systems and Individual Accountability

OPG will focus less on “after the fact” auditing and place an increased emphasis on individual

## Policy

**OPG BUSINESS MODEL**

accountability and robust management systems. Management's ongoing monitoring and self-assessment of management systems, where implemented, will enable this. OPG Assurance may place appropriate reliance on robust management self-assessment processes where they meet the reliance criteria explained above, resulting in an effective balance of internal review and independent assurance activity.

## PURPOSE

This standard provides the criteria and expected behaviours for the oversight of supplemental personnel executing work within Ontario Power Generation – Nuclear (OPG-N). Oversight of supplemental personnel is an important and critical consideration to ensure project deliverables and objectives are achieved safely and with a high level of quality.

This standard receives its authority from N-PROG-AS-0007, Project Management.

Title:
<b>OVERSIGHT OF SUPPLEMENTAL PERSONNEL</b>

### 1.0 DIRECTION

This standard provides the oversight principles and requirements to be applied to work packages initiated and/or executed within OPG by supplemental personnel. Oversight is the independent assessment necessary to ensure a common understanding of the attributes, principles, and performance standards for performing work successfully and effectively. Additionally it includes the appropriate due diligence required to ensure all contractual obligations are met. This standard is intended to provide guiding principles for the determination of Supplemental Personnel Oversight within the wide range of categories for these personnel.

Two general classifications of workers are considered:

- A. Workers that are integrated into the station workforce with supervisory and management requirements left to OPG staff.
- B. Transient workers involved with managed task work where the contractor assumes the accountability for the management and supervision of workers.

Oversight is applicable but not limited to:

- Safety
- Quality
- Cost and schedule performance
- Solution effectiveness
- Risk management
- Value for money
- Regulatory and environmental compliance
- Human performance
- Planning
- Engineering
- Procurement suppliers and contractors
- Installation and construction activities

Oversight is based on a proactive and graded, risk based approach. The means by which the different executing organizations implement this standard may vary based on business requirements.

### 1.1 PRINCIPLES

The guiding principles for attaining high levels of performance will be adapted to the classification of the personnel utilized, and shall include the following;

1. OPG line management retains the responsibility for ensuring nuclear safety and cannot delegate this responsibility to supplemental personnel.
2. The performance standards and expectations for the conduct of work activities by supplemental personnel are the same as those high performance standards expected of OPG staff.

## Nuclear Standard

Title:

### OVERSIGHT OF SUPPLEMENTAL PERSONNEL

3. Supplemental personnel, when directly supervised by OPG, understand and use the same OPG processes for performing work activities. Supplemental workers performing managed task activities may utilize their own processes only after qualification and acceptance by OPG.
4. Supplemental personnel who perform work independently (under their own supervision) are qualified to criteria commensurate with OPG standards.
5. Good industrial safety performance of supplemental personnel cannot be assumed.
6. The roles and responsibilities of the supervisor (OPG or a supplemental supervisor) are clearly defined and vigorously implemented for supervising supplemental personnel.
7. A close, interdependent relationship between supplemental and OPG personnel is established that generates a spirit of cooperation.

## 1.2 Key Supplemental Personnel Process Objectives

Excellent performance of supplemental personnel is achieved through the following underlying process objectives and key attributes: Refer to N-INS-00120-10026, Supplemental Personnel Oversight, Appendix B for the process flow diagram.

- (a) Standards and expectations are thoroughly communicated and understood by supplemental personnel.
- (b) OPG (service organizations and station line managers) clearly identify and reinforce accountabilities for supplemental personnel performance.
- (c) Supplemental personnel understand roles and responsibilities specific to the tasks they are performing.
- (d) Supplemental personnel understand the significance of the work they are performing to nuclear safety and station reliability. The technical competencies of supplemental personnel who perform work for OPG are verified and are appropriate for the tasks.
- (e) Supplemental personnel know, understand, and demonstrate use of event free tools and that they are expected to stop and ask questions when unsure.
- (f) The responsibility in OPG for the monitoring and oversight of supplemental personnel is identified clearly and is performed effectively.
- (g) Supplemental personnel exhibit proper industrial safety and human performance behaviours.
- (h) An effective means of feedback exists that promotes continual improvement in supplemental personnel performance.

Title:

### OVERSIGHT OF SUPPLEMENTAL PERSONNEL

- (i) The amount and frequency of oversight shall be applied strategically using a graded approach based on complexity, risks, and performance. The level of oversight shall be modified to reflect the current performance and changes in the risk profile. Examples where increased levels of oversight may be required include:
- Areas that include new processes or technology activities of high consequence to safety, quality, cost or schedule
  - Critical evolutions or changes
  - Where suppliers are new or have performed less than expected on previous work activities
  - Fabrication by sub-contractors
  - Where nuclear safety or operation may be impacted
  - Work activities where there is evidence of negative trends, e.g. safety, quality, cost, or schedule, performance
  - Where industry OPEX indicates there is a higher level of risk

## 1.3 OVERSIGHT OF SUPPLEMENTAL PERSONNEL

1.3.1 The same rigor as used within OPG is applied to oversight of all supplemental personnel including:

- Contractors who perform work on site
- Contractors who perform work off site such as engineering modifications, analysis, component fabrication, equipment refurbishment, and testing
- Utility personnel from an industry alliance who perform work on site such as a shared resource during outages
- Utility personnel who may work part time such as switchyard personnel or roving teams

1.3.2 Oversight shall be proactive to support early detection of potential issues and to ensure effective and timely implementation of corrective actions. Refer to N-INS-00120-10026 Supplemental Personnel Oversight for the process details. Methods of proactive oversight include but are not limited to:

- Establishing and communicating expectations and targets
- Conducting regular status meetings
- Look ahead planning and strategy execution

<b>OVERSIGHT OF SUPPLEMENTAL PERSONNEL</b>

- Conducting challenge and preparedness meetings
- Performing direct observation, surveillance and assessments
- Utilizing trend analysis and performance metrics
- Tracking and timely resolution to issues
- Prompt escalation of issues not resolved

## 2.0 ROLES AND ACCOUNTABILITIES

### 2.1 Contract Owner

- Provides oversight of the contract from initiation to closeout
- Ensures proper resources are available to manage and monitor the contractor for quality and efficiency
- Ensures all procedural and work practices are followed and achieved by supplemental personnel
- Ensures Performance (cost, schedule, safety, etc) goals are met

### 2.2 Contract Management Team

Administers and monitors the supplemental personnel to:

- Ensure on a daily basis that all regulatory requirements are met during the execution of the work
- Exercise the delegated authority to stop all work for unsafe acts or potential environmental hazards
- Establish an interdependent relationship between supplemental and station personnel that is based on a spirit of cooperation
- Ensure on a daily basis the contractor's workplace activities are carried out in a safe and productive basis.

## 3.0 TRAINING AND QUALIFICATION

- 3.1 Staff providing oversight for supplemental personnel shall be qualified in accordance with Training Qualification Document (TQD) N-TQD-510-00001, Supplemental BTU Direct Hire and Contract Management Training and Qualification Description.

### 4.0 DEFINITIONS AND ACRONYMS

#### 4.1 Definitions

Supplemental personnel – Are persons who conduct work or provide services on or off site to OPG-N who are not full-time OPG-N site personnel. These include any of the following:

- contractor personnel who perform work on site
- contractor personnel who perform off-site work, such as engineering modifications, component fabrication, equipment refurbishment, and equipment testing
- personnel from another location within OPG or from an industry alliance who perform work on site, such as shared resources during outages
- personnel from within OPG who may only work part time at the station, such as switchyard personnel, diving and other water services, environmental services, and roving valve teams
- personnel from another location who perform work off site, such as corporate engineering support

Title:
<b>PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS</b>

### 1.0 DIRECTION

Governing documents include Policies, Charters, Programs, Procedures, and Standards. Forms, Instructions (INS), Lists, Manuals, Qualification Guides (QG), Templates, and Training and Qualification Descriptions (TQD) may also be deemed governance documents by the Document Owner. A governing document stipulates philosophy, mandatory rules, regulations, licensing requirements, and management controls, in order to implement business processes.

Criteria for choosing the correct document type and format are provided in OPG-STD-0001, Requirements for Administrative Governance Documents.

Computer Assisted Learning (CAL) 76186, Governance, is suggested for all employees that are new to the Governance process or require refresher training.

Refer to OPG-INS-08133-0001, Submission, Approval, and Issuance of Documents Using Smart Form, for instructions on performing the actions relating to Smart Form throughout this document.

Document Owners and delegates should be identified in accordance with the [Governance Ownership](#) database on the Governance website.

For TQDs, QGs and Training INSSs, refer to N-PROC-TR-0021, Training and Qualification Description, Development and Approval Process, for additional requirements on the routing of OPG-FORM-0001, Governance Management Record (GMR).

### 1.1 Initiation

#### 1.1.1 Submitter or Author should perform **one** of the following:

- (a) If a **new** governing document, or **revision** to an existing governing document, is required, complete Section A of OPG-FORM-0001, and forward to the Document Owner (or delegate).

**Note:** To confirm there is no existing governance that may already address the need, it is good practice to execute a search (using PowerSearch tool).

- (b) If a **review date** for an existing governing document is approaching, but revision may not be required as the document is still accurate, complete OPG-FORM-0051, Governance Document Review Checklist, by proceeding to Section 1.11.
- (c) If a **change** is required to an existing governing document, but does not necessitate an immediate revision, create and progress a Document Change Request (DCR) in Asset Suite in accordance with OPG-INS-00700-0001, Document Change Request Data Administration.
- (d) If **reducing governance** by superseding, obsoleting or changing the classification to a non-governance controlled document, refer to Section 1.10.

## Ontario Power Generation Procedure

Internal Use Only		
Document Number:	OPG-PROC-0001	Revision:
Usage Classification:	Information	Page:
Sheet Number:	N/A	5 of 25

### Title: PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

- 1.1.2 Document Owner (or delegate) should review the GMR and perform the following:
- (a) If in agreement with the proposed change, perform **one** of the following, as applicable:
    - (1) **New** document:
      - (i) When using Smart Form application, reserve new governing document number.
      - (ii) When not using Smart Form application, forward approval with OPG-FORM-0001 to the OPG Governance mailbox to have a new governing document number reserved.
    - (2) **Revision** to existing document required:
      - (i) When using Smart Form application, check out and retrieve or receive the editable electronic copy.
      - (ii) When not using Smart Form application, forward approval with OPG-FORM-0001 to the OPG Governance mailbox to check out and request the editable electronic copy.
  - (b) If not in agreement, reject the GMR, inform Submitter or Author, and/or cancel DCR if created.

## 1.2 Development

1.2.1 Submitter or Author should perform the following:

- (a) Prepare draft document, using latest revision of applicable template, as follows:

- OPG-TMP-0001, OPG Governance Document
- OPG-TMP-0004, Form - Portrait, Landscape & Tag
- N-TMP-10017, Approved Roles.

**Note:** Re-templating to the most recent revision of the template is mandatory for **intent** revisions. Minor revisions and non-intent revisions do **not** require re-templating.

- (b) For a new centre-led Program document owned by a centre-led organization that supports N-CHAR-AS-0002, Nuclear Management System, complete N-FORM-11604, Nuclear Quality Program Checklist.
- (c) If applicable, verify bases (licensing, legal, regulatory, and quality assurance) requirements are identified and satisfied.
- (d) Review any existing related documentation including DCRs, minor revisions, Station Condition Records, operating experience, and benchmarking activities assigned to Document Owner for inclusion in draft. Refer to OPG-INS-00700-0001 for further direction relating to DCRs.

Title:  
**PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS**

- (e) Determine whether the document supports the implementation of the Nuclear Pressure Boundary Certificate of Authorizations by referring to N-LIST-01913.11-10001, Nuclear Pressure Boundary Governing Documents, and return to this procedure.

If the document is related to Pressure Boundary:

- (1) Select the “Document is related to Pressure Boundary” checkbox on OPG-FORM-0001, OPG-TMP-0001, and in Smart Form application if used.
  - (2) Include OPGN - CDS & ST -NUCLEAR as a mandatory reviewer of the document for all changes.
- (f) Determine whether the document requires Canadian Nuclear Safety Commission (CNSC) notification, approval, or requires an amendment to a licence by referring to N-LIST-00531-10002, OPG Documents Referenced in Licence Conditions Handbook.

If the document requires CNSC notification or approval, identify on OPG-FORM-0001, OPG-TMP-0001, and in Smart Form application if used.

**Note:** Document changes requiring **CNSC Approval** (as identified in N-LIST-00531-10002) that involve an adverse impact on any facility’s licensing basis, or require a licence amendment should be discussed with Manager, Nuclear Regulatory Affairs .

- (g) Ensure document complies with the requirements of OPG-STD-0074, Accessibility for Ontarians with Disabilities Act Integrated Accessibility and Customer Service Standard.
- (h) Ensure document association to parent document is valid and approved by Document Owner. The parent document is required to direct use of child.
- (i) Ensure consistency with role documents (N-MAN-08131-10000 series). If role document requires a revision, refer to OPG-PROC-0166, Organization Design Change, for direction.
- (j) Ensure decision rights are followed in accordance with OPG-POL-0033, OPG Business Model.
- (k) Assess impact of document revision to the following:
  - N-LIST-08130-10023, CSA N286-05 to OPGN Governance Cross Matrix
  - N-LIST-08130-10025, CSA N286-12 to OPGN Governance Cross Matrix

Contact the Document Owner of the applicable N-LIST, if applicable.

- (l) Ensure document header is updated to current revision number and appropriate watermark is applied to the document.
- (m) For Minor Revisions, ensure “Compliance” field on the first page of document is updated to “Immediate”.

## Ontario Power Generation Procedure

Internal Use Only		
Document Number:	OPG-PROC-0001	Revision: R010

### Title: PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

- 1.2.2 Submitter or Author may apply structure and minimum content requirements established in OPG-GUID-08130-0001, Writing Guide for Administrative Governance Documents.

**Note:** Appropriate Information Management Services mailbox may be contacted for forms due to their specialized formatting features.

## 1.3 Implementation and Communication Planning

Identifying a compliance date is mandatory for all types of revisions. Communication Plan information is mandatory for new, intent revisions, and reducing governance only.

- 1.3.1 Submitter or Author should complete Section C of OPG-FORM-0001 including:
- Compliance Date** is by which applicable Business Units or Facilities should be complaint. Date(s) should align with compliance date(s) on document. Input as Immediate or YYYY-MM-DD.
  - Communication Plan** including:
    - What** is changing or needs to be communicated?  
(e.g., process requirements, accountabilities, training, organization, etc.)
    - Who** are the change stakeholders that need to be informed?  
Include Roles and Accountabilities impacted by the change.
    - How** are stakeholders to be informed?  
(e.g., e-mail, classroom training sessions, roll-outs, stand downs)
    - When** are stakeholders to be informed or activities to be completed?  
(e.g., 30 days after issue, etc)
    - Who** is the Responsible Manager to ensure completion of each line action below?  
Prepare Action Tracking request and assignments as required.

## 1.4 Review

- 1.4.1 The level and extent of review should depend on the scope or complexity of the change or its potential impact on safety as determined by Document Owner. Document Owner shall indicate reviewers that may be significantly impacted by the change. Reviewers shall be listed in Section D of OPG-FORM-0001. (Suggest 10 business days for review period).

**Note:** Board approved Policies shall be sent to OPG Governance for review.

- 1.4.2 Sending document(s) for review is mandatory for new documents, intent revisions and reducing governance only.
- Mandatory reviewers shall include:
    - OPG GOVERNANCE
    - RIMGOVREVIEWS

## Ontario Power Generation Procedure

Title:  
**PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS**

- OPGN CDS & ST (for documents on N-LIST-01913.11-10001, all new documents supporting N-CHAR-AS-0002, all new Programs where N-FORM-11604 has been completed, and for revisions if applicable)

(b) Additional reviewers should include:

- Document Owner or SPOC of the authorizing document.
- At least one stakeholder for each affected facility or organization.
- Interfacing Program Owners or LOB SPOCs where there are Bases applicable to that organization.
- Impacted positions identified in Roles & Accountabilities section.
- Key stakeholders based on Recommend, Agree, Perform, Input, Decide (RAPID) Model (OPG-POL-0033).
- If document is related to Training, include Manager, Training, Planning and Design.
- Peer Team members.

1.4.3 Submitter or Author should forward draft document and OPG-FORM-0001 (refer to Appendix A, Review Process E-mail Samples), for review as follows:

**Note:** Alternate methods for obtaining stakeholder review comments may be conducted (e.g., face-to-face, e-mail, SharePoint Document Workspace [refer to OPG-INS-08180-0004, Technical Review from a SharePoint Document Workspace]).

- (a) Include reviewers identified in Section D of OPG-FORM-0001.
- (b) Recommend that reviews be returned within 10 business days.
- (c) For revisions to TQD, QG, and Training INS documents, refer to N-PROC-TR-0021 for additional requirements pertaining to review and communication planning.

1.4.4 Each reviewer identified in Section D of OPG-FORM-0001 should:

- (a) Review content of document appropriate to area of expertise, for example:
  - Business impact
  - Compliance to regulatory and licensing requirements and commitments
  - Technical content
  - Format
  - Records.

Title:
<b>PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS</b>

- (b) Review communication plan outlined in Section C of OPG-FORM-0001 to assess business impact and adequacy of planned communication or change management activities.

### 1.5 Comment Disposition

This section is mandatory for new, intent revisions, and reducing governance only.

#### 1.5.1 Submitter or Author should perform the following:

- (a) Disposition reviewer comments, ensuring significant comments are discussed with reviewer.
- (b) If required, arrange for Document Owner or delegate to resolve stalemate comments.
- (c) Record disposition of reviewer comments in Section D of OPG-FORM-0001. Do not use “no comment” as it could be misinterpreted. Instead, use wording such as “comments incorporated”, “no comments received”, “reviewed and no comments”, “comments received and rejected with explanation”.
- (d) File significant comments in an Approved Information Management System (AIMS) as a record, e.g., Asset Suite, or include as Additional Files if using Smart Form application.

### 1.6 Validation

For new (R000) documents and intent revisions with extensive changes, Submitter or Author should perform the following:

- (a) Assign a Validator who is familiar with process but not Authorization Authority, SPOC, Reviewer or Author, to ascertain whether steps may be performed as written and:
  - Are technically correct
  - Are specific and not ambiguous
  - Accomplish their objective
  - Are in logical order.

**Note:** Validation may be performed in a flexible way as deemed by Document Owner or delegate (e.g., walkthrough, comparison, table top).
- (b) Confirm the requirement described in N-LIST-08130-10023 or N-LIST-08130-10025 continues to be met. File a DCR on N-LIST-08130-10023 or N-LIST-08130-10025 if required.
- (c) Once comments are received from Validator, complete Section E of OPG-FORM-0001.

### Title: PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

## 1.7 Approval

### 1.7.1 Submitter or Author should perform the following:

- (a) Finalize OPG-FORM-0001, Sections A through F as applicable.
- (b) If applicable, finalize and have approved N-FORM-11604 filed in AIMS or include as Additional Files if using Smart Form application.
- (c) Prepare approval package (e.g., native file, Portable Document Format [PDF], and associated OPG-FORM-0001). Ensure completeness, accuracy, and acceptability for use as follows:
  - (1) For intent or non-intent revisions of documents, ensure document is in final format (i.e., no watermark, and in PDF or some other acceptable non-editable format).
  - (2) For minor revision, ensure document is watermarked with 'CHANGE' and tracked changes are visible.

**Note:** If the extent of the changes cause the document to become illegible revision bars may be used in place of Track Changes.

- (3) Disposition outstanding DCRs ensuring status is either at Approved, Modified, or Active status for incorporation. Refer to OPG-INS-00700-0001.
- (d) If document is listed in N-LIST-00531-10002 and requires **Prior Written Notification** or **Written Notification**, prepare CNSC notification in accordance with the sample e-mail in Appendix B, Sample E-Mail for Documents Requiring Prior Written Notification / Written Notification to the CNSC.

**Note:** Document changes requiring **CNSC Approval** (as identified in N-LIST-00531-10002) that involve an adverse impact on any facility's licensing basis, or require a licence amendment should be discussed with Manager, Nuclear Regulatory Affairs.

- (e) For revisions to TQDs, QGs, and Training INS documents, refer to N-PROC-TR-0021 for additional requirements pertaining to the approval stage.

### 1.7.2 Once approval package and applicable inclusions are finalized, Submitter or Author should perform **one** of the following:

- (a) When using Smart Form application, upload approval package with applicable inclusions, and release for approval.

**Note:** For forms, ensure that the "Filling in Forms" and password protected copy is loaded to the Electronic Document Management System (EDMS) link and an unprotected copy is loaded to the Native Files link on the Asset Suite Upload screen. This will ensure that future revisions will be editable.

Title:

### PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

- (b) When **not** using the Smart Form application, prepare and forward routing e-mail including approval package with applicable inclusions for electronic approval and authorization of the document. Refer to Appendix C, Sample E-Mails for Authorization of Documents.

#### 1.7.3 Document Owner (or delegate) shall perform the following:

- (a) Review approval package for completeness, accuracy, and acceptability for use.
- (b) For documents listed in N-LIST-00531-10002 requiring **Prior Written Notification** or **Written Notification**, review CNSC notification e-mail in accordance with the sample e-mail in Appendix B.
- (c) For documents requiring **Prior Written Notification** or **Written Notification to the CNSC**, proceed to Subsection 1.7.5.

If required, confirm there is no adverse impact on a nuclear facility's licence basis, or that appropriate CNSC approvals are being obtained in accordance with N-PROC-RA-0047, Communications with the Canadian Nuclear Safety Commission

- (d) For Programs, proceed to Subsection 1.7.4.
- (e) For all other documents, proceed to Subsection 1.7.6.

#### 1.7.4 Authorization Authority (for Programs) shall perform the following:

- (a) Review approval package for completeness, accuracy, and acceptability for use.
- (b) For documents listed in N-LIST-00531-10002 requiring **Prior Written Notification** or **Written Notification**
  - (1) Review CNSC notification e-mail in accordance with the sample e-mail in Appendix B.
  - (2) Forward approval package to Manager, Nuclear Regulatory Affairs or submit using Smart Form application.
- (c) If not listed in N-LIST-00531-10002, proceed to Subsection 1.7.6.

#### 1.7.5 Manager, Nuclear Regulatory Affairs shall perform one of the following:

- (a) Submit document for CNSC notification or ensure any required requests for approval or licence amendment are submitted as required.
- (b) Indicate CNSC notification or approval is complete by attaching supporting documentation to approval package and forwarding approval package back to Document Owner or Authorization Authority by e-mail or forward using Smart Form application.

### PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

1.7.6 Document Owner (or delegate) or Authorization Authority should perform one of the following:

- (a) When using Smart Form application, approve and release.
- (b) When not using Smart Form application, indicate **approval** in e-mail (i.e., using the word “approved” or “authorized”) and forward approval package to OPG Governance mailbox for issuance.

## 1.8 Issuance

1.8.1 Governance staff should complete the following:

- (a) Perform final quality check.
- (b) Ensure document is linked to the Governance Framework and to Governance Ownership list.
- (c) Perform any actions noted in Section F of OPG-FORM-0001.
- (d) Initiate applicable distribution.
- (e) If applicable, Governance staff shall update Governance Ownership list with changes to Document Owner or SPOC to align with issued document.

## 1.9 Communication Plan Execution

When notified that document has been issued, Responsible Manager or delegate shall perform the following:

- (a) Execute the communication activities as documented in Section C of OPG-FORM-0001.
- (b) Advise OPG Governance mailbox when communication activities have been completed.

## 1.10 Reducing Governance

Reducing governance refers to superseding, obsoleting, or changing the classification to a non-governance controlled document.

Where documents identify the following as Bases, ensure that any alteration or removal of Bases components of the documents is considered prior to removal:

- CSA N286-05, Management System Requirements for Nuclear Power Plants, or
- CSA N286-12, Management System Requirements for Nuclear Facilities, or
- N-LIST-01913.11-10001

1.10.1 Submitter or Author should complete OPG-FORM-0001 and forward to Document Owner (or delegate).

### PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

- 1.10.2 Document Owner or delegate should review request and perform the following:
- (a) If **not in agreement** with the request, reject request and return OPG-FORM-0001 to Submitter or Author.
  - (b) If **in agreement** with the request, assign an Author to perform the following:
    - (1) Execute a search using PowerSearch to identify any governance documents impacted by the removal. File DCRs as appropriate in accordance with OPG-INS-00700-0001.
    - (2) Forward OPG-FORM-0001 to reviewers, as noted in Section D, to assess the impact of document removal on their processes or organization.
      - (i) Refer to Appendix A.1.0 or A.2.0 for samples of review e-mails.
      - (ii) If document is to be superseded by a document from a different program area, include mandatory reviewers from both program areas.
      - (iii) Record disposition of reviewer comments in Section D of OPG-FORM-0001.
    - (3) Disposition any pending DCRs against document being superseded or obsoleted in accordance with OPG-INS-00700-0001.
    - (4) If document is listed in N-LIST-00531-10002, prepare CNSC e-mails in accordance with Subsection 1.7.1(d).
- 1.10.3 Document Owner or delegate or Authorization Authority (for Programs) shall forward approval package by e-mail or submit using Smart Form application in accordance with Subsection 1.7.3 or Subsection 1.7.4.
- 1.10.4 If required, Manager, Nuclear Regulatory Affairs shall perform steps identified in Subsection 1.7.5.
- 1.10.5 Document Owner or delegate or Authorization Authority should perform one of the following:
- (a) When using Smart Form application, approve and release.
  - (b) When not using Smart Form application:
    - (1) Indicate **approval** in e-mail (i.e., using the word “approved” or “authorized”) and forward approval package to OPG Governance mailbox for issuance.
 

**Note:** If Smart Form application has **not** been used, assigned Document Custodian shall perform any actions noted in Section F of OPG-FORM-0001.
    - (2) Notify Submitter or Author and OPG Governance mailbox.

### PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

- 1.10.6 Governance staff should remove superseded documents, obsoleted documents, or documents removed from governance from the Governance Ownership list and the Governance Framework.

#### 1.11 Monitoring Governance Document Review Cycles

When the end of a document review cycle is approaching, OPG-FORM-0051, Governance Document Review Checklist, should be used to determine if the document is accurate or should be revised. A completed OPG-FORM-0051 is required as evidence that the document has been reviewed, deemed to be accurate, and that revision is not required as follows:

- 1.11.1 Document Owner should monitor quality and effectiveness of program requirements to ensure each governance document is reviewed and, if necessary, revised and issued within the established review cycle.
- 1.11.2 Document Owner or delegate should complete OPG-FORM-0051 for each governance document, within the established review cycle, to determine if document is accurate or if revision is required as follows:
- (a) If revision is required, discard OPG-FORM-0051 and revise document in accordance with Subsection 1.1.
  - (b) If revision is **not** required, submit OPG-FORM-0051 to OPG Governance mailbox for approval.
    - (1) When using Smart Form application, upload OPG-FORM-0051 and release for approval.
    - (2) When not using Smart Form application, submit OPG-FORM-0051 to OPG Governance mailbox for approval.
  - (c) OPG Governance should update Last Reviewed Date in Asset Suite.
- 1.11.3 Document Owner (or delegate) should request changes in review cycle as follows:

**Note:** The default review cycle is 2 years for a governance document but shall not exceed 5 years. Policies are typically 1 year while some Forms may be up to 5 years.

- (a) Complete OPG-FORM-0001, Sections A and F.
- (b) Forward completed OPG-FORM-0001 with Document Owner approval to OPG Governance mailbox for updating in AIMS.

- 1.11.4 To update the Governance Ownership list when a revision is not being performed, the Document Owner, SPOC, or delegate should forward approval to OPG Governance mailbox with requested change.

**Note:** For Document Ownership changes, obtain approval from both the **new** Document Owner and the **previous** Document Owner (where applicable).

### Title: PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

## 2.0 ROLES AND ACCOUNTABILITIES

### 2.1 Authorization Authority

#### 2.1.1 Approves Programs, as follows:

- (a) For Nuclear documents, this role is delegated by the Nuclear President & Chief Nuclear Officer (CNO) to Senior OPG Executives who are accountable to ensure integrity of N-CHAR-AS-0002 is maintained. Refer to N-PROG-AS-0001, Managed Systems.
- (b) For all other LOBs, Programs are approved by Vice-President or higher.

### 2.2 Manager, Nuclear Regulatory Affairs

2.2.1 Communicates licensing requirements to applicable Document Owners.

2.2.2 Communicates changes to applicable governance documents to CNSC.

### 2.3 Document Owner (or Delegate)

Document Owner is the position-holder who has the accountability for content, accuracy, and execution of a governance document. Typically the Document Owner is the Business Unit Leader (e.g., Manager or higher, could be Program Owner). Role may be delegated.

2.3.1 Ensures governance documentation is acceptable for use.

2.3.2 Maintains quality and effectiveness of governing document requirements.

2.3.3 Ensures external requirements such as licensing, regulatory, and legal and internal commitments (e.g., quality assurance, records) are included within business unit governance.

2.3.4 Ensures applicable Corporate policies are met.

2.3.5 Resolves significant comments and compliance statements with the best interests of the Corporation in mind.

### 2.4 Senior Manager, Information Management Program Authority

Ensures Nuclear Management System activities performed under OPG-PROC-0001 and OPG-STD-0001 are in compliance with N-PROG-AS-0001.

### 2.5 Single Point of Contact

2.5.1 Ensures governing document content is complete and accurate, and external requirements and internal commitments are satisfied.

2.5.2 Provides clarification of document content for user community.

## 5.0 REVISION SUMMARY

This is an **intent** revision.

- Extensive rewrite for clarification of Governance processes.
- References and titles updated throughout.
- Replaced “Initiator” and “Assigned Author” with “Submitter or Author” throughout to align with Smart Form.
- Replaced Director, Nuclear Regulatory Affairs and Stakeholder Relations, with Manager, Nuclear Regulatory Affairs throughout per request from Nuclear Regulatory Affairs.
- Removed requirement for OPG Governance to review requests to reserve or check-out governance documents (previously Section 1.1.4) (DCR 134551).
- Removed requirement for Document Owner, SPOC or delegate to request change to Governance Ownership list (previously Section 1.9.4) (DCR 133370)
- Section 1.1.1: Clarified process for review cycle changes (DCR 131609)

### PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

- Section 1.2.1 (i): Replaced reference to N-PROC-AS-0068 with OPG-PROC-0166 (DCR 132062)
- Section 1.7.2 (a): Added clarification for protecting forms when using Smart Form application (DCR 132840)
- Section 1.9 (b): Added requirement for Responsible Manager (or delegate) to advise OPG Governance mailbox when communication activities have been completed (per action from Internal Control Over Financial Reporting (ICOFR) audit, November 2015) (DCR 133356)
- Section 1.2.1 (a): Removed outdated link to Information Management website (DCR 133725)
- Section 3.1: Replaced list of definitions with link to Records Management Lexicon.
- Section 4.3.2: Replaced reference to N-PROC-AS-0003 with OPG-PROC-0178 (DCR 133045).
- Appendix B: Consolidated CNSC notification sample emails in Sections A.5.0 and A.6.0 per request from Nuclear Regulatory Affairs.

### PROCESS ADMINISTRATIVE GOVERNANCE DOCUMENTS

#### Appendix B Sample E-Mail for Documents Requiring Prior Written Notification / Written Notification to the CNSC

OPG Proprietary

**[Insert pdf of document from approval]**

CD # **[FACILITY]-CORR-00531-[xxxxxx]**

CNSC Staff's Prior Written Notification/Written Notification of Document Changes: **[document number]**, **[document title]**, R**[xxx]**

Dear Messrs. (CNSC Director, Regulatory Programs [more than one Director may apply]):

The purpose of this e-mail is to provide prior written notification/written notification (which ever applies as per N-LIST-00531-10002) to CNSC staff of revision Rev **[xxx]** to **[document number]**, **[document title]**.

Rev **[xxx]** will be issued on or about **[nominal 30 days from prior written notification vs notifications which are issued shortly after notification]**. This written notification is in accordance with the Pickering, Darlington and DWMF (which ever applies) licence condition which requires OPG to give written notification of changes made to the documents submitted to support the licence application.

OPG has revised this document to: **[select as applicable. If none apply, provide other.]**

- incorporate identified enhancements
- implement changes to the scope of a program
- implement changes to incorporate regulatory changes to standards or codes
- reflect organizational changes and/or changes to other governance
- **[other]**

Specific changes are described in the Revision History section of the document. **[If not included due to major re-write, provide a brief summary of major changes.]**

As this revision was performed in accordance with OPG document change management requirements, OPG maintains this revision:

- Has no adverse impact on the health and safety of persons, security, the environment, or Canada's international obligations.
- Has no adverse impact on the licensing basis and have no impact on the limits stated in the Safety Report.

Please update the Pickering, Darlington and DWMF LCHs accordingly (select applicable facility LCHs).

Title: <b>PROJECT COMMUNICATIONS</b>		

### 1.0 DIRECTION

This process provides guidelines on communications regarding Ontario Power Generation (OPG) Nuclear Projects for internal and external audiences (i.e. the public, community, industry and other stakeholders and contractors), the Canadian Nuclear Safety Commission (CNSC) and other regulatory agencies. The project manager must ensure that all project communication are as clear and precise as possible in order to reduce the incidence of misinterpretation and outdated information being used as current, which may lead to delays, errors and rework. To facilitate this, a communication plan should be developed. Communication planning essentially entails identifying the audience of the information and when that information should be received.

This manual complies with N-STD-AS-0028, Project Management Standard.

### 1.1 Internal Communications

Open communication is essential for timely decision-making, efficient execution of project work and error prevention. The audience for internal communications includes:

- (a) OPG executive management
- (b) Project stakeholders
- (c) Project team members
- (d) OPG supporting organizations (e.g. Design, Supply Chain, Operations)
- (e) Contractors and suppliers
- (f) OPG personnel not directly involved in the Project.

#### 1.1.1 General Direction

All communications should be complete, accurate and timely. Internal communications generally do not require the development of a communication strategy or communication plan, except where noted.

Major events (e.g. key project announcements, schedule changes, process changes) may require the development of an event specific communication plan. Event specific communication plans should be reviewed and approved by the appropriate authority defined by the business unit prior to issue.

#### 1.1.2 Ontario Power Generation Executive Management

A central organization should determine and document the communication expectations and requirements to coordinate internal communications between the project and OPG executive management. Roles and responsibilities should be clearly identified in the strategy to ensure timely and accurate project submissions to the OPG Board of Directors, and other board and executive committees.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>COM</b>	Revision Number: <b>R000</b>	Page: <b>5 of 8</b>
Title: <b>PROJECT COMMUNICATIONS</b>		

### 1.1.3 Project Team Communications

Project team members will adopt the most effective interface method (face to face, e-mail, telephone conference, memoranda, small group discussion, etc.) to ensure that the latest information is available to the required project team members whose work will be affected. Face-to-face is the most effective and preferred method, but should be followed up with documentation. Information that should be communicated includes, but is not limited to:

- Safety and quality issues/concerns
- Environmental and regulatory constraints
- Risks and associated changes
- Design issues and changes
- Progress reports
- Issue / action logs
- Meeting minutes

Projects should develop a communications plan as a part of the Project Management Plan (PMP) and the Contract Management Plan (CMP), if applicable. The communication plan should include strategies on performance reporting (including quality and safety), how to facilitate problem solving, conflict avoidance and issue resolution, etc.

#### 1.1.3.1 Communications with Program or Portfolio Stakeholders

Projects often involves stakeholders that are not directly involved in the project, but are accountable for reporting the performance of the projects in an aggregated program or portfolio. Project managers are accountable to ensure that the applicable and accurate information is conveyed to program and portfolio managers for distribution to program and portfolio stakeholders.

#### 1.1.3.2 Project Team Communication Methods

Project team communication methods include, but are not limited to:

- (a) Planning and progress meetings involving key project team members, stakeholders and supporting groups for planning, reviewing performance, changes, issues and corrective action plans.
- (b) Lessons learned meetings, at appropriate points to review lessons learned, and implement continuous improvements.
- (c) Face-to-face / Audio or Video conference discussions and presentations.
- (d) Intranet and SharePoint sites dedicated to the project for project team communications, access to latest files and work flow.
- (e) Meeting minutes, including actions for monitoring and completion

Title: <b>PROJECT COMMUNICATIONS</b>		

- (f) Manager's briefing cards.
- (g) Reports.
- (h) E-mails.
- (i) Blogs & team discussion boards
- (j) Posters

### 1.1.3.3 Project Issue Management

Project issues may be identified through monitoring and reporting, team discussion, meetings, normal system surveillance, or oversight of vendor activities. Upon identification of an issue, it should be communicated to the appropriate authority and stakeholders as required. This should include any corrective actions that have been put in place or are planned.

Communication also involves the timely escalation of issues and implementing corrective actions. The roles and responsibilities of project issues identification and the list of authorities and stakeholders for notification should be documented in the communications plan.

### 1.1.4 Communications with Project Contractors and Suppliers

Projects should have a communications plan for contractors and suppliers. Communications with contractors and suppliers should include:

- Progress and performance reports
- Issue/ action logs
- Submittals
- Change requests
- Meetings
- Emails

Verbal communication with contractors and suppliers should be followed up with documentation. For more information on the transmittal of records and documents with project contractors and suppliers, refer to N-MAN-00120-10001-RDM-03, Nuclear Projects Supplier Document Submission.

## 1.2 External Communications

External project communications include the sharing of information with the public and external stakeholders and audiences.

Title: <b>PROJECT COMMUNICATIONS</b>		

### 1.2.1 CNSC and Other Regulatory Agency Communications

All communications with the CNSC or other regulatory agencies should be processed in accordance the appropriate OPG standards and policies and channeled through senior management and OPG Regulatory Affairs.

### 1.2.2 Communication with the Public

All methods and forms of external communications to the public, by or on behalf on the project including written, oral, and electronic communications should be processed in accordance the appropriate OPG standards and policies and channeled through senior management and OPG Public Affairs.

Title: <b>PROJECT CONTROLS</b>		

### 1.0 DIRECTION

This manual complies with N-STD-AS-0028, Project Management Standard. Projects shall have control processes established to track, review, and regulate the progress and performance of the projects.

#### 1.1 Introduction

- 1.1.1 Project Controls are developed and implemented to monitor project performance in order to identify whether or not work is being executed per plan, as well as to provide early detection of potential issues and risks.
- 1.1.2 Project performance monitoring is achieved through key performance indicators and established baselines. These are recorded in documents such as the Project Management Plan (PMP), Gate approval package, approved Business Case Summary (BCS), and organizational and project reporting.
- 1.1.3 The planned work is managed as outlined in the Project Management Plan. The project team collects, monitors and reports on project data and deliverables on a regular basis. Project performance is regularly monitored and analyzed for trends and signs of risk to planned completion. This is achieved by comparing baseline deliverables with actual progress achieved. To facilitate baseline comparison, key performance indicators should be established for:
- Safety
  - Quality
  - Scope
  - Cost
  - Schedule
- 1.1.4 Project controls are applied to a project throughout its entire life cycle. A baseline for scope, cost and schedule is established when funding is approved at a decision gate for that particular scope. As the project progresses through the life cycle, a new baseline will be established to reflect the latest approved plan and funding release.
- 1.1.5 Deviations from the approved plan may arise, for examples, as a result of project performance, changes to scope, realization of known or unforeseen risks, etc. A change control process is used to manage, document and authorize changes to the baselines as required. Authorized changes may or may not result in a baseline revision.
- Change control is to provide information to the decision makers who are responsible for approving a change request. Change control is not intended to realign a project plan due to poor performance.
- 1.1.6 Certain aspects or phases of a project may be managed on behalf of OPG by external contractors. Contractors will use their project controls processes to monitor and control project work but should be aligned with the requirements of this manual. OPG

## Manual

Title: <b>PROJECT CONTROLS</b>		

will provide oversight in accordance with the contract management plan, and the contract terms and conditions.

## 2.0 PROJECT CONTROLS

Project control is the process of tracking, reviewing, and regulating the progress to meet the performance objectives of the project.

If performance issues, trends or risks are discovered during project execution, they must be investigated, understood and mitigated to maintain the baseline. The key is to detect such issues as early as possible, understand the potential impacts, and take appropriate steps to mitigate, as part of risk mitigation. Mitigation includes preventative and/or corrective actions to minimize the impact on the deliverables at risk.

Tools such as the following can be utilized to detect issues:

- Reports and metrics
- Progress meetings
- Documents
- Quality assurance and control plans
- Change requests
- Risk reviews

### 2.1 Cost Controls

Project Manager is accountable for ensuring that regular cost monitoring and control processes are defined, implemented and diligently used by project team members and contractors. Active cost monitoring and controlling activities will include:

- 2.1.1 Using standard project reporting to monitor cost performance. The key function of cost monitoring is to determine any *variance* between the actual costs and the plan in order to flag any areas for concern.

Regular monitoring provides early detection of potential and actual cost overruns, under spending, incorrect estimates, accounting errors, and cash flow trends. Monitoring frequency will depend on the phase the project. For example, more frequent monitoring may be necessary during crucial work execution periods such as outages, high-profile or critical projects.

- 2.1.2 Reporting and communicating the cost trending analysis, cost performance results and any corrective actions to the project team, sponsors and stakeholders.
- 2.1.3 Developing sufficient cost detail to allow for effective monitoring of project cost performance. The costs, the Work Breakdown Structure (WBS), and the cost or control accounts must be aligned in order to have a direct comparison to assist in detecting any issues.
- 2.1.4 Ensuring proper project cost or control accounts are setup in OPG systems.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>PC</b>	Revision Number: <b>R000</b>	Page: <b>6 of 14</b>

Title:

## PROJECT CONTROLS

- 2.1.5 Ensuring planned value (or budget) is accurately allocated to and actual cost is collected in the cost or control accounts to support measurement of cost performance.
- 2.1.6 Ensuring accrual is captured in the actual costs.
- 2.1.7 Identifying incorrect, inappropriate, or unauthorized charges and implementing corrective actions to rectify.
- 2.1.8 Performing cost trend analysis and forecasting the Estimate At Completion (EAC) and cash flows. Forecasting is performed to assess if the EAC is still within the approved budget. This assessment is used to initiate any corrective action and recovery plans required to mitigate and resolve identified project cost issues. If warranted, change requests shall be initiated.
- 2.1.9 Projects often encounter changing conditions and issues as they are executed. The cost impacts of these changing conditions on the project budget and cash flow must be evaluated to support the project in managing the issues. If warranted, change requests shall be initiated.

## 2.2 Schedule Controls

- 2.2.1 The project schedule shows what activities are to be done, who will undertake them, and when they will be done in relation to other activities. Schedule development, management are described in N-MAN-00120-10001-SCH, Scheduling Process.
- 2.2.2 The current project schedule is updated, reported and communicated on a regular basis to show activity progress, overall progress, and actual milestone achievement dates. Comparison of the current schedule to the baseline provides the schedule variance and metrics that are used to flag and identify areas of concern and risks. These areas of concern must be understood and if necessary corrective actions implemented so that projects are completed within the committed time frame and approved budget. Updated schedule data can also be used for forecasting cost and time at completion and will identify whether or not the project is on track to meet its commitments.
- 2.2.3 In addition to reflecting the current status of the project, the update process allows for the detection and correction of possible errors (or incorrect assumptions) embedded in the schedule.
- 2.2.4 Important deliverables that are at risk of being missed must be resolved with the accountable individual and/or department to minimize cost and schedule impacts to the project. If an issue is not resolved, it should be escalated quickly within the organization to communicate impacts and obtain support to resolve the issue.
- 2.2.5 Schedule Baseline Change

Schedule baseline changes must be implemented through a controlled and documented process. The process prescribes when changes are allowed and the

**Manual**

<b>Internal Use Only</b>		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>PC</b>	Revision Number: <b>R000</b>	Page: <b>7 of 14</b>
Title: <b>PROJECT CONTROLS</b>		

level of approval required. It is important to maintain the previous history of the project schedule either in the revised baseline, or as an archived copy.

Schedule baseline change processes should allow for activity changes that do not affect the overall project schedule and committed milestone dates. These can include changing activity descriptions, adding additional detail to facilitate tracking completion of certain deliverables or insignificant activity logic changes.

## 2.3 Key Performance Indicators

- 2.3.1 Key Performance Indicators are performance metrics established to assist in demonstrating performance achievements in safety, quality, scope, cost and schedule. The intent of monitoring these metrics is to identify performance gaps or trends early, allowing for timely implementation of recovery plans and corrective actions in order to maintain the project plan or at least minimize the impacts. It will also identify when initiation of change requests may be required.

Typical areas addressed by Key Performance Indicators include:

- (a) Safety – nuclear safety; conventional safety; radiological protection; and environmental compliance;
  - (b) Quality – human performance (e.g. rework), equipment or materials (e.g. failed inspections); and installation (e.g. defects);
  - (c) Scope (e.g. number of scope changes; design change revisions);
  - (d) Schedule – life-to-date and projected “at-completion” milestone adherence;
  - (e) Cost – life-to-date and projected “at-completion” performance; contingency and management reserve management;
  - (f) Value for Money using Earned Value Management (e.g. Schedule Performance Index, SPI and Cost Performance Index, CPI).
- 2.3.2 For monitoring to be effective, any performance gaps or *variances* identified need to be investigated and understood. Analysis should be performed on an ongoing and routine basis to determine the causes of temporary and permanent *variances* and trends. The results of the analysis should be documented in project reports.
- 2.3.3 If performance is not meeting expectations, analysis should be conducted to determine appropriate corrective actions to be taken if contingency plans do not already exist as part of the Risk Management Plan process to determine if a mitigation plan is required (refer to N-MAN-00120-10001-RISK, Nuclear Projects Risk Management Process).
- 2.3.4 The SCR program is a useful source of data. The benefit of using the SCR system is the information can be readily compiled to review and identify trends, and corrective actions taken can be documented.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>PC</b>	Revision Number: <b>R000</b>	Page: <b>8 of 14</b>
Title: <b>PROJECT CONTROLS</b>		

- 2.3.5 Frequency of Key Performance Indicator reporting will depend on the requirement of the project phase and the frequency of data updates. For examples, actual cost information is available weekly whereas schedule progress updates may not be performed as frequently.
- 2.3.6 Earned Value Management (EVM)
- a) EVM is a method used to objectively measure project cost and schedule performance relative to the project baseline. The application details of EVM are provided in N-MAN-00120-10001-SCH-07, Earned Value Management.
  - b) EVM metrics can assist in identifying performance issues that need further investigation and potentially a recovery plan if the baseline plan is to be maintained or the impacts minimized. It is also an effective tool for prioritizing work and resources.
  - c) Two important Key Performance Indicators are used in EVM – Schedule Performance Index (SPI) and Cost Performance Index (CPI). Generally speaking, an index value less than 1.0 indicates performance below baseline targets.  
  
CPI less than 1.0 indicates a potential for cost overrun because the actual cost of the activity or project exceeds the earned value for that activity or project. SPI less than 1.0 indicates the activity or project is behind schedule.
  - d) A CPI or SPI greater than 1.0 indicates the project or activity is performing better than planned. Generally this is desirable however, it may be an indicator that estimates were too conservative or actual costs are not being allocated correctly. It may also represent an opportunity to re-prioritize resources to other project areas which may be underperforming.
  - e) The project team should monitor and analyze CPI and SPI and the trends. The goal is to understand the causes and potential impacts of activities under or over performing. Investigation may uncover errors (e.g. accounting) or risks that can be corrected early to prevent larger effects to the project. Corrective action and recovery plans are often required to restore the project plan or at least reduce the impacts.

## 2.4 Forecasting

- 2.4.1 Forecasting is performed by analyzing the work performed against the work planned, identifying trends, analysing remaining work and determining the impact of performance on the estimated cost and schedule going forward.
- 2.4.2 Forecasting cost shall take into consideration the committed costs, the actual execution efficiency for the work performed and the planned efficiency for the remaining work.
- 2.4.3 Similarly, schedule forecasting is required to predict the completion dates of activities and milestones.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>PC</b>	Revision Number: <b>R000</b>	Page: <b>9 of 14</b>
Title: <b>PROJECT CONTROLS</b>		

- 2.4.4 The Project Manager is accountable for having the forecast updated as necessary to reflect the latest status and expected performance of the project. Effective forecasting can be achieved when experience and objective judgement are applied together with consideration of risks and the usage of quantitative forecasting techniques, such as Earned Value technique. A number of forecasting methods are provided in Appendix A.

## 2.5 Contingency Monitoring and Control

- 2.5.1 The need to access *Contingency* and *Management Reserve* should be identified through periodic risk monitoring and forecasting. The project organization shall have a process to manage *Contingency* and *Management Reserve* drawdown. This process shall define and document the authority of approval required to access the *Contingency* and *Management Reserve*, and the impact on project baselines.
- 2.5.2 The owner(s) of the *Contingency* and *Management Reserve* shall ensure that the *Contingency* and *Management Reserve* usage is monitored closely to determine if sufficient funds remain available to address future known and unknown risks. Control and monitoring of *Contingency* and *Management Reserve* includes understanding the reason for the allocation, the amount required, the total value authorized, and the amount of *Contingency* and *Management Reserve* funds remaining available.
- 2.5.3 *Management Reserve* will be managed at the program or portfolio level.

## 2.6 Change Control

- 2.6.1 Change Control is the process of reviewing all change requests, approving changes and managing changes to the deliverables, documents and the baseline scope, costs, and schedule. Change Control is implemented to maintain the integrity of the baseline and control scope and cost creep.

Change Control process includes the following change management activities:

- (a) Reviewing, analyzing impacts and approving change requests promptly.
  - (b) Managing and communicating the approved changes.
  - (c) Incorporating approved changes into project documents.
  - (d) Reviewing, approving and implementing all recommended corrective and preventive actions.
  - (e) Coordinating changes across the entire portfolio or program.
  - (f) Documenting the complete impact of change requests.
- 2.6.2 Specific criteria will be used to provide guidance on when a Change Request is required, when a change to baseline will be allowed, and what levels of approval are required. Generally, Change Requests are required when the proposed changes have material impacts on the baseline.

## Manual

Internal Use Only		
Document Number: <b>N-MAN-00120-10001</b>		Usage Classification:
Sheet Number: <b>PC</b>	Revision Number: <b>R000</b>	Page: <b>10 of 14</b>
Title: <b>PROJECT CONTROLS</b>		

- 2.6.3 Only *Directed Changes* are allowed to amend the baselines. Generally, re-baselining is only considered if a change proposal is caused by situations that are beyond the project managers' or work program owner's control.
- 2.6.4 When a re-baseline is warranted, the existing baseline will be modified to establish a new control baseline. The original baseline will always be kept for audit purposes.

Examples of *Directed Changes* are:

- (a) regulatory changes or changes in regulatory requirements,
  - (b) changes in legislation;
  - (c) changes in strategy;
  - (d) changes in key assumptions;
  - (e) significant, externally driven changes where the baseline needs to be realigned to reflect the actual conditions (e.g., pension increases or above contractually-agreed-to changes in raw materials or utilities costs, corporate direction);
  - (f) Change in scope
- 2.6.5 Not all change requests will result in a baseline revision. Change requests used to obtain and document approval to change a commitment, such as a project milestone, may not result in a revision to the schedule baseline. When a re-baseline is not warranted, the impacts of change requests will be documented and *variance* to baseline monitored.

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

**Accrual** is the value of work completed and eligible for payment but not yet included on an invoice.

**Committed Costs** is value of work purchased, but not yet paid, against the budget allocation for that work.

**Directed Changes** are changes generally initiated by entities external to the project, such as project sponsors. Examples are scope change, regulatory change, change due to a change in program strategy, etc.

**Management Reserve** is added over and above *contingency* reserves used to account for "unknown-unknowns" in a project, including, but not limited to major estimating or scheduling errors and natural disasters. (See also N-MAN-00120-10001-RISK, Nuclear Projects Risk Management Process).

**Performance** is the comparative ratio between the planned rate of progress and the actual rate of progress.

**Residual Risk** is the risk remaining after the mitigation actions in the risk response plan have been executed. The probability and impact of the risk may have been reduced but not completely eliminated, thus may still materialize. (See also N-MAN-00120-10001-RISK, Nuclear Projects Risk Management Process).

**Variance** is the nominal differential between planned and actual progress or forecasted cost.

**Work Breakdown Structure (WBS)** is a deliverable-based hierarchical breakdown of the entire project scope used to define and group a project's discrete work elements (or tasks) in a way that helps organize, define and control the total work scope of the project.

## Appendix A: Forecasting Methods

The following methods can be used for project forecasting:

**Method 1:** The most accurate method is to consider all committed costs and obtain an estimate of the hours or cost of the remaining work, hence:

Estimate at Completion (EAC) = Actual costs + Estimate To Complete (ETC).

**Method 2:** This method assumes the rate of progress, efficiency or burn rate realized to date will continue.

$EAC = [Budget\ at\ Completion\ (BAC)] \div [Cost\ Performance\ Index\ (CPI)]$ .

This is useful for predicting what the total cost will be if the progress continues at the current rate. Knowing this will often trigger corrective actions to mitigate the impacts of any poor performing project activities. It is also an excellent gauge against Method 1.

Similarly, to forecast date of completion:

$EAC_t = BAC_t \div SPI$ .

For example planned duration of 10 weeks with an  $SPI=.90$  ,  $10wk \div 0.90 = 11.1$  weeks estimate to complete.

**Method 3:** Another forecasting method using EV metrics assumes that future performance is influenced by both current cost and schedule performance.

$EAC = AC + [BAC - EV] / (CPI \times SPI)$ , equal weighting.

$EAC = AC + [BAC - EV] / (0.8\ CPI + 0.2\ SPI)$ , non-equal weighted sample (80/20).

**Method 4:** Used for forecasting costs and work-hours by assuming that work from this point forward will progress at planned rates whether or not these rates have been realised to this point. Therefore,

$EAC = Actual\ Costs + Remaining\ budget$ .

This method is normally not very useful since it ignores the actual progress rate or efficiency to date.

### 1.0 PROJECT DEFINITION

This Project Execution Plan (PEP) identifies the work required for the Darlington Station Integrated Implementation Plan (IIP). The need for this work is identified in the Darlington NGS Integrated Implementation Plan [R-1].

#### 1.1 Needs Statement (Background)

The justification for the continued operation of Darlington following Life Extension is documented in the Global Assessment Report [R-2] and Integrated Implementation Plan [R-1]. These two documents were prepared in accordance with the CNSC Regulatory Document RD-360, "Life Extension of Nuclear Power Plants" [R-3]. RD-360 requires the licensee to demonstrate that continued station operation poses no unreasonable risk to health, safety, security of the public or the environment, and will continue to conform to international obligations.

RD360 also provides the steps required when undertaking a project to extend the life of a nuclear power plant (NPP). As required by RD360, Section 7.1 - Project Execution Planning, this PEP document identifies what needs to be done to achieve the desired outcomes for the life extension project. Furthermore, per RD-360- Section 7.3, Project Monitoring, the licensee is expected to monitor the (Life Extension) project for progress, safety, and quality at all phases of execution. These requirements are reflected in OPG governance, N-PROC-LE-0005, Nuclear Refurbishment Integrated Safety Review – Darlington.

The IIP presents the scope and the schedule for implementation of corrective actions and safety improvement identified through the Integrated Safety Review (ISR) [R-4]. There are two main sources of scope: Component Condition Assessments (CCA) and Darlington Scope Requests (DSR). CCAs were performed on critical components, in accordance with N-PROC-MP-0060, Aging Management Process [R-5] to provide a snapshot of their condition. These assessments generated actions to repair / replace components and to monitor the condition of components going forward. DSRs are the scope items that are generated by Nuclear Refurbishment's scope management system, overseen by the Program Scope Review Board (PSRB). Life extension DSRs that can be executed outside of the Refurbishment outages have been assigned to Darlington Station, which are subsequently managed by this project.

There are total of 162 IIP items committed to CNSC. The scope of Darlington Station IIP Project covers the IIP scope that is not covered by the existing programs within Refurbishment. DNGS IIP Change Control and Closeout Process, Appendix A [R-6] identifies the list of station owned IIP items.

## Project Execution Plan

<b>Internal Use Only</b>	
Document Number: <b>NK38-PEP-01060-10016</b>	
Revision: <b>R0001</b>	Page: <b>6 of 26</b>
Title: <b>DNGS Integrated Implementation Plan Project</b>	

### 1.2 Project Objectives (Critical Success Factors)

The Objective of the Darlington Nuclear Station Integrated Implementation Plan Project is to inspect, overhaul or replace the components as required in accordance with the Darlington NGS Integrated Implementation Plan [R-1] in order to support safe and reliable operation post-refurbishment.

Plant Aging Management department plans and oversees the execution of Station-Owned Integrated Implementation Plan (IIP) items. These IIP items are regulatory requirements, owned by Darlington SVP. DNGS Integrated Implementation Plan [R-1] provides a description of the IIP items and the regulatory commitment date.

The scope of this PEP only covers the IIP items that owned by Darlington SVP. Each of the IIP items will have to be completed on-time and within budget.

### 1.3 Project Scope

The scope of the station-owned IIP items can be found in Appendix A, as cross referenced from the two following documents:

- DNGS Integrated Implementation Plan [R-1]
- DNGS IIP Change Control and Closeout Process, Appendix A [R-6]

#### 1.3.1 Inspection / Assessment IIP items

The scope of the inspection / assessment IIP items is to:

- Perform inspection to the component condition and assess the inspection result.
- Determine the replacement strategy if required in order to support safe and reliable operation post-refurbishment.
  - Inspection results that are favorable will require no further action.
  - Inspection results revealing minor degradation will require either enhanced monitoring or will be addressed by normal station practices.
  - Inspection results revealing significant defects that will be corrected by replacement of the component. If the component replacement has been identified as one of the IIP items in the Darlington NGS Integrated Implementation Plan [R-1], the component replacement will be managed by this project. Otherwise, the component replacement will be addressed through normal station work management processes.

## Project Execution Plan

Internal Use Only	
Document Number: <b>NK38-PEP-01060-10016</b>	
Revision: <b>R0001</b>	Page: <b>7 of 26</b>

Title:  
**DNGS Integrated Implementation Plan Project**

Assessment of inspection result and the recommended path forward will be accepted by Darlington Performance Engineering, Component Engineering or Nuclear Safety Engineering as appropriate.

### 1.3.2 Replacement IIP items

Replacement of the component is either identified in the Darlington NGS Integrated Implementation Plan [R-1] or determined from the inspection IIP items. The component replacement will be executed through Item Equivalency Evaluations (IEE), Non-Identical Component Replacement (NICR) or Modification. If applicable, the scope will include the following:

- Execute modification following Engineering Change Control (ECC) process, N-PROC-MP-0090.
- Prepare Engineering Specifications for the procurement of the replacement component.
- Obtain necessary design, operations and / or regulatory approvals to execute the project.
- Identify training needs for the replacement component and identify impact on the training simulator.
- Complete a Human Factors (HF) evaluation and integrate recommendations into the replacement strategy in order to ensure the HF deficiencies are suitably addressed.
- Perform qualification and factory acceptance testing of the replacement component, as necessary.
- Procure the replacement component and provide spares if required.
- Develop plans and schedules, for the installation and commissioning of the replacement components.
- Identify changes to operating and maintenance procedures.

### 1.3.3 Code Gap IIP items

The code gap IIP items are activities to address the code gaps resulting from ISR and CNSC comments. The activity description and CNSC commitment date to address the code gap are provided in the Darlington NGS Integrated Implementation Plan [R-1].

## Project Execution Plan

Internal Use Only	
Document Number: <b>NK38-PEP-01060-10016</b>	
Revision: <b>R0001</b>	Page: <b>8 of 26</b>

Title:  
**DNGS Integrated Implementation Plan Project**

### 1.3.4 Contingency IIP items

Contingency IIP items will need to be executed if there are significant defects identified in the inspection IIP items. The contingency IIP items are the compensatory activities to address significant defects that will be corrected by replacement of the component. This is applicable to the component replacement that has been identified as one of the IIP items in the Darlington NGS Integrated Implementation Plan [R-1].

### 1.4 Priority/Timing

The CNSC commitment date for IIP items can be found in Darlington NGS Integrated Implementation Plan [R-1].

The project schedule of the station owned IIP items can be found in Appendix A.

## 2.0 PROJECT ORGANIZATION AND RESPONSIBILITIES

### 2.1 Organization

The primary roles and associated organizational positions are as follows:

Table 2.1 - Organization	
Customer	D. Burger, Manager, Darlington Performance Engineering K. Leung, Manager, Darlington Component Engineering E. Sorin, Manager, Darlington Reactor Safety Engineering
Project Sponsor	J. Lehman, Director Station Engineering, Darlington
Design Approval	J. Wight, Senior Manager and Design Authority, Plant Design, Darlington
Installation Approval	S. Gregoris, Director Operations and Maintenance, Darlington
Regulatory Interface	D. Coleman, Manager, Reg. Affairs, Darlington
Project Owner	S. Shaikh, Manager, Darlington Plant Aging Management

The project's organization is shown in Figure 1.

### Note:

Plant Aging Management Department will also oversee the planning and execution of IIP items that are managed by Projects and Modifications and Computers and Control Design (CCD) Department

## 2.2 Responsibilities

### 2.2.1 Project Responsibility Matrix – WBS (Provide Input/Prepare/Review/Approve)

The detailed task responsibilities are provided in the Table 2.2.2.

### 2.2.2 Description of Responsibilities

Plant Aging Management department has budget for 21 individuals in the department. Additional staffs will be obtained when required.

Table 2.2.2 – Project Management Responsibilities		
Role	Name	Responsibility
Project Owner	S. Shaikh	<ul style="list-style-type: none"> <li>Oversee progress of IIP items on behalf of DN SVP, to ensure completion of the IIP work.</li> <li>Approve the Project Execution Plan.</li> <li>Ensure sufficient Plant Aging Management resources are available to meet project commitments.</li> <li>Support Section Manager in resolution of issues requiring Stratum IV intervention and raise issues to the Project Sponsor when required.</li> <li>Approve assignment of OPG Plant Aging Management Department resources.</li> <li>Assess and approve contracts and fulfill Contract Owner role.</li> </ul>
Section Manager – Execution	P. Tangestanian	<ul style="list-style-type: none"> <li>Project oversight on behalf of Project Owner.</li> <li>Responsible for managing execution work and is the primary interface with the customer(s).</li> <li>Responsible for ensuring that the personnel involved in project activities have the required qualifications.</li> <li>Identify and obtain commitment of resources with required qualifications.</li> <li>Review and approve project scope, schedule, and deliverables.</li> <li>Ensure accurate project reporting is provided to Project Owner, Sponsor, Customer and other stakeholders.</li> <li>Project oversight for IIP items that are managed by Projects and Modifications and CCD.</li> </ul>
Section Manager – Engineering Services	M. Holmes	<ul style="list-style-type: none"> <li>Responsible for providing technical support for project.</li> <li>Responsible for ensuring that the personnel involved in project activities have the required qualifications.</li> <li>Identify and obtain commitment of resources with required qualifications.</li> </ul>

<b>IIP Oversight:</b> Manager, Refurbishment Project Engineering, Quality Engineering	Ensure oversight is provided for Station IIP items	Ensure any IIP change requests are prepared and submitted to CNSC. Ensure IIP status update is provided to CNSC when required.

### 3.0 WORK SCOPE AND SCHEDULE

#### 3.1 Work Breakdown Structure, Complete With Account Codes

The project Work Breakdown Structure (WBS), complete with account codes is shown in Figure 2. Corresponding TEMPUS work events and external contracts will be established in accordance with this WBS.

The complete charge number associated with the WBS elements is described below:

XXXX-62030-YYY-XXXX-4301-80110-000-00000-09-3100-LOCAL

Where:

- **XXXX:** RC code
- **YYY:** Resource type and varies depending on what type of purchase resource (e.g., OPG staff, managed task, augmented staff, materials)
- **LOCAL:** Local number will be created for each of the IIP items that are funded under 16-80110.

**Note 1:** 16-80110 covers the project expense such as labour, material and purchased services expenses. The labour cost for Plant Aging Management department will be charged to 16-80079 (Aging Management Project). Tempus events will be provided to other organizations to cover the planning and execution or overtime expenses. Material will be purchased through material request associated with the work orders that will be charged to 16-80110.

**Note 2:** Separate project number will be created for replacement IIP / contingency IIP items that cost more than \$200 k per unit. Any projects that are managed by Projects and Modifications and CCD department will have a separate project number as well.

Revision: <b>R0001</b>	Page: <b>15 of 26</b>
Title: <b>DNGS Integrated Implementation Plan Project</b>	

### 3.2.2 Requirements Definition

This includes defining the scope of work of the inspection / replacement activities, which is based on the Darlington NGS Integrated Implementation Plan [R-1], CCA and DSR. If a modification is required, the design requirement will be defined in Modification Design Requirement (MDR).

### 3.2.3 Design

This is only applicable to the replacement IIP items. This includes preparation of the design change papers such as drawings, technical specification, etc. Document Scoping Checklist will identify the affected documents associated with the modification.

### 3.2.4 Installation and Commissioning

If applicable, this includes preparation of the installation and commissioning strategy, preparation of the commissioning specification, preparation of work plans, modification of Operations documents, execution of the work plans, and preparation of the commissioning reports and Available for Service (AFS) activities.

### 3.2.5 Close-Out

This includes the commissioning reports that document the findings and recommended path forward of the associated inspection activities. Integrated Implementation Plan (IIP) Completion Declaration Form will be filled in order to close the IIP items as per N-INS-03680-10001, DNGS IIP Change Control and Closeout process.

For modification, this will also includes Design EC close-out activities (including all update and approvals to affected documents), Project EC and Master EC close-out activities, project financials finalized and closed, completion of any required self-assessments and completion and approval of project close out report.

## 3.3 Constructability, Operability, Maintainability

The process of inspection / replacement is consistent with normal maintenance activities. The activities will be completed by qualified technicians under existing maintenance procedures. Walkdown and informal Constructability, Operability, Maintainability and Safety (COMS) meeting are recommended to define the feasibility and issues of the inspection / replacement activities.

## 3.4 Approved Schedule

The project schedule is included in Appendix A.

## Project Execution Plan

### 3.5 Interactions with Other Projects and/or Divisions

The interaction with other related projects, activities or organizations is described in Table 3.5.

Table 3.5 – Interactions with other Projects/Activities	
Project/Activity	Interactions
16-31432 - DN Containment Button-up Activity Monitors Replacement	Monthly meeting to review the level 1 plan report from Projects and Modifications. Review any major scope variance, risk of missing important milestone and any long term risk in meeting the CNSC commitment date, and opportunities to optimize execution timeframe and resources.
16-31532 - DN Powerhouse Water ACUs Replacement	
16-31544 - DN Radiation Detection Equipment Obsolescence	
16-31710 - DN Shutdown Cooling Heat Exchanger Replacement	
16-80036 - DN R22 Refrigerant ACU Replacement	
16-80037 - DN ECI Hydraulic Control Circuit Replacement	
16-80124 - DN Obsolete Programmable Logic Controller Replacement	
16-80151 – FHA and FSSA Project	
16-82887 - DN LISS Ball Position Detection System Replacement	Monthly meeting to review the level 1 plan report from Computers and Control Design. Review any major scope variance, risk of missing important milestone and any long term risk in meeting the CNSC commitment date, and opportunities to optimize execution timeframe and resources.
16-33977 - DN DCC Replacement / Refurbishment / Upgrades	
16-80078 - DN DCC/CP/SEM Aging Management	
16-82824 - DN Annunciation Modifications and Post-Accident Monitoring Configuration Management	Coordination with Performance Engineering / Component Engineering will be required to ensure they are informed of the scope of work, inspection results and recommended path forwards.
Performance Engineering / Component Engineering	
Work Control	
Regulatory Affairs	
Operations and Maintenance	
Refurbishment Project Engineering, Quality Engineering	Bi-weekly meeting to provide status update of Station IIP items. Review any major scope variance, risk of missing important milestone and any long term risk in meeting the CNSC commitment date, and opportunities to optimize execution timeframe and resources.

### 4.0 PROJECT RESOURCES

#### 4.1 Project Resource Demand

Project resource demands have been established as part of setting up the Plant Aging Management department. The project resource is funded by 16-80079 (Aging Management Staffing Project).

All the staff from Plant Aging Management are essential to the success of the project. Staff from Planning and Execution Section will lead for the duration of the project. In addition, they will perform the MTL role in the ECC process. Plant Aging Management Engineering Section will provide resolution to technical issues.

Support from other station base resources such as Plant Design, Operations, Maintenance, Supply Chain, Reactor Safety, Performance Engineering and Component Engineering will be required to support this project.

- Plant Design will provide support during detailed design, installation and commissioning phase.
- Operations and Maintenance are responsible for supporting the installation and commissioning planning. Maintenance is also responsible performing the installation and commissioning if the Chestnut Park Accord (CPAA) has awarded the execution of IIP items to Power Workers Union (PWU).
- Supply Chain is responsible for procuring the required materials, securing the services of qualified external service providers and administering the associated contracts.
- Staff from the Darlington Reactor Safety department will provide support to the project during the design phase.
- Staff from Performance Engineering and Component Engineering will provide support and be integrated throughout the project in their areas of responsibility, as necessary.

In addition, external consulting services from service providers such as Kinetics Inc. will be established to help perform some of the inspection analysis in order to determine the degradation condition of the equipment.

In terms of the projects managed by Projects and Modifications and CCD department, the project resources have been established from their organization. The project resource is funded by the associated projects.

R0001

Page:

18 of 26

Title:  
DNGS Integrated Implementation Plan Project

### 4.2 Project Resource Availability

Project resources from Plant Aging Management are committed to the project. Management from other organizations has committed to provide support as needed to the project.

Purchase Order for external consultant service is currently in-progress.

### 4.3 Contracting/Procurement Strategies (If Applicable)

External contracting will follow the Purchased Services Agreement (PSA) for all contracted staff requirements, as necessary.

External consultant contract will follow the Purchased Services Agreement (PSA) for all contracted consultant requirements, as necessary.

## 5.0 PROJECT COSTS

### 5.1 Cost Breakdown Structure

The Cost Breakdown structure corresponds to the project WBS. Costs are collected from OPG's time management (TEMPUS), purchase management (Asset Suite) and financial management systems. The project cost is compiled and reviewed monthly. Forecast updates are provided when requested.

### 5.2 Project Estimates and Assumptions

The cost estimate for this project is \$98.2 million, which was based on the assessment from the CCA / DSR. It includes the IIP items that are managed by Project and Modifications and CCD department. However, cost estimate for DN Station IIP items were not adequately assessed in the CCA / DSR (SCR D-2015-26444). There is an action to provide a Class 5 cost estimate by the end of 2016 Q2.

The cost estimate for 16-80110 (DN Aging Management Scope Defining BCS) is \$7.91 million (without contingency), which was based on the assessment from the CCA / DSR. BCS will be revised when the Class 5 cost estimate is completed.

### 5.3 Project Cash Flows

The project cash flow for 16-80110 in 2015 to 2018 are \$682 k, \$2,555 k, \$2,893 k and \$1,780 k respectively (without contingency). The total budget is \$9,888 k including \$1,978 k contingency.

## Project Execution Plan

Revision:

**R0001**

Page:

**19 of 26**

Title:

**DNGS Integrated Implementation Plan Project**

### 5.4 Project Funding and Release

The approved BCS for 16-80110 is classified as OM&A Project. Partial Execution BCS was approved in 2015. The final execution BCS will be submitted once the cost estimate is completed.

## 6.0 PROJECT CONTROLS

The project will be planned, managed and controlled in accordance with the principles identified in N-PROG-AS-0007, Project Management. This includes the use of a standard set of project management mechanisms, including planning, monitoring and reporting tools. The project controls will be consistent with N-STD-AS-0028, Project Management Standard.

### 6.1 Safety Control

All work on the project will be conducted in accordance with all applicable legal, corporate, and OPG Nuclear safety programs.

### 6.2 Reactor Safety Control

Changes to physical plant and/or station work processes impacting reactor safety will be managed in accordance with established OPG procedures to ensure reactor safety. In the event that these normal processes define issues requiring a project specific reactor safety plan, such plan will be developed and incorporated into the PEP at that time.

### 6.3 Environment Control and Waste Management

Environmental Management, N-PROG-OP-0006 is used to identify considerations with respect to the environmental aspects of a project.

N-FORM-10422, Environmental Impact Worksheet and N-FORM-10114, Radioactive Waste notification will be completed during the design phase if required.

## 7.0 PERFORMANCE MEASUREMENT AND EVALUATION

### 7.1 Project Management Measures (CPI, SPI, Etc.)

Standard project Cost Performance (CPI), Schedule Performance (SPI) and activity completion indices will be used to monitor this project. Cost, quality, safety and schedule performance will be measured against the project start and completion for each activity. This information will be reviewed on a monthly basis and can be provided when requested.

### 7.2 Effectiveness Measures

#### 7.2.1 During Implementation

During the implementation of the Preliminary and Detailed Engineering phases, project schedule included in Appendix A are monitoring to ensure the scope and CNSC commitment date for each IIP items defined in Darlington NGS Integrated Implementation Plan [R-1].

#### 7.2.2 Safety and Environmental Performance in the Context of Ontario Power Generation Being the Owner of This Project

All safety and environmental targets are zero (see Table 7.2.2). Any deviations will be handled in accordance with approved OPG-N procedures.

Table 7.2.2 - Project Safety and Environmental Performance	
Performance Indicator	Target
Fatalities	0
Permanent Disabilities	0
LTA's	0
MRPH's	0
Injuries to the public	0
Ministry of Labour Non-Compliance or Stop Work Orders	0
Contractor Safety Infractions vs. Requirements	0
S-99 Reportable Events	0
Reportable Spills	0

#### 7.2.3 Upon Completion

Upon project completion, the stakeholders should agree that the project objectives have been met, and that the needs statement requirements have been satisfied by the deliverables. The following measures should also be used to gauge the success of the project:

- Milestone dates committed to vs. met
- Actual cost vs. budgeted cost

## Project Execution Plan

### 8.0 RISK MANAGEMENT AND CONTINGENCY PLAN

The Risk Management and Contingency Plan (Table 8.0) is designed to identify and quantify specific risks to project activities and results. It also establishes mitigating strategies to ensure successful completion of the activities and results in accordance with established schedules. Note that to effectively manage these risks, the project requires support in the form of a strong commitment from senior management and involvement of the line organization.

**Table 8.0 - Risk Management and Contingency Plan**

Risk Class	Description of Risk	Risk Probability	Risk Impact	Risk Management Strategies (Avoidance/Mitigation/Correction)
Cost	Cost estimate accuracy from CCA / DSR	High	Cost and schedule	Perform a Class 5 estimate by 2016 Q2. In addition, a contingency of 20% will be included in the estimate.
Scope	Additional scope identified / transferred from Refurbishment Department	Medium	Cost and schedule	The current project scope is defined in the Darlington NGS Integrated Implementation Plan. DN Senior Management approval is required for additional scope transferred from Refurbishment department.
Schedule	Execution is delayed due to station conditions not allowing work to proceed on schedule	Medium	Schedule	Advance planning and alignment with station resources and work management milestones. Plan with schedule margin to ensure no impact to the CNSC commitment date. Communicate the importance of IIP scope to other organizations.
Resources	Resource constraint of skilled / qualified in-house staff to provide support	Medium	Schedule	Management from other organizations has committed to provide support as needed to the project.  The needs and plan for the skills required will be identified early on. An allowance for the higher cost of contractors has been factored in. Contingency for overtime is available, if necessary.  Prioritize work to ensure critical work is done within the available envelope.
Quality	Unavailability of station SME support / input / verification	Medium	Quality / Performance	Monitor and coordinate activities with management support (if required). Regular performance monitoring of the team members. External consultant will be obtained if required.
Technical	Component inspection does not identify the degraded condition of the component	Low	Quality / Performance	The inspection scope and procedure will be reviewed with Performance Engineering / Component Engineering.
Regulatory	Delay in execution of IIP items impact to the DN license submission and the CNSC condition for completion of DNRU2	Medium	Quality / Performance	Any risk of meeting the CNSC commitment date or required deliverables will be communicated to CNSC in advance. Provide regular project status update to Regulatory Affairs.

**Table 8.0 - Risk Management and Contingency Plan**

Risk Class	Description of Risk	Risk Probability	Risk Impact	Risk Management Strategies (Avoidance/Mitigation/Correction)
Environmental	None			
Health and Safety	Normal health and safety concerns	Very Low	Schedule	All work on the project will be conducted in accordance with all legal, OPG corporate, OPG Nuclear and site safety programs.
Investment	Inadequate determination and management of IIP items results in not meeting the equipment reliability requirement and potential FLR impacts.	Very Low	Cost and schedule	The scope of IIP items were based on CCA / DSR. Systematic approach has been used to identify the life extension actions for critical components in order to finalize the IIP scope.  The remaining Non-IIP items will be managed through regular maintenance / modification procedure.
Other	None			

### 8.1 Description of Risk

See the *Description of Risk* column in Table 8.0.

### 8.2 Risk Probability

See the *Risk Probability* column in Table 8.0

### 8.3 Risk Impact

### 9.0 PROJECT COMMUNICATION PLAN

The following communications plan is designed to communicate to the project participants and the stakeholders key information as it is produced in this project, as well as the results of important meetings, which could have an impact on the project work.

#### 9.1 Reports (Including Status Reports at All Levels)

The following reporting will be used:

- Weekly update will be provided to DN Director of Station Engineering. Highlight of one or few items will be shared with CNE and CNO as part of overall engineering program progress reporting.
- Quad charts updated monthly and presented to DN Senior Management team monthly.
- Quarterly progress updates presented at the Darlington Senior Work Management meeting and Engineering Alignment meeting
- Progress updates presented to Nuclear Executive Committee meeting, PAC meeting, DN Journey of Excellence meeting, etc as required.
- Bi-weekly project progress update will be provided to DN Refurbishment.
- IIP project update presentation will be prepared and issued to the Plant Aging Management intranet website once a quarter.

#### 9.2 Documentation/Filing

Documentation is prepared, verified, approved and issued in accordance with standard OPGN Procedures. Adverse conditions and actions are handled via the corrective action program and the action tracking process, as appropriate.

## Project Execution Plan

**NK38-PEP-01060-10016**

Revision:  
**R0001**

Page:  
**25 of 26**

Title:  
**DNGS Integrated Implementation Plan Project**

### 9.3 Meetings

Weekly project status update meetings will be scheduled to review each of the IIP items that are managed by Plant Aging Management. In addition, team meetings with different working groups will be held regularly as required. Actions assigned at these meetings will incur regular follow-up until actions are closed out.

Monthly meeting to review the Level 1 plan report from Projects and Modifications and CCD Department. Review any major scope variance, risk of missing important milestone and any long term risk in meeting the CNSC commitment date, and opportunities to optimize execution timeframe and resources.

### 10.0 PROJECT CLOSURE

The project will be declared complete with all the DN Station IIP items declared complete and Integrated Implementation Plan (IIP) Completion Declaration Form have been filled in order to close the IIP items as per N-INS-03680-10001, DNGS IIP Change Control and Closeout Process. This is also including the completion of the close-out activities for the replacement IIP items that follow the ECC process.

Receives Authority from:	N-CHAR-AS-0002, Nuclear Management System

Document is Related to Pressure Boundary ☐ Document Requires CNSC Notification ☐

## PURPOSE AND SCOPE

This Program describes the organizational responsibilities, interfaces and key program elements for managing and executing projects in Ontario Power Generation – Nuclear (OPG-N). Projects are widely used to implement solutions to improve, repair or correct issues that arise in the course of conducting OPG-N business. Program activities are performed in accordance with governing documents that prescribe controls and responsibilities to ensure activities are carried out in a safe and effective manner by qualified personnel. Key activities of this Program include, Project Management, Contract Management, Field Engineering, Project Oversight and Management of Supplemental Workers.

This program is applicable to all OPG-N organizations that manage and/or execute projects and the

Title:
PROJECT MANAGEMENT

### 1.0 DIRECTION

All organizations executing projects within OPG-N shall follow the principles and requirements set out in this program for the planning, organizing, executing, and controlling of resources to ensure the safe and effective execution and completion of projects. Safety and quality shall be the overriding priority and shall not be compromised for cost or schedule.

It is recognized that projects will differ in complexity, resource requirements, duration and cost and therefore in order to accommodate these variances a *risk based graded approach* shall be used to determine requirements for planning and control of the project work effort. This risk based graded approach will maximize project control effectiveness and assist in identification and mitigation of project risk. The specifics of the risk based graded approach used for the project should be documented.

#### 1.1 Organization

Detailed information regarding the organizational roles and responsibilities for the Project Management Program are provided in section 2.0 of this document.

Roles and responsibilities for the Nuclear Projects organization as well as organizations supporting and interfacing with the Nuclear Projects organization are described in N-STD-AS-0020, Nuclear Organization.

#### 1.2 Managed System

N-PROG-AS-0007, Project Management (this document) incorporates, directly or by reference, the controls necessary to meet the requirements of CSA N286-05, Management system requirements for nuclear power plants and CSA N286-12, Management system requirements for nuclear facilities, for all program activities. The program describes the processes and controls for Project Management, Contract Management, Field Engineering, Project Oversight and Management of Supplemental Workers that are not explicitly addressed in other programs under N-CHAR-AS-0002 Nuclear Management System. Appendix A shows the implementing governance and the interfacing programs that together establish the managed system for the Project Management program.

Executing organizations may use guides, manuals, instructions, or other directions, to implement the principles of this program and the associated standards.

The authority and responsibility for developing, implementing and maintaining this Program has been delegated to the Project Director, Contract Management and Project Controls Office in Projects and Modifications department. All other management personnel designated in the Program have the authority and responsibility to participate and support the implementation of Program requirements in their area of activity.

##### 1.2.1 Key Principles

Projects executed in OPG-N shall be guided by the following set of key principles:

- (a) Projects are defined, planned, managed, and controlled. [B3]

## Nuclear Program

Internal Use Only		
Document Number:	Revision:	
N-PROG-AS-0007	R009	
Usage Classification:	Sheet Number:	Page:
Information	N/A	5 of 13

Title:  
**PROJECT MANAGEMENT**

- (b) Business drivers for projects are clear and in support of corporate business goals. **[B3]**
- (c) Each project has a clear need or opportunity statement. **[B3]**
- (d) A graded, risk-based approach is used for Project Management processes and controls. **[B1],[B3]**
- (e) Project risks are identified and managed. **[B3]**
- (f) Each project has a Sponsor or receiving organization and an executing organization where the project objectives, roles, responsibilities, and accountabilities are well communicated. **[B3],[B4]**
- (g) Each project has a clear set of stakeholders identified who are consulted for project input. **[B4]**
- (h) Staff are competent at the work they do and clearly understand the expectations. **[B5],[B6]**
- (i) Projects are planned, approved, and executed using a phased approach. **[B3]**
- (j) Projects have a defined scope and corresponding cost estimate, schedule, and resource requirements. **[B3],[B4]**
- (k) Operating experience and lessons learned are captured, shared, and integrated as part of a continuous improvement process. **[B2],[B7]**
- (l) Information required for successful project execution shall be managed and communicated in a timely manner. **[B8]**
- (m) Contracts and contractors are managed. **[B11]**
- (n) Graded and effective oversight is applied to projects. **[B1],[B2]**
- (o) Project performance is monitored in order to direct corrective actions as needed. **[B3][B8]**
- (p) Projects follow an appropriate quality program. **[B3][B4]**
- (q) Project changes are managed and controlled. **[B9]**
- (r) Project Records are maintained. **[B10]**

### 1.3 Implementing and Interfacing Documents

The implementing and interfacing documents that establish the project management governance framework are described below and shown in Appendix A, Nuclear Projects Governing Document Hierarchy.

## Nuclear Program

Internal Use Only		
Document Number:	Revision:	
N-PROG-AS-0007	R009	
Usage Classification:	Sheet Number:	Page:
Information	N/A	6 of 13

Title:
<b>PROJECT MANAGEMENT</b>

### 1.4 Project Management

A project is defined as a temporary and unique endeavor undertaken outside the routine base activities of the normal work program. A project is initiated to address an identified business gap, need, or opportunity. Portfolio or Program Management (as used in this document and its associated standards) is the management of a set of projects coordinated to achieve strategic level objectives and benefits which would otherwise not be realised if the projects were managed individually.

Project Management is the application of a methodical approach for guiding a project from start to finish to ensure project objectives including safety, quality, schedule, budget, and intended benefits are realized.

N-STD-AS-0028, Project Management Standard provides the principles and requirements for managing and executing all projects undertaken by OPG-N. This standard identifies the critical project management attributes and methodology required to manage projects throughout the project life cycle.

### 1.5 Contract Management

Contract management is the process that enables parties to a contract to meet their obligations in order to deliver the objectives required from the contract. It involves active monitoring, managing issues proactively as they arise, and anticipating future issues throughout the contract life cycle. Contract management incorporates oversight of Supplier personnel to ensure they meet all safety, quality, cost, schedule, and performance requirements. Contract management also involves building a good working relationship between OPG and the Supplier.

N-STD-AS-0029, Contract Management Standard provides the principles and requirements for managing contracts, contractors and suppliers for projects initiated and/or executed by OPG-N.

### 1.6 Project Oversight

Project Oversight is the assessment necessary to ensure project objectives are achieved. It is distinct from the in-line and normal quality assurance and control processes. Oversight is based on a proactive and graded, risk based approach. The means by which the different executing organizations implement project oversight will vary based on business requirements. Project Oversight is applicable but not limited to the areas of Safety, Quality, Cost and schedule performance, Solution effectiveness, Value for money, Regulatory and environmental compliance, Human performance, Project planning, Engineering, Procurement, sub-suppliers and sub-contractors and Installation and construction activities.

N-STD-AS-0030 Project Oversight Standard, provides the principles and requirements for project oversight and surveillance for projects initiated and/or executed by OPG-N

### 1.7 Field Engineering (for Project Execution)

Field engineering activities including technical support, quality planning, quality control, and field oversight are necessary to ensure project execution activities meet the specified safety,

### Title: **PROJECT MANAGEMENT**

quality, and documentation requirements for all execution activities that are undertaken under the OPG-Nuclear Management System

N-STD-AS-0031, Field Engineering Standard provides direction for persons performing field engineering activities in compliance with the nuclear management system and Canadian Standards Association CSA N286-05, Management system requirements for nuclear power plants and CSA N286-12, Management System Requirements for Nuclear Facilities

## 1.8 Management of Supplemental Personnel

Supplemental personnel are vital to the success of Nuclear Projects and OPG-N. They fill an important gap created by insufficient resources or skills of OPG-N employees. Operating Experience (OPEX) shows that building strong relationships with these workers, treating them with the same respect as OPG employees, and integrating them fully into their project teams are vital to good performance, regardless of the processes in use. "Supplemental Workers" refers to persons who conduct work or provide services on or off site who are not full-time OPG-N personnel but who follow the same high standards and processes as regular OPG-N personnel as defined in N-CHAR-AS-0002, Nuclear Management System. Supplemental workers include any of the following:

- contractors and vendors who perform work on site
- contractors and vendors who perform off-site work, such as engineering modifications, component fabrication, equipment refurbishment, and equipment testing
- personnel from another location within OPG or from an industry alliance who perform work on site, such as shared resources during outages
- personnel from within OPG who may only work part time at the station, such as switchyard personnel, inspection services, diving and other water services, environmental services, and roving valve teams
- personnel from another location who perform work off site, such as corporate engineering support

N-STD-AS-0032, Oversight of Supplemental Personnel provides the oversight principles and requirements to be applied to work packages initiated and/or executed within OPG by supplemental personnel.

## 1.9 Performance Indicators and Review

Program shall be reviewed and reported in accordance with N-PROC-RA-0023, Fleetview Program Health and Performance Reporting.

## 2.0 ROLES AND ACCOUNTABILITIES

### 2.1 Senior Vice President, Nuclear Projects

Establishes and Authorizes N-PROG-AS-0007, Project Management.

## Nuclear Program

Internal Use Only		
Document Number:	Revision:	
N-PROG-AS-0007	R009	
Usage Classification:	Sheet Number:	Page:

Title:  
**PROJECT MANAGEMENT**

Ensures that the Program is maintained and delivered in accordance with program requirements and N-CHAR-AS-0002, Nuclear Management System, and in accordance with applicable regulations, codes and standards, and to accepted professional standards.

### 2.2 Vice Presidents, Nuclear Projects

Support the SVP Nuclear Projects in integrating programs to manage execution of work in their respective Business unit in accordance with the approved Project Management Program and Standards.

Develop Business Unit policies and processes and establishes performance standards for activities and functions.

Provide direction and oversight of the quality program and governance in accordance with this program for their respective Business unit.

### 2.3 Project Director, Contract Management and Project Controls Office, P&M,

Assumes Program Owner roles and accountabilities in accordance with section 1.2 above as delegated by SVP Nuclear Projects and as described in N-PROG-AS-0001, Managed Systems.

Act as the Single Point of Contact for all Governance issues for the Nuclear Projects business unit.

Develops and maintains the Project Management Program including policies, programs, standards, and other required processes in support of the Nuclear Projects business unit and in accordance with N-CHAR-AS-0002, Nuclear Management System and to meet OPG policies and requirements and Canadian Standards Association CSA N286-05, Management system requirements for nuclear power plants and CSA N286-12 Management system requirements for nuclear facilities.

As delegated Program Authority, rules on decisions regarding all other program changes which may be in dispute and directs the change(s) to be implemented and complied with by all parties working with or using this program

Ensures that Project Management Program is periodically monitored and assessed.

Ensures consistent performance standards are established and reported.

### 2.4 Directors and Managers in Nuclear Projects

Ensure requirements established in the Project Management program are incorporated into all phases of nuclear projects work and any supporting processes are developed and fully supported and aligned with the program.

Ensures nuclear projects activities meet standard and procedural requirements.

Ensures competent resources are available to support the program work activities.

See also standard accountabilities for Manager.

### Title: PROJECT MANAGEMENT

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

#### ***Graded Approach<sup>1</sup>:***

A flexible selection process that allows the project manager to choose a more or less rigorous application of project control elements. This flexibility permits customizing project control needs to the specific project and focuses the team efforts

#### Clarification Notes:

1. it must be remembered that the Graded Approach Process cannot be used to “grade to zero” (i.e., eliminate requirements).
2. Even in the least stringent application of the Graded Approach Process, compliance with applicable portions of stated requirements is mandatory.
3. The graded approach that is used must be documented in the project records and should be communicated to the project team and all stakeholders

#### ***Risk Based Graded Approach:***

Accounts for identified risk elements and their likelihood of occurrence while using a graded approach. The approach can be simple identification of risk consideration or formally documented in the format of A “Graded Approach Worksheet” which identifies and documents values for predetermined risk elements with their likelihood of occurrence which is then used to determine a total risk score to assess the graded approach to use.

### 3.2 Abbreviations and Acronyms

None

## 4.0 BASES AND REFERENCES

### 4.1 Bases

The bases below pertain to various clauses in CSA N286-05 and CSA N286-12

Title:  
**PROJECT MANAGEMENT STANDARD**

### 1.0 DIRECTION

This standard provides the criteria, expected behaviours and output requirements for the successful and timely execution of all projects in Ontario Power Generation – Nuclear (OPG-N). It describes the Project Management attributes and methodology required to manage projects throughout the project life cycle.

The requirements for effective management of a project are dependent on the level of risk inherent to the project. Projects are managed using a graded, risk based approach.

Portfolio or Program Management is the management of a set of projects coordinated to achieve strategic level objectives and benefits. Projects executed as part of a Portfolio or Program should implement additional levels of integration and oversight within the context of this standard.

Projects are initiated, funded, and executed by many different groups and organizations within OPG-N

All staff within OPG-N that work on projects will apply the criteria, methodology and good practices described in this standard for all project management activities.

Detailed process instructions, guides, work aids and good practices for all key elements of project management in OPG-N are stored in the controlled documents module of Asset Suite and can also be accessed via N-MAN-00120-10001 which is available on the OPG intranet through “PowerSearch” or as an E-Manual under the Nuclear Projects webpage.

### 1.1 Project Management

Project Management is the discipline of planning, organizing, securing, and managing resources to bring about the successful completion of specific project goals and objectives. It is the application of a methodical and iterative approach for guiding a project from start to finish. It incorporates tools and processes to plan, execute, monitor, control and close-out project activities to ensure all project requirements are met.

Managing a project typically includes:

- (a) Identifying and documenting project requirements and deliverables to satisfy the project needs and objectives including key constraints, risks and assumptions.
- (b) Providing graded, risk based oversight of the project team, supporting departments, contractors, and suppliers.
- (c) Addressing the various needs, concerns, and expectations of stakeholders.
- (d) Developing project plans, estimates and schedules.

## Nuclear Standard

Internal Use Only		
Document Number: N-STD-AS-0028		Revision: R003
Usage Classification: Information	Sheet Number: N/A	Page: 4 of 16

Title:

## PROJECT MANAGEMENT STANDARD

- (e) Developing funding and contracting strategies.
- (f) Monitoring, reporting, communicating, and controlling project performance.
- (g) Documenting and managing project risks, identifying mitigating actions to eliminate or reduce the risk and implementing corrective measures.
- (h) Planning, managing and directing the project execution.
- (i) Managing and controlling project changes and priorities.
- (j) Incorporating operating experience and lessons learned.
- (k) Balancing competing project constraints including the following:
  - Scope
  - Schedule
  - Cost/Budget
  - Resources
  - Risks
  - Value for money.

1.1.1 The Project Manager has the overall accountability for the project and project management and shall use a graded, risk based approach when selecting the type and detail for Project Management processes and tools. The required level of Project Management and controls are a function of the project risk, complexity, duration, expected cost and project phase.

1.1.2 All work performed during a project shall:

- (a) Maintain safety and quality as the overriding priority.
- (b) Be executed by staff who are competent for the type of work.
- (c) Be executed in phases. Progression from one phase to the next is approved at a *Decision Gate* where project progress and performance is reviewed by management and validated to ensure project requirements and objectives are being satisfied.
- (d) Use as required the guides, instructions, forms and good practices for the specific project management area that are provided in the project management manual N-MAN-00120-10001 and further described in the project management e-manual available on the Project Management Intranet web page.

## 1.2 Project Phases and Decision Gates

Consistent with industry best practices, project development, execution and close-out is broken into Project Phases separated by *Decision Gates*. The gated concept provides points in the development and execution of the project for management decision to stop, rework or

Usage Classification:	Sheet Number:	Page:
Information	N/A	5 of 16

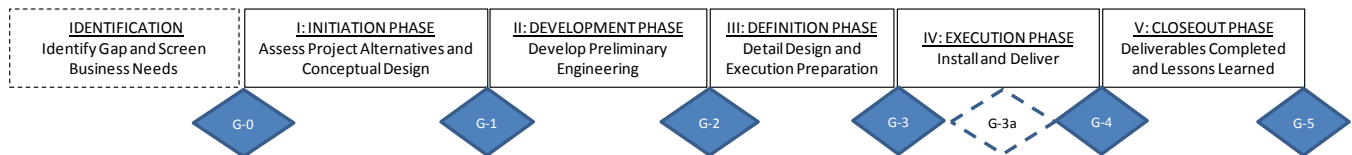

### Title: PROJECT MANAGEMENT STANDARD

proceed. It controls progression approvals and shall be used to manage the project through the project life cycle. This process requires that projects meet a consistent expectation of quality and performance. At each *Decision Gate*, the current phase deliverables and project performance are reviewed together with the plan and deliverables for the next phase(s).

1.2.1 The project life cycle typically consists of the following five phases:

- Identification phase
- Initiation phase
- Development Phase
- Definition phase
- Execution phase
- Close Out phase.

Figure 1, Project Phases and Associated Decision Gates, illustrates the typical project phase and *decision gate* relationship.

**Figure 1: Project Phases and Associated Decision Gates**

**Note:** There may be additional *Decision Gates* (e.g. G3a) within a project phase depending on project risk, funding release and execution strategy, and organization's process. *Decision Gates* may be revisited when priorities or strategies change. In specific instances some projects will not be required to go through certain Gates. These projects will document why certain Gates are not applicable to their project.

A project proposal begins at *Decision Gate 0*. During the period prior to Gate 0, a business gap, need or opportunity has been identified by the initiating organization. The Gate 0 decision is primarily focused on confirming strategic alignment and intended benefits with the initiating organization and OPG-N business objectives.

## 1.3 Identification Phase

The Identification of the Business Proposal finishes at Gate 0 and includes actions to assess the business need or gap. The purpose of Gate 0 is to approve progression to the Initiation Phase.

1.3.1 The Identification Phase deliverables typically include:

- (a) Project Alternatives

## Nuclear Standard

Document Number: N-STD-AS-0028		Revision: R003
Usage Classification: Information	Sheet Number: N/A	Page: 6 of 16

Title: <b>PROJECT MANAGEMENT STANDARD</b>
--

- (b) Project Charter or equivalent created.

### 1.4 Initiation Phase

The project Initiation Phase begins after Gate 0 and ends at Gate 1. The objective of the Initiation Phase is to evaluate viable alternatives and develop the scope and conceptual design of the preferred alternative. The Gate 1 supporting documents are prepared to summarize the alternatives analysis and rationale for recommending the preferred alternative so that an informed decision to continue or cancel the project can be made.

#### 1.4.1 The Initiation Phase deliverables typically include:

- (a) Alternative options evaluated and a preferred alternative recommended.
- (b) Initial scope description and conceptual design report
- (c) Development Phase Business Case Summary
- (d) Initial total project cost estimate and schedule for the preferred alternative.
- (e) Work for the next phase(s) defined and planned, complete with a detailed estimate and schedule.
- (f) Project charter update and supporting documents.
- (g) Applicable Gate 1 *Approval Package* to support the development of the project.

### 1.5 Development Phase

The Development Phase starts at Gate 1 and ends at Gate 2. The objective of the Development Phase is to develop the preferred alternative to a point where there is confidence that all major elements of the scope are accounted for. At the conclusion of this phase, Gate 2 decision approves progression to define the project.

#### 1.5.1 Development Phase deliverables typically include:

- (a) Refined total project cost estimate and schedule
- (b) Preliminary engineering complete
- (c) Project Management Plan
- (d) Identification of engineered equipment and services
- (e) Initial project contracting strategy

Title:  
**PROJECT MANAGEMENT STANDARD**

- (f) Definition Phase Business Case Summary
- (g) Applicable Gate 2 *Approval Package* to support the definition of the project

### 1.6 Definition Phase

The Definition Phase starts at Gate 2 and ends at Gate 3. The objective of the Definition Phase is to demonstrate readiness for execution. The definition phase includes the procurement of engineered equipment, completion of detailed engineering, preparations for construction/field work, and, detailed scoping of work. During this phase inputs to the performance baseline are refined, engineering, designs are completed, and execution contracts are assembled.

#### 1.6.1 Definition Phase deliverables typically include:

- (a) Final scope description and requirements.
- (b) Detail engineering complete.
- (c) Risk Assessment and mitigating plans
- (d) Regulatory Approvals identified and received or pending.
- (e) Control cost estimate and integrated resource loaded schedule.
- (f) Execution Phase Business Case Summary.
- (g) Applicable Gate *Approval Package* with updated project plans to support the next phase(s) including Gate 3 approval to begin the Execution Phase.

### 1.7 Execution Phase

The project Execution Phase includes the main construction/installation and commissioning work. It may also include completion of procurement.

#### 1.7.1 Execution Phase deliverables typically include:

- (a) Pre-installation and commissioning readiness.
- (b) Quality Plan.
- (c) Safety Plan.
- (d) Regular reporting on project safety, quality, schedule and budget.

- (e) Installation and Commissioning Work Plans (if applicable).
- (f) Installation and Commissioning Execution Packages.
- (g) Installation/construction, inspection/testing and commissioning complete.
- (h) Project Close Out phase planned.
- (i) Operations and Maintenance documentation updated.
- (j) Next *Approval Package* with updated plans and schedule, if applicable, for a multi-unit/phase project.
- (k) Available for Service (AFS) or Operations Acceptance approved (Gate 4).
- (l) Gate 4 approval to begin Close Out Phase.

#### 1.8 Close Out Phase

The Close Out Phase is the last phase in the project life cycle and includes the final actions to complete all activities and formally finish and close out the project. This phase should be completed as quickly as possible after final AFS in order to minimize project costs.

##### 1.8.1 Close Out Phase deliverables typically include:

- (a) Completion of any outstanding actions/deficiencies from final AFS and Gate 4.
- (b) Project financials finalized and closed.
- (c) Remaining project materials dispositioned as spares, surplus or obsolete.
- (d) New and affected drawings updated, approved and issued.
- (e) Records and documents filed.
- (f) Information Managed Systems updated.
- (g) Lessons Learned captured and documented.
- (h) Regulatory actions dispositioned and/or completed as needed.
- (i) Action tracking assignments completed and closed.
- (j) Completion and approval of project close out report (Gate 5).

Title: <b>PROJECT MANAGEMENT STANDARD</b>
--

### 1.9 Key Project Management Elements

Each executing organization shall have graded, risk based processes to incorporate the key Project Management elements.

The key Project Management elements include the following items:

- Safety
- Scoping
- Estimating
- Resource planning
- Risk management
- Scheduling
- Cost management
- Procurement and contract management
- Communication
- Quality management
- Project oversight
- Project controls.

The ability to influence the outcome and success of a project is greatest at the front end of the project lifecycle. The key Project Management elements shall be applied in a manner that minimizes the likelihood of encountering issues during the execution of the work. As the project progresses and matures, the planning products should be further developed and refined to reflect the latest project information.

The products of the key Project Management elements are summarized in a Project Management Plan. Any other elements unique to a particular project should also be specified in the plan.

#### 1.9.1 Safety

Safety, including nuclear safety, radiological safety, environmental safety and conventional safety, is an overarching element in project management. Safety impacts people, quality, costs and schedule.

Each project shall consider safety in the planning, managing, controlling and execution of project deliverables.

#### 1.9.2 Scoping

Project scoping involves defining the project objectives and deliverables based on business requirements, assumptions, constraints and value for money.

### PROJECT MANAGEMENT STANDARD

- (a) Each project shall have a well defined project scope in order to produce an accurate estimate and schedule.
- (b) The inputs to determining the project scope should include but are not limited to:
  - Project Charter or equivalent
  - Project stakeholders
  - Station/System Health Reports
  - Station Engineering (system engineer)
  - Design Basis and Design Requirements
  - Facilitated workshops and Value Engineering
  - Regulatory requirements
  - Field Walk Downs
  - Lessons Learned (internal and external)
  - OPEX and SCRs
  - Governance
  - Challenge and COMS meetings
  - Risk mitigating plans.
- (c) There shall be a process and plan to deal with scope changes. Project scope changes shall be managed and strictly controlled, with the impacts thoroughly understood, as they have the potential to affect the project risks, cost, schedule and stakeholders. Project scope changes require approval from the project sponsor or the applicable authorization authority appropriate for the project. If changes are significant the project may need to be re-evaluated.

### 1.9.3 Estimating

Estimating is the process of quantifying the funding and resources required to complete the relevant project activities to achieve project objectives. An accurate cost estimate leads to a more precise project schedule and budget which forms the basis for project decisions, value and performance. Each project shall have a cost estimate and:

- (a) Each project should create a cost estimate which includes the documentation of assumptions, constraints, class of the estimate along with the cost range, deliverables, and other relevant information that the estimate is based on.
- (b) Estimating should be repeated for each project phase and should become more refined and accurate as the project scope and details mature.
- (c) Estimating should be performed to determine the cost of changes including the addition of project scope.
- (d) The estimate for the next immediate project phase should be of sufficient detail and accuracy to ensure thorough resource planning and cost control.

## PROJECT MANAGEMENT STANDARD

### 1.9.4 Resource Planning

Resource planning includes identifying the quantity and type of resources required for the successful completion of project deliverables.

- (a) The Project Manager shall ensure that qualified personnel, equipment and material are available at each stage of the project, in order to meet the oversight, schedule, quality and technical requirements.
- (b) Resource planning shall be graded and risk based and should be used as an input to develop the contracting and procurement strategies, and project schedule.

### 1.9.5 Risk Management

Risk Management is the process used to identify, manage and control project risks throughout the project lifecycle.

- (a) The Project Manager shall ensure that project risk management is executed thoroughly to decrease the likelihood of unexpected issues occurring and adversely impacting the project and stakeholders.
- (b) Risk Management includes:
  - Identification and analysis of project risks
  - Mitigation and/or avoidance of risks through preventive action planning and execution
  - Determining the budget and schedule contingency required for residual risks
  - Developing risk contingency plans to deal with residual risks that may materialize
  - Monitoring and controlling risks throughout the project lifecycle.

### 1.9.6 Cost Management

Cost management includes the processes related to assessing and managing the actual cost of deliverables against the budget baseline. The budget or cost baseline is based on the resource loaded project schedule. Cost management includes:

- (a) Establishment of the budget or cost baseline.
- (b) Monitoring the status and trend of cost performance.
- (c) Implementing corrective actions as required.
- (d) Managing the use of contingency funding required to manage project risks.
- (e) Forecasting future budget requirements.
- (f) Managing required budget changes.

<b>PROJECT MANAGEMENT STANDARD</b>

### 1.9.7 Scheduling

The project schedule outlines the deliverables and activities, their interrelationship and execution sequence. It is the main planning and monitoring tool used to communicate the execution of project deliverables.

Scheduling includes:

- (a) Identification of key activities including their start and finish date, duration and resources.
- (b) Activities that are deliverable based and communicate what needs to be done.
- (c) The sequence and logical interrelationship of activities and milestones.
- (d) Identification and optimization of the critical path.
- (e) Regular monitoring and updating to track performance and initiate corrective action for schedule threats.
- (f) Look ahead planning and strategizing to identify and manage priorities, opportunities, and threats.
- (g) The inclusion and management of float in the schedule.

### 1.9.8 Procurement and Contract Management

Projects shall manage contracts and suppliers in accordance with N-STD-AS-0029, Contract Management Standard.

### 1.9.9 Communication

The project manager shall ensure that proper and effective communication practices are used throughout the project life cycle. This is to ensure that all project team members, stakeholders, contractors and suppliers understand the deliverables and are working with the required and most recent information.

The communication requirements include:

- (a) Maintaining alignment between team members and stakeholders.
- (b) Timely distribution and control of information, documentation and changes.
- (c) Communicating targets and expectations.
- (d) Regular project team planning and progress meetings.
- (e) Informing stakeholders of project progress, risks and changes.

### PROJECT MANAGEMENT STANDARD

- (f) Expediting support and issue resolution.
- (g) Reporting on project performance.

#### 1.9.10 Quality Management

Quality management processes are required to control human performance, engineering, work planning, materials, and field work, in order to meet the requirements of the project.

- (a) Each project shall define what quality program is to be used in the project's quality plan.
- (b) The quality plan includes the methods that will be used to measure the project actual performance against the defined quality requirements.
- (c) The project quality plan should demonstrate the following elements where applicable:
  - (1) Quality planning to determine the type and frequency of internal and external quality standards and monitoring required for project success.
  - (2) Quality Assurance to plan a systematic pattern of means and actions designed to provide confidence that items or services will meet specified requirements and perform satisfactorily in service. These include quality systems, instruction, training, qualification and checklists.
  - (3) Quality Control processes to ensure that specified requirements are met through monitoring, inspections, testing, examinations or verifications. This includes the documentation of non-conformances and corrective actions.

Refer to N-STD-AS-0031, Field Engineering Standard, for projects using OPG-N's quality program.

#### 1.9.11 Project Oversight

Projects using a contractor's or vendor's quality management system shall implement oversight in accordance with N-STD-AS-0030, Project Oversight Standard.

#### 1.9.12 Management of Supplemental Personnel

Supplemental personnel are vital to the success of Nuclear Projects and OPG-N. They fill an important gap created by insufficient resources or skills of OPG-N employees.

N-STD-AS-0032, Oversight of Supplemental Personnel provides the oversight principles and requirements to be applied to work packages initiated and/or executed within OPG by supplemental personnel.

### 1.9.13 Project Controls

- (a) Projects shall have control processes established to support key project management elements including but not limited to:
  - (1) Planning support.
  - (2) Monitoring of key project performance indicators (i.e. metrics).
  - (3) Schedule and cost variance and indicator analysis.
  - (4) Forecasting of project costs and schedule.
  - (5) Risk management.
  - (6) Project reporting to communicate project health and facilitating oversight.
  - (7) Contingency development and control.
  - (8) Safety and quality monitoring and reporting.
  - (9) Change management.
  - (10) Document control and records management.
- (b) Project performance shall be measured, on a regular basis, in comparison to the baseline deliverables and milestones approved in the applicable project gate *Approval Package*.
- (c) The monitoring and reporting of key performance indicators shall allow for the detection of at risk deliverables and support the direction of any corrective actions needed to recover performance. Analysis and corrective action shall support consideration of both project performance and business planning.
- (d) Changes to scope, cost, and schedule shall be managed and controlled through the applicable executing organization process.

## 2.0 ROLES AND ACCOUNTABILITIES

### Project Manager

The project manager is accountable for the following for all assigned projects:

- Initiating, planning, executing, controlling, and closing project management processes
- Setting and managing the project team priorities and ensuring that the assigned projects are supported and executed per the approved Business Case Summaries and Project Management Plans.
- Ensuring that all project activities are carried out safely, integrated into site work planning, and executed in accordance with the standards and processes established under the Nuclear Projects program in the areas of scope management, schedule management, cost management, quality management, resource management,

## 3.0 DEFINITIONS AND ACRONYMS

### 3.1 Definitions

**Approval Package** is a general term for a prescribed assembly of documentation prepared by the Project Manager and submitted for approval at a *Decision Gate*. The *Approval Package* forms the basis for authorizing authority consideration and subsequent approval for the project to proceed to the next phase. The content, structure, and rigor of the *Approval Package* will vary at each *Decision Gate* depending on a number of factors including organizational process, scope and complexity of the project and project stage.

**Decision Gate** is a management hold and review point in the Project Life Cycle where project attributes such as readiness, quality, value, risks and funding requests may be reviewed prior to approval of project advancement to the next phase or stage.

**Engineered Equipment** is equipment requiring application-specific technical specifications to meet the performance requirements for the project.

**PROJECT OVERSIGHT STANDARD**

### 1.0 DIRECTION

This standard provides the Project Oversight principles and requirements to be applied to projects initiated and/or executed within OPG-N. Oversight is the independent assessment necessary to ensure OPG and project objectives are achieved. It is distinct from the in-line and normal quality assurance and control process. Oversight is applicable but not limited to:

- Safety
- Quality
- Cost and schedule performance
- Solution effectiveness
- Value for money
- Regulatory and environmental compliance
- Human performance
- Project planning
- Engineering
- Procurement, suppliers and contractors
- Installation and construction activities

Oversight is based on a proactive and graded, risk based approach. The means by which the different executing organizations implement this standard may vary based on business requirements and taking into consideration the risk profile and complexity considerations of the particular project being undertaken.

#### 1.1 Key Oversight Elements

- (a) Oversight shall be performed throughout the project lifecycle.
- (b) The extent and frequency of oversight shall be applied strategically using a graded approach based on project complexity, risks, and performance. The level of oversight shall be modified to reflect the current project performance and changes in the risk profile. Examples where increased levels of oversight may be required include:
  - Project areas that include new processes or technology
  - Activities of high consequence to safety, quality, cost or schedule
  - Critical evolutions or changes

## Nuclear Standard

### PROJECT OVERSIGHT STANDARD

- Where suppliers are new or have performed less than expected on current and previous projects
  - Fabrication by sub-contractors
  - Where nuclear safety or operation may be impacted
  - Project areas with evidence of negative trends, e.g. cost, schedule, safety or quality performance.
- (c) Oversight shall be applied proactively in a manner that allows for early detection of potential issues and effective implementation of corrective actions. Methods of proactive oversight may include:
- Communicating and establishing expectations and targets
  - Conducting regular status meetings
  - Look ahead planning and strategizing
  - Conducting challenge and preparedness meetings
  - Performing direct observation, surveillance and assessments
  - Using trend analysis and performance metrics
  - Tracking and resolving issue
  - Prompt escalation of issues
- (d) Oversight shall be applied in a manner that respects contract terms and conditions. It does not direct the work of suppliers who are performing under their own approved management system. Oversight results shall be communicated to stakeholders through the pre-approved designated authority for the oversight.
- (e) Oversight shall be applied to the portfolio or program of projects as well as to individual projects. The portfolio or program oversight shall be conducted in a manner that ensures:
- communication, coordination and integration between projects in order to establish and understand the interrelationships
  - overall portfolio safety, quality, cost and schedule performance
  - a higher degree of oversight for large projects and programs that include multiple projects.
- (f) The oversight strategy, roles and responsibilities shall be documented in a project oversight plan. The oversight plan shall be reviewed and updated when required to meet the project objectives in alignment with project and supplier performance.

## Nuclear Standard

Internal Use Only		
Document Number:	Revision:

Usage Classification:	Sheet Number:	Page:
Information	N/A	5 of 8

Title:  
**PROJECT OVERSIGHT STANDARD**

- (g) The Project Manager should develop the oversight plan with stakeholder input and shall:
  - (1) Direct and execute the overall project oversight.
  - (2) Obtain the necessary resources to execute the oversight.
- (h) Oversight results that include corrective actions shall be documented and communicated to the appropriate project stakeholders.
- (i) Lessons learned are used for continuous improvement.

### 1.2 Project Oversight Process

Detailed process instructions, guides, work aids and good practices for all key elements of project oversight in OPG-N are provided in various documents which have been independently developed and implemented.

The following instructions have been -written to assist Project Managers and contract owners implement the requirements of N-STD-AS-0030 Project Oversight Standard (governance), N-STD-AS-0032 Oversight of Supplemental Personnel (governance), and the guidelines presented within the following documents:

N-MAN-09701-10002, Nuclear Refurbishment Project Oversight.

N-INS-09701-10007, Project Oversight Planning and Implementation

N-INS-00120-10026, Supplemental Personnel oversight

N-GUID-01920-10000, Guideline for Engineering Oversight

N-GUID-09701-10022, Supply Chain Oversight

N-GUID-09701-10120, Guideline for Construction Oversight

[N-GUID-00120-10008, Contractor Management Process](#)

N-INS-09701-10007, Project Oversight Planning and Implementation is primarily intended to assist with the development of the Project Oversight Plan (POP) particularly for obtaining consistency on format and content. This is essential when recognizing that there are various groups executing projects across OPG Nuclear. It is imperative that consistency in format and minimum content is required specifically because of, the variation in project cost, complexity, duration and risk, and user groups such as Inspection and Maintenance Services (IMS), Station Engineering and Project & Modifications(P&M).

[N-GUID-00120-10008, Contractor Management Process, identifies the minimum process requirements for monitoring a contractor during the field execution of contracted work at Ontario Power Generation Nuclear \(OPGN\).](#)

In addition, oversight departments charged with ensuring that adequate oversight is being applied on projects require consistency and some minimum standard for POP's in order to

measure application of governance and foster continuous improvement through the analysis of oversight results.

The Oversight process documents are available on the OPG intranet through "PowerSearch" or as an E-Manual under the Nuclear Projects webpage.

## 2.0 ROLES AND ACCOUNTABILITIES

### Vice President - Nuclear Projects Oversight

The Vice-President - Nuclear Projects Oversight, acts as the Program Owner for oversight and sets direction, monitors compliance, and assesses effectiveness in accordance with N-STD-AS-0030 Project Oversight Standard,. This is also described in the Nuclear Refurbishment Project Oversight Guide, N-MAN-09701-10002. Nuclear Projects Oversight supports the project teams in the development of their Project Oversight Plans (POPs) and the associated tools, including training, as required.

### Project Manager

The Project Manager is accountable for the following:

- Ensure adequate oversight is planned and implemented for the project.
- Develop and implement the Project Oversight Plan (POP)
- Engage and utilize the support of the functional groups in the development and implementation of the POP.
- Determine and resource the project oversight team (functional & support group representation) and how they will function.
- Document the expectations around communicating (internal and with vendor) and on the importance of sharing critical oversight results in an expeditious manner.
- Communicate expectations around oversight effort (full time, part time, twice a week, etc).
- Hold recurring meetings with the project team to review oversight results and revise the POP as required.

### Functional Support Organization Managers:

The functional organizations, in accordance with approved RACI (Responsibility, Accountability, Consultation, Information) documentation, are accountable to identify the oversight to consider for inclusion in the POP. They are also accountable to provide additional and or specialized resources to execute the plan when requested by the Project Manager.

Document Number: <b>N-INS-08400-10027</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>4 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

### 1.0 DIRECTION

This instruction provides a joint approach to making good business decisions regarding the use of Purchased Services.

It reinforces the principles and processes for deciding how work gets done, but is not intended to hinder getting work done.

In order to complete discussions and any necessary dispute resolution process prior to work commencing, it is essential that initiators start the Purchased Services Agreement (PSA) process immediately upon recognizing an external contract may be required.

If differences arise between this instruction and the OPGN PWU/Management PSA Operational Plan, May 2004, the Operational Plan shall prevail.

### 1.1 Background

Article 12, item 12.4.1, Purchased Services Agreement, of the PWU Collective Agreement (CA) requires Management and the PWU to maintain a working Operating Plan

### 1.2 Philosophy

1.2.1 It is OPGN's intent to use regular staff to perform most work of a continuing nature.

1.2.2 OPGN shall strive to provide regular staff with continuous employment.

1.2.3 All parties agree that a consistent, managed, and joint approach to assignment of work within the Company is necessary to provide security for employees, a more effective, productive organization, and an excellent product for the customer.

### 1.3 Principles

With respect to work performed by PWU members, OPGN shall be guided by the following principles. OPGN shall:

- Conduct all work as effectively as possible.
- Measure effectiveness of all work by its impact on staff, business, and ultimate impact on customers.
- Perform most work of a continuing nature with Company employees.
- Determine when work is to be done by a non-PWU member through a joint decision making process, with both parties assuming joint responsibility for these decisions.
- Ensure that the impact of such decisions on continuous employment is minimized.

Instruction

Internal Use Only		
Document Number: <b>N-INS-08400-10027</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>5 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

- If possible, use a team and consensus approach when making decisions and resolving any issues that arise internally.
- Consult and make timely decisions consistent with the need to get work done.
- Develop, implement, and continue a joint process of communications and education.
- Strive for consistency through use of these principles versus policy and procedure.

**1.4 Decision Makers**

1.4.1 It is recommended that Decision-Makers for PSA discussions should be as follows:

- PWU PSA Single Point of Contact (SPOC) as designated by PWU executive.
- Management PSA SPOC as designated by Management.

1.4.2 The Management Working Committee shall make decisions regarding the following:

- A Work Package controlled by a Site, Head Office department or division, and affecting **only** that particular Site
- A Work Package controlled by a Work Unit affecting another Work Unit in Ontario Power Generation Nuclear (OPGN).

1.4.3 The local Site SPOC shall present the Management Working Committee's decision to the PWU site SPOC.

1.4.4 Persons identified as SPOCs shall be given appropriate decision-making authority by OPGN and the PWU executive, as applicable, and shall be responsible for following the decision-making process.

1.4.5 It is recognized that a given decision may require involvement of more than these two individuals.

**1.5 Work Jurisdiction Issues**

1.5.1 Prior to entering into PSA discussions, work assignments shall be made following the Chestnut Park Accord (CPAA) process.

**Note:** All CPAA requests shall follow the Management Working Committee review process.

1.5.2 Jurisdictional disputes between the PWU, Society, Building Trade Unions, or non-represented employees are **not** fit matter for PSA discussions, and shall **not** be dealt with under provisions of Article 12.

1.5.3 A PSA is required for any work assigned to the PWU for which OPGN is contemplating utilizing non-PWU represented personnel or non-OPGN personnel to perform the work in question.

Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>6 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

**1.6 Decision Making Process**

- 1.6.1 Management and the PWU shall notify each party, in writing, which PSA contacts have appropriate decision making and signing authority.
- 1.6.2 N-FORM-11245, Purchased Service Agreement Request, shall be used to initiate the PSA process.
- 1.6.3 Responsibility for initiating the PSA process for a particular Work Package shall rest with Initiator/Project Manager for the controlling Work Unit, or the unit accountable for completing work.
- 1.6.4 The initiator shall route completed PSA request forms to the Management Nuclear SPOC.
- 1.6.5 The Management Nuclear SPOC shall perform the following:
- (a) Present the PSA request to the Working Committee, which shall review the details and assign a threshold classification.
  - (b) Following Working Committee review, forward the document to the Site SPOC for presentation to the PWU.
- Note:** A site specific number is assigned to the document prior to presentation to the PWU.
- 1.6.6 In determining information requirements, the Working Committee should take into consideration the effort required to collect this information, relative to the size of the job and CA requirements.
- 1.6.7 Based on resource requirements identified in a PSA request, the Working Committee shall assess availability of qualified internal resources, taking into consideration station or site work program priorities. Availability of internal resources shall include those:
- Within the work unit
  - In other units within the location
  - Other sources identified by the parties.
- 1.6.8 In order to optimize the review process, a joint review of the Work Program should be undertaken early in the year and at appropriate levels, using the budget and/or business plan as an information source. This would allow Purchased Services joint decisions to be made in a timely manner.
- Note:** It is expected that most decisions would be made at that time, including contracts of a recurring nature.
- 1.6.9 For work not known or defined at the budget stage but identified later in the year, the PSA process shall be initiated as early as possible.

**Instruction**

Document Number: <b>N-INS-08400-10027</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>7 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

**1.7 Joint Decisions**

- 1.7.1 If Site Decision-Makers reach a consensus decision regarding preferred alternative(s), the decision is documented on the PSA form and work proceeds accordingly.
- 1.7.2 Site Decision-Makers shall communicate their decisions to the Management SPOC.
- 1.7.3 If parties are unable to reach a consensus decision, the issue shall be referred to the dispute resolution process after the local resolution process has been exhausted.

**1.8 Establishment of Threshold**

- 1.8.1 Establishment of Threshold is designed to remove from the process, on a case by case basis, certain issues relating to Purchased Services. The Threshold shall operate in such a way as to allow flexibility in local decision making. Any decisions regarding what is below Threshold shall be non-precedent setting.
- 1.8.2 If there is a dispute with the PWU on whether the threshold permits a proposed Purchased Service, and there is no consensus, and, if it is reasonable in the circumstances, parties shall strive to resolve this dispute before the Purchased Service occurs.
- 1.8.3 Failure to obtain a resolution in advance shall not preclude work from being performed, nor shall it preclude the matter from being resolved under Article 12.2.7, Dispute Resolution Process.

**1.9 Below Threshold Discussions**

- 1.9.1 Below Thresholds include the following:
- Subject matter lacking in substance.
  - Consequences which are relatively insignificant.
  - Where the nature or consequences of the work which represents a Purchased Service is remote from work currently performed by the PWU on a continual basis. For purposes of clarity, this does not mean geographically remote.
  - Emergencies.
  - Any work performed under a manufacturer's warranty, except where the manufacturer authorizes the company to do the work.
  - Work being done for OPG by Hydro One, AMEC, NSS, Kinetricks, and NHSS at the point each company is spun off from OPG and the work of the same nature done by these companies in the future, so long as the union continues to represent the employees of these companies.
  - Where a distinct work program or work package at a worksite identified in the PSA request(s) is 250 hours or less annually.

Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

- 1.9.2 If Management requires a contractor or Purchased Service to perform certain work, and if that work falls under one or more of these thresholds, then the Working Committee will assign a below threshold classification to the PSA request and notify the Site SPOC.
- 1.9.3 The Site SPOC shall notify the appropriate PWU SPOC of the proposed Purchased Service, and provide them with specific information with regard to Purchased Service.
- 1.9.4 After receiving information, the PWU has three working days to request further discussion in an effort to come to an agreement that the work is in fact below threshold.
- 1.9.5 If the PWU does not request further discussion within three days then Purchased Service shall be deemed to be below threshold.
- 1.9.6 If discussions are requested, the Site SPOC shall arrange a meeting within three working days of a request for discussion.  
**Note:** Failure of Site SPOC to provide the required information, as set out in notice form shall indicate work is automatically deemed to be above threshold.
- 1.9.7 Discussions should focus on whether or not the work in question falls under one or more thresholds, and therefore does not require a signed PSA to proceed.
- 1.9.8 If no agreement on threshold can be reached, Management shall proceed to contract the work. After all Local Dispute Resolution options have been exhausted, the PWU has the right to grieve. All parties shall strive to reach an agreement prior to letting the contract.
- 1.9.9 In case of emergency, decisions to use Purchased Services shall be subject to the same information requirements, review, and dispute resolution as non-emergency cases, but management may contract the work immediately.
- 1.9.10 The arbitrator has indicated Management is required to present a written business case to the PWU. This does not have to be an in-depth business case for below threshold matters, but the arbitrator would like to ensure that contracting out makes business sense and that any cost estimates or comparisons are accurate.
- 1.9.11 Grievances shall be referred to the arbitrator, (in accordance with Article 12 of the OPGN/PWU collective agreement), who shall act with full remedial powers. The PWU usually drives this grievance process.
- 1.9.12 As stated above, discussions shall take place within three working days of the PWU request.
- 1.9.13 When the work has been completed, and if requested, the PWU shall be provided with details of the final contract cost. Refer to Appendix A, Process for Below Threshold Flowchart.

Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>9 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

**Note:** For above threshold Purchased Services, refer to Appendix B, Above Threshold Process.

### 1.10 Below Threshold Dispute/Grievances

1.10.1 Processing threshold grievances shall be used by both parties, in accordance with Article 12 of the OPGN/PWU CA. The process is as follows:

- (c) The required joint discussions shall take place to decide whether the work in question falls under one or more threshold.
- (d) If no agreement can be reached, Management may proceed to contract the work, and the PWU has the right to grieve. Or, both parties may agree to refer the matter for Local Dispute Resolution. If unsuccessful the matter may be referred to arbitration.

**Note:** Damages are more likely if work is contracted before the dispute is resolved.

- (e) Threshold grievances shall be prepared by the PWU PSA SPOC, as designated by the PWU individual responsible for PSAs, and presented to the Site Management PSA SPOC.
- (f) Within 48 hours, Management shall respond to the grievance, in writing, stating its position.
- (g) Both parties shall endeavour to complete a Record of Discussion form, or an agreed upon Statement of Facts sheet.

**Note:** Arbitrator (in accordance with Article 12 of the OPGN/PWU CA) has already ruled that a response such as “no violation of CA” shall not be sufficient.

- (h) The PWU office shall assign a grievance number.
- (i) The Site Management PSA SPOC shall forward copies of the completed grievance forms and associated Fact Sheets or Record of Discussion forms to the PWU office and Corporate Labour Relations.
- (j) Grievances shall be referred to arbitration and scheduled through joint agreement between Corporate Labour Relations and the PWU.
- (k) If required, local discussions shall take place with a view to resolving a threshold grievance up to the arbitration date.

### 1.11 Above Threshold Purchased Service Agreement discussions.

1.11.1 Above threshold Purchased Services will not commence until they have been agreed to by the PWU. Failure to have joint agreement means that Purchased Services shall not proceed until the Joint Resolution Committee (JRC) resolves the dispute.

**Instruction**

Internal Use Only		
Document Number: <b>N-INS-08400-10027</b>		Usage Classification: <b>Information</b>

Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

(Reference: OPGN PWU/Management PSA Operational Plan, Section 7.0).

**1.12 Evaluating Alternatives**

**1.12.1 Parties shall consider such alternatives as:**

- Doing work internally.
- Doing part of the work internally and part externally.
- Doing work externally and agree to acquire capability to do work internally in future.
- Doing work externally.

**1.12.2 When evaluating alternatives, parties shall consider the impact on the customer, employees, and business, using the following criteria:**

- Reliability of service to customer
- Customer responsiveness
- Community impact
- Company relations' impact
- Job continuity
- Ability to perform work
- Amount of overtime required for work
- Availability of resources
- Cost
- Timeliness
- Quality
- Need for control over results
- Safety
- Impact on environment.

**1.12.3 In order to evaluate a proposed Purchased Service against above criteria, both parties require sufficient information to have a meaningful discussion. Such items as scope of work, budget, and resource requirements, including skills, equipment requirements, facilities, supervision, and overtime are all areas that may be discussed.**

**1.12.4 It is important that Management 'package' work appropriately. Management should be prepared to share this information with the PWU.**

**1.12.5 Prior to a meeting of the JRC, Management shall provide the following:**

- Copies of tender or request for proposal documents, if any.
- An accurate description of the work which is subject of the proposed PSA.
- Accurate details on bids, price, and scope of the work, as set forth in the bid.
- A full cost-benefit analysis, including incremental costs, but excluding overhead costs that may be incurred.

**1.12.6 If Management wishes to proceed with a PSA and cannot get local agreement, they shall complete the required information listed above and send to the PWU. This**

**Instruction**

Internal Use Only		
Document Number: <b>N-INS-08400-10027</b>		Usage Classification: <b>Information</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>11 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

information is designed to be used as Management's business case for above threshold PSA's.

- 1.12.7 Parties shall endeavour to complete discussions within 10 days of the PWU receiving the business case, and if no agreement can be reached the matter shall be forwarded to internal local dispute mechanism.

**1.13 Purchased Services Agreement Joint Resolution Committee**

- 1.13.1 If parties cannot come to a local decision on a Purchased Service, Management shall have the right to refer the matter to the JRC.
- 1.13.2 In accordance with Article 12 of the OPGN/PWU CA, the JRC consists of one Management representative, one PWU representative, and the Arbitrator, who shall act as chairperson, plus additional resources, if required.
- 1.13.3 The JRC shall resolve disagreements on proposed above threshold Purchased Services on a consensus basis and in an expeditious manner, within 30 days of notice to PWU.
- 1.13.4 The Chairperson shall:
- (a) In the event that the parties are unable to resolve the issue by consensus decision, render a decision.
  - (b) Issue such orders as appropriate to give full effect to such decisions, and address any consequences the decisions may have in the workplace.
- 1.13.5 If formal bids have been received for a proposed PSA, management shall provide the PWU and, if necessary, members of the JRC, with details of the price and scope of the work bid.

**1.14 Contracts of a Recurring Nature**

- 1.14.1 There are Work Packages that are carried out on a regular basis for which PSA decisions for each contract would not be practical. For most of these contract types, an annual review is sufficient, unless documented reasons for the initial decision to contract changes significantly.
- 1.14.2 Parties should strive to identify these types of contracts so that they can be dealt with efficiently.

**1.15 Contracts Not Subject to In-Depth Review**

Normally, types of contracts not subject to in-depth reviews shall be those identified as below threshold.

**Instruction**

Sheet Number: <b>N/A</b>	Revision Number: <b>R001</b>	Page: <b>12 of 15</b>
Title: <b>PURCHASED SERVICES AGREEMENT OPERATING INSTRUCTION</b>		

**1.16 Time Frame for Decision Making**

- 1.16.1 The fundamental principle of the PSA review process is that it shall not hinder getting work done. Enough time shall be left between the proposed start of job and the target date for the PSA process to take place.
- 1.16.2 Unless extenuating circumstances dictate otherwise, the Initiator of the PSA process for a particular Work Package shall establish a target date for reaching a PSA decision, taking into account such factors as work schedule, size of job, potential impact on staff, and number of affected Work Units.
- 1.16.3 When a target date has been agreed to, Decision-Makers shall make every effort to meet that target date. If no agreement is reached by the target date, the issue shall be automatically scheduled for dispute resolution, even if discussions continue locally.

**1.17 Joint Training of Decision Makers**

- 1.17.1 All PSA Decision-Makers shall receive joint training on the PSA process, and the PSA operating procedure, including the Teplitsky video created for this purpose.
- 1.17.2 Signatories of this document shall ensure development and delivery of joint training for Decision Makers.

### Title: REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

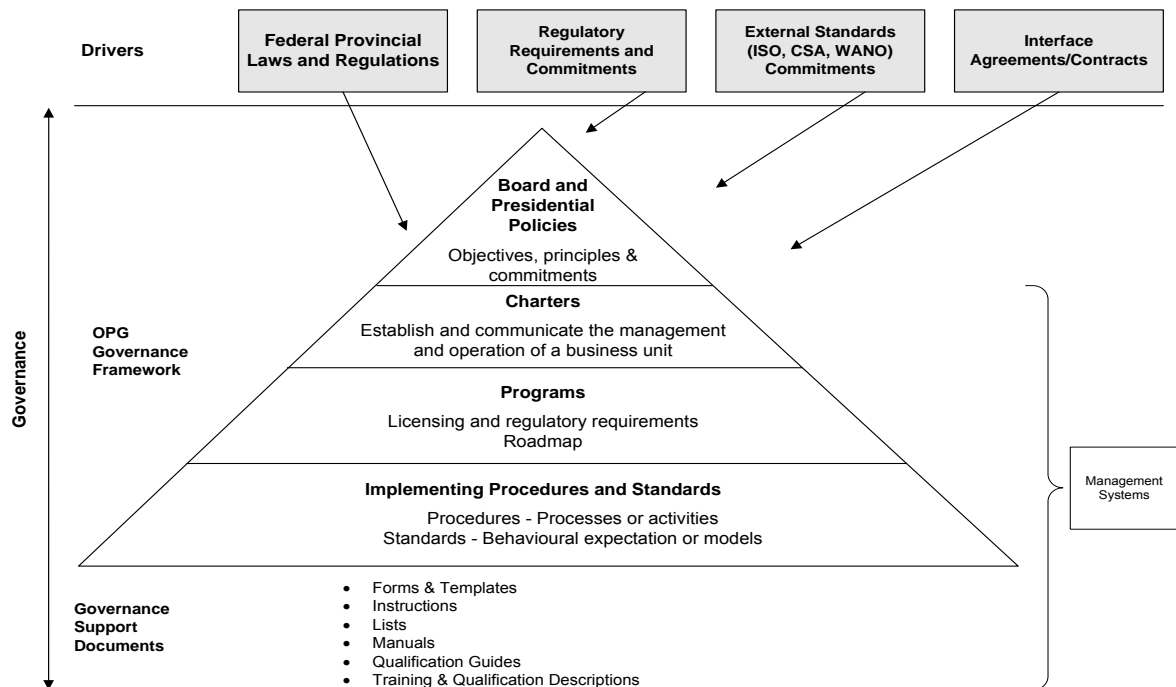

## 1.0 REQUIREMENTS

OPG's Integrated Framework describes how the company's governance and management systems interact to guide the operation of OPG.

Administrative Governance documents are documents that support and satisfy:

- Best business practices
- OPG's mission statement
- Code of Ethics
- Legal, regulatory, licensing, and quality assurance (QA) obligations and commitments
- Hierarchical authority; and
- Administrative levels associated with safe and ethical conduct of a successful business.

Figure 1, Ontario Power Generation Governance Framework Relationships, demonstrates the relationship amongst OPG's drivers, The Framework, and Governance support documents required to provide OPG with a compliant, consistent, and cost-effective control of its business.

**Figure 1: Ontario Power Generation Governance Framework Relationships**

Where appropriate, each Line of Business (LOB) should define governance that meets the minimum requirements of their business and obligations.

## Ontario Power Generation Standard

Internal Use Only		
Document Number:	OPG-STD-0001	Revision: R006
Usage Classification:	Information	Sheet Number: N/A Page: 6 of 21

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

In general, Governing documents:

- Stipulate philosophy, mandatory rules, regulations, and management controls.
- Contain only objectives, requirements, or processes required to comply with legal, regulatory, and licensing requirements.
- Contain commitments to external standards.
- Are appropriate where there is risk of unacceptable economic impact.
- Are appropriate if endangerment of personnel, public, environment, or damage to plant equipment is possible.
- Shall consider the impact on people with disabilities. Refer to OPG-STD-0074, Accessibility for Ontarians with Disabilities Act Integrated Accessibility and Customer Service Standard.

#### 1.1 Ontario Power Generation Governance Framework

The Framework is a webpage showing Governance documents in a hierarchical manner alongside all other Governance documents in the same LOB or business program area.

#### 1.2 Lean Principles

Proposed Governance changes driven by new requirements need to be rigorously reviewed against the source of the requirement, with an evaluation of the change to improve performance, increase efficiency, and lower costs. The bias should be against creating new Governance.

The following principles apply:

- (a) **Mandated** – There is a legal, regulatory, or high-level Corporate goal requiring the Governance which, if not documented, would represent an unacceptable risk to the company.
- (b) **Unique** – The Governance addresses a unique purpose. No other Governance exists that covers the proposed process or program.
- (c) **Material** – There is substantial benefit and value added by implementing the Governance, considering the cost of implementing and maintaining the processes associated with the document.

#### 1.3 Usage

##### 1.3.1 Classification

- (a) Usage Classification designates the applicable requirements for Governance use during an activity. It denotes the frequency or degree of reference by the user versus the dependence on the user's memory and recall.

## Ontario Power Generation Standard

Internal Use Only		
Document Number:	OPG-STD-0001	Revision: R006
Usage Classification:	Information	Sheet Number: N/A Page: 7 of 21

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

(b) Any document that contains Nuclear bases shall comply with N-STD-AS-0002, Procedure Use and Adherence.

(c) Levels of use from higher to lower are Continuous, Reference, and Information.

**Note:** Typically, administrative Governance documents are Information. For documents in a legacy format, if no usage classification has been designated, assume usage classification to be Information.

#### 1.3.2 Shall, Should, and May

Evaluate use of the following verbs to indicate an obligation to carry out an action. Use of the words **shall**, **should**, and **may**, shall be interpreted as follows:

- (a) Actions or steps associated with the word **shall** are mandatory and strict compliance is required with the step as written. Deviations are permitted only by formal prior Governance revision and authorization. Actions or steps associated with the word **shall** are used in Governance to denote activities where failure to execute would result in a violation of a code, standard, licence or legal requirement or where, in the Program Owner's judgment, similar significant negative consequences would result.
- (b) Actions or steps associated with the word **should** are recommended or preferred management expectations or actions. The Band G Manager directing the task has approval to authorize occasional and rare deviations from the directions contained in the Governance. However, such deviations shall:
  - (1) Not violate the intent of the Governance.
  - (2) Not become a common or usual pattern of behaviour.
- (c) Actions or steps associated with the word **may** provide the end user with the option, on his/her own authority, to differ from the directions contained in the associated step(s). This provides the end user with flexibility, while intelligently meeting the purpose and intent of the step.

#### 1.4 Document Types

Governing documents consist of the following types:

- Policy
- Charter
- Program
- Procedure
- Standard.

Governance support documents may include the following types:

- Form
- Instruction
- List
- Manual

## Ontario Power Generation Standard

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

- Qualification Guide
- Template
- Training and Qualification Description.

OPG-GUID-08130-0001, Writing Guide for Administrative Governance Documents, provides recommendations for creating or revising Governance documents.

#### 1.4.1 Policies

Highest level of governing documents, used by the President or Board of Directors, to define high-level objectives, principles, or commitments for the conduct of OPG's business. Policies define the powers, rights, and privileges which may be exercised by OPG and its officers.

#### 1.4.2 Charters

Establish and communicate the management and operation of a business unit. In Nuclear, the Charter and its associated Programs and lower-level governance form the Nuclear Management System. In non-Nuclear, Charters may be used to implement OPG-POL-0033, OPG Business Model.

#### 1.4.3 Programs

- Intermediate-level Governing documents that take authority from a Policy or Charter.
- Articulate how business objectives, requirements (licensing, legal, regulatory, QA), and commitments are fulfilled.
- Program activities are implemented by Procedures, Standards, and Governance support documents.

#### 1.4.4 Procedures and Standards

- Lower-level Governing documents that take authority from a Program or Policy.
- Peer-level documents and do **not** take authority from each other.
- May exist at either an OPG or LOB level for a given process or implementation requirement, but **not** both.
- A Standard should **not** define technical, design, or training requirements. These are defined in design basis documents or training documents.

#### 1.4.5 Governance Support Documents

- Provide detailed instructions, criteria, or requirements for tasks or activities **mandated** by a Governance document.
- Satisfy an internal commitment.
- Typically take authority from a Procedure or Standard.

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

#### 1.5 Revision Types and Criteria

##### 1.5.1 New

Creation of a new document.

##### 1.5.2 Intent Revision

Non-urgent change to a Governance document that modifies, deletes, or adds actions, roles, purpose, or conditions.

##### 1.5.3 Minor Revision

- (a) An urgent intent change required in less than 5 business days when adherence with existing process is not possible.
- (b) May be used to initiate a pilot process.
- (c) Shall not be processed on documents listed in N-LIST-00531-10002, OPG Documents Referenced in Licence Conditions Handbook, without prior approval from Manager, Nuclear Regulatory Affairs.
- (d) Should not be used for forms or templates due to the requirement to show tracked changes.

##### 1.5.4 Non-Intent Revision

A change to a Governance document that does **not** modify, delete, or add actions, roles, purpose, or conditions, e.g., typographical errors, obvious incorrect sequence of steps, added or removed statements for clarification, compliance date changes, renumbering with no other intent changes.

#### 1.6 Document Section Requirements

- (a) All sections of OPG-TMP-0001 are **mandatory**, however if there are no requirements for a section, state "None".
- (b) Requirements outlined in this section are for Programs, Procedures, Standards, and Governance support documents. If writing a Charter or Policy document, consult Senior Manager, Information Management Program Authority.

##### 1.6.1 Authorization

This section appears on the cover sheet. Refer to Governance Ownership list on the Governance website for correct position holders.

##### 1.6.2 Document Relationship

This section appears on the cover sheet.

- (a) Identify document applicability (e.g., OPG Wide, All of Nuclear, Supply Chain).

Usage Classification:	Information	Sheet Number: N/A Page: 10 of 21

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

- (b) Identify document number and title from which the document receives direct authority. The “parent” document is required to direct use of “child” document and to build the framework structure.

#### 1.6.3 Document is Related to Pressure Boundary Checkbox

This section appears on the cover sheet.

Pressure Boundary related governing documents are those that support the implementation of the Pressure Boundary QA program as documented in N-MAN-01913.11-10000, Pressure Boundary Program Manual. Refer to N-LIST-01913.11-10001, Nuclear Pressure Boundary Governing Documents. If a document is included in this list, select the “Document is Related to Pressure Boundary” checkbox.

#### 1.6.4 Document Requires CNSC Notification Checkbox

This section appears on the cover sheet.

Documents listed in N-LIST-00531-10002 require Canadian Nuclear Safety Commission (CNSC) written notification or acceptance. If a document requires CNSC notification, select the “Document Requires CNSC Notification” checkbox.

#### 1.6.5 Purpose or Purpose and Scope

This section appears on the cover sheet of the Governance document and requires text input.

- (a) Provide a clear and brief description of the fundamental intent or focus of the document.
- (b) Limit rationale, background, or process details.
- (c) Include any external requirement references (associated Program document bases) that the document supports.

#### 1.6.6 Dates

This section appears on the cover sheet.

- (a) The PDF Creation Date updates automatically to always show as “today’s” date. When the final PDF is prepared for approval, the PDF will show the date the PDF was created.
- (b) Compliance date should match compliance indicated on OPG-FORM-0001, Governance Management Record, Section C and should be assigned as follows:
- Immediate

**Note:** Compliance date for forms is always “Immediate”.

## Ontario Power Generation Standard

Internal Use Only

OPG-STD-0001	R006	
Usage Classification:	Sheet Number:	Page:
Information	N/A	11 of 21

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

- Immediate (See Exceptions)

If “Immediate (See Exceptions)”, the exceptions should clearly indicate exceptions to immediate compliance (e.g., Compliance with Section X is not required until YYYY-MM-DD. Compliance at Darlington is not required until YYYY-MM-DD).

- Future Date (See Exceptions)

If “Future Date (See Exceptions)” is used, the exceptions box should state “Previous revision (R0XX) should be used until the Compliance date of YYYY-MM-DD”.

#### 1.6.7 Exceptions

This section appears on the cover sheet.

- (a) If there are no exceptions, state “None”.
- (b) Identify exceptions or specific circumstances in which the document or parts of it do not apply.
- (c) If there are specific functional areas, processes, or organizational units that would normally fall under the scope of the document, but are purposely excluded, identify and provide the rationale for such exceptions.
- (d) If there are specific circumstances, periods of time, or conditions under which all or parts of the document do not apply, give specifics.

#### 1.6.8 Relevance to Nuclear Safety Policy

This section is optional and if selected, appears on the cover sheet and requires a simple statement.

Include N-POL-0001, Nuclear Safety Policy, requirements to which the relevant Governance is most closely aligned.

#### 1.6.9 Table of Contents

- (a) If a document is greater than 12 pages or contains appendices, a Table of Contents (TOC) is required.
- (b) If included in a document, TOC should appear on its own page. Font size may be reduced to conserve space.
- (c) TOC should be refreshed after all revisions are made to the document.

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

#### 1.6.10 Direction or Process or Requirements

This section is the most important section of a Governance document and is **mandatory**. Content requirements vary according to the specific Governance type. Consult the requirements listed below for the most common Governance document types.

##### 1.6.10.1 Programs

Programs are “roadmap” documents that convey how implementing and support documents are integrated to form a managed system that meets specific program requirements.

- (a) Section 1.0 should be titled either Direction or Requirements.
- (b) Define compliance to external requirements. These are licensing, legal, regulatory, and QA requirements and principles. These requirements are called ‘Bases’ and should be noted and listed as follows:
  - (1) If entire Program implements a basis requirement, identify basis requirement in Purpose or Purpose and Scope Section of document.
  - (2) In the Program document text, identify each basis requirement as shown in example below.
 

**Example:** Any work activity that affects reactor regulation or fuel cooling shall be governed by an approved procedure. **[B-1]**
  - (3) If multiple bases apply to a statement, enclose each basis number in separate brackets.
 

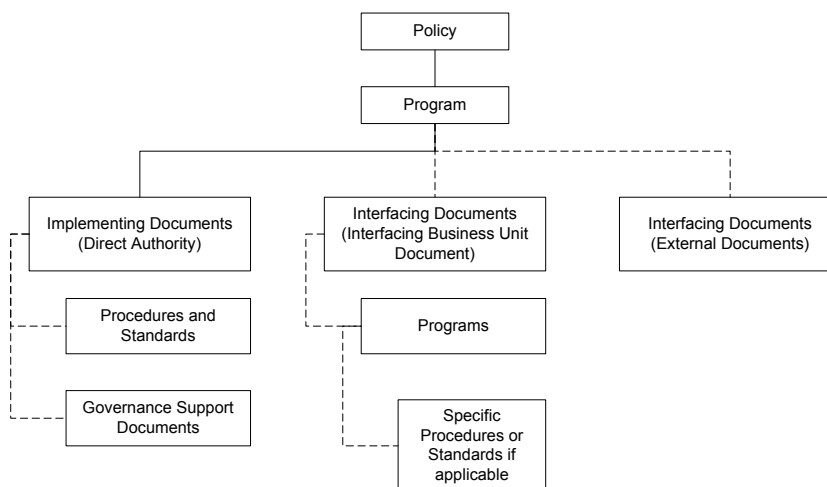

**Example:** Any work activity that affects reactor regulation or fuel cooling shall be governed by an approved procedure. **[B-1] [B-2] [B-3]**
  - (4) List bases documents in Section 4.1, Bases, of the document.
- (c) Include a figure illustrating the entire program scope to at least the level of Procedure and Standard, including implementing and interfacing documents. Refer to Figure 2, Program Model, as an example.
  - (1) Implementing documents should include documentation that provides implementing details for requirements, activities, and processes described by the Program.
  - (2) Interfacing documents should include documentation that interfaces or interacts with the Program to fulfill requirements or commitments.
  - (3) If the figure is large, it may be included as an appendix.

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

**Figure 2: Program Model**

- (d) Specify the performance indicators or monitoring activities that are necessary to ensure overall Program requirements are met.

#### 1.6.10.2 Procedures and Standards

Title Section 1.0 as either Direction or Process (Procedure) or Direction or Requirements (Standard), and include a **brief** overview of the process or requirement to serve as an introduction.

- (a) A Procedure establishes:

- **Who** has to do it.
- **What** has to be done.
- **When** it is required.
- **Where** it is required.
- **How** it is done.

**Note:** If the level of detail on the “how” is complex, consider the creation of an Instruction (Governance support document) to further detail the activities or tasks required by staff.

- (b) A Standard:

- (1) Defines behavioural expectations or criteria requirements used to control business activities.
- (2) Prescribes specific criteria common to a class of outputs.

Usage Classification:	Sheet Number:	Page:
Information	N/A	14 of 21

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

#### 1.6.11 Roles and Accountabilities

- (a) Identify and provide a high-level summary of accountabilities for Manager level (Band G) or higher position holders or roles concerning the accomplishment of activities related to the implementation of the document.
- (b) If accountability is shared by multiple positions, use whatever term is encompassing (e.g., Line Management).
- (c) Use positions outside the functional area covered by the document only as necessary to define boundary accountabilities.
- (d) If required, include definition or description of a role as an introduction to this section.
- (e) Do **not**:
  - (1) Duplicate actions, activities, or tasks already covered by Section 1.0 of the document.
  - (2) Use personal names.

**Note:** Governance support documents should not specify accountabilities or responsibilities.

#### 1.6.12 Definitions

- (a) If there are no definitions, state "None".
- (b) Define only those terms that are unfamiliar to the user. If a term is understandable within the context of the statement in which it appears, do not define it.
- (c) Do **not** define:
  - (1) Generic terms if the dictionary definition conveys the meaning of a term.
  - (2) Terms commonly used within the applicable business area.
  - (3) Criteria, process steps, or activities already in the body of the document. Examples may be included.

#### 1.6.13 Abbreviations and Acronyms

Some abbreviations and acronyms are more widely known than the spelled out versions. Use of abbreviations and acronyms should be for the benefit of the reader, however there should not be so many acronyms that the document becomes unreadable.

- (a) If there are no Abbreviations and Acronyms, state "None".
- (b) If there are abbreviations and acronyms, list in the Abbreviations and Acronyms section at a minimum.
- (c) Do not add commonly known terms to the abbreviations and acronyms list, e.g., OPG.

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

#### 1.6.14 Bases, Records, and References

##### 1.6.14.1 Bases

- (a) For program documents, this subsection is **mandatory**.
- (b) For procedures and standards, if no bases, state “None”.
- (c) Bases are a listing of licensing, regulatory, and legal requirements and external commitments such as International Organization for Standardization (ISO), World Association of Nuclear Operators (WANO), Canadian Standards Association (CSA), etc. Could also be industry guidelines and standards of excellence (e.g., INPO or WANO) and requirements of codes and standards.
- (d) Many records must be retained by the Corporation in order to satisfy the requirements of federal and provincial statutes and regulations. The following are a few examples of statutes and regulations that require records to be kept:
  - Nuclear Safety and Control Act
  - Ontario Business Corporations Act
  - Ontario Corporations Act
  - Federal Income Tax Act
  - Limitations Act and Canada and Ontario Evidence Acts
  - Ontario Power Generation Administrative Requirements.
- (e) For each basis requirement, identify specific clauses or sections of the basis requirement so that it is clear which is being addressed by the Program document.

**Note:** Basis coverage may be detailed in an associated document.

##### 1.6.14.2 Records

- (a) If no records are produced, sentence and table may be removed and state “None.”
- (b) Complete the Records Table provided as part of the template. State what outputs in the form of records are generated from the process and how, where, and for how long they are retained. Refer to Figure 3, Records Table, for required information.

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

Record Created	Associated Form or Template Number	QA Record? Y/N	Filing Information/Retention (AIMS Type/Sub-Type)
<i>Name of Record Being Created</i>	<i>Form or Template used to record the record</i>	<i>QA Record? In accordance with OPG-PROC-0179</i>	<i>WHERE INDEXED/FILED? e.g., Indexed in AIMS. HOW IDENTIFIED? Document Number e.g., Facility- Doc Type/Sub Type – SCI – 7 or 5 digit Sequence No. RETENTION? Records Retention Code (RRC) in accordance with the Corporate Records Retention Schedule (CRRS), (this may be blank if in progress, or for stand-alone records, provide a recommended retention period). E.g., ADM-0012</i>

Figure 3: Records Table

- (c) Refer to OPG-PROC-0019, Records and Document Management, and, for Nuclear, OPG-PROC-0179, Nuclear Quality Assurance Records, for further information and guidance.
- (d) For Forms:
  - (1) Ensure the Records File Information in the header has only 3 generic statements and remove any other wording.
  - (2) Provide direction as to where or what to do with the Forms once completed.
  - (3) The SCI/GSI/USI line is only required if the Form has a unique SCI/GSI/USI, if it doesn't, this line is not required.

**Note:** If a record is mentioned in a governance document, but receives authority from another, it should be listed in the records table but the filing directions should reference the applicable document.

### 1.6.14.3 References

Ensure documents listed as performance or developmental references are available (e.g., issued in an Approved Information Management System [AIMS]).

#### (a) Performance References

List documents a user needs to obtain for use in conjunction with the document. This includes any forms or templates that a user may need.

- (1) Identify each reference by document number and title. Do not include revision number, unless a specific revision or version was used.
- (2) Industry guidelines and standards of excellence (e.g., INPO or WANO) and requirements of codes and standards are considered to be performance references. If only a specific portion of the performance reference is implemented or applies, document that portion specifically.

Title:

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

(3) If there are no performance references, state “None”.

(b) Developmental References

List documents that were used in the preparation of the document that may provide the user with additional information.

(1) Identify each reference used to develop the content of a Governance document by both its document number and title (if known). If a specific revision or version was used, identify it.

(2) If there are no developmental references, state “None”.

#### 1.6.15 Revision Summary

(a) Remove all previous revision summaries as only the current summary is required.

(b) Indicate revision type (i.e., intent, non-intent, minor revision, or new document).

(c) State if revision bars are not used.

(1) Use the revision bar tool in the body of the document to designate document alterations, **except** as noted below:

- Shifted document text
- Editorial corrections
- Page header information
- TOC
- Forms
- Major rewrites
- Rev 000 documents
- Authorization box on cover sheet
- Revision Summary.

(2) Show revision bars in right margin.

(d) Indicate any superseding or obsoleting action(s), including minor revisions.

(e) Provide a clear and simple summary of changes, including a gap analysis between the current revision and the previous one.

#### 1.6.16 Appendices

(a) Use appendices for information such as tables, illustrations, or narrative text that is difficult to integrate into the body of the document.

(b) Samples of forms and templates should normally be included in appendices. If included, each form should be a completed sample and watermarked as “Sample”.

(c) Ensure each appendix is referred to in the document or by another appendix.

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

- (d) Appendices should be designated by letters and placed in alphabetical order. Arrange the appendices in the order they are referred to within the document.

## 1.7 Document Control

### 1.7.1 Document Numbering Scheme

The minimum set of information required should be consistently applied and recorded in the "Document Number" box (header of template), as follows:

**Note:** Legacy document numbering schemes may remain in place.

- (a) Sponsoring Business Unit identifier or Facility (i.e., FIN [Finance], N [Nuclear], PC [People & Culture], etc.)

**Note:** If Governance compliance is expected across all LOBs, choose OPG.

**Note:** Centre-led organizations that own Program documents tied to generating business management systems may use the generating facility identifier, e.g., N.

- (b) Document type.
- (c) Governance Support documents include a System/Subject Classification Index (SCI) number.
- (d) Unique numeric number assigned sequentially for each document type.
- (e) In Nuclear:
- (1) Include a third-level, two-letter code, e.g., AS, MA, TR. These are used for Charters, Programs, Procedures, and Standards as described below:

AS	Provide Administrative Assistance
HR	Manage Human Resources
LE	Life Extension
MA	Maintain Plant
MM	Procure and Control Material
MP	Modify Plant (Engineering)
OP	Operate Plant
RA	Comply with Nuclear Regulatory and Industry Requirements
SS	Safe Storage
TR	Training
WM	Waste Management

### REQUIREMENTS FOR ADMINISTRATIVE GOVERNANCE DOCUMENTS

**Note:** Refer to N-CORR-00583-{332055}, OHN Work Breakdown Structure (NEI Code) Dictionary, for further information regarding the Administrative Code chart.

- (2) Any requests for a new third-level code should be approved by Senior Manager, Information Management Program Authority.

**Note:** Applicability within the sponsoring business unit is identified on the cover sheet under Document Relationships (e.g., a procedure applicable only to Supply Chain would be numbered BAS-PROC-XXXX, applicability would be Supply Chain).

#### 1.7.2 Watermarks

- (a) Draft watermark should be applied to Governance documents that are not yet approved for use.
- (b) Minor revisions shall be issued with a “**CHANGE**” watermark.

#### 1.8 Writing Practices and Format

OPG-GUID-08130-0001 may be used when preparing Governance documents.

### 2.0 ROLES AND ACCOUNTABILITIES

#### 2.1 Senior Manager, Information Management Program Authority

- 2.1.1 Ensures The Framework is maintained.
- 2.1.2 Monitors review cycles and reports/communicates on overdue and coming due documents.

### 3.0 DEFINITIONS AND ACRONYMS

## 5.0 REVISION SUMMARY

This is an **intent** revision.

- Minor changes throughout for clarification.
- Changed Director, Nuclear Regulatory Affairs and Stakeholder Relations, to Manager, Nuclear Regulatory Affairs throughout.
- Removed references to specific Lines of Businesses throughout.
- Replaced N-PROC-AS-0003 with OPG-PROC-0178 throughout (DCR 133045).
- Replaced N-PROC-AS-0042 with OPG-PROC-0179 throughout (DCR 133041).
- Replaced N-PROG-AS-0006 with OPG-PROG-0001 throughout (DCR 132951).
- Section 1.6.14.3: Removed requirement for reference lists to appear in alpha numeric order (DCR 135272).

**RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN**

## Revision Summary

Revision Number	Date	Comments
R000	2012-02-03	Initial Issue
R001	2012-06-20	Revised to include updated project gate progression strategy, RFR EPC Agreement Information, RFR Contract Oversight, and alignment with RFR Contractor management plans.
R002	2013-02-04	Revised and detailed all plans and created separate detailed plans referenced herein for Project Controls, Engineering, Contract, and Oversight.
R003	2016-10-13	<p>Comprehensive update to reflect scope, organization, and management plans as of Gate 3A: Unit 2 Execution Estimate was approved in august 2016. This includes Execution phase plans and processes. Minor clarifications, formatting and grammatical corrections throughout the document.</p> <p>Section 1.0 changed from Introduction to Executive Summary with overview of current project status. Duplicate listings of PMBOK sections with reference to chapters removed – the table of contents identifies where in this PMP information is located. Significant updates to rest of Section 1.</p> <p>Section 2 Streamlined, duplicate lists removed.</p> <p>Section 7, 8, 9, 10, 11 Project Controls Plan contents incorporated into this PMP. PCP contents updated to reflect current processes.</p> <p>Section 13 Roles and Responsibilities table updated for execution phase.</p> <p>Section 15 Risk management significantly revised to reflect significant alignment of RFR process with NR Risk management governance as well as “JV risk management plans for execution phase.</p> <p>Appendices updated to include PCP contents (PCP to be superseded to this document after issue)</p>

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 1.0 EXECUTIVE SUMMARY

Darlington Nuclear Generating Station (DNFS) requires a major refurbishment to extend the service life of all four units. The Nuclear Refurbishment (NR) Program has completed its Definition Phase, with the Execution Phase started in early Q1 2016 after the OPG Board of Directors approved the Release Quality Estimate in November 2015. Unit 2 Execution Estimate has been approved as of August 2016.

The major component of the refurbishment program is the Retube and Feeder Replacement (RFR) project. This document is the Project Management Plan of the RFR project and is intended to:

- Define the scope of the project.
- Explain how RFR project activities are carried out.
- Explain RFR interfaces with Nuclear Refurbishment program as a whole.
- Provide the current execution baseline and define how the project will be carried out to completion.

This PMP takes its authority from the DNFS NR Project Charter [R-30] and the Project Management Program of OPG Nuclear [R-11]. This PMP will be kept current to ensure it accurately reflects the approved execution baseline and the processes for managing it.

### Current Project Status

The following are key issues that are being planned and executed at this time:

- Overall Execution Planning
  - Clarifying project management execution organization, including roles and responsibilities.
  - Identification and evaluation of opportunities to further reduce project schedule, cost and risks.
  - Finalize overall Series Readiness Requirements.
- Engineering, Operations & Maintenance
  - Completion of detailed engineering, issue of final Comprehensive Work Packages, Work Plans, ITPs and more detailed planning through NR optimized OPG work management processes.
  - Execution of Mobilization Plan work on mockups at DEC and WTS at vendor site is in progress. CWP contingency operations are being executed and CWPs marked up as applicable.

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>9 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Execution of Process Qualification work is in progress on mockups at DEC for compliance with Technical Specifications incremental requirements.
- Development of future units MEC packages is in progress.
- Infrastructure
  - Planning for Logistics (onsite and offsite). Moving equipment between warehouses, clean room, contaminated facilities etc.
  - Finalize plans for inter-station transfer vehicle/movements/MODs.
  - Planning for training at the DEC mockups.
  - Finalize RWN waste streams and containers for storage of waste.[R-1]
- Tooling
  - All baseline tooling milestones have been completed as of this time.
  - progressing additional tooling milestones per project change directives.
  - Oversight of materials management plans [R-57], series readiness activities and repair/replace/troubleshooting work orders created through the JV's Tool Management Organization (TMO). [R-67]
  - Oversight of JV populating tooling, components/assemblies, and work orders in EPICOR material tracking and work management software application.
  - Detailed planning for commissioning of the Waste Tooling System.
  - Finalize process for Tooling Change Control.
  - DA signatures of RFS packages.
  - Oversight of ESCROW repository for Tooling Intellectual Property.
  - Interface with RTS project for pressure test of PHT system.
- Procurement
  - Oversight of procurement of Goods and OSM for unit 2 with associated Contract Milestones, OSM for future units in progress.
  - Oversight of JV recovery plans for critical at risk components (Feeder I690 material and lower feeder production).
- Project Integration
  - Ongoing integration efforts through NR stakeholders including O&M, schedule and work management.
  - Alignment between RFR schedule and other Refurbishment project schedules.

## Plan

Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>10 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Construction and Field Work
  - Oversight and support of Prerequisite construction activities including Retube Control Centre construction and TPDS installation
  - Ongoing field walkdowns.
  - RWPB construction.
  - Transition of organization location to RPO and RFRISA.
  - Ongoing review and incorporation of lessons learned from current and previous construction projects (especially inside the DNGS protected area).

### 1.1 Revision Control

This document is reviewed and revised on periodic basis to update the changes and existing practices. The revision status is documented in the revision summary of this document.

### 1.2 RFR Project Scope

All Nuclear Refurbishment scope is allocated to project bundles via the Darlington Scope Request (DSR) Database [Appendix A]. The RFR DSRs describe the scope in general terms and the RFR project Scope of Work (SOW) [R-21] more precisely elaborates the work in functional terms. The RFR SOW is the key reference in the Contract established with The Joint Venture (JV) of SNC-Lavalin Nuclear Inc. and Aecon Construction Group Inc. The JV is also referred to in this document as the "EPC Vendor" or the "RFR Contractor". Scope is then managed using change control, in the NR program and in the Contract. A more detailed account of scope management is provided in Section 6.0.

In general, the RFR scope consist of all work required to complete the repair and replacement of feeders and fuel channels. In addition, some construction scope from other project bundles will be executed by the RFR Contractor where there is a substantial risk of interference between the scopes of work due to either system or geographic interferences. In order to keep the RFR team focused on its core scope, all reasonable efforts will be made to have any potential new scope completed by other workgroups.

Any changes to scope of RFR project are managed in accordance to the Change Control process described in Nuclear Refurbishment (NR) Program Change Management [R-71] . Any additional scope to the RFR contractor is managed through Project Change Directives (PCD) and Contract Amendments.

The RFR project scope is defined by breaking down its constituent activities by focus area:

- **Mock-ups:** Includes development of full scale Mock-Ups of the reactor at the Darlington Energy Complex (DEC), including vault internal structures, fuel

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

channels, feeders, feeder cabinet, Fuelling Machine bridge, vault cranes and channel array. These mock-ups were utilized to perform Tool testing and commissioning, as well as integration activities during the Mobilization Plan activities and will be used extensively for trades training to minimize the performance ramp up when transitioning to the station environment.

- **Station Modifications:** Includes the engineering, procurement and construction of all temporary and permanent modifications to support the field execution of the RFR work scope. This will also include development of any required tooling, procedures, documentation, licenses, permits and approvals from regulatory bodies, Inspection & Test Plans, Job Safety Analysis, Comprehensive Work Packages and Work Plans.
- **Containment Isolation:** Includes the engineering, procurement and construction of all temporary and permanent modifications to separate the refurbishment unit reactor vault from station containment, including the test equipment to be installed and operated to demonstrate that the new temporary containment boundary meets all requirements for the station containment. Shielding will be installed as required to allow RFR work to continue when a fuelling machine with irradiated fuel onboard transitions beneath the refurbishment unit. This will also include development of any required tooling, procedures, documentation, licenses, permits and approvals from regulatory bodies, Inspection & Test Plans, Job Safety Analysis, and Comprehensive Work Packages.
- **Tooling:** Includes development of all removal, inspection, installation and common tooling, development of the associated procedures for their use, procurement of materials and goods, as well as qualification, testing and commissioning of the equipment.
- **Procurement:** Includes planning for, acquisition and storage of materials to support the RFR work scope. An overview of the major components required for acquisition is provided in the following sub-section.
- **Balance of Reactor Vault:** RFR will take on certain scope that could result in significant integration concerns in the vault so that RFR can have full control of the vault during Execution Phase. To date, the following items have been accepted into RFR for field execution:
  - Replacement of vault Air Cooling Units (ACUs). Engineering and Procurement remains with the Fuel Handling Project bundle.
  - Replacement of the Fuelling Machine (FM) bridge ballscrews. Engineering and Procurement remains with the Fuel Handling Project bundle.
  - FM bridge part replacement during bridge re-assembly. Engineering and Procurement remains with the Fuel Handling Project bundle.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>12 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Vacuum dry of PHT and moderator auxiliaries. Engineering, Procurement and Construction for the auxiliaries to agreed boundary point accepted from the Shutdown and Layup Project bundle.
- Annulus Spacer Retrieval Tool (ASRT) - during the end fitting removal series, this new set of tooling will retrieve 24 intact spacers for material surveillance and fitness for service assessment; the spacers are removed from four axial locations in each of six selected channels and transferred into a set of flasks for transport to an offsite testing facility. Engineering, Procurement and Construction (field execution) performed by RFR Vendor.
- Feeder and fuel Channel Baseline Inspections: to perform both the feeder and fuel channel inspections prior to installation activities. This strategy would eliminate the need for an initial in-service inspection outage.
- Flow element inspections: RFR to segregate 4 feeder flow elements in RFR waste containers to allow MCED to retrieve at Western Nuclear Waste Division to redirect to a 3rd party facility for destructive examination via COG.
- **Execution Phase Plan:** Includes the estimate development from Class 5 to Class 2 and a final version, Class 2 Estimate, Level 5 Schedule and RMO.
- **Waste Process:** Includes construction of the Retube Waste Processing Building (RWPB), processing of all wastes generated by the RFR project (primarily the reactor component waste streams such as fuel channel components), their segregation by type (non-radioactive, Intermediate and Low-Level Waste; incinerable, compactable, or processible), volume reduction, procurement of storage containers, and packaging in a form suitable for transfer to OPG's nuclear waste management division. This also includes all modifications and procedures to support the in-station transfer of waste flasks from the refurbishment unit to the RWPB.
- **Project Infrastructure:** OSM and Tooling Warehouse in DEC, OSM & Goods & Tooling storage (not in DEC), DEC Clean Room, Tooling Laydown areas in DEC, Tooling Laydown areas in DNGS, Tooling Contaminated Equipment Maintenance.
- **Integration, Logistics, and Optimization:** Integration of the work streams, planning the logistics of people and material movements through the infrastructure and transitions from series to series during the retube and waste processing and handling, and optimization of all of the work required for retube. Also managing the logistics for the entire Execution Phase, e.g. OSM, on-boarding, etc.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>13 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- **Training:** For Execution Phase, train the trainers, running scenario by scenario, practicing and simulating the integration, logistics, troubleshooting, and optimization of the procedures, with the goal of reaching productivity rates in each series as quickly as possible and being predictable against the estimate series to series.
- **Execution – Unit 2:** Performing pre-requisites, on-boarding staff and organization, training series-by-series, commencing each series in unit, managing day-to-day schedule, achieving productivity rates, time reporting, quality record-keeping, RWPB waste factory operation, Warehousing and material delivery operations, tooling maintenance operation, transitions execution, flask transfer operations, managing the Execution Phase Milestone Schedule and reviewing the evidence required to pay the fixed fee payments and progress payments as the Execution Phase progresses.
- **Planning – Units 1, 3 and 4:** Planning for follow-on Units 1, 3, and 4 may require updates to modifications, tooling, mock-ups, procedures, logistics, etc. This planning will need to occur leading up to and during each Unit refurbishment window in parallel with current unit field execution.

### 1.3 RFR Project Phases

The RFR Project is divided into two phases: Definition and Execution phase based on the Contractual terms [R-28].

**Definition Phase:** Definition Phase referred to the period between Contract award (March 2012) until completion of Definition scope as defined by Contract Milestone “Definition Phase Complete”. The milestone date for Definition complete was 30 June 2016, however a negotiated settlement was agreed between OPG and the Joint Venture (JV) that extended dates for select deliverables.

Completion of some scope packages added via PCD was contractually exempt from the Definition phase milestone. Examples include the completion of Retube Waste Processing Building (June 2017) and various Tooling PCDs (June 2017).

The Definition Phase covers the development of the common work packages such as the Tooling and Mockups to be utilized for all Units, Mods Engineering for unit 2, Procurement of Reactor components and Goods for Unit 2 and all the planning activities for the work to be carried out in the Execution Phase.

**Execution Phase:** Execution Phase began with the signing of the Execution Phase Contract Amendment in January 2016, will carry the RFR project through mobilization, pre-requisite work, Mobilization Plan testing, training and on-boarding prior to first unit breaker in October 2016 to Commissioning, close out, de-mobilization of last unit (Unit 4) in 2026.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>14 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

The Execution Phase covers the actual carrying out of the work on a Unit by Unit basis, Commissioning work required to return the Units to service, the closeout activities related to individual unit and overall project/Contracts closeout.

#### 1.4 RFR Project Execution on Multiple Units

Subsequent to the demonstration of acceptable project performance on the first refurbished DNGS Unit and approval by OPG and its stakeholders, the remaining Units will continue to be refurbished. The planning assumption at this time is that the unit sequence is Unit 2→3→1→4, with unit 1 starting after removals on unit 3, and Unit 4 starting after unit 3 is restarted (resulting in approximately 3 years of overlap of units in refurbishment). This overlap sequence will allow the removal team to complete removals on Unit 3, integrate lessons learned from this second unit then proceed into training and preparation for removals on the third unit, then onto the fourth. Similarly, the installation team will gain efficiencies through the overlapped units. This will significantly increase the logistics efforts in the station and at the DEC mock-up where simultaneous demands for space and transition areas will need to be tightly choreographed.

#### 1.5 NR Program Gated Process for RFR Project Progression

Funding of the Nuclear Refurbishment project bundles is done via several progression gates, with each gate requiring an elaboration of project plans including the scope, schedule, cost, and risks. This elaboration can also be called “rolling-wave planning”. In this manner, the risk of less accurate long-term planning is minimized via multiple gated reviews based on the maturity of the project and integration within OPG and with our Contractor Partners. The Gated process is described in “Nuclear Projects– Gated Process” [R-70]

The gated approach for the RFR Project defines the work to be completed in each project phase and the applicable gates. Multiple sub gate releases were planned to allow more accurate forecasting as the Definition Phase work progressed as depicted in Table 1 below.

Table 1: NR Program Gated Process for RFR Project Progression			
Gate	Date	Progression Period	Scope for Funding request
Gate 1	Feb 2012	Mar 2012- Aug 2012	Project Initiation,
Gate 1 Refresh	Aug 2012	Sep 2012- Feb 2013	Progression to Feb 2013
Gate 2A	Mar 2013	Mar 2013-May 2014	Progression to the end of Mock Up scope
Gate 2B	June 2014	June 2014-June 2016	Progression to the end of Definition Phase scope
Gate 2C	April 2015	Apr 2015- Dec 2015	Retube Waste Processing Building(Incremental scope ) -Engineering, Pre construction, Estimate
Gate 3	Dec 2015	Dec 2015-June 2017	Retube Waste Processing Building- Construction Scope, Building Readiness

<b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 2.0 PROJECT GOVERNANCE, STRUCTURE AND PLANNING

A Nuclear Project's Management Model has been created for Nuclear Projects to provide the Standards which the Projects must comply with and incorporate into their plans. Refer to Darlington Refurbishment Program Framework. The Darlington Refurbishment Program Framework may be referenced in the RFR project plans so as not to duplicate detail in the RFR PMP and its supporting sub-tier plans.

### 2.1 Darlington Retube and Feeder Replacement Management Planning

This RFR PMP follows the guidelines of the Darlington Refurbishment project management Program [R-11] and Project Management Standard [R-12]. This RFR Project Management Plan adopted the best practices and aligns with the Project Management Body of Knowledge (PMBOK), shown in Figure 2 below.

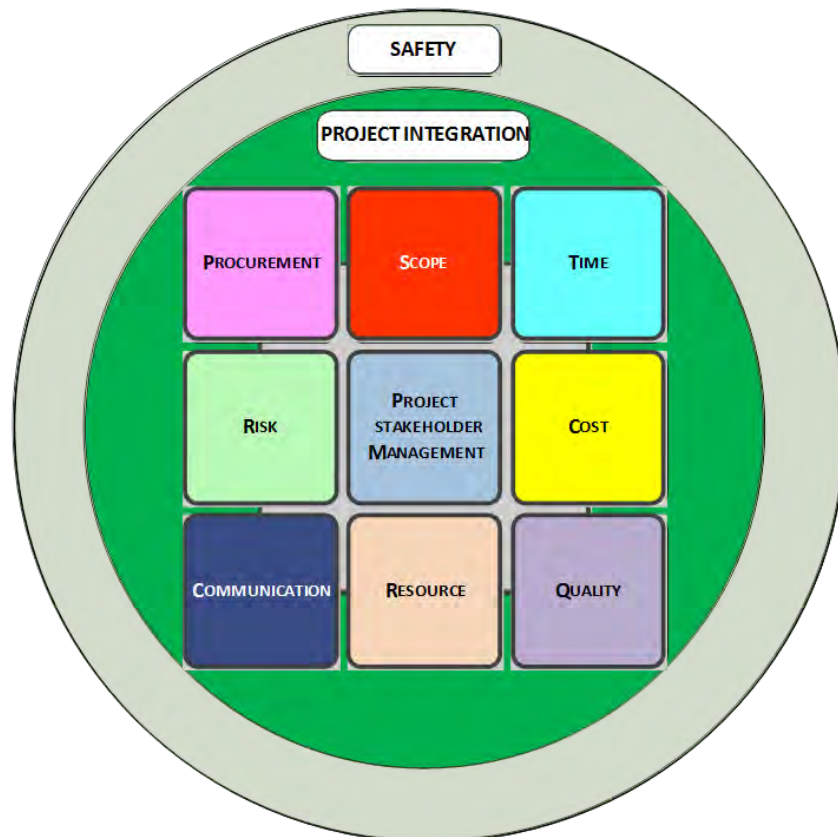

Figure 1: Darlington RFR Project Management Visual Representation

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>17 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Integration of OPG Governance, RFR Project Plans, and RFR EPC Contractor plans with all of OPG's Contractors is a key element for the successful execution of the RFR Project; the remainder of this PMP explains the plans of how this can be accomplished. It then becomes every team member's responsibility to follow the plans.

## 2.2 EPC Contractor Project Management Plans

A crucial input to the management and execution of the RFR Project is the integration of the EPC Contractor's plans [Section 20.0]. The EPC Contractor performs Project Management in accordance to the JV's governance per the Contract [R-28]. JV will create their own plans in accordance with the RFR Contract [R-28] and COIR [R-26],

For example, integration of the JV schedule, cost, risks and infrastructure must be aligned with OPG plans and the overall refurbishment program. Certain key JV plans in individual project management knowledge areas (cost, scope, time etc.) are noted in subsequent sections of this PMP, where the integration of these documents within OPG's project governance framework is also discussed.

## 3.0 PROJECT STAKEHOLDER AND INTERFACE MANAGEMENT

This section describes the:

- Identification of the project stakeholders
- Stakeholder matrix listing their involvement on the project
- Stakeholder matrix listing their expectations of the project

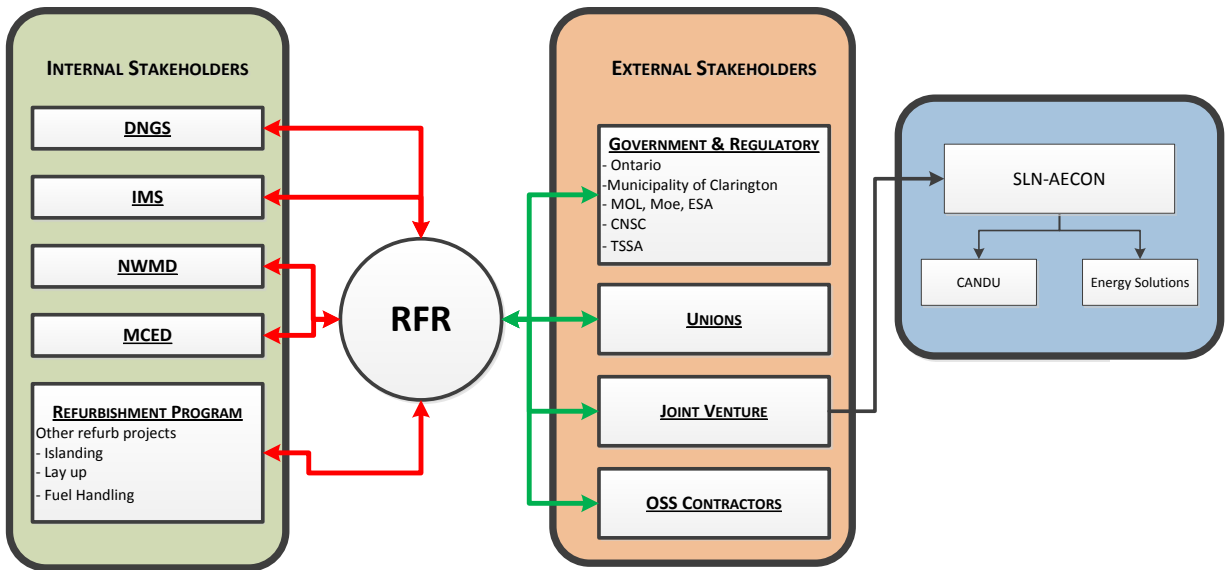

The major interfaces of stakeholder management are identified and presented in this section at a high-level, supplemented by a breakdown of key stakeholders by each discipline (Tooling, Engineering etc.) within RFR and a description of the specific areas of common interest at this time. A current understanding of future stakeholders or future needs of current stakeholders is presented and is subjected to update as the project progresses.

### 3.1 Stakeholder organizations of the RFR project

The following table lists the stakeholder organizations that RFR project interfaces with and the accountability matrix

Stakeholder	Requirements or Expectations	Influence	Timing of Influence	Classification (Responsible, Accountable, Consult, Inform)
DNGS	Return to service of all units per Refurbishment Program Charter	RFR's key client; Owner of Plant SSCs	Project lifecycle	Consult
Refurbishment Program	Return to service of all units per Refurbishment Program Charter	Oversight to RFR	Project lifecycle	Accountable
QA	Adherence to standards and processes	Oversight to RFR	Project lifecycle	Consult
HSSE (Refurbishment)	Adherence to standards and processes	Oversight to RFR	Execution	Consult
Licensing	Adherence to regulatory standards and processes including Licence Condition Handbook	Oversight to RFR	Project lifecycle	Consult
Design Authority	RFR deliverables satisfy design requirements and have no adverse impact on plant SSCs	Oversight to RFR	Project lifecycle	Accountable
O&M (Refurbishment)	Interface in defining specific shutdown, pre-commissioning and startup requirements on RFR, as well as transfer of accountability of work planning and scheduling, and integration with station plan	Oversight to RFR	Project lifecycle	Consult
Balance of Plant	Interface in areas of common interest/scope such as Negative Pressure Containment (contingency items related to equipment readiness), structures (inspect RB and contingency RB structure repair), STOP, Airlock Door Seal Replacement, ESC inspection and contingency repairs), Emergency Heat Sink (EHS), PHT inspections and contingency work, Vault Vapour Recovery work	Responsible for Balance of Plant Work	Project lifecycle	Consult
Steam Generator	Interface in areas of common interest/scope such as Primary Side Systems Layup, Division of Work	Responsible for Steam Generator Work	Project lifecycle	Consult

Title:

**RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN**

Islanding	Interface in areas of common interest/scope such as Bulkhead and Containment Isolations	Responsible for Islanding Work	Project lifecycle	Consult
Fuel Handling	Interface in areas of common interest/scope such as removal of irradiated fuel (including development of defueling tools and strategy)	Responsible for Fuel Removal Work	Project lifecycle	Consult
NWMD	Definition of waste generated (quantity and type) and select waste container design support	User of RFR products (waste) and waste container design support	Project lifecycle	Consult
IMS	Interface in areas of common scope such as ASRT tooling.	Responsible for transfer to transport flask.	Execution	Consult
MCED	Protecting assets (reactor and supporting SSCs)	Oversight to RFR	Execution	Consult
Joint Venture	Executing work as per RFR EPC agreement	Key Vendor	Project lifecycle	Responsible
OSS	Executing work as per OSS agreement	SME support and support on technical assessments	Execution	Responsible
Government of Ontario	Complete work on time, budget, within scope and with no safety incidents	Makes Go, no-go decision	Execution	Accountable
CNSC	Compliance with applicable regulations	Can stop work due to non-compliance	Project lifecycle	Accountable
Ministry of Environment	Compliance with applicable regulations	Can stop work due to non-compliance	Project lifecycle	Accountable
Ministry of Labour	Compliance with applicable regulations	Can stop work due to non-compliance	Project lifecycle	Accountable
Unions	Compliance with applicable collective agreements	Can stop work due to safety issues per OHSA.	Project lifecycle	Consult
TSSA	Compliance with applicable regulations	Can stop work due to non-compliance	Project lifecycle	Accountable
Electrical Safety Authority	Compliance with applicable regulations	Can stop work due to non-compliance	Project lifecycle	Accountable

### 3.2 Communication

Section 14.0 describes the Communication Management Plan for effectively engaging stakeholders in project decisions and execution.

The JV has issued a Communication Plan for the RFR Project [R-42] [R-48].

## 4.0 SAFETY AND ENVIRONMENT

Safety is the core value of OPG [R-1][R-2] the NR Program and the RFR Project. Safety focus areas include (but are not limited to) nuclear safety, the conventional safety, radiological safety and protection of the environment.

Nuclear Refurbishment Health and Safety Program Management Plan [R-90] must be followed for the entire refurbishment project and is the highest level Safety document for the project. The RFR JV Site Specific Safety Plans [R-61][R-62], contain the unique requirements for management of H&S risks associated with the specific project activities in the mockup and in the field. The JV has also issued a Fire Safety Plan [R-63] for the RFR Project.

OPG has issued safety expectations for work in the Darlington Energy Complex warehouse and mockup area [R-27].

The RFR JV has issued an Environmental Management Plan [R-64] in alignment with the Darlington Refurbishment Environmental Program Management Plan [R-89] ,

The JV has issued an ALARA Plan [R-65] to document how they will manage the work and workforce to maintain radiological dose update as low as reasonably achievable..

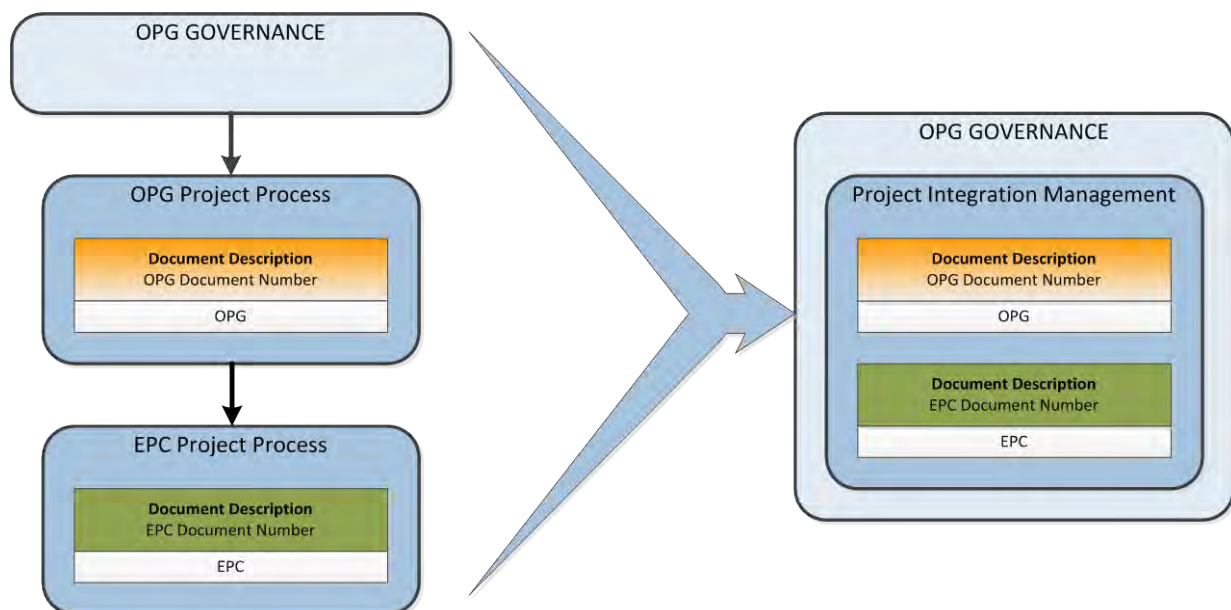

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>	Usage Classification: <b>N/A</b>	
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>22 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 5.0 PROJECT INTEGRATION MANAGEMENT

This PMP focuses on the integration of OPG and EPC Contractor planning and execution.

For each area of the project, a review of the relevant OPG, Darlington Refurbishment, RFR Project and EPC (Joint Venture) Project Governance was conducted. Figure 3 schematically shows the hierarchy and implementation of this governance for the RFR Project.

**Figure 3: RFR Project Document Set**

The figure on the left indicates a hierarchical view of governance, while the figure on the right shows the VenDiagram version. In each view, OPG governance is used to derive RFR project processes and integrate the EPC Contractor processes.

For example, the OPG program document on Project Management [R-11] is used to derive this project management plan. This is the highest level plan on the RFR project, and points, in turn, to the JV's internal Project Management Plan [R-47].

The RFR OSS Project Execution Plan [R-7] describes the general support and oversight of the managed task work to be undertaken by OSS staff, on behalf of OPG, in the areas of Tooling, Engineering, Owner Specified Material, and Infrastructure. This document was prepared for definition phase, and a review will be taken to determine if it should be updated given the retention of OSS services into the execution phase (to ensure seamless transition out of OSS Contract into a largely OPG staffed organization).

**Plan**

## 5.1 Project Management Toolset

The project management toolset used by the RFR Project team is as follows:

Focus Area	Tool
Actions	Actions module in RMO Tool Project Lead's action registers – Sharepoint JV actions – AIR database JV actions – ACER database
Assumptions	Key RFR Project Assumptions – RMO tool, Non-key RFR Project Assumptions – PMP, Sharepoint, Contractor's Submittals
Issues	Issues module in RMO tool
Schedule	Primavera P6
Cost – Cost Management including Budget and Change Management, Earned Value Management, Forecasting	Ecosys
Cost – Contract Budgets, Actuals and Forecast transactions	ONCORE and Ecosys
Cost – Invoices, Salary Information	Invoices through OnCore and Asset Suite 7. Salary is also in ONCORE with restricted access
Risk	Risk module in RMO tool and JV Stature ( Risk Register)
Documentation – Working Files	Sharepoint
Documentation – Submittals from Contractors (excluding Invoices and Salaries)	VenDM, Sharepoint
Safety	SCR/CAR/NCAR, Oversight Findings in RMO Tool, Construction Oversight Binder Contractor Submittals
Quality	SCR/CAR/NCAR, Oversight Findings module in RMO Tool, Contractor Submittals, Design Reviews and Comment and Disposition Forms, ITPs, Reports
Oversight	SCR/CAR/NCAR, Daily Log in SharePoint, Oversight Findings in RMO tool, Contractor Submittals
Interface Management	Meetings and Minutes, Contractor documentation Integrated OPG Refurbishment schedule
Contract Documentation, Changes, Amendments, Claims	VenDM, Contractor's Submittals

## Plan

<b>N/A</b>	<b>R003</b>	<b>25 of 92</b>
Title:		
<b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 5.2 Project Oversight

The RFR Project Team will be performing oversight of vendors in compliance with Project Oversight Standard [R-14]. As described in the standard, oversight is the independent assessment necessary to ensure project objectives are achieved based on a proactive and graded, risk based approach, distinct from the in-line and normal quality assurance and control process.

The individual sub bundle leads will review the RFR RMO on at least a monthly basis to identify potential strategic oversight activities that would proactively detect potential problems with sufficient time to take mitigating actions to mitigate the impacts. It is expected that the RFR project will complete on average approximately 5-10 strategic oversight activities per month. The oversight activities will be planned in the RMO oversight tab with suitably SMART criteria and cross references to risks and actions as appropriate. The observations will be recorded in the Oversight Findings tabs of the RMO tool with reference to the source oversight activity. Observations and findings from routine and in-progress oversight activities will be recorded in the Daily Log tab of the RMO tool. In addition, RFR personnel can also email [RMORFR@opg.com](mailto:RMORFR@opg.com) to provide their updates to the RFR SPOC for review. This does not relieve them from their responsibility of entering the content into RMO.

The Nuclear Refurbishment Management System Oversight (MSO) group, over the course of the project, will also review the project work execution across all the project bundles and as required, implement the Corrective Action Program and co-ordinate Program Assurance activities (see also Darlington Program Management Systems And Performance Improvement Program Management Plan [R-92]).

### 5.3 Engineering Management

The Darlington Refurbishment Engineering Program Management Plan [R-91] defines the engineering and design roles and responsibilities for the refurbishment program. All Engineering Change Control (ECC) deliverables will be accepted or authorized in accordance with established Governance, usually through the Engineering Design Authority.

The Engineering Interface Requirements Guide [R-31], provides further direction and expectations for Refurbishment Engineering interfaces with OPG Project Managers and Contractor Agencies during the definition and execution of EPC contracts in support of the Program.

The RFR project has developed three documents to reflect the implementation of this governance: The Retube and Feeder Replacement (RFR) Design Plan [R-4], the RFR COIR [R-26] and the Retube Feeder Replacement (RFR) Engineering Plan [R-25]. (under revision at time of PMP revision 4 issue).

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>26 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

The RFR Design Plan explains that although RFR is defined as a Repair and Replacement project, the ECC process will be used maintain configuration management. The Design Plan identifies the critical tasks for preliminary engineering, detailed design, installation and commissioning. An explanation of how the project adheres to OPG procedures, guidance and instructions is provided, which is to be used in conjunction with the RFR COIR [R-26]. As well, deviations, due to the timing of the Program development and the establishment of the EPC contract agreement are identified and the rationale for acceptability provided. Roles and responsibilities for the project team and relevant stakeholders are identified. Further, specific engineering related tasks to be performed by OPG are described in this plan.

The RFR Engineering Plan describes the principles, approach and responsibilities of OPG to oversee the engineering work that is performed by the RFR Contractors.

### 5.4 Construction Management

An RFR project-specific Construction Management Plan (in draft at time of PMP revision 4 issue), provides RFR Project-specific details regarding construction oversight activities that complement the Darlington Refurbishment Program Construction Plans, Guides, and Checklists which are contained in the following documents:

- Darlington Refurbishment Construction Program Management Plan [R-93]
- Guideline for Construction Oversight [R-32]

An RFR project-specific Retube Waste Processing Building (RWPB) Construction Management Oversight Plan [R-29] provide similar details for the RWPB Owner Only construction project.

The RFR Project will generally adhere to the Plans listed above with one noted exception that the Oversight Findings and routine/in-process observations will be documented in the appropriate tab of the RMO tool and not N-FORM-09701-00001, Oversight Report as specified in N-GUID-09701-10120. Further details of the RFR Construction Management and Oversight approach will be documented in the RFR Construction Management Plan [R-40].

### 5.5 Integrated Change Management

Change management refers to reviewing all change requests, approving changes and managing changes to the deliverables, documents and the baseline scope, costs, and schedule. Change Control is implemented to maintain the integrity of the project baseline including control of scope, cost, and schedule.

RFR project document management will be governed by the Refurbishment Program Planning and Controls Program Management Plan [R-88] and the Darlington Refurbishment Requirements for Process Support Controlled Documents [R-37].

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>27 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

RFR project documents are tracked and stored in VenDM and the RFR Sharepoint site. Important project emails are retained by cc'ing to a project RFR email. There is one email for each project bundle.

The Project management toolset that is being employed is defined in section 5.1.

### 5.6 Incorporating OPEX and Lessons Learned

Nuclear Refurbishment Processing Operating Experience and Lesson Learned [R-77] describes the processes that enable the Nuclear Refurbishment (NR) Program to meet the requirements of OPG Nuclear Operating Experience [R-33] and also to ensure that relevant project OPEX associated with NR is documented, reviewed and archived to be used to improve project planning. Each RFR subbundle team will review available OPEX or Lessons Learned and ensure it is incorporated into the OPG and vendor plans for conducting and delivering the project work packages, e.g. Tooling, RWPB, Mockups, Estimate, etc. Engineering OPEX will be recorded in OPEX Reports prepared for design packages, others will be recorded in the NR OPEX library.

To facilitate search for OPEX, a webpage has been established within the Nuclear Refurbishment intranet Team Site (**OPG Web > Nuclear > Projects > Darlington Refurbishment > Project Management** ). From this page, numerous sources of OPEX can be accessed including COB, WANO and INPO.

In addition to event based OPEX, documents such as INPO 09-007 Principles for Excellence in Nuclear Project Construction [R-34] shall be utilized as they have distilled numerous lessons learned from past projects down to principles and attributes of a healthy construction environment and organization that will produce results that demonstrate a commitment to quality and safety throughout the work.

The JV have issued an OPEX Management Plan [R-50] and a Lessons Learned and Continual Improvement Work Instruction [R-49] to ensure that lessons learned are incorporated into current and future unit execution.

### 5.7 Contractor Submittals Processing, Roles and Accountabilities

Submittals are defined in the EPC Agreement [R-28] Exhibits. Processing, roles, and accountabilities for project documentation will be managed according to the requirements of the RFR Contract and Refurbishment Program Planning and Controls Program Management Plan [R-88].

### 5.8 Requests for Information (RFI) Processing

The RFR EPC Agreement specifically states that the RFR Contractor is accountable for obtaining whatever information is required to complete The Work, and that any information provided by OPG is for information purposes only. As such, formal RFIs are not to be submitted by the Contractor. Having said this, the OPG team will work collaboratively with the Contractor to support and expedite requests for help in locating information that is not readily available.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>28 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Responses to any vendor request for support in locating information are to be carefully considered in the context of the Terms and Conditions of the RFR EPC Agreement to ensure that in providing any additional design basis information to the Contractor, OPG does not give direction nor does it take on additional accountability for the result of the output or deliverable and thus liability for the results. See section 2.1(d)(8) of the RFR EPC Agreement for the definition of “OPG Information on which Contractor may rely”.

## 6.0 PROJECT SCOPE MANAGEMENT

### 6.1 OPG Scope Management

### 6.2 Scope Definition

The main scope and critical path of the Nuclear Refurbishment (NR) Execution Phase is Re-tube and Feeder Replacement (RFR). This includes the replacement of fuel channels and feeders, as these are life limiting components of the reactor. The timely, cost effective replacement of these components of the RFR core scope is critical to refurbishment success.

RFR Scope is managed in accordance with the Nuclear Projects Scoping Process [R-87], and Darlington Nuclear Refurbishment Program - Scope Control [R-6]. The Change Control Board process is used to approve changes to scope, cost or schedule assigned to the RFR bundle.

Through the NR scope development process identified in the Refurbishment Project Reference Plan – Scope Definition [R-5], individual Darlington Scope Requests (DSR), composed of both core and non-core scope, were bundled together to form the approved scope for the RFR Project. All DSRs are assigned to one of the Refurbishment Project Bundles. The DSRs assigned to the RFR Bundle are listed in Appendix A. The RFR scope has been organized into a suitable Work Breakdown Structure, details of which can be found in Section 7.1.1.

A large portion of the RFR scope has been included in the RFR EPC agreement. The functional, project, and quality requirements have been written into the RFR EPC agreement. The functional and performance requirements have been documented in the Scopes Of Work for the RFR EPC Agreement [R-28] as defined in Exhibit 1.1 (www) Mock-ups Contract and Exhibit 2.1 RFR Scope of Work [R-21].

Plan

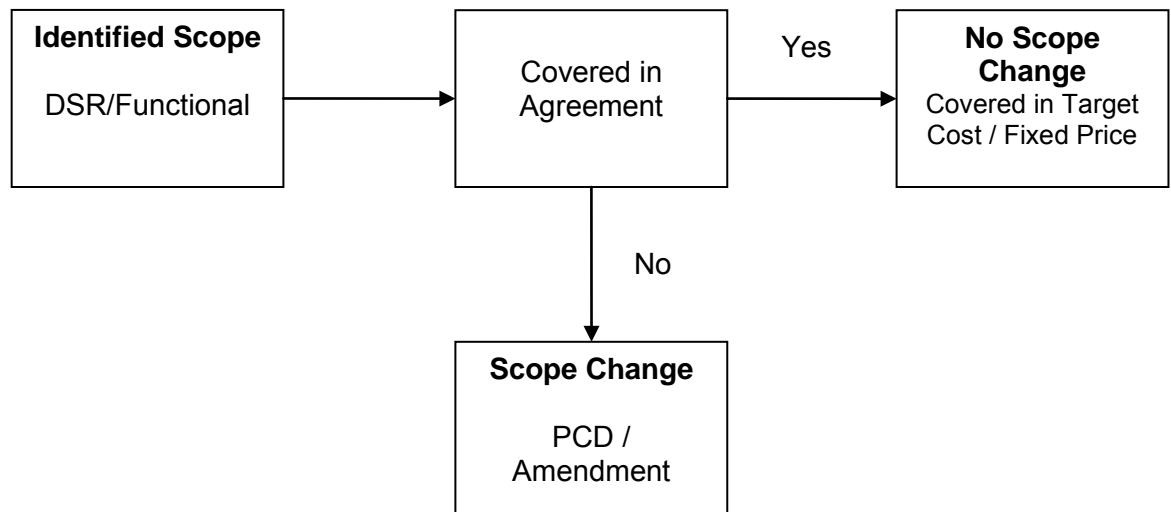

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>29 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 6.3 Commercial Scope Control

The scope change process, including the issuance of Project Change Directives (PCDs), is outlined in Article 4 of the RFR EPC Agreement [R-28]. PCDs are incorporated into future Amendments to the Contract as soon as practical.  
**Error! Reference source not found..** Project Scope Management by the Joint Venture is governed by the JV Scope Management Plan [R-45] and the various sub-plans and work instructions. The commercially relevant scope of the RFR work is defined in the Scope of Work Document [R-21]. Changes to scope are incorporated into the next revision of this SOW document.

### 6.4 Scope Management Integration

Project scope will be managed per the process shown in the flowchart below. As new scope (either DSR or functional) is identified, if it is covered by the agreement no scope change is required. If it is not covered by the Agreement, a Project Change Directive or amendment will be required after a cost-benefit analysis has been performed and the scope has been approved for execution. The project plans will then be updated (as required) to reflect the impact on cost and schedule as a result of inclusion of the new scope.

Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10074</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>30 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

#### 6.4.1 Accepted Deliverables

The RFR project team will perform a thorough review prior to declaring elements of scope complete. Refer to RFR Contract Management Plan [R-38] for evidencing requirements for the EPC work and Section 2.9 of the RFR Agreement [R-28]. The Execution Phase Plan will require development of new evidencing requirements for the Execution Phase deliverables.

## 7.0 PROJECT TIME MANAGEMENT

This section supercedes the Project Controls Plan. The contents of the Project Controls Plan Rev 0 was updated to Execution Phase and incorporated in the current Project Management Plan under Cost Management and Time Management sections (PCP to be superseded to this document after issue).

This section details the process involved for the time management of the project through Schedule Development, Schedule Management, monitor and control.

#### 7.1.1 Work Breakdown Structure (WBS)

The project Work Breakdown Structure was developed in accordance with Nuclear Refurbishment Project Work Breakdown Structure Guide [R-19]

The project tasks have been organized according to the WBS in a planned, manageable and logical format using the 100% rule. That allows the integration between EPC Contractor and OPG schedules established to ensure the ability to “roll-up” the Contractor’s schedule into the OPG schedule.

A high level representation of RFR WBS Structure is shown in Appendix C.

## 7.2 Schedule Development –Execution Phase

During the definition phase the contractor developed an execution phase Level 5 schedule as per the requirements stated in the Exhibit 3.5, Article 3 of the RFR Contract [R-28].

The execution phase schedule is developed by the contractor in progression which is submitted along with the various classes of estimates as listed below:

Class 5 Estimate, Level 2 Schedule  
Class 4 Estimate, Level 3 Schedule  
Class 3 Estimate, Level 4 Schedule  
Class 2 Estimate, Level 5 Schedule

Schedule levels are as defined in the AACE recommended practice 37-R and in RFR JV Schedule Management Plan [R-51] .

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>31 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Guidance on development, management and control of NR level 3 execution phase schedule is provided in: Schedule Management Plan for Integrated Level 3 Execution [R-86],

RFR project team, NR P & C team and the NR work management team supported the development and review of the execution phase schedule.

The requirements, development process and schedule basis of level 5 schedule is documented in “DNGS RFR PROJECT – Class 2–Schedule Report” [R-68] submitted by the JV as part of the Class 2 Estimate, Level 5 Schedule deliverable.

### 7.2.1 Level 3 Execution Schedules Integration:

- Developed and updated in a single P6 instance, controlled and managed by OPG
- Activities are created using standard WBS and broken into Segments
- Activities are man hour based, resource loaded, and are generally less than one week in duration. Longer duration activities may require additional monitoring mechanism (e.g. Workdown Curve)
- All activities will be represented in Level 2 Summary Work Packages using the WBS structure
- Schedules were baselined (in September 2016) following integration with Ecosys. Baseline will be re-established only upon approval by CCB.
- Activities are generated using 2 methods:
  - Manual Input by the Scheduling Leads
  - Automatic upload of Work Orders from AS7
- Each P6 file will be owned and managed by a single Work Group/Vendor
- Standard P6 templates will be utilized to communicate the scheduling requirements for similar work across different Work Groups
- Activity Code dictionaries, resource codes and calendars will be established in OPG P6 instance and used by all the work groups
- RFR Critical path is divided by “windows” based on the Unit 2 Refurbishment Level 1 Rev 0 schedule.
- Appendix D lists the RFR Windows

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>32 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 7.2.2 Level 3 Interface/Integration:

- All the integration activities (hand-offs) between Work Groups/Vendors will be logically tied through Interface Milestones
- The Interface Milestones are created by the Master Scheduler and each Scheduling Lead will create logic ties between the milestones and their activities
- All the interfaces within the same Work Group will have direct ties between L3 activities
- Milestones will be created using standard WBS and broken into Segments and Systems

### 7.2 Milestones

Nuclear refurbishment program has classified the milestones into tier structure as described in “Nuclear Refurbishment – Milestone Definition Framework” [R-69]. Following are the various tiers of milestones:

- **Program Tier 1** - Commitments to the Board
- **Program Tier 2** – Critical Impact
- **Program Tier 3** – Program Controls
- **Project Tier 4** – Project Gates
- **Project Tier 5** – Standard Project Milestones & Project Manager Milestones

Tier 1, 2, & 3 milestones are managed using the “ milestone definition form” as described in the Milestone Definition Framework document.

### 7.3 Schedule Quality Compliance

All schedules are checked for quality compliance using Acumen Fuse software and Job aid that lists the quality checks required:

- All milestones clearly identified
- Variances from last update, and from baseline
- Minimal or no constraints
- Float is identified
- Activities are cost and resource loaded to the extent practical
- Reflect the WBS

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>33 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Show OPG tasks
- Show critical path and near critical path (within 20 days)
- Logically linked with predecessors and successors (no open ends)

Various layouts are developed to verify the quality of schedule as required on periodical basis.

All changes are recorded in the schedule change log which is updated when any change occurs and placed in share point site.

Any negative trends will be identified to the project team and formal notice provided to the EPC contractor of any findings.

**RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN**

## 8.0 PROJECT COST MANAGEMENT

This section supersedes the Project Controls Plan. The Project Controls Plan Rev 0 was updated to Execution Phase and incorporated in the current Project Management Plan under Cost Management and Time Management sections (PCP to be superseded to this document after issue).

### 8.1 RFR Cost Model

RFR Project Costs primarily consists of:

- EPC Costs
- OPG Oversight Costs
- Interest & escalation Costs
- Contingency

RFR costs are tracked at Work Package level by the project in OPG's cost Management system 'Ecosys'.

The following table shows the project numbers and phase against which the cost tracking is done.

Project #	Project Description	Phase
73105	OPG Oversight Costs	Definition Phase
73117	OPG Oversight Costs-Retube Waste Processing Building	Definition Phase
73106	OPG Oversight Costs - Unit 2	Execution Phase
73108	OPG Oversight Costs - Unit 1	Execution Phase
73107	OPG Oversight Costs - Unit 3	Execution Phase
73109	OPG Oversight Costs - Unit 4	Execution Phase
73110	Reimbursable Costs	Execution Phase
73111	Mock Up	Definition Phase
73112	Tooling	Definition Phase
73113	Major Retubing Unit 2-Procurement	Definition Phase

Plan

Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10074</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>35 of 92</b>

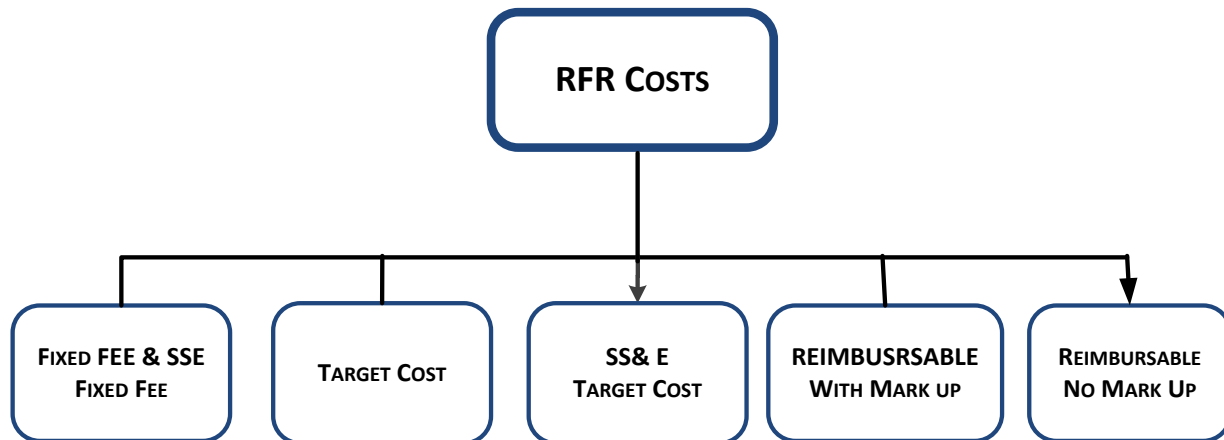

Title:

**RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN**

Project #	Project Description	Phase
73113	Major Retubing Unit 2	Execution Phase
73115	Major Retubing Unit 1	Execution Phase
73114	Major Retubing Unit 3	Execution Phase
73116	Major Retubing Unit 4	Execution Phase
73118	Retube Waste Processing Building	Definition Phase

### 8.1.1 EPC costs

The cost breakdown of RFR project execution phase EPC costs is as illustrated below:

**Fixed Fee** is paid upon achievement of milestones against the fee as prescribed in the Contract Exhibit 3.1 (b)[R-28].

**Target Cost** means the Target Cost for all Reimbursable Work to be performed during the Execution Phase

**SS&E Target Cost** means the target cost, being a subcomponent of the Execution Phase Target Cost, for all Execution Phase Support Services & Equipment Work to be performed during the Execution Phase.

**Reimbursable Costs** means actual costs that are determined to be a Reimbursable Cost pursuant to section 6.3 of the Contract [R-28], which will be payable by OPG to the Contractor.

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>36 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Reimbursable costs with markup include costs of Owner-Specified Materials and costs of Goods.

Contractor will procure materials based on specifications provided by OPG and is responsible for competitive sourcing, quality, source surveillance site receipt, etc.

OPG pays actual costs plus fee. A 10 % mark-up on OSM materials and 5 % on goods and services is paid.

OPG reviews and approves any purchases in excess of \$1 Million.

Owner specified materials include pressure tubes, calandria tubes, end fitting, feeders, retube waste containers and other reactor components.

**Reimbursable Costs-No Markup** means the actual costs of:

- (i) travel, accommodation and subsistence (pursuant to lines 6.16, 6.16.1 and 6.17 of the Cost Allocation Table in the contract);
- (ii) Interim Project LC and the Project LC (pursuant to line 8.14 of the Cost Allocation Table); and
- (iii) insurance (pursuant to line 9.1 of the Cost Allocation Table) that are determined to be a Reimbursable Cost-No Markup pursuant to section 6.3, which will be payable by OPG to the Contractor without mark-up

**Support Services & Equipment** means the Costs associated with the support services and equipment as listed below.

- Business Services
- Project Office & Site Establishment
- Office Consumables
- Electronic Equipment
- Construction Tools & Equipment
- Company Vehicle

EPC costs are tracked by the contractor in the contractor cost management system PM+, cost reports are provided to OPG on monthly basis.

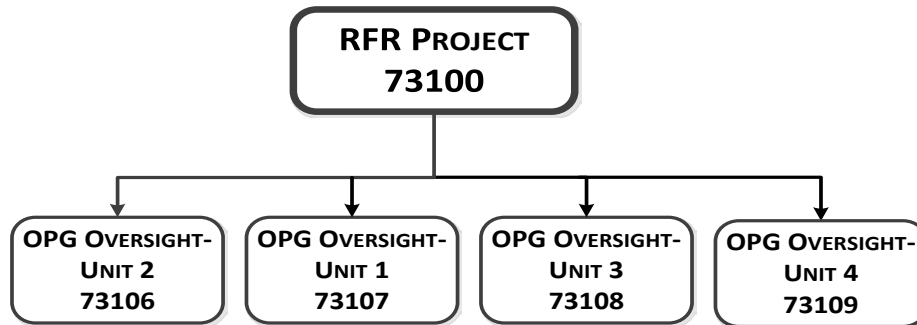

According to the NR cost model, costs associated with Retube waste containers are provisionally funded by Nuclear Waste Management Division and hence are excluded from NR reporting.

Plan

<b>Internal Use Only</b>

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>37 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 8.1.2 OPG Oversight Costs

Oversight costs for execution phase are under the project numbers illustrated below..

Budget for the oversight costs are based on the estimates for full time equivalent of oversight personnel.

Project oversight costs are grouped by WBS Project Management, Engineering, Procurement and Construction.

Actual costs are tracked by assigning appropriate tempus work events as listed below:

<b>73106</b>	10101	Project Management	Oversight costs for Unit 2 execution, includes OPG direct labour, matrix staff, Augmented Staff, and Managed Tasks Staff, expenses,
	30201	Engineering	Oversight costs for Unit 2 Engineering (Field Engineering, Mods Engineering oversight, includes OPG direct labour, matrix staff, Augmented Staff, and Managed Tasks Staff
	40101	Procurement	Oversight costs for Unit 2 procurement includes OPG direct labour, matrix staff, Augmented Staff, and Managed Tasks Staff,
	50101	Construction	Oversight costs for Unit 2 Construction, includes OPG direct labour, matrix staff, Augmented Staff, and Managed Tasks Staff,
	00701	Interest Costs	Interest costs associated with oversight
	00901	Contingency	Contingency tracking

A 44 Digit code is used to track Material requests for services such as augmented staff/managed tasks

## Plan

For Resource Type

010	Labour – Regular
200	Materials & Equipment
310	Managed Task Services/Contract Services
320	Augmented Staff

Appropriate Project number will be applied.

## 8.2 Budget Control

RFR budgets are established during the gated process for the gate period.

Per the NR Gated Process [R-35], the NR Program secures the required funding to support the entire Refurbishment Program, including the funding needs identified by each project and functional organization.

The RFR Project will "apply" for a release of funding from the program to support its work through the gated process. The NR Program will "roll up" these funding requirements across all project bundles and functions, including estimated amount and timing to meet the needs of the project to progress the work in a timely fashion.

The EPC contractor provides the cash flows for the gate period. These cash flows align with the deliverables and schedule forecast for the gate period.

OPG oversight cash flows are estimated using the resource planning and spread sheet provided by the Darlington refurbishment program that contains resource costs by job family and associated rate tables.

OSS organizations provide the cash flows for the gate period with back up information on deliverables and resource costs based on the task request from OPG.

Non EPC contracts are appropriately estimated based on the vendor quotes and negotiated values, included in the overall budgets.

All the costs described above are compiled in "RFR Resource Plan" spread sheet and the summary of the costs by month for the gate period are presented to Gate Review Board for approval. Once the budget is approved at the GRB [R-20][R-70] meeting, the P&C Lead updates the "Released Amount" in Ecosys via the CCF process.

The Ecosys OPG Cost Management system is used as a repository for approved budgets, control budgets, forecasts and approved changes for monthly cost management and analysis on the project.

### 8.3 Financial Analysis

The Financial Analyst reports to the Controller Financial Major Nuclear Projects – but supports the RFR Project. The Financial Analyst is responsible for invoice reviews including:

- Reconciling the RFR Contractor actual vs. Forecast,
- Reconciling the ONCORE loads vs. cost report from the RFR Contractor,
- Auditing on an ad hoc basis the Reimbursable/Target Costs against the Cost Allocation Table,
- Referencing Section 6 of the RFR EPC Agreement, and
- Referencing RFR EPC Agreement [R-28] Exhibit 3.1, Exhibit 6.1, Exhibit 6.3 and other sections/exhibits as required.

### 8.4 Invoice Payment Process

This section explains the invoice and payment process for the EPC costs portion of the RFR project.

The EPC Contractor costs are collected through the ONCORE at the appropriate summary level in accordance with NR procedure for Contract Administration in ONCORE [R-39].

The ONCORE flow of transactions, approvals and reconciliations are as explained in the flowchart in Appendix E.

A draft invoice package is submitted by the EPC contractor. Following steps are performed:

- Complete the reconciliation check list: (see Appendix F)
- Check Date of Memo, Signed
- Check Invoice - tie all amounts back to the back-up, get clarification on any discrepancies, or add additional backup to the invoice package
- Ensure all of the supporting documents provided in the invoice package reconcile to the Invoice
- Check ONCORE to make sure what is presented in the invoice was input to ONCORE
  - Report to run out of ONCORE - Audit Detail run against NFRA – attach to invoice package

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>40 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- If milestones are being claimed on an invoice or Fixed Fees:
  - Validate that milestone certificate(s) are completed and are signed by an OPG Project Manager
  - Report to run out of ONCORE – PO% Spent Summary
    - Validate amounts claimed on invoice match what was input into ONCORE
  - Attach Exhibit from contract to validate the amounts claimed are the negotiated amounts from the contract
- Confidential Salary information
  - Validate the fringe claimed is either 37.51% or 37.18%
  - Validate amounts charged to each PO line item are supported by the Confidential Salary information package.
- Expenses
  - Validate expenses being claimed are allowable expenses on Exhibit 6.3 (a)
  - Indicate the Exhibit 6.3(a) cost allocation reference number for each expensed item
- Meet with Step 2 and Step 3 approvers and go over the invoice package:
  - Follow up with Joint Venture if Step approvers have additional questions
    - Document and attach to invoice package
  - Step 2 and Step 3 approvers sign Reconciliation Summary Sheet
  - Over see approvals in ONCORE

The Contractor invoices monthly forecast costs in accordance with the EPC Agreement.

If OPG does not accept the Contractor's monthly reconciliation, the amount that is not accepted will be offset from the next payment. Any outstanding advance will be deducted in full by OPG from payments to the Contractor, or repaid by the Contractor to the extent deductions are not sufficient to fully reimburse any overpayment.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>41 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Non-Labour costs (materials, subcontracts etc) that incur costs but are not invoiced will be accrued monthly in accordance with OPG's finance governance.

- The Contractor will provide evidence of completion of the work to be invoiced at a future date and the associated costs. Accruals will be performed monthly and reversed upon invoice for those costs

The payment milestones that are accepted are aggregated to the 25<sup>th</sup> of the month and paid on the 25<sup>th</sup> of the following month.

### 9.0 PROGRESS MEASUREMENT AND PERFORMANCE MANAGEMENT

Scope Performance Measurements are done in accordance with "Darlington Nuclear Refurbishment Program-Scope Control" [R-6], Section 7.1 outlines the Health of Scope metrics. The milestones in the RFR schedule are coded to this requirement and metrics are run by the NR Program.

Progress measurement and performance on RFR project is measured through Earned Value methodology.

Earned value measurement is done as per the guide line described in Nuclear Refurbishment Earned Value Management [R-84].

The Earned Value methodology and reporting for the execution phase is outlined in Appendix I of this document. This section will further be updated with more detailed information.

EPC Contractor project performance measurement is done as per the Contract requirements and in accordance with JV Project Controls Plan [R-43]

### 10.0 PROJECT REPORTING

RFR project produces various reports to present the performance and report to the stakeholders on regular frequencies. Besides reports that produced to meet individual project team needs, following reports are produced to report to the NR program :

#### 10.1 Monthly Reports

The RFR Project prepares monthly reports and provides the input to NR Program overall status reports.

Executive Summary on overall project status is provided for:

- KRM (Key Results Meeting)
- NEC (Nuclear Executive Committee)

## Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>42 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Program Status Report which feeds into Darlington Refurbishment Committee report

Monthly project status report (“quad chart”) is prepared by RFR project controls team in accordance with the format and template provided by NR planning & controls.

Schedule data milestone summary table are electronically extracted with the help of BI tool into the monthly project status report from P6 updates performed on month end by the RFR project control team based on the Contractor updates.

Cost data is electronically extracted with the help of BI tool to monthly project status report from Ecosys based on the input from invoice data and the schedule progress inputs provided by the RFR project control team.

Earned Value data is electronically extracted with the help of BI tool to monthly project status chart report from Ecosys and Earned Value application based on progress complete input provided by the RFR project control team.

Reporting requirements and structure for the execution phase will further be developed during execution.

## 10.2 Contractor Reporting

### 10.2.1 Monthly Progress Report

The RFR EPC Contractor provides status updates and reports on monthly basis in the monthly report in accordance with the Contract requirements specified in the RFR EPC Agreement [R-28] Exhibit 2.9(j). The Contractor monthly report contains the following elements:

- Health, Safety & Environmental Performance;
- Schedule Performance including but not limited to:
  - Engineering Activities;
  - Procurement Activities;
  - Permitting Activities;
  - Construction Activities; and
  - Submittals.
- Cost Performance;
- Quality Performance;
- Risk & Contingency;

## Plan

Internal Use Only

Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>43 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Scope;
- Issues, Assumptions and Decisions; and
- Training Activities

### 10.2.2 Schedule Reporting

The Contractor updates their schedule at the lowest activity level on a weekly basis. These activities all roll into the WBS Summary activities provided to OPG. The following updates are provided by the Contractor:

- P6 (xer) file on a monthly basis. This (xer) file is posted on Sharepoint project team site.
- PDF versions of the monthly updated schedule consist of physical progress percent complete and schedule variance in days for each of the activities.
- Critical Streams and updates on the float.
- Variance explanation on critical path activities whose variance exceeds 20 days in a 30 day period.
- Schedule Performance Index (SPI)

### 10.2.3 Cost Reporting

NR Cost Management and Reporting follows the procedure Nuclear Refurbishment - Cost Management and Reporting [R-72]

Project Cost Management by the JV is governed by the JV Project Controls Plan [R-43] and its subsidiary documents.

The JV provides the cost updates through the PM+ cost report which is attached to the monthly report. This report provides the Original Budget, Approved Changes, incurred costs by period and cumulative, trends and commitments, forecast at completion.

The JV also provides a summary table in the monthly report by category such as Target Cost, Fixed Fee, Reimbursable costs and Fixed Price components.

The monthly report includes the forecast for the next 3 reporting periods and ONCORE reconciliation.

The JV provides the cash flows and the raw data as required.

OPG Oversight costs are available from NFRA reports produced by OPG Finance.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>44 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 10.3 Forecasting

This section outlines the process adopted for forecasting of cost and schedule on the RFR project.

Schedule progress is updated on monthly basis. Milestone completion dates are forecasted in the JV schedule based on the logic ties from predecessor activities.

Cost forecasts are done on a monthly basis to determine forecast to complete (FTC) and estimate at completion (EAC) for the gate period for which funding is approved.

Forecasts are assessed and reported for each sub-project as per the Cost Breakdown Structure.

OPG oversight cost forecasts are done based on the assessment of the requirement of full time equivalents required to perform the oversight.

EPC cost forecasts are done based on assessment of the schedule and inputs from JV.

Cost forecasts are assessed on monthly basis from the input from the JV and the project teams for the oversight costs. Forecast at completion is calculated for each month end period at the Work Package level.

Cost variances are measured and reported against the approved budget at the Control Account level.

The Ecosys cost management tool is used currently for reporting forecasting data.

Plan

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 11.0 CHANGE MANAGEMENT

This section outlines the change control process followed on the RFR project.

RFR Change Control process follows the Nuclear Refurbishment Change Management Process [R-71].

RFR JV change control is in accordance with Scope Management Plan [R-45]  
Schedule Changes

Schedule baseline is changed only when:

- There is scope change: Changes when the activities are impacted by scope changes, scope transfers, scope removal, Contract Milestone changes and program milestone changes.
- The current plan is no longer valid: Changes when activities are impacted due to the changes in execution strategy, for example, procurement/manufacturing strategy is changed after vendor development process.
- When a new plan/budget is approved at the Gate: Changes due to the new gating strategy.

JV schedule baseline may be changed with the approval from OPG in any of the scenarios described above.

Gate Review Board approval process is used for the approval of the baseline. In case of changes after the GRB [R-70], a Change Control Form (CCF) is used to record and approve the changes.

### 11.1 Budget Changes

A budget baseline is created with approval from the Gate Review Board. Any further changes are managed through CCF process described above.

Target Cost changes to the Contract are handled through the PCD process.

Scope/Budget transfers between Nuclear Refurbishment project bundles are handled through the CCF process.

### 11.2 Joint Venture Cost Management

Project Cost Management and integration by the JV is governed by the Project Controls Plan [R-43]

Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>46 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 12.0 PROJECT QUALITY MANAGEMENT

Quality Management includes the following activities:

- Reviews of JV-produced deliverables against requirements, standards, and best practices.
- Planning and executing surveillance on JV with follow-up on findings.
- Self-assessments against OPG procedures and audit findings

### 12.1 Approach to Quality Management

The project has defined requirements during the Definition Phase and these are included in various project documents including the Scopes Of Work, the EPC Contract, and applicable referenced OPG governance.

Implicit project requirements include meeting applicable Codes and Standards as prudent practices/best practices are employed to perform the work.

Explicit project requirements include technical, functional, performance, and commercial requirements that must be verified during the project execution. The oversight, auditing and verification of the work should occur as early as possible (prevention vs. inspection) in the project work so that if changes are required, they are identified early and the impact to the cost and schedule will be minimized.

Wherever possible, evidence criteria should be clarified collaboratively with the JV and agreed to in writing to ensure that all aspects of quality required to meet milestones are explicitly understood by all relevant stakeholders.

### 12.2 Requirements Traceability and Verification Methods

The explicit project requirements will be identified throughout the project, be tracked by the project team, and verification methods will be used to ensure each deliverable is achieved. Some examples of verification methods include:

- Design review
- Design Authority
- Analysis review
- Calculation
- Demonstration
- Inspection
- Functional test
- Mockup acceptance test
- Performance test
- Destructive or non-destructive examination
- Review of report

**Plan**

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10074</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>47 of 92</b>

Title:

**RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN**

All design requirements will have a dedicated Requirements Traceability Matrix established for each design package, and it will be managed through the engineered change control process and associated governance and process support documents. Other items such as SOW commitments will be tracked separately in a centralized location (at the time of revision of this PMP this tracking is happening in different formats across the sub-bundles, consolidation is in progress). The verification activities for completion of commitments/requirements throughout the project will be planned in numerous vehicles including but not limited to the JV schedule, the OPG schedule, the procurement look ahead plans, and the RMO oversight and actions tabs.

A sample template of a requirements matrix is included below for reference:

Requirement ID	Explicit Requirement Reference	Requirement Description	Verification Methods	Document Reference	Requirement Met?
1	SOW 2.2(a)	The deliverable shall achieve a speed of X	Review of Design, Performance Test	Design EC #, COMS Reference, ITP #	Yes
2	EPC Exhibit 3.5	The estimate shall be prepared according to the Plan	Review of report	Report # Rev 1	Yes
...	...	...	...	...	...
N	Etc	Each Requirement tracked shall be unique and measureable	Review of X, Y, and Z	Document references provided by team performing the work and provided Submittals	Track requirement as project progresses and reviews are completed

Note that there may be multiple Verification Methods for each requirement so as to reduce the residual risks as the work progresses, for example a design may be reviewed against the requirements and then subsequently inspected or tested against the requirements later in the project execution.

Note that some Explicit Requirements may start off as functional and be elaborated as the project progresses to become specifications or detailed functional requirements documents (also referred to as derived requirements) so that each of the detailed specifications or requirements are verified later in the project execution prior to acceptance and signoff.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>48 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Note that this traceability matrix is a live document and can be updated and tracked as the project progresses so that the project team knows what outstanding requirements are to be met by the end of the project. This provides a view of the potential risk to the schedule and project performance based on what is outstanding and how long it may take to achieve all of the requirements. Also, it provides a predictor to discover if there may be concessions required as the project progresses.

### 12.3 Compliance to Standards and Plans

It is recognized that Quality Management on the RFR project is composed of the following distinct areas.

1. OPG Quality Management - This is accomplished through compliance with the standards and procedures listed throughout the project plans, in particular the Darlington Refurbishment Management Systems And Performance Improvement Program Management Plan [R-92]. The Management System Oversight (MSO) group provides an independent mechanism to ensure project quality objectives are met. These plans also provide guidance on the appropriate use of Corrective Action Programs (both OPG and the vendor's), and direct the MSO organization to set up a schedule for self-assessments [R-18] as well as internal audit and to support internal audits by OPG Performance Assurance.
2. Contractor Quality Management
  - a. Joint Venture – This is verified through all of the OPG project team's activities working with the Joint Venture. Trust through verification is obtained through a variety of methods including design reviews and Design Completion Verification, acceptance of ITPs, field oversight at manufacturers to verify proper oversight being applied by the JV, "deep dives/audits" of the Joint Venture following their project plans and quality management system. The RFR Project Oversight activities perform checks from time to time based on risk associated with JV compliance to their own applicable procedures and processes. Additional quality assurance is provided by other supporting teams such as MSO, Supply Chain quality services, internal audit, external audit, self-assessments, and third-party reviews.
  - b. OSS – The type of QA applicable depends on the task. The RFR OSS scope is generally performed under the OPG QA program, with specific activities performed under the OSS QA program. Additional quality assurance is provided by other supporting teams such as MSO, Supply Chain quality services, internal audit, external audit, self-assessments, and third-party reviews.

### 12.4 Management System for Quality

The Quality Management of the project will be in compliance to:

- N-CHAR-AS-0002 - Nuclear Management System [R-8],
- N-CHAR-AS-0003 Darlington Refurbishment Managed System [R-9]

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10074</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>49 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- N-PROG-AS-0001 - Managed Systems [R-10],
- N-PROG-AS-0007 - Project Management [R-11],
- RFR EPC Agreement [R-28].

Along with the following Standards and Guideline documents:

- N-STD-AS-0028 - Project Management Standard, [R-12]
- N-STD-AS-0029 – Contract Management Standard [R-13],
- N-STD-AS-0030 – Project Oversight Standard [R-14],
- NK38-DP-09701-10001 – Retube & Feeder Replacement (RFR) Design Plan [R-4],
- N-MAN-09701-10002 – Nuclear Project Oversight Guide [R-16],
- NK38-NR-PLAN-09701-10001 Sht: 0010, Darlington Refurbishment Management System Oversight and Performance Improvement Program Management Plan [R-92]
- N-PROC-MM-0010 – Establishing and Maintaining Ontario Power Generation Nuclear Approved Supplier List [R-17].

## 12.5 Quality Assurance

For EPC work on RFR, the JV has prepared a project Quality Assurance Plan [R-54] that addresses the interface responsibilities with external organizations. The Plan addresses all applicable requirements of CSA 299.1, CSA N286-05 and CSA N286.7 standards identifying what quality program and procedures will be followed, including the contractor's and their sub-contractor's personnel responsibilities under the various quality programs.

The Contractor's QA program will be audited by OPG as required.

The Project team, jointly with the Functional teams, will work to ensure the quality of design, quality of materials and services provided and the quality of installation and commissioning work performed are meeting OPG standards, Purchase Order requirements, and compliance to codes and standards as applicable.

In the instance of a Quality system failure or a breakthrough event occurring for which the Contractor is accountable, the adverse conditions will be documented per the Contractor's QA Program . The Contractor will be asked to initiate a Corrective Action as per their program for any identified quality issues. When there is a systemic failure of their implemented Quality System, a formal Non Conformance and Corrective Action Request process will be initiated by OPG Supply Chain Quality Services as per N-PROC-MM-0010 [R-17].

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>50 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

To ensure compliance to OPG requirements, the contractor interface will be controlled by the Contractor Owner Interface Requirement (COIR) document [R-26] forming part of the Agreement and deviations, additions, exceptions, revisions thereto will be accepted by both OPG and the Contractor.

### 12.6 Quality Control

Quality on the project is achieved through the implementation of OPG's Program and project plans and the JV's Plans.

As the great majority of the work is executed under the JV's Quality Assurance program, OPG will perform oversight and witness key aspects of the work program. For example, witness points will be included in Manufacturing Inspection & Test Plans for Reactor Components.

The specific metrics used to track performance on quality are currently being developed by the Refurbishment Program. To date, numbers of SCRs and numbers of non-conformances have been used by the project to track performance on quality.

## 13.0 PROJECT HUMAN RESOURCES MANAGEMENT

### 13.1 OPG Human Resources Management

#### 13.1.1 Team Resourcing

In Nuclear Refurbishment, OPG has made Project Directors/Managers accountable for overseeing all EPC Contractor work. The EPC Contractors will be responsible to deliver the contracted work as per the individual EPC Agreements.

The OPG RFR Project Organization is shown in Section 13.2 below. The key roles and their respective accountabilities are described in the following sections.

Nuclear Refurbishment has elected to employ a strong Matrix organizational model to execute the Refurbishment Program. RFR has staffed the project team with OPG staff, supplemented by augmented staff and OSS Managed Task activities to meet the project schedule and needs. OPG staff will either be embedded in the team or will perform functions matrixed from the NR functional organizations. Where NR functional staff are unable to fulfill a specific need, due to unavailability or missing skill sets, the project will work with the accountable Functional Manager to either utilize managed task contracts to maximize outside experience or attempt to find staff within other OPG business units. In the strong matrix model, it is the accountability of the Functional Manager to acquire the required resource.

At this phase of the RFR project, project human resource management will include:

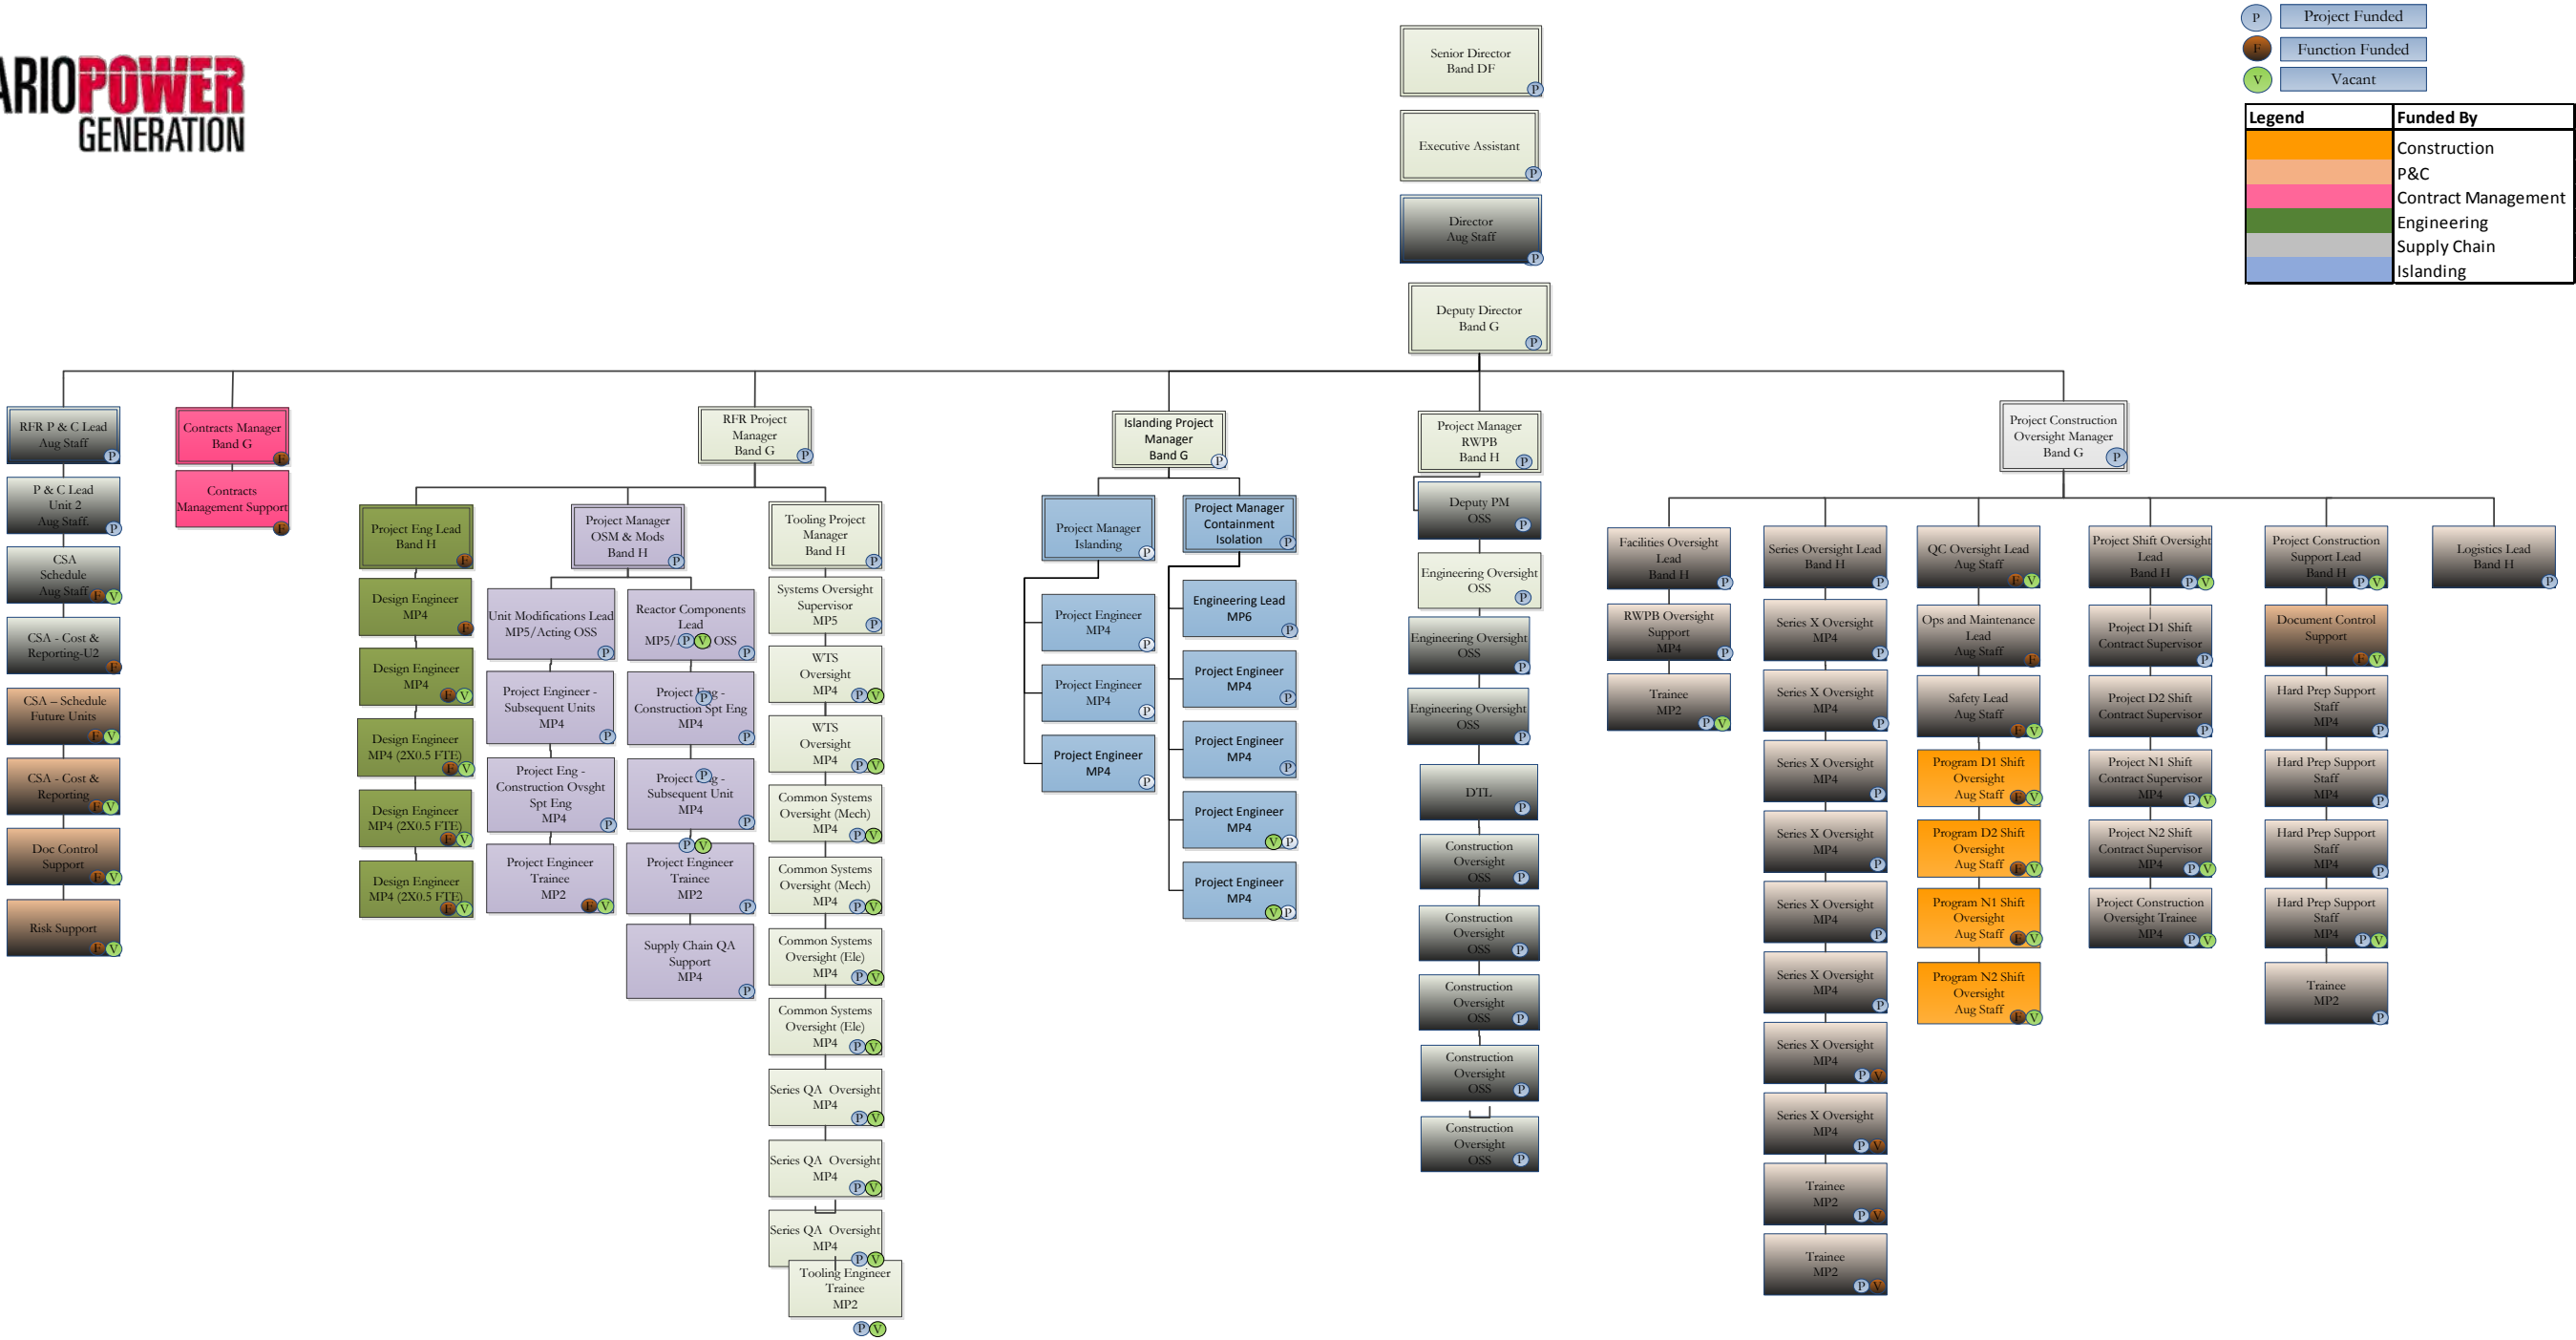

- Identify and documenting in this PMP the project roles, responsibilities, required skills, and reporting relationships
- Confirming human resource availability and obtaining the team necessary to complete the project activities
- Developing the team through improving competencies, improving team member interaction and overall team environment to enhance project performance
- Managing and tracking the project team member performance, providing feedback, resolving issues, and managing changes to optimize project performance

**RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN**

### 13.3 Project Organization- Roles & Responsibilities

#### Sr. Project Director / Project Director / Deputy Project Director

- Overall responsibility of all areas of the project (scope, contract, resourcing, risk, etc...)
- Budget owner per gate
- Project Signing Authority

#### Planning and Controls Lead [Matrixed Role]

- Reports to Project Director.
- Reports to functional manager in the P&C line to ensure standards and governance related to P&C are adhered to. Any requirements from functional management that could impact project duties needs to be vetted and coordinate with the PD.
- Project Reporting
- Primary interface with Contractor P&C Manager and scheduling
- Invoice review coordination and approval
- Schedule management (incl. Oversight of vendor cost and schedule management)
- Weekly interfacing with each PM on cost, schedule, and risk including trend analysis
- Risk Management
- Routine interfacing with function
- Gate package cost and schedule preparation

#### Contracts & Commercial Manager [Matrixed Role]

- Reports to Project Director
- Delegated project signing authority from Project Director
- Responsible to interface with Project team to ensure adherence to Agreement.
- Advises Project management on commercial strategy
- Reports to functional line in the contracts/commercial organization to ensure standards and governance related to contracting are adhered to. Any requirements from functional management that could impact project duties needs to be vetted and coordinated with the Project Director.
- Responsible for preparing and issuing PCDs, commercial/contracts letters, Amendments.
- Primary interface with contractor contracts manager

<b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### Project Manager RFR [Direct Project Role]

- Reports to RFR Project Director RFR/Islanding
- Responsible for RFR scope, cost, risk, quality, safety, schedule
- Responsible for Engineering and Procurement oversight (routine, process, strategic)
- Succession Planning and Staff Training and Development
- Staffing Strategy for accountable areas
- Gate preparation
- Preparation of OPG management plans
- Monthly preparation of RFR project status quad chart

### Project Manager Islanding [Direct Project Role]

- Reports to RFR Project Director RFR/Islanding
- Responsible for Islanding scope, cost, risk, quality, safety, schedule
- Responsible for Islanding oversight (routine, process, strategic)
- Succession Planning and Staff Training and Development
- Staffing Strategy for accountable areas
- Gate preparation
- Preparation of OPG management plans
- Monthly preparation of Islanding project status quad chart
- Note that Islanding project organization is elaborated in more detail in the Islanding PMP.

### RFR Project Engineering Lead [Matrixed Role]

- Reports to Project Manager RFR
- Manages engineering resources (including qualifications) to execute oversight and vendor deliverable reviews.
- Coordinates any decision making with PM to ensure alignment to Contract.
- Reports to functional managers in the engineering line to ensure standards and governance related to Engineering are adhered to. Any requirements from functional management that could impact project duties needs to be vetted and coordinate with the PM.

### Project Manager – OSM & Modifications [Direct Project Role]

- Reports to Project Manager RFR
- Responsible for OSM and modifications scope, cost, risk, quality, safety, resources, schedule
- Scope is delivering as per Agreement:

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10074</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>55 of 92</b>
Title:		
<b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Engineering modification oversight and review
- Engineering associated with procurement of OSM (tech specs)
- Field initiated changes (process and oversight of)
- Procurement management and oversight of:
  - OSM
  - All Goods including waste, Modifications and infrastructure related

### Project Manager – Tooling [Direct Project Role]

- Reports to Project Manager RFR.
- Responsible for tooling scope, cost, risk, quality, safety, resources, schedule.
- Responsible for oversight of JV Tool Management Organization: including oversight of ECR process, WO process, Tool Tracking/Readiness process, and EPICOR software system.
- Support for Series Leads during execution readiness and troubleshooting: this includes providing tooling technical expert support for series leads when SIR or HIT teams are required.
- Support Series Leads in AFS for category 1 tools.
- PM lead for Tooling Change Control process during execution.
- PM level lead for RFR Risk Management and Oversight (this is an assigned role at time of PMP issue, the role may be rotated to another member of the team at the discretion of the Project Director RFR/Islanding)
- Responsible for integration of the Waste Tooling System (WTS) into the RWPB construction.

### Project Manager – RWPB [Direct Project Role]

- Reports to Project Director RFR/Islanding
- Responsible for RWPB scope, cost, risk, quality, safety, resources, schedule
- Responsible for implementation of Owner Only execution model for construction and operation of the RWPB through the full refurbishment project
- Oversight of JV work planning in compliance with MA22 for RWPB tie ins to station systems requiring coordination with operating units through IPG schedule
- Responsible for oversight and coordinating reviews of deliverables (e.g. estimates, cost reports, engineering products)

### Project Construction Oversight Manager

- Reports to Project Director RFR/Islanding.
- Functional reporting relationship with NR Construction Director
- Responsible for construction oversight (routine, process, strategic)

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>56 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Delegated RFR Project Director OHSA accountability for Owner/Constructor
- Facility interface w/OPG Facilities (e.g. DEC, RFRISA)
- Develop bridging strategy to transition from definition to execution phase
- Readiness management (e.g. tooling to DEC, RWPB in service, OSM on site, facilities ready for use such as RFRISA,...)
- Interface with other projects re: schedule, logic, etc
- Safety Plan
- JV Gang Owner (currently executed by RFR Project Manager, PM has initiated request for this role to be self performed by the JV as it is only a communication tool for RP, OPG training, security and tool overdue notices for which JV has full accountability)
- COMS input/oversight focused on Construction
- COIR – oversight of and changes to Construction section
- Dose/ALARA/RP planning oversight
- Labour agreements (requirements, involvement in establishment)
- Transition planning for program construction management oversight

**Construction - Facilities Oversight Lead [Direct Project Role]**

- Reports to Project Construction Oversight Manager
- RWPB Oversight Support following building AFS
- DEC warehouse and mockup oversight and support

**Construction – Series Oversight Lead [Direct Project Role]**

- Reports to Project Construction Oversight Manager
- As Counterpart to JV Series Lead, accountable for oversight of series readiness, training, execution and closeout
- Development of construction execution metrics (in collaboration with Project Construction Support Lead for alignment with Program requirements)

**Construction – QC Oversight Lead [Functional Role]**

- Reports to Project Construction Oversight Manager
- Lead in oversight of JV Quality program activities including compliance with JV Quality Plan, governance, ITPs (which will require targeted shift coverage during execution)
- has matrixed Operations and Maintenance reports to this role but supports the entire project in alignment with RFR priorities
- Safety Lead, performing oversight on JV compliance with safety management plan, in close coordination with NR Safety organization to optimize alignment on focus areas and sharing of observations to allow efficient cross program trending

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>57 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### Construction – Project Shift Oversight Lead [Direct Project Role]

- Reports to Project Construction Oversight Manager
- Lead of Construction oversight personnel that will be on shift with JV
- Oversight of field activities, primarily inside the protected area, coordinating oversight efforts with Series Leads, QC oversight, logistics lead

### Construction – Project Construction Support Lead [Direct Project Role]

- Reports to Project Construction Oversight Manager
- Integration of project reporting into program focus areas (e.g. RQE, Hard Preps)
- Oversight of JV work planning in compliance with MA22 for work requiring coordination with operating units through IPG schedule (e.g. RCC installation, weather enclosure, excluding RWPB tie ins) in collaboration with P&C lead for scheduling requirements
- Doc Control Support

### Construction - Logistics Lead [Direct Project Role]

- Reports to Project Construction Oversight Manager
- Lead RFR logistics activities across RFR projects, including OPG and JV staff accommodations, oversight and support for logistic areas with high interaction with operating units (e.g. waste interstation transfer route to RWPB)

### Manager Design Projects - RFR [Functional Role]

- Dedicated Band G Design Manager to RFR, direct interface with NR Design Authority to ensure project execution in accordance with OPG engineering governance defined in RFR COIR,
- works with project to prepare engineering products (e.g. DCAVR) and recommends to the DA acceptance of said products
- Working with engineering peers and design authority, supports timely escalation and resolution of engineering issues
- Ensuring design staff matrixed to the project (design engineering, resident engineering) are fully qualified and trained to perform required duties
- For Tooling, Modifications, OSM, Waste, Containment Isolation, provides reviews and recommendations to Design Authority to accept design deliverables, or disposition deviations to the specs.
- Interface with RFR Project Manager to ensure function actions are consistent with project needs and priorities

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>58 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### Components & Equipment Manager [Functional Role]

- As Engineering Authority for nuclear refurbishment, approves OSM specifications, manufacturing DDRs (requests for deviations from specification) and NCRs (one off non-conformances to specifications)
- As a SPOC for all component engineering issues, ensures alignment between project, vendors, plant engineering and nuclear support (MCED and FCLMP) and regulatory affairs.
- Interface with RFR Project Manager to ensure function actions are consistent with project needs and priorities

### **13.4 On-boarding New Team Members**

Onboarding of staff onto the project is done in accordance with established processes, OPG staff per HR process, augmented staff per augmented staff MSA requirements, OSS through RFR OSS project manager.

Initial focus is dependent on assignment, however key areas for all staff include familiarity with high level understanding of RFR Agreement, role of OPG in performing oversight on EPC vendor, RFR COIR, RFR SOW, RFR organization and RFR schedule.

The JV have issued a Trades On Boarding and Training Plan [R-60] and a Mockup Training Plan [R-66] to document the process by which trades will be engaged and trained for RFR Execution.

### **13.5 Off-boarding Team Members**

Offboarding of staff will be done in accordance with established processes, OPG staff per HR process, augmented staff per augmented staff MSA requirements, OSS through RFR OSS project manager.

Change in matrix staff assigned to the project is performed by functional organization at the request of the project

### **13.6 JV Resource Management**

The JV have issued a Resource Management Plan for the RFR Project [R-44]

<b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 14.0 PROJECT COMMUNICATIONS MANAGEMENT

At this phase of the RFR project, project communications management largely consists of managing communications with the JV and stakeholders in a manner that optimizes prompt completion of activities and resolution of issues, with records generated in a manner that supports future retrieval of relevant information. In addition, project status communication is accomplished by maintenance of reporting infrastructure (e.g. P6 schedule, ECOSYS) to allow automated centralized reporting by the P&C Function, with variance explanations provided as required by the project. In light of the fact that RFR activities make up over 80% of the NR critical path and the largest proportion of NR costs, it is understood that RFR will be a main area of focus for senior management which may result in communication requirements (e.g. mockup tours for Government officials, DRC presentations) over and above that of other NR project bundles.

### 14.1 OPG Communications Management

### 14.2 Information Control

The main stakeholder communication methods are:

- Telephone and Email communications,
- Submittals,
- Meetings, and
- Publications and Reports.

Emails: Regularly used to document interface with stakeholders, the project team and with the Joint Venture. A RFR Project Mailbox has been set up (NR-RFR PROJECT) which is accessible by all members of the OPG RFR Team to capture emails deemed important for the RFR project.

Submittals: As per the RFR EPC Agreement, Submittals are important communication methods. Submittals are described in Section 2.9 of the RFR EPC Agreement.

Meetings: Conducted face-to-face with available teleconference and videoconference as required. Stakeholder meetings involving the RFR project and its stakeholders are listed in Table 2. Internal RFR Project Meetings are shown in the table below.

Publications and Reports: RFR publications and reports are described in the applicable sections of this PMP. Publications of RFR information are also communicated to internal stakeholders via OPG newsletters (e.g. The Pulse) and Intranet websites (e.g. RFR intranet website).

Meeting Title	Description	Frequency
RFR/IMS Interface Meeting	Discussion on tooling and logistics for RFR	As Required
Nuclear Refurbishment All Staff Face-to-Face Meeting	Project update	As Required

Records: The Communication Technology and Information distribution tools that will be used by the project are described in section 5.1. In summary, the following are the main project communication vehicles are as follows:

- Supplier Document Hub (SDH): External environment used for exchange, management of Submittals as per the RFR EPC Agreement and Project Communication Plans
- Electronic Data Management System (VENDM): OPG environment used for exchange, management of Submittals as per the RFR EPC Agreement and Project Communication Plans
- SharePoint 2007: Internal document storage, exchange environment used for storage of project documents, deliverables, schedules, cost information, as well as confidential & commercially sensitive information relevant to the RFR project and contracts.
- PDMC: This is the external instance of SharePoint used by SLN-Aecon JV for their documentation management. Some OPG staff have limited access to this site to facilitate collaborative reviews of preliminary documents.
- OPG Records & Document Management (RDM) are owners of both the SDH, VenDM, and SharePoint, and are responsible for process definition and support, technical support for SDH, VenDM, and Sharepoint as it relates to Submittals, and comments and dispositions as outlined in the RFR EPC Agreement.
- Project Records will be maintained in VenDM, SharePoint and Project Emails. As applicable, project records will be indexed and stored in Asset Suite.

### 14.3 Performance Reporting

Performance reporting will be done in accordance with the Darlington Refurbishment Communications Program Management Plan, [R-1].

The RFR EPC Agreement Exhibit 2.9(j) specifies regular project reporting requirements in the following areas:

- Health, Safety & Environmental Performance;
- Schedule Performance including but not limited to:
  - Engineering Activities;
  - Procurement Activities;
  - Permitting Activities;
  - Construction Activities; and
  - Submittals.
- Cost Performance;
- Quality Performance;
- Risk & Contingency;
- Scope;
- Issues, Assumptions and Decisions; and
- Training Activities.

### 14.4 Joint Venture Communication Management

Communication by the Joint Venture is done in accordance with their Communication Management Plan [R-48].

Plan

<b>Internal Use Only</b>

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 15.0 PROJECT RISK MANAGEMENT

RFR project risk management is performed in accordance with Nuclear Projects Risk Management [R-77]. Any RFR specific processes are detailed in this section of the PMP. The Risk Management and Oversight (RMO) tool is the risk register for OPG risks, which includes JV risks where there is residual risk to OPG after JV mitigation.

For most RFR risks related to performing the work in definition or execution scope, the JV is responsible for the primary risk management. The risks identified during the class 2 execution estimate or identified by JV on an ongoing basis are tracked in the JV's risk register in compliance with their Risk Management Plan [R-46].

### 15.1 OPG Risk Management with RMO

#### 15.1.1 OPG Risk Management Process Overview

In alignment with Nuclear Projects Risk Management [R-77], key activities in risk management include:

1. Identifying new risks.
  - Ensure title and description are appropriate: event, cause, impact.
  - Ensure risk rating is compliant with heat maps.
    - Pre Risk Rating – initial values;
    - Post Risk Rating – end state, assuming risk response strategy is effective. This score shall be reassessed if conditions change.
    - Current Risk Rating – best estimate of current state of the risk. This score shall be reassessed regularly, especially when actions are closed or new info indicates risk is more severe.
  - PMs ensure appropriate risk owner and delegate (technical expert).
2. Managing existing risks on a regular basis.
  - PM teams have bi-weekly meetings with minimum of monthly review period.
  - The current risk rating is expected to change as a risk increases (i.e. changing conditions) or decreases (i.e. through mitigating actions).
3. Escalation of high level or urgent risks to senior management.
4. Identifying risk response
  - Preparing mitigation strategies with SMART actions if applicable. OPG actions are tracked to completion in RMO and must be updated with the same frequency as risks.
  - Preparing strategic oversight and generating oversight findings in RMO when appropriate.
5. Closing risks when they are either realized (may be converted to issue), fully mitigated, or no longer relevant.
6. Ensuring contingency plans are prepared and accepted for high level risks should the risk become realized (Risks with post mitigation score  $\geq 15$  per heatmap).

## Plan

Internal Use Only		
Document Number:	Usage Classification:	
<b>NK38-PLAN-09701-10074</b>	<b>N/A</b>	
Sheet Number:	Revision Number:	Page:
<b>N/A</b>	<b>R003</b>	<b>64 of 92</b>

Title:

## RETUBE & FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN

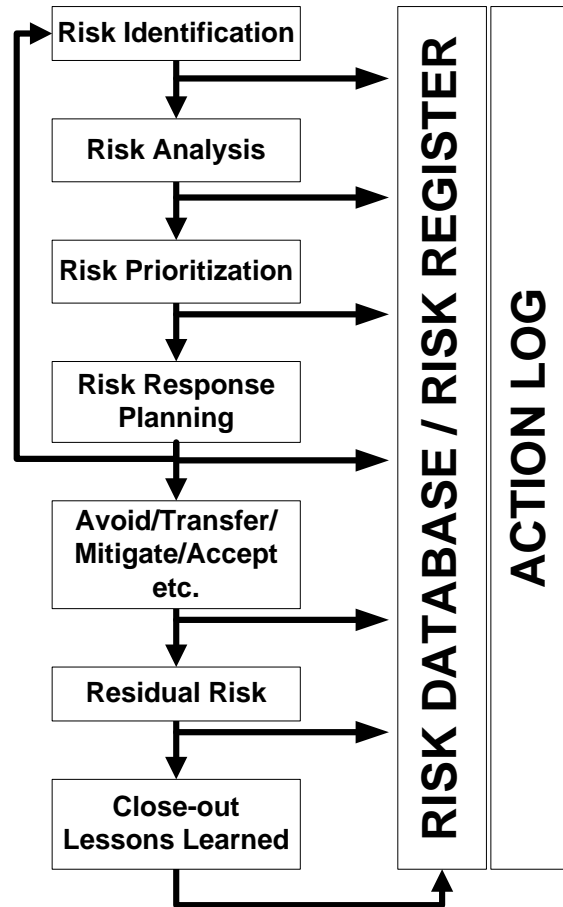

Figure 4: Overall Risk Management Process

- RFR participates in regular bi-weekly alignment meetings with Darlington Refurbishment program.

### 15.1.2 Actions and Oversight in RMO linked to Risks

Risk response actions are actions created and tracked in RMO and must be linked to the risk. At least one action is required for any risks with a response strategy of mitigate (note that these may point to an action in another managed process, with progress and status to be tracked in that managed process e.g. P6 schedule activity). These actions are intended to capture all SMART activities required to complete the mitigation strategy. As actions are completed, it is expected that the risk rating will be modified accordingly (typically it will be partially mitigated by completed actions). When all actions are completed for a 'mitigate' type risk, the expectation is that the risk rating is equal to the post mitigation risk rating. If there is still a gap, then additional mitigating actions should be identified and added.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>65 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

Depending on the complexity of the risk, it is recommended that one or a few higher level actions are more readily managed than many low level actions. Details of the actions and routine status updates should be entered in the comments field of the action in RMO on a minimum of a monthly basis.

The target completion dates for actions are intended to be committed targets and missed dates are tracked by refurbishment management. If an action date must be extended, the expectation is that the PM or delegate will seek appropriate approvals for the extension and document the change in the action comments update.

For any medium or high risks with a response strategy of monitor or transfer, the expectation on the PM or delegate is to create at least one action linked to the risk to document increased degree of in-process or routine oversight activities, for example more regular oversight field presence, meetings, recovery plans etc.. Where a strategic oversight activity/finding is applicable, an RMO action is not necessary because the oversight is tracked in the oversight module of RMO and should be linked to the risk.

### 15.1.3 Transfer of Risks and Actions

Risks may be transferred between the JV risk registry and OPG RMO risk register when the other party is more accountable for managing the risk. There needs to be a confirmation of acceptance by the receiving party before the risk in the transferring risk register can be closed. This acceptance takes the form of a new risk with appropriate actions being created in the receiving risk register.

For example, OPG has a risk in RMO and during regular reviews, the PMs agree the JV should be managing the primary risk. The JV would need to create a risk in their risk register with appropriate mitigating actions. The JV risk ID and a brief summary of the JV's action plan must then be listed as closure notes in the OPG risk register, RMO. The risk would then be closed in OPG RMO, or if there was still a significant residual risk to OPG, the risk might remain active in RMO to track the residual risk only with a reduced score - the JV would be responsible for managing the primary risk.

### 15.1.4 OPG Risk Management Roles & Responsibilities

Overall accountability for RFR risk management is the RFR Project Director. A central RFR Project Risk Manager (Risk SPOC) is a delegated role from the RFR Project Director, with accountability to work with all PMs to ensure a consistent and effective approach to risk management and implement continuous improvement.

Each PM is accountable for risks related to their scope including oversight of relevant JV risks. In RMO, the PM is typically the owner of the risk. They are responsible for ensuring compliance with refurbishment governance as per Nuclear Refurbishment Risk Management [R-77] and RFR risk management (this Section). Each PM may assign risks to a delegate who may be any members of the RFR project management team if they are deemed by the PM to be competent to provide appropriate status update for the risk, actions, and oversights. The delegate is typically either a technical expert or a SPOC familiar with the risk process and RMO tool.

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>66 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

The following roles have been defined for the RFR Project:

- OPG Project Director
- OPG Project Risk Manager (Risk SPOC)
- OPG Risk/Action Owners
- OPG Risk/Action Delegate
- Reviewers and Advisors

### 15.1.4.1 OPG Project Director

The OPG Project Director has overall accountability to ensure that the Project Risk Management process is appropriately implemented.

### 15.1.4.2 OPG Project Risk Manager

The OPG Project Risk Manager (Risk SPOC) is a position delegated by the OPG Project Director to support all aspects of the Project Risk Management process. The specific functions of the Project Risk Manager include:

- Coordinate RFR PM level risk review meetings. This meeting is a strategic forum for PMs, NR program risk representative, the JV risk manager and a broad representation of stakeholders to discuss the highest risks from RFR project, refurbishment program, and vendor risk register as well as opportunities for continuous improvements in RMO and oversight of vendor risk management.
- Assist PMs in tracking compliance of risks, actions, and oversight with governance. For example, through dashboards identify risks not updated in the past month, mitigated risks without actions etc.
- Coordinate timely entries of risks and mitigation actions and updates in the OPG RMO tool (risks and action log).
- Interface with the Contractor Risk Manager on Contractor's Risk Management process. Participate in Contractor's risk meetings and workshops
- Interface with the NR Program Risk Management representative to align RFR Project Risk Management process with the NR Program.

### 15.1.4.3 OPG Risk/Action Owners

All risks and actions in RMO require a OPG Risk Owner identified in RMO by their corporate profile name. The owner is typically a RFR Project Manager (but may be a Director for higher level risks), should be a person knowledgeable about the scope of the risk and with sufficient authority to actively plan responses to the risk, including assigning resources as a risk delegate and to mitigate the risk. The owner of the actions is typically the same person at the owner of the applicable risk.

Plan

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>67 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

The OPG Risk/Action Owner has accountability for managing their risks and actions linked to the risks. The OPG Risk/Action Owner can appoint a delegate, typically either a technical expert or a SPOC familiar with the risk process and RMO tool.

#### 15.1.4.4 OPG Risk/Action Delegate

Risks and Actions may be assigned to a delegate who may be any members of the RFR project management team if they are deemed by the Risk/Action Owner to be competent to provide appropriate status update for the risk, actions, and oversights. The delegate is typically either a technical expert or a SPOC familiar with the risk process and RMO tool.

The responsibility of the delegate includes (but not limited to):

- provide or coordinate expertise to provide a quality status update in the comments field of the risk/action in RMO on a regular basis, minimum monthly. Consult other stakeholders (i.e. SMEs, JV personnel, external experts) as applicable to provide as much detail as appropriate to complexity and significance of the risk and action.
- advise the risk owner if the risk ratings, risk description, or risk response fields in RMO need to be changed. All changes to these fields should be approved by the risk owner as they may impact the escalation and contingency requirements of the risk.
- advise the risk owner when an action or risk is able to be closed and with approval, close the risk/action and enter closure notes in RMO.

## 15.2 RFR Project Oversight of JV Risk Management

The formal interface between OPG and the Contractor has been documented in the Contractor documents: the Darlington RFR – Communication Plan [R-48] and Darlington RFR – Risk Management Plan [R-46] . The main activities include:

- Oversight of the Contractor's Risk Register progression per Exhibit 3.5 in the RFR EPC Agreement.
- Working with the Contractor to assist in planning risk responses to risks, ensure appropriate owners and completion dates for actions.
- Development of the Execution Phase Target Cost and Execution Phase Target Schedule, as specified in Exhibit 3.5 in the RFR EPC Agreement (this was completed as the class 2 estimate).

The Contractor will have their own risk register which houses risks and their mitigation actions. Contractor Workshops are the formal meetings by which risks (including uncertainties) will be jointly reviewed by the Contractor and OPGy. Refer to DNGS RFR Project – Risk Management Plan [R-46] for details.

The Contractor Risk Manager is the owner of the risk register. He or she ensures that it is maintained current with inputs of all the required information through a series of risk meetings and workshops with their Risk Management Team.

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 15.3 RFR Project Support to Refurbishment Program Risk Management

Alignment between OPG NR Program and OPG RFR Project is key. The Project Risk Management process follows as much as possible the processes directed to projects from the Program. Variations, if any, from the NR Program's Risk Management Plan is detailed in this Risk Management Plan.

- The Release Quality Estimate (RQE) was approved as of early 2016. This included RFR financial and schedule contingency estimates.
- For gate 3a, the program risk management contingency template has been prepared and submitted by RFR with updated values for U2 execution estimate.

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

## 16.0 PROJECT PROCUREMENT MANAGEMENT

For the majority of materials being purchased for the RFR Project, OPG's role is oversight of the procurement management performed by the EPC Contractor. Typical activities include:

- Oversight of vendor's procurement processes
- Oversight of vendor warehousing of material procured
- Review of decisions to outsource work ("make vs. buy")
- Approval of vendor recommendations for procurement packages as required by the RFR Agreement
- Review of vendors/suppliers list (especially if single-source)
- Review of submittals related to milestone payments

### 16.1 OPG Procurement Management

The procurement terms and conditions are defined in the RFR EPC Agreement [R-28] (including Exhibit 2.11 – Procurement Work and Contractor/Owner Interface Requirements (COIR) [R-26] Section 4.0, Procurement Interface Matrix), and are in alignment with Procurement Activities [R-22] and Nuclear Procurement [R-36] .

The RFR Project will be performing work for other NR bundles where activities in the vault must be tightly coordinated. Where the procurement is being performed by the other bundle(s), the material will be free-issued to the RFR Contractor in a manner that it is accepted into their quality program for installation as part of the RFR project.

OPG may free issue materials to the vendor where availability or lead time is a factor. This will be done in accordance with contract terms and conditions including the COIR

For all OPG initiated procurement activities, the processes as defined in OPG-PROC-0058 Procurement Activities [R-22] and Nuclear Procurement [R-36] will be followed.

Project-specific plans include NK38-PLAN-31100-10001 Sheet 0015 - RFR at Risk and Long Lead Materials Procurement Management Plan [R-23].

### 16.2 Joint Venture Procurement Management

The JV is accountable for procuring all Owner Specified Materials specified in the RFR SOW [R-21] and all Goods required to execute the Work, including consumables.

The EPC Joint Venture manages procurement according to their Materials and Procurement Management Plan [R-56] and the Materials Control Plan [R-57].

## Plan

Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

### 17.0 CONTRACT MANAGEMENT

The OPG RFR project team performs oversight of the RFR EPC Contractor in compliance with the OPG Contract Management Standard [R-13] and the Darlington Refurbishment Contract Management Plan [R-1].

Contract Management for the RFR Project involves the management and oversight of the following key items:

- Contractor adherence to the EPC Agreements terms and conditions
- Risk-based audits, e.g. Contractor adherence to their plans and schedule
- Development and completion of Notices / Project Change Directives
- Development and completion of Contract Amendments
- Reconciliation of Contractor invoicing against EPC Agreements, e.g. allowed / disallowed costs
- Management of Interfaces between OPG and all Contractors in RFR Project

RFR Contract Management is described in detail in the RFR project-specific Contract Management Plan [R-38].

JV contract management is described in their Contract Management Plan [R-58]

<b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

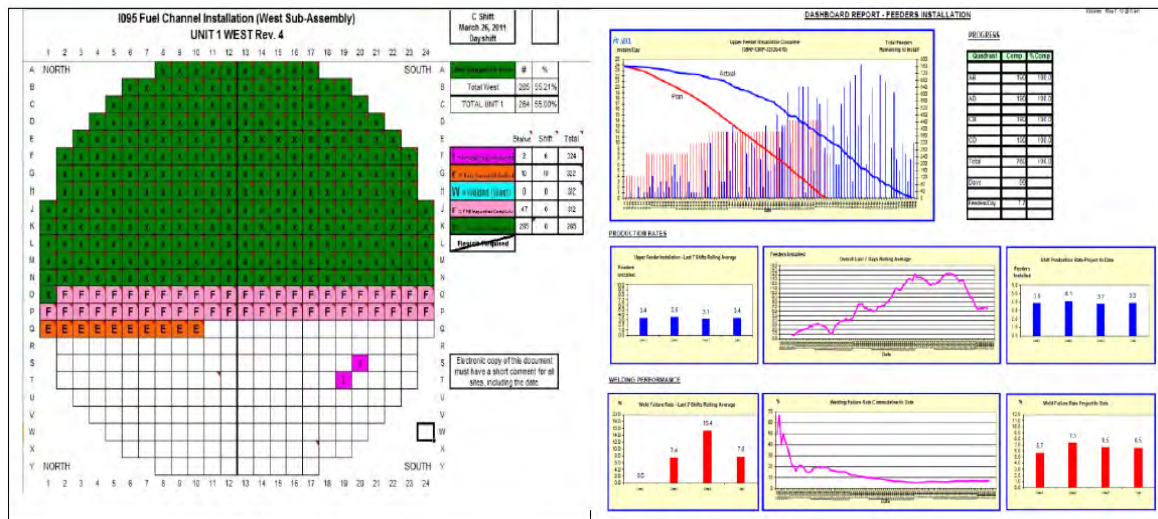

## Appendix I: Summary of RFR Execution Phase Metrics and Reporting

### PSP (Procedure Sequencing Program):

The JV will implement a computer based work management system called "PSP" (Procedure Sequencing Program) which will be used to monitor the work in the field on a step by step basis from the retube control center (RCC) used for series while unit is Islanded

This software suite (PSP) reports:

- Tracks work at the CWP operation level via inputs from supervisors, QC, etc.
- Displays a visual representation of the reactor face, or header map showing status at each site
- Tracks start and finish time for each site, and the start and finish time for each CWP operation
- Linked to P6 through a flagged field that allows cross referencing from PSP activities to P6 activities

Examples of face map report and workdown curves from previous Retube Project

### Asset Suite 7

Implemented for series before breaker open and when plant is not islanded, for example:

- Bulkhead install and removal
- Vault crane upgrade
- FM Carriage removal
- Terminal Point interfaces (PDS hookups, PHT Vac Dry hookups)

## Plan

Internal Use Only		
Document Number: <b>NK38-PLAN-09701-10074</b>		Usage Classification: <b>N/A</b>
Sheet Number: <b>N/A</b>	Revision Number: <b>R003</b>	Page: <b>89 of 92</b>
Title: <b>RETUBE &amp; FEEDER REPLACEMENT (RFR) PROJECT MANAGEMENT PLAN</b>		

- Will feed JV schedule with updates at this period of time

High-level implementation once plant is islanded:

- Once work-order created with single task for each JV scope "Series"
- Tasks for OPG required support (permittry, Radiation Protection, class 7 shipping, etc...)
- Applies to Face and Feeder series
- Will not feed JV schedule with updates at this period of time

### Labour Reports:

- Report on PMT labour spent vs. budget bi-weekly, report on trades labour on a weekly basis
- Data will come from JV systems – applicable to JV staff and trades
- Average labour rate for trades. Vs. budget labour rate will be reported

### Logic Flow Diagram:

The Logic Flow Diagram will be updated with actual and forecast start and completion dates for each series listed on it, and will serve as a high-level communication report on the overall status of the outage. It will be updated as required, but at minimum it will be updated monthly

## 1.0 INTRODUCTION

The Darlington Refurbishment Project Charter, D-PCH-09701-10000, documents the purpose of the Darlington Refurbishment Program.

Darlington NGS (DN GS) is aging and there is a need to assess and make recommendations with respect to the feasibility of continuing to operate beyond the current nominal end-of-service life dates. The goal of the refurbishment project is to extend the service life of the units by an additional 30 years of post-refurbishment operations.

Refurbishment will involve an outage for replacement of life-limiting components, as well as maintenance or replacement of other components which can be most effectively done during the refurbishment outage period.

The Nuclear Refurbishment (NR) organization has been established with the responsibility of assessing, making recommendations to Ontario Power Generation (OPG)'s Senior Management with respect to the feasibility of refurbishing the Darlington units, developing the scope, schedule and estimate for the Refurbishment Program, and providing overall program oversight on the execution of all activities associated with refurbishment. For Darlington, NR will undertake the Darlington Refurbishment Project, in phases per the approved Program Release strategy, to:

- Assess the technical feasibility of refurbishing Darlington and operating it for an additional 30 years of post-refurbishment operations
- Make recommendations as to the lead time required to be prepared to refurbish each unit,
- Fully define refurbishment scope,
- Execute front end planning including developing contract management strategies, cost estimates, schedules, a full risk assessment, and a release quality estimate for the project,
- Manage the refurbishment pre-outage planning and preparation activities,
- Provision of overall program oversight on all execution and commissioning activities, and
- Project Closeout.

The refurbishment is currently planned to begin in 2016. Each of the units will be shutdown in a partially overlapping sequence with the second unit shutdown commencing after removal of all components in the first shutdown unit (i.e. end of the removal phase of the first unit)

**Plan**

<b>Internal Use Only</b>		
Document Number: <b>NK38-PLAN-09701-10238</b>		Usage Classification:
Sheet Number:	Revision Number: <b>R002</b>	Page: <b>8 of 56</b>
Title: <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

Currently, the approved plan to refurbish the four units, with first two units “unlapped”, is shown in the following table:

Unit	Start of Refurbishment Outage	Finish of Refurbishment Outage	Duration (Months)	Overlap on Previous Unit
D2	October 2016	October 2019	36	
D3	October 2019	October 2022	36	0
D1	March 2021	March 2024	36	19
D4	October 2022	October 2025	36	17

The current reference schedule is as follows:

- Initiation Phase – 2008 - 2009 COMPLETE
- Definition Phase - Preliminary Planning – 2009 - Dec 2011 COMPLETE
- Definition Phase - Engineering and Detailed Outage Planning – 2012 - 2016
- Field Execution and Closeout Phase (four units) – 2016 - 2025
- Operation Phase (Return to Service of Units) - Starting with the first unit in 2019

The goals of the Darlington Refurbishment project (ref: NK38-CORR-09701-0458306, *Common Outage Goals and Objectives for Darlington Refurbishment*), are:

- Station and Refurbishment scope is completed safely, at the specified quality, on time and on budget;
- Transitions of units, work programs and staff between the Station and Refurbishment are planned and controlled to minimize disruption in Refurbishment and Plant Operations;
- Darlington operation post-Life Extension meets OPG documentation requirements and operating objectives, as defined by the Nuclear Performance Index and the Equipment Reliability Index.

# SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN

## 2.0 PROJECT DESCRIPTION

### 2.1 Project Scope and Objectives

The Shutdown Layup/Services/RSF Project (“the Bundle”) consists of a series of projects whose collective purpose is to establish the conditions within plant systems and equipment to ensure continued asset preservation during the refurbishment period, provide increased plant services, and provide support facilities. The various projects in the Bundle are described below:

- Shutdown and Layup Sub-bundle – Establishes dry conditions within plant systems and equipment. Projects include:
  - Steam Generator Secondary Side Layup
  - Monitoring of Permanent Equipment and Laid up Systems
  - Monitoring of Temporary Station Equipment
  - Dry Air Provision to Conventional Side Systems
  - Dry Air Provision to Nuclear Side Systems

NOTE: The following project has been transferred to RFR via DRAS 557 and 685.

- Moderator and PHT Auxiliary Layup (Drain & Dry)

NOTE: The following project has been transferred to BOP via DRAS 517.

- Low Pressure Service Water Layup

NOTE: The following project has been cancelled from scope following RQE via DRAS 728.

- Contingent D2O storage (contingent)

NOTE: The following project has been transferred to SG bundle via CCF 926.

- SG Primary Side Layup

NOTE: The following project has been transferred to TG bundle via CCF 927.

- TG and Auxiliary Layup

Title:

**SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT  
MANAGEMENT PLAN**

- Services Sub-bundle – Additional services required to support Refurbishment activities. Projects include:
  - Breathing Air
  - Service Air
  - Cranes
  - Temporary Power
  - Moderator Flush
- Refurbishment Support Facilities (RSF) Sub-bundle – Facilities required to support Refurbishment activities. Projects include:
  - Work Control Area (WCA)
  - Non-Contaminated Shops and Work Areas
  - Radiation Protection Teledosimetry (RPT)
  - Contaminated Shops & Contaminated Scaffold Storage Area
  - Decontamination Room S107 Upgrade
  - Washroom facilities (Installation and Removal only, maintenance scope transferred to NR Construction via CCF 938)

Holt Road/South Service Road / Highway 401 Interchange OPG ServicesNOTE:

The following projects have been removed from scope at a Gate Review Board (GRB) meeting on Sep 23, 2014.

- Vestibules, Storage Pad, and Pressure Boundary laydown area
- Off-site Security X-ray Scanner
- Turbine Hall Lunchroom

NOTE: The following project has been transferred to the CIO via DRAS 671.

- Wifi

NOTE: The following project has been removed from scope per DRAS 715.

- Turbine Auxiliary Building (TAB) Elevator

NOTE: The following project has been transferred to NR Construction via CCF 928.

<b>Title:</b> <b>SHUTDOWN &amp; LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN</b>		

- Maintenance and Custodial of RSF facilities

## 2.2 Overall Execution Strategy

### 2.2.1 Execution/Contracting Strategy

There are two main execution/contracting strategies for the scopes of work under the bundle:

1. Engineering Contract + Procurement/Construction Contract
2. Engineer/Procure/Construct (EPC) Contract

The first strategy is being applied to modifications where projects can maximize the efficiency in terms of availability of engineering expertise, cost and schedule. The Procurement/Construction Contract will be issued under the Extended Services Master Service Agreement (ES MSA) contracts. This strategy is being applied to these projects:

- Dry Air Provision to Conventional Side
- Dry Air Provision to Nuclear Side
- Moderator Flush
- Holt Road Services
- Temporary Power
- Decontamination Room S107 Upgrades
- Washroom Facilities

All other remaining scopes of work will be executed via the Engineer/Procure/Construct (EPC) model using the ESMSA contracts.

### 3.0 GOVERNANCE STRUCTURE AND INTERFACES

#### 3.1 OPG Project Management Plans

The Bundle's Project Management Plan has followed the guidance set within the OPG Governance per Figure 1. The content of this PMP is divided into ten knowledge areas as shown below:

- Section 4.0: Safety Management,
- Section 5.0: Project Integration Management,
- Section 6.0: Project Scope Management,
- Section 7.0: Project Schedule Management,
- Section 8.0: Project Cost Management,
- Section 9.0: Project Quality Management,
- Section 10.0: Project Human Resource Management,
- Section 11.0: Project Communications Management,
- Section 12.0: Project Risk Management, and
- Section 13.0: Project Procurement Management.

MANAGEMENT PLAN**

### 3.2 Contractor Management Plans

#### 3.2.1 ES MSA Contractor Management Plans

All ES MSA projects being managed under the SDLU/Services/RSF Bundles will follow the strategy in this plan.

Plan

Internal Use Only

	<b>R002</b>	<b>14 of 56</b>

Title:

**SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT  
MANAGEMENT PLAN**

## 4.0 SAFETY

### 4.1 Safety Management

Safety is a core value at OPG for Nuclear Refurbishment and is reflected in all safety management plans produced by OPG and contractors. The Bundle will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), the OPG expectations (N-POL-0001, OPG-POL-0001, and N-GUID-09701-10011), as well as the requirements set out in the EPC contracts terms and conditions.

For work contracted to an ES MSA contractor, each of them will be required to issue a SSSP for OPG acceptance.

Compliance to SSSPs will be monitored by OPG.

### 4.2 Construction Management

The Shutdown Layup/Services/RSF Project will adhere to all applicable obligations as defined in the Occupational Health and Safety Act (OHSA), OPG expectations, and the terms and conditions for each EPC Contract under which Shutdown Layup/Services/RSF work will be executed.

Construction Oversight and Support is being provided by the Construction Department in Nuclear Refurbishment. Should contract monitoring support be required for individual projects, the project will secure the appropriate resources to perform field oversight to ensure that the construction work is being executed according to plan and meeting safety and quality requirements. These field oversight resources will align with the Refurbishment Program strategy for construction oversight:

- NK38-PLAN-09701-10012, Management Plan: Management of Contractors for Darlington Refurbishment Project
- N-GUID-09701-10120, Guideline For Construction Oversight

Plan

Title:  
**SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT MANAGEMENT PLAN**

## 5.0 PROJECT INTEGRATION MANAGEMENT

### 5.1 Integrated Governance

The integration of OPG and EPC vendor processes will enable coordination of activities between OPG and EPC organizations. The referenced standards in Figure 2 will be applied to ensure contractors are working within OPG governance and within their quality program. Project oversight will be the method utilized to ensure Safety standards are being met.

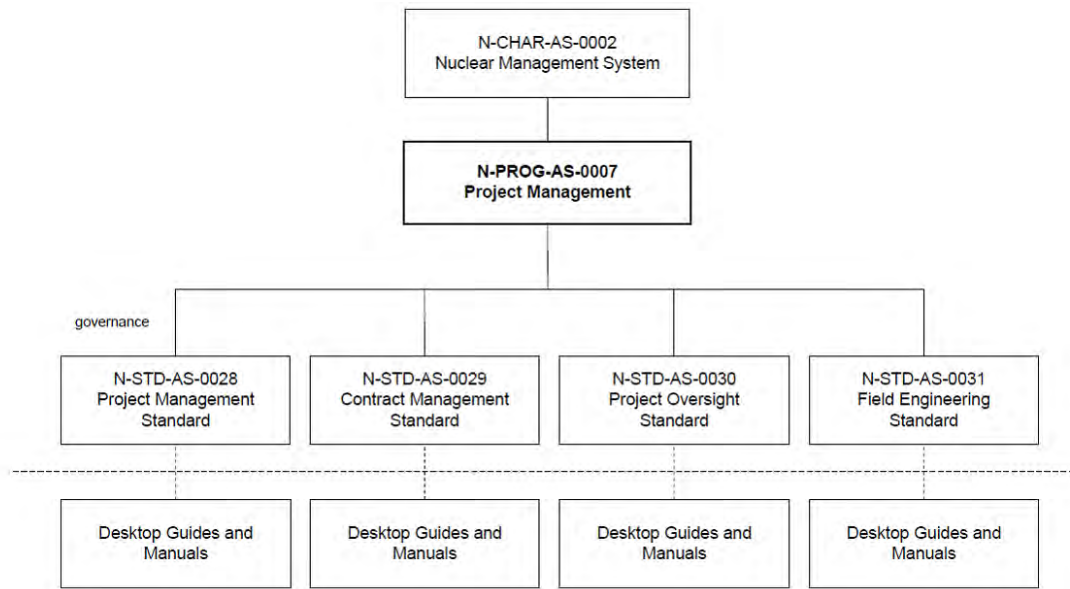

Figure 2 - OPG Management System

### 5.2 Project Management Toolset

The OPG project management toolset is illustrated in Figure 3 below. The toolset will be used to manage OPG internal project activities, facilitate coordination with the EPC vendor activities and document and manage findings resulting from vendor oversight.

	<b>R002</b>	<b>16 of 56</b>

**SHUTDOWN & LAYUP / SERVICES / REFURBISHMENT SUPPORT FACILITIES PROJECT  
MANAGEMENT PLAN**

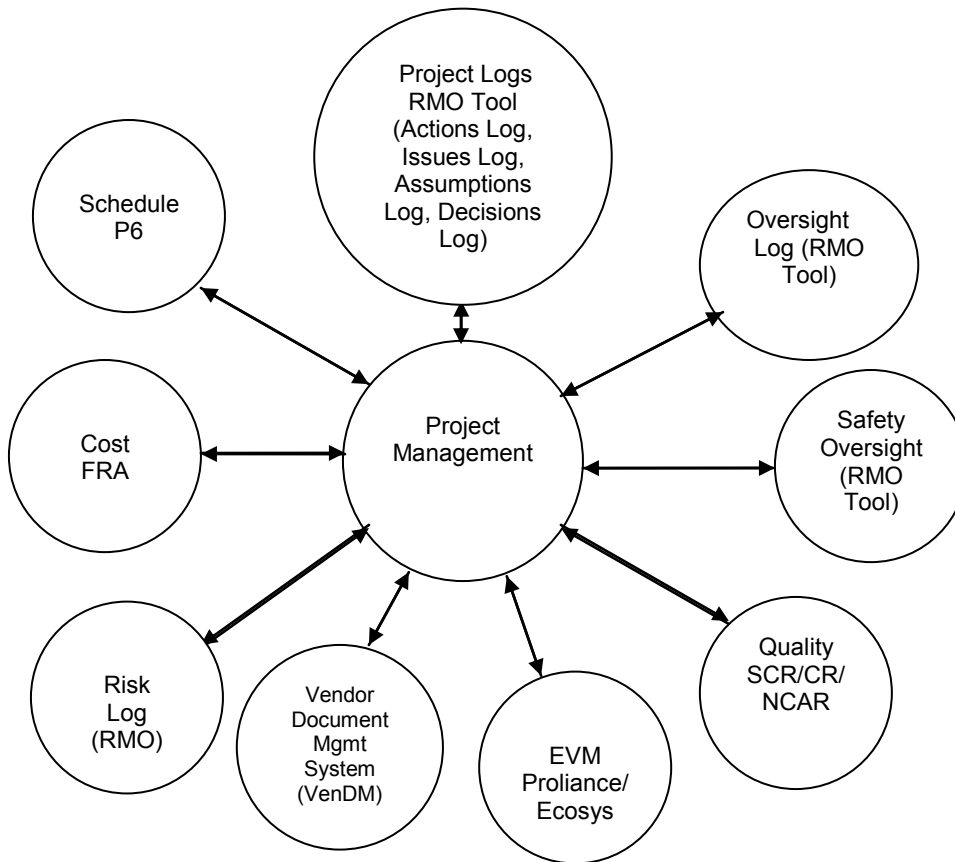

Figure 3 - Project Management Toolset

### 5.3 Project Oversight

The Shutdown Layup/Services/RSF Project team is accountable to provide oversight of the contracted scope to ensure that the Contractor delivers the products and services safely with acceptable technical quality and appropriate project controls critical to success. This Project Oversight Plan will provide a uniform methodology to be used for oversight activities ensuring that the deliverables, as supplied by the Contractor, meet the intent of the ES MSA Agreement.

This plan covers the different stages of Engineering, Procurement, and Construction as it applies to the individual project Scope of Work (SOWs) and ES MSA Contract Terms and Conditions.
